Dedication

On a personal note, I'd like to dedicate this book to my incredible family – to my wonderful wife, Susan; to my phenomenal children, Nadia, Rebecca, and David.

On a professional note, I'd like to dedicate this edition to my colleagues who participated in this book – to the authors who gave generously of their time and talents to help produce this phenomenal resource for the veterinary profession.

Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS

3.15 Engaging Staff, *Robin Brogdon, MA* 204
3.16 Effective Coaching for the Exam Room, *Mary Ann Vande Linde, DVM* 206
3.17 Mentoring, *Kurt A. Oster, MS SPHR, SHRM-SCP* 210
3.18 Staff Scheduling Options, *Kurt A. Oster, MS SPHR, SHRM-SCP* 212
3.19 Staff Performance Evaluations, *Shawn G. McVey, MA, MSW* 216
3.20 Staff Turnover and Retention, *Lorraine Monheiser List, CPA, CVA* 218
3.21 Employee Manuals, *Katherine Dobbs, RVT, CVPM, PHR* 222

Vet-eBooks.com

3.22 Measuring Your Human Resource (HR) Performance, *Karen E. Felsted, CPA, MS, DVM, CVPM, CVA* 224
3.23 Office Politics, *Karyn Gavzer, MBA, CVPM* 226
3.24 Conflict Resolution, *Karyn Gavzer, MBA, CVPM* 228
3.25 Dealing with Difficult Employees, *Angela Schneider, CVT, CVPM* 230
3.26 Effective Disciplinary Protocols, *Heather Prendergast, RVT, CVPM, SPHR* 232
3.27 Personnel Records, *Katherine Dobbs, RVT, CVPM, PHR* 234
3.28 Terminating Staff, *Randy Hall* 236

SECTION 4
CLIENT RELATIONSHIP MANAGEMENT 239
4.1 The Basics of Client Service, *Amanda L. Donnelly, DVM, MBA* 240
4.2 Client Service Strategies, *Randy Hall* 244
4.3 Exceptional Client Service, *Robin Brogdon, MA* 248
4.4 What Clients Expect from Their Veterinarian, *Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS* 250
4.5 Meeting the Needs of Pet Parents, *Robin Brogdon, MA* 252
4.6 Client Perception and Learning, *Dallas McMillan, BVSc, BSc (Vet)* 254
4.7 The Client's Buying Journey, *Robert Sanchez* 258
4.8 Pet-Specific Care, *Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS* 260
4.9 Lifelong Excellence in Healthcare, *Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS* 264
4.10 Personalized Pet Profiles, *Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS* 268
4.11 Compliance and Adherence, *Karyn Gavzer, MBA, CVPM* 272
4.12 Creating a Client-Centered Hospital, *Nan Boss, DVM* 276
4.13 Creating a Feline-Friendly Focus and Facility, *Jane Brunt, DVM* 280
4.14 Developing a Fear Free Hospital, *Heather Prendergast, RVT, CVPM, SPHR* 284
4.15 Client Appointment Scheduling, *Kurt A. Oster, MS, SPHR, SHRM-SCP* 288
4.16 Client Reminders Systems, *Justin Phillips* 290
4.17 Maintaining Regular Client Contact, *Robin Brogdon, MA* 292
4.18 Telephone Service Management, *Karyn Gavzer, MBA, CVPM* 294
4.19 Measuring Client Satisfaction, *Justin Phillips* 296
4.20 Client Rewards Programs, *Diederik Gelderman, BVSc, MVS, MT-NL, TAE Cert IV* 300
4.21 Client Retention, *Kurt A. Oster, MS, SPHR, SHRM-SCP* 302
4.22 High-Touch and High-Tech Customer Service, *Nan Boss, DVM* 306
4.23 The Extended Hospital Team: Making Referrals Work, *Amanda L. Donnelly, DVM, MBA* 308
4.24 Telehealth, *Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS* 310

SECTION 5
COMMUNICATION 313
5.1 Effective Client Communication, *James P. Humphries, DVM, CVJ* 314
5.2 Identifying Client Communication Styles, *Angela Schneider, CVT, CVPM* 316
5.3 Speaking as a Professional, *Kathleen A. Bonvicini, MPH, EdD* 318
5.4 Making Clear Client Recommendations, *Mary Ann Vande Linde, DVM* 320
5.5 Translating Medicalese, *Kathleen A. Bonvicini, MPH, EdD* 324
5.6 Shared Decision-Making, *Kathleen A. Bonvicini, MPH, EdD* 328

EDITOR-IN-CHIEF

LOWELL ACKERMAN, DVM, DACVD, MBA, MPA, CVA, MRCVS

Dr. Lowell Ackerman is a board-certified veterinary specialist, an award-winning author, an international lecturer, and a renowned expert in veterinary practice management. He is a graduate of the Ontario Veterinary College and a Diplomate of the American College of Veterinary Dermatology. In addition to his veterinary credentials, he also has a Masters in Business Administration from the University of Phoenix, a Masters in Public Administration from Harvard University, and a Certificate in Veterinary Practice Administration from Purdue University/American Animal Hospital Association. Dr. Ackerman is a Certified Valuation Analyst (CVA) through the National Association of Certified Valuators and Analysts and is a Fear Free Certified Professional. Throughout his career, Dr. Ackerman has been engaged in specialty practice, primary care practice, academia, consulting, industry, and teaching. Dr. Ackerman is the author or co-author of several books, and he lectures extensively on a global basis on topics relative to both medicine and management.

Preface

This book was designed to help provide a valuable resource for veterinarians on all things management related, from understanding the marketplace in which we practice, to appreciating where money flows into a practice, and where it flows out. It is an appropriate source of information for practice owners, administrators, associates, staff and students.

Whether you want to know how to price a service, how to market it, how to prevent embezzlement, or the meaning of the term "shrinkage" as it applies to inventory, you'll find it within the pages of this book.

The veterinary marketplace has changed dramatically from only a few decades ago. Pets are considered as family members, more so than at any time in the past. The gender distribution within the profession has also changed dramatically, which has in turn altered the demographics not only of veterinary school classes, but the profession in general. Specialization within the profession has become more commonplace and the creation of specialty and referral hospitals has been robust across the country. Corporate practices are coming into their own, as are retail-anchored practices, and some are even spreading outside the confines of American borders. Benchmarks are available, so practices can now compare their own financial statistics with those of other practices in their region.

Yes, things are changing, and change is often difficult to assimilate, especially within the veterinary profession. Veterinary practice often stood as an anachronism, an attempt to hold back the escalation in healthcare costs as they pertain to animals. There was a belief that these costs needed to be kept artificially low, because pet owners would be unwilling to pay those costs for the sake of an animal. Yet, study after study has shown that this is not the case and owners do understand the high cost of healthcare and are often prepared to shoulder those costs … as long as they see the "value" in those expenditures and reasonable expectations have been established for them by veterinarians. The success of specialty practices and advanced modalities such as magnetic resonance imaging (MRI) that are now routinely used on animals is a testament to this reality. There is the realization that pet owners, like all consumers, are value shoppers. It is not the price tag that is an impediment to spending – pet owners just want appropriate value for their dollars spent and reasonable warning as to when such expenditures are expected.

The profession is indeed changing, and clients have changed, and the services available for pets have changed, but primary care veterinary practices are still very much as they have been in the past and face many challenges ahead. It is the goal of this book to provide veterinary practices with the factual information necessary to compete effectively in the marketplace and to demystify the business side of veterinary practice.

Compiling all this information in one volume was an immense task, and I am eternally grateful to my gifted colleagues who helped contribute to this incredible resource. It wasn't that long ago that practice management in veterinary medicine was a self-taught discipline with few factual reference sources. That has changed, and I am very proud to be involved in a project, along with the many authors of this book, that helps deliver this much-needed resource to the veterinary profession.

Lowell Ackerman, DVM, DACVD, MBA, MPA, CVA, MRCVS

1.1. MODELS OF VETERINARY PRACTICE

BASICS

OVERVIEW

In general, veterinary practices have changed very little over the past few decades. Although there are a number of corporate players in the field in the United States, probably representing 12–15% of small animal practices, the vast majority of veterinary practices in the country are owned as sole proprietorships, closely held corporations, or partnerships. The retail environment, on the other hand, has changed dramatically over the same period. Major retailers have entered bankruptcy protection, whereas online retailers and discount chains have evolved to better serve the perceived needs of the public.

Pet owners today want choices in the services they can request: 24-hour access to health-related information, the ability to price-shop for items they consider commodities, the opportunity to participate as equal partners in health decisions, and the ability to interact on their own schedules. Today's consumer also wants choice, variety, value, and time-saving options. These are often hard to accommodate in current veterinary practice models.

TERMS DEFINED

Commodity: An item that is considered interchangeable, and whose price is a reflection of supply and demand. For example, one 500 mg capsule of cephalexin is much like any other to a client, regardless of brand name and whether they get it at a veterinary hospital, at their local drug store, or through an online pharmacy.

Economy of Scale: The reduction in cost per unit that results when operational efficiencies allow increased production. Thus, there are savings, because as production increases, the cost of producing each additional unit decreases.

Economy of Scope: The reduction in cost that results when delivering two or more distinct goods or services, when the cost of doing so is less than that of delivering each separately. It is the efficiency attributed to variety and diversification rather than volume.

Full-Time Equivalent: A method of comparing practices based on a full-time schedule of 40 hours a week. If a practice has two veterinarians, one working 50 hours a week and one working 20 hours a week, that practice has 1.75 full-time equivalent veterinary positions [i.e., (50 + 20)/40].

Mom-and-Pop: A colloquial term for a small, closely held company in which the principals owning the business are also the principals working in the business.

Retail-Anchored Practice: A veterinary practice affiliated with a retail entity.

ISSUES AND OPTIONS

THE CURRENT SITUATION

- The veterinary small animal market in the United States is a highly fragmented environment of approximately 28,000 primary care practices. The majority of practices employ fewer than three full-time equivalent veterinarians.[1]
- The small number of veterinarians per practice does not bode well for the continued success of the current veterinary model. Operating a veterinary hospital is an expensive undertaking, and there are few economies of scale or scope to be derived from such small business ventures (see 2.1 – Workplace Management). Other small retail units, such as "mom-and-pop" drug stores or hardware stores, have largely been replaced by entities that have revolutionized those industries to better meet customer needs.
- Most veterinary practices in a community are remarkably similar, with little to differentiate one from another in the minds of consumers (see 6.15 – Practice Differentiation). They are often competing against one another for the same small market share, with new veterinary practices opening in local markets that can barely support the practices already in existence.
- The result is that communities often have many small veterinary practices with proportionately high overheads, because these practices tend to offer all veterinary services (e.g., surgery, hospitalization, radiography, etc.) and must be staffed accordingly. The competition puts downward pressure on prices while keeping hospital costs high. This leaves these small practices chasing the same resources that become harder and harder to attract: clients, trained staff, and associate (employed) veterinarians.
- The current model – in which clients who have pets with health problems schedule appointments with their primary care veterinarians, receive treatment, and/or are referred to specialists and then are expected to follow special instructions – is a system fraught with inefficiencies. It is one that has never worked particularly well, either in human medicine or veterinary medicine. Current studies of compliance in the veterinary industry, in which veterinary estimates of client compliance are far more optimistic than the facts suggest, attest to this (see 4.11 – Compliance and Adherence). Actually, few veterinary practices track compliance, increasing the likelihood that clients are not being adequately served by the practice or that they are receiving some of the needed services elsewhere (including nonveterinary outlets).

Vet-eBooks.com

• Today's veterinary graduates also confound the picture for current practice models. Many are seeking lifestyle benefits that are harder to come by in small practices: a shorter workweek, on-the-job mentoring, continuing education, and the potential for piecemeal equity ownership. These smaller practices can also be difficult to market when the owner wishes to sell. Corporate practices have their own criteria for practice acquisition that often does not include small practices, and valuations for these small practices no longer mirror past standards wherein the seller could expect to be paid based on a certain percentage of gross revenues. In addition, in recent years, there has even been the prospect of staff joining unions in some practices, suggesting that not everyone is satisfied with the current business model.
• Veterinary graduates these days also tend to concentrate in clinical practice. Although needs assessments suggest that there are no shortages of veterinarians in practice, need and opportunities exist in research, industry, and public health.[2]

THE MARKETPLACE

• Today's pet owner is also a savvy consumer, familiar with elite business practices such as those used by Walmart, eBay, Disney, Amazon, Internet pharmacies, and out-of-country pharmacies that offer lower rates (see 1.5 – Today's Pet Owner).
• In the American family of yesteryear there was a male head of the household, a female stay-at-home spouse, and two-plus children. With a stay-at-home mom, it was relatively easy to schedule a veterinary appointment during the workday. But things have changed. The typical American family no longer exists; most adults, both male and female, are working during normal business hours. And consumer debt is rising.
• As can be seen in other industries, consumers want selection, choice, value, and time-saving options, and they want it on their own schedules.

POTENTIAL FOR NEW MODELS

• Human physicians learned long ago that they could not be all things to all patients. These days, general practitioners rarely deliver babies, perform surgery, or do their own radiography. In many instances, offices of general practitioners do not even collect samples to send to the laboratory. Instead, the patient typically goes to the laboratory to have the sample drawn. Even something as basic as vaccination may be delegated to other entities, such as public health outlets and even retail pharmacies.
• For a similar system to work and be convenient for veterinary clients, there needs to be considerable consolidation in the industry, which is only now starting to take place in earnest. For most small veterinary practices, the examination rooms are the profit centers that drive the practice. Performing other duties in the clinic, even such things as radiography and surgery, are often only marginally profitable, and sometimes are actually money-losing ventures when a true profit-center analysis is done.
• Currently fewer than 20% of practices in the United States are corporate (see 1.21 – Corporate Veterinary Practices) but without compelling evidence that they are leveraging hospital numbers to attain true economies of scale and scope. Whether this will change as more and more hospitals are added or assimilated has yet to be determined. It has been suggested that when 25% of practices are corporate owned that this could actually represent 50% of all veterinary visits (https://brakkeconsulting.com).
• Retail-anchored practices have started to appear in some communities. These are independent veterinary practices that are directly affiliated with retail entities (e.g., pet stores, human pharmacies, big box retailers, etc.) and can benefit from extensive cross-promotion with the retailer with which they are affiliated. In many ways, these may pose more of a threat to traditional veterinary practices than corporate clinics, since they tend to concentrate on the more profitable outpatient care, which they often price competitively to attract retail business.
• Efficient models of veterinary practice have veterinarians performing the duties for which they are best suited and working in a collaborative fashion with other professionals to deliver more comprehensive care. Even in a two-doctor model, it will always be more efficient if one doctor is performing surgeries all day while the other is seeing clinical cases all day, rather than each doctor alternating between clinical and surgical duties. It is even more efficient if separate services are run as distinct profit centers. This would allow veterinarians to charge on the basis of their costs and not spread the costs of all hospital operations across the total client base. In too many veterinary hospitals, certain services (e.g., surgery, imaging, hospitalization) are subsidized by other services (e.g., pharmacy or laboratory), such that neither is appropriately priced to the consumer (one is unfairly high and the other is unfairly low). This, in turn, invites competition for the service that is priced unfairly high. Similarly, with enough general veterinary practitioners in a given hospital setting, there are economies of scale to permit the functioning of separate profit centers at fair prices to consumers and fair remuneration for practicing veterinarians (see 7.12 – Pricing Strategies).

Vet-ebooks.com

1.1. Models of Veterinary Practice

• Creating profit centers in large collaborative practices is not enough to fully meet the needs of pet-owning clients (see 9.5 – Profit Centers). A truly client-centered practice should also emphasize the following:
  ◦ Access to specialists: Clients are very aware of specialists in human medicine, but are not necessarily aware that the same kinds of services are available for animals. Clients should realize that specialists are an extension of their primary care veterinary hospital and that the specialists and primary care veterinarians will work together with them as a healthcare team (see 4.23 – The Extended Hospital Team – Making Referrals Work).
  ◦ Access to telehealth: There are many forms of telehealth available to both clients and veterinarians (see 4.24 – Telehealth).
  ◦ Access to reliable medical information: Veterinary practitioners traditionally have not done a very good job of educating their clients on the entire spectrum of healthcare options available. With websites and databases, it is now possible for veterinarians collectively to create an evidence-based resource in which clients can research the most effective drugs, treatments, and tests to address the patient's individual needs (see 4.8 – Pet-Specific Care). It may even be possible to give clients access to some aspects of their pets' medical records (see 10.9 – Blockchain). If clients do not get this kind of support from the veterinary profession they will seek it elsewhere, so it is best that this access be viewed as part of the solution rather than part of the problem.
  ◦ Access to health educators: There is a much-needed role in client education that is currently unmet in the profession. Clients need help with understanding care pathways and treatment plans (see 9.3 – Standards of Care and Care Pathways), having someone check on them periodically to see if they have questions or need a veterinary visit, and helping them navigate the veterinary healthcare arena. This kind of client advocate could be a veterinary nurse/technician or specially trained assistant, or could even be a network affiliate of a larger veterinary healthcare system. If veterinarians are concerned with compliance and client loyalty, this is an important consideration.
  ◦ Access to clients with similar concerns: Social media is very popular, and many people are comfortable hearing accounts from other individuals who share the same concerns. Sometimes, just hearing from another individual who has been through the process is enough to put clients at ease regarding procedures being contemplated. Having such a discussion moderated by a veterinarian or trained nurse/technician is even more valuable and helps stop medically inaccurate information from being disseminated.
  ◦ Access to training and behavior consultants: Surveys have shown that many pet owners do not initiate discussions with veterinarians about behavior problems, and the converse is also true. Behavior problems are the main cause of pets being relinquished, however, so training is a critical component of pet ownership that must not be ignored (see 5.14 – Discussing Behavior).

These are important changes, but they are not necessarily the only changes that need to be made to veterinary practice models in order to create a more effective healthcare delivery service.

EXAMPLES

A client who owns a Doberman pinscher pup searches a veterinary medical resource linked to the primary care veterinarian's website and learns that the breed is susceptible to von Willebrand disease, a bleeding disorder. The client sees that there is both a DNA test and a von Willebrand factor assay available, and initiates a discussion with the health educator assigned by the practice. They schedule an appointment for the tests to be run. It turns out that the dog does, in fact, have von Willebrand disease. The client joins a veterinary-supervised discussion group for the disorder and makes arrangements with the veterinary hospital to be appropriately prepared for upcoming neutering surgery. The veterinary hospital provides a higher level of care at higher revenue, and averts a potential emergency – all initiated by the client. The alternative may have been that the diagnosis was made following complications of the surgery, proving costly for both practice and client.

CAUTIONS

It is hard to make firm conclusions about models of veterinary practice that currently do not exist. Also, developments in human medicine may take decades to filter down to the veterinary profession, and not all may be appropriate.

What does seem clear is that the profession needs to engage in discussions with pet owners about the costs of veterinary care and pet health insurance, regardless of the individual model of veterinary practice.[3]

1.2. CHALLENGES TO THE PROFESSION

BASICS

OVERVIEW

By definition, a challenge is a call to battle. In addition to all the standard challenges to the profession, it is also important to consider the following:

- **Information glutted, knowledge starved:** The respect, credibility, and trust of veterinarians have all been battered by the media and the Internet. Unmoderated information can be misleading and downright dangerous.
- **Too many versus too few:** Some areas have an overabundance of veterinarians and others have a paucity, leading to a conflict between veterinary schools and the profession over the distribution of veterinary school graduates. There may also be a lack of minorities in the profession.
- **Profitability:** A business model may provide a living wage to hospital owners but in some cases does not provide a reasonable long-term ROI. About 50% of practices have low or limited value when it comes to a sale.
- **Prescribing:** There could be an assault on the veterinary drug dispensary as a profit center, including but not limited to federal bills that require the provision of written prescriptions for any drug being prescribed.
- **Debt:income ratio:** The escalating cost of education and student debt load contrasts with the ability of recent graduates to earn a reasonable wage to help retire debt.
- **Cost–value disconnect:** A conflict arises between the cost of care and the ability of the "average" consumer to afford it. A disconnect exists between the perceived value of the services and products sold by a veterinarian and the cost as determined in the mind of the consumer.
- **High-tech/low-touch methods:** New technologies and new tools coming in from outside of the profession include genetic testing, wearable collars, at-home diagnostic tests, telemedicine, etc.
- **Corporate consolidators:** These challenge the long-standing business model and the independent practice owner model.
- **Enough already:** All this can lead to burnout, substance abuse, suicide, shorter life expectancy within the profession of doctors and nurses/technicians.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

RESPECT AND TRUST

For many years, the veterinary profession was considered to be one of the most highly respected professions. It appears from recent media sources that the credibility, respect, and trust of veterinarians may have experienced some erosion.

The Internet, sometimes referred to as "Dr. Google" when diagnosis and treatment are concerned, allows consumers to query everything at any time, and for free. There are many websites challenging the need for the level of care that is being provided by veterinary practices. Specific questions include: Is there a need for blood testing, whether pre-anesthetic or baseline? Is there a tendency to over-treat in terminally ill cases? Is the more expensive and new surgical option that much better than what was used in the past? Even the level of day-to-day care that might be needed is under scrutiny.

Such myriad opinions can indirectly call into question the level and type of care provided by veterinarians (see 9.3 – Standards of Care and Care Pathways), which in turn can erode the level of trust that pet owners have for their veterinarian.

Internet resources can provide a wealth of information that does nothing more than muddy the waters for pet owner decision-making. Veterinary professionals and organized veterinary medicine need to create fact-based and knowledge-based resources for consumers that become the go-to resource and have been fully vetted and approved. Until we can be the trusted-veterinarian source for patient care we will have an uphill battle against the volume overload that raises more questions than answers.

Without a common agreement as to what is best patient care, there is inconsistency when it comes to the standard of care at all levels from wellness to sickness. And this inconsistency is within practices and between practices. Inconsistency at this level gives the Internet sources more credibility because the profession itself cannot agree as to what is best or what is right. And of course, with inconsistency comes inability – the inability to improve compliance by taking a firm stance on patient care and needs.

THE VETERINARY SCHOOL MODEL

Since 2013, the number of veterinary schools in the United States has grown, and a number of new veterinary schools are under serious consideration. At the same time, many of the existing veterinary schools have increased their graduating class size to address economic pressures. Thus, there are more veterinary school graduates than ever being produced in the United States. And in the last few years, the number of unique applications to veterinary schools has increased as well.

While the number of veterinary school graduates is projected to increase, in many areas of the United States veterinarians are unemployed or underemployed, whereas in others it is nearly impossible to find a new associate (employed veterinarian). In some states, there are more jobs listed than candidates looking for positions. How can you explain a glut and a dearth simultaneously? Supply and demand economics do not seem to make sense when applied to veterinary employment.

Veterinary colleges are challenged to be economically viable. In response to decreasing state and federal funding, they are increasing admission class sizes and increasing the cost of education for newly admitted as well as already enrolled students to help balance the budget.

There are definitely some underserved areas and professional focuses when it comes to veterinary care.[1] However, identifying candidates for these locations or areas of interest is not being addressed by increasing class size. Although more veterinarians are graduating with the same general concentration (clinical practice) this does not necessarily address the greater needs.

As the cost of education is going up, so is the student debt for graduates of veterinary schools. With debt hovering around $175,000 upon completion of veterinary school[2] and with salaries not growing as rapidly as debt, a vicious cycle is impending for the now 4,000 or so veterinary school graduates and the profession as a whole.

With regard to veterinary schools, another question is whether the entire process from start to finish is based upon selecting the best candidates to complete the veterinary education or the best candidates for the consumer (veterinarians or industry or school). In other words, does the admission process and educational process meet the needs for the end user at this point in time?

Taking this issue into another global veterinary issue: Is the current veterinary student gender-ation (gender and generation) adversely selected when it comes to business ownership or entrepreneurship? Is the student debt and the nature of those selected a barrier for entry to small business ownership? Taking this even further, if the current or recent gender-ation of graduates does not want to purchase veterinary businesses, who will? The VBMA (Veterinary Business Management

Vet-ebooks.com

Association (www.vbma.biz) has provided a student-run resource for business education within the veterinary schools. However, the veterinary schools themselves need to better integrate financial literacy and knowledge into the curriculum, not just for the potential entrepreneurs but for the requisite life skills of any university graduate.

THE VETERINARY BUSINESS MODEL

In the original so-called "mega-study,"[3] 19 standard business practices were noted as being associated with well-managed veterinary hospitals. It was also noted that almost 80% of practices use fewer than ten of those standard practices. Subsequent studies do not indicate much improvement in this area, even though it was statistically significant that those who used more standard practices were more profitable. For the most part, the veterinary business model remains entrenched in its 60-year-old approach to delivering veterinary care.

Profitability may not be directly correlated to happiness and career satisfaction, but it is definitely influential in these areas. The veterinary business model may not provide sufficient return on investment to meet the long-term needs of most veterinarian business owners, especially when it is time to sell their business. The current net profit margin for most practices does not provide return on investment commensurate with the risks involved (see 7.11 – Understanding Practice Profitability).

The veterinary delivery model is more labor intensive than virtually any other healthcare model. Veterinarians require more staff per doctor than medical physicians or dentists. This would be fine if the staff were delegated tasks that would make the practice more effective, efficient, and profitable. Although a registered dental hygienist can generate hundreds of thousands of dollars per year in practice revenue, a veterinary staff member is rarely allowed to fully utilize the skills they have. Veterinary hospitals that have fully leveraged staffs are the most profitable and report the highest level of staff satisfaction. Unfortunately, this model is not universally applied. Thus, as a rule, veterinary practices are "people heavy," and because payroll is the highest expense for the hospital, profitability wanes.

Another drain on profitability is the failure to make efficient use of the physical plant. Rent or mortgage is paid on 100% of the square footage. However, at any one point in time, only a small percentage of the area is being fully used. Although the exam rooms are in use for billable income, the surgery suite may sit unused for much of the day. When the surgery suite is in use, often times the exam rooms are unused. Additionally, many veterinary practices actually close their doors and are not available for periods of time during the day. The rent does not stop when business is not being transacted. A business model that finds greater use of the various areas, such as imaging, laboratory, exam rooms, surgery, and treatment, at all times of the day (and night), will have a greater return on the physical plant investment. And because the physical plant is also a large expense, this increased efficiency should improve profitability.

After payroll costs, the highest expense for most veterinary practices is the inventory of drugs and supplies. With the current markups in use by most hospitals, the sales of drugs and supplies by practices may not provide a positive net profit for the practice (see 9.15 – Pharmacy Management). Past issues in the pharmacy were the result of too much inventory sitting unsold, the physical space required for storage, overlapping product lines, and shrinkage, among other factors. In recent years, a new challenge to pharmacy profitability has arisen and provides a huge challenge to practice profits. This is the growth of online pharmacies, human pharmacies, and retailers. The in-practice dispensing of prescription drugs, flea control, heartworm control, and other products is being seriously challenged by outside competition (see 9.13 – Medication Dispensing, Compounding, and Prescribing Practices). How veterinarians respond to this challenge will determine how well the current veterinary business model survives in this hyper-competitive landscape.

Another challenge to success is that many veterinary hospitals are operated with only a small number of veterinarians. The inefficiencies previously noted are exacerbated in these small practices where the physical plant is underutilized, as is the staff. Affordability makes these practices most attractive for young veterinarians seeking to buy a practice. On the other hand, profitability in these small practices means the cash flow method for determining purchase price leads to practices that are frequently undervalued (in the owner's eyes) or overvalued (in the buyer's eyes).

With over 40% of new and recent graduates going on to postgraduate internships and/or residencies, the proliferation of veterinary specialists has also rocked the delivery model (see 1.25 – Specialty and Emergency Centers). Whereas in the pre-specialist era veterinarians did everything in their own practice (and still do in many rural practices), in urban settings the immediate availability of specialists in surgery, ophthalmology, dermatology, internal medicine, emergency/critical care, and so on, has started to push the general practitioner into the role of preventative care and triage physician, with everything else referred to the appropriate specialist. Specialty veterinary medicine is offering new options for pet owners when it comes to the treatment of many conditions. For those pet owners who can afford it, specialists provide the best care possible. For generalists, specialists have become the "go-to" doctors for much of what was done in general practice not that long ago.

Nontraditional sources of veterinary care are also becoming available with more prominence. With pets being spayed or neutered at shelters before placement, the spay–neuter income has been diluted. Add to that private, public, and not-for-profit spay and neuter clinics, and the revenue potential gets sliced even thinner. Of course, vaccination clinics have been around for a while, offering a direct challenge to practice income at pet stores, feed stores, parking lots, and so on.

The overall foundation of the veterinary practice is being rocked by all of this and calls into question the presence of a model that will provide for all stakeholders in a practice setting.

COST:VALUE DISCONNECT

Over the last 50 years or so, as the small animal practitioner plied his or her trade, improved skills, and offered higher levels of care, the cost of care escalated but was still long considered a "healthcare bargain," when compared with the services offered by our human health counterparts. However, with veterinary medicine still being a discretionary expense for pet owners, veterinary costs have certainly come under more scrutiny lately.

Over the last 10–15 years, veterinarians increased prices on a regular and continual basis at a rate higher than inflation. When prices were increased, the income for veterinarians also increased. These price increases usually encompassed all fees, although some of the more competitive services were raised at lower rates to remain in line with other practices.

Unfortunately, in many cases, the fee increases were not accompanied by a commensurate value increase to the pet owner. Thus, higher fees were often charged with no change in service, care, compassion, understanding, or education. The consumer has started to push back on care, and client visits to veterinary hospitals has dropped. Fewer veterinary visits, lower compliance, lower adherence, and more resistance to healthcare plans (estimates) will not bode well for the profession.

The cost of care question, which never seemed to be an issue previously, is now a real issue and further validates that the veterinary profession is not recession proof. It also will challenge the communication skills of many practices who were used to discussing a pet's needs without question and now will be facing questions from the client or even more second opinions before care is provided. It has also led to pet owners delaying care for conditions, and thus only increasing the cost of care because pets are coming in for care later than they should.

Vet-ebooks.com

1.2. Challenges to the Profession

Reconciling the disconnection between the cost of care and the value of care is a challenge at all levels of veterinary medicine. It will require a combination of organized veterinary medicine and industry support to address this issue.

CORPORATE-OWNED PRACTICES AND CORPORATE CONSOLIDATION

The presence of veterinary practices that are owned and operated by large financial backers may be considered a challenge or a benefit, depending on who you are speaking to. Veterinarians who have sold their practices and benefited from the deep pockets of a corporation may offer one opinion, whereas those who have had practices impacted by the presence of a corporate practice in their community may have another opinion.

Over the last 20 years, the increasing presence of corporate practices has concerned many practitioners. The concerns include: unfair competitive edge; loss of identity of the veterinary profession similar to other franchised businesses; diminishing standards of care; lower prices; higher salaries and challenges to meet the available benefits; and other factors. Even with these concerns, the number of corporate-owned practices is still less than the 15% of all practices that was once projected. It is still undetermined what role corporate veterinary practices will play in the future of veterinary medicine, but most of the fears regarding corporate practices remain unsubstantiated.

Corporate practices (see 1.21 – Corporate Veterinary Practices) provide a great model to learn from and veterinarians can emulate what has made them successful while making sure not to repeat their mistakes. The size of corporate practices can make them slow to change; the independent practice owner, in contrast, can start and stop on a dime to respond to their environment. It is in the hands of the independent practice owner to control their own destiny.

THE INDEPENDENT VETERINARY PRACTITIONER

Just as one could question whether corporations are a challenge, one might wonder why this is listed as a challenge. The single-doctor practice model has existed for decades. It is a model that human physicians followed for decades until various challenges they faced caused them to change.

A single doctor needs to balance business and clinical care, provide leadership and doctoring, manage day-to-day operations, and have long-term vision. And they do all this without having other professionals around to support them. The opportunities for survival, let alone growth, all depend upon the doctor coming to work every day, until the business can support a second doctor. The good news is there is no reason to share the profits. The bad news is that the profits are limited to the abilities of the doctor in charge.

With the gender-ational changes, the need to balance life and income has taken a front seat to many other priorities. In a single-doctor practice, the ability to balance life is challenged by the need to be profitable. The time needed to run a single-doctor practice comes from the time that would be spent at home or taking care of oneself. This business model has become less attractive because of the time challenges and the somewhat constrained profitability, based upon how much work one doctor can do.

FUTURE THINK

The high-tech world is investing a lot of money in the veterinary world at a variety of levels. Wearable collars that can track heart rate, respiratory rate, exercise levels, etc. allow for distant monitoring of pets. Urine cups impregnated with testing strips enable owners to check their pet's urine for abnormalities at home. Genetic screening can now detect hundreds of variants, from a very young age (see 4.8 – Pet-Specific Care). These and other "conveniences" may make veterinary visits seem obsolete. And then the growth of telemedicine can change the dynamic even further.

Telemedicine with its multitude of definitions already exists in veterinary medicine. How entrenched it becomes and to what level it impacts the cash flow of clinical practices is still to be determined. The veterinary medical boards and practice acts are going to be tested by new and updated definitions of the veterinary client patient relationship. The ability to use smartphones and tablets for examinations from a distance will tax the hands-on physical examination as the gold standard. Can this help practices provide more convenient care for patients and clients or will it further decrease client visits to the physical veterinary hospital? Will it eliminate state borders when it comes to veterinary licensure and leave us with a national license, since the veterinarian and the patient do not have to be in the same area, let alone state, when we are using technology? Numerous questions and more challenges arise.

EXAMPLES

To get a feeling for the public perception of the veterinary profession, all you have to do is listen. Whether they are online, at the bank or the grocery store, flying on an airplane or surfing the Internet, walking the dog, or visiting a pet store, consumers are increasingly ready to offer unsolicited comments about their veterinary experiences.

A major area that practices can benefit from is a better understanding and use of the plethora of data available in their practice management and accounting software (see 10.3 – Selecting Computer Software and 10.4 – Selecting Accounting/Financial Software). Understanding data and key performance indicators allows for goal setting, benchmarking, and tracking, which are all keystones to successful business management (see 7.8 – Key Performance Indicators). Efforts to standardize the chart of accounts, diagnostic codes, service codes, and other commonly used terms will enable all veterinary practices to use the same vernacular when talking about the relevant numbers. This will also make huge differences in helping the business of veterinary medicine become a real business and not just a hobby.

CAUTIONS

The areas noted above represent challenges that have been identified by the veterinary profession. Addressing these challenges and finding solutions will require an overarching effort from practitioners, organized veterinary medicine, industry supporters, and universities. The veterinary profession has been and continues to be a reactive profession and yet can be glacial in its speed. Taking a proactive approach and providing solutions to the above identified challenges and others may start to turn the Titanic away from the iceberg that looms.

MISCELLANEOUS

These challenges do not mean that the veterinary profession is not thriving. They are just indicators of the maturation process and the need for evolution within the profession. Additionally, the number and variety of challenges indicate that the world in which veterinary medicine survives is also changing rapidly. The long-term question examines what is needed for veterinary medicine to overcome the challenges, reconfigure or transform itself, and continue to flourish.

1.3. TRENDS IN COMPANION ANIMAL VETERINARY PRACTICES

BASICS

OVERVIEW

The numbers and types of practice models for the ownership and management of veterinary practices have proliferated in recent years. These varied practice models will continue to diversify, and we will also see increased hybridization of models. No single model is likely to dominate, and in the aggregate these trends will lead to a decreased proportion of practices owned and operated as conventional small-companion-animal practices. Although it is not possible to predict all the future changes, it seems certain that certain trends will continue, including:

- the proliferation of larger practices;
- continued consolidation in general practice and referral practice at national, regional, and local level (increasingly driven by market forces including global capital and private equity's interest in veterinary medicine as an investment thesis along with competition for practices);
- more competition for clinical staff, notably emergency veterinarians, specialists, and technicians/nurses;
- more innovation of models or combinations of models intending to solve new or emerging business challenges, or targeting increasingly specific sectors of the care-delivery spectrum;
- generational trends, with Baby Boomer practice owners beginning to implement exit strategies and wealth liquidation as part of their retirement.

TERMS DEFINED

Competition: The process of two or more businesses vying for the same group or a fixed pool of customers.

Consolidation: The mergers or acquisitions of smaller companies into a single, larger company. Entities operating multiple practices within or across regions are often referred to as "consolidators."

Differentiation: A manner of creating competitive advantage through offering products or services that stand out from rival businesses through the quality, service level, or cost of the services. Offering a unique combination of services or a uniquely focused set of services are other means of differentiation.

Disintermediation: Giving the user or the consumer direct access to information that otherwise would require a mediator. This is often done through technological innovation.

Diversification: Attempting to gain increased sales through offering new products or services or by selling products or services into new markets.

Economies of Scale: The cost advantages an organization gains through expansion, or more simply doing things efficiently. Common economies of scale involve purchasing, managerial knowledge, and finance.

Generational Wealth: The development of significant stable financial resources which can be passed down to future family generations.

Humanization of Pets: The societal trend of treating pets more like human family members than as property or with lesser status than people.

Investment Thesis: The beliefs that investors decide to use when determining what investments to purchase or sell, when to take an action and why. An investment thesis helps investors establish goals for their investments, and measures whether they have been achieved, either in written form or simply as an idea.

Market Maturation: As a growth market for services or products begins to transition into a more stable market, this often marks a time when customer needs or demands are not evolving or growing rapidly. As a market shifts from growth to maturation, businesses need to adopt different strategies due to the nature of competition and the demands of the customer. Signs of mature markets often include competition, differentiation, and diversification.

Practice Models: The array of various aspects of ownership and management of veterinary practices including the practice size, and the scope and breadth of services or markets served.

Recurring Revenues: The portion of a company's revenue that is highly likely to continue in the future. This is revenue that is predictable, stable, and can be counted on in the future with a high degree of certainty. It usually does not require the major costs of new customer acquisition.

Roll-Up Merger: A roll-up (also known as a "roll up" or a "rollup") merger occurs when investors (often private equity firms) buy up companies in the same market and merge them together. Roll-ups combine multiple small companies into something bigger and better in order to enjoy economies of scale. Private equity firms use roll-ups to rationalize competition in crowded and/or fragmented markets and to combine companies with complementary capabilities into a full-service business.

1.3. TRENDS IN COMPANION ANIMAL VETERINARY PRACTICES

ISSUES AND OPTIONS

A larger and more diverse selection of practice models exists today than ever before. Practice models evolve in responses to economic forces, including those within the profession as well as those in the general business community and even global forces related to the supply and demand for capital. Some of the forces contributing to the proliferation of practice models include generational preferences, market forces, and the supply of veterinarians.

GENERATIONAL PREFERENCES

Recent graduates have shown reduced interest in practice ownership, perhaps reflecting both their generational tendencies and an awareness of the challenges of business ownership (see 1.13 – Generational Differences). Real or perceived lack of access to capital may be an issue as graduate veterinarians manage increasingly large student debt burdens.

MARKET FORCES

In many metropolitan areas or regions the demand for veterinary services may be considered a "mature market," having reached a balance of supply and demand. Competition, differentiation, and diversification all become more prominent in mature markets. Increasingly, there are an array of global and national market forces that lead to increased practice consolidation along with the development of new practice models to exploit smaller or more specialized or fragmented niches.

The global and national market forces resulting in consolidation and business model diversification include:

- the existence of a global pool of capital in an environment where yields are low or even negative, essentially turning financial capital into something of a commodity;
- private equity as a high returning asset class for investors;
- the positive investment thesis for veterinary medicine as generally understood by private equity;
- societal trends, including humanization of pets/animals and the increased pace of translation of technology from human medicine to veterinary medicine;
- positive economic trends, including practice revenues as recurring revenues, based on relationships of practice owners with pet owners and pet owners with their long-lived pets and stability of cash flows through multiple economic cycles;
- competition as market forces and high levels of investment interest result in rising prices (valuations) for practices, simply based on supply and demand. These rising valuations produce unique opportunities to create and harvest generational wealth for many practice owners.

SUPPLY OF VETERINARIANS

Veterinary student enrollment has grown systematically and demand for veterinary services has largely recovered with the economy. Speculation about the supply of and demand for clinical veterinarians is rife within the profession and can be polarizing. In recent years, there has been a relative undersupply of clinical veterinarians, notably in the specialty and emergency practice sectors. This has led to stiff competition in clinician recruiting and hiring. Larger entities that can create and implement broader strategies for recruitment and retention of key clinical veterinarians may have a key advantage over smaller practices or groups.

EXAMPLES

CURRENT MODELS

Traditionally, the primary care (general) practice has been the most common practice model. Varying sizes of practices exist, including smaller practices owned and operated with one to three veterinarians and mid-sized or larger practices employing four or more, and sometimes as many as 25. Mobile and house-call practices also fall into the primary care practice category, often functioning as the smallest general practices.

Consolidated Practices

These are practices created by mergers with, and acquisitions of, other practices or practice groups. Consolidation is often driven by business imperatives such as profitability through economies of scale, revenue growth, and market competition. As practices grow in size, they may achieve a variety of business advantages unavailable to smaller practices. Current business tools and technology continue to increase the ease of operating multiple locations across a city, region, or country. Consolidation takes place at national, regional, and local levels.

Nationally and regionally, there are an increasing number of consolidators operating dozens to hundreds of practices (see 1.21 – Corporate Veterinary Practices). National and regional consolidators may be publicly traded or privately held and may have investment backing from any number of sources including private equity firms. In addition to acquiring existing practices, some national and regional practice groups start new hospitals. Consolidation is occurring locally, regionally, national and globally in many geographic markets, with certain practice groups owning and operating two to six hospitals. The difference between a general practice with multiple locations and a consolidated practice may be mostly one of semantics as both types increasingly focus on economies of scale and on growth strategies. Consolidated practices still own a relatively small proportion

Vet-ebooks.com

1.3. TRENDS IN COMPANION ANIMAL VETERINARY PRACTICES

of all practices but their growth is continuing and new consolidators continue to emerge. Increasingly, the profession is experiencing a consolidation of consolidators, notably with one large business having purchased four US veterinary consolidator groups.

Roll-Up Mergers

A distinct and increasingly common subtype of a consolidated practice, these are a part of the consolidation process that occurs as new market sectors mature. Larger practices (or groups of practices) are usually valued at a higher multiple of earnings than are smaller practices, so a private equity firm that has bought and integrated smaller businesses can sell the rolled-up practices at a profit. Many roll-up mergers focus only on acquisitions and refrain from implementing national systems or trying to drive improved practice operations. They may simply aim to achieve a specific size threshold that will allow increased valuation and sale to the next buyer or set of investors.

Species-Specific Practices

These focus on a single species of pet. Common examples are feline-only, canine-specific, and equine practices. Practices may also specialize in a particular group of species, such as avian or exotic-specific practices.

Care Segment-Specific Practices

These practices focus only on a certain segment of care or specific aspect of the pet's life cycle. This type of care is often delivered by animal shelters, spay–neuter clinics (for-profit and not-for-profit), vaccination clinics, hospice practices, and even urgent care practices. Increasingly, various for-profit practices are being developed to target low-cost care and veterinary care in the home. These are attracting substantial investment interest.

Other Management Structures

More recently, a number of new structures have emerged as structures for ownership and/or management of practices. These include the following:

- **Contracted management** occurs when a management company manages the business operations of the practice for a fee. This model may blend certain aspects of investment-backed entities (see Investment-backed entities), where the management fee may also include an equity interest in the practice. Contracted management is being practiced in primary care, specialty, and academic practice.
- **Group purchasing organizations (GPOs)** can be viewed as a subset of contracted management and also may be known as buying groups. GPOs work to improve profitability of participating practices through economies of scale in aggregating buying power, often focusing on drugs and medical supplies. They often develop offerings in other areas such as office supplies, laboratory services, and business services such as credit card processing, payroll processing, and even management services. GPOs currently operate in the United States, Canada, Australia, and the United Kingdom.
- **Investment-backed entities** invest private funds into existing practices, but purchase a partial interest in the practice, less than the complete ownership interest. Beyond providing financial capital for the owner, the entity brings management expertise and a focus on the business aspects of the practice. Several of these entities operate today. The original seller might then participate in the economic returns of future economic events.
- **Peer groups** are intended to facilitate general business knowledge for owners. These groups may also endeavor to improve profitability through operating as a GPO. At times, these groups may facilitate mergers or consolidation, either intentionally or as an unintentional outcome of bringing like-minded business owners together. Peer groups often focus on collaboration between practices similar in scope or mission (e.g., general practices, equine, feline, referral).
- **Specialty practices** have undergone a proliferation of practice models. Older models of specialty practice continue to exist and to thrive in certain circumstances. Examples of these models include "cooperatively owned" practices, where a group of local general practitioners own and operate the practice; the "condo model," where multiple practices operate under a single roof; and the "clustered model," where a group of separate practices are located in close proximity to one another to create a medical campus effect. There has been a steady movement to owner-operated referral practices such that the various specialty services are operated by a single entity, which is usually held closely by a single owner or small group of partners working in the practice. The owner-operated practices are often able to operate more nimbly than the older models of specialty practice. In many areas of the country, there are also specialists who work on a mobile basis, working regularly at many or a few general practices. Some fixed-location specialty practices provide certain services on a mobile basis.
- **Academia** has also undergone a proliferation of practice models. Some veterinary schools are expanding by operating standalone practices, which may be located at some distance from their primary campus location or even in a different region. Other practice models in the academic setting include contracted management and partnerships with private practices.

FUTURE MODELS

What lies ahead? Just as with the rest of the business community and society at large, the veterinary profession is undergoing transformation as entrepreneurship and technology are being brought to bear on all aspects of the profession. This results in attempts to create new business models through disintermediation and changing pet owner preferences along with use of data, telemedicine, and other technologies. It is impossible to predict which business models will be the most or least successful, but we can know for certain that the array of business models will continue to diversify.

CAUTIONS

If the model of smaller veterinarian practices continues to have diminished appeal to graduate veterinarians, then these practices will generally have diminished economic or resale value. If a cycle of diminished appeal leading to diminished value develops, this may hasten the proliferation of other models relative to the presence of the more traditional, smaller general practice model.

Companies executing a pure roll-up merger strategy face the risk that the business cycle will turn down and that they will hold practices that they do not have the ability to manage. This is likely to result in a discounted sale of these practices to entities that have focused on financial strength, systems development, and management expertise.

Vet-ebooks.com

1.3. TRENDS IN COMPANION ANIMAL VETERINARY PRACTICES

No single practice model is best on an absolute basis because they each have relative advantages and disadvantages. The choice of business or practice model should be intentional and should match the needs of the individuals involved and the business plan and market sector. Ideally, the practice model should solve current challenges while being durable and flexible enough to meet future challenges. From time to time, veterinary practices may find that they need to change their model or their business plan to adapt to the needs of the pet owners and practice owners and to create the best conditions for success.

1.4. VETERINARY TRADE AREAS

BASICS

OVERVIEW

Knowing your practice's trade area or potential trade area can help with:

- planning a start-up practice and assessing the practice's market potential,
- developing focused marketing plans to help grow your practice and/or to increase your market penetration,
- crafting equitable and data-supported noncompete covenants (see 13.11 – Noncompetition), and
- identifying potential practice relocation sites and/or locations for satellite offices.

TERMS DEFINED

Trade Area: The geographic area from which the organization draws most of its customers and within which the organization's market penetration is the highest. The traditional benchmark for defining a trade area is the area that contains 80% of a business' clients. A trade area is also known as a "region of influence" or "catchment area."

ISSUES AND OPTIONS

IDENTIFYING YOUR TRADE AREA: EXISTING PRACTICE

Zip Code Counts

Zip code counts are a decent way to determine where your current clientele originate. Historically, trade areas were estimated by counting the number of clients in each zip code. This shows where your client densities are the highest, and works best when you have zip codes that cover small areas; large-area zip codes will be less descriptive. With current veterinary practice management software, client zip code counts are fairly easy to accomplish.

Better Method: Drive Times

See the section below on using drive times to estimate a trade area. When combined with a zip code count, this can help to refine your trade area boundaries.

Best Method: Address Mapping

Your practice management software contains a wealth of data, including the client address information. This data can be geocoded, or address mapped, so that you can see the actual distribution of your clients.

- By using actual practice data, the trade area can be more precisely identified, and it is much more reliable and supportable in legal situations. It is important to only use your active clients – those clients that have transacted at your practice in the last two years.
- To do the mapping, you can purchase mapping software or hire a qualified consultant to do it on your behalf. If you are not mapping all of your active clients, try to use a representative sample with a minimum of 1% of the total number of active clients.
- Once active clients are mapped, a polygon can be generated that contains 80% of the mapped clients. Figure 1-4-1 shows the actual client distribution of a practice and the resulting trade area boundary. The practice is located in the center, the dots are client locations, and the trade area boundary is the peripheral polygon.
- With active clients mapped and trade areas defined, it is possible to identify the portions of the trade area that have strong concentrations of clients and the holes where there are few clients – which represent opportunities to grow the practice. This also helps identify the best locations for relocation or satellite offices.

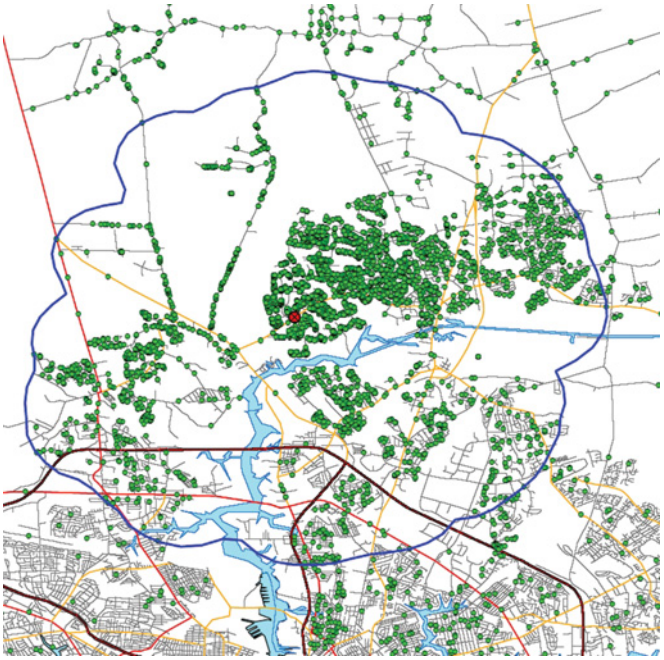

Figure 1-4-1.

Client distribution for a practice and the resulting trade area boundary.

IDENTIFYING YOUR TRADE AREA: START-UP PRACTICE

For a start-up practice, it is important to assess the location's market potential before you commit all of your time and resources. In other words, you need to determine if the area can support a new (or another) veterinary practice.

The first step in this assessment is to identify your potential trade area. Without client data, it is still possible to reasonably define a potential trade area where most of your clients will come from. There are two methods to establish a potential trade area for a new practice:

- **OK method: radius rings:** The traditional means of estimating a trade area boundary is to use a radius ring or rings such as a 3-mile radius ring or a 5-mile ring for a nonrural, small animal practice. While this is an easy method, it does not usually match well when compared with actual client distributions. The problem is that a simple radius does not take into account factors that will impact your clients, such as ease of access (the good and bad of the community's road network) and physical barriers (e.g., lakes, mountains, road-less areas).
- **Better method: drive times:** Using drive times to estimate the potential trade area's boundary takes into account factors that the radius ring does not. Also, when compared to known trade areas, drive time estimates have been shown to be a better representation than the radius ring. Figure 1-4-2 shows a comparison of a 5-mile radius ring and a 10-minute drive time. The practice's location on a main road helps provide easy access, which extends its potential trade areas in some directions, but limits it in others.

Selecting the most relevant drive time depends on several factors, including the types of services provided; whether the area is urban, suburban, or rural; traffic congestion, etc. In general, clients are typically willing to drive further in rural and suburban communities than in urban ones. The following guidelines are based on calculations from known practice trade areas:

- 10–12 minutes for a small animal practice

Vet-eBooks.com

1.4. VETERINARY TRADE AREAS

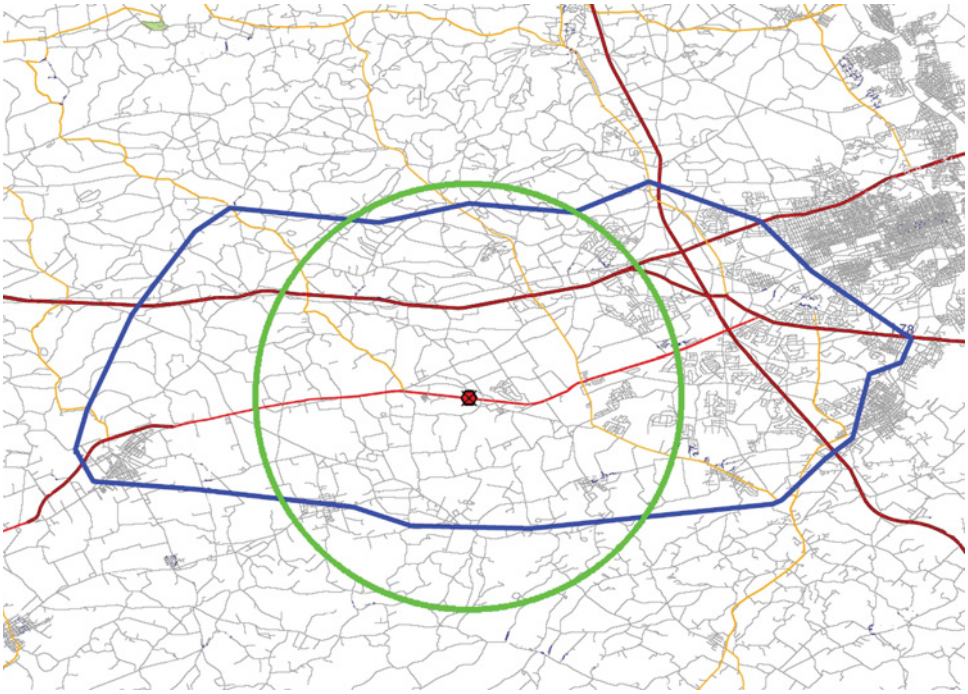

Figure 1-4-2.

Comparison between a 5-mile radius ring and a 10-minute drive time.

• 30–40 minutes for mobile and large animal practices, although the limit tends to be your preference with respect to how far you are willing to drive from one edge of the area to the other
• 30–40 minutes for a kennel or emergency practice
• 45 minutes or more for a specialty practice.

To estimate the trade area, start at the practice location, drive in the different directions for the designated times, and mark the locations on a map. For a more client-focused perspective, you may want to drive those routes twice – once at a low traffic time and once at the peak time. Alternatively, you can have the estimate done for you by a consultant with access to appropriate mapping software.

For a start-up practice, establishing the boundaries of your potential trade areas provides a foundation for analyzing the market potential of your planned practice. For an existing practice, knowing your trade area helps to keep you focused on where your clients are really coming from and where additional potential clients may be.

1.5. TODAY'S PET OWNER

BASICS

OVERVIEW

Today's pet owner is an informed consumer and, more than at any time in the past, has the ability to acquire pet health information from sources other than a veterinarian. In years past there would certainly be books on pet care, and members of the "fancy" had access to periodicals targeted to purebred ownership and healthcare. However, now the Internet provides ready access to virtually limitless amounts of information and product sales. That surging volume of available information is not only confusing, but it can also adversely affect personal wellbeing, decision-making, and productivity, and it can serve as a major interruption in one's day.[1]

For veterinarians to compete effectively in such an environment of information overload, they must increasingly rely on value delivery, customer service, and acting as an advocate for pet owners – helping dog and cat owners navigate the confusing path toward optimal pet healthcare.

TERMS DEFINED

Demographics: Description of objective and quantifiable characteristics of an audience or population, such as age, marital status, household income, and pet-spending index.
Market Research: Determining attitudes and behaviors of various public segments and their causes in order to plan, implement, and measure activities to influence or change those attitudes and behaviors.
Medicalization: In veterinary medicine, this term has come to represent the percentage of animals that have been seen by a veterinarian at least once in a 12-month period. This is different from the sociologic use of the term to describe nonmedical issues that are described in medical terms of prevention, diagnosis, and treatment.
Psychographics: Research that attempts to explain behavior by analyzing people's personality traits and values.

ISSUES AND OPTIONS

Even though the numbers change slightly from year to year, America remains a nation of pet lovers. In the most recent demographics available, approximately 57% of households in the country owned a pet and close to two-thirds of those pet-owning households actually owned two or more pets.[2] This does vary a bit, depending on the survey selected, but it is fairly consistent with the other major survey, which contends that 68% of US households own a pet, representing approximately 90 million dogs and 94 million cats.[3]

MEDICALIZATION

Although the United States is clearly a country of pet lovers, that affection does not necessarily translate into regular veterinary visits. In addition, there is often a significant discrepancy between veterinary care provided for dogs versus what is done for cats.

Over 60% of pet owners consider their pet a family member, whereas 36% consider them companions, and only 1% consider them property.[2] With those kinds of numbers, one would expect very high levels of medicalization. In this context, medicalization refers to any level of veterinary care that a pet receives in a 12-month period, but obviously this does not necessarily represent optimal care.

Close to 75% of pet-owning households took their dogs to the veterinarian at least once a year for routine checkups and preventative care.[2] From that same study, only 45% of households owning cats had taken them to the veterinarian at least once a year. Feline visits have actually declined 13.5% from the same survey done five years previously, which means that most cats are not receiving the level of veterinary care needed, and the situation seems to be worsening.

One clear determinant of medicalization rates is the human–animal bond (see 1.19 – Importance of the Human–Animal Bond). Although households that owned dogs saw the veterinarian an average of 1.6 times a year, households that saw their dog as a family member had, on average, 2.9 veterinary visits a year, compared with 2.0 visits a year for households considering their dog a companion, and only 1.2 times a year for households considering their dog property.[2] The same benefit seems to hold true for cats as well. Households that owned cats saw the veterinarian an average of 1.6 times a year, whereas households that saw their cat as a family member had, on average, 1.9 visits a year, compared with 1.2 visits a year for households considering their cat a companion, and only 0.5 visits a year for households considering their cat property. In another study, owners with strong owner–pet bonds took their pets to veterinarians 40% more often than owners with weaker owner–pet bonds.[4]

From these studies, it is reasonable to suggest that promotion of the human–animal bond by practices is the best way to improve medicalization of existing patients. It is less clear how veterinarians, as a group, can help drive current nonusers of veterinary services to more closely bond with their pets and to seek appropriate veterinary attention.

DEMOGRAPHICS AND PSYCHOGRAPHICS

Although the standard family unit of one husband, one wife, and two-plus children has evolved considerably in the last half century, it is less clear that so-called nontraditional families are any less pet-friendly, and there is much evidence that total pet numbers and numbers of households owning pets are fairly steady. One thing that seems to be consistent across all age groups is who is ultimately taking responsibility for pet care. At a resounding 80.7%, the primary pet caretakers are female.[2]

The big question on the horizon for veterinary care is the generational differences yet to be observed as the Millennials (people born between 1982 and 1999, although there is no consensus on this range) become the next big generation of pet owners (see 1.13 – Generational Differences). As a cohort the Millennials comprise about 80 million people in the United States, a generation even bigger than the Baby Boomers, and it is not yet known with any certainty what their attitudes will be toward pet ownership and regular veterinary care. At present, the Millennials are the predominant pet-owning demographic, and there is at least preliminary evidence to suggest that they take the responsibility seriously and are prepared to spend accordingly.[5]

One thing that likely will change regarding the Millennials is how they will want to receive veterinary services. As a generation that grew up with the convenience of the Internet, smart devices, and social media, will the Millennials be content to bring their pets physically to a veterinary office when they otherwise seem to be well and not in need of specific services? By the same token, will veterinary offices need to evolve their business models from relying on owners physically bringing a pet to an office? Perhaps even telehealth options may need to be considered (see 4.24 – Telehealth).

SPENDING

From the most recent statistics available, the US pet industry represents sales of approximately $70 billion and of that, only about a quarter is spent on veterinary care.[3] Perhaps more compelling is the fact that although these same surveys indicate that pet spending has grown at a healthy pace, the growth in veterinary spending has been relatively anemic by comparison. This seems to indicate that although pet owners value their pets and spend consistently on them regardless of the economy, veterinary care may not be valued as highly as some other goods and services.

Vet-ebooks.com

1.5. TODAY'S PET OWNER

We have mentioned that visits to veterinary offices are a direct reflection of the human–animal bond (see 1.19 – Importance of the Human–Animal Bond), but the same is true of expenditures. Dog-owning households that considered dogs to be family members spent 1.6 times more on veterinary expenditures per household than those that considered their dogs to be companions and 2.3 times more than those that considered their dogs to be property.[2] In the same study, cat-owning households that considered cats to be family members spent 1.7 times more on veterinary expenditures per household than those that considered their cats to be companions, and 5.1 times more than those that considered cats to be property.

Veterinarians have also not done as good a job as needed at educating clients about the need for routine veterinary care (see 4.9 – Lifelong Excellence in Healthcare and 5.12 – Discussing Pet-Specific Care). Vaccination remains the main reason for pet owners to visit the veterinarian.[4] It can be confusing for owners when vaccination protocols change or when vaccination becomes available through alternate channels.

Even though there are more cats than dogs, because medicalization rates and expenditures per pet are higher in dogs than in cats, 68% of total veterinary expenditures are spent on dogs.[2] This represents both a challenge and also a great opportunity to become more feline-friendly and to reap the potential benefits of providing needed professional services to cat owners (see 4.13 – Creating a Feline-Friendly Focus and Facility).

A look at today's pet owners would not be complete without examining their attitudes to the current use of veterinary services. About 30% of dog owners and over 40% of cat owners would not take their otherwise healthy pets to the veterinarian if vaccinations were not necessary.[4] This suggests that veterinarians have not done an acceptable job in communicating the importance of regular veterinary visits, apart from vaccination.

According to the Bayer veterinary care usage study,[6] pet owners would be prepared to take their pets to the veterinarian more often if certain criteria are met. The following are the top four criteria, each followed by the percentage of owners that either completely or somewhat agreed:

- If they knew it would prevent problems and more expensive treatment later (59%)
- If convinced it would help their pet live longer (59%)
- If each visit was less expensive (47%)
- If they really believed their pet needed exams more often (44%).

In addition to all the other factors responsible for driving client visits and appropriate healthcare spending on pets is one factor that is completely under veterinary control. Lack of effective communication is one of the largest impediments to clients doing the right things for their pets. Clear and thorough communication with the client, including direct recommendations for action rather than vague suggestions, can ultimately increase compliance by as much as 40%.[4]

EXAMPLES

N/A

CAUTIONS

In addition to information overload, we are also seeing global changes in consumer behavior that are reflected in the actions of many customers today. There have been noticeable trends that are likely to affect spending on veterinary care for many years to come. These trends include[7]:

- a demand for simplicity (preference for simpler offerings with the greatest value);
- discretionary thrift (economizing activities, even by affluent consumers);
- the decline of deference (consumers' growing confidence in their own ability to find information and products, and make smart choices, without the need for experts);
- fickle consumption (erratic loyalty, with the belief that there are so many options available that there is no need to settle for what is immediately available).

Businesses that streamline the client experience by providing goods and services that make it easier for customers to buy and use them actually strengthen consumer loyalty and attract new customers who defect from less user-friendly competitors.[8] This suggests that veterinary practices need to concentrate on providing end-to-end solutions for pet owners, solving their problems, saving them time, providing what is actually needed, and continuously improving the process with the client's total satisfaction in mind.

MISCELLANEOUS

When it comes to today's pet owners, veterinarians need to convey value in their offerings, take time to educate clients on the immediate and lifelong healthcare needs of pets, and make clear recommendations as to what medical care is appropriate.

1.6. TODAY'S VETERINARIAN

BASICS

OVERVIEW

• The veterinary profession and the service providers who represent it have gone through a number of sweeping changes over the last few decades.
• There has been a marked shift who the "typical" veterinarian is, from predominantly male and from a rural background, to predominantly female, and from an urban background.
• There are approximately 3,000 graduates per year from US colleges of veterinary medicine, over 75% of whom are female. Of active practitioners 55% are female and 45% male.
• The average US veterinary student graduate now is 28 years old and female. This average graduate may or may not remain in the workforce as a full-time veterinarian and may or may not choose to embark at some point in their career on practice ownership.
• There is a greater influx of graduates from "for-profit" international schools returning to North America.
• An increased importance and reliance and prioritization of the human–animal bond has redefined the role of a pet and is changing the training and role of the veterinarian as well (see 1.19 – Importance of the Human–Animal Bond).
• With the emergence of social media channels and a changing demographic of clients, the veterinarian's role has evolved from one of being a guardian and providing information, to being a collaborator and clarifying information for today's clients (see 1.5 – Today's Pet Owner), many of whom will have made a conclusion or diagnosis prior to visiting the veterinarian.
• A higher proportion of new graduates are seeking internships before commencing work as employed practitioners for a number of reasons, including a lack of confidence upon graduation, no jobs to their liking, or seeking specialty training.
• As a result of the demographic shift, a higher proportion of job positions may be part time and many women in the profession will leave the profession and may re-enter the profession on a part-time basis following maternity leaves.
• By 2048 Millennials will represent 39% of the electorate, but only 13% aspire to move up a corporate ladder or become CEO of their own business.[1]
• Veterinarians today face more-, but not necessarily better-informed clients, information overload, and increasing client education effort through emerging technology.
• The core value equation for clients and challenge for veterinarians to delivery has not changed significantly in past few decades and is founded on having reliability, responsiveness, good knowledge, empathy, and meeting the client experience expectations when interacting with the staff and facility.

ISSUES AND OPTIONS

• A growing number of employers are corporate consolidators (see 1.21 – Corporate Veterinary Practices) and have created a significant competitive presence for ownership of practices when a practice is targeted for acquisition by a corporate combiner (see 1.2 – Challenges to the Profession). It is anticipated that by 2020 they will own roughly 20% of all companion animal practices.
• In 2006 there were approximately 1,700 veterinarians retiring per year; by 2026 that number will climb to over 2,500 per year.
• The veterinarian today has a number of business models to choose from, ranging from proprietary single veterinarian practices to large business enterprises owned at arm's length or by corporate consolidators (see 1.1 – Models of Veterinary Practice).
• Average starting salaries for full-time practitioners across all species of practices in 2017 was ~$67,000 a year; however, commission-based remuneration and benefits are often added onto this base salary.
• As the profession evolves from a time- and effort-based compensation system to a results-based compensation formula, more employed veterinarians must become accustomed to the concept they will be paid based on the economic activity they generate for the practice in a compensation format called "pro-sal" or "commission-based compensation."
• Salaries have not moved consistently with the GDP as the veterinary marketplace for new graduates faced a much more volatile market as the veterinary marketplace for new jobs has been slow to adapt.[2]
• The mean age of all practice owners, regardless of whether small animal practice, large animal practice, or equine, is over 60 years old.
• Veterinarians have the option to pursue many alternative career paths outside of traditional practice, including pharma, government and regulatory, research, teaching, full- and part-time positions.
• A combination of higher tuition fees, perceived lower salaries over the course of a career, more schools, and lower standards may lead to less-qualified and competent graduates.

STUDENT DEBT

• A veterinary graduate's student loan burden could exceed $175,000 on graduation and would take many years to pay off.
• There is a disparity in income needed between graduates with significant debt and those with no debt. Those with high levels of debt may find it impossible to work in practices where the salaries are typically lower.
• Debt is often incorrectly measured against starting salaries, whereas debt should be considered a cash flow management issue and measured against the "total return" and considered in context with the time value of money.
• The profession needs to continue to do a thorough and detailed job of educating and putting debt and the leverage it creates over time into context, not misleading individuals interested in veterinary medicine as to what their potential return on investment for the degree really is.
• The total return for a veterinary degree includes total wealth accumulation potential, status in society, standard of living achieved, and the social return of career satisfaction.
• Many newer and emerging debt management tactics for student debt exist, including income-based repayments, occasional forbearance opportunities, consolidation of loans, access to more flexible credit, and loan deferrals.

GENERATIONAL DIFFERENCES AND TRENDS

• In future years Millennials will have a progressively increased position of predominance demographically in the profession. They will approach being a veterinarian with their own values in mind, including being much more tech savvy, very civic oriented, and more conscious about social and client economic issues (see 1.13 – Generational Differences).
• From a business standpoint, Millennials are more entrepreneurial but with some reluctance to focus on moving up in an organization, more frugal, more compassionate, and very team oriented.
• Men and women entering the profession are driven by different motivations and influences. Men tend to look at debt-to-salary ratios and have a desire to work in a profession where they can act independently. Women more often enter because they have a love of animals, are attracted to science, and want to pursue a lifelong dream.[3]
• A 2016 survey of small businesses in the United States indicated that 72% of small business owners do not have an exit plan and 54% intend to leave in 10 years.[4] The veterinary profession may have a succession crisis, particularly in more rural areas and with smaller large animal practices.[5]

Vet-eBooks.com

• Unlike their post-WWII Baby Boomer counterparts, Millennials are more used to changing jobs and have less loyalty to an employer. This may work to the veterinary profession's advantage though, as they are more likely to view owning their own business as a means to better job security.

WILLINGNESS TO OWN A BUSINESS AND THE VETERINARY MARKETPLACE

• The cost of buying a profitable practice continues to increase. Practices demonstrate a variance on value based on their profitability and amount of risk, a reflection of the acumen of how well they are managed.
• Increased competitive presence from corporate buyers may "squeeze out" individuals who could find their ability to maneuver in the marketplace more limited.
• Periods of low interest rates and more formulaic means to assess a practice's value have resulted in shorter payback periods and quicker returns on investment than in the past, when rules of thumb largely determined practice values and transaction prices.
• There is a continuing deficit in general business knowledge of veterinarians and these skills are necessary for financial success.
• The most important metric for sustainability for the practice and business owner is true or normalized profitability to ensure continued employment, succession, and value.
• Equine and food animal practices continue to lag behind the companion animal industry when it comes to consolidation and are more fragmented, with many small practices across the country.
• Veterinarians who understand that the profession is a customer service profession using animal healthcare as its platform will also understand that professional and financial success and career satisfaction are about mastering client compliance and adherence.
• Many veterinarians represent second-income sources for a household and may have no interest in becoming practice owners.
• Consolidation is also happening on a smaller scale, with veterinarians able to maintain ownership of groups of practices, possibly as a prelude to a sale to a larger scale consolidator.

EXAMPLES

N/A

CAUTIONS

• Given a decline in or loss of government funding, many veterinary schools have and will continue to increase tuition levels, resulting in an increasing amount of student debt.
• Given a variance in performance metrics and profitability and value, analytics to mitigate and quantify risk for veterinarians contemplating buying a practice are essential to predict more certainty of results and qualify for financing.
• The rising cost of healthcare and cost burden on a practice could result in a lower proportion of veterinary staff members having access to healthcare benefits compared to other small businesses.
• There continue to be mixed opinions about the value of pet health insurance (see 8.11 – Pet Health Insurance). Insurance companies have streamlined their claims procedures but there continues to be concern about using veterinary practices as the marketing channels for insurance versus direct to consumer, and further concern that insurance companies with a greater share of the market may attempt to exert more control over fees.
• Service delivery modalities such as telemedicine will require a redefinition of the veterinarian client patient relationship.
• Some areas of the profession may experience a shortage in years to come and these underserviced areas include rural areas, research, and government positions.
• The legal definition of a pet is slowly evolving from chattel to be recognized as a living being with standing and this has resulted in the courts considering new legal precedents, including lawsuits for non-economic or emotional loss and punitive damages (see 13.19 – Ownership versus Guardianship).
• More paraprofessionals not regulated by standards expected of licensed veterinarians in all states are engaging in services traditionally protected or provided by veterinarians. These services include emerging alternative therapy modalities, including acupuncture, naturopathy, and homeopathy.

1.7. TODAY'S VETERINARY STUDENTS

BASICS

OVERVIEW

• Today's veterinary students are bombarded by knowledge. Rote memorization is inconsistent with learning, yet content overload is a valid concern in modern-day veterinary curricula.[1]
• In addition, today's veterinary students are financially strapped. Economic stability is becoming harder to attain as the cost of veterinary education rises.
• The value of the veterinary degree is increasingly difficult to justify, particularly if courses do not prioritize skills that new graduates need in order to succeed in clinical practice.

TERMS DEFINED

Debt-to-income ratio: A measurement of financial stability. A debt-to-income ratio of zero indicates that debt matches income and there are no net gains or losses. Higher debt-to-income ratios indicate that debt exceeds income.

ISSUES AND OPTIONS

CONTENT OVERLOAD

• It is impossible for veterinary students to keep up with the growing body of knowledge and live up to the public perception that veterinarians must know everything, yet veterinary educators of traditional curricula may attempt to cover it all.
• This style of delivery has led to adoptive rather than adaptive learning: students memorize facts to pass assessments.
• Because students may not have actually learned the material, they may be unable to apply concepts to new course content or case studies.
• This adversely impacts health by increasing stress and fatigue, causing fluctuations in weight and altering sleep patterns.[2–6]
• Content overload also does little to prepare the new graduate for clinical practice, in which the graduate will be expected to construct knowledge through problem-solving.[7]

EDUCATIONAL DEBT AND LOW EARNING POTENTIAL

• Nearly 20% of veterinarians owe more than $200,000 in educational debt.[8]
• Factoring in the cost of a veterinary education, the average veterinarian's educational debt, and the interest repaid over time, a Bachelor of Science degree holder is expected to have higher career earnings than a veterinarian.[8–10]
• According to the 2015 American Veterinary Medical Association (AVMA) Report on Veterinary Debt and Income:
  ◦ the average educational debt for US veterinary graduates was $135,000[8] and it has risen to about $175,000 within a few years;
  ◦ the average starting salary for new graduates that had accepted a full-time position in private practice was $67,000;[8]
  ◦ the debt:income ratio (DIR) was 2.05:1, meaning that educational debt is twice starting salary.[11]
• Job positions as associate veterinarians do not average a positive return on educational investment compared to jobs in government and academia.[10]
• Practice ownership is more likely to raise the value of a veterinary degree; however, new graduates tend not to see practice ownership as feasible in the face of substantial, pre-existing educational debt.[9]
• DIR is higher for female veterinarians than for male veterinarians because women earn less than their male counterparts.[10]
• DIR is higher for graduates that enter into equine or food animal practice.[9]
• DIR is even greater for veterinary graduates who pursue advanced education because the average intern or resident earns 50% less than a colleague who enters into clinical practice.[12]
• Educational debt grows by an estimated $6,854 per year.[8] This growth in debt is occurring at a faster rate than that at which veterinary salaries increase.[8]
• One contributing factor is the rising cost of tuition: over the past 15 years, the average cost of tuition has more than doubled at AVMA-accredited colleges of veterinary medicine.
• There are also increasing numbers of veterinary graduates who are pursuing advanced education.
• Each year of advanced education costs an estimated $40,000–$50,000, and many veterinarians take up to an additional five years to achieve specialty board certification: 1–2 years of internship followed by 3 years of residency.[10,13,14]
• Rising interest rates of educational loans contribute to educational debt.[9,10]
• Monthly loan payments comprise a substantial amount of new graduates' income and may not be compatible with the quality of life that new graduates envisioned.[15]
• Salaries cannot keep pace with debt, yet new colleges of veterinary medicine continue to break ground, and class sizes of established schools increase.[10]

INCREASED DEMAND FOR NONTECHNICAL SKILLS

• The majority of veterinarians graduate to work in the service industry of clinical practice.[16]
• Long gone are the days when a paternalistic approach to patient care dominated the examination room.
• Today's veterinary client expects relationship-centered care, in which the client has a voice in decision-making and patient outcomes (see 1.5 – Today's Pet Owner).
• Today's veterinary client also values nontechnical skills as much as knowledge.[17]
• A team approach to case management, communication, leadership, proactivity, professionalism, and business acumen are essential for graduates to succeed in and be retained by the profession.[18–20]
• These so-called "soft skills" are not always prioritized by veterinary educators due to curricular time constraints, yet these skills can and should be taught.
• Nontechnical competence facilitates on-the-job performance and increases job satisfaction.
• In addition, employers often value nontechnical competence more than factual knowledge.[7]

EXAMPLES

• It is no longer sufficient to ask, "What do I need to know?" Instead, ask "How do I apply what I am learning?" or "How does this concept apply to that case?" As a direct result of technology, knowledge is easily accessible. Knowledge is no longer a limited resource; it is available in excess. There is too much knowledge to sift through at any given point in time. The veterinary student and graduate must therefore learn how to discriminate between irrelevant and relevant, poor- and high-quality, or inaccurate and factual information.[21]
• Construct knowledge rather than reproduce it. Trade the short-term gain of cramming for a test with the long-term gain of conceptual learning. Lay the foundation of one or more concepts. Create bridges between them. Investigate how each course links to another and how concepts from one course are interdependent upon and relate back to concepts in another. Be an active, adaptive learner who can critically think and problem-solve rather than robotically recite.

Vet-ebooks.com

• Recognize that there is no end to learning. You will never know it all. Instead, redefine educational value. Value the process of getting to the answer more than the answer itself. Accept that learning is a continuum and that lifelong learning is an obligation of the profession rather than a choice.
• Make an educated decision concerning your pursuit of a veterinary degree. What are your professional and personal goals? How do they align with the financial reality of selecting veterinary medicine as your chosen profession?
• Do not dismiss nontechnical skills as being "soft" or "nice-to-haves." They are teachable "must-haves" that can be learned and will contribute to success in the profession.

CAUTIONS

• Today's veterinary students are under a significant amount of pressure. Mental health issues and suicide are appreciable concerns in the veterinary profession.[5,22] Additionally, veterinary turnover is high.
• Veterinary students need to be aware of potential triggers for stress and address them early on in their professional journey to develop adaptive rather than maladaptive responses.
• One aspect of being adaptive is recognizing how to learn effectively and strategically so that material is gained, refined, and mastered rather than tabled and purged in the aftermath of examination.
• Moreover, to build career resilience, students must guard against silencing their concerns and be proactive about establishing an individualized plan for reaching professional and personal success.

1.8. Internships and Residencies

BASICS

OVERVIEW

• The Veterinary Internship and Residency Matching Program (VIRMP) was established by the American Association of Veterinary Clinicians (AAVC) to pair prospective interns and residents with participating programs.[1] Participation within the program is voluntary and includes teaching hospitals as well as private practices.
• Applicants rank programs that they would be willing to attend, and participating programs rank applicants. From these rankings, VIRMP creates computerized "matches."
• Over 1,500 applicants applied for 1,330 internship positions in VIRMP in 2017 compared to 473 applications for 175 positions in 1988.[2,3]
• There were 1,091 applications through VIRMP for residencies in 2017 to fill 379 positions.[3]
• In addition, the American Association of Equine Practitioners (AAEP) Avenues Program lists over 150 practices that offer equine-specific internships.[4]
• Companion animals are the focus of 59.3% of internships; 32.1% have an equine focus. Food and mixed animal, exotic and wildlife internships are less commonly available and/or pursued.[5]
• Most internships are rotating: interns cycle through multiple hospital services. Less than 5% of internships focus on one area, such as internal medicine (4.6%) or surgery (3.5%).[5]
• A 2012 survey of US veterinarians sponsored by the American Veterinary Medical Association (AVMA) confirmed that one-in-four respondents completed an internship immediately following graduation. Of these respondents:
  ◦ 36.6% became interns to pursue residencies[5]
  ◦ 35.6% became interns to practice high-quality medicine[5]
  ◦ 24.0% became interns because they did not feel prepared to practice medicine[5]
  ◦ 1.1% became interns because they felt it would lead to higher salaries in clinical practice.[5]
• The average intern earns 50% or less than a new graduate in clinical practice, but has longer shifts and workweeks; 85.9% of interns in private referral practices and 74.3% of interns in university teaching hospitals work 60 hours/week or more.[5]
• The majority of interns (85.4%) report satisfaction with their internship,[5] but there is no regulatory body to oversee program quality.[2]
• Successful residents of approved programs are eligible to take the examinations for board certification. However, use of the term "board-eligible" is discouraged or prohibited by most specialty colleges and boards.
• There are currently 22 AVMA-recognized specialty organizations. These represent 41 specialties.[6]
• Residency-trained veterinarians earn significantly more than those without.[7]

TERMS DEFINED

Internship: A one-year, postgraduate, supervised educational learning opportunity within clinical practice to enhance the graduate's exposure to case management and/or to prepare the graduate for specialty training.
Residency: A two- to three-year period of supervised, advanced training in a concentrated discipline of veterinary medicine with the intent to qualify for specialty certification. An internship may or may not precede a residency.

ISSUES AND OPTIONS

• Many graduates are not "day-one" ready.
• Entering into clinical practice straight out of veterinary school is a giant leap.
• Graduates may be uncertain how to apply textbook knowledge to actual cases and may find it difficult to be solely responsible for case management.

Vet-eBooks.com

1.8. Internships and Residencies

• Critical thinking and technical skills may not have fully developed, and time management is often a concern. The pace of private practice exceeds the pace of a typical day in a teaching hospital. It is a steep learning curve to weather the unpredictability of a clinic day and manage a schedule that is often derailed by emergencies.
• Many new graduates do not feel practice-ready, competent, or confident in their ability to execute day-one skills including:[5,8]
  ◦ physical examination
  ◦ venipuncture
  ◦ intravenous catheter placement
  ◦ abdominocentesis
  ◦ rectal palpation
  ◦ lameness diagnosis
  ◦ communication.
• Most new graduates believe that mastering interpersonal skills is important to their professional success, but they often struggle with these so-called "people skills."[9]
• Delivering bad news, managing cases with financial constraints, and discussing euthanasia are challenges for new graduates.[9]
• An additional challenge for graduates entering the field of equine medicine and surgery is that horse owners tend to be very knowledgeable about their animal and its condition. This may cause new graduates to lose confidence in themselves or feel that a client is questioning their competence.[4]
• Employers agree that communication is the most important contributor to professional success.[4,9] They also find that new graduates often struggle with this content area.[4,10]
• In particular, new graduates are uncertain how to manage "difficult" or emotional clients, or how to simplify descriptions of complicated procedures into basic, everyday language.[10]
• Employers expect new graduates to be practice-ready; however, the reality is that few are.

THE VALUE OF ADVANCED EDUCATION

• Opportunities for advanced education in veterinary medicine are increasingly available and attractive to new graduates.
• Internships provide graduates with transition time and mentorship: graduates can refine their skills under the direct supervision of more experienced colleagues.[4]
• Compared to new graduates, veterinarians who complete internships are more likely to consider themselves to be extremely or very competent in general and advanced clinical skills.[5]
• In addition, internships provide value by improving the candidate's application to pursue a residency.[11]
• A little over one-third of graduates pursue internships as a stepping stone to residency.[5]

THE COST OF ADVANCED EDUCATION

• Veterinary education represents a significant financial investment (see 1.7 – Today's Veterinary Students).
• Interns are paid significantly less than their colleagues in clinical practice, regardless of the type of internship (private, referral, academic) and the species focus (companion animal, equine, production animal).[7,12]
• During the 2014–2015 academic year, the average intern in an academic setting was paid $26,572, and the average resident was paid $32,707. By comparison, the average salary for a new graduate in practice during that same time interval was $66,879.12
• In addition to lost earning power, graduates must consider the cost of relocation and accrued interest on outstanding student loans.
• Completing an internship does not translate into higher earning potential for the graduate unless the intern advances to a residency and becomes board-certified.[7]

QUALITY CONTROL

• Specialty colleges oversee residency programs.
• Specialty colleges ensure that programs uphold certain standards and meet predetermined requirements.[11]

Vet-ebooks.com

1.8. Internships and Residencies

• Applicants who are accepted into specialty programs should expect to receive adequate preparation toward board certification.[11]
• By contrast, internships are not externally regulated.[11,13,14]
• Any practice can offer and design an internship and post it in the VIRMP.[2,11]
• The quality of internships hinges solely upon internal monitoring.[13]
• High-quality internships provide value that compensates for the lower salary and longer workweek; poor-quality internships do not.[11]
• Complaints from interns about participating programs to the AAVC are rare.[2] The majority of these report that program descriptions are inaccurate.[2]
• Applicants rely upon written descriptions of internships in VIRMP to gauge program quality. However, AAVC provides no guarantee that listings are accurate.[2,11]
• To address the criticism that program descriptions should more accurately represent the experience of participating interns, the AVMA Internship Task Force developed an internship disclosure form and internship guidelines. These were hoped to encourage transparency from participating programs.[2]

EXAMPLES

GRADUATES

• Consider your reasons for pursuing advanced education in veterinary medicine: what do you hope to gain?
• Weigh the pros and cons of pursuing advanced education to determine if your goal is feasible in light of personal, professional, and financial considerations.
• Explore your options for programs listed in VIRMP in the autumn, the year before you anticipate starting your internship or residency.[14]
• Review program descriptions that apply to you: do they align with your goals for pursuing advanced education?
• Visit the program(s) to which you are considering applying and, if possible, complete externships. These are opportunities for you to "interview" each program to see if it is the "right" fit.
• Consult with former and current interns/residents in a private, informal setting. Have them elaborate on the program in terms of its strengths and weaknesses. Ask how well the program aligns with its online description.

PRACTICES

• Consider your reasons for offering advanced education.
• Evaluate the resources that you and your practice can offer the applicant:
  ◦ Opportunities for primary case responsibility and case review
  ◦ Adequate case-load with breadth and depth of case presentations
  ◦ Access to "standard of care" diagnostic and therapeutic equipment
  ◦ Appropriate training in advanced clinical skills
  ◦ Mentorship and direct supervision
  ◦ Access to in-house library
  ◦ Access to didactic training such as teaching rounds, presentations, seminars, journal club, and other forms of continuing education
  ◦ Availability of support staff, 24-hour patient care, and 24-hour emergency.
• Ask whether the value of your available resources exceeds the cost to the applicant.
• Determine how you will formally evaluate candidates' performance and growth.

CAUTIONS

Internships and residencies are investments of time and money. Unless the internship leads to a residency, the return on the investment of an internship will not be financially favorable. Understanding what your goal is before pursuing advanced education will help you to determine whether the value exceeds the cost and/or whether the opportunity is likely to meet expectations.

1.9. VETERINARY PARAPROFESSIONALS

BASICS

OVERVIEW

The veterinary technician or nurse is a critical member of the veterinary healthcare team. The veterinary nurse/technician profession has continued to expand and evolve to match the needs of the veterinary profession and innovative veterinary medicine. Today, veterinary medicine is highly sophisticated. Veterinary technicians/nurses provide a high level of medical care and assist the veterinarian in attaining acceptable profit margins. Obviously, the role of veterinary technician/nurse has evolved in scope of responsibilities and value to a practice. These paraprofessionals have become skilled practitioners of patient assessment and critical thinking, independently generating and enacting plans for patient nursing and care.

Veterinary nurses/technicians have also looked to further their knowledge and skill level especially in certain areas of veterinary medicine, thus resulting in higher levels of recognition. This drive to advance one's own knowledge and skill has resulted in the formation of veterinary technician specialties.

In 1994, The National Association of Veterinary Technicians in America (NAVTA) formed the Committee on Veterinary Technicians Specialties (CVTS). The CVTS is recognized by the American Veterinary Medical Association (AVMA). The CVTS provides guidelines to veterinary technician organizations to facilitate the formation of a specialty organization. Academies develop advanced pathways, which a candidate must follow and complete in order to be awarded the designation of VTS (Veterinary Technician Specialist) in their specific discipline. The first specialty academy to receive recognition was the Academy of Veterinary Emergency and Critical Care Technicians (AVECCT) in 1996. By 2018, there were 15 recognized Veterinary Technician Specialties, with more being discussed and explored.

As mentioned previously, the profession of veterinary technology has grown. Veterinary technicians were first titled animal health technicians, and are still referred to by that designation in Canada and elsewhere. The adjective "veterinary" referred exclusively to veterinarians until 1989, when the term veterinary technician was approved for use by the House of Delegates of the AVMA. Although the term veterinary technician is widely used, the credential is not standardized across the United States. Currently, a veterinary technician may be a licensed veterinary technician, a credentialed veterinary technician, a registered veterinary technician, or a licensed veterinary medical technician. The Veterinary Nurse Initiative introduced by NAVTA aims to standardize the credential for the profession in terms of credentialing requirements, title, and scope of practice throughout the United States.

There are many initiatives taking place within the profession, including the following:

- **Committee on Veterinary Technicians Specialties (CVTS):** This is a NAVTA committee providing guidelines to veterinary technician organizations to facilitate the formation of a specialty organization.
- **Veterinary Nurse Initiative (VNI):** This is a NAVTA-formed coalition to pursue legislative amendments in the 50 states.
- **Veterinary Technician Specialty Academy:** This is a NAVTA-recognized veterinary technician specialty academy which meets the standards established by the CVTS for certification of veterinary technicians in a specialized field of veterinary technology.
- **Veterinary Technician Specialist (VTS):** This is a veterinary technician who is certified in a medical skill set by a NAVTA-recognized veterinary technician specialty academy.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

VETERINARY TECHNICIAN SPECIALTIES

To pursue becoming a technician specialist, one must be committed to advanced learning and have the drive and passion for one's chosen specialty. The process is time consuming and hard work, requiring documentation of case logs, time requirements in the chosen area of medicine, continuing education requirements, and a certifying examination. The process takes at least two years. Veterinary technicians should pursue a VTS for personal, intrinsic reasons, not necessarily for extrinsic, monetary reasons, as those are not guaranteed. Becoming a specialty technician improves skills and results in professional accomplishment, and will help the individual to set themselves apart from colleagues who have not pursued further knowledge and skill training. However, attaining a VTS does not guarantee an increase in compensation.

Specialized veterinary technicians may have more success if they work in an environment suited for them. Veterinary technician specialists, if utilized properly, are valuable assets in specialized practices that tout their expertise to clients. They are also valuable and should be utilized in general practices where more services should equate to more patients, more visits should lead to increased revenue, and more money should translate to higher wages.

As of 2018, the NAVTA CVTS has recognized 15 areas of medicine in which veterinary technicians can specialize. These areas are:

1. Emergency and Critical Care
2. Anesthesia and Analgesia
3. Dentistry
4. Behavior
5. Internal Medicine
6. Surgery
7. Equine Nursing
8. Clinical Practice
9. Zoo Medicine
10. Nutrition
11. Clinical Pathology
12. Dermatology
13. Ophthalmology
14. Physical Rehabilitation
15. Laboratory Animal.

VETERINARY NURSE INITIATIVE

NAVTA seeks to unite the profession under a single title, credentialing requirements and scope of practice. Through the standardization and public awareness of the credential, the profession will make strides toward better recognition, mobility, and elevated practice standards, leading to better patient care and consumer protection.

The unified title will create a national and global standard for those Credentialed Veterinary Technicians and Veterinary Technician Specialists looking to advance their careers. NAVTA's VNI aims to create alignment within the veterinary profession as a whole, provide education for veterinarians, paraprofessionals, and consumers, and elevate the understanding of roles and responsibilities for patient care by veterinary nurses.

NAVTA will work hand in hand with the AVMA, American Association of Veterinary State Boards (AAVSB), professional veterinary organizations, and legislators to create common terminology, practice acts, policies, and procedures to ease the burden that could be placed on individual states and associations in credential governance.

Currently, veterinary technicians throughout the United States have varying credentialing requirements, titles, and scope of practice with little perceived value-related clarity of their roles in the eyes of the consumer. A single, unified title and a standardized credential

Vet-ebooks.com

throughout the nation is the next step to improve the level of patient care, align public perceptions of the veterinary nurse, and bring clarity to the field of veterinary medicine.

The VNI is not without debate. There are veterinary technicians who have voiced their concern and displeasure with the veterinary nurse designation. The discussion revolves around the duties and implications of the role of nurses in human medicine versus veterinary medicine. The term "technician" implies an individual has mastered the science and technology involved with the profession. The term "veterinary nurse" will incorporate the art of caring for our animal patients from a whole picture perspective in addition to the science and technology.

Outside of the United States, individuals who serve the role of veterinary technician are more commonly called veterinary nurses; their status as medical professionals is solidified and supported by some governments. Moreover, standardization with a title easily recognizable to the public aids in public awareness of the role. In human medicine, the term "nurse" is widely recognized to describe a group of medical professionals working in collaboration with physicians to treat a patient. It is believed the term "veterinary nurse" will in turn have similar association in the public's perception.

The process has begun, but it is anticipated that the VNI will take years of hard, patient, and professional work. Support at the national and local level from each individual in the profession is important in adding to the momentum of change.

To date, there have been no changes in the terminology. However, the coalition is currently defining the legislative strategy and planning for legislation reform efforts to begin.

1.10. VETERINARY STAFF

BASICS

OVERVIEW

• Veterinary practices are "powered" not only by veterinarians, but also by a number of very important paraprofessional and administrative staff.
• The ultimate profitability of a veterinary practice often depends on the successful leveraging of veterinary skills over its nonveterinary staff.
• Leveraging is critical because the veterinarian's time and availability comprise the limiting factor, or bottleneck, in delivering veterinary services.
• Pricing in the veterinary practice must be sufficient to adequately compensate all staff working in that practice. In too many instances, staff salaries are kept artificially low in an attempt to shield clients from the true costs of delivering high-quality medicine.

TERMS DEFINED

Hospital Administrator: Similar to practice manager, with more responsibility for veterinary doctors and technicians. This is an unregulated position in that credentials are not needed to use this title.
Office Manager: Administrative staff primarily responsible for reception, clerical, and nonmedical staff in a practice. There is no standard definition for this term, and it is unregulated, so anyone can refer to himself or herself as an office manager.
Practice Manager: Similar to an office manager, but typically with more responsibility for staff supervision and human resource issues. This is an unregulated term, although there is a certification program (Certified Veterinary Practice Manager) offered by the Veterinary Hospital Managers Association (VHMA).
Veterinary Assistant: A title sometimes used for individuals who have received training less than that required for identification as a credentialed veterinary technician, technologist, or nurse. There is no American Veterinary Medical Association (AVMA)-approved credentialing process for veterinary assistants at this time.
Veterinary Technician/Technologist/Nurse: A veterinary aide, often equated to a nurse, and referred to as a veterinary nurse in some countries. Typically, technicians receive an associate's or bachelor's degree from an AVMA-accredited program and are recognized in most state practice acts. However, in some areas there is no legal definition of technician/nurse nor is there mandatory registration, and any veterinary aide may use the term.

ISSUES AND OPTIONS

VETERINARY TECHNICIANS/TECHNOLOGISTS/ NURSES

• Veterinary nurses/technicians are the most important medical paraprofessionals in veterinary practice, and certified or registered technicians in most states can legally do everything in a veterinary practice except make a diagnosis or prognosis, prescribe drugs, or perform surgery (see 1.9 – Today's Veterinary Paraprofessionals).
• From both a medical and a financial perspective, veterinarians should do those tasks they alone are qualified to do – diagnose, prescribe, and perform surgery. All technical tasks, including laboratory work and radiography, can be delegated to technicians/nurses. The veterinary technician is educated and trained to support the veterinarian in surgical assisting, laboratory procedures, radiography, anesthesiology, prescribed treatment and nursing, and client education. Some veterinary technicians pursue additional credentials such as Veterinary Technician Specialist (VTS) in specialties such as emergency and critical care, anesthesiology, surgery, internal medicine, dermatology, behavior, dentistry, nutrition, and others, as recognized by the National Association of Veterinary Technicians in America (NAVTA). In turn, technicians can delegate tasks that do not require their skill levels to assistants, creating efficiency in the process.
• Veterinarians are the greatest limitation to the successful utilization of veterinary technicians/nurses. Too many veterinarians are reluctant to delegate clearly technical duties, such as blood collection, positioning for radiography, and administering prescribed medications, which serves to build inefficiency into the system and frustrate technicians in the process.
• There are very real problems with a system in which there is not a well-defined paraprofessional status. There would not be enough trained veterinary technicians if all veterinary practices were to decide to hire only graduates of technician programs. Many veterinary practices continue to train their own staff, some even to perform duties for which they are not qualified. An option is to enroll staff in the American Animal Hospital Association (AAHA) Distance Education Veterinary Technology Program (DEVTP; see https://www.aaha.org/professional/education/devtp.aspx). This is an AVMA-accredited associate's degree in veterinary technology offered through distance education.

Vet-eBooks.com

1.10. VETERINARY STAFF

• Other paraprofessional groups (e.g., nurses, dental hygienists) have been recognized for contributions to their respective professions, and veterinary technicians/nurses deserve the same recognition, respect, and potential for remuneration.

VETERINARY ASSISTANTS

• Veterinary assistants are a disparate collection of veterinary employees with skill levels below those of technicians/technologists/nurses. While there are distance and onsite programs providing diplomas for veterinary assistants, none are accredited by the AVMA at this time.
• Veterinary assistants act as support personnel to both veterinarians and veterinary technicians. Many assistants aid in the restraint and handling of animals, they feed and exercise the animals, and they help in other capacities commensurate with their training.
• If veterinary assistants are to have any dealings with the public, and most do, it is critical that they receive appropriate training. It is also mandatory that they receive specific safety training for tasks that they might occasionally perform, such as helping in radiographic procedures, handling laboratory specimens, exposure to animals with potentially communicable diseases, and dealing with a variety of chemicals and pharmaceutical agents.

RECEPTIONISTS

• Receptionists, also known as client service representatives, often present the first impression that clients have of a veterinary practice. They project the level of professionalism to be anticipated, because when a client visits with a pet, the receptionist is usually the first and last person with whom the client deals. This is a critical position, and one best not minimized by practices hoping to improve their customer service and profitability.
• Receptionists/client service representatives also field questions from clients on the telephone, so it is important that they have excellent communication skills and are able to handle a variety of questions and requests from clients. Accordingly, these front office professionals must be adequately trained on practice protocols and procedures so that the information they provide to clients mirrors that provided by the veterinary and paraprofessional staff.
• Because receptionists are so important to the effective operation of a veterinary practice, considerable time should be spent selecting candidates with excellent communication skills, a professional demeanor, and an honest desire to serve the pet-owning public. Receptionists are the gatekeepers to veterinary services in a practice, and whereas an excellent receptionist can effectively bond clients to a practice, less-skilled individuals can cost a clinic dearly.
• Just as technicians have career options outside the realm of clinical veterinary practice, professional client service representatives are also in high demand. It is unfortunate that many practices continue to hire relatively unskilled individuals for front office duty. In some respects, the receptionist/client service representative is actually more important than the veterinarians in helping clients to bond to the practice rather than to individual doctors.

VETERINARY MANAGERS

• Many veterinarians are not necessarily skilled in business matters, and the efficient management of hospital operations and administration can often be more cost-effectively delegated to others with appropriate training.
• Even when veterinarians are well skilled in business matters, there is often better financial return if they spend their time delivering veterinary medicine rather than trying to manage the day-to-day operation of a busy hospital.
• The lack of standardization of the titles and duties of veterinary managers within the profession has made it difficult to select managers based on credentials and duties to be performed. In general, office managers handle more administrative duties, such as making bank deposits and managing accounts receivable, while practice managers and administrators are more likely to be involved with strategic planning, equipment purchases, and reviewing and adjusting fees.
• The VHMA provides credentialing in terms of their Certified Veterinary Practice Manager (CVPM) designation.
• Many veterinary practices continue to train existing staff (receptionists, technicians, spouses) to be management staff. This is a less expensive alternative to professional management, but can be far more costly in the long term because small financial missteps tend to become magnified.
• Even when veterinary practices hire or train practice managers, it is critical that they also engage the services of an outside management consultant to monitor processes and provide unbiased advice and support for the in-hospital manager or administrator.

Vet-ebooks.com

1.10. VETERINARY STAFF

EXAMPLES

A veterinary practice scheduled a specified number of cases each morning, leaving time for the doctor to periodically work with the technician/nurse to take radiographs, collect laboratory samples, and treat animals. The system worked well, according to the veterinarian, with the technician restraining the animals and the doctor doing the procedures. Unfortunately, most technicians lasted less than six months in the practice, and then a new technician needed to be hired and trained. This was affecting the productivity of the practice. A consultant was called in to investigate and advise, and to work with the practice manager in terms of staff allocation, training, and scheduling.

Following the consult, a new protocol was instituted in which the receptionist scheduled the doctor for full-time office appointments and a veterinary assistant was hired to support the technician. Now, when laboratory sample collection was needed, the assistant restrained the animal and the technician collected the samples. The paraprofessional team also did radiographs, patient treatments under the doctor's direction, and assisted the veterinarian in the examination room when needed.

As a result, the veterinarian became more productive, which was reflected in her production-based compensation. The technician felt fulfilled in her position and remained with the practice as a loyal and valued employee. The assistant learned new skills and became a valuable part of the healthcare team. The receptionist was happy because appointments ran on schedule and there were fewer complaints from clients regarding waiting times for their appointments. The practice manager oversaw a more effective hospital system, one that generated revenues far surpassing the costs of the additional staff member. The system was not only more efficient in terms of healthcare delivery to clients and pets, but was also more rewarding for the healthcare team and more profitable for the practice.

CAUTIONS

- Veterinary practices must compete with all other businesses in the retail marketplace for staff, not just with other veterinary practices. This means that salaries and benefit packages must be competitive.
- As a compensation guide, veterinary staff working in a practice should be able to afford the recommended medical care that practices advocate to their clients. In too many instances, veterinary staff cannot afford to properly care for their own animals by following recommended hospital guidelines.
- Most nonveterinary employees do not commit to lifelong employment at a clinic and some turnover should be expected. Sooner or later, many employees will explore new opportunities, and this should not be regarded as betrayal to the clinic. Support mutually beneficial tours of duty.

MISCELLANEOUS

- It is not enough that veterinary staff perform their own duties effectively and efficiently, they must also be capable of functioning as a healthcare team to truly deliver exceptional healthcare.
- Because veterinarians can only perform one duty at a time, they are often the rate-limiting step in delivering cost-effective care to animals. Leveraging the skills of the veterinarian across a diverse support staff allows additional quality care to be delivered, and in a more profitable manner.
- Veterinarians should be aware that their time is better spent seeing clients or performing procedures, rather than restraining animals, collecting laboratory samples, or providing all aspects of client education.

Vet-ebooks.com

1.10. VETERINARY STAFF

• Similarly, it is possible to leverage the skills of veterinary technicians/nurses with the aid of veterinary assistants.

1.11. FUNCTIONING AS A HEALTHCARE TEAM

BASICS

OVERVIEW

• Each member of a veterinary healthcare team contributes to the goals of providing exceptional patient care and customer service and ensuring a successful business.
• A great team is formed by a group of people who have a shared purpose and who know how their individual roles fit with the others on the team.
• A dedicated, proficient team that understands basic practice management should be able to achieve extraordinary goals and boost the practice's compliance rate.
• Simply being a good technician, doctor, or surgeon is no longer enough. Success derives from a synergistic team composed of a committed, focused leader and a cohesive group that believes in the practice vision.
• Good communication is crucial to functioning as a whole unit. For a sure recipe for failure, mix several team members who do not know where the practice is going with a leader who does not communicate consistent expectations and consequences.
• Successful teamwork relies on clearly defined written job descriptions, ongoing training, and individual opportunities for self-improvement.
• Constructive, specific, and recurring performance evaluations provide accountability and direction and further define expectations.
• All practices should strive for compliance (see 4.11 – Compliance and Adherence), including clients complying with your medical recommendations and hospital team members complying with your practice's philosophy and business standards.

TERMS DEFINED

Skills-Based Compensation: A system of wages and raises based on achievement in different skill blocks as determined by the individual practice's need.
Standards of Performance: Written protocols regarding patient care, customer service, and team professionalism.
Total Quality Management: Consistent performance, expectations, and consequences of nonperformance from all staff and doctors.

ISSUES AND OPTIONS

PRACTICE LEADERSHIP

• A leader sets the practice's vision and goals (see 2.12 – Leadership). A manager communicates the vision to the staff so they can accomplish the practice's goals. A leader defines values, fosters professionalism, and sets benchmarks.
• A manager handles interpersonal conflicts and provides hands-on direction. A practice's leader and manager are not necessarily the same person, but every practice needs someone performing each role.
• Leaders must create a psychologically safe culture in which it is safe for any team member to raise issues, challenge ideas, and develop innovative solutions.
• Through good leadership, team members can better appreciate how their actions contribute to the larger good of providing exceptional patient care and client service.
• Through good leadership, the culture operates within a few strong core values of trust, respect, and accountability (both individual accountability and team accountability).
• An inspirational leader generates enthusiasm and excitement. An organizational leader plots the path to achieving goals. The strongest leaders meld both qualities.
• Effective leaders evaluate each unique situation and respond accordingly, mentor and motivate staff, and teach others. Top leaders recognize strengths and weaknesses in themselves and others then match complementary qualities that further benefit the practice while encouraging personal growth.
• Leaders seek out and proactively offer both positive and negative feedback. They hold themselves to a higher standard for patient care, customer service, performance, and self-mannerisms.
• A leader can create a dysfunctional team by not communicating consistent expectations and consequences.
• Fundamental among the "levels of leadership" is emotional intelligence (EI), according to author Daniel Goleman.[1] He defines EI as the ability to manage our relationships and ourselves effectively (see 2.15 – Emotional Intelligence). The five competencies of EI are:
  ◦ Self-awareness
  ◦ Self-regulation
  ◦ Self-motivation
  ◦ Empathy
  ◦ Effective relationships.

JOB DESCRIPTIONS

• Most employees support the practice's vision and want to please the team. Specific, detailed job descriptions outline exactly what they need to do to fulfill their duties (see 2.19 – Staff Performance Planning).
• Written job descriptions are crucial for smaller practices, in which one employee may assume several roles during a week or even a day. Included in the employee manual should be job descriptions for all positions, as a ready, accessible reference, and teams should be encouraged to use them when they must step outside of their own roles.
• Effectively written job descriptions include a detailed summary of the position and how it affects the practice, performance expectations, required and desired qualifications, and a thorough list of specific duties (in addition to some other duties the employee may assume during unique circumstances). Use them as a training outline.

Vet-ebooks.com

1.11. FUNCTIONING AS A HEALTHCARE TEAM

• Also included in job descriptions is a section that describes skills and/or competencies needed to perform the tasks. Skills are learned through education and performance. Competencies are traits or behaviors that must be displayed while performing the role.
• Established, written performance standards (PSs) detail behavior expectations and consequences for not following through. Benefits of having PSs include consistency of care, efficiency, and a standard to which practice leadership can measure performance and team members can understand consequences (see 3.19 – Staff Performance Evaluations).

TRAINING AND CONTINUING EDUCATION

• Hire for attitude and personal characteristics, and train for skills.
• Find and match a team member's niche with the practice's needs. Once the match is achieved, nurture and encourage each employee to grow and contribute to the hospital's goals.
• Proactively cash in on teachable moments and create them whenever possible.
• Take advantage of regular team meetings to incorporate training (see 3.10 – Staff Training). Encourage doctors and team members to share information from continuing education courses or conferences attended during these group meetings.
• Compensate employees who take on extra responsibilities and complete them outside of normal business hours. Pay for or reimburse self-improvement expenses.

PERFORMANCE APPRAISALS

• Traditional performance evaluations try to motivate a person based on historical data that is often subjective or nonspecific. A more effective process is to provide positive appraisals based on goal setting and accountability.
• Performance appraisals are an opportunity to talk about what is being done well, to celebrate successes, or to develop a plan to correct poor performance (see 3.19 – Staff Performance Evaluations).
• A two-part appraisal is most effective. The first part counts for 40–50% of the total review and is completed by the team member in advance to review goals and contributions and set the stage for his or her continued progress. The second part is filled out by the evaluator and measures operational tasks. It counts toward 50–60% of the total review.
• Just as you base wages on skills, you should base raises on skills enhancement. Evaluate individual raises on how well the employee has improved patient care, customer care, and the financial health of the practice.
• In addition to an annual meeting, conduct frequent check-ins. Frequent check-ins give managers and employees the opportunity to discuss goals, remove obstacles, and assess progress. They allow for a more agile business. Rather than waiting for the annual review, frequent check-ins quickly address what is happening now and how the employee fits into the big picture.

INTERVIEWS

• Conduct "stay interviews" with your team to discuss what keeps them staying at the practice, what motivates them, what they like best about the job, and what they would like to see changed.
• Stay interviews are a great way to spend some time with your team members and really listen to your best and brightest for ideas to improve the business and employee relations.
• "Exit interviews" are also helpful tools, not for convincing the person who is leaving to stay, but for addressing concerns that the remaining team members may be dealing with. The exit interview can be viewed as an opportunity for management to learn some important information to improve the culture of the practice.

MEETINGS

• Meetings are the most powerful team-building tool used to reinforce your practice mission to your team (see 2.11 – Making Meetings Work). Regular team meetings raise practice benchmarks, provide total quality management (TQM), increase profits, and improve compliance. You can address current practice or client issues, new medical developments and techniques, and training.
• Put team members in charge of presenting results from projects, such as tracking performance goals or establishing new procedures, to foster ownership and accountability.
• Make sure your meetings are productive and efficient – and end on time. An hour-long meeting with 13 support staff and two doctors carries significant costs in wages and lost revenue, even before you figure in the cost of refreshments! It is better to accomplish two or three things than trying to pile too much on the agenda. Therefore, have an agenda and post it for the team to review prior to the meeting date. Encourage preparation for the topics to be discussed in a safe and open environment.

MOTIVATION

• Appreciation for a job well done is a team-building tool doctors say they use liberally, but the support team say they do not see often enough (see 2.5 – Motivating the Healthcare Team).

Vet-ebooks.com

1.11. Functioning as a Healthcare Team

• Immediate and appropriate positive reinforcement motivates employees to strive harder, whereas incentives such as bonuses, days off with pay, or personalized gifts reward achievement in exceeding goals.
• Delegation gives leaders the chance to share that exhilaration one feels when achieving a goal. It also allows the practice a chance to develop its leaders by giving individuals a chance to take charge of a short-term project, learn leadership skills, and thus be more prepared to step in when a leadership position is vacated.
• Naturally self-motivated team members do not rely on outside recognition as much as others do. Understand and respect each person's needs, but do not heap hollow praises.
• Encourage team members' interests and ideas that can enhance your practice goals. Foster accountability and ownership by putting them in charge of a project complete with deadlines, guidelines, and budgets.
• Personalize incentives for each employee – what motivates one might backfire with another. Also, do not reward the entire team when only one or two individuals deserve the accolades.

EXAMPLES

EXAMPLE 1: IN THE BEGINNING

At the beginning of a training session, ask your team to complete a written test on the topic, but do not grade them. Review the correct answers together to identify and correct inconsistencies in procedure.

EXAMPLE 2: PERFORMANCE REVIEW

The employee should fill out the performance review form in advance:
• List what you consider your three biggest contributions to improve the hospital.
• List three accomplishments you made this past year of which you are most proud.
• List three ways you have improved client service during the past six months.
• List three times that you have stepped out of your comfort zone to overcome a tough situation.
• In the last six months, what self-improvements and CE (CPD) courses/books/meetings have you attended or read? How have you implemented these improvements?
• Are you on track for your CE/CPD goals? Include a copy of your skill lists.
• What are your CE/CPD goals for the next six months?
• List six new goals for the next year. What is your plan to accomplish them?
• What areas do you need to focus on for the next six months and the next year?
• List what projects/teams you would like to be involved in during the next year.

EXAMPLE 3: GOLDEN RULES

The following are "golden rules" for effective team meetings:
• Schedule meetings in advance with posted agendas.
• Rotate the meeting leader and note-taker to help the team take ownership and develop potential leaders.
• Prepare the meeting room in advance, including refreshments.
• Prepare audio/visual or written materials in advance and provide enough copies for all.
• Start and end on time.
• Create a fun, nonthreatening environment to encourage open exchanges.
• Allow enough time for comments, questions, and feedback.
• End with consensus, conclusions, and a summary.
• Provide clear follow-up action plans in writing.
• Always start and end the meeting with an upbeat message to motivate your team.

CAUTIONS

• Your team members consider veterinarians to be the practice authorities and will take performance cues from them. Lead by example, because the team watches your every move.
• The worst leaders and managers are those who try to please everyone. Good leaders willingly don the bad-guy hat occasionally to ensure their teams stay focused and directed.
• Drive for improvement must come from within. Some people are self-motivated and self-directed, while others are just not interested in going as far as you would like them to. Respect individual temperaments, but realize that for some employees you will need to push and push and push.

Vet-ebooks.com

• It takes more than one or two successful meetings or the perfect job description to function as a team. Team building is a continuous process filled with fluctuating performances and stress levels, which peak with each new hire or change. Do not get discouraged when it seems your efforts are failing. You build a team with much teeth gnashing and banging of heads against a wall.
• Remember, the more we learn, the more we realize how much we do not know. We will never be as wise as we thought we were at 16.

1.12. DIFFERING PERSPECTIVES OF PRACTICE TEAMMATES

BASICS

OVERVIEW

Your veterinary practice is composed of a very diverse group of individuals. Just think about your team. You may very well be looking at four or five generations when you consider the ages of your team members. You also have the newly hired and the seasoned professionals, the full-time career employees, and the part-time parents returning to work now that the kids are in school. With so much diversity, how can a business possibly meet all the different needs of the practice team?

One mission of the business should be to create a workplace that will attract talent and keep team members engaged. In order to accomplish this feat and remain competitive in today's economy, your business must consider the needs of a diverse workforce. However, you cannot spend your resources concentrating only on the needs of your team because you also have to consider the needs of your clients, the patients, and the business.

By developing programs to address a few key areas important to your team, you can satisfy all of those stakeholders with "needs" – because a great team will deliver exceptional client service and help the business to thrive.

TERMS DEFINED

Absenteeism: The practice of regularly missing work without good reason.

Onboarding: Teaching a new hire the skills they need, the standards of care expected, and the correct way that things are done at your practice.

Presenteeism: The practice of being at work while ill or not performing to full potential while at work.

ISSUES AND OPTIONS

ONBOARDING

- Hiring new team members starts with an analysis of current staffing levels as compared to the needs of the business (see 3.7 – Effective Staff Recruitment). After all, you cannot hire what the business needs if you do not take the time to evaluate the strategic plan of the business (see 14.5 – Strategic Planning and Implementation) and the status of your personnel. Knowing your plan and your current team will allow you to successfully staff your facility.
- To maintain the right balance of individuals in your practice, you must have a performance appraisal system in place (see 3.19 – Staff Performance Evaluations), which not only assesses skills and knowledge, but also behaviors and attitude.
- Onboarding (see 3.9 – Staff Orientation (Onboarding and Integration)) is not a single event, it is a process that begins with the pre-hiring stage and continues through the first 12 months of a new hire's employment.
- Send new hires all key documents to complete prior to their start date. Cover the basic legal and policy rules and regulations.
- A newly hired person needs to feel a connection to the team and needs to perform their job well. Do not leave the onboarding process to just anyone in your practice. Establish a trained core group who is responsible for teaching a new hire the skills they need, the standards of care expected, and the correct way that "things are done around here" (rather than letting poor performers or those with bad attitudes influence the new hire) (see 3.11 – Structured On-the-Job Training).
- Connect the new hire with a colleague/mentor/coach instead of simply leaving them to get to know their colleagues and enter the different social groups in your practice (see 3.17 – Mentoring).
- Coach and teach team members how to communicate with their team, the clients, and even the pets. Take the time to provide new hires with a sense of organizational norms – in other words, the culture.
- Take the time to concentrate on building a great team through various team-building exercises, training, and open communication techniques.
- Teach for and expect accountability. Accountability to clearly defined performance standards is critical. It is needed by the business and other team members in order to deliver exceptional medical care to every patient, every time (see 2.6 – Accountability).
- Continue to coach long after the initial new hire process is over. Focus on accountability and self-management as you develop your team.

TEAM WELLNESS

- A healthy team is a productive team.
- Realize the complexity of employees' personal situations and the implications of these "distractions" on job performance and team morale.
- Absenteeism and presenteeism are both "attendance" issues affecting productivity and team morale.
- An employee who shows up for work but is not performing to their full potential is suffering from presenteeism. It is a situation whereby a person's job performance suffers due to conditions such as illness, fatigue, or stress from various physical, mental, and emotional factors.
- Habitual absenteeism or presenteeism requires management to work with the employee to resolve the issues, and also to pay attention to the rest of the team who may be going the extra mile to deliver high-quality services.
- Team members need understanding regarding certain issues affecting their personal wellness, but they also need options for managing those issues.
- Consider establishing an employee wellness program to deal with issues that employees face by giving them options such as:
  - flexible scheduling to help deal with family matters,
  - wellness tips and healthy meetings to discuss lifestyle changes that promote healthy living,
  - nutritional snack choices in the break room,
  - a plan for your management team to direct employees to additional assistance programs when the employee needs help with personal concerns.

ATTENTION TO HIGH-POTENTIALS

- High-potential employees need challenging assignments and opportunities to learn and grow.
- The business needs to develop leaders – individuals who will be able to step in or take over according to the changing needs of the team and the business.
- Management should cultivate team members with a potential for growth and advancement by aligning their interests and talents with the needs of the business.
- The establishment of a career-mapping program within the performance appraisal program may develop those team members designated as high-potentials.
- Programs to develop talent also help a business retain talent and explore other options for satisfying the changing needs of clients by utilizing the strengths of the team.

THE GENERATION MIX

- Different generations have different expectations of a work environment (see 1.13 – Generational Differences). Programs that factor these in are more likely to attract and retain talent.
- **Traditionals** (1925–1945) are your older team members who have forgone retirement and continue to stay active in the workplace. They tend to be frugal, work long hours, and strictly adhere to rules. They also welcome the opportunity to have flexibility in their work schedule and duties.

Vet-ebooks.com

1.12. DIFFERING PERSPECTIVES OF PRACTICE TEAMMATES

• **Baby Boomers** (1946–1964) most likely occupy management positions or are considered the "seasoned" employee. They are known to be workaholics, competitive, and rigid, and to find their identity in their chosen profession. They also welcome flexibility, personal growth, sabbaticals to explore hobbies and other interests, challenging assignments, and meaningful work.
• **Gen X** (1965–1981) employees are approaching the height of their careers and may be finding themselves at a crossroads in their career. They are known for being aloof, cynical, abrasive, and jaded. Typically they reject the conventional leadership of the Baby Boomers and feel that innovation is a top priority. They welcome networking, collaboration, and being able to choose their own path (highly self-directed).
• **Gen Y or Millennials** (1982–1999) are starting out in their chosen career and quickly advancing through the training program. They are known for being overly confident and optimistic, yet needing constant attention. They welcome continuous feedback and being able to navigate their own career paths. Millennials want personally fulfilling work that also permits them to be socially conscious. They are strongly associated with team activities.
• **Gen Z** employees are those born after 1999 and are the youngest generational cohort currently in the workforce. Your kennel team may be staffed with a number of Gen Z people. They are known for being technical savvy at their young age. They are group-oriented and easily integrate social networking into their daily lives.

EXAMPLES

• Onboarding programs are not just for new hires. Consider the importance for people taking on new duties or those promoted to management positions and create onboarding programs for them.
• Accountability needs to be a business priority and part of the core values. It begins with leadership, requires buy-in by the individual, relies on job descriptions and performance standards to communicate what is expected, incorporates continuous training in the business strategy, has systems in place to measure compliance, provides regular, constructive feedback, has consequences that are understood by the team, and creates a culture of trusting in each other.
• Absenteeism must be monitored and accountability to attendance expected. Certain absenteeism and presenteeism issues may be improved by instituting a Performance Improvement Plan and advocating involvement in employee wellness programs that address common issues such as diabetes, smoking cessation, stress, elder care, high cholesterol, and so on.
• Develop a program to regularly assess your team and identify high-potential employees.
• Use an assessment tool to identify unproductive team members, and then evaluate whether or not the practice can develop a performance improvement plan, or discuss terminating the work relationship.
• Developing leadership competencies is an essential ingredient in any program involving high-potentials.
• Use the generational mix to your advantage. Set up mentoring or coaching pairs: a Baby Boomer mentoring a Gen Y on leadership, or a Gen Y coaching a Baby Boomer on techno-gadgets, or a Traditional providing networking connections to the Gen X.
• Use the generational mix to develop your recognition and rewards program, understanding that one-size does not fit all. Obtain feedback from the groups and use their input to develop meaningful programs to motivate and engage all generational groups.
• "Needs" extend beyond the needs of the team members and include the needs of the client, needs of the pet, needs of the community, and needs of the business. Visit the mission "needs" of the business on an annual basis with the entire team – then evaluate needs of the team in relation to the needs of the business.

CAUTIONS

• The desires and needs of the different generations may be in direct conflict with the needs of the business.
• The same assessment tools cannot be used in every practice or for every situation. Talk to other professionals to explore available options and what will work best in your practice and with your team culture.
• Many wellness programs require some financial incentives to encourage team participation. Please check with a certified wellness program provider (such as your current insurance provider) or attorney before implementing any program.

1.13. GENERATIONAL DIFFERENCES

BASICS

OVERVIEW

• Veterinary medicine is a field where there is often, even in smaller hospitals, a mix of the different generational categories. There are typically older, more experienced individuals in the ownership and management structure of a hospital and often a mix of generational representation in the veterinary, technical, and reception areas of the hospital.
• It is common for hospital owners to feel that the younger generation has an inferior work ethic, takes no responsibility for their actions, and simply does not care as much about their performance as the owners themselves do and did at that age. Conversely, younger workers often feel that management is out of touch, old fashioned, and too rigid for the younger staff to thrive, so they struggle with following the hierarchical structure in the practice.

TERMS DEFINED

Baby Boom Generation: Commonly called "Boomers," this generation of people was born after the end of World War II, between the years 1946 and 1964.
Generation X: People in this generation were born between 1965 and 1981, but more generally this includes anyone born in the 1960s and 1970s.
Generation Y or Millennials: This generation includes anyone born between 1982 and 1999.
Generation Z: Also known as the iGeneration or Net Generation, these are individuals born after 1999. They grew up in the post 9/11 era and have always had familiarity with communications and media technology. Their tendencies in the workforce have yet to be fully characterized.

ISSUES AND OPTIONS

Figure 1-13-1 shows a timeline for the three generations that currently dominate demographics in veterinary practices.
• One important point to understand about generational differences is that this is not a new phenomenon. Chances are that at some point during our younger years, no matter how old we are, our elders felt like we were impetuous kids with little work ethic or sense of responsibility. There has always been a perception that the younger generations possess different beliefs and values than those who are older. Although the contrasts may be a bit clearer due to some of the reasons discussed later in this chapter, there have always been and will likely always will be differences of opinion between older and younger individuals.

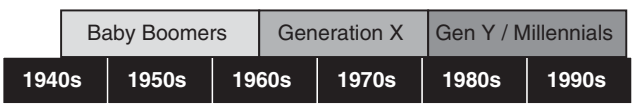

Figure 1-13-1.

The three main generations represented in today's veterinary practices.

• Many of the things people categorize as "generational differences" are simply differences of opinion on what is important. These views tend to shift as we grow older and, often, we have different priorities at different phases in our life.
• Another big factor in perceived generational differences is the comfort and proficiency with rapidly changing technology. The Baby Boomers remember rotary phones and record players whereas the Millennials grew up with personal computers, cell phones, and iPods.
• Most of the challenges that arise in the workplace due to generational differences have to do with using the same technology, following the same forms of communication, and existing within the same hierarchy (see 2.1 – Workplace Management). This leads to a meshing of values and beliefs, which often creates conflict and tension and can interfere with our quality of care as well as our client service level.

ADAPTIVE LEADERSHIP

• The people who deal best with a diverse generational work environment are adaptive leaders who are capable of working well with any diverse group, be it based on age, experience, ethnicity, religion, culture, or any other groups of individuals with different sets of beliefs.
• An adaptive leader understands that you cannot force others to mold themselves to your leadership style in order to be successful in your organization. This means you must adapt your leadership style to the needs of the people and the business, and that you must work with people as individuals and learn to help them engage based on their own style, goals, priorities, and strengths. Ultimately, it means that you become a leader who focuses more on what other people need to engage and be fulfilled at work, and less on how you believe they should behave based on how you would behave.
• Adaptive leaders are able to build organizations with enough flexibility that virtually any generation can be comfortable and can contribute to the success of the hospital.
• It is important to recognize that, even when someone is not like-minded to us, he or she can still contribute, innovate, make a difference, and help our practice achieve more. Sometimes, someone with completely different ideas and beliefs can do an even better job in certain roles than we ourselves could do.
• Becoming an adaptive leader is one of the best ways to create a veterinary practice that can employ any generation and become even more successful because of your ability to hire and engage diverse talent.

ENGAGEMENT

• Different generations will need different things from an employer in order to remain fully engaged and work toward the growth and success of the business. It is important to consider the various generations when you think about how to execute organizational changes, kick off new projects or marketing plans, make changes in job roles or duties, or even bring new team members into the hospital.
• Engagement is best created in a multi-generational hospital when changes are made collaboratively and the staff has input into the changes and how to implement them. This does not mean that decisions get made based on consensus but it does mean that people feel as if they had a say in shaping how things happen, and that they have some control over their work life.

Vet-eBooks.com

1.13. GENERATIONAL DIFFERENCES

	Boomers	Gen X	Millennials
Work	Work largely defines who you are	Work is what you do, but balance is important	Work is integrated with life, friends at work matter
Time	Overachieving is important no matter how much time it takes	Family time and work time should be separate with rigid lines	Can work in smaller increments and shift back and forth quickly from work to play
Communication	Long letters and emails	Brief, but complete	Short, to the point messaging in real time
Goals	Longer term, bigger picture	Short term or quarterly objectives	What is going on this weekend
Job	Career	Current role, but could change at some point	A good gig for now
Development	Get to a senior role and then manage others	Work my way up with varied experiences	Constantly try new things, learning is what jobs are for
Structure	Hierarchy with clear roles and titles	More of a team environment, but with clearly defined leadership	Flat organization with little hierarchy

Figure 1-13-2.

Features of the three most common generations represented in veterinary practices today.

• Creating an environment where people feel empowered to contribute ensures that no matter the generation, staff members will be able to express their views and that goes a long way toward helping them engage and feel good about the place where they work and the leaders with whom they work.

Figure 1-13-2 offers some examples of how each generation thinks about common workplace and life values. Understanding these differences is critical to becoming an adaptive leader.

Once you have a good understanding of these differences, it is important to begin creating a culture in your hospital where multiple generations can thrive and engage (see 2.26 – Changing Organizational Culture). Because people from different generations can have different motivators, communication patterns, and approaches to how they work, it is important to build a culture where they can work together and where the owners and managers can effectively improve everyone's performance over time. We must therefore look at several key factors that will drive individual motivation and engagement throughout the practice, taking into account everyone's values and viewpoints, not just the ones we relate to. In many cases, managers and owners communicate well with and "get" the people from their generation, whereas people from other generations leave managers scratching their heads.

The following sections discuss some concepts and examples that will help you manage across different generations and still build a high-performing practice. Although every generation can benefit from effective coaching as they change behavior, learn new skills, and improve performance, in a multi-generational veterinary practice there are some key points to keep in mind as we have coaching conversations.

GOALS

• One of the most powerful and engaging things we can do with any employee, regardless of when they were born, is to help them set meaningful and compelling goals for themselves. This not only allows them to focus on doing things differently today but also goes a long way toward building the kind of relationship that causes people to step up and do more for the business because working there has made a difference in their own lives.

• It is best for the individual staff member to set his or her own goals and for the manager/coach to provide input, but let the individual drive the conversation. This is a good practice anytime we coach others but becomes more critical when we are working with someone from a different generation. We may not be able to anticipate or even understand others' goals because they might differ greatly from what ours would be in their situation. For example, Boomers often feel a sense of loyalty to their employer and one goal might be to work their way into a management role and give back to the practice, as they become a more effective contributor to its growth. Millennials may operate more from an "in the moment" perspective and be motivated more by how their team perceives their value and their work. Clearly, we need to have very different coaching conversations with these individuals if we are to help them establish their work goals. We also need to connect their performance to different motivators to keep them fully engaged as employees. It is often difficult for Boomers to understand why the motivation does not naturally exist in everyone to do a good job because they were asked to do it and paid for it. In reality, people might be motivated more by contributing new ideas and seeing them come to fruition than by doing what they are asked to do.

Vet-ebooks.com

1.13. Generational Differences

Younger generations increasingly want to have a say in how the business operates and how things are executed, whereas many older employees are satisfied by excelling at the tasks they are given. Neither is right nor wrong, they are just very different and in our coaching we need to allow for people to play to their own strengths and their own sources of satisfaction.

• It is effective with any generation to start performance and coaching conversations with questions like: "What are the things that you would like to accomplish here as part of our team?" or "Two years from now what do you want to have learned or become better at as part of our hospital?" Many people have not given a lot of thought to these questions and they may need some time to contemplate them between conversations.

ACCOUNTABILITY

• Practice owners are commonly concerned with having more accountability throughout the hospital (see 2.6 – Accountability). Their expectation is that people take ownership for solving problems, improving processes and growing the practice. Coaching conversations can be a great way to create this sense of accountability, but how we coach can make a big difference in how much initiative people take. Often, employees bring problems to managers or owners in a practice and expect "management" to fix those problems. Effective coaching that asks questions like "What do you think the best way to solve this might be?" or "How can I help you best have that conversation with that person to work through your differences?" changes the whole dynamic of how problems are solved. Different generations may approach the solutions differently, but if we allow them to think through those solutions on their own by asking good questions, we do not have to try to come up with solutions that will please everyone. We can simply let them come up with their own solutions, within reason, which ensures that they select the path that suits them best and solves the problem. It also creates an environment where people close to the problem solve it, rather than pushing everything up to management for a decision. People will begin, after hearing the same kinds of questions over time, to think about solutions before they ever bring them up to management in the first place. Staff members can change pretty quickly in this regard.

• Managers will face the bigger challenge of letting others take accountability for things, especially if they are accustomed to being in control of everything. We have to make choices as leaders whether we want our team to have accountability or whether we want to keep it all for ourselves. Keeping it all means we have to have all of the answers. Sometimes Boomers can make that system work, where management solves all of the problems and knows what to do in every situation. In multi-generational businesses though, it is a real challenge to grow, evolve, and improve the efficiency of the business if one person or a very small group of managers has to touch every solution. We are much more effective as an organization if people take the initiative, solve problems, communicate horizontally about changes rather than up the chain of command, and feel ownership for making things better. Ultimately, when we have people from multiple generations on our team, we limit our growth and our ability to achieve our potential if all of the decision-making remains at the highest levels of the business.

SUPPORT

• Support from a coach or manager comes with different expectations, depending on which generation we are from. Some Boomers may feel like the paycheck is their reward and that's all they need whereas Gen Xs may care more about the praise they receive and how they compare to their peers. Millennials may want more input into the next project as a reward for executing the current one well. As owners and managers, we can cause significant change just by focusing on how we reward and support people in their efforts to contribute more and perform at a higher level. It is a helpful practice for us to leave our office a few times each day and focus solely on walking through the hospital and catching someone doing something right. The statement it makes about what good looks like in terms of performance is substantial and comes through loud and clear to the staff. For example, imagine we are working through an initiative where we are improving our client service levels. We have had a collaborative meeting on how we might do that, we have broken down and prioritized our efforts, and have committed as a team to execute five things differently in our daily interaction with clients. Noticing people who are stepping up and making those changes quickly will both cause them to speed up their own changes and clarify the behaviors that are desired for everyone around them. It serves to cement the new behaviors as part of the culture and give people feedback and clarity on what the expectations are.

• Coaching conversations with staff members who are struggling with changes or shifts they need to make should also come from a supportive place. The overarching message has to be: "I want to help you and that is my main goal. How do we work together to get you to the goals we outlined for you as a part of this team? What changes do you want to make and how do I support you in making those changes?" Once again, we create a sense of accountability while simultaneously providing support for the individual to operate more effectively.

The key to managing different generations of people is really no different from how we might manage people from different cultures, different backgrounds, or even just from another hospital where the environment and processes might have been very different. We should create a collaborative culture where everyone has input into how we make changes, coach effectively to ensure that we focus on each individual's goals, encourage a sense of accountability so people begin to solve problems and make changes on their own, and consistently provide support. Changing the way we lead the people in our hospital will greatly reduce our need to have every answer, solve every problem, and figure out how to help a group of very different people perform better.

1.14. GENDER ISSUES

BASICS

OVERVIEW

- Gender issues, though often subconscious, can adversely affect professional/personal relationships and career advancement.
- Traditional reviews have referenced attitudes toward males and females. The LGBTQ community is tacitly included in the following.
- Gender issues are global; they affect all cultures, educational levels, professions and socio-economic demographics.
- Contributing factors include cultural, national, religious, personal, and generational experiences.
- Particular male-dominated professions such as sciences, the military, and law enforcement are prone to culturally ingrained gender mismatch.
- Women comprise approximately half of the general labor force but hold a much smaller proportion of political and business decision-making positions.
- Occupations such as teacher, nurse, and support staff that have been traditionally female dominated continue to be so.
- Remediation for gender mismatch/bias is a function of self-awareness, willingness to accept change, and access to role models and mentors.
- Often blind to personal bias. Subconscious bias may be in stark contrast to conscious attitudes and professed beliefs. Stressful situations can exacerbate biases.
- Resistance to change can have various origins from fear of the unknown, complacency, and desire to maintain status quo to the belief that over time matters will resolve themselves.
- Role models have historically been few in numbers for individuals experiencing gender bias. Changes over time in these statistics are hard to predict.
- Gender issues are not a matter of black and white, wrong and right, male or female, straight or LGBTQ, but exist along a continuum.

TERMS DEFINED

Authenticity: Being genuine, truthful, honest.
Bias: Prejudice in favor of or against one thing, person, or group compared with another, usually in a way considered to be unfair.
Feminine/Female: Used interchangeably in this context. Having qualities or appearance traditionally associated with women, especially humility, self-deprecation, softness, and emotionality.
Masculine/Male: Used interchangeably in this context. Having qualities or appearance traditionally associated with men, especially strength, aggressiveness, and dominance.

ISSUES AND OPTIONS

Gender bias has been historically entrenched in veterinary medicine. The first US veterinary graduates appeared in the mid 1800s, but Dr. Mignon Nicholson was the first woman to be granted a degree in 1903. Four decades later, animosity toward women in the profession was palpable. In 1943, Dean Ward Giltner told a class of six women at Michigan State to go back to the kitchen and not take jobs away from men. Fast forward to 2007 when female veterinarians outnumbered men. Gender bias toward women and the LGBTQ community may not be as blatant but prejudice still is an undercurrent impeding job success and fulfillment.

Gender issues impact perceived and applied management/leadership practices. The different masculine and feminine stereotypic styles need to be recognized for their strengths and weaknesses with a blending being optimal.

TYPECAST COMPONENTS OF MANAGEMENT STYLES

Male

- Autonomy, self-promotion, task oriented, greater risk tolerance, toughness, penchant for verbal sparring.
- Origin of the male style: Boys praised for being assertive and independent. Boys want to be respected.

Female

- Seeks collaboration, risk averse, seeks perfectionism, person oriented, empathic, nurturing, belief that hard work will be recognized and rewarded, willingness to take one's turn.
- Origin of the female style: Girls are admired for being honest, humble, and respectful. Girls want to be liked.

Successful managers/leaders can be male or female, LGBTQ or straight. Awareness of your own and others' personal communications style, strengths/weaknesses, and potential bias increases your chances of being effective.

COMMUNICATIONS

How/why genders communicate are divergent.

- Masculine communication style is to transmit information/solve problems; give reports.
- Feminine approach is to express feelings, gain emotional relationships, establish intimacy; speak to build rapport.

When a man and a woman deliver the same speech, the man may be viewed as being more credible. The disparity is a function of tangible and intangible factors: word choice, thought organization, rate, tone, pitch, body language, self-confidence, personal bias, and life experiences.

Word Choice

- Fewer words are more effective. Speak words that count.
- Do not speak down to someone but use terms/phrases that are understandable. Continually reassess word choice during conversations. Learn to read body language to gauge if your message is hitting its mark or being lost.
- Use strong versus weak words/phrases:
  - Examples of weak words/phrases: feel, maybe, perhaps, recommend, what if, don't you think, in the future.
  - Examples of strong words/phrases: believe, advise, need, now.
- Do not phrase statements as questions. Make declarative statements. Do not end sentences with inflection.
- Use an unclutter speech style. Monitor speech patterns for filler words such as um, huh, ugh, you know, like.
- Sound assertive but not aggressive; be balanced not bitchy.

Thought Organization

- Pause. Think before speaking.
- If being questioned, repeat the query at the start of your reply. It gives your brain a chance to formulate an answer.
- Be concise and do not ramble.

Rate

- Women's speech tends to speed up more than men's when nervous. People worth listening to know this and speak more slowly than others.
  - Pace yourself
  - Breathe
  - Be aware of tone/pitch.
- Nervousness/intimidation/insecurity can raise the pitch of a voice and make the tone strident. Unconscious bias may be triggered in the listener causing them to turn off to what is being said. Typically, people prefer to listen to lower-pitched, melodic voices.
  - Listen more, speak less
  - Relax shoulders and throat
  - Slow down
  - Breathe.

Vet-ebooks.com

1.14. GENDER ISSUES

Body Language

"When a man speaks, people listen then look. When a woman speaks, people look and if they like what they see then listen" (Pauline Frederick (1908–1990), American journalist and author). Men often have the advantage with body language because of their usual more imposing physique and presence. As can be seen in politicians who excel at personifying confidence/presence, it is not so much what you say but how you come across.

Components of body language include:

- Touch
  - Hand shake is a demonstration of interpersonal courtesy and self-worth. It should be firm but not bone crushing. Best performed with steady eye contact. Timing should be long enough to register the color of the other person's eyes.
  - Respectful touch – significance varies dramatically with gender. For women it is a means of strengthening comradery. For men it implies a demonstration of power.
- Facial expression recognition
  - Women are generally more expert in interpreting facial expressions, with extended eye contact being the preferred method of deducing the intent of the discourse.
  - Men are often more astute at construing messages cloaked in spoken nuances and of utilizing "poker faces" in their business and personal dealings.
- Nodding is a simple act with the intuitive meaning of agreement but gender differences exist.
  - From a masculine perceptive a nod usually implies accord.
  - From a feminine mindset a nod is viewed as a sign of encouragement and a desire for additional disclosure of information.
  - Care must be taken when using a nod with the opposite sex as interpretation can drastically affect the interaction.

Self-Confidence

Self-confidence is an external manifestation of internal self-worth. You cannot communicate with confidence unless you believe in yourself. Research reveals that men more than women typically have a more inflated sense of self-worth secondary to positive self-talk.

- Men tend to tell themselves routinely that they are leaders, successful, and possess innate qualities and skills that guarantee their desired achievement.
- Men usually rank their job performance as being 35% better than it truly was.
- Women often engage in negative self-talk: I am not good enough, someone will find out that I am not qualified and that I don't know what I am doing. The classic "imposter syndrome."

Ways to boost self-confidence:

- When flustered … slow down, admit when you don't know (then find out and report back), stop talking.
- Listen. This is an opportunity to learn. Form of soft power displays that you do not need to speak. Stay attentive. When you do speak your words have greater significance.
- Become comfortable with silence.
- Stop apologizing. Overapologizing weakens the appearance of self-confidence.
  - Women are more inclined to apologize than men.
  - Rather than saying "I'm sorry," acknowledge the circumstance or make a declarative statement concerning the situation. This is especially important in meetings. When you have a thought to contribute, do not start your announcement with "Excuse me but …", try instead "I was thinking …".
- Focus on others. Often the other person is as uneasy in a situation as you are. By focusing on them, drawing them out in conversation, you put them at ease, the spot light is off you and it becomes a win/win proposition.

Personal Bias/Life Experiences

Life experiences can bias interactions with others. Extremely good or bad life events can result in irrational visceral reactions that cloud interpersonal communications. Little can be done to anticipate or counteract someone else's subconscious reaction to you. The only person you can control is yourself.

Communications Summary

- One gender is not superior to another in their ability to effectively communicate.
- Particular circumstances – to whom you are speaking and how/what you are attempting to – are best served by incorporating the archetypal styles of each gender.
- Identify your personal strengths and weakness. Convert a perceived weakness to a strength, emotionality to empathy, timidity to thoughtfulness.
- Modifications in your personal technique will take time, patience and effort.
  - Video your interactions in different scenarios and stress levels.
  - Review them with the audio on and off.
  - View them with honesty and in as dispassionate manner as possible. We are frequently more critical of ourselves than others are.
- Talk less, listen more.

NEGOTIATIONS

The pay gap between genders has long been recognized. The breach in salary parity is closing but still exists.

Overview

- Women outnumber men as practicing veterinarians and students.
- The majority of practice owners and decision-makers are men.
- Men earn more than women because:
  - US society assumes men will earn more and men are considered to be the primary breadwinners;
  - according to Census Bureau data in 2017 women earned 77.1 cents for every dollar earned by a man;
  - men have higher wage expectations.
- Success in negotiating early salaries has a dramatic immediate and long-term effect on career, personal fulfillment, and pocketbook.

Negotiating Styles

Styles fundamentally differ along gender lines.

- Women negotiate by what they feel is fair, men by what they want.
- Men are more self-assured, assertive, and successful in converting expectations into reality.
- Women are viewed less favorably than men when they negotiate in a manner similar to a man or when they ask for what they believe is equitable.

Securing pay/advancement/leadership equity despite gender is a function of timing, authenticity, self-promotion, networking, self-respect, ethics, moving outside of one's comfort zone, working well under pressure, perception by others, networking, and mentors.

Timing

- Women succeed more often than men but take longer to do it.
  - Men – shoot/ready/aim
  - Women – aim/ready/shoot
  - Perfectionism and imposter syndrome plague females more than males. Women feel they must meet 100% of all prerequisites; men much less.
- Timing affects the views of family life and work/life balance:
  - Women feel that more help at home will help them achieve balance; men believe increased personnel at work will do the same.
  - Women more often harbor fears of not being able to do it all and being unable to juggle potential career advancements.

Vet-ebooks.com

1.14. Gender Issues

- "Doing it all" can't be done by men or women.
  - Decide on your priorities … plan for them
  - Don't get overwhelmed
  - Stay focused and get enough sleep and exercise
  - Ask for help. This is not a sign of weakness but wisdom.

Authenticity

Seek authenticity over perfection. Share an appropriate amount of yourself in order to demonstrate your humanity and approachability. Feminine stereotypes that weaken a woman's (perceived) potential include:

- being overly solicitous to other's real or imagined needs,
- inserting yourself into other's lives when not requested,
- being excessively emotional.

Reframe stereotypes as being caring, empathetic and consensus builder. Do not try to be a friend to all at all times. It is better to be fair and consistent than popular.

Self-Promotion

- Verbal swaggering is often condoned in boys; humility and self-deprecation are the norm for girls.
- Advocate and define yourself. Do not let someone else do it for you.
- Self-promotion is not bragging if it is true.
- Stress your experience and activities in the context of work with others. Focus on how your efforts facilitated the group's success.

Comfort Zone

Do not wait to be asked. Seize opportunities. Challenges need to be viewed with curiosity and anticipation not dread. Not accepting a challenge may bias others to deny them to you in the future. Studies have shown that it is not the chances we take that we regret in the future, it is not taking them that causes more distress.

- Failure is integral to success. Failures leads to seeing possibilities that did not exist before.
- A willingness to fail is a sign of courage and strength.
- Fail fast, often, learn from it, and move on.
- Decision-making can lead to feelings of guilt. Make your best choices. Be willing to accept the consequences of your actions.
- Guilt makes us doubt ourselves and holds us back.

Working Under Pressure

Leaders/managers often guide others in directions that they would not otherwise pursue. The demands of the position can be daunting and filled with self-doubt, internal and external pressures, and criticism.

- Welcome constructive criticism. Do not take it personally. Learn from it.
- Learn to say no.
  - This is more difficult for a woman than a man.
  - Women have penchant for multi-tasking, which can lead to overload, resentment, and exhaustion.
  - Learn how deflect requests. Rather than saying no, say "I prefer be involved in another capacity."
  - Be willing to consult on a limited basis, on your terms.
  - Be discriminating as to which commitments you agree to.

Perception by Others

Grab some prime real estate. Sitting at the periphery of a conference table is tempting when confidence levels are low. Better to seat yourself near or at least directly across from the person with the greatest status. It demonstrates self-worth and increases your chances of interacting with a key decision-maker. You garner elevated importance by your sheer proximity.

- Women more than men suffer from the "disease to please." This can delay decision-making. Some solutions are to:
  - communicate frequently, openly, heed the ideas of others;
  - accept that choices made may not be universally pleasing;
  - not compromise principles. This undermines your credibility.
- Women often fear that power and femininity are not compatible.
  - An assertive man is considered bold.
  - An assertive woman is considered bitchy or hormonal.

A woman with attributes such as an aggressive speech pattern, dominant negotiating style, or unilateral decision-making is likely to experience a more severe reaction than a man who exhibits the same behaviors. A self-confident, empathetic, inclusive/caring approach is empowering to both sexes.

Networking/Mentors

Networking and mentors are some of the most effective means of countering bias. Both can advocate for you with their circle of decision-makers.

- People like doing business with people they know. Having others vouch for your character and abilities decreases the discomfort of the unfamiliar.
- Networks and mentors will vary with time.
- Diversity in networks and mentors extends their reach of influence. Secure people of various backgrounds, ethnicities, and genders.
- Be proactive. Establish networks and secure mentors before you need them.
- Mentors are not meant to provide the answers (see 3.17 – Mentoring). They should direct you to the correct questions, actively listen, provide constructive feedback, and give the occasional well-timed kick in the bum.

Negotiation Process

Advancements do not come automatically or just because you deserve them. You need to advocate for yourself and proactively negotiate for what you need and deserve. View the process as a challenge.

- Disagreements/conflicts are not personal but business. Remember to:
  - focus on the task at hand not the other person;
  - be prepared for push back, do your homework, have facts at hand that support your proposition;
  - maintain control of the conversation.
- Men are sometimes hesitant to negotiate with women because of the fear that they will become emotional or hold a grudge.
- Resolutions achieved through empathetic dialog are longer lasting and more equitable.
- Negotiation skills take practice (see 2.17 – Negotiating 101).

Negotiation Summary

- Negotiating involves the risk of conflict, disagreements and rejection.
- Misconceptions, misinterpretations, and lack of experience in process can dissuade individuals to initiate the process.
- Spend 70% in active listening, 20% in probing questioning, and 10% talking.
- Negotiating salary or career advancement can cause consternation; your perceived self-worth may not be appreciated equally by another. This can be paralyzing.
- The problem with negotiation is not with the negotiation process itself but how we view it. Consider it a challenge, as a learning endeavor. Remember to:
  - do your homework;
  - realize that there is never a perfect time and you will never be 100% ready;
  - promote yourself with confidence and with the assistance of a broad-based network of mentors.
  - negotiate with integrity and authenticity.

Vet-eBooks.com

1.14. GENDER ISSUES

EXAMPLES

• Conventional wisdom would say careers and advancement should be based on meritocracy. But studies have shown that if you have a woman's, minority, or ethnic-sounding name you are less likely to get the nod. Attempts at gender parity in orchestras have led to musicians being auditioned behind partitions and having the sound of their footfalls muffled so as to mask their gender. A Harvard School of Business experiment revealed that one job applicant was viewed as being less competent than another with the same exact qualifications solely because they had the name Heidi versus Howard.[1]
• Competency and qualifications are not synonymous. "Fake it till you make it" is a mantra that should be especially voiced by individuals for whom bias is an issue.
• Self-confidence elevates perceived aptitude and has been proven to be enhanced by the mere act of playing superhero. Stand with legs shoulder distance apart, hands on hips, head held high and chest out (do this in private). Measured levels of testosterone and self-assurance were found to increase in both sexes.
• The 10 "secrets of confidence" are a winning attitude, a sense of self, an understanding of others, a loyal group of friends and associates, a charming personality, the assurance to be self-promoting, the ability to negotiate to everyone's advantage, the instincts necessary to survive, the ability to lead, and a powerful presence.
• Negotiating a contract/raise or advocating for a leadership/management role can be intimating. The cost for not doing so, especially in the nascent career can literally cost you tens of thousands of dollars over a lifetime. Ask for what you need and deserve. Ask and act as though you were not afraid of what they might say. All they can do is say no. Then it is up to you to ask why.
• If you are from an ethnic minority group, a woman, a member of the LGBTQ community or someone else who was not expected to succeed but you did, it is your responsibility to serve as an example and to mentor to others. You can not be what you do not see.

CAUTIONS

• Veterinary medicine needs to reflect the demographics and culture of a community. Addressing issues of gender bias does not constitute giving one group special treatment but it does acknowledge a challenge that society and the profession must grapple with. Issues are best resolved through open effective communications, self-promotion, and self-realization of any bias. We need to recognize, celebrate, and support the success of others no matter whether male, female, straight, or LGBTQ.
• Gender bias is an amalgam of nature, nurture, culture, and social mores. Early socialization and life lessons – good or bad – mold who we are and how we react to the world and people around us. We have no control in how the world reacts to us. We can only control ourselves.
• We are all biased. Admit it. Work on it.

1.15. PERSONALITY PROFILING

BASICS

OVERVIEW

• Interacting well with clients and coworkers is an important part of any veterinarian's job. Knowing how to recognize and respect the innate differences in people is critical. Concepts explained to a group are interpreted and understood on an individual basis, and knowing how to tailor a message to different personality types improves the odds that the message will be received as intended.
• There are several personality type theories, but one of the most reliable and understandable is the MBTI (Myers–Briggs Type Indicator). Its developers set out nearly a century ago to identify basic differences in normal, healthy people that could be described uniquely and that would be observable over large groups of people and in many different cultures.
• Myers–Briggs types look at whether we are energized by being alone or with others, how we take in information, how we make decisions, and how we like to organize our world.
• There are no good or bad personality types; all 16 MBTI personality types are good – they are just different.
• Everyone exhibits characteristics of all the personality types at various times in order to be successful in our personal and professional lives, but our individual preferences are inborn and cause us to filter other people's behavior through our own preferences.
• Recognizing one's own preferences makes one more aware of the differences among people, helps us to respect others by knowing that they may not think or behave as we do, and allows us to recognize and acknowledge skills and traits that complement our own.
• If you knew, for example, that a specific individual gets more out of written than verbal instructions, why would you continue to give only verbal instructions? If you could figure out their preference, you likely would give that person information in writing to enhance his or her understanding of the material. The same is true for the 16 personality types: If you understand and can identify a person's preferences, you can then accommodate those preferences when you believe it makes a difference in the outcome of your interaction.
• Another common and important personality profiling option is DiSC, which can be used to better appreciate client and staff communication (see 5.2 – Identifying Client Communication Styles).

TERMS DEFINED

Myers–Briggs Type Indicator (MBTI): A well-established test instrument that measures the personality traits and preferences of normal, healthy people. The test is a personality inventory, not a test of skills or abilities. The MBTI relies on four scales, each of which is a continuum ranging from a slight to a very clear preference for a particular characteristic. The four scales are described in the next section. There are unofficial versions of the instrument available on the Internet, though their results may not be as reliable as the actual MBTI.

Myers–Briggs Type Indicator (MBTI) Personality Types: These types (16 in all) are the result of individual preferences on the four MBTI scales. An individual's personality type does not change over time; however, people may express their type in somewhat different ways at different times, and at different ages and stages of life.

ISSUES AND OPTIONS

PERSONALITY TYPES AND TERMS

The four dimensions that make up Myers–Briggs personality types are listed below. All of these are on a continuum and a preference can either be strong (near the edge on either side) or more moderate (nearer the center). Your preferences on the four scales define one of the 16 Myers–Briggs types that is said to be closest to your individual personality type. The author, for example, is an ISTP – someone who prefers Introversion, Sensing, Thinking, and Perceiving. Here are the four scales:

How People Are Energized
(E) Extraversion ——— Introversion (I)

The Kind of Information We Naturally Pay Attention To
(S) Sensing ——— Intuition (N)

How We Make Decisions
(T) Thinking ——— Feeling (F)

How We Like to Organize Our World
(J) Judging ——— Perceiving (P)

EXTRAVERT (E) VERSUS INTROVERT (I)

This continuum is not about who is talkative and who is not, even though that is a common misconception. Even outgoing people, the life-of-the-party types, can demonstrate a strong preference for introversion on the Myers–Briggs scale. They may simply be adept at functioning all along the continuum, so much so that everyone's first impression of their preference for extraversion or introversion can be incorrect. That's because this scale is actually about whether we prefer to focus on the outside world or on our inner thoughts and feelings, not how we act in a particular situation. The key to an introvert's preference is to ask what he or she generally does at the end of a long, stressful day. An introvert will frequently answer: "I go home and stay there." On the other hand, an extravert will seek out other people and places to recharge an internal battery. Ask yourself:
• Are you energized by interacting with other people or by being by yourself? At the end of a long, hard day at the clinic, would you rather meet some friends and go out on the town, or go home and hope no one calls? If being with other people energizes you, you likely have a preference for Extraversion (E). On the other hand, if you rejuvenate yourself at home in solitude and comparative privacy, you may be an Introvert (I).
• Are you more comfortable acting first, then thinking about it, or do you prefer to think things through before acting on them? If you act first, you may prefer Extraversion (E).
• Do you think out loud – do you explain your thought process as you make a decision, or do you analyze the options, make a decision, and then announce your conclusion? If you think out loud, you may be an Extravert (E). If you prefer to do your analysis inside your head, not sharing your thought process with other people, then you likely prefer Introversion (I).

People who prefer extraversion are more comfortable in the outside world. They want to share their ideas, their thought process, and their conclusions with others. They thrive on interacting with other people. People who prefer introversion, however, are most comfortable inside their head, dealing with their ideas, thoughts, and conclusions mentally, sharing only key points with the others. Neither introversion nor extraversion is inherently good or bad; they are just different, and you need to adjust your communication style in a way that acknowledges other people's preferences.

Remember this: If you don't know what an Extravert (E) is thinking, you haven't been listening. On the other hand, if you don't know what an Introvert (I) is thinking, you haven't asked.

If, on the basis of your Myers–Briggs personality type, you prefer extraversion, you cannot assume that others have incomplete or incorrect thoughts because they do not share those thoughts with you.

Vet-ebooks.com

You may, however, need to draw them out by asking specific questions or encouraging others to share their ideas.

On the other hand, if your personality type prefers introversion, try not to be annoyed with others who tell you more than you want to know. What sounds like babbling to you may simply be their way of working through a problem and reaching a conclusion. To do that comfortably, they need to share the process with you.

Watch your team interacting during staff meetings. Some are more vocal than others and you likely know their thoughts on the current discussion topic. But you will get different (and valuable) viewpoints by asking the "quieter" members for their thoughts.

SENSING (S) VERSUS INTUITION (N)

This scale can be the most difficult preference to identify. You will need good powers of observation to determine how best to give information to any one person. Again, do not rely on some generic definition of "sensing" or "intuition" to define this characteristic. In Myers–Briggs terms, this relates to the way we prefer to perceive or take in information.

- Do you rely on your five senses – what you see, hear, touch, taste, or smell – or do you rely on some sixth sense that allows you to see the big picture, not just the details? Sensors (S), or people who prefer sensing, pay attention to facts and details and are most persuaded by information they can see or hear. They tend to focus on the present: what is happening now. Intuitives (N), or people who prefer intuition, look for the connections, the underlying meaning, and the implications of a situation. They look past the details and are comfortable trusting their intuition and their instincts to correctly interpret the situation. These are "big picture" people who get bored with the details of ordinary life.
- Imagine looking at a photograph of a person standing by a car in front of a mountain range. The Sensor (S) would likely focus on the person and the car, whereas the panorama in the background would be secondary. An Intuitive (N) would take in the larger picture instantly and would likely focus on the panorama first, with the identity of the person and the car being secondarily important. A Sensor (S) would ask who is the person and what kind of car is he driving? An Intuitive (N) would wonder what a person with a car is doing at that location.
- Sensors (S) are gifted at accumulating and organizing data and at finding new applications for something that has already been invented. Because they are comfortable relying on facts from their own or others' experience, they can spot inconsistencies or discrepancies that merit further investigation. Intuitives (N) can be very creative, as they think in terms of possibilities and require less empirical proof to believe something is possible.

How does this affect you? What's your preference? If your staff wants to get you to make a decision, do they bring you facts and figures to support their position or do they ask you to focus on the results of implementing that decision? They likely have learned already whether you need facts and figures before making a decision (you are a Sensor [S]) or whether you are more likely to focus on the possibilities and ignore their supporting data (you are an Intuitive [N]).

The same is true when you need someone else to make a decision. Giving facts and details to Intuitives (N) is likely to bore them and make it difficult for them to act on your request. They need to know how that decision will impact other systems within the hospital or whether it will create new problems because of the interrelationships within the clinic. Likewise, asking Sensors (S) to make a decision without giving them all the relevant facts creates stress and may make them feel as though you are setting them up for failure. Without seeing or hearing the details and the facts that are the underpinnings of that decision, a Sensor (S) will be uncomfortable making any decision. He or she simply does not have enough information.

THINKING (T) VERSUS FEELING (F)

This preference has to do with how we make decisions and come to conclusions, but it does not imply that Thinkers (T) are heartless or that Feelers (F) are illogical. Each of us is more comfortable making decisions by relying on one of these two frameworks. People who prefer thinking (T) make decisions by analyzing the information related to the decision. They tend to be objective, weighing the information they have received, and making decisions on the basis of a logical thought process. On the other hand, people who prefer feeling (F) make decisions on the basis of a more personal, subjective set of values. They are concerned with the impact on people (i.e., what is pleasing, harmonious, supportive, and respectful of others).

- In your own environment do you make decisions more objectively, analyzing the pros and the cons (a Thinker [T]) or do you rely on what effect your decision will have on others (a Feeler [F])?
- Thinkers (T) derive great satisfaction from analyzing situations logically and objectively, and they are more comfortable making the tough decisions that are sometimes required in business. Feelers (F), on the other hand, thrive on harmony and will go out of their way to please other people. They are attuned to other's needs and feelings. The author's unscientific observations over many years suggest that there is a disproportionately large number of Feelers (F) in veterinary medicine compared with the general population. That is not surprising in view of the care and compassion that are critical for veterinarians and for the profession overall, but it may also help explain why veterinarians have trouble charging for the true value of their services (they don't want to displease the client).

Thinkers (T) are often drawn to careers that allow them to use their analytical skills, and in veterinary medicine Thinkers (T) are frequently attracted to the diagnostic element (the puzzle) of their jobs. Some even enjoy the business side of owning and operating a practice. Feelers (F) are often attracted to careers in service industries. Feelers (F) are very focused on the compassionate side of practice, whether dealing with animals, their owners, or the practice's employees.

Thinkers (T) are sometimes viewed by Feelers (F) as being cold and calculating, because they make decisions based on analysis and logic, with people issues representing only one factor to be considered. Thinkers (T) may say that Feelers (F) are too emotional, because they focus on the impact of their decisions on people and systems, not the facts or the analysis of the underlying data. Thinkers (T) also say that Feelers (F) take everything personally, so Thinkers (T) find it hard to train Feelers (F) or evaluate their performance without emotions getting in the way.

JUDGER (J) VERSUS PERCEIVER (P)

This factor describes the way we like to organize our world: planning it or winging it. The terms themselves are awkward because Judgers (J) are not necessarily judgmental and Perceivers (P) are not necessarily more perceptive than anyone else. Focus instead on the difference between a planned versus an unstructured lifestyle. This is one of the easiest traits to observe if you know what to look for – the clues will be all around you.

- Judgers (J) like to come to closure – that is, make a decision and move on. They like meetings to be structured, to start and end on time, and they tend to keep "to do" lists, deriving great satisfaction from crossing things off the list. Perceivers (P) enjoy the process of getting information and exploring possibilities. They enjoy brainstorming sessions and they like to keep their options open. They tend to take pleasure in starting a project, but not necessarily in finishing it.
- Judgers (J) prefer to work in organized workspaces, keep their work areas tidy, and enjoy working on one project at a time. Perceivers (P) are more comfortable dealing with multiple tasks and their workspaces look like nests – everything close at hand but generally untidy.

Vet-eBooks.com

1.15. Personality Profiling

• Judgers (J) have a keen sense of time, arrive at functions promptly, and have little patience with people who are late. Perceivers (P) are mostly oblivious to time, tend to be perennially late, and forget to go home when they are engrossed in a case or a project.
• Judgers (J) like to be in control in most situations and will step into leadership in order to make something happen. They frequently see choices as black or white, right or wrong. Perceivers (P) can have strong opinions, but tend to see situations in terms of shades of gray with lots of choices. They are flexible and stay open to other possibilities that might come up along the way.

Keep in mind that Judgers (J) are uncomfortable until a decision is made and Perceivers (P) are uncomfortable about rushing to a decision. Also, Judgers (J) and Perceivers (P) who share a workspace can experience lots of stress, because the Judger (J) wants it tidy and organized and the Perceiver (P) wants everything close at hand, placing much less value on having everything in its place. Understanding this basic difference among people allows both Perceivers (P) and Judgers (J) to become more tolerant when sharing a workspace (such as doctors' offices).

THE IMPLICATIONS OF MYERS–BRIGGS PERSONALITY TYPES IN A VETERINARY PRACTICE

• Consider personality types before assigning job responsibilities. Putting people into the wrong tasks forces them to work in awkward and stressful situations.
• Promoting a good technician who is an Intuitive (N) to an Office Manager position may not work for the employee or for the practice. Big picture people can become frustrated dealing with lots of detail.
• Conflicts among employees can often be traced to differences in personality types. If employees understand the basic types of differences, they are more likely to respect and tolerate these differences.
• If you're an Extravert (E), do you actually seek out the opinions of the Introverts (I) on your staff, or do you assume that if they had anything to say, they would speak up? The reality is that they may have lots of ideas that they have never voiced under the scrutiny of the entire staff in staff meetings.
• If you are a Thinker (T), you might find it useful to try ideas or changes in policy out on a Feeler (F) in your life to see if there are hidden messages that might inadvertently offend your staff. For example, leaving memos in people's boxes about even routine matters may seem cold or a "sneak attack" to a Feeler (F), even though you find the process routine and time-efficient.
• Over time, practices can develop a distinct personality as the owner hires people who are similar in personality type to his or her own. This is easy to do, because we are all most comfortable with people who think and act like we do, and we tend to hire them because they will "fit in well." However, research shows that the most effective work teams find strength in the differences among their members. The conflict that arises as your staff deals with issues and opportunities through their different filters can be very healthy, and that conflict can ensure that you will not miss a problem or pass up an opportunity that you and your staff truly could not see.
• The noted management guru Tom Peters advocates "taking a freak to lunch." What he means is that we should not always associate comfortably with people who think like we do and who work in environments like ours. We need to get out of our box by associating with people who are significantly different: different in age, background, career, culture, etc. – people who can help us see the world through different eyes. When's the last time you took a freak to lunch?
• Your clients may come from many walks of life, and they likely represent all 16 personality types. How much do you actually modify your communication style to accommodate those differences? Do you take a "one-size-fits-all" approach? If so, you are likely not reaching some of your clients as well as you could.
• With the current focus on compliance – that is, how well do clients take our advice and follow our recommendations – personality types take on increased importance. If the client did not follow your advice because you did not acknowledge his or her differences and tailor your approach accordingly, who is really to blame? Handing a list of postoperative instructions to an Intuitive (N), for example, might not lead to postoperative action. However, explaining how the follow-up enhances the effectiveness of the surgery itself and then going over the actual instructions verbally might give the person "the big picture." You may think it is obvious to read and implement the instructions you hand out, but does your client?

HOW MIGHT YOU INTRODUCE THE USE OF PERSONALITY TYPES IN YOUR HOSPITAL?

Even if the theory and concept of personality types intrigue you, there are some significant steps that need to be taken to use these concepts well. When first introduced to the MBTI, most people find it interesting but not necessarily useful. That is because it requires the user to learn new concepts and become conversant in the language and theory that underlie the instrument itself. People who attend seminars may have a hard time remembering their own four-letter type (ISTP, for example) after only a few days. Even if they remember their own type, they may still struggle to remember what the letters stand for and what preference each letter suggests. Therefore, consider taking the following actions:
• Because the actual MBTI instrument can only be administered by someone who has been qualified to do so, alternative ways of indicating MBTI types have been developed. Suggest, but do not require, that each staff member take an abbreviated version developed by David Keirsey called the Keirsey Temperament Sorter II, available in his book, *Please Understand Me II* (see the Recommended Reading list), or online at www.Keirsey.com. Both the licensed MBTI and Keirsey's sorter are designed only to suggest what a person's personality type may be. When reading the descriptions of the 16 types, people can generally recognize themselves in one or two of the descriptions, which likely will be the type suggested for each by the sorter. By having each staff person identify his or her type, there is a common base of knowledge established at the same time so that no one will feel excluded. Do not pressure a team member who refuses to take the test – some people feel threatened by the entire process at first – just continue to include them in the discussions as though they had used the sorter. In almost all cases, they will self-select their type from the discussions that follow. Similarly, no one should be required to disclose their suggested type to anyone else, unless they choose to do so. Most people will readily share the results of their sorter experience, but there should be no stigma against anyone who hesitates to do so. Sooner or later they will understand that the way we each behave every day gives clues to our type, so there is really no secret to be kept.
• Suggest that each person make an effort to remember his or her own four-letter type and be able to explain what each of the four letters represents. Some practices even suggest that staff members wear their type on a temporary name tag as the team members learn more about types. This is a great way to learn to recognize common behaviors for each type. It is also a great conversation starter with clients who are knowledgeable about personality types.
• Consider having a five-minute discussion at each staff meeting as a team member describes an experience (in or out of the clinic) where personality types were observable. This increases each person's awareness of the clues we all give as to how we are most comfortable in our daily environment.
• Also at staff meetings, encourage team members to incorporate personality theory into discussions about problems, issues, difficult client situations, etc. By learning to recognize personality types in action, each person can improve communication skills with clients and

Vet-ebooks.com

other staff members by tailoring the communication style and approach to fit the recipient, not the sender.

Over time, dividing up projects or assigning tasks gets easier as the group learns to capitalize on people's individual strengths. If the inventory needs to be counted, a Sensor (S) will be less intimidated by the detail than an Intuitive (N). If someone is needed to speak at a school about careers in veterinary medicine, an Extravert (E) is likely to be less intimidated by the process than an Introvert (I), although each could do the job well.

1.16. VALUE DISCIPLINES

BASICS

OVERVIEW

• The concept of value disciplines was first introduced by Treacy and Wiersema in the *Harvard Business Review* in the early 1990s.[1]
• Value disciplines describe three different paths management may take to deliver value to their customers. Businesses that strive for market leadership focus efforts on one value discipline.
• The three value disciplines are: operational excellence, product leadership, and customer intimacy:
  ◦ Businesses that excel in operational excellence deliver quality products and services efficiently and at low costs.
  ◦ Businesses that excel in customer intimacy develop in-depth relationships with their customers and deliver products and services geared to a specific customer's desires.
  ◦ Businesses that excel in product leadership deliver innovative products and services to their customers.
• To compete and survive, a business must meet minimum standards in each of the value disciplines. To become a market leader, however, a business must go beyond minimum standards and excel in the delivery of one of the value disciplines. They must create superior customer value in the chosen value discipline.
• Businesses that strive only for minimal standards in all value disciplines will achieve only mediocre success.
• Businesses that try to excel at all three value disciplines will find themselves unfocused and unable to deliver their products and services in a competitive manner.
• Businesses that meet the minimum standards of all three value disciplines and excel in one value discipline become market leaders according to Treacy and Wiersema.
• In the past, clients judged value by quality and price. Today's clients judge value by much more – convenience, dependability, service, communication, and so forth.

TERMS DEFINED

Discipline: A branch of knowledge.
Value: Determined by what is important, desirable, and useful to clients.
Value Disciplines: Three ways businesses deliver superior value to their customers – operational excellence, customer intimacy, and product leadership.

ISSUES AND OPTIONS

• To be even remotely competitive, businesses must meet minimum performance standards in each of the value disciplines. Businesses that strive only to meet the minimum acceptable standards of value expected from clients in each of the value disciplines will be capable of only average or mediocre levels of performance (see 9.6 – Value-Added Analysis).
• Businesses that subscribe to the value disciplines philosophy become market leaders because they provide value to their clients well above the minimum acceptable standards in one of the value disciplines. Market leaders outperform their competitors in the chosen discipline, and remain competent in the other two dimensions.
• Managers must understand that minimum acceptable standards are constantly being raised by clients. Efforts must be made to continually meet the minimum standards of the future, which will always be higher than they are today. Likewise, a client's perception of superior value today will be the minimum standard of the future. A market leadership position requires management to continually strive for improvements in superior value to exceed the needs and expectations of clients in the future.
• Management on a path to market leadership must align the total organization to the chosen value discipline. Resources, processes, and systems must all revolve around the delivery of superior value within the value discipline category. The value disciplines model guides management in developing internal processes, systems, and organizational structure.
• Maintaining market leadership requires a continuous effort. There is no room for complacency once you have achieved a market leadership position.

THE THREE VALUE DISCIPLINES

Operational Excellence

• As the name suggests, this value discipline involves a value proposition to customers that emphasizes operational excellence. The focus is on processes and low costs; however, quality is not sacrificed to achieve low costs. In today's business environment, quality is a given. Under no circumstances is poor quality acceptable to consumers.
• Businesses that excel in operational excellence do not cater to the individual preferences of their clients; they cater to the masses.
• They are convenient and they are reliable.
• Processes are redesigned and technology is used to enhance operational excellence. All processes throughout the organization are targeted. Examples include client payments, supplier transactions, etc.
• Management applies continuous improvements to the processes, resulting in a steady stream of increased efficiencies.
• The focus of staff training is on operational efficiencies.
• Management strives to monitor performance to control costs and improve service quality.
• Operational excellence may be achieved by limiting the number of products and services offered to the customer or client.

Product Leadership

• Businesses that pursue a product leadership strategy possess the necessary knowledge and skills for product and service innovation, commercialization, and market exploitation.
• Constant innovation results in product leadership.
• Businesses embrace new technology.
• The time it takes to take a new product or service from concept to commercialization is minimized.
• Organizations that follow this path to delivering superior value to their customers and clients are risk takers. They are willing to cannibalize their own current product and service sales to bring the new product or service to market.
• Competitors' products and services become obsolete.
• Businesses operating within this value discipline recognize that customers need to be educated on the use and benefits of new products and services.
• Innovative products and services push normal performance boundaries.
• Employees are encouraged to develop new product and service offerings.

Customer Intimacy

• Businesses in this category cater to the individualized needs of each client; they do not cater to the masses.
• Clients are loyal because employees build strong interpersonal relationships with them – employees know specific details about each client.
• Employees are empowered to use creativity in meeting the demands of individual clients.
• Services are customized to specific customers (see 4.8 – Pet-Specific Care).
• Businesses in this category understand and anticipate customer needs (sometimes before the customer realizes their needs).
• Clients are willing to pay for individualized services.

Vet-eBooks.com

• Businesses generally offer a broad range of products and services to meet the needs of their clients.
• Organizations excelling in customer intimacy look at each client transaction in terms of the client's lifetime value to the business (see 4.9 – Lifelong Excellence in Healthcare).

EXAMPLES

EXAMPLE 1: OPERATIONAL EXCELLENCE

Spay/neuter clinics are an excellent example of clinics specializing in operational excellence. The following are possible characteristics of a clinic that excels in operational excellence:
• Practice policies that state no client will wait more than five minutes for an appointment, phones will be answered by the third ring, and clients will not be put on hold for more than one minute.
• Appointments are run on schedule 90% of the time; general care appointments are scheduled for no longer than 20 minutes each.
• In a general practice, complicated cases are referred to other, specialized, practices. Wellness exams that uncover a nonemergency medical problem are offered another appointment time in which to address the medical issue.
• Inventory levels are geared toward just-in-time delivery. When a product is purchased, technology is in place to automatically order a replacement product from suppliers.
• Clients rely on consistent services.
• Management tracks daily the number of appointments seen per hour, client waiting times, and so forth.
• Management is obsessed with the continuous improvement of processes and always implements changes to enhance the efficiency of the process.

EXAMPLE 2: PRODUCT LEADERSHIP

Practices operating in this value discipline were the first to offer high-end hotel-like boarding facilities, and the first to offer web cameras in their boarding facilities. They were among the first practices to have ultrasound machines, digital radiography, and the like.

What might the future bring – perhaps a mobile treatment administration service for those hard-to-medicate animals?

EXAMPLE 3: CUSTOMER INTIMACY

A clinic that excels in customer intimacy may display the following characteristics:
• Employees become familiar with clients on a personal and sincere level.
• When a client enters the practice for an appointment, all employees are able to refer to the client and pet by name. They are also familiar with the other pets owned by the client, including their gender and their health status.
• Employees can refer to personal notes regarding the client and are able to sincerely ask pertinent questions regarding the last European tour, the latest grandchild, and so on.
• When Mr. Smith asks Dr. Jones to view "Buffy's" unusual behavior in the home environment, Dr. Smith willingly complies.
• On critically ill patients, the hospital offers hourly updates for clients 24 hours a day. The hospital also allows clients to stay in-hospital with their critically ill animals.
• Employees do not evaluate a $10 transaction with a client any differently than a $1,500 transaction, because each client and patient is viewed in terms of their lifetime value to the clinic.

CAUTIONS

Practices must meet minimum standards in all three value disciplines to survive. The bar is constantly being raised in the delivery of value to clients. Practices must continually provide innovative and superior value to their customers to be competitive.

MISCELLANEOUS

It is possible for businesses to excel in the delivery of more than one value discipline. This creates a significant competitive advantage for the business. It is not recommended that a practice attempt to excel in more than one value discipline at a time. One value discipline should be mastered before attempting to master another while maintaining minimum standards in the third value discipline.

1.17. PRACTICE MANAGEMENT SUPPORT PROFESSIONALS

BASICS

OVERVIEW

Veterinarians know how important their internal support staff are to the operation and success of their clinics. Practices function with a team of receptionists, technicians/nurses, assistants, managers, and so forth. Each grouping of support staff brings an essential and different set of skills to the practice. The hospital team must work efficiently and effectively together to deliver quality services to the animal-owning public.

To achieve their practice potential, veterinarians also need an external group of management support professionals. Each group of support professionals will bring a different set of skills to the practice. Management support professionals working together can produce results for practices that would otherwise be unattainable.

Veterinarians use the services of consultants for three general reasons:

- When they recognize they lack the expertise within the clinic setting to address some of the issues that arise while operating a veterinary business. Consultants can offer their expertise in areas where the clinic lacks the expertise.
- Because their hospital personnel do not have adequate time to devote to problem-solving or enhancing business potential. The expertise may exist in-house, but employees are too busy with day-to-day operations.
- Because management recognizes the benefits of receiving unbiased third-party opinions, analysis, and recommendations. In many cases, an outside opinion (even if it is the same) can serve to motivate the practice to new levels of performance and facilitate the resolution of problems.

TERMS DEFINED

Management Support Professionals: Individuals or teams with specific expertise in practice management, accounting, law, and other business-related disciplines that apply their skills to the betterment of veterinary practices.

ISSUES AND OPTIONS

- The practice team – composed of veterinarians, technicians/nurses, receptionists, managers, and assistants – is actively engaged in the day-to-day operations of veterinary practice. Periodically, practices will require additional human resources and skills to address business issues and concerns.
- Employees may be asked to devote their time and effort to these issues and concerns, but there are many circumstances under which the knowledge and skills of the in-hospital team are insufficient to meet the needs of the organization. If an employee is called upon to fulfill these additional roles, their day-to-day schedules will be disrupted and the practice operations will ultimately suffer. Additional resources should be sought from outside the organization, while the in-hospital team should be allowed to focus on its daily work. Consultants are able to fill the knowledge and skill gaps.
- The in-hospital teams can often benefit from the views and opinions of an objective outsider. A management consultant can provide insight into problems that may not be apparent to hospital members because they are too busy and often too close to the situation. New ideas and new approaches can breathe life into a stagnant hospital environment and provide motivation for staff to achieve new goals.
- Veterinarians should develop an external network of professionals to support their business from a different management perspective other than day-to-day management. The team should be similar to the in-hospital team, in that each team player should bring a different set of skills to the table. In addition, the external team should work together for the benefit of the practice.
- Consultants can be hired to deal with a specific project, but they can also be hired to provide ongoing support to the management of a veterinary practice.
- There has been a trend toward increased use of consultants in the business world. This trend is likely to continue. Businesses are reaping benefits of improved performance and flexibility by outsourcing work

Vet-eBooks.com

1.17. PRACTICE MANAGEMENT SUPPORT PROFESSIONALS

to individuals or organizations with specialized knowledge, skills, and expertise. Consultants allow businesses to become more effective without having to establish long-term commitments.

- Practices that form a network of alliances with management support professionals will be well positioned to survive and thrive in an increasingly competitive business environment.

THE EXTERNAL TEAM

The external team consists of a varied group of individuals. Some individuals will be generalists and provide practices with a broad range of services, whereas others may provide in-depth services regarding a specialty area. A specific consultant may operate as a sole provider, whereas others are part of a large group of consultants. The following is a partial list of some of the services that are offered by consultants.

Legal

Veterinarians use the services of attorneys for many reasons (see 13.1 – Veterinary Practice Legal Practice Needs and Dealing with Attorneys), including but not limited to:

- Developing and reviewing partnership agreements and buy and sell agreements
- Developing and reviewing employee agreements and noncompete clauses
- Employment law
- Advice regarding tax law
- Incorporating a business and other issues involving corporate structure
- Malpractice prevention and defense
- Purchase and sale of veterinary practices, real estate transactions, and mergers and acquisitions
- Estate planning, including wills and trusts.

Financial and Accounting

The advice provided by financial consultants (see 7.4 – Getting the Most out of your Accounting Professional), including but not limited to the following, will depend on the individuals' qualifications and expertise:

- Financial statement preparation
- Tax preparation and tax planning
- Financial analysis, projections, and management reports
- Feasibility analysis
- Budgeting and cash flow
- Strategic planning
- Purchase and sale of veterinary practices
- Mergers and acquisitions
- Financial planning
- Estate planning
- Financing.

Human Resources

Experts in human resource management generally consult veterinarians in the following areas (depending on their qualifications and experience):

- Employee recruitment, employee retention, employee turnover, and termination
- Organizational behavior, change management, and conflict resolution
- Employee compensation and benefits
- Performance measurement
- Training and development, communication
- Policy and procedures
- Employment law.

Marketing

Marketing professionals provide information on the following:

- Marketing plans (branding, advertising, websites, brochures, newsletters, and so forth)
- Marketing implementation
- Market research (demographics, client service levels, and so forth)
- Public relations.

Practice Valuations

Consultants generally provide practice valuations (see 14.13 – Determining a Practice's Worth) for the following reasons:

- Purchase and/or sale of a practice
- Mergers
- Legal divorce involving a partner
- Practice management – benchmarking and goal setting.

Vet-ebooks.com

1.17. PRACTICE MANAGEMENT SUPPORT PROFESSIONALS

Other

- Practice start-up services
- Strategic planning
- Operations management (inventory control)
- Succession planning
- Architectural services
- Mediation, negotiation
- Leadership development.

Note: These lists are not meant to be all-inclusive. There are many other services that are provided by support professionals in the veterinary industry.

LOCATING A MANAGEMENT SUPPORT PROFESSIONAL

Many practices use local management support professionals who may adequately meet the practice's needs. However, support professionals familiar with the veterinary industry that can provide expertise may be unavailable at the local level. There are several ways to locate a management support professional with veterinary industry expertise:

- **Word-of-mouth** referrals from colleagues.
- **Published authors:** Many consultants provide content to various veterinary management books, magazines, newsletters, websites, and so forth.
- **Speakers:** Management support professionals can be found delivering lectures at national, state/provincial, or regional continuing education meetings.
- **Professional associations:** National, state or provincial, and regional associations may be able to provide a list of possible candidates. Specialty associations are also valuable resources.

A particularly noteworthy specialty association is VetPartners™ (www.VetPartners.org). This group consists of individuals with expertise in day-to-day operations, accounting and tax, finance, law, human resources, architecture, marketing, practice valuation, succession planning, and so on. VetPartners promotes excellence and ethics in veterinary management consulting and advising. Members of VetPartners are bound by a code of ethics and professional conduct. This is not a certifying body, and membership in this group does not imply specialty training, although many members have sought specialty training and certification elsewhere. Members are categorized by the following specialty categories: General Practice Management, Human Resource Management, Speaking/Presenting, Practice Valuations, Brokers, Mergers, Strategic/Succession Planning, Accounting and Tax Related Services, Financial Planning Services, Marketing/Media, Legal and Regulatory Compliance, Architects and Related Services, Education, and Industry.

EXAMPLES

CHOOSING A VETERINARY MANAGEMENT SUPPORT PROFESSIONAL

Management support professionals can have a significant impact on your practice performance. Veterinarians should choose their management support professionals carefully:

- Step 1. Develop the scope and objectives of the project:
  - Identify issues, problems, or symptoms as you see them.
  - Outline the budget, timelines, and so on.
- Step 2. Develop your expectations of the consultants:
  - Desired achievements
  - Performance measures
  - Communication – to whom and when.
- Step 3. Develop criteria for potential candidates based on the scope of the project and your expectations. Do you need:
  - A generalist?
  - A specialist?
  - A certified person with qualifications in a specific area?
  - An experienced consultant in a certain area?
  - A consultant located within a certain geographic area?
  - Someone who provides advice or implements it?
  - Someone within a certain budget range?
  - An individual or firm familiar with the veterinary industry?
  - Someone who will get along with your hospital staff?
  - Determine which of these criteria are the most important.
- Step 4. Search for potential candidates and compare your criteria against the candidate.
- Step 5. Select two or three candidates (individuals or firms) to submit proposals.

Vet-ebooks.com

1.17. PRACTICE MANAGEMENT SUPPORT PROFESSIONALS

- Step 6. Evaluate proposals and conduct reference checks.
- Step 7. Choose the candidate and enter into a written contract.

A written contract should be used to ensure expectations are understood and met. The contract should include the objectives of the project, timelines, budget, fee structure, deliverables, and so forth. Keep in mind that some projects evolve over time and it may be necessary to re-establish a new contract with different objectives, budgets, and so on.

CAUTIONS

N/A

MISCELLANEOUS

DEALING WITH THE CONSULTANT

- Veterinarians must be open to the advice and solutions offered by consultants. Do not assume you know the underlying problem or solution to your problem.
- If you are considering the services of a large business with multiple consultants, communicate with the consultant assigned to your hospital.
- An excellent way to test a potential relationship with a consultant is to begin with a small project. Alternatively, if you have a large project, divide the project into sections, with the understanding that further progress will be made only upon successful completion of the first section.

1.18. STAKEHOLDERS AND STRATEGIC PARTNERS

BASICS

OVERVIEW

• Veterinarians are not alone in their quest to deliver value to clients. Additional stakeholders in the animal health industry include pharmaceutical companies, manufacturers, distributors, laboratories, referral and emergency practices, breeders, groomers, boarding facilities, pet stores, and other pet-related businesses.
• These stakeholders can be strategic partners if veterinarians work cooperatively to deliver excellence in pet care (see 9.6 – Value-Added Analysis).
• Strategic partnerships and alliances have become more numerous in all business environments, and the animal health industry is no exception. These cooperative efforts allow the participants to operate more efficiently and effectively than if they operated alone.
• Veterinarians who pursue cooperative efforts with other industry stakeholders may be at an advantage over veterinarians who do not.
• Veterinarians should strive to develop long-term relationships with industry stakeholders and move away from purely transactional relationships where products and services are bought and sold with dialog occurring only in relation to price.
• Cost is frequently the focus of most, if not all, veterinary communications and interactions with suppliers. This focus is narrow-minded. It prevents veterinarians from generating their true revenue potential and delivering quality services to clients. Veterinarians working with other strategic partners are often better able to deliver more value to clients.
• Interactions between two businesses are not about creating a winner and a loser. The goal in today's business environment is to create win–win relationships among all players, building long-term trust.
• Veterinarians who pursue such relationships will prosper over those veterinarians who do not.

TERMS DEFINED

Stakeholder: An individual or a group with an interest in a particular business; the individual or group has something at risk (at stake).
Strategic Partnerships and Alliances: A relationship between businesses in which the parties work cooperatively in a business effort to achieve shared goals. The scope of a strategic partnership or alliance can range from an informal business relationship based on verbal commitment to a more formal contractual relationship such as a joint venture.

ISSUES AND OPTIONS

PARTNERSHIPS

• Partnerships involve collaborative agreements under which the parties involved share business goals, risks, benefits, responsibilities, and resources such as knowledge and expertise, capital, technology, services, products, and markets.
• Competitive advantage can be gained by accessing the resources of a partner. Businesses should concentrate on their own core competencies and partner with other organizations in other areas.
• Partnerships often result in products and services that otherwise would be unavailable if either party operated on their own.
• Collaborative agreements between businesses allow the parties involved to grow and operate more efficiently.
• Strategic alliances are formed to minimize risk while maximizing business rewards.

THE ENVIRONMENT

• Today's business environment is characterized by businesses that collaborate and build long-term relationships using win–win strategies with all stakeholders, including competitors. Businesses that have a "go it alone" strategy will find it increasingly difficult to grow and be competitive.
• Strategic partnerships and alliances are present in every industry sector. Implemented and managed correctly, they are proving to be the drivers of superior growth.
• The animal health industry is no exception when it comes to strategic partnering and cooperative business efforts. It is more common than not to find alliances among the industry's players. There are literally hundreds of these types of cooperative efforts in the animal health industry.
• The advantages that many large firms have gained through strategic partnering can be experienced by smaller businesses as well.
• Veterinarians should make efforts to align their businesses with other stakeholders in the industry. Relationships with stakeholders should move away from interactions that are purely transactional in nature (buy–sell) to long-term, relationship-based interactions.
• Veterinarians can gain more from their industry partners than the "deal of the week" if they work cooperatively to achieve their strategic goals in a trusting long-term relationship. The result should be a win–win situation for all parties involved.

BENEFITS

• Strategic partnerships can increase revenues, reduce costs, improve profitability and quality of services.
• A strategic partnership or alliance can be made with suppliers, distributors, competitors, and customers and other businesses related to the industry. The partnership can take many forms including:
  ◦ joint marketing, promotion, merchandising, and sales,
  ◦ pooled purchasing efforts,
  ◦ distribution partnerships,
  ◦ technology licenses and partnerships,
  ◦ outsourcing agreements,
  ◦ product research,
  ◦ product development,
  ◦ inventory management.

THE PARTNERSHIP PROCESS

• For as many partnership arrangements that succeed, there are equally as many partnerships that do not succeed. Partnerships should be developed and managed with care.
• The key to a successful partnership is largely based on partner selection. Partnerships can be formed between businesses of significantly different sizes. The success of a partnership can be improved by having clearly defined goals, objectives, and expectations, and the goals and strategic objectives should be shared by both businesses. Negotiations should result in a win–win situation for both parties involved.
• The partnership can be phased in over time and can begin with a pilot project that builds trust between the partners. Select a project that meets the needs of both partners then determine the resources necessary to complete the project. Evaluate the strengths and weaknesses of both partners and compare to the resources required. Develop strong interpersonal relationships based on trust and respect.

Vet-ebooks.com

1.18. STAKEHOLDERS AND STRATEGIC PARTNERS

EXAMPLES

DISTRIBUTOR/MANUFACTURER/POOLING PARTNERSHIPS

• ABC Veterinary Hospital plans to increase clinic revenue over the next 3–5 years by 25%. They believe dental services are underutilized by clients. The practice possesses the clinical expertise to deliver these services, but lacks the resources to effectively market its services to clients. The practice hopes to select a partner with whom they currently have a good working relationship. The selected partner, which could be a single manufacturer or a trusted distributor, should benefit from the cooperative efforts and should possess the resources the clinic lacks – for example, marketing and sales. The practice realized that it would be necessary to establish a long-term relationship with the company over time if it were to expect such support. If the potential partner is a distributor and currently the practice uses more than one distributor, some type of future commitment to the partner either formally or informally would be indicated.
• The partner might agree to conduct several in-clinic seminars to educate the practice staff on marketing and selling dentistry services.
• One should be innovative and creative when discussing how the businesses can work together to achieve their goals. Discuss the possibility of a direct mail campaign to the clients, with financial support and marketing material from the partner. Perhaps marketing material supplied by vendors can be personalized to the clinic, or client educational material that does not currently exist can be created.
• Pooling partnership: The above partnership can be further enhanced if the clinic joins forces with other clinics in the area to increase the use of quality dental services. The benefits to the industry partner would be greater, as would the potential to develop more innovative marketing and selling techniques with participating clinics. For example, your industry partner may be interested in supporting a local radio announcement promoting dental health week, geriatric wellness, and so forth.

CAUTIONS

In some industry circles, veterinarians have a reputation for not living up to their agreements with industry members. Do not enter into such an agreement unless you are committed to upholding your end of the deal.

MISCELLANEOUS

There are many reasons why veterinarians may choose to partner with industry, including but not limited to the following:

• **Staff training:** Veterinarians realize the importance of staff training, which can be an expensive pursuit. Onsite and online staff training to support the sale of products and services is provided by many industry suppliers. An educated staff is better able to educate clients, and educated clients are more likely to make the right decisions regarding the health of their animals. Assess your staff training needs and determine if a suitable and willing industry partner has the resources to fulfill your needs.
• **Client education:** A significant function that veterinarians perform on a daily basis is client education. Industry stakeholders realize the importance of this role in the veterinary practice. Communication tools, including posters, brochures, client handouts, and animal models, are but a few of the resources made available to veterinarians for client educational purposes. Be innovative in approaching industry members with needs not currently being met in this area.
• **Community support:** Veterinarians can partner with one another and their industry stakeholders to support their local community (humane societies and so forth). Build such support into your long-term plans with your industry partner(s). For example, industry partners may be interested in supporting the administration and marketing of these events to the community. Perhaps they would be willing to donate a sign or contribute financially to an advertisement announcing the event.
• **Veterinary community team approach:** Support could be provided in several ways. Veterinarians within the same community can join forces and organize an educational seminar for pet owners, and industry partners could help offset the cost of organizing the event. Financial support could, for example, help cover the costs of advertising and renting a location for the event, and client education materials could be supplied free of charge. Industry partners who would see a return on this investment would make excellent partnership candidates.
• **Pooling partnerships:** Corporate practices have a distinct advantage over independent practices in their cooperative negotiations with industry stakeholders. This is based on the volume that business corporate practices generate for stakeholders; costs associated with a sale to one entity are dramatically reduced. Independent practices could organize themselves into their own small buying group, because the buying power of even three hospitals is greater than one.

1.19. IMPORTANCE OF THE HUMAN–ANIMAL BOND

BASICS

OVERVIEW

• The relationship between owners and companion animals is complex. There is a growing body of research into the human–animal bond (HAB) that shows that interaction with pets results in positive outcomes for humans and the animals. Human physical and psychological health can be improved by a healthy bond with companion animals.
• The HAB affects owner perceptions of the health of their pets and the decisions they make regarding treatment. The bond may affect lifestyle decisions by owners such as where they choose to live, the work they do, where they take their holidays, friendships and other significant relationships. The HAB may also affect an owner's decision to obtain or retain a pet.
• Understanding how the bond is expressed and how it affects owner decisions can aid veterinary practices to provide the kind of care they want while avoiding compassion fatigue.

TERMS DEFINED

Compassion Fatigue: Also known as Secondary Traumatic Stress Disorder, Compassion Fatigue is the gradual loss of compassion by people who work with individuals that are ill, suffering, or victims of trauma. This includes veterinary staff working with worried clients with sick or injured animals. Signs include indifference, disengagement, withdrawal from patients and coworkers, and even physical signs relating to chronic stress.
Human–Animal Bond: The relationship between humans and animals. The relationship is measurable from the human side but not well understood from the animal's perspective.

ISSUES AND OPTIONS

ISSUES

• The HAB is a measurable, multi-factorial construct. Research has identified two factors – owner attachment and owner commitment to the pet – that affect animal health decisions.
• Highly attached owners consider their pet to be a family member, whereas poorly attached owners are more likely to consider the pet to be a thing. The remainder of owners fall between the two extremes.
• Owner attachment affects owner ratings of their sick dog's health. Highly attached owners rate their sick dogs as less sick than less attached owners with sick dogs.[1] This can be an issue if owner attachment is preventing them seeking or agreeing to appropriate treatment for their pet.
• Highly attached owners who see their pet as a family member are often more willing to accept financial burdens. Less attached owners are more likely to take a reasoned approach to the costs of treating their pet's health problems.
• Expression of the bond varies with individuals. An owner's personality, family history with pets, attitudes to animals, and the perceived beliefs of their social group and social norms may all affect their experience and expression of the bond.
• The HAB is fragile. It is most prone to fracturing when owners have high expectations of their relationship with their pet that are not met because the pet shows undesirable behaviors. The level of a dog owner's reported satisfaction with their pet is highly influenced by the dog's tendency to be friendly and relaxed in the home and in public. In Western countries a significant cause of relinquishment of dogs to shelters is due to behavior. Annoying behaviors such as being boisterous or destructive and dangerous behaviors such as aggression are frequently given as reasons for surrendering dogs.
• The decision to relinquish a pet is emotionally painful for owners. It is not known how fracture of the HAB affects the animal. Anecdotal evidence suggests that it may have serious effects for the animal and may affect future bonds formed with people.
• Highly attached owners may find it difficult to cope with the loss of a pet. Studies have shown that for some the experience is similar to the loss of a spouse or child.
• The HAB plays an important role in community health and attitudes to animals. This role can be positive, with owners of pets finding their pets provide unconditional positive regard and companionship and help facilitate social interactions between the owner and other people. Pet owners are also less likely to access human health services and more likely to survive major life crises such as heart attacks or loss of a spouse.
• The HAB can also have negative effects for communities. Attached and committed owners are less likely to evacuate during natural disasters. If unable to take their pets with them, people in abusive relationships may delay leaving and seeking help. The large numbers of pets relinquished to animal shelters every year due to fracture of the HAB create community problems in caring for, rehoming, or euthanizing unwanted pets. Noise from dogs and cats, feces left in public places, aggression by dogs to people and other animals, and cruelty and neglect of animals are all community issues that stem from the HAB.

OPTIONS: METHODS OF ENABLING THE BOND

In the Veterinary Clinic

• Veterinary staff can facilitate healthy bonds between humans and pets and support the bond through all stages of the animal's life.
• Staff training about the HAB can make each staff member aware of their own feelings and attitudes about animals and how this may affect their interactions with clients.
• The most obvious way to support the HAB is for all staff to show interest in the animals treated in the clinic. Friendly staff who admire and interact with the patients meet owner expectations that their pet is important.
• Displays of photos of new pets to the clinic and existing pets meeting treatment milestones or weight-loss goals support the HAB by celebrating the individual pets. These can also be posted to social media sites (with owner permission) to help build a community that celebrates the HAB.
• Encourage staff to interact with pets in the hospital and to offer treats where appropriate. Train staff about normal greeting behavior of the animals treated so they know when to approach and when animals are asking to be left alone.
• Celebrate the bond staff members have with their own pets through photos of staff with their pets displayed in the clinic, on the clinic website, social media posts, and in newsletters.
• Genuine caring matches owner expectations better than marketing gimmicks. If sending birthday cards and letters addressed to your patients feels right for you and your clientele then do this.
• Facilitation of the bond is done through education of clients about the needs of companion animals throughout their life stages. The needs of a puppy or kitten are different from the needs of the geriatric pet.
• Emphasis should be placed on educating clients about normal behavior across the life stages of the pet. The HAB may fail if the animal's behavior does not meet owner expectations. For example, discussing boisterousness and offering strategies such as games, training, and toys that owners can use may help them manage (and enjoy) this time of their pet's life.
• Well-run puppy classes and kitten classes (and bird classes) hosted by trained staff means owners get the right information about their new

Vet-ebooks.com

pets and gives them a contact person and forum where they can ask questions.
• Providing this information in other formats such as on social media posts, newsletters, and in-house seminars helps remind clients about what is normal for animals kept as pets and encourages them to contact the clinic if they have questions.

In the Consult Room

• Take time to allow the animal to become familiar with the consult room. Gentle, friendly handling with minimal restraint is preferable.
• Low-stress, force-free, fear-free handling techniques all aim to minimize stress on the patient while in the clinic (see 4.14 – Developing a Fear-Free Hospital). Programs and accreditation are available and become a point of difference for your practice.
• Matching your approach to the client's level of attachment gives a better chance of them agreeing to treatment. This may mean presenting treatment recommendations concentrating on quality of life and pain relief with some clients while with others it may be more about expected outcomes versus costs.
• Ask about behavior at every consultation. Normal behavior that is challenging for the client can be managed by qualified dog trainers. Problem behaviors may need referral to a veterinary behaviorist. Remember, undesirable behavior is a leading cause of relinquishment and loss of the pet from the clinic.
• How you manage the ending of an animal's life can make a lasting impression on clients. Strategies for minimizing the stress of euthanasia for the animal and clients may include: a room dedicated for euthanasia, offering home euthanasia and body removal, and placing catheters before the procedure to allow clients to hold their pet.
• Palliative-care and pain-relief protocols for animals are improving all the time. In some instances, these can give attached owners more time with their pet and help the owner prepare for the end. If the animal's welfare can be maintained, consider offering these options for patients.
• The decision to euthanize is difficult. Strongly attached owners may struggle with making the decision in a timely fashion for their pet. Discussing the quality of life may help.
• Offering burial or cremations services with high-quality urns or mementos can be a fitting final celebration of the HAB between an attached client and their pet.
• Strongly attached owners may find the loss of a pet very traumatic. Build a relationship with local grief counsellors and refer grieving pet owners to minimize strain on staff.
• Some clients find it hard to return to clinics where a beloved pet was euthanized. Consider offering in-home euthanasia or using a pet euthanasia service for these clients.
• Encourage debriefing after stressful events to allow all staff involved to discuss events and be part of formulating future management plans.

EXAMPLES

• Clinics running puppy classes often find that clients become more bonded to the practice and call with questions about their puppy's health and care.
• My personal experience is that asking about behavior during all vaccination and health checks identifies animals with storm phobias and separation anxiety, which means that treatment options can be discussed with the owners.

CAUTIONS

• Compassion fatigue can come about in veterinary clinics when staff are dealing with highly attached pet owners who need extra attention to help them cope with sick pets, dying pets, or recently deceased pets.
• Compassion fatigue can also occur when staff are interacting with clients whose attachment levels are very different from their own beliefs and attitudes about the HAB. Education of staff about the HAB and how it varies with different people can help staff accept owner decisions and minimize staff stress.
• As companion animals are more highly valued, negative treatment outcomes may be less tolerated by some owners, leading to litigation. Care should be taken to cover the risks associated with treatments in writing and have the owner sign the form in all cases. Adequate professional insurance is also a necessity.

1.20. MERGERS AND ACQUISITIONS

BASICS

OVERVIEW

• Mergers and acquisitions are becoming more commonplace in veterinary practices today.
• With a large number of Baby Boomers nearing retirement age, the number of practices potentially for sale is increasing substantially.
• The number of veterinarians graduating and entering the workforce is increasing at a faster rate than the number retiring.
• The large numbers of graduates entering the workforce are bringing with them large student loans. The median veterinary student's debt load in 2016 was a little more than $167,534, with over 20% of the graduates being at least $200,000 in debt.
• The large pool of eligible buyers of these practices is substantial, yet there are circumstances making it difficult for the sales to occur. These include:
  ◦ student debt,
  ◦ some potential buyers seeing ownership as being too risky,
  ◦ disillusionment with the profession and people leaving the ranks of clinical medicine,
  ◦ difficulty in deciding upon a fair value for the practice.
• The pet population is flat or slightly decreasing in the United States, whereas the number of veterinarians is growing larger and at a much faster rate. As a result, practices may be seeing the number of new clients or patients entering the practices remaining static, or even decreasing.
• Asking prices for the best practices are making it difficult for some potential buyers to acquire adequate financing.

TERMS DEFINED

Acquisition: The act of one entity acquiring control of another entity.
Capital Gains: The difference between an asset's purchase price and selling price, when the selling price is greater.
Merger: The act of several practices combining operations to create an economy of scale (reducing expenses) and improving the growth potential of the new entity.

ISSUES AND OPTIONS

PRACTICE VALUATION

• A value for the practice needs to be determined (see 14.13 – Determining a Practice's Worth). There are many methodologies for determining value, but two seem to be the most commonly used in veterinary medicine. These are variations of the income approach.
  ◦ **Excess Earnings Method**: In this methodology the balance sheet is restated at a fair-market value followed by calculating the probable future earnings of the practice. A reasonable return on the net tangible assets (i.e., equipment, inventory) is subtracted from the probable future earnings, resulting in excess earnings attributable to the intangible assets (goodwill). The excess earnings are capitalized to determine the value of the intangibles, and then the adjusted book value of the tangible assets is added to arrive at a value for the practice.
  ◦ **Single Period Capitalization Method**: This model normalizes the net cash flow (NCF) of the practice for the previous 3–5 years, with more emphasis on the most current year (or two). The NCF, plus an anticipated growth for the next year out, is calculated and a capitalization is determined that, when divided into the benefit stream (NCF plus anticipated growth), equals the value of an ongoing entity.
• The capitalization rate is an indicator of the risk involved in investing in a certain practice. The capitalization rate should vary based on pertinent risk factors specific to the veterinary profession and to the practice.
• Transactions are either as an equity sale or an asset sale.
  ◦ An **equity sale** means an individual sells his or her share of the business to the buyer who, in turn, assumes both the assets and liabilities of the seller. A seller who owns a C-corporation would prefer this type of sale in order to take advantage of the capital gains tax. A buyer may think twice about an equity sale knowing they will acquire both the assets as well as the liabilities (disclosed and undisclosed) of the practice as a whole.
  ◦ An **asset sale** is one where the buyer purchases the practice's assets without assuming stock or any liabilities from the seller. The buyer would prefer this type of sale because now they have assets they can depreciate (and they can take advantage of Section 179). The seller does not like it because they will be paying taxes at higher rates (as ordinary income).
• There are ways that both the seller and buyer can gain some tax advantage. Check with your tax advisors on the best strategy if you are a seller or buyer. The tax laws change on a regular basis and to achieve the best strategy you should contact your tax attorney or accountant.

MERGERS

• Mergers are occurring more frequently in the profession as practices of similar culture or ones who can expand their service offerings are merging to improve on economies of scale.
• In some cases, the practices are closing locations and working out of a single location. This location could be a new, modern facility or one of the merged practice sites.
• A newer model called a "group without walls" is being utilized. In this scenario:
  ◦ the owners form a new practice to gain the economies of scale while maintaining their own locations;
  ◦ certain tasks (bookkeeping, inventory issues, management services) are centralized, which leaves the autonomy of each practice and the ability to refer to one another for specialized services without losing clients or revenue;
  ◦ equipment purchases can be controlled without duplication. Instead of each practice having an ultrasound, one could be purchased and placed in one of the practices.

ACQUISITIONS

• Acquisitions are the most common form of transfer of practices.
• They may be either an internal purchase (associate buy-in) or from external buyers. External buyers are either veterinarians or corporations.

SPECIAL ISSUES: DUE DILIGENCE

Acquiring a practice is a huge financial investment for the buyer. It is of the utmost importance that, by the closing, the buyers and their advisors are comfortable with all aspects of the sale. This is referred to as due diligence.

The documents to be evaluated prior to acquiring the practice as an asset sale include the following. The list is not meant to be complete, but is instead a sampling.
• All reports, applications, and significant correspondence filed with, and transcripts of any significant proceedings before, any state or federal regulatory agency and/or self-regulatory authority, including without limitation the EPA, EEOC, DEA, applicable state department of human rights, OSHA, state veterinary board, and all current governmental permits and licenses issued to the practice.
• All federal and state income tax returns filed by the practice for the most recent period and as far back as readily available (at least three years), and all communications between the practice and the Internal Revenue Service, including notices of assessment and reports of

Vet-ebooks.com

revenue agents, with respect to matters raised by the IRS in the course of any audits.
• The most recent year's property tax (real, personal, and intangible) and returns or invoices.
• Copies of all current federal, state, and local business licenses; qualifications and all correspondence relating to such licenses for the practice, including all information regarding any actual, pending, or threatened suspension or termination of such licenses or qualifications.
• Income statement, balance sheet, notes, and accountants' report for the practice prepared by the practice's certified public accountants for the past three years.
• Year-to-date income statement and balance sheet for the current year.
• Listing of all fixed assets such as equipment, furniture, fixtures, and so forth, including original cost, accumulated depreciation, net book value, location, and serial numbers (if readily available).
• Revenue breakdown reports by month for the most recent accounting year and by service type for the most recent accounting year.
• All invoices, day sheets, appointment books, practice management system (PMS) computer reports, or other documents supporting the revenue and expenses reported on the practice's tax returns for the past five years.
• All leases of any amount of equipment and personal property to which the practice is party, either as lessor or lessee.
• All insurance policies providing coverage to the practice, including all workers' compensation and liability policies issued and all pending insurance claims. This should include the following insurance policies:
  ◦ Property
  ◦ General Liability
  ◦ Umbrella
  ◦ Workers Compensation (including a workers' compensation "loss runs" claims summary from insurers covering the last five-year period)
  ◦ Professional liability
  ◦ Disability
  ◦ Health (including a copy of the last insurance billing detailing which amounts were paid by the practice and which by each employee)
  ◦ Disability (including a copy of the last insurance billing detailing which amounts were paid by the practice and which by each employee).
• All employment agreements, including commission agreements and termination agreements, and material consulting agreements to which the practice is party.
• All personnel policies and procedure manuals, including the employee handbook, safety manual, and new employee orientation material.
• A schedule describing the number of employees in the practice, together with current payroll information, including a copy of the last payroll run; a report of the payroll year-to-date by class code (i.e., totals for veterinary and for nonveterinary employees); and any information on general policies regarding vacation, sick, personal, holiday, and other time off, including current accruals for each employee.
• Names of all employees bound by noncompete agreements and copies of such agreements.
• All employee personnel files including W-4s, I-9s, and state new-hire reporting documents.
• Any environmental audits or other reports relating to the properties owned or occupied by the practice at any time, not otherwise provided.
• Any other documents or information that should be considered and reviewed in making disclosures regarding the business and financial condition of the practice to prospective investors.

EXAMPLES

N/A

CAUTIONS

• Acquisitions or mergers consume a lot of energy, money, and time. Because of that, make sure you understand the process.
• Spend the money to have a feasibility analysis done to start with, before making an informed offer.
• Create a team of advisors to assist in acquiring the best practice at the best price with good terms.
• Do (or have your advisors do) a due diligence inventory to make sure there are no hindrances to an opportunity to succeed.

1.21. CORPORATE VETERINARY PRACTICES

BASICS

OVERVIEW

Historically, veterinary hospitals have been privately owned by one or more veterinarians. When the owners wished to retire, they typically sold their hospitals to younger associates or other local veterinarians and the businesses remained locally owned. The advent of the "corporate" practice, one owned and managed by a group of investors rather than one or more private veterinarians or managers, has changed the landscape of veterinary medicine, both for the professionals within the industry and for the pet-owning public.

TERMS DEFINED

Corporate Practice: A veterinary hospital owned and managed by a group of investors, rather than by private veterinarians.
Economies of Scale: The cost advantages an organization gains through expansion, or more simply doing things efficiently. Common economies of scale involve purchasing, managerial knowledge, and finance.
Profitability: The revenue for a practice once all expenses are paid, a fair-market facility rent is paid, and the owner is compensated at a rate similar to what employees in the same position are paid.

ISSUES AND OPTIONS

While the corporate ownership environment in the United States began with Banfield, VCA, NVA, and VetCor, the landscape has changed dramatically in the last few years. Many consolidators have entered the market, some eventually selling to one of the original four, others planning to do so at some point in the future. Still others have stated intentions of remaining in the industry for the long haul. With dozens of consolidators in the market, a tremendous amount of variation exists.

Some of the corporate groups have years of experience in the veterinary industry whereas others, particularly the newer corporate consolidators, have little to no prior experience in veterinary medicine. These groups are focused on the financial investment and the opportunity for a strong return on that investment. They will own veterinary hospitals until a more lucrative investment opportunity presents itself. Many consolidators are formed with the purpose of acquiring enough practices to draw the interest and attention of a major financial player. Once that cadre of practices is collected, the entire group is sold to a larger consolidator.

Corporate veterinary organizations realize economies of scale only after acquiring high numbers of practices. The consolidators can realize cost savings and increased profitability by centralizing administrative activities such as bookkeeping and payroll for all the practices they own. In addition, consolidators realize cost savings through economies of scale. When they buy for dozens, even hundreds of hospitals, they have the power to negotiate lower prices on everything from health insurance to paper towels to pharmaceuticals.

Corporate ownership of veterinary practices can streamline operations and improve profitability, while still focusing on the quality of care and practice culture. Although "celebrity" practices may command a premium, in general these corporate players pay a fair-market price for each hospital they acquire. Typical targets are hospitals with at least three doctors, a minimum of $1.5 million in gross fees, and moderate to high levels of profitability.

A highly profitable, well-run veterinary practice is attractive to investors because little needs to be done to maintain the revenue stream. Due to the level of competition for these practices, some newer groups have different selection criteria for practices they acquire. For example, they may target lower grossing hospitals, those in a specific geographic location, or those with lower levels of profitability. Some consolidators focus on practices that treat one or more specific species, while others purchase veterinary emergency or specialty practices. These variations allow owners of hospitals that may not meet the historical criteria required to interest one of the biggest corporate players to have the option to consider a corporate sale also. This option may be particularly attractive to owners when the practice has no associate (employed) veterinarians, or the associates are not interested in buying.

The differentiation among consolidators does not end there. Some consolidators allow veterinarians to retain a minority ownership in the hospital. This partnership allows veterinarians to experience the financial benefits of ownership without carrying the burden of the management of the business. The veterinarian may participate in business decisions, but cannot control those decisions.

A second way some consolidators differentiate themselves is by offering a percentage of the management company, the corporation itself, to the hospital owners. Instead of partnering with ownership on the practice level, these consolidators offer a stake in the corporate's parent company. Generally, a percentage of the proceeds from the practice sale are converted to shares in the parent company. There is a maximum allowable percentage of the sale that can be converted to equity in the parent company. Although the sellers no longer hold ownership interests in the veterinary hospital, they become minority shareholders in the holding company. As such, they are eligible to receive dividends for as long as they own shares, provided the holding company pays dividends. When the holding company subsequently is sold to a larger player, the former practice owners receive a proportionate share of the proceeds.

Selling to a corporate can be a good option for many veterinarians (see 7.27 – Selling to a Corporate Entity). It is important to understand, however, that the seller may be required to continue to work in the practice for several years after the sale. The length of that agreement is highly dependent on the size of the business, the number of other doctors working in the practice, and the ease of hiring another veterinarian to replace the revenue generated by the seller.

The sale of a veterinary practice to a corporate player may provide many potential benefits to the selling veterinarians as well as the doctors and staff who work for them. Benefits may include the following:

- A buyer for Baby Boomer hospital owners when associate veterinarians are not interested in ownership.
- In some instances, a higher purchase price than a private veterinarian can afford due to the availability of money. However, in many cases, the sales price is similar to that of a sale to an individual.
- A faster closing process than with a private buyer, due to established protocols, dedicated staff, and standardized contracts.
- Work-life balance for owners faced with both practice and personal time demands.
- Sometimes a minority ownership position for veterinarians. This would allow veterinarians to be among the beneficiaries of the financial return generated by the hospital.
- Professional management practices.
- Expanded employee benefits, particularly for nonveterinarians.
- Opportunities for career growth for both veterinarians and nonveterinarian employees.

While corporate practice ownership offers many benefits, there are common concerns with these sales, including the following:

- The quality of medicine. One of the greatest concerns when veterinary hospitals attract diverse and multiple consolidators is whether the quality of patient care will suffer in practices that are not owned by veterinarians.

Vet-ebooks.com

1.21. Corporate Veterinary Practices

• Decisions about medical care will be based on profit, not patient needs. State veterinary acts require that decisions related to medical care are made by a veterinarian, not by a business person.
• Profit-driven companies are changing pet owners' opinions of the veterinary profession for the worse.
• Poor client service.
• Fewer opportunities for veterinarians to own hospitals due to the competition from corporate buyers.
• Difficulty competing for associates and staff when a corporate practice can provide substantial employee benefits.
• Concerns over the private hospital's ability to compete against businesses with huge marketing budgets and their ability to drive down prices to pet owners through economies of scale.

While no broad conclusions can be made, it is clear that corporate veterinary practices will be part of the profession for many years. Given the number of consolidators buying hospitals as well as the diversity of practices targeted, many hospital owners will have the opportunity to consider a corporate sale. However, given the independent nature of veterinarians as a whole, a large number of hospitals will likely remain in the hands of doctors.

1.22. NOT-FOR-PROFIT VETERINARY HOSPITALS

BASICS

OVERVIEW

Not-for-profit, or nonprofit, hospitals face many of the same challenges as for-profit hospitals, including managing the most expensive aspects of operating a veterinary hospital – payroll and overheads.

TERMS DEFINED

Endowment: A fund, usually in the form of an income-generating investment, established to provide long-term support for an organization.

Inurement: Inappropriate benefit of a private person or company from a charitable organization.

Means Test: A determination as to whether an individual, family or group has the ability to pay for services without assistance (i.e., literally do they have the financial means to afford care without being subsidized).

Nonprofit: An entity that is not conceived for the purposes of earning a profit, but rather to serve a public good.

Not-for-Profit: Any activity that is conducted without purposes of earning a profit. Often used interchangeably with nonprofit.

ISSUES AND OPTIONS

UNDERSTANDING NONPROFITS

- Nonprofit veterinary hospitals are typically set up to fulfill a specific purpose such as:
  - meeting the needs of an indigent population that could not otherwise afford veterinary care;
  - performing sterilization procedures;
  - treating non-owned species such as wildlife.
- To qualify for nonprofit status in the United States, an organization must be approved by the IRS and adhere to specific requirements and limitations imposed on its activities by Congress (see 2.29 – Not-for-Profit Foundations). A nonprofit is not prohibited from making a profit (known as a surplus in the nonprofit world), but there are limitations on how the money can be made and the purposes for which it can be used. In general, to get tax-exempt status, a business must serve a certain tax-exempt purpose, which might be to reduce the population of unwanted pets by offering low-cost neutering, or offering veterinary services at low prices to low-income pet owners.[1] Means testing to determine eligibility is recommended when possible.
- Similarly, most full-time workers at nonprofit veterinary hospitals are not volunteers. They tend to earn salaries commensurate with their abilities, because the nonprofits must compete with for-profits for the same labor force. Similarly, managers of nonprofit hospitals, both human and veterinary, tend to be well compensated. Once recognized as a nonprofit organization, the enterprise is exempt from paying taxes that for-profit businesses pay.
- It is important to realize that nonprofit status does not always imply that charitable work is being done. A group of animal fanciers can be registered as being a nonprofit without performing any charitable work. Similarly, not all nonprofits are capable of accepting tax-deductible donations. This is restricted to charities described in Section 501(c)(3) of the Internal Revenue Code, and to a few other categories. Exempt organizations that solicit contributions that are not deductible charitable contributions are obliged to indicate to donors that such contributions will not be tax deductible. Donors can check with the IRS to determine if a tax-exempt organization has been recognized as being able to receive tax-deductible contributions, or to request copies of its three most recent information returns, including the Form 990 series (which provides a detailed breakdown of an organization's revenues and expenses, including compensation paid to executives and outside individuals and to companies that do business with the organization), its exemption letter, and its approved application with supporting documentation. This series is often

Vet-eBooks.com

1.22. Not-For-Profit Veterinary Hospitals

available on Internet sites of organizations soliciting tax-deductible contributions. Information about donors is excluded from public inspection, except for donors to private foundations and political organizations.

- In many nonprofits, earned income from goods and services is playing an increasingly important role in ensuring funds are available for continued operations. Even then, in most cases, earned income accounts for only a small share of funding, and few of the ventures actually attempt to make money for their organizations. In fact, nonprofits can easily misjudge the actual financial benefits of their earned income ventures.
- The Financial Accounting Standards Board (FASB) sets nonprofit rules requiring that all contributions to nonprofits be reported as revenues, and that distinction is made between unrestricted and legally restricted contributions. Restricted contributions, both temporary and permanent, designate the specific purpose for which the donation was intended. Unrestricted contributions are those that have not been specifically restricted by the donor and include contributions for operating purposes (such as an annual fund drive).
- Earnings of invested endowment principal are called endowment revenues, and most nonprofits use a spending rate (typically about 5% of the market value of the endowment) for operating expenses. Spending significantly more than this could affect the long-term sustainability of the organization.
- The Balance Sheet of for-profit businesses has three major categories: Assets, Liabilities, and Owner's Equity. In the nonprofits, Owner's Equity is replaced by Net Assets, which in turn is subdivided into three classes: Permanently Restricted Net Assets, Temporarily Restricted Net Assets, and Unrestricted Net Assets.

CHALLENGES TO THE NONPROFIT SECTOR

- The major challenge to nonprofit veterinary hospitals is often sustainability of services. These hospitals face the same challenges related to expenses (especially payroll and overheads) as do for-profit veterinary hospitals, but rarely have the same revenue base and often do not cultivate the same long-term client relationships.
- Nonprofit veterinary hospitals should be operated on a cost-recovery basis, wherein revenues should closely mirror costs (and not consume large shares of endowment revenues), but it is not unusual that a portion of the nonprofit's endowment be used to help meet operational costs.

RIFTS BETWEEN FOR-PROFIT AND NONPROFIT HOSPITALS

- Occasionally, there has been potential for rifts to develop between the for-profits and nonprofits, often over competitive issues. This is most likely to occur when there is direct competition for the same client base but unequal treatment between the two in terms of taxation. There is often a discussion about the "community benefit" of nonprofit hospitals as one of the main reasons for their tax-exempt status, and in an ideal scenario, the clients visiting the nonprofit and those visiting the for-profit should be different.
- If nonprofits only treated patients whose owners could not otherwise afford veterinary care, there would be little cause for concern. The main issue for most for-profit hospitals occurs when nonprofit hospitals treat patients of clients who are not needy, and may charge amounts comparable to the for-profits, but then have no tax obligation. From the nonprofit perspective, full-paying clients may be one of the only ways to offset services for clients unable to pay.

PEACEFUL COEXISTENCE

- Veterinary medicine is probably best advised not to take lessons from the human hospital sector, in which there is often considerable animosity between nonprofit and for-profit hospitals, legal challenges to the nonprofit activities of hospitals, and questions about continued tax-exempt status.[2] Most nonprofit veterinary hospitals are performing valuable services, and the point of conflict typically represents a minority of clients and services.
- Nonprofits everywhere are facing difficult times and continued pressures. Funding is often shrinking as consumers' discretionary funds are stretched thinner and there are more and more appeals for charitable giving from different organizations. On the other hand, requests for services from nonprofits have never been greater. In many cases, there needs to be extensive fundraising efforts and expenses to help keep nonprofits afloat. Most nonprofits have a dedicated Development Department that is staffed for the sole purpose of raising funds for the organization.
- There are many opportunities in veterinary medicine to bypass those problems seen in the human hospital sector and work together for mutual benefit. This is possible as long as the nonprofits and the for-profits respect each other's missions and legal requirements for nonprofit activities. The most important concerns are for inurement and private benefit. Inurement occurs when an individual or company

Vet-ebooks.com

1.22. NOT-FOR-PROFIT VETERINARY HOSPITALS

with a personal interest in the tax-exempt organization acquires economic gain through the use of funds or assets of that exempt organization. Private benefit occurs in transactions with the tax-exempt organization in which benefits favor private rather than public interest. The important aspect is that there is nothing prohibiting the fair interaction of for-profits and nonprofits as long as reasonable compensation at fair-market values is exchanged and that the compensation arrangement is consistent with the tax-exempt purpose of the organization.

- There are many exciting opportunities for the interaction of nonprofits and for-profits in the veterinary field:
  - Nonprofits, especially shelters, can be a key stream of newly adopted pets entering a community, which can provide new clients to for-profit veterinary hospitals.
  - Nonprofits can operate as teaching hospitals and referral centers.
  - Nonprofits may act as "incubators" for the advanced clinical training of students and new veterinary graduates.
  - Nonprofit hospitals may have for-profit clinical departments.
  - Nonprofit agencies may outsource for-profit veterinary services.
  - Nonprofit referral-only hospitals may be supported by area for-profit hospitals.

EXAMPLES

MNO Animal Friends operates a shelter and adoption facility and has a small veterinary clinic to care for its animals. A donor has made a contribution of a 20,000 square-foot (1,858 square meters) building, which the organization has gratefully accepted. They considered expanding their veterinary hospital operations, and discussed the matter with their consultant. The consultant evaluated the options and other possibilities, such as creating a state-of-the-art "rehoming center" for its adoptions and outsourcing veterinary operations to for-profit veterinary entities, including several specialists. The premise was to develop the facility as an animal care center, have the specialists pay for the build-out of their specific space, and charge fair-market rent to the for-profits on long-term leases. Other than fair-market rent, there was no revenue sharing with the nonprofit.

Rather than offering their own veterinary services, the consultant contacted the regional veterinary association on behalf of the nonprofit and made arrangements for volunteers from the association to offer veterinary services and to treat animals in the adoption areas as part of their own contributions to the community and part of a well-received public relations campaign. Other volunteers were solicited from the community to socialize and train the animals and to make sure they were suitable to be placed in loving homes. The nonprofit, which had continually operated at a loss when it ran its own veterinary hospital, was functioning at a surplus and able to commit more resources to its core mission, thus supporting the human–animal bond. Area veterinarians were happy that there were no more conflicts with the services being offered, and they could control, as a group, the extent of services being offered. The specialists, who owed their allegiance to primary care practitioners in the area, were happy to practice out of a location that was so warmly supported by the general veterinary population.

CAUTIONS

Nonprofits can be slow to respond to circumstances because they have a more cumbersome bureaucracy than most private veterinary hospitals. There is typically a board of directors that meets periodically

Vet-ebooks.com

to discuss organizational matters, and an executive director dealing with day-to-day operations of the nonprofit. With an existing hospital, there might also be a hospital administrator and possibly a chief of staff/medical director as well. Accordingly, although changes do occur at nonprofits, they might not occur as quickly as in similarly sized for-profit hospitals.

1.23. House-Call and Mobile Practices

BASICS

OVERVIEW

House-call and mobile practices are an increasingly popular means of practicing veterinary medicine. They appeal to clients who value their convenience, and provide a great alternative for patients who find the clinic experience unacceptably stressful or whose health or physical constraints make transportation difficult. They also appeal to veterinarians who enjoy the opportunity to develop deeper bonds with their clients and patients, expand their client reach, own their own business for less capital investment than would be required for a clinic, and to work under more flexible schedules. Practicing medicine in a house-call or mobile practice setting is generally comparable to doing so in a stationary clinic, with a few logistical exceptions.

TERMS DEFINED

Ambulatory Practice: Generally used to refer to work with large animals and involves operating out of a vehicle, with or without additional equipment such as a portable ultrasound, x-ray unit, or dental equipment.
House-Call Fee (or Trip Fee): An additional fee added to an invoice to reflect the veterinarian traveling to the client.
House-Call Practice: A veterinary practice operated from a vehicle, where services are provided at a client's residence or place of business.
Mobile Practice: Used to encompass house-call and ambulatory practices, in which examinations and procedures take place inside the mobile unit, which may be equipped with an examination table, dental equipment, and/or a surgical suite.
Partner Clinic: A full-service veterinary practice to which a mobile practice may be affiliated.
Stationary Practice: A traditional "bricks and mortar" veterinary practice, as compared to a mobile practice.
Travel Surcharge: An additional fee added to an invoice to reflect travel-related expenses of the visit.

ISSUES AND OPTIONS

SERVICE PROVISION

• **Pharmacy:** Options include dispensing medication at the appointment, calling in prescriptions to a veterinary, human, or compounding pharmacy, handwriting prescriptions, or online pharmacies.
• **Diagnostic sampling:** Blood samples may be processed using an onsite machine or sent to an independent laboratory. Independent laboratories can collect samples from your office, home, or partner clinic. Some also offer mail-in options. You can analyze cytology and fecal samples using a portable microscope or use one at a different location.
• **Euthanasia and disposal:** Bodies may be buried onsite or collected by a cremation company from the client's home, a partner clinic, or a freezer.
• **Dentals and surgeries:** These may be performed onsite if using a mobile or ambulatory practice, or referred to a partner clinic.
• **Imaging:** Portable ultrasound and x-ray units can be a great option for mobile practices, and can either be purchased upfront or leased. Alternatively, cases can be referred to a partner clinic.
• **Technician assistance:** Technicians (nurses) can help offer a broader array of services such as blood testing, increase the efficiency of appointments, and perform their own appointments, such as for blood draws and vaccines, depending on your state's regulations.

MEDICAL RECORD AND PRACTICE MANAGEMENT SYSTEM

• When choosing a medical record system bear in mind that paper records or cloud-based software are preferable to desktop software, as they permit use on the go. Blockchain can offer other possibilities for record-sharing as well (see 10.9 – Blockchain).
• Appointment schedules may be set manually or through the use of booking software. You should consider how well your scheduling system integrates with the medical record system so that client and patient details can be efficiently accessed in the field.
• Appointment bookings may be taken in person, over the phone, via email, or via a web form or booking software associated with the practice website. Responsiveness is key: many clients will go elsewhere if their requests are not answered in a timely manner, especially for same-day appointments. Many sole practitioners choose to book their own appointments as they enjoy the opportunity to interact directly with clients. The downsides to this approach are that this takes up time that could be otherwise spent performing appointments, and can lead to unrealistic client expectations about your availability and willingness to provide free advice over the phone. More efficient alternatives include outsourcing the booking and triage process to an assistant or third-party operations provider.
• Route optimization is an important feature of mobile practice. Travel time, distance, and traffic conditions can significantly reduce the efficiency of your day. Routing may be coordinated manually on the fly, or by using booking software designed for mobile practices.
• Your practice management system should allow you to effectively arrange recheck appointments and provide clients with vaccine certificates and copies of medical records.
• Obtaining patients' previous medical records is particularly important for a new business: some practice management software automates these requests to save you from needing to manually call clinics.
• Billing options include paying by cash, check, credit card (in person or online), or bank transfer. You will need to consider whether to require a deposit at the time of booking; payment at the time of service; invoicing; and/or payments in installments.
• Inventory ordering can be done manually or through integration with your practice management software. Bulk ordering offers the benefits of discounts, whereas "just-in-time" ordering minimizes the amount of capital you have tied up as unused assets.

ECONOMICS

• Your business's profit will be the result of your revenue minus the total costs of performing your appointments and running the business.
• Your revenue is a function of the volume of appointments that you see over a given time period and the amount that you charge for each appointment. You should also consider charging for time spent outside of appointments, such as conversing with clients over the phone and email.
• Your case-load will be influenced by how far you are willing to travel for appointments, traffic conditions, how many multi-pet appointments you see, and the duration of each examination.
• Your appointment prices can be set on a cost-basis or community-basis, or combination of the two (see 7.12 – Pricing Strategies). Cost-based pricing involves calculating how much it costs for you to provide your services, and adding a markup to ensure that you make a profit. Community-based costing involves basing your prices on the kinds of prices offered by comparable services. An example of a combination would be to consider how much a blood test costs you, marking up that price so that you make an appropriate profit, and then making sure that that price is comparable to what your competitors offer.
• Costs include the "cost of goods sold" (COGS) and business overhead. Examples of COGS include the cost of your disposables (e.g., syringes and diagnostic aids); the cost of supplies that you will

Vet-eBooks.com

1.23. House-Call and Mobile Practices

sell (e.g., diets and medication); and assistants/technicians, if you are paying them on an appointment basis. Business overhead costs include salaries, administrative expenses, utilities, advertising, and your vehicle. You may wish to pass some costs on to clients such as mileage and fuel fees as a travel surcharge.

SAFETY

- **Client safety:** Clients are often a lot more involved in examinations than in a clinic setting. This brings them into closer proximity with their animals, who may behave unpredictably in their home environment. You can be held liable for any client injury that occurs in your presence (see 12.3 – Client Safety).
- **Patient safety:** Examples of restraint options include gentle handling techniques,[1] cat restraint bags, muzzles, scruffing, and burrito wraps. Some veterinarians choose to use sedation on fractious patients or in lieu of an assistant. It is a good idea to carry endotracheal (ET) tubes, laryngoscopes, Ambu bags, and a crash cart containing fluids, epinephrine, dexamethasone, and diphenhydramine, and to have clients sign a consent form in case of negative outcomes. Some states require these measures for all mobile veterinarians (e.g., in the event of allergic reactions from vaccinations).
- **Veterinarian safety:** Injuries can be more common for veterinarians who work unassisted or who feel pressured to get the job done in clients' presence. Home visits to new clients bring additional personal safety concerns, which may be mitigated by performing background checks, bringing an assistant, and ensuring others know of your whereabouts at all times.

LEGAL CONSIDERATIONS

- Practice registration: State Veterinary Medical Associations/Licensing Boards can provide advice on their specific requirements for the licensing and registration of house-call and mobile practices.
- You may choose to incorporate your business, for example by establishing a Limited Liability Company (LLC), Limited Liability Partnership (LLP), or operating as a sole practitioner. Some states have specific requirements for incorporation.
- All practicing veterinarians will need a valid state veterinary license. You will need a Drug Enforcement Administration (DEA) license if you plan to prescribe and/or administer controlled substances, and a Department of Agriculture (USDA) license if you plan to issue travel certificates.
- Information about prescription requirements for controlled drugs can be found on the DEA website.[2]
- You are also required to meet Occupational Safety and Health Administration (OSHA) standards and provide worker's compensation if you have employees.
- The American Veterinary Medical Association Professional Liability Insurance Trust (AVMA PLIT) is a good resource for determining medical liability insurance options.

EXAMPLES

- **Small animal house-call and mobile practices:** Services may include wellness exams, hospice care, euthanasia, ear, eye, and skin checks, minor procedures, sedated procedures, x-rays and ultrasounds. Mobile practices may also offer dentals and soft tissue surgeries.
- **Ambulatory services:** Services may include wellness exams, herd health, lameness, skin and intestinal issues, dentals, and surgeries.
- **Specialty services:** These may operate out of a mobile practice or within a partner clinic, and include radiology, dentistry, anesthesia and surgery, internal medicine and cardiology.
- **Exotics:** Mobile settings may prove less stressful and allow the veterinarian to examine the environment and husbandry.
- **Discount vaccine clinics:** These generally offer basic wellness exams, vaccinations, heartworm, and fecal tests out of a mobile unit. These are normally reduced-cost, high-volume affairs.
- **Holistic:** These may provide alternative services such as acupuncture, therapeutic laser treatments, and Chinese medicine.

CAUTIONS

- Mobile practice requires more pre-appointment preparation to ensure that you have the resources you need to effectively execute your appointment. You should develop contingency plans for issues such as bad weather, illness, or vehicle breakdown.
- Working independently can also feel more isolating and it is important to maintain contact with peers through career development courses, online forums, and use of specialist consultants.
- As you are not a full-service clinic, it is important to appropriately manage client expectations about the limitations of what you can perform and provide arrangements for supplemental patient care at referral and emergency clinics.

1.24. HOSPICE AND PALLIATIVE CARE

BASICS

OVERVIEW

• Animal hospice has its origins in human hospice philosophy and focuses on the palliation of a terminally ill patient's pain and physical symptoms while attending to social and emotional needs as end of life nears (see Figures 1-24-1 and 1-24-2).
• Animal hospice and palliative care (HPC) seeks to maximize comfort and minimize suffering for the pet patient.
• When the healthcare team and caregiver recognize that death is a likely outcome, entering the pet into a hospice care program can allow the veterinary team and client to develop a collaborative plan for the time between that recognition and the pet's death.
• In addition to the needs of the pet, HPC focuses on addressing the needs of the caregiver as well, helping them prepare for the death of their pet and offering a collaborative and supportive partnership during the end of life (EOL) journey.
• HPC enables the veterinary team to fully support the human–animal bond (see 1.19 – Importance of the Human–Animal Bond).
• For optimal patient and client care, HPC should be implemented at the time of diagnosis, not when "there is nothing left we can do."
• Hospice does not accept a pet owner's decision to allow a pet to die without euthanasia unless measures are in place to alleviate discomfort and distress under the care of a licensed veterinarian.

TERMS DEFINED

Animal Hospice: A philosophy or program of care that addresses the physical, emotional, and social needs of animals in the advanced stages of a progressive, life-limiting illness or disability. Animal hospice care is provided to the patient from the time of a terminal diagnosis through the death of the animal, inclusive of death by euthanasia or by hospice-supported natural death. Animal hospice addresses the emotional, social, and spiritual needs of the human caregivers in preparation for the death of the animal and the grief experience. Animal hospice care is enhanced when provided by an interdisciplinary team approach.
Hospice-Supported Natural Death: Use of palliative care measures during a patient's terminal life stage, including the treatment of pain and other signs of discomfort under veterinary supervision until the natural death of the individual.
Humane Euthanasia: The intentional termination of life by human intervention utilizing American Veterinary Medical Association (AVMA)-approved methods that cause minimal pain, discomfort, and anxiety for the purpose of relieving an animal's suffering.
Palliative Care: Treatment that supports or improves the quality of life (QOL) for patients and caregivers by relieving suffering; this applies to treating curable or chronic conditions as well as EOL care.
Quality of Life: The total wellbeing of an individual animal that considers the physical, social, and emotional aspects of its life.
Suffering: An unpleasant or painful experience, feeling, emotion, or sensation, which may be acute or chronic in nature. This is an umbrella term that covers the range of negative subjective experiences, including, but not limited to, physical and emotional pain and distress. In veterinary medicine, suffering can be experienced by the patient and the caregiver.

ISSUES AND OPTIONS

FOCUS OF CARE

Animal hospice is segmented into three major areas of care that address the patient's physical, social and emotional needs. To provide optimal QOL and EOL care, each area must be fully addressed.
• **Physical needs** consist of the management of pain and symptoms of disease, hygiene, nutrition, mobility, and the implementation of environmental modifications.
• **Social needs** center around the mental stimulation and meaningful engagement with family members and the other pets in the home.
• **Emotional needs** address a pet's emotional wellbeing, including a will to live and preserving dignity.

CATEGORIZING HPC PATIENTS

Canine and feline patients who are candidates for HPC generally have at least one of the following conditions:
• A terminal diagnosis (e.g., malignancy)
• A chronic progressive disease (e.g., end-stage renal disease, congestive heart failure)
• A progressive, undiagnosed disease
• A chronic disability (e.g., degenerative myelopathy, debilitating osteoarthritis)
• Terminal geriatric status exacerbated by wasting or a failure to thrive.

Patients who are candidates for HPC generally fall into one of five categories:
• Diagnosis of a life-limiting disease
• Decision not to pursue diagnosis or curative treatment
• Curative treatment has failed
• Progressive illness with complications
• Clinical signs of chronic illness that interfere with normal routine or QOL.

DIFFERENCES BETWEEN ANIMAL HOSPICE AND HUMAN HOSPICE

In several important aspects, animal hospice care is distinct from its human counterpart.
• A guiding principle of human hospice care is to "neither hasten nor postpone death," and the same approach applies when the death of an animal is imminent. However, when caring for seriously ill animals, euthanasia is a widely accepted option to relieve suffering.
• With animal hospice, it is the pet owner's ethical and legal right to decide whether the terminally ill pet will die by euthanasia or by hospice-supported natural death.
• There are considerable differences between the financial resources available to families providing animal EOL care compared to human EOL care.
• In human healthcare, qualifying for hospice benefits is dictated by law, while in animal hospice, the vast majority of costs are covered by pet owners as an out-of-pocket expense. As a result, the financial resources available to caregivers to cover the costs of animal hospice services can be significantly more limited.

Vet-ebooks.com

1.24. HOSPICE AND PALLIATIVE CARE

BEAAAAPP Pain Scale for Dogs

PetHospice.com

Many signs of chronic pain are non-specific. Make sure to see your vet to rule out other disease as a cause of these signs.

0 — No Pain

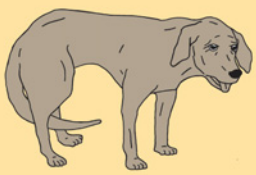
- ☐ **B:** Breathing normally
- ☐ **E:** Eyes bright and alert
- ☐ **A:** Walks normally on all four legs; no lameness present
- ☐ **A:** Engages in play and all normal activities
- ☐ **A:** Eating and drinking normally
- ☐ **A:** Happy; interested in surroundings and playing; seeks attention
- ☐ **P:** Comfortable at rest and during play; perky ears and wagging tail
- ☐ **P:** Enjoys being touched and petted; no body tension present

1-2 — Mild Pain

Speak to your vet during your next appointment

- ☐ **B:** Breathing normally
- ☐ **E:** Eyes bright and alert
- ☐ **A:** Walks normally; may exhibit very subtle lameness when walking
- ☐ **A:** May show first signs of being just a little more slow to lie down or rise up (subtle!)
- ☐ **A:** Eating and drinking normally
- ☐ **A:** Happy and engaged, may seem a little more subdued with some "off" moments interspersed with normal behaviors
- ☐ **P:** May show occasional shifting of position; tail may be down just a little more, ears slightly flatter
- ☐ **P:** Enjoys being touched and petted; no body tension present

3-4 — Moderate Pain



See your vet to assess pain

- ☐ **B:** May pant intermittently
- ☐ **E:** Eyes slightly more dull in appearance; can have a slightly furrowed brow
- ☐ **A:** Noticeably slower to lie down or rise up; may exhibit lameness when walking
- ☐ **A:** May be slightly unsettled and more restless; difficulty getting comfortable; shifting weight
- ☐ **A:** Appetite more finicky, such as wanting only treats or "people" food
- ☐ **A:** Subdued; engages less or does not initiate play
- ☐ **P:** Difficulty squatting or lifting leg to urinate, subtle changes in posture; tail more tucked and ears more flattened
- ☐ **P:** Does not mind touch except on painful area; turns head to look where touched; mild body tension

5-6 — Moderate to Severe Pain

CONCERNING! See your vet

- ☐ **B:** Panting often noted, possibly with an increased breathing effort
- ☐ **E:** Dull eyes, worried look
- ☐ **A:** Very slow to rise up and lie down; hesitation with movement; difficulty on stairs; reluctant to come when called; more obvious lameness
- ☐ **A:** Not eager to interact but may be in tune with surroundings; obvious lameness when walking; may lick painful area
- ☐ **A:** Will frequently lose appetite
- ☐ **A:** Anxious, unsettled or restless; unable to settle or sleep well
- ☐ **P:** Abnormal weight distribution when standing; difficulty posturing to eliminate; arched back, tucked belly, head hanging low; tucked tail; frequently shifts positions; ears more flattened
- ☐ **P:** Pulls away painful area when touched; moderate body tension when being touched

7-8 — Severe Pain

VERY CONCERNING! See your vet

- ☐ **B:** Faster breathing rate with more noticeable effort; frequent panting episodes common
- ☐ **E:** Dull eyes, may also have distressed look
- ☐ **A:** Obvious difficulty rising up or lying down; will not bear weight on affected leg; avoids stairs; obvious lameness
- ☐ **A:** Avoids interaction with family or environment; will often "go off" or hide; may frequently lick painful area
- ☐ **A:** Loss of appetite; may not want to drink
- ☐ **A:** Agitated, fearful, worried, reclusive, potentially aggressive
- ☐ **P:** Tail tucked, ears flattened or pinned back; abnormal posture when standing; more hesitant to move or stand
- ☐ **P:** Significant body tension when painful area touched; may vocalize in pain; guards painful area by pulling away or changing position

9-10 — Worst Pain Possible

EMERGENCY! See your vet

- ☐ **B:** Panting; increased breathing rate and effort
- ☐ **E:** Dull eyes; may have panicked look
- ☐ **A:** May refuse to get up; may not be able to (or willing to) take more than a few steps; will not bear weight on painful limb
- ☐ **A:** Difficulty in being distracted from pain, even with gentle touch or soothing voice
- ☐ **A:** No interest in food or water
- ☐ **A:** Extremely depressed or minimally responsive ("flat out"); may vocalize in pain; in distress at rest
- ☐ **P:** Prefers lying position or being on side; flat or pinned ears; may prefer to be very tucked up or stretched out
- ☐ **P:** Severe body tension when touched; will not tolerate touch of painful area; becomes fearful when other areas that are not painful are touched

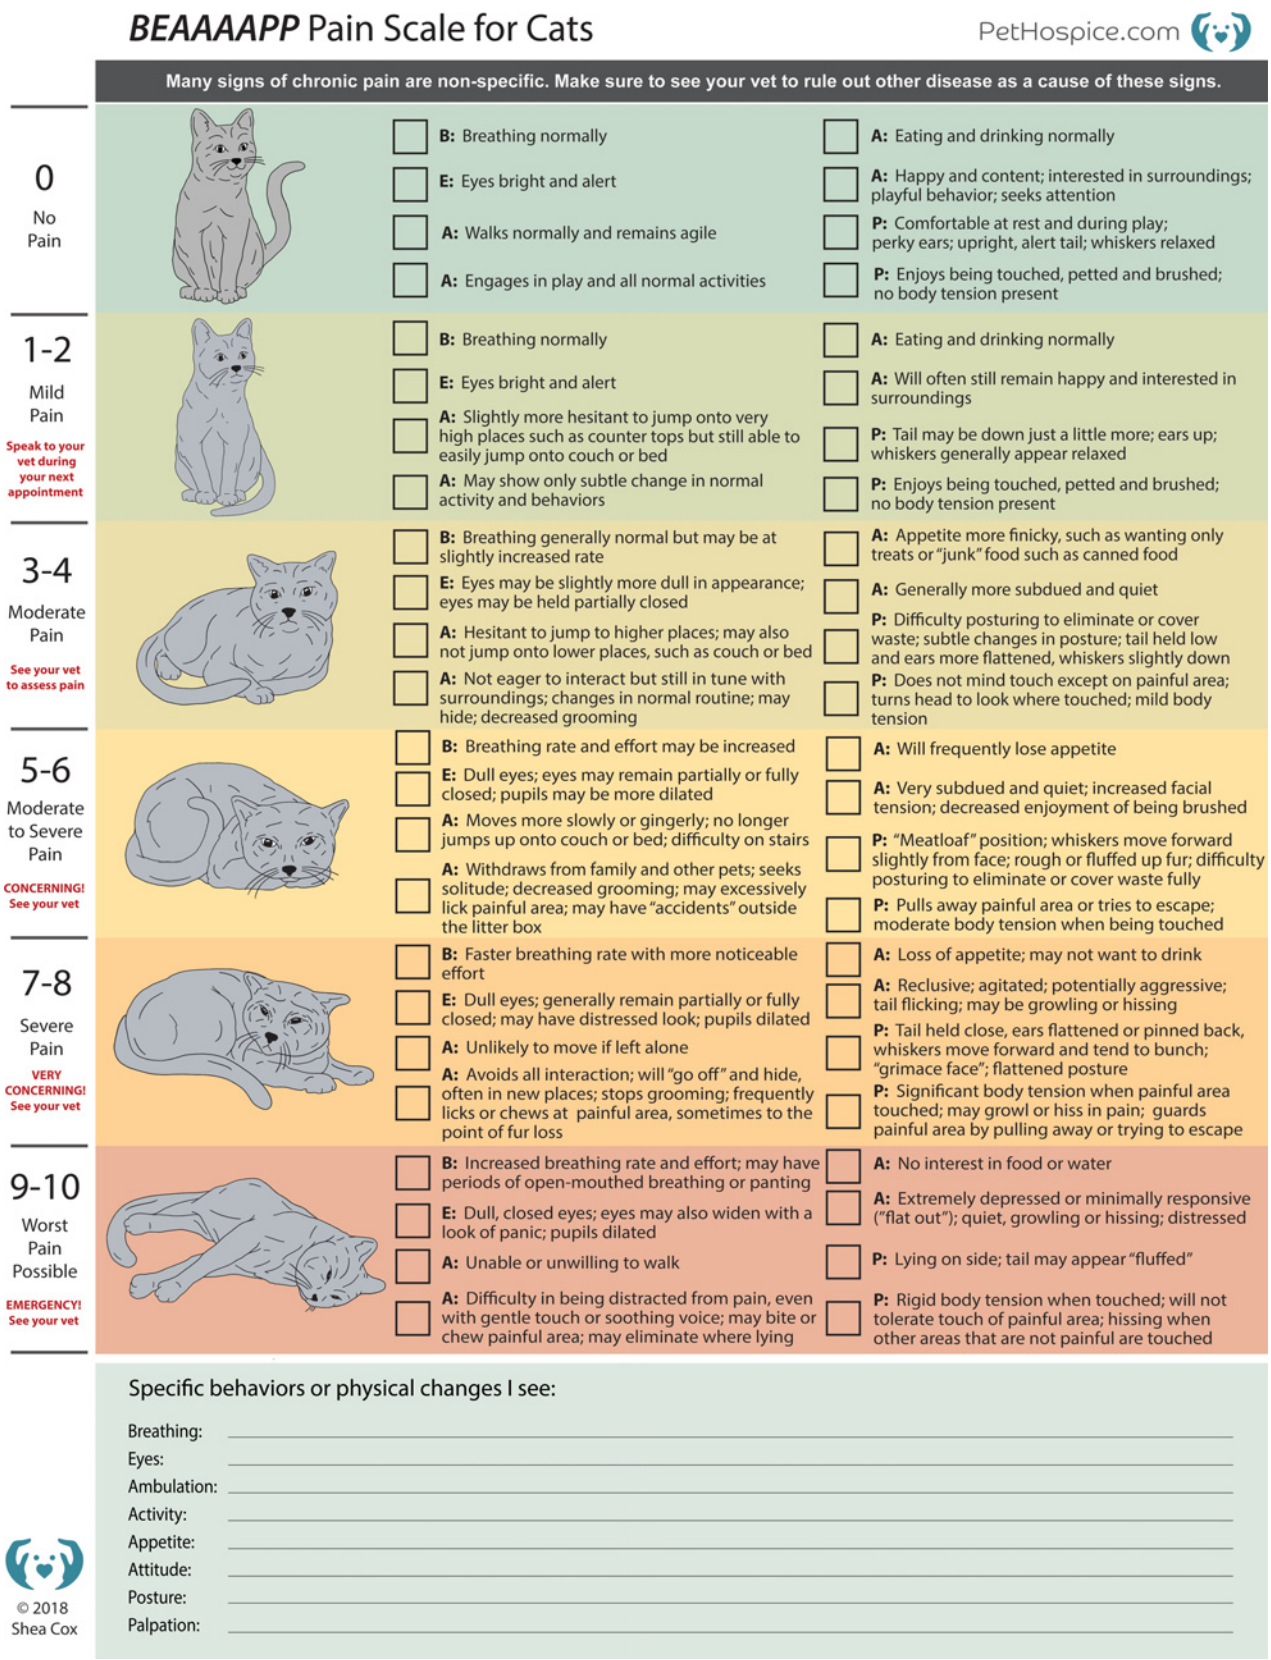

Figure 1-24-2.

Pain scale for cats.

Vet-ebooks.com

• In spite of the growth of the pet insurance industry, financial considerations are a primary concern in many veterinary EOL decisions, and finances often dictate the extent and length of the client's ability and willingness to provide their pet professionally guided EOL care.
• Pet insurance can, however, help offset the cost of hospice care for the client, and the vast majority of reputable pet insurance policies reimburse clients for both in-home and in-hospital hospice services.

HOSPICE IS A TEAM APPROACH

• The skills required to provide optimal patient care and meet the client's needs have become more advanced and complex, and because of this, hospice care is best delivered using an interdisciplinary team approach.
• Each member of the healthcare team should have defined caregiving and client-support roles that ideally utilize their individual skills, strengths, and experiences. Despite defined roles, care should still be delivered as a team with a unified voice, providing seamless and consistent care for both the patient and caregiver.
• In addition to the medical and emotional support that the veterinary healthcare team provides, it is recommended that practices partner with human support professionals, such as social workers and pet loss support groups, to offer additional caregiver support that is beyond the scope of what the veterinary team can provide.
• No member of the veterinary team should be left out of hospice and EOL training. EOL training is an ongoing and dynamic process due to staff turnover and evolving EOL strategies within a practice.
• It is also important to establish a system whereby all staff members are alerted when a patient is entered into hospice care. Everyone, including reception, medical and technical staff, and kennel assistants, needs to understand their team role and be prepared to handle emotionally challenging situations.
• All veterinary healthcare team members should have the skills needed to effectively communicate with owners of pets receiving HPC (see 5.22 – Discussing Quality of Life and End of Life Issues). Practice owners should consider communication skills training specifically tailored for EOL care for their entire team.

EXAMPLES

As with human hospice, the physical, social, and emotional health of veterinary patients is strongly intertwined and it is difficult to achieve optimal quality of life when any one of the components are missing. For example, a chronically debilitated pet with osteoarthritis and urinary incontinence may be able to have his hygiene needs met and his pain managed appropriately, but will not have optimum quality of life if he is confined to the garage or outdoors, isolated from his family due to his incontinence. In situations such as this, suffering can exist despite adequate management of clinical symptoms.

CAUTIONS

• A patient's passage from hospice care to death is a progression that can range from hours to many months. During this time, unexpected changes in the demands of home care, the client's wishes or the patient's condition may occur.
• Scheduling regular communication contacts with the client during the course of the hospice care relationship will avoid situations where the patient's EOL needs are inadvertently neglected. Follow-up appointments or phone consultations initiated by the veterinary team are vital to intervening with potential problems in a timely manner, ensuring optimal QOL is maintained for the patient.
• Successfully responding to these changes will not only fully support the pet and client, but will also help determine whether the client can maintain an appropriate level of care or if a different approach is needed to the HPC plan.
• There may be situations where a primary care veterinarian should consider referral to a veterinarian with advanced skills in providing animal hospice care (resources are available from the International Association for Animal Hospice and Palliative Care, iaahpc.org).

1.25. SPECIALTY AND EMERGENCY CENTERS

BASICS

OVERVIEW

• Specialty and emergency practices are driven by a combination of doctor referrals and the general public's desire for advanced or specialized care for their pets.
• Specialty and emergency practices reflect the importance of the human–animal bond (see 1.19 – Importance of the Human–Animal Bond). These niche markets are a true reflection of the desires of the pet-owning population to receive 24-hour-a-day access to high-quality medicine and surgery, similar to that found in human medicine.
• These types of practices need to have a strong referral base or "gatekeepers" (the generalist – the veterinarian) to work properly.
  ◦ Due to the importance of the gatekeepers, the specialty and/or emergency practices must be proactive in communicating with these individuals.
  ◦ Communication should consist of returning phone calls in a timely manner, sharing completed medical records as soon as possible, noteworthy news updates, continuing education seminars to improve the skills of the referring doctors, and visiting of practices to improve and grow relationships between the generalist and the specialist.
• There are multiple combinations of these types of facilities, and these types of practices are highly specialized niche practices providing cutting-edge technology and skills to their patients. They have special issues to be considered.

TERMS DEFINED

After-Hours Emergency Practice: This type of facility can be owned by an individual, a group of area veterinarians, or as part of a large specialty referral practice. Originally, these practices were open from 6 p.m. until 8 a.m. during the week and from noon on Saturday until 8 a.m. Monday.
Central Hospital: Multiple-specialty practices coming together to form a central hospital similar to a human hospital model. There are several of these either ready to open or close to opening. The big plus with this concept is the economy of scale while maintaining independence and autonomy of each practice or practitioner participating in the hospital.
Critical Care Facility: A facility that is open 24 hours a day, seven days a week, and is able to handle emergencies and the critical care needs of patients similar to the urgent care facilities available to people.
Specialty/Emergency Practice: A facility that opens an emergency facility to ensure 24-hour-a-day care for all hospitalized patients. The increasing number of specialists combining practices and the need for specialized care of patients 24/7 has opened the way for these practices to start and maintain emergency practices.
Standalone Specialty Practice: A facility that does not have an emergency facility present on site and would send critical cases to an emergency practice for observation during the evenings and/or weekends.

ISSUES AND OPTIONS

EMERGENCY PRACTICES

General

• It typically takes a minimum of 25 practicing veterinarians within a 30–45 minute drive time from a suitable site to provide an adequate client base for the practice to grow and prosper.
• There must be willingness by the referring veterinarians and a consensus of the area veterinarians to support such a practice.
• The organizational committee needs to perform a survey of the veterinarians as well as a SWOT (strengths, weaknesses, opportunities, threats) analysis to better aid in identification of the need for such services (see 6.7 – Basic Tools of Marketing).
• The organizational committee needs to stay flexible in designing and creating an emergency practice. Make sure everything you do has both purpose and benefit for all of the stakeholders (clients, patients, and the shareholders).
• Perform a demographic survey of the area to locate the most central site for the facility (see 1.4 – Veterinary Trade Areas).
  ◦ The location needs to have good access to major roadways for ease of accessing the practice.
  ◦ There must be good visibility from the highways.
  ◦ Make sure parking is more than adequate.
  ◦ Does the practice site lend itself to expansion in the future?
  ◦ Determining the greatest and best use for the property is a must. It would not be wise to have a practice on a piece of property that is better suited for a fast-food franchise or motel. It still comes down to (affordable) location, location, location.
  ◦ The location should be convenient for at least 80% of the pet-owning population that the practice plans to service.
  ◦ If the practice is being established by area veterinarians, a survey of these veterinarians asking questions to better assess the needs and wants of the veterinary community needs to be performed.
  ◦ Questions to consider asking are as follows:
    ▪ What will the hours of operation be?
    ▪ Will the shareholders be working shifts in the practice, or will doctors be hired to work on the clinic floor during the hours of operation?
    ▪ Would shareholder doctors be willing to fill in on holiday shifts as needed?
    ▪ Will a practice manager be hired to run day-to-day operations, or will a board of directors run the practice?
    ▪ Will a steering committee be formed to work with the attorney and accountant in establishing the practice? Who will be on this committee?
    ▪ Will a governance board be established for the practice, and who will be on the board (e.g., veterinarians, clients)?
    ▪ What is the vision for the practice?
    ▪ What are the purposes in establishing the practice?
• Two committees need to be formed – one for operational and a second for facility issues. There needs to be open lines of communication between the two committees.
• Working relations should be developed with advisors, including:
  ◦ an attorney
  ◦ an accountant
  ◦ a banker (or two)
  ◦ insurance people
  ◦ a veterinary consultant familiar with emergency practices.
• A business plan needs to be developed (see 14.10 – Business Plans).
  ◦ A good budget gives a clear vision and idea of the costs of starting the practice as well as an idea of the asking price of a share (see 8.2 – Revenue Budgets and Forecasts).
  ◦ How much will be financed from a lender for the facility, equipment, and working capital for at least the initial 6–9 months of operation?
  ◦ What type of business entity will be formed? Will it be a C-corporation, an S corporation, or an LLC? A discussion with your advisors will identify the best model for the practice.
  ◦ Will real estate be held in the practice, or will it be held by a few individuals under a separate corporation? There are pluses and minuses that go with the decision and your advisors can aid in making the best decision for the group.
• A well-planned organizational chart must be devised (see 2.2 – Organizational Charts):

Vet-ebooks.com

- ◦ Who is responsible for the day-to-day management duties of the practice? Will there be an administrator or will decisions be made by the committee?
- ◦ What person or group will make the final management decisions?
- ◦ Who makes up the governance board of the practice?
  - ▪ The governance board should be made up of the administrator of the practice, area veterinarians, and possibly one or more of your advisors.
  - ▪ Monthly board meetings are necessary to ensure the practice is meeting its mission and goals.
  - ▪ Weekly meetings with the management team are mandatory for the continuum of care of the patients and the hospital.
- ◦ A medical director position needs to be created and filled.
- ◦ There should be a human resource director to handle training and staffing issues.

• Everything the practice does must have tangible and intangible benefits for the patients, the clients, and the practice.
• An emergency practice needs to provide care for the injured, sick, and critical care patients. Typically, these practices will not perform wellness care on pets because they are the emergency extensions of the generalist veterinarians.
• Definition of the practice's goals should be established. Providing needed after-hour care for the pets and people of the area and turning a profit are typically the main goals for these practices.
• The pet owner will be at an emotional high point when arriving at the practice and it is mandatory that the practice provide exceptional client satisfaction and care for their pets at all times (see 4.2 – Client Service Strategies). The emergency practice is a mirror image of the entire veterinary community and needs to reflect the highest standards of care possible.

Special Issues

• Emergency practices have many issues that are significantly different than the generalist-type practice.
• Who are the clients?
- ◦ In most emergency practices it is a combination of both the referring veterinarians and the pet-owning population. The practice's primary job is to provide quality care to the patient, whereas its secondary job is to create not only satisfied clients, but also advocates for the practice. To accomplish this task, it becomes very important to constantly improve on client service as well as the level of medicine and surgery. Providing quality medicine is good, but it is the perceived value the client or referring veterinarian has of the practice that has the greatest impact.
- ◦ Communications are of paramount importance with referring veterinarians. Keeping the referring doctors in the know is extremely important for the survival of the emergency practice (see 4.23 – The Extended Hospital Team – Making Referrals Work). This can be accomplished by sharing patient records in a timely manner and by conducting phone consultations with the referring veterinarians regarding the records.
- ◦ Most emergency practices are set up as an extension of the generalist-type veterinary practice. The typical emergency practice is open from early evening until 8 a.m. the next morning plus the entire weekend. The owners are typically area veterinarians who have teamed up to provide care for their clients.
- ◦ State laws are now requiring that veterinarians provide 24-hour-a-day access to care for their clients and pets. This can be done by providing care in your practice, a colleague's practice, or by referral to an emergency facility.
- ◦ As a community-based practice serving the needs of the pet-owning population with medical and surgical care to all companion animals, emergency practices typically will accept new clients who are not referred from a practice.

• What about fees?
- ◦ Most emergency practice fee schedules are higher than comparative services provided by generalist practices due to the higher cost of labor, more advanced technology used, higher costs for the practice facility, and the specialized market concept.
- ◦ The fee schedule can be developed by combining one or more of the following models: surveying the referring veterinarians to determine what their perception of value for a particular service will be, activity-based cost accounting for the service, surveying other emergency practices of similar size, and location.
- ◦ If you know what referring veterinarians consider a reasonable fee, then the use of activity-based costing (ABC) can be instituted to better define the cost of the activities needed for the service to be profitable (see 7.14 – Activity-Based Costing and Cost Allocation).

Fee Collections

• In an emergency practice, collections can be a real issue versus the situation in the generalist practice.
• In a generalist practice, a billing and collection policy is essential. At times you may make an exception to the policy for a client based on past experiences.
• An emergency practice does not have the luxury of knowing clients and their ability to pay as well as the generalist knows theirs.
• A strong financial policy is mandatory for an emergency practice:
- ◦ Deposits of up to 50–75% of the initial estimate (contract) should be required for any hospitalized patient.
- ◦ Each day a new estimate or contract for the services being provided should be prepared. This needs to be accepted and understood by the listed responsible adult party.
- ◦ Payment alternatives need to be given to the client at the time of service. Options could include cash, check, debit or credit cards, pet health insurance or other third-party payers (friends or relatives), or third-party lending companies (see 8.10 – Getting Paid for Services Rendered).
- ◦ If you elect to allow billing, then make sure you create a credit application that gives you as much information as possible about the client. Make sure you have established your minimum acceptable credit score and have performed a through credit check on the person.
- ◦ An increasing number of software vendors are incorporating third-party payment applications in their practice management software. This can expedite the application process and give an answer in short order.
- ◦ A strong, assertive, honest, congenial employee with strong communication skills should be sought to head the financial policy department of the practice. This individual can help ensure that the practice maintains a high cash flow with minimal (if any) accounts receivable issues (see 8.9 – Accounts Receivable Issues).

Labor Costs

Veterinarians who work in emergency practices usually are well trained in thinking and reacting to situations in a very rapid fashion.
• They love the adrenaline rush associated with this type of practice.
• Good emergency clinicians are well skilled in all aspects of emergency medicine and surgery.
• Scheduling of veterinarians to fill the hours is a combination of determining peak hours (more veterinarians needed) versus the slower hours.
• The attempt is to staff at 40–50 hours per week. This will mean using a number of veterinarians to cover the hours of operation on a weekly basis.
• Due to emergency doctors' knowledge, skills, and willingness to work the hours that veterinary clinics are typically closed, they are paid at a higher rate.
- ◦ Compensation is typically by percentage of production more than straight salary. Sometimes you will need to pay whatever it takes to staff certain shifts.

Vet-eBooks.com

1.25. Specialty and Emergency Centers

- ◦ In their book *Contracts, Benefits, and Practice Management for the Veterinary Profession*, Wilson et al.[1] suggest emergency veterinarians be paid on a percentage (25–30%) of the collected receipts of the work they generate.
- ◦ Some of the practices are finding that 21–23% of collected services is a more realistic percentage, as long as there is adequate client traffic.
- ◦ Benefit packages may be similar to a generalist practice (continuing education allowance, dues, health insurance, retirement plans, vacation time, etc.).

• It is difficult to find good emergency doctors, and when you do find them and wish to keep them, you will be paying them very well compared with a generalist.

• Nonprofessional healthcare team members will also cost the emergency practice more than they would a generalist practice. Create a list of questions to ask each candidate. Consider asking if the person has any problems with euthanized and dying pets, if they can work under constant stress, how would they handle emotional clients, and if they communicate and work well with their peers.

• Consider surveying referring practices to determine their pay scales for client service people, certified veterinary technicians, and veterinary assistants.

- ◦ Make sure your hourly schedule is equal to or higher than the best practice in the area. Hiring qualified people to fill the multitude of shifts is difficult in a day practice, and even more difficult for an emergency practice
- ◦ Create a "shift differential" for different time periods (before midnight, after midnight, weekends, etc.).
- ◦ Create tiered salary levels for each group. There should be an entry level with a minimum to maximum range they can earn before they may take the practical exam needed to advance to the next level. The next level will have a salary range to earn before the employee may advance to the top level, where there is another exam or competency evaluation and additional job expectations for the person.
- ◦ Performance reviews are essential (see 3.19 – Staff Performance Evaluations). They need to be done semi-annually, at least. The increased frequency of reviews will help in improved client service and patient care.

• The use of 360 reviews is gaining in acceptance in veterinary medicine. An example would be having a certified technician review by the administrator, a fellow technician, an assistant, and a doctor reviewing this individual. The goal is to acquire a complete (360) view of the individual.

• Pay a premium (double time or more) for working on holidays, and consider making it special for the healthcare team by providing nice meals (turkey on Thanksgiving or hot dogs/hamburgers on the Fourth of July, for example).

• Consider conferring with area practices to see if any of their staff would be interested in working weekends, part-time, relief, or on a need-to basis. It is common for emergency practices to be training the future staffs of area day practices.

- ◦ Hiring and training team members for an emergency practice is a continuous process. A lot of well-trained emergency personnel will work for a period of time, and then decide to leave emergency medicine and go to the more traditional day practices.
- ◦ If that is the case, create an actual training coordinator and set up training classes during the day.
- ◦ Training is a continuous process to improve the skills of the staff in client communications and clinical or patient care. Training enhances the skills of everyone. Consider incorporating testing of staff to ensure they are using their new skills.
- ◦ Consider setting up a training coordinator to visit referring practices and provide in-house continuing education for their people. This will improve relationships with the referring practices as well as improving their staffs' skill levels. At the same time, this coordinator can ask: What can we do to improve our relationships with referring practices and their clients?

REFERRAL PRACTICES

For many years, the clinics at veterinary schools were the only referral practices available to generalists, but now veterinary referral practices are an increasingly important sector in the care of companion and equine animals in the United States.

General

• In the past decade the number of privately owned specialty referral practices have become a closer source of referral service for the gatekeepers (the generalists). In the earlier years of referral practices, they were located predominately in larger urban markets, but are now expanding into the secondary- and tertiary-size markets.

• The majority of referral practices in earlier years were single-specialty practices (i.e., surgery, ophthalmology, or internal medicine).

• Now there is increased desire for the different specialties to combine into mega referral centers, similar to those found in human hospitals. This provides these practices an economy of scale and the ability to work more closely with other specialists.

- ◦ The majority of the mega practices are found in the larger urban and suburban centers, and it is not unusual for some of these areas to have two or more of these facilities strategically located within the area.

• With the increased numbers of large mega referral hospitals, the tendency is to include emergency services in the mix.

- ◦ One of the driving forces in the addition of emergency services to the specialty mix for the larger referral practices is to ensure that each of their critical care patients receives maximum exposure to the highest quality of care (medical and nursing) from the doctors and other healthcare team members 24/7.
- ◦ By adding emergency services into referral practices, it is beginning to reduce the number of emergency facilities owned by local veterinarians (generalists). One of the biggest reasons for this reduction is better access by the clients and patients to referral practices and state-of-the-art equipment with highly trained personnel.
- ◦ These types of practices are more likely to hire board-certified critical care veterinarians to staff the facilities.

• There are three distinct referral practice models. Within each model there may be slight variations noted in some practices:

- ◦ **Single-specialist standalone practices:** These appear to be more common in smaller markets and may be driven by a desire to live in a less metropolitan area. In the early years of referral practices, this was the norm even in larger metropolitan areas. You could say they were the beta testing practices for the referral industry. As the larger markets filled with multiple-doctor specialty practices, these smaller, single-specialty practices will expand into multiple-specialty practices.
- ◦ **Mega practices:** In the larger markets, these practices grew from a single specialty to encompass more and more different specialties under one roof. These practices are typically owned by a few individuals within the practice who were very progressive in their thinking and willing to take a huge risk. Such practices contain a full complement of specialists and are housed in buildings that rival some small human hospitals.
- ◦ The third model is actually a blend of the first two. In this model each specialty is owned independently of the others, yet they are all housed under the same roof. Each specialty practice pays for certain shared expenses (facility, cage space, utilities, etc.) while maintaining their separate identities. It is similar to the "practice without walls" concept found in human medicine.

• Some mega referral practices are developing strong alliances with some of the veterinary teaching hospitals in many areas of the country.

Vet-ebooks.com

1.25. SPECIALTY AND EMERGENCY CENTERS

This relationship has included sharing residents, student clinical opportunities, and internships.

Special Issues

- Who are the clients?
  - Referral practices have the generalist as their main client.
  - The generalist is the gatekeeper for the referral practice, similar to models found in human medicine.
  - Referral practices need to maintain a strong line of communication with the generalist. This can be done in many ways:
    - Report findings on a referred patient promptly. Besides sending the written report in a timely fashion, phone follow-ups are also advisable.
    - Regularly schedule visits with referring practices to discover what each referring practice is doing right and what needs improvement. This task can performed by a nurse/technician, who may also perform in-house training CE for the technical staff of the referring practices.
    - Schedule CE classes for the referring veterinarians at the specialty practice facility.
    - Visit nonreferring practices to better determine what it would take to win their business.
    - Staff with friendly, helpful, and knowledgeable client service people.
    - Make sure veterinarians are easily accessible for phone consultations.
  - The pet owners and the referring veterinarians are the true clients of the practice, and both must be treated with the utmost respect and compassion.
- It is a combination of the referring veterinarians and pet owners who provide opportunities for the referral practices to succeed.
- Labor costs
  - Finding and compensating specialists is a special issue.
  - There appears to be a growing pool of board-certified specialists to select from. In the early years of referral practices, the majority of these individuals came from academia. Now, with an increased demand for boarded specialists, it is a sellers' market, with some practices taking a year or longer to find the best candidates.
  - Compensation is by percentage of the work generated and collected, with a range of 21–23% as a benchmark, but differing significantly between specialties. Along with this are benefits (retirement plans, health insurance, continuing education, etc.).
  - Nonprofessional staffing is another challenging issue. A significant number of these healthcare team members will gravitate over from generalists' practices because there is more responsibility for the individual and more challenge, with better benefits. The hourly wage or salary will be at the higher end of what the generalist practices are paying.
    - To keep an excellent relationship with your referring practices, try not to directly hire from their healthcare teams.
- Exit strategies are a concern for referral practices.
  - The buying pool for a direct sale of a specialty practice can be limited at this time.
  - The mega practices owned by a few individuals are faced with a dilemma – their size may be a hindrance in finding a suitable buyer with enough financial resources to purchase the practice.
  - Options for these types of practice include:
    - internal sale to associates, similar to the succession planning done in large law or medical offices,
    - the creation of smaller specialty practices under the same roof. This option would be the same as the second model described earlier.
  - There are individuals who are working on developing a new model that will allow the practices to continue to grow and be an active part of the veterinary landscape.

1.26. EQUINE PRACTICE MANAGEMENT

BASICS

OVERVIEW

- There are two distinct types of equine practices: ambulatory practices and hospital, or haul-in, practices.
- Each of these practice types can be further broken down into subcategories: racetrack, pleasure horse, broodmare, sport horse, and specialty.
- Each type of practice shares similarities with the others while having unique qualities that make practice management a challenge.

TERMS DEFINED

Accounts Receivable: Money that is owed to a business by a customer for products and services provided on credit.

Associate Veterinarian: An employed veterinarian or independent contracting veterinarian who does not have an ownership stake in the practice (cf. owner veterinarian).

Capitalization Rate: The rate of return needed to attract capital to the practice. This is essentially the rate of return a buyer would expect for investing in the practice. The rate is a reflection of the risks associated with the business, with emphasis on the practice's ability to maintain its net income.

Deferred Payment Plan: A written document stating amount owed, dates, and amounts for expected payment installments; consequences of failing to make payments on time; and a signature line for the client to sign.

Finance Charges: The amount of money charged for payments that extend beyond an agreed-upon time limit. The amount charged is governed by the usury laws in the state within which you practice. The amount of finance fee charged must be clearly reflected on the invoices rendered.

Human Resources: Hiring, training, firing, and supervising activities of the entire healthcare team, including maintaining the legal requirements of the management of people.

Inventory: Goods ready to be sold.

Inventory Turns: The frequency with which you use inventory items. This is determined by calculating the total cost for one year of drugs and medical supplies. Divide that number by your average inventory (beginning inventory plus ending inventory, divided by 2), and then divide 365 by the number you just calculated. This will give you the number of days of inventory you own. Dividing 365 by the number of days on hand will tell you how many times in a year you turn over your inventory.

Minimum Order Point: The level below which you do not want your stock to fall.

Net Cash Flow (NCF): Revenue less expenses plus noncash expenditures (depreciation and amortization expenses, for example).

ISSUES AND OPTIONS

HUMAN RESOURCES

- One of the keys to success is to hire people with great attitudes and train them for skills.
- Human resources may be one of the largest expenses in an equine practice.
- People are an asset to a practice, especially when they are well-trained.
  - To be an asset to the practice, the staff members must become advocates for the practice.
  - To become advocates, they must understand the importance of quality care and must be able to communicate it to the client.
  - Staff need to be educators for the practice to clients.
  - There must be consistency in the healthcare team's actions. In other words, everyone needs to deliver the same informational message to the client, each in his or her own words.
  - To become an advocate for the practice, the team needs to believe and participate in all services the practice offers, which should include a wellness program. In other words, their animals should be better protected against disease, and have experienced every wellness program the practice offers. This will allow the staff to talk more efficiently and effectively to clients about the services or programs offered by the practice.
  - Client education via the healthcare team increases the likelihood of improved profitability of the practice.
- Leveraging the healthcare team is essential for improved profitability of a practice, as well as for improving the efficiency of the doctor.
- To leverage and empower the healthcare team, it takes time to educate and train the staff. Developing practice standards, and then training staff to meet those standards, is essential for accomplishing this task.

Method of Compensation

- There are three basic models for compensation of associates:
  - Flat salary
  - Pro-sal, a method using a base salary plus a percentage of collected fees from services and product sales that the veterinarian generates each month
  - Percentage of collected business the associate generates each month.
- A large number of equine veterinary owners prefer to compensate recent graduates by using a flat salary with annual reviews. Experienced associates are more likely to accept either the pro-sal or straight percentage of collected revenues.
- If paying by percentage of production, the range is typically from 21 to 25%.
- A higher percentage of the total fee is typically paid for an after-hour emergency.
- Benefit packages vary from practice to practice. According to the American Veterinary Medical Association 2012 *Economic Report on Veterinarians and Veterinary Practices*,[1] the five most common benefits were:
  - Continuing education expenses – 76.6%
  - Annual vacation leave – 73.4%
  - Medical/hospital insurance – 67%
  - Liability insurance – 67%
  - Continuing education leave – 62.3%.
- Mentoring the new associate shortens the integration period into the culture of the practice and makes him or her a more productive member of the team.
- Mentoring of the new associate by the owner or a senior clinician aids in the development of the new practitioner into a more productive doctor for the practice (see 3.17 – Mentoring).
  - Mentoring allows the new doctor to be validated to the client by the senior clinician.
  - Mentoring allows the sharing of ideas and development of practice protocols for medical and surgical care.
  - Mentoring should be a continuous program.

Nonprofessional Healthcare Team

- Hiring the right people is essential for the continued growth and profitability of the practice.
- It is essential to hire individuals with the proper attitude, and train for skills.
- A key component of a successful veterinary practice is a training program for the staff that will aid them in educating clients, ensure the doctors are more efficient, and make the practice more profitable.
  - One of the most commonly missed opportunities in an equine practice is the inability of the healthcare team members to educate clients and aid in closing the deal. In the fast-food industry, for

Vet-ebooks.com

example, people learn to offer all customers the option of "super-sizing" their meals. The number of times customers respond in a positive manner to such an offer is proportional to the number of times it is offered – a technique that is applicable to any industry, including equine practices.
  ◦ Clients are well educated about the needs of their horses via the Internet, magazines, and meetings. Why not become a part of the educational bonanza of horse owners by empowering the healthcare team to deliver a consistent message regarding health issues to your existing or potential clients?
• One of the goals of every practice should be to become efficient in the workplace and effective in servicing the clients (and community). To achieve this goal, it will take a healthcare team that understands the mission and vision of the practice.

EXIT STRATEGY PLANNING

• What type of business entity is your practice? There are five business models to consider:
  ◦ Sole proprietorship
  ◦ Partnerships
  ◦ C Corporations
  ◦ S Corporations
  ◦ Limited liability company (LLC).
• Each business model has its strengths and weaknesses, and it is wise for you to discuss these issues with your accountant and attorney to discover the best one for you (see 1.17 – Practice Management Support Professionals).
• Real estate associated with a practice typically is owned in a separate LLC. The main reason for this move is to reduce the risk of liability exposure. Creating a lease from the practice to the real estate company creates an arm's-length transaction and can be viewed favorably by the IRS.
• The moment you become a practice owner, it is time to create an exit strategy (see 14.21 – Succession Planning):
  ◦ When considering an exit strategy in an established practice, you need to be thinking 3–5 years out to improve the profitability and eventually the value of the practice.
  ◦ The ideal exit strategy is selling to an associate or third party or merging the practice with another practice with similar ethics, protocols, and mindsets.
  ◦ The cornerstone of an exit strategy is to know and understand the value of your assets (practice and real estate) as of a particular date (see 14.13 – Determining a Practice's Worth).
  ◦ Understanding that a business has value is very important in creating a realistic exit strategy.
  ◦ Exit planning is more than knowing what the value of your assets are at a particular time. It is having a plan to reduce your tax burden, investing your funds effectively for retirement, as well as insurance issues in case of an accident or death.
  ◦ Discuss your situation with your exit planning team (consultant, attorney, accountant, financial planner, and your family)/
• Consider a Section 1031 exchange for the real estate (see 7.25 – Practice Sales: Planning, Structure, and Methods to Minimize Taxes). Check with your accountant, attorney, and financial advisor to determine if a 1031 exchange is correct for you.
• There are other reasons for creating an exit strategy:
  ◦ Unexpected extended illness
  ◦ Career change
  ◦ Death
  ◦ Burnout
  ◦ Tax strategy
  ◦ Estate planning.
• Owning a practice (and accompanying real estate) is a very important asset in your net worth.
• The value of any veterinary practice is based on the profitability (net cash flow, NCF) of the business divided by a capitalization rate (risk factor in owning an investment).
• Typically, last year's gross is no longer the value of an equine practice. It takes management skills to generate sufficient cash flow to create value in a practice.
• Practice valuations are the preferred method of determining the value of the practice, not by a rule of thumb of "x" percentage of last year's gross revenue (see 14.15 – Practice Value Rules of Thumb).
• There are many methods written for valuing a business. At the present time, there are two methodologies consistently used for valuing veterinary practices:
  ◦ The excess earnings model
  ◦ The single period capitalization model.
• The driving force in both models is NCF.
• It is wise to update practice valuations every 2–3 years, both as a means to see if management practices have improved the value and to have a current value in case something happens to warrant a sale. At the same time, revisit your exit plan and make the needed changes as well as the strategy to accomplish the new plan.
• Valuations should be used as a management tool to aid in measuring the effectiveness of achieving practice goals.
• Real estate appraisals need to be updated at least every five years by a commercial appraiser.

Options

• Closing the doors and selling the hard assets (equipment) is an option for an exit strategy. For some single-doctor ambulatory practices, this option is all too common.
• Preparing for an internal sale to an associate is a very attractive option. It requires a plan or strategy to be developed several years in advance, starting with meaningful discussions with the associate about practice ownership.
• Another option is to sell the practice to an outside or third party.
• Merging with another practice is becoming a more viable option. It takes time and multiple discussions with an interested colleague to determine if the practices' philosophies can become synergistic. The methods and techniques used in accomplishing a merger are limited only by the creativity of the advisors and the merging practice owners.
• There is a type of merger where the owner of the practice being acquired becomes an associate in the new practice. As an associate, the owner is paid a percentage plus 10–15% more for any work that the owner or any of the other doctors perform on a published list of their clients. This technique is typically set up for a two-year period, and then the associate is paid strictly on a percentage of production basis. This allows the acquiring practice to pay for the acquisition with money generated from the former practice's client base.

ACCOUNTS RECEIVABLE/BILLING ISSUES

General

As Earl Nightingale, the motivational speaker and writer, once said, "All of the money you will ever have is currently in the hands of someone else." Herein we will describe how to fairly obtain such funds from your clients for the services that you render to their horses:
• Receiving payment in a timely fashion for work performed is a mark of a well-managed business, which is what an equine veterinary practice should strive for.
• Horse owners are less price-sensitive than companion animal pet owners. At the same time, equine clients tend to be very sensitive to the prices of retail product sales.

Minimizing Problems

• Use a new client information sheet for every patient and make sure that they sign an agreement with the following:

Vet-ebooks.com

1.26. EQUINE PRACTICE MANAGEMENT

While a client of _____ Veterinary Practice, I consent to the provision of routine veterinary services. I agree to pay for such services within 30 days after receiving an invoice. If the bill is not paid, and I do not make other arrangements in writing, it may be billed to my credit card,
#_____
Expiration date _____
Signed _____

• Accept credit and debit cards, and keep a credit card number on file for each client, if legally permissible to do so. Verify the number's validity annually with each client. Otherwise, consider a mobile device that will allow you to charge the card at time of service. Notify your clients that any invoice more than 60 days past due will be charged to the card, unless other arrangements have been made in advance. Stick to this policy. The 2–3% merchant fee is much cheaper than playing banker with your clients, or worse, writing off an uncollectable bill.
• Offer and recommend third-party payers, such as CareCredit.
• Payment at time of service is the best way to reduce your accounts receivable.
• If you do not charge or invoice at the time of service, consider billing weekly to improve the cash flow.
• Consider e-bills. These are invoices attached to an email and sent out immediately after the service is completed.
• Have a designated accounts receivable person who creates a system for billing clients. This person needs to be assertive, detail oriented, and able to communicate effectively.
• Bills that clearly reflect services performed and related charges help to ensure collectability. "Horse vaccinations" does not let the owner know exactly what you did and certainly does nothing to engender a feeling of worth associated with whatever you did. In an equine practice, you are often dealing with absentee owners. If you give them details about the services you performed, it then makes the billing process much more efficient and minimizes telephone calls that seek to clarify the reason for the invoice. Clients can be busy people too. Delays in obtaining clarification on an invoice can stretch into longer delays. This can translate into your bills not getting paid in a timely manner.
• Minimize disputes arising from invoices rendered. If you are going to be performing expensive, complicated treatments, written estimates are certainly appropriate. With the use of smart devices in the field, there is no reason why an estimate of the treatment plan cannot be generated and discussed prior to embarking upon an expensive course of action. Updating your client as to charges incurred and course of action taken should help to keep them "buying into the plan."
• Use consent forms with signature lines agreeing to pay for costs incurred when dealing with treatment plans. A signed consent form is a legal document and will reduce the risk of the client stating they did not know or were unaware of the costs. While your client data sheet covers this, it is a good idea when dealing with expensive treatment options to remind clients that there will be costs incurred and that they are responsible for paying them.
• Multiple ownership of animals occurs much more frequently in an equine practice than in a typical companion animal practice. Make sure your practice management software can deal with multiple ownership issues. Review your client data sheets to make sure there is one person named as ultimately responsible for payment of charges incurred. Even though you may send invoices to all owners of the animal, you do not want to get caught in the middle of disputes that may arise between or among the owners.
• Have a written policy in place that you adhere to for especially high-risk situations, such as pre-purchase examinations, first-time clients requesting expensive procedures, and out-of-state clients with no history of payment at your practice. Substantial deposits should be required in these situations.
• Monitor your accounts receivable schedule, and print out an aged listing on a regular basis. This schedule lists current, 30–60, 60–90, and >90 days past-due accounts. Telephone communication as well as invoicing past due clients is always recommended, and make sure your staff and associates know who owes the practice money so that further service, if done at all, is done on a cash-on-demand basis only.
• The majority of horse owners today do not have to rely on crops coming in to pay for veterinary care for their animals. Therefore, some of the older rules regarding appropriate levels of accounts receivable in an equine practice need to be examined. If you have the correct policies in place and adhere to them, the overwhelming majority of your accounts receivable should be in the "60 or fewer days" column on your aged accounts receivable schedule.
• A good collection policy does not mean that you need to check your compassion at the client's door – you can make room for reliable clients who run into financial trouble. Deferred payment plans may be appropriate for clients with a good payment history.
• Small Claims Court is an option, but that gives you lien rights, not generally a check in your pocket. Documentation is key to winning these cases, which involve time and money on your part, so make sure your records support that the individual is liable for your charges.
• When it comes to money issues, having policies in writing minimizes more problems with clients than it causes. Clients want to know where they stand and what options are available to them.

INVENTORY ISSUES

• Depending on the kind of equine practice you have, inventory issues can be extensive.
• The full cost of maintaining an inventory involves more than the purchase price of the products. There are myriad indirect costs such as storage, personnel costs, shrinkage (thief, breakage, or forgetting to charge for the item), insurance, and tracking costs (see 9.11 – Effective Inventory Management).
• Balancing stock-outs (not having inventory available to meet your clients' needs) and overstocking (carrying too much inventory) is a learned skill and takes constant effort.

General

• Use your computer software, both for tracking what you have on hand, and to interface with your price list to adjust for price increases. Bundling of products used in treatment procedures can help to keep track of items used. This also helps to track supplies and drugs used in treating the animals in addition to products dispensed.
• Determine the minimum order point for individual items with your software's help. Use your software to determine your usage of a particular item per month, and use that number as your minimum order point for that item. Start with keeping three-quarters of a month's usual volume on hand, then track your usage and reorder as appropriate. Monitor your results.
• Spot-check your inventory to be sure that the count in the computer matches the physical count of items on hand. Analyze any reason for differences and adjust your procedures to minimize the occurrence of these variations.
• Adjust your prices at the time you receive price increases from your vendors, not when you use up your inventory on hand.
• Limit your number of vendors to three or four. Your time is worth more seeing clients than saving a few cents here and there, and you will get more benefit from vendor loyalty than if you order small quantities from many vendors to save a few pennies. Vendor reps can be a source of information and assistance.
• Check return policies from your vendors and keep familiar with their terms. This is another reason to limit the number of vendors from whom you purchase supplies.
• Track costs versus sales to be sure you are getting the markup price you think you are getting.

Vet-ebooks.com

• Watch your "by the way" charges. Medication administered that is not part of a scheduled visit, for example, is a major source of missed charges.
• Make friends with other equine veterinarians in the area as a possible way to split large-dollar, low-usage product orders among several practices. This becomes a modified group purchasing unit.
• Purchase price of the item is not the only cost of the product. Storing, insuring, tracking, and shrinkage (such as intentional or unintentional theft) are all indirect costs that must be added to figure the true final, all-inclusive cost of your items.
• Use the 80/20 rule to help you begin managing your inventory (see 9.15 – Pharmacy Management). Start with the products that account for the top 20% of revenue from inventory and get those items under control, then work your way through the remaining 80% of meaningful items in stages.
• The ability of most vendors to get your orders to you in a relatively short time (24 hours in some cases) allows for turning your inventory 10–12 times a year, and generally results in more profit to the practice.
• Inventory is a cost for your practice, not an investment. Inventory only becomes worth something when you do something with it to generate income.

1.27. FOOD ANIMAL PRACTICE MANAGEMENT

BASICS

OVERVIEW

Food animal-exclusive veterinarians comprise 5.5% of the total veterinary population in the United States.[1, p.44] They hold a major responsibility for the safety, quality, and efficiency of our food supply. The clients of food animal veterinarians are producers, in the form of farms, ranches, or companies that own and manage food-producing animals. Food animal veterinarians must balance the economic factors of the producer with the need for a safe and wholesome food supply, and the welfare of the individual animal and herd. These additional factors make management of food animal practices different and more complex than that of small animal and mixed animal veterinary practices.

A fundamental difference in food animal practice is the need to create economic value to the producer. When a veterinarian can provide services and advice that creates economic benefit to the producer, the demand for veterinary services will increase. Without tangible economic benefit, veterinarians will lose market share to nonveterinary competition, or animals will go without adequate healthcare.

TERMS DEFINED

Animal Medicinal Drug Use Clarification Act of 1994 (AMDUCA): This federal law allows veterinarians acting within a valid veterinary client patient relationship (VCPR) to prescribe and dispense medications in an extra-label manner to food-producing animals subject to detailed regulations establishing the need for extra-label use and establishing withdrawal times.

Veterinary Client Patient Relationship (VCPR): This is required by federal and some state regulations to prescribe or dispense extra-label drugs and to issue a Veterinary Feed Directive. The requirements of a valid VCPR include sufficient knowledge, gained through a physical exam, by the veterinarian to establish a general or preliminary diagnosis.

Veterinary Medicine Mobility Act: This federal law allows ambulatory veterinarians with a Drug Enforcement Administration registration to transport controlled substances used to treat patients in the field.

ISSUES AND OPTIONS

Major areas of food animal practice include the following:

- Bovine practice, which primarily comprises dairy and beef practice. The major life stages of beef practice are cow–calf practice, stocker practice, and feedlot practice.
- Small ruminant practice, which is predominantly caprine and ovine practice.
- Commercial swine practice, which in private practice is predominantly consulting.
- Commercial poultry practice, which comprises chickens, layers (egg production), and commercial poultry (meat) turkey practice.
- Other minor species of commercial food production including aquaculture, rabbits, bison, and honeybees.

The species and type of food animal practice depend on the geographic location of the practice, as various food-producing species are concentrated in certain geographic areas. The majority of food animal-exclusive practices are bovine, either dairy or feedlot practices.

The poultry and swine industries are largely vertically integrated, meaning that one entity maintains ownership through the life span of the food-producing animal. Vertically integrated companies generally employ on-staff veterinarians to oversee animal health. Although these poultry and swine veterinarians are responsible for economic factors relating to animal health, they are not managing a veterinary practice in the traditional sense.

Traditionally, food animal practitioners are responsible for herd heath management, biosecurity, disease identification, and individual animal procedures. Increasingly, however, food animal practitioners monitor herd and individual animal performance and feedback through data collection, analysis and reporting to the producer. They are also increasingly responsible for monitoring and training animal husbandry employees and working within a team to serve the client.

Another shift occurring in food animal practice is away from individual animal practice toward herd health and consulting. Traditionally, producers sought veterinary services for individual animal disease, injury, or emergencies. Progressively, however, veterinarians are filling consultant roles, as advisors to producers on protocols for herd health, increased production, data analysis, animal welfare, and business practices.

In areas of concentrated dairies and feedlots, it is common for practices with 10 plus veterinarians to form in order to consolidate resources and better serve producers. These larger food animal practices are often owned by a group of partners or shareholders and are governed by a board of directors and managed by a dedicated practice manager.

Areas of consulting include:

- Nutrition
- Biosecurity and disease prevention
- Immune enhancement through vaccine and immunology protocols
- Parasite control
- Genetics
- Reproduction
- Animal husbandry practices
- Record analysis
- Antimicrobial usage
- Quality assurance for products (beef quality assurance, milk quality)
- Facility design
- Production data collection, analysis, and reporting.

In a 2016 survey of American Association of Bovine Practitioners (AABP) members, 7% of food animal practices reported that more than 50% of revenues are derived from consulting activities.[1, p.95]

A rapidly increasing area of food animal practice is data analysis and creating individual animal and herd production for producers. This can create value for the producer and place veterinarians in a position of trust and value.

FOOD ANIMAL VETERINARY BUSINESS BEST PRACTICES

Although food animal practice management is extremely diverse, standard best business practices still emerge. A food animal practice owner or manager should develop expertise in the following areas.

Strategic Planning

Partners, leaders, managers and the staff of the practice should gather regularly to discuss the mission, vision and core values of the practice. This should culminate in identifiable and specific goals for the time period. All aspects of marketing, leadership, key performance indicators (KPIs), and finance should focus around the agreed-upon strategic plan.

Vet-ebooks.com

1.27. Food Animal Practice Management

Marketing

Developing and following a marketing plan can create greater value while focusing efforts to save money. A marketing plan is generally divided into actions directed at established clients and those aimed at prospective clients. Successful food animal practices often communicate with established clients regularly with newsletters, both in print and digital formats. These newsletters update clients on new services, expertise, and training that practice veterinarians can offer. Often, they will share best practices among area producers, creating a community and value to the client. Many food animal practices also hold regular client events with educational seminars hosted by the veterinarians and possibly product representatives.

Marketing to prospective clients includes digital platforms such as a website and Internet-based information. Food animal clients are a small and select group and require targeted information. Sponsoring community events such as county fairs, livestock shows, rodeos, and trade association events can also reach the targeted prospective customer. However, community goodwill and word-of-mouth advertising is still the principal mode of food animal practice marketing. This is achieved by providing excellent customer service to established clients and encouraging them to tell other producers.

Human Resources

Food animal practices are often larger organizations than their mixed animal and companion animal counterparts. This necessitates organized leadership and human resource (HR) management. Roles and responsibility for a HR manager include organization of the workforce, compensation and benefits management, performance appraisals, and employee development and training. Food animal practices often have fewer paraprofessionals per veterinarian and in some practices veterinarians outnumber paraprofessional employees.

Food animal veterinarians are often better compensated than veterinarians of other practice types.[1, p.42] Practice owners and managers should carefully structure compensation packages for maximum incentivization and tax savings. Benefit packages that take advantage of nonwage compensation should be developed and maintained. These include heathcare, retirement accounts, generous continuing education, use of company vehicle, and paid time off. Other incentivization compensation pieces, such as profit sharing, individual client growth, and partnership status within the organization, are common in food animal practice and should be considered by progressive managers and owners.

Employee motivation and goal setting is also an important aspect of successful food animal practice management. Because the food animal practitioners often work long hours in physically demanding environments, leadership becomes critical. Moreover, associate veterinarians are often separated from the practice for the majority of their day, and providing open channels with regular communication and focus is important.

Finance

Successful food animal practice managers and owners will regularly view and analyze business financials. Because of the variability in practice types and small relative number of food animal practices, comparative analysis and benchmarking across practices is not readily available. However, historical financial analysis of a given practice can be very beneficial.

There are certain key metrics to derive from financial statements. Total revenue should be categorized into the following:

- **Revenue generated by activity:** Amount of revenue by product sales, professional services, ambulatory services, and consulting services and their historical trends, for example, are essential to determining the strength of the business.
- **Revenue generated by veterinarian:** This will show individual veterinarian production and can help to establish where efforts should be focused.
- **Revenue by client:** Because food animal practices generally regularly serve a small numbers of clients, tracking revenue by client can help determine on which clients to focus efforts.

These expenses categories of the practice are monitored most closely:

- **Labor costs:** The largest expense in most food animal practices is labor. Tracking veterinary and paraprofessional labor expenses regularly and as a percentage of revenue is essential for practice financial health. Seasonal variability must be understood and managed for long-term success.
- **Cost of goods sold (COGS):** This expense is highly variable in food animal practices. Some practices rely heavily on product sales from both in-practice retail and off-the-truck sales to producers. These items generally have low markups but can generate large amounts of revenue based on volume. Tracking the cost of goods as a percentage of revenue is necessary to determining financial health of the practice. Regular COGS percentage tracking can identify issues with missed charges, shrinkage, and incorrect pricing. If the percentage of COGS is increasing, then a detailed analysis of the markup percentage, items sold, and ordering history is warranted. For food animal practices that offer large amounts of products to producers, the profitability and long-term success of the practice is often determined by the COGS.
- **Accounts receivable:** The amount owed to the practice is another key metric that can easily cause financial detriment without careful attention. Prudent food animal practice owners and managers will track and manage and update their accounts receivable regularly (see 8.9 – Accounts Receivable Issues).

After historical analysis of financial indicators, a prospective budget, accounting for the projective growth or decrease in revenue should be developed and approved by the practice owners. Successful food animal practices use the annual budget process to implement strategic planning decisions (see 8.21 – Controlling Cash Flow – Budgeting).

Other KPIs that are specific to food animal practice include:

- Active clients per veterinarian
- New clients per veterinarian
- Lapsed clients per veterinarian
- Diagnostic testing costs percentage as a percentage of revenue
- Product sales as a percentage of total revenue.

Lastly, variable external expense factors affect food animal practice more so than companion animal and mixed animal practices. For example, fuel and vehicle costs tend to be variable and fees should be adjusting accordingly. Regular fee adjustments based on distributor and manufacturer pricing should also be scheduled and performed regularly.

Software

A robust practice information management software (PIMS) package is essential for successful medical recordkeeping, herd health analysis, client communications, invoicing, and accounting. Traditionally, server-based PIMS systems were run at the food animal practices' office and ambulatory practitioners or technicians entered medical records, notes, and invoicing after returning from farm calls. Some server-based systems had laptop-based programs that could be taken in the field, then uploaded and integrated back into the server upon return. Some food animal practices modify producer-based herd management systems for practice management use. Cloud-based PIMS are becoming more robust and feature-rich for ambulatory and mobile practices. Cloud-based PIMS do need Internet access to fully function, but widespread use of wi-fi and mobile hotspots allow real-time access to databases from many producer locations.

Vet-ebooks.com

1.27. Food Animal Practice Management

EXTERNAL ECONOMIC FACTORS

Food animal veterinary practices are more susceptible to external economic factors than their companion animal counterparts. Many external factors affect the demand for veterinary services and thus the profitability of food animal veterinary practices.

- Domestic and international demand for animal proteins drive production at the farm level, and changes in production levels directly affect the market for veterinary services, more so for smaller producers.
- Commodities prices, in the form of inputs to producers, such as cost of feedstuffs and fertilizers, can affect the producers' demand for veterinary services.
- Consumer behavior, habits, and fears, such as the marked decrease of beef consumption during a disease outbreak, or the overall consumer trend away from red meat to fish, have an impact.[1, p.25] This is evidenced by projections of supply increases in swine (9.9%), poultry (20.8%), and turkeys (12.6%), relatively small projected increases in cattle (2.9%), and decreases in dairy (1.7%) and sheep (6.4%).[2]
- Localized weather patterns can also affect food animal practice revenue and profitability, because of feeding and movement during drought, severe cold, or heat periods.
- International trade factors, tariffs, and disease-related trade restrictions also affect food animal practice. International trade is a major driver of producers' profitability and thus food animal practice revenue.
- Large-scale consolidation in the farm sector of the economy is necessitating changes in many food animal practices as the numbers of clients decrease, but the overall services required of larger producers increase.

Progressive food animal practice owners and managers should track and understand the external factors that can influence their practice and make decisions according to retrospective analysis and best projections. Typically external economic factors are cyclical and temporary but do create issues for managers.

BILLING AND FINANCIAL ISSUES

Food animal practices have historically billed as a "fee for service" model, which means that the client is billed when they call the practice and a veterinarian provides individual animal services and products. As producers consolidate into larger entities and food animal practices shift to herd health and consulting business models, some have begun to change their billing practices to retainer-type fees. Using a retainer-billing model, the client and practice enter a contract where a flat fee is paid for regular visits, services and possibly some products. Here the practice needs to be aware of their costs and the amount of time required for the client, but overall a retainer fee arrangement can simplify billing and save time in the field.

Other progressive fee models include hourly billing for consulting time, protocol development, and training of herdsmen and other employees of the client.

Traditionally, food animal practices carry inventory both in the office and "on the truck" for sale to producers. These are generally vaccines, parasiticides, and antimicrobials. These products are generally of large quantities, relatively expensive and have short expiration dates. They also have specific temperature and handling specifications, which can be difficult to adhere to in an ambulatory vehicle. With the popularity of Internet shopping and expedited delivery, the competition to veterinary practices has dramatically increased and thus potential markups on products has decreased. Additionally, nearly 51% of food animal veterinarians report competition from route trucks delivering supplies, and 26% report competition from technical service veterinarians employed by distributors or manufacturers.[1, p.91]

Some food animal practices have stopped carrying products, some continue to carry the products as a client service gesture, and some have gone to "off-the-truck" delivery, or scheduled delivery from a practice service provider or package delivery service. This reduces the need to carry large amounts and varieties of product but keeps some revenue in the practice.

EXAMPLES

N/A

CAUTIONS

ETHICAL RESPONSIBILITIES

Food animal veterinarians and practices have increased ethical responsibilities due to their role in food safety. They also hold a position of trust in disease identification and control. For example, making a facility's disease public knowledge may be financially devastating to a producer. At the same time, other clients need to have knowledge of biosecurity risks in the area. This requirement of confidentially while serving other area producers and clients can place food animal practices in a precarious ethical and legal position. Mishandling confidentially and disease biosecurity situations can lead to large liabilities and financial risks. Food animal practices should have confidentially protocols and ethical discussions to minimize the risks of liability to the practice.

MALPRACTICE AND RISK MANAGEMENT

Many clients and producers are large economic entities with equally large financial implications. Food animal practices face larger risks of liability due to the potential economic damages of negligence and malpractice than their mixed or companion animal counterparts. Food animals are also typically larger and thus more likely to cause human injury to practice employees, clients, and the public. Lastly, food animal practice employees spend more time traveling in ambulatory vehicles, increasing the risks of motor vehicle accidents. Therefore, malpractice insurance, general liability insurance, worker's compensation, and used and unowned vehicle policy limits should be maximized and maintained as current.

A major source of legal liability and risk to food animal practice is drug residues in foodstuffs such as meats and milk. Food animal practices should have strict drug use policies for veterinarians and producers. Multi-doctor practices should also implement and follow policies on judicious use of antimicrobials, extra-label drug use, and VCPR requirements to minimize risk to the practice at large.

Food animal practices must comply with the Food and Drug Administration regulations concerning medically important antibiotics in feedstuffs (see 9.17 – Veterinary Feed Directives). To comply with VCPR and Veterinary Feed Directive (VFD) requirements, food animal veterinarians must maintain state licensure in all states where animals are housed and feed according to VFD.

1.28. MIXED ANIMAL PRACTICE MANAGEMENT

BASICS

OVERVIEW

A mixed animal veterinary practice is defined as a practice that services varied species, with at least 25% from companion animal contacts and at least 25% from food animal or equine contacts.[1] Mixed animal practices serve a wide variety of clients and animals, leading to a diverse and varied day but also inherent management challenges.

TERMS DEFINED

Mixed Animal Veterinary Practice: At least 25% of the client contacts are companion animal and at least 25% are either food animal or equine.

ISSUES AND OPTIONS

Managing a business with a broad variety of services and products is inherently more complex than a more focused revenue stream. This increased complexity is the result of several distinct factors.

- Clients and animal owners are diverse in terms of backgrounds, incomes, and uses of their animals. This creates a need for varying customer interactions and product offerings.
- Employees need to have had more broad experience, training, and development. Although employees of larger mixed animal practice can focus on a practice type or species, every team member must be cross-trained and minimally competent in all of the practice product and service offerings.
- Equipment and facility must be more diverse, which requires more capital investment, maintenance, and upkeep.
- Inventory and product offerings must be more diverse, requiring additional capital investment and management.
- As veterinary medicine progresses and the collective body of knowledge grows, a mixed animal practitioner must learn relatively more to maintain practice to the standard of care.

For these reasons mixed animal practice management is more complex and practice profitability is less than species-focused veterinary practices. However, mixed animal practices are a strong component of the veterinary industry and remain a strong draw to joining the profession.

In the United States, mixed animal practices produce approximately $4.5 billion.[2] This comprises about 12% of total veterinary services. Approximately 6% of veterinarians are employed in mixed animal practices in the United States and about an additional 15% are employed in food animal-predominant or companion animal-predominant practices.[1]

On average, mixed animal associates and owners work more hours than their counterparts in companion animal, food animal, and equine practices.[3] They also earn less professional income than companion animal-exclusive and food animal-exclusive practitioners.[3]

The average mixed animal practitioner spends about 30% of their time on dogs, 15% on cats, 10% on horses, 10% on beef cattle, 2% on sheep and goats, 1% on dairy cattle, and 0.5% on swine.[3]

These numbers and statistics show that mixed animal practitioners and their practices serve a very diverse patient population, thus creating management challenges. However, living and working in smaller communities or rural areas is often a lifestyle choice for the veterinarian and their family. Mixed animal practice leaders should embrace the variation in case-load and small community lifestyle when recruiting and retaining talented associates and employees.

COST OF GOODS SOLD

Successful long-term management of a mixed animal practice requires profitability. The factors that most heavily influence profitability are revenue and the variable expenses of cost of goods, veterinary labor, and paraprofessional labor.

Generally, cost of goods is tracked and measured as a percentage of total revenue. The percentages of costs of goods in well-managed mixed animal practices ranges from 18% to 35% depending on the species mix, the amount of ambulatory services, and product sales.

The more companion animal services that the mixed animal practice provides, the lower the benchmarks are for cost of goods. The percentage of costs of goods is influenced by expired product, shrinkage, and prices paid to vendors or distributors.

Other common factors that contribute to a higher than benchmarked cost of goods percentage are improperly priced items, missed charges, or improper discounting. These factors lead to lower revenue and a higher percentage. The mixed animal practice manager must track and manage these factors as a direct correlation to profitability. The wide variation in species, conditions, and medicine creates difficultly in stocking inventory items efficiently. The following are techniques that can reduce the cost of goods sold.

- Tracking inventory turns will aid in determining which products to stock, how much and for what season.
- Just-in-time inventory management, leveraging next-day shipping from distributors can help minimize stocked items.
- Careful consideration should be given to medications that are needed immediately and to those that can wait 1–2 days for client pick-up.
- Practices should consider online-based retail pharmacies that are controlled by the practice and drop ship directly to the client. These services can help the practice retain some of the revenue of the medications without stocking the inventory item while still providing good customer service.
- Medications that are rarely used, are expensive, are needed in emergencies, and have short shelf-lives can be split with local practices that specialize in the labeled species.
- When starting an analysis of inventory costs start with the top 50 invoice items by revenue and the top 50 inventory items measured by expense. Identifying and starting with the most commonly used and bought items will make the largest difference first and help an otherwise very tedious task.
- To help with shrinkage, move large quantities of expensive products to a limited access, locked storeroom. It is essential to count, audit, and track inventory regularly, between once monthly and once quarterly.
- To reduce missed charges, first identify where and by whom charges are not being entered. Most commonly this is in hospitalized patients, in large animal working areas, and on ambulatory calls. Flow charts that follow a patient through the hospital with common charges for highlighting or circling, either on paper or digitally, can drastically reduce missed charges. On ambulatory visits or in large animal areas, use patient visit report forms printed on carbon copy paper to reduce time, give client instructions, and create a record for the technician or receptionist to enter and invoice.

In sum, overstocking, undercharging, and shrinkage of inventory are the most impactful drivers of low profitability in mixed animal veterinary practices. Generally, services are much more profitable for a mixed animal practice.

HUMAN RESOURCES

Labor is usually the largest expense at a mixed animal practice. Labor can be divided into paraprofessional labor, which includes all nonveterinarian staff, and veterinary labor, which includes licensed and practicing veterinarians. Some practices will include a third category of labor compensation for management personnel. Veterinary

Vet-ebooks.com

1.28. MIXED ANIMAL PRACTICE MANAGEMENT

compensation generally comprises 18–30% of total revenue, depending on the amount of ambulatory services and product sales that comprise a practice. Paraprofessional labor expense generally comprises 18–25% of a practice's total revenue.

Together over 40% of all revenue is spent on compensation and truly makes human capital both the largest expense and biggest asset of a mixed animal practice. The cost of employee turnover is often concealed, but is excessive in most mixed animal practices. Therefore, practices should focus management time on hiring, training, developing, and retaining long-term productive team members.

Practice owners and managers that make time and financial investment in developing and training the veterinary and staff team generally are more successful and profitable.

Leadership, guidance and development of team members is essential for successful mixed animal practice management. Leadership books and training generally focus on clear expectations, regular feedback, and consistent accountability by leaders. Many leaders constantly focus on clear and concise communication and seeking feedback and ideas from team members. Other successful leaders concentrate on understanding and answering the legitimate needs of employees while differentiating them from wants.

Scheduling of employees and appointments is a regular challenge of mixed animal practices. This is due to the ambulatory, emergency, and unpredictable nature of practice. Some team members will be more skilled and knowledgeable for areas of practices and even particular clients. Regular and consistent scheduling of types of appointments and team members will help the team and clientele alike.

AMBULATORY MIX

Ambulatory visits to houses, barns, facilities, and ranches are an important component of mixed animal veterinary medicine. The reasons that clients prefer ambulatory medicine include convenience, less stress on the animal, inability to transport, impracticality to transport, and lack of adequate facilities at the mixed animal practice. In general, the less time the mixed animal veterinarian spends in transit, the greater revenue that they can produce. For solo and two-doctor practices, this becomes an impactful issue because of the fixed costs associated with the practice sitting relatively inactive while the veterinarian produces less revenue. As practices grow to four or more full-time equivalents (FTE), profitability increases partly because of the ability to greater leverage fixed costs. When pricing the charge for an ambulatory visit, the practice should consider opportunity costs in the hospital, transportation costs, and time of staff and labor.

The cost associated with transportation is increasing, including capital outlay for a capable vehicle, depreciation of the vehicle, fuel, and maintenance costs. These costs should be factored into pricing the ambulatory visit; however, it is unlikely that the market will bear the entire cost to the practice.

INCENTIVIZING CLIENTS TO "HAUL-IN"

Emergency Medicine

Mixed animal practices commonly provide emergency services. Emergency and after-hours care is an excellent customer service, often providing better patient care and generally being profitable to the practice. However, providing emergency services is a major cause of burnout and fatigue, ultimately leading to individuals leaving mixed animal practice or veterinary medicine entirely. The following factors can balance the necessities of mixed animal emergencies:

- Practices with four FTE veterinarians report less burnout and fatigue than smaller practices, possibly because of the reduced workload and ability to rotate the on-call schedule.
- Consider a veterinary-trained answering service to triage and forward after-hours calls only after the client has agreed to the emergency fee.
- Create an on-call schedule for technicians and assistants to aid the veterinarian during after-hour calls, provide better patient care, and expedite the call.
- Compensate employees with all or a percentage of the emergency fee to incentivize accepting the emergency.
- Watch for signs of anxiety and burnout and provide weekday breaks for those on weekend call.

COMPENSATION OF VETERINARIANS

A high percentage of mixed animal associates (60%) are paid on salary compensation, whereas their companion animal associate counterparts and a few mixed animal associates are paid on salary and production compensation or straight production compensation.[4] Straight salary tends to be easier to calculate, is more predictable for both parties, and does not incentivize competitive behavior among associates.

- Straight production compensation packages do not provide a safety net or base for the associate, although they ensure the practice that the associate will not be overpaid.
- "Base or production" compensation packages provide a base salary to the associate but allow associates earn production compensation once the production threshold is met. "Base or production" can be thought of as a hybrid of straight salary and straight production compensation packages.
- Straight production and "base or production" compensation is more time consuming to calculate, requires the provider of each transaction to be recorded correctly, and can incentivize price gouging and competitive behavior by the associates.

Many services and products in mixed animal veterinary medicine have different markups and profitability. Setting singular production percentages across all products and services has the effect of creating losses to the practice for some transactions and windfalls for the associate on others. Before setting associate production percentages a mixed animal practice must know and understand the markups and profitability of commonly used items and services. Because of the wide variation in practice species and product service mix it is difficult to create one-size-fits-all compensation packages.

Taxable and Nontaxable Compensation

Mixed animal veterinarians and staff in the United States pay income tax and payroll tax on compensation that is reported on their IRS W-2 form. Regular salary, production compensation, and bonuses are required to be reported. As a general rule, all compensation and benefits that flow from an employer to employee is reportable W-2 wage compensation. Congress and the IRS, however, have created exceptions from reportable compensation. The following are nontaxable benefits that are common to associates in mixed animal practice:

- Health insurance, health savings account (if applicable), retirement account, liability, disability and life insurance, cost of travel, lodging, registration and meals for continuing education, state licensure, DEA registration fees, cell phones (primarily business), national and local association memberships, Veterinary Information Network (VIN) or other educational platforms, vehicle expenses or allowance, use of lodging (if required for employment), paid vacation, sick and continuing education leave.

CLIENT SERVICE AND SATISFACTION

A mixed animal practice owner or manager should realize that client service and satisfaction are keys to long-term success and profitability of the practice. Team culture should center on service to the client and their animals. Once that is established, other factors will then become easier to manage and control.

MARKETING

Due to their location in small rural communities, many mixed animal practices market via community outreach and involvement campaigns. Most common are sponsorships in youth or school-related events, local sporting or entertainment events, area livestock or equine-related shows or performances, and overall community involvement such as the local Chamber of Commerce, church and school activities, or local government.

Vet-ebooks.com

1.28. Mixed Animal Practice Management

This leads to individual relationships and word-of-mouth advertising generating goodwill within the community. However, the more mobile or transitory a community is, the greater the return on other forms of marketing. Web or digital-based marketing, such as websites, listings on search engines services, map-based and direction services, for example, usually generate good return on investment in mixed animal practice. Social media advertising and marketing should also be a part of any marketing plan. In addition, print advertising such as local newspapers or community guides can generate client visits in some communities.

Internal marketing programs are essential to long-term success. The most common are reminder systems, notifying clients of upcoming wellness examinations, vaccinations, dental procedures, and other preventative medicine. Large animal client development programs are also commonly successful. These include education events, invited speakers, social events, youth programs, and other community building events.

Practice owners and managers should develop a marketing plan based on the type of client they are marketing to, existing or potential, and the type of client that they want to reach. At times this will involve separate and distinct marketing efforts to distinct market segments.

A mixed animal practice should build on the community that is naturally formed around clients and their pets, animals, livestock, and livelihoods. In many communities the mixed animal practice becomes a center of commerce and community. The veterinarians become leaders in the community, generally active in youth programs and other social events. This is excellent goodwill and marketing, leading to consistent client flow, but requiring constant internal focus on customer service, revenue capture, and expense management.

PRACTICE MANAGEMENT SYSTEM

A robust and versatile practice information management system (PIMS) is essential for mixed animal practice management. The PIMS software must be flexible, with data input for multiple species, owners, and caretakers. Within the software program, the practice should develop a system for tracking over-the-counter product sales for herd health.

Medical recordkeeping systems that can track herd health, individual patients, and owners with multiple species are essential. Electronic medical records (EMR) can aid in efficiency, transportability, and security of medical recordkeeping.

In a PIMS and EMR system, robust reporting capability is essential. Reporting, key performance indicators (KPIs), and metrics are discussed below.

Managers should focus on PIMS with workflow automation, reduced clicks for common tasks, and streamlined steps. Proper selection and utilization of the PIMS can reduce staff labor by creating more efficient workflows. Most PIMS packages are grossly underutilized by mixed animal practices, leading to inefficiencies, increased expenses, and reduced revenues.

Proper inventory tracking within the PIMS is particularly important for mixed animal practice management.

EXAMPLES

METRICS AND KEY PERFORMANCE INDICATORS

Mixed animal practices are complex and relatively difficult to manage compared with single type practices. An old business adage is "You can't manage what you don't measure." Tracking of KPIs is vitally important to mixed animal practice management. Unfortunately, benchmarking data is rare and can be misleading due to the wide variation in mixed animal practices' species mix, and haul-in and ambulatory mix. These factors are largely dependent on factors outside the control of managers, such as location, demographics, and clientele. However, studying the reasons for data variation within benchmarking and how they apply to the individual practice is important for effective practice management.

KPIs pertaining to revenue include revenue by category, revenue by species, revenue by FTE doctor and individual doctor, discounts, and missed charges. Expense metrics should be tracked as an aggregate dollar and as a percentage of revenue and these include professional veterinary labor expense, paraprofessional staff labor, cost of goods sold, and fixed cost.

Client and patient numbers should be tracked and these should be broken down by species and by in-hospital or ambulatory examination. KPIs to consider include new clients, active clients, lost clients, patient visits by doctor, and sources of new clients.

Accounts receivable in a mixed animal practice can be a very detrimental financial indicator. Mixed animal practices should track accounts receivable by species, by doctor, as well as by the total and aging reports.

Other KPIs that significantly impact financial performance include total paraprofessional and overtime hours as well as the total number of paraprofessional hours per transaction per species. This ratio will give the manager trending data on the efficiency and time available to spend with the patient and client.

SERVICE PRODUCT MIX

Regarding staff employment, mixed animal practices employ fewer paraprofessional staff than their companion animal-exclusive or food animal-exclusive counterparts.

CAUTIONS

LIABILITY AND COMPLIANCE

Employment in a mixed animal veterinary practice can be dangerous work. Common injuries to employees include those caused by lifting heavy objects, injury due to inadequate working facilities, scratches, bites, and kicks from fractious animals, motor vehicle accidents, and heat stress. A mixed animal practice owner or manager should understand and mitigate these risks.

Other less common but devastating injuries include exposure to cytotoxic drugs and radiation during pregnancy or otherwise, and exposure to zoonotic disease.

FOOD AND DRUG ADMINISTRATION

Regulations that commonly affect mixed animal practitioners include food animal residues from either banned or restricted drugs in food animal practice. Always check labels, known residues, provide client information, and obtain consent before prescribing or dispensing medications to food animal species.

- Mixed animal practitioners must have knowledge on how to legally issue Veterinary Feed Directive orders and properly create the medical record (see 9.17 – Veterinary Feed Directives).

DRUG ENFORCEMENT ADMINISTRATION

Proper storage, transportation, tracking and recordkeeping of DEA controlled drugs is a common source of potential liability for mixed animal practices. It is essential that correct controlled drug procedures are followed at all times.

Similar risk management and liability insurances are needed for mixed animal practices, with the exception of commercial vehicle policies for practice-owned vehicles and unowned and used vehicle policies for use of owner and employee vehicles due to the mobile nature of mixed animal practice.

Occupational Safety and Health Administration (OSHA) potential safety hazards are often found in mixed animal practices. Commonly included are cytotoxic and hazardous chemicals and drugs. This

Vet-ebooks.com

includes chemotherapy drugs, prostaglandins, anesthetics, and immunosuppressive drugs. Cleaning agents, needles, sharps, and other hazards pose additional safety hazards.

To mitigate these risks, protocols for handling should be developed and employees should be trained on the hazards and how to handle spills and other events. Employees should have access to and be required to wear personal protective equipment when handling possible hazards. Potential exposure to radiation, chemotherapeutics, and prostaglandins should be eliminated for pregnant or nursing women.

Section 2

Administrative Management

Vet-ebooks.com

2.1. WORKPLACE MANAGEMENT

BASICS

OVERVIEW

• Workplace management is about balancing the needs of those receiving care through the hospital with those providing the care.
• Building the support infrastructure into the practice business model is essential for this purpose, and can make the difference between the business strategically driving outcomes, or the outcomes driving the business.
• Most veterinarians are trained to deal with healthcare issues and are not necessarily trained in how to manage the business aspects of the workplace, but a hospital cannot survive and thrive without both aspects being managed effectively.

TERMS DEFINED

Economy of Scale: The reduction in cost per unit that results when operational efficiencies allow increased production. Thus, there is an increase in savings because as production increases, the cost of producing each additional unit decreases.
Economy of Scope: The reduction in costs of operations when a company enters two or more markets where the operations in one market can be used to make operations in another market more efficient.
Holacracy: A flat organizational structure in which authority and decision-making are controlled by self-organizing teams rather than by a management hierarchy.
Open-Book Management: The premise that employers should share with employees the measures of the practice's business success so that employees better understand the efforts that impact the success of the business.
Profit Center: A section of a practice that can be assessed in terms of its revenues and expenses (e.g., surgery, imaging, or laboratory).

ISSUES AND OPTIONS

ATTITUDINAL DIFFERENCES

• It is important to realize that operating a for-profit veterinary hospital is done with the intention that the business should be profitable.
• Although this is true, veterinarians often perceive that there must be some charitable component to the business, which partly explains the relatively low salaries not only of veterinarians, but also of the other positions employed by the hospital.
• Partially associated with this attitude is the misconception that clients do not want to spend money for veterinary care. There is abundant evidence that pet owners spend more money on their pets with every passing year, although it is clear that the growth in spending on veterinary care may be much less. This implies that clients might not be recognizing the value in the veterinary care offered, rather than a reluctance to indulge their pets in appropriate veterinary care.
• The main impediment to growth in veterinary spending is likely a failure on the part of the veterinary profession to communicate effectively with clients about the importance of following recommendations, and perhaps the value of those services being offered.[1] Improving communication skills is the most effective way to increase revenue generation in veterinary hospitals.

BUSINESS MODEL DIFFERENCES

• The current business model for veterinary practices in the United States is to have many small primary care hospitals serving communities (see 1.1 – Models of Veterinary Practice).
• Most of these practices have relatively few full-time equivalent veterinarians and limited opportunities to grow substantially, other than by mergers and acquisitions.
• Each hospital has essentially the same types of services to offer, and the same types of equipment.
• Accordingly, there are relatively few opportunities to improve economies of scale and/or scope, which makes it difficult to be more competitive in pricing.
• Because of high fixed overhead costs and the necessity of providing some services that might not be profitable, hospitals sometimes engage in pricing that makes little sense from a profit center perspective (see 7.12 – Pricing Strategies).
• Staff are often confused by veterinary pricing schemes, and if they are not certain where the value is delivered, then they are likely to be less than convincing when delivering that message to clients.
• Partially because of the confusion with the veterinary business model, there is often a dichotomy between the goals of practice owners and managers who are seeking to maximize revenue generation, and associate (employed) veterinarians and nonveterinary staff who are often most concerned with meeting the needs of clients while saving them money.

GENERATIONAL DIFFERENCES

• It is natural for there to be differences in attitude among generations in the workplace, but the veterinary business model often makes it difficult to reconcile some of these differences within veterinary hospitals (see 1.13 – Generational Differences).
• Currently, many of the veterinary hospitals in the United States are owned by the Baby Boomers and Generation Xs, but most young

Vet-eBooks.com

veterinarians in the marketplace are Generation Y (Millennials), and they already account for more than half the employees in most practices. While most attention is focused on Millennials, veterinary practices are starting to see Generation Z (iGeneration) individuals entering the marketplace, especially for receptionist and paraprofessional positions.

- Millennials tend to set high standards for themselves, but in return they expect their work to be fulfilling, and they have hopes that they will receive mentorship, clear career path advice, ongoing training and education, and a workplace that blends well with the rest of their life.[2]
- Millennials represent the largest population of pet owners as well as veterinarians, but there are concerns that today's veterinarians do not appear to be that interested in practice ownership and those changes are very apparent. In 2006, 53% of veterinarians surveyed aspired to veterinary practice ownership, but by 2016, that number had dropped to 30%.[3]
- Currently, the majority of pet owners in the United States are Millennials, so the veterinary workplace needs to change to meet the needs of this demographic.

GENDER DIFFERENCES

- It is an inescapable fact that there is a major demographic shift in the veterinary profession as far as gender is concerned.
- In most veterinary schools in the United States, over 70% of the classes are female, with some schools approaching 90%. Although men used to predominate in the profession, that is no longer the case and the current population of licensed veterinarians is close to parity between the sexes. And women are bound to predominate in the years ahead if current student ratios persist.
- Regarding practice ownership, nearly 60% of practice owners are male, whereas almost 75% of associate veterinarians are female.[4] The salaries of female veterinarians seem to lag behind those of their male counterparts, but males typically work longer hours.
- To date, it is unclear what effect this demographic shift in the profession will have. At present, it does not seem to affect practice ownership as men were actually less likely than women to aspire to practice ownership.[3]
- In the United States, new graduate veterinarians are more likely to be female, veterinary technicians/nurses are more likely to be female, and receptionists are more likely to be female, so whatever changes come with the female predilection for the profession are likely to be magnified in the years ahead.

OPEN-BOOK MANAGEMENT

- The premise of open-book management is that organizational business information shared with employees not only helps them to do their jobs better, but helps them understand their role in the company and the company's ultimate success.
- It is important to realize that open-book management does not require business owners to share sensitive financial data with staff. In most instances, the information presented may be productivity ratios, or key performance indicators (see 7.8 – Key Performance Indicators) that allow employees to see how their overall efforts are reflected, positively or negatively, in the company's financial performance. For example, if the company's target is to keep nonveterinary wages below x% of total revenue, it is easy for everyone in the hospital to check if things are on target if they have access to this statistic.
- When employees understand the metrics of business success for the hospital, it is easier for them to appreciate how altering their performance to move those numbers in the needed direction can improve outcomes for all concerned.

CHANGE MANAGEMENT

- The care of pets is changing profoundly and it will be the ability of veterinary hospitals to change along with it that will ultimately determine the success or failure of many veterinary hospitals (see 2.7 – Change Management).
- For many years, practices have been perhaps over-reliant on revenues from product sales, which allowed them to undercharge for professional services while keeping overall profitability stable.
- With the advent of the Internet, and many products entering the retail channel, it has been challenging for veterinary hospitals to consider pricing their products competitively now that the marketplace is much more transparent.
- This poses a concern for the overall business model because veterinary owners are now going to have to be much more aware of individual profit centers and be prepared to price their professional services much higher than they have done previously.
- In addition to pricing issues, veterinary practices will need to be more responsive to the needs of pet owners. This includes taking a lifelong perspective to healthcare needs, rather than concentrating on individual transactions (see 4.9 – Lifelong Excellence in Healthcare).
- To be effective, all employees will need to be aligned around the common hospital mission, and will need to effectively charge clients for the value they receive.

Vet-ebooks.com

2.1. WORKPLACE MANAGEMENT

• Telehealth options are likely to be more important to the veterinary business model as veterinary teams seek to provide services requested by clients (see 4.24 – Telehealth).
• New business models are being contemplated in some sectors, including self-management models like holacracy. While on the surface, it might appear that such systems lack structure, in reality, the teams are the structure, the teams govern themselves, and leadership tends to be distributed among roles rather than individuals.[5] There are a variety of such self-management terms (e.g., podularity, circle, cabal, etc.) and some are bound to take root in the veterinary workplace.

WORK-LIFE BALANCE

• Everyone functions better with appropriate work-life balance, but this can be difficult in veterinary practices where profitability is a concern.
• Some of the issues are generational in nature, yet they cannot be ignored. Members of the Baby Boomer generation that started many of the veterinary practices currently in existence were used to working long hours with few niceties, and there might be some resentment among Millennials who might not share the same motivations.
• On the other hand, we are at a crisis point, with new graduates who value work-life balance but have relatively meager starting salaries, given the student debt they likely need to service.[6]
• Despite this issue and the fact that there is no shortage of veterinary clinicians, veterinary schools have actually increased the number of graduating students, and new veterinary schools are under consideration, creating additional concern for the future of the profession.[7]
• The salary concerns do not end there. Many veterinary paraprofessionals and receptionists do not make enough money for them to be considered independent and able to regard their job as a career that would allow them to own a home and make a living in their work position.

REGULATORY COMPLIANCE

• Although veterinary medicine in many respects is a "mom-and-pop" industry, hospitals still need to be accountable for many aspects of practice.
• Product dispensing and administration is the largest revenue center in most veterinary hospitals, but is tightly governed in the United States by a variety of laws and agencies, principally the Food and Drug Administration (FDA) for prescription drugs, the Environmental Protection Agency (EPA) for over-the-counter medications such as many flea and tick-control products, and the US Department of Agriculture (USDA) for pet foods.
• Hospital employees are protected under many different laws that regulate pay, conditions, and allowed work hours. The workplace itself warrants safety precautions, most regulated by the Occupational Safety and Health Administration (OSHA).
• Operating a business contrary to any of the current regulations is not only improper and can lead to fines and other punishments, but also undermines the sanctity of the workplace for all who work and do business there.

2.2. ORGANIZATIONAL CHARTS

BASICS

OVERVIEW

An organizational chart is a visual representation of the positions within the veterinary practice team and how communication should flow among these different positions. The resulting picture illustrates the various levels of management, from the floor workers with a small amount of authority on one end, to the practice owner as the highest authority on the other. The organizational chart typically resides in the employee handbook or policy manual.

TERMS DEFINED

Associate Veterinarians: Veterinarians who work for the practice but do not have any ownership in the business.

Board of Directors: The collective ownership or overseers of the practice.

Employee Handbook (Policy Manual): Document that describes the employment policies of a specific employer, describing what the employer expects of the employee, and what the employee can expect from the employer. This term puts the focus on the audience of the document so that it is produced for the employees.

Floor Workers: People on the veterinary team who are doing the hands-on work of a veterinary practice. These people are not involved in the management of the business, but instead are the first line for taking care of the patients and clients.

Hierarchy: Classification of people in accordance to their professional standing or position of authority.

Hospital Administrator: Typically a person in leadership who understands the owner(s)' strategic plan, and directly assists in guiding the business in that direction. This position is typically seen in larger hospitals with 30 or more employees.

Lead Position (Shift Lead): The first level of management, the person who becomes responsible for providing the closest observation of the floor workers. This person still works their assigned floor position for the majority of their time. They may oversee a certain position on the team or a certain area of the facility. Typically, they serve in a leadership role in the event of a crisis during their work shift, particularly if the practice is open nights and/or weekends.

Management: In this context, the combined efforts of the people responsible for overseeing the production of the employees and operations of the facility. There can be multiple levels of management depending upon the size of the facility and how many people it employs (i.e., a very large practice can have a hospital administrator, a practice manager, and an office manager in place).

Office Manager: Typically a person in leadership who is responsible for the operation of the front office of the practice and the performance of the client service team.

Policy Manual (Employee Handbook): Document that describes the employment policies of a specific employer, describing what the employer expects of the employee, and what the employee can expect from the employer. This term puts the focus on the content of the document, and the policies existing within the document.

Practice Manager (Hospital Manager): Typically a person in leadership who is responsible for the overall operation of every area within the facility and the human resource functions for the entire staff of a hospital that employs 6–30 employees.

Supervisor: The person responsible for overseeing a larger number of people or larger area of the facility than the lead position. This person continues to work some of the time on the floor, but the majority of the time they are involved in the management of the business.

ISSUES AND OPTIONS

It is necessary for communication to flow in both directions on an organizational chart to achieve a well-managed business.

- In a small practice, the flow of communication is easily understood, as the "boss" or practice owner can discuss and announce decisions to each individual on the team. At this size, it is likely that everyone knows how to perform every position needed in the facility, from running the front office, to assisting the veterinarian, to providing animal care and medical support (Figure 2-2-1).
- As the practice grows, and more associate (non-owner) veterinarians are hired, the number of support staff increases. Oftentimes position specialization begins to happen as well. There are a few employees who stay up front to excel at running the office, there are a few employees who concentrate on assisting and animal husbandry, and there are a few employees who provide nursing care to patients and medical support to the veterinarians. It becomes more difficult for the boss to individually inform each person about changes and solicit appropriate feedback, so a "point person" is established. This is typically an office manager or practice manager, and this person relays the decisions or questions from the boss to the employees, and vice versa (Figure 2-2-2).
- As each area grows, it becomes necessary to have someone who is working that specific position or area keep an eye on productivity and efficiency for that inner team. This is when the practice may develop a supervisor for that area. The manager relays information to these supervisors, who then relay the information to the team members who directly report to them (Figure 2-2-3).
- Communication takes on many forms, and needs to go in both directions. The organizational chart depicts the flow of communication from the boss or upper levels down to the subsequent levels when information is relayed. The chart also functions when there

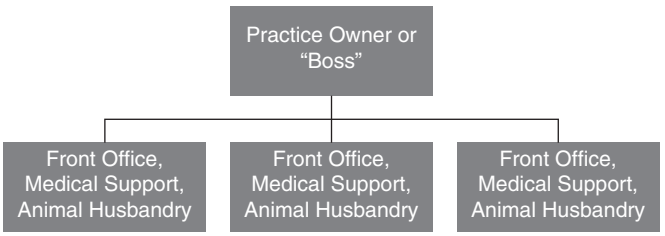

Figure 2-2-1.

Organizational chart for a small practice.

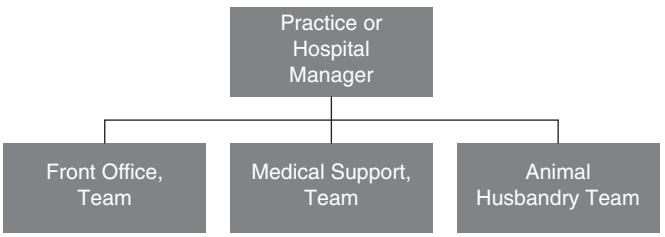

Figure 2-2-2.

Vet-eBooks.com

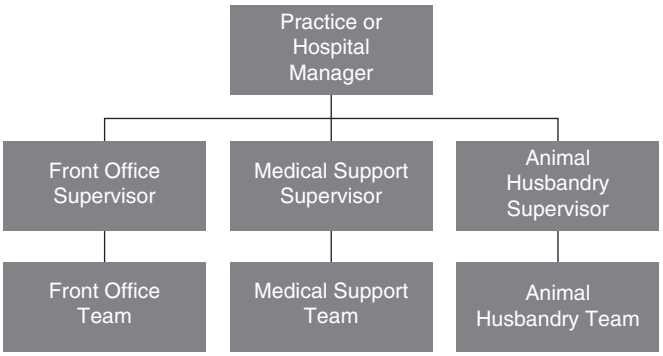

Figure 2-2-3.

Organizational chart for a large practice. Note: the practice/hospital manager answers to the practice owner or board.

is an issue or problem to demonstrate to the employee who to seek first when trying to resolve the issue. If a member of the front office has an issue, they know to go first to their lead for that shift or supervisor in that front office area. If needed, that supervisor will take the issue a step further to the office or practice manager. If the issue remains unresolved, then the manager will approach the boss or practice owner.

EXAMPLES

N/A

CAUTIONS

The organizational chart is one of the fundamental human resources tools, but there are concerns including the following:

- A small organization does not necessarily need a chart (Figure 2-2-1) to represent the relationship between the team members. When the organization grows to four or more people total, this diagram needs to become part of the practice's business story.
- When team members are allowed, or encouraged, to communicate with someone other than the person designated by the next "level" of the chart, this can set up a precedent for future communications to be misrouted.
- When team members are allowed, or encouraged, to communicate with a person who is in the second level up rather than the person designated by the next "level" of the chart, the authority of the person at that first level is ignored or damaged.
- The concept of the organizational chart depicting the flow of communication should be stressed, so that team members do not think the main purpose is to dictate who is "over" or "above" others on the chart. For this reason, it is uncommon but can be advisable to flip the chart onto the horizontal axis.

When introducing the concept to the veterinary team, one should not imply that the organizational chart ranks people in regard to their skills, personality, or contribution to the team; instead, it describes a conduit of communication that everyone on the team will benefit from learning and using.

2.3. MANAGING PEOPLE

BASICS

OVERVIEW

Managing people is about developing trust and respect.

- Trust and respect are earned, not granted to a manager.
- Identify dysfunctions that disrupt the efficiency, involve the team to solve the problem, implement the developed solution, and coach the employees to success.
- Successful management involves the integration of leadership skills (see 2.12 – Leadership).

TERMS DEFINED

Culture: Set of shared attitudes, morals, values, and goals that characterizes an organization.
Delegating: Entrusting a task or a skill to another person.
Employee manual: Document that details the policies, procedures, standards of conduct, and expectations for employees.
Empowerment: Authority of power given to someone to do something (carry out a task that has been delegated).
Human Resources: Managing the workforce of an organization as a significant asset. The main component of managing people. Typically refers to hiring, administration, and training of personnel.
Leadership: The means of social influence in which a person can enlist the support of others to achieve a common goal.
Mentor: Team member assigned to a new employee that serves as a trainer.
Open-Book Management: Process of sharing the financial information of the business with employees.
Standard Operating Procedure (SOP): A collection of documents detailing how hospital protocols are to be carried out. This can be used as a teaching manual as well as a reference guide for procedures that are not often carried out.

ISSUES AND OPTIONS

- Basic management of a veterinary practice includes organizational development and employee development:
  - Organizational development is the development, improvement, and effectiveness of an organization and includes the culture, values, system, and behaviors of such practice.
  - Employee development helps improve the vision, empowerment, learning, and problem-solving abilities of team members.
- To effectively manage people, a manager must have the skills to be a leader and facilitator. There must also be reciprocity of trust and respect. Allowing people to use and professionally develop the skills for which they were hired promotes their confidence, making them feel valued by the hospital and willing to continue to grow professionally.
- Leadership is vital to the success and growth of a practice (see 2.12 – Leadership). Leadership is influence; a leader is one who influences others, motivating them into action and inspiring them to become the best they can be. Leaders in veterinary practice must guide effective communication and create an environment that facilitates teamwork. Through good leadership, team members can appreciate how they contribute to the big picture of exceptional patient and client care.
  - Inexperienced managers may manage with a "lenient" approach, in which they allow employees to do as they please to keep them happy. This type of management style stifles practice growth and prevents employee development.
  - Over-authoritative managers manage with a dictatorial style, indicating "it's my way or the highway." This type of management style also stifles practice growth, as team members fear expressing their opinion or making suggestions. These managers are often micromanagers, preventing growth and empowerment in employees.
- Open communication is the cornerstone to employee satisfaction and building of business. It is advisable to practice open-book management with employees. Employees want to learn and understand the business and goals of the practice, but cannot do that without having the knowledge of how much it "costs" to run the business.
- Employee turnover is expensive; be sure to consider the costs of offboarding the employee, advertising the position, and interviewing, hiring, and training of the new employee. It is estimated that turnover costs 1.5 times the salary of the person that was terminated. Develop a culture that supports employee growth and maintains a low turnover rate (see 3.14 – Staff Development).
- Other useful management techniques include the following:
  - Create a positive culture by implementing and tying performance to the practice mission, vision, and core values statements (see 14.9 – Mission and Vision Statements).
  - Develop trust and respect from team members by working side by side with them on a daily basis. Managing from a desk inhibits the understanding of problems and finding solutions to inefficiencies. Working with individuals allows personal coaching, facilitates training opportunities, and enables the manager to determine tasks that can be delegated to appropriate individuals.
  - Keep employee conversations confidential. Do not share corrections, discussions, or coachings with anyone other than the individual team member.

COMMUNICATION TOOLS

- Utilize face-to-face communication versus email, texting or phone calls.
- Remember that a message has three components: verbal, paraverbal, and nonverbal. Verbal (the words used) accounts for 7% of the message; paraverbal (tone of voice) accounts for 38% of the message; nonverbal (eye contact, facial expressions, posture, etc.) accounts for 55% of the message. As a manager, pay attention to what the body language is saying. Keep the tone of voice in check, ensuring the message is not unintentionally condescending.
- Maintain an employee manual and update it annually. Train upon hiring and/or when changes have been made (see 3.21 – Employee Manuals).
- Maintain a book of standard operating procedures (SOPs) to enable the completion of tasks in a consistent manner. This will also serve as a training manual for new employees (see 2.22 – Procedure Manuals).
- Establish a mailbox for each employee, allowing messages and interpersonal communication to be delivered.
- Maintain an employee bulletin, allowing notices to be posted, required posters to be visible, and safety data sheet (SDSs) to be posted for 30 days when new products have been received.
- Host regular staff meetings to build and maintain open communication procedures. All employees should be encouraged to participate and provide opinions, problem-solving solutions, and education to fellow team members. Maintain a summary of notes and place in employee mailboxes immediately following the meeting.
- Encourage "morning huddles." Identify which clients and patients are scheduled for the day and discuss methods to deal with difficult clients.

Teams that practice open and honest communication encourage ideas and opinions and are open to disagreements and discussions. Strong teams are likely to have disagreements (a healthy part of communication); when disagreements are aired, all opinions can be discussed. With open communication, members are more likely to resolve conflicts quickly and constructively and will not need the help of management. Each team member is more likely to accept and understand others' thoughts and opinions, and accept them with an open mind. Open communication is a major component of a successful practice.

Vet-ebooks.com

TOOLS FOR DELEGATING

Delegation often fails because of the person delegating the task, rather than the person to whom the tasks were delegated.

- Use the SMART system to delegate effectively.
  - S – Be Specific. Write down the exact task being delegated.
  - M – Measurable. Determine how the task is going to be measured for successful completion.
  - A – Attainable. Is the task that is being delegated attainable for the person the task is being delegated to?
  - R – Resources. Does the person that is accepting the task have the resources to complete the task? Be sure to ask the person what they need, not what the manager thinks they need.
  - T – Time bound. Predetermine dates together, preventing the perception of micromanagement.
- Encourage two-way communication when delegating. If the delegatee is not asking questions, they may not have a full understanding of the task being delegated.
- Empower the person receiving the delegated tasks. Allow them to carry out the task without muddling. Empowering is the concept of encouraging and authorizing workers to take initiative to improve operations, reduce costs, and improve the quality and quantity of service.
- Delegate items that inherently play to a person's strengths. Recognize that different people have different strengths.

Empowering team members to use their skills brings satisfaction to the employee, veterinarian, and client. The goal is to have team members who can manage themselves individually as well as their own projects. Teams that are engaged in daily operations are proactive and strive for the highest quality of care for patients and clients while striving to improve profits for the business.

TRAINING AND COACHING

- Create phase training programs for all positions in the practice. Allow the onboarding process (see 3.9 – Staff Orientation) to take place over weeks to months (depending on the experience of the individual).
- Training is teaching: memorize the SEE, SAY, and DO methods:
  - Talk through the demonstration (SEE and SAY).
  - Allow them time to ask questions (SAY).
  - Have them DO it (DO).
  - Repeat until they can satisfactorily perform the task.
  - Repeat several days later, ensuring content retention.
- Use trainers with positive communication skills.
  - Provide trainers with Leadership and Adult Learning Theory Training.
- Schedule and allow training time.
- When training, use visuals such as videos, 3D animations, and models.
- Build continuing education into the budget. Encourage a minimum number of hours per year for every employee to attend professional development courses.

HUMAN RESOURCE TOOLS

Employment practices encompass implementing a hospital policy and manual in legal compliance with federal and state regulations. Some state regulations supersede federal when they are more stringent.

- Establish personnel records that document coaching conversations, verbal and written warnings, and performance evaluations.
- Develop hiring protocols that are consistent with state laws to prevent discriminatory practices.
- Develop coaching and termination procedures that protect the manager from discrimination claims.
- Remember that employee relations encompass crisis management, harassment issues, investigating and documenting, health and safety, and employee development.
- Prevent employee bullying practices and create a safe working environment for all team members.

2.4. Working in Teams

BASICS

OVERVIEW

• People in any workplace talk about building the team and working as a team, but few understand how to create the experience of teamwork or how to develop an effective team.
• Belonging to a team, in the broadest sense, is a result of feeling part of something larger than yourself. It has a lot to do with your understanding of the mission or objectives of your organization.
• In a team-oriented environment, you contribute to the overall success of the organization and you work with fellow members of the organization to produce these results. Even though you have a specific job function and you belong to a specific department, you are unified with other organization members to accomplish the overall objectives.
• The bigger picture drives your actions; your function exists to serve the bigger picture.
• It is important to differentiate this overall sense of teamwork from the task of developing an effective intact team that is formed to accomplish a specific goal. People confuse the two team-building objectives. This is why so many team-building seminars, meetings, retreats, and activities are deemed failures by their participants – leaders failed to define the team they wanted to build. What you would do to develop an overall sense of teamwork is different from building an effective, focused work team.
• Executives, managers, and organization staff members universally explore ways to improve business results and profitability.
• Many view team-based, horizontal, organization structures as the best design for involving all employees in creating business success.
• No matter what you call your team-based improvement effort – continuous improvement, total quality, lean manufacturing, or work teams – you are striving to improve results for customers.

TERMS DEFINED

Forming: Members are uncertain about rules, roles, and expectations.
Horizontal versus Vertical Organization: Technical terms for describing a nonteam environment (vertical) or a team environment (horizontal).
Inner Leadership Qualities: Qualities an individual must have as inner strengths to be an effective leader: vision, self-belief, integrity, courage, and being results-focused.
Norming: Working styles are agreed to and systems are set up.
Outer Leadership Qualities: Qualities an individual must possess as outer signs that he or she can be an effective leader: communication skills, visibility, ability to work in teams, attentiveness, and commitment.
Performing: Teams work positively, creatively, and productively together.
Storming: Members come into conflict over goals and personalities.
Task Objective versus Team Objective: Many "teams" come together because a task needs to be completed and that is a bit of "the cart before the horse." It is important to remember that these are separate functions.
Team/Group Stages: A team grows and changes markedly during its lifetime. The process of development has been described as having four stages – forming, storming, norming, and performing.

ISSUES AND OPTIONS

TOOLS/THE 12 CS FOR TEAM-BUILDING

Clear Expectations

• Has executive leadership clearly communicated its expectations for the team's performance and expected outcomes?
• Do team members understand why the team was created?
• Is the organization demonstrating constancy of purpose in supporting the team with resources of people, time, and money?
• Does the work of the team receive sufficient emphasis as a priority in terms of the time, discussion, attention, and interest directed its way by executive leaders?

Context

• Do team members understand why they are participating on the team? Do they understand how the strategy of using teams will help the organization attain its communicated business goals?
• Can team members define their team's importance to the accomplishment of corporate goals?
• Does the team understand where its work fits in the total context of the organization's goals, principles, vision, and values?

Commitment

• Do team members want to participate on the team? Do team members feel the team mission is important?
• Are members committed to accomplishing the team mission and expected outcomes?
• Do team members perceive their service as valuable to the organization and to their own careers?
• Do team members anticipate recognition for their contributions?
• Do team members expect their skills to grow and develop on the team?
• Are team members excited and challenged by the team opportunity?

Competence

• Does the team feel that it has the appropriate people participating? (Example: In a process improvement, is each step of the process represented on the team?)
• Does the team feel that its members have the knowledge, skill, and capability to address the issues for which the team was formed? If not, does the team have access to the help it needs?
• Does the team feel it has the resources, strategies, and support needed to accomplish its mission?

Charter

• Has the team taken its assigned area of responsibility and designed its own mission, vision, and strategies to accomplish the mission?
• Has the team defined and communicated its goals, its anticipated outcomes and contributions, its timelines, and how it will measure both the outcomes of its work and the process the team followed to accomplish their task?
• Does the leadership team or other coordinating group support what the team has designed?

Control

• Does the team have enough freedom and empowerment to feel the ownership necessary to accomplish its charter? At the same time, do team members clearly understand their boundaries?

Vet-ebooks.com

• How far may members go in pursuit of solutions? Are limitations (i.e., monetary and time resources) defined at the beginning of the project before the team experiences barriers and rework?
• Is the team's reporting relationship and accountability understood by all members of the organization? Has the organization defined the team's authority? To make recommendations? To implement its plan?
• Is there a defined review process so both the team and the organization are consistently aligned in direction and purpose? Do team members hold one another accountable for project timelines, commitments, and results?
• Does the organization have a plan to increase opportunities for self-management among organization members?

Collaboration

• Does the team understand team and group process? Do members understand the stages of group development?
• Are team members working together effectively and interpersonally? Do all team members understand the roles and responsibilities of team members? Team leaders? Team recorders?
• Can the team jointly approach problem-solving, process improvement, goal setting, and measurement? Do team members cooperate to accomplish the team charter?
• Has the team established group norms or rules of conduct in areas such as conflict resolution, consensus decision-making, and meeting management? Is the team using an appropriate strategy to accomplish its action plan?

Communication

• Are team members clear about the priority of their tasks?
• Is there an established method for the teams to receive honest performance feedback?
• Does the organization provide important business information regularly?
• Do the teams understand the complete context for their existence?
• Do team members communicate clearly and honestly with one another?
• Do team members bring diverse opinions to the table? Are necessary conflicts raised and addressed?

Creative Innovation

• Is the organization really interested in change?
• Does it value creative thinking, unique solutions, and new ideas? Does it reward people who take reasonable risks to make improvements? Or does it reward the people who fit in and maintain the status quo?
• Does it provide the training, education, access to books and films, and field trips necessary to stimulate new thinking?

Consequences

• Do team members feel responsible and accountable for team achievements?
• Are rewards and recognition supplied when teams are successful?
• Is reasonable risk respected and encouraged in the organization? Do team members fear reprisal? Do team members spend their time finger-pointing rather than resolving problems?
• Is the organization designing reward systems that recognize both team and individual performance? Is the organization planning to share gains and increased profitability with team and individual contributors?
• Can contributors see their impact on increased organization success?

Coordination

• Are teams coordinated by a central leadership team that assists the groups to obtain what they need for success?
• Have priorities and resource allocation been planned across departments?
• Do teams understand the concept of the internal customer – the next process or anyone to whom they provide a product or a service?
• Are cross-functional and multidepartment teams common and working together effectively?
• Is the organization developing a customer-focused, process-focused orientation and moving away from traditional departmental thinking?

Cultural Change

• Does the organization recognize that the team-based, collaborative, empowering, enabling organization of the future is different from the traditional, hierarchical organization it may currently be (see 2.26 – Changing Organizational Culture)?
• Is the organization planning to or in the process of changing how it rewards, recognizes, appraises, hires, develops, plans with, motivates, and manages the people it employs?
• Does the organization plan to use failures for learning and support reasonable risk?
• Does the organization recognize that the more it can change its climate to support teams, the more it will receive in payback from the work of the teams?

EXAMPLES

N/A

CAUTIONS

Although team projects can lead to great rewards, they can also be perilous. When a "lone wolf's" project fails, the damage is minimal. Often only one person is affected, and that person generally assumes full responsibility for the results. Few outsiders will even take notice. You made a mistake, you only hurt yourself, and hopefully you learned from it. Sometimes a failed individual project is even considered a badge of honor, a sign that you endeavored to stretch beyond your previous limits. When a team project fails, however, many lives are affected. Fingers point in all directions.

Yet some team projects actually manage to succeed. The team synergizes well, completes a game in a reasonable amount of time, the game sells well, and the team continues to work together on future projects and lives happily ever after. Why? Did they just get lucky? Or do they know the magic formula that others do not?

Here's the good news: There are ways to increase the chance of success for a team project, and magic is not required. Most of what follows will probably resonate as common sense, but despite that label, the application of "common sense" principles in team-building remains all too uncommon.

Vet-ebooks.com

2.4. Working in Teams

Develop Proficiency

To build a strong team, you must develop proficiency in team-building. No one seems to question that if you want to practice veterinary medicine or create quality music, you need to develop proficiency in those areas, yet how many team leaders dive into team-building with no real skill or experience in this area? Team-building is a skill like any other, and for a team project, this skill is more important than technical, artistic, and musical talent combined. Team-building is very challenging, and it demands respectful consideration. If you do not know how to select team members, how to manage for results, how to resolve conflicts, and how to handle poor performance, you had better learn these skills first before you assemble a team.

- Read at least five books and articles on teams.
- You are ready for teams when you can acknowledge that you would willingly join a team formed and managed by someone else.

Team First, Project Second

- Get the right people on board first. For a team project the limiting factor is securing the right team members. With the wrong team, you will end up spending most of your time worrying about control. With the right team, excessive control is unnecessary, and individual empowerment becomes the norm. When selecting members, we want to search for people who have growth potential – they need talent, knowledge, or skills to get on the team because performance is the result of those attributes.
- Another problem with the "project first, team second" approach is that it fails to leverage the team's strengths. A game designed to exploit the specific talents you have available is a far better choice. Selecting the right team members is the single most important factor and is absolutely critical in determining the success or failure of your project.
- If the wrong team members are selected, it is possible that even the best manager in the world cannot salvage the situation and keep the original team intact. When a team is broken, an effective manager will frequently give some team members the axe and recruit new members to replace them.
- For a team project to survive and thrive, you must select and recruit people who are team players, not individual superstars.
- Team players respect individual differences while at the same time committing to the achievement of a mutual goal. Team players are still highly ambitious, but their ambition is directed into the project or the company, not their own egos. Their ambition is for the team.
- Because team players accept personal responsibility for the success of the project, you do not need excessive control and management. Problems will not be ignored; team members will root them out and fix them. Why? Because they are personally responsible. They "own" the project.
- Character trumps personality. Where personal honor is sacred, every individual assumes responsibility for the project. When honesty is paramount, suspicion and distrust cannot gain a foothold. And where mutual respect is high, petty personality differences simply do not matter.

Leadership

Your team must have a single individual in charge.

- Every team must ultimately have exactly one leader, and everyone on the team must know who that leader is with no ambiguity whatsoever. The leader sets the example that the other team members follow, and he or she must earn the respect of the team (see 2.12 – Leadership). When the team members no longer respect the team leader, the downward spiral begins. Respect cannot be coerced, it can only be earned.
- How does a team leader earn respect? By embodying integrity and by putting the needs of the team first. The team leader is the quintessential team player. He or she must strive to be honest, fair, and objective; and if the leader makes a promise, it must be kept. Whatever standards the team members are expected to live up to, the team leader must become the personification of those standards. There is widespread belief that, for leaders to be effective, they must embody certain internal and external qualities. They need to be both facilitator and inspirer; a veterinary team depends upon its leader to provide it with the facility and tools to make decisions and support it while it grows.
- Leadership of a team serves three functions: to facilitate, to inspire, and to implement. These functions should include:
  - planning roles to be filled and selecting appropriate individuals;
  - leading the team in meetings, starting with discussions of team objectives and values;
  - ensuring that targets are met and that values, above all the values of working collectively, are observed by the team;
  - analyzing and correcting failures swiftly and surely, but always remembering to celebrate the successes just as enthusiastically;
  - carrying the responsibility of representing the team loyally to others, both inside and outside the organization.

Communications

Keep communications channels open.

Share the Rewards

- If you feel that a fair compensation structure is impossible, then simply do not begin the project.
- Aside from financial compensation, ensure that every team member receives credit within the game. Praise team members liberally, and be sincere and genuine in your praise. Do not just assume that they know they are doing a good job. Praising people is an easy way to boost morale. If possible, always praise individuals publicly, in front of the other team members. Be specific in your praise. Do not just say, "Great job." Instead say, "You did an outstanding job on those textures last week. The level of detail and lighting were superb. Excellent work! Your art is really helping to make this game shine."

Replace Underperformers

Cut team members who do not perform as expected.

- If a team member is not performing well, you must take immediate action to correct the situation. Explain what you expect of the team member in terms of performance, and put it all in writing. But if such correction does not satisfactorily occur within a relatively short period of time (30 days, perhaps), this team member will quickly lose the trust of the other team members, and lack of trust kills unit integrity by acting like a cancer that may eventually spread to the whole team. In this situation you must cut the underperforming team member and replace him or her as quickly as possible. It does not matter if this person intends to do better; all that matters is the actual performance. If you have selected only team players, there will be no grudges held in such a parting – the team player will recognize that the health of the team and the success of the project may require his or her departure.
- A common mistake made by inexperienced team leaders is that they are too patient and forgiving of underperforming team members. Although it may seem like a good idea on the surface to give people as many opportunities to change as possible, this generosity comes at great cost. Holding onto the underperformer for too long ends up punishing and sabotaging the entire team. Yes, it can be very tough to let someone go who very much wants to succeed, but it is a necessary and unavoidable part of management. If you cannot stomach letting someone go, then you simply are not fit to lead a team, so do not put yourself in this position. Another note of caution for veterinary team leaders: your front-line reports are likely to have limited-to-no-experience in formal team training or group work within the parameters of true teaming. Most paraprofessional veterinary healthcare providers have grown up with a "mom-and-pop" business

Vet-ebooks.com

sense and may have been in one organization for their entire career. The flip side to this is that these same employees are fiercely loyal to their practice owner and to the clients, and are willing to weather tough times to remain in their practice. Teamwork for these individuals will require education on the fundamentals of professional feedback and performance evaluation, how to receive coaching and critique without taking it personally, and reassurance that it is okay to not get things right the first time. To these folks, corporate speak like "teamwork" and "coaching" and "personal accountability" will feel like a shake up of their world and a challenge to the workplace as they know it. They have been taught by well-meaning veterinary practice owners that a benevolent dictatorship is the way that the veterinary world is and that it is out of place for them to speak their mind or contribute at a level that requires them to challenge hierarchy or authority when it would be in the team's best interest. Be gentle at first; behind the resistance are hearts of gold and dedicated team players who truly love pets and their families.

This provides only a small glimpse of the rules for building and managing a successful team. Team-building is a rich subject that can require a lifetime to master, and it is one of the most sought-after skills for CEOs. But despite all the risks and hard work, being a part of a team is an extremely rewarding experience and most people who have enjoyed it will tell you that it is indeed worth the effort.

2.5. MOTIVATING THE HEALTHCARE TEAM

BASICS

OVERVIEW

Why is motivating a team so important? In today's economy, having a competitive advantage means more than having a product or service that customers are buying; it also means having a team that forms great relationships with your clients that keep the clients satisfied and returning for more – more products and more services.

Engaged, motivated employees translate into better care of the patients, better relationships with the pet owners, and better collaboration with fellow team members. This is what gives you a competitive advantage over any other business in town – having a professional, energized team. So how do you get that professional, energized, engaged, and motivated team?

First you must understand what motivates people, and you must then apply that knowledge to your motivational program. A report by the Society for Human Resource Management looked at motivation in today's workforce and discussed what fosters employee motivation.[1] It highlighted that motivating team members starts with understanding human nature through classic theories such as Expectancy Theory, Maslow's Hierarchy,[2] and Herzberg's Motivator–Hygiene Theory. These and others serve as guides to assist managers in formulating a balanced program to motivate every member of a team.

TERMS DEFINED

Engaged Employee: An employee who is actively involved in his or her work, and highly committed to duties and the company mission.
Expectancy Theory: The theory that motivation is increased when employees believe that increased effort leads to desired results.
Herzberg's Motivator–Hygiene Theory: The theory that meeting basic needs results in motivation and increased performance.
Maslow's Hierarchy of Needs: People seek to satisfy basic needs and satisfying a lower level need results in the next level being a motivating factor.
Motivation: A method to move a person toward a goal using psychological, behavioral, cognitive, or social factors.
Open-Book Management: The premise that employers should share with employees the measures of the practice's business success so that employees better understand the efforts that impact the success of the business.

ISSUES AND OPTIONS

Apply Maslow's Hierarchy to a motivation program at your practice. According to Maslow's Hierarchy, a person (your employee) is motivated by unsatisfied needs (see Figure 2-5-1). Once the need is satisfied, it no longer acts as a motivator and the next level contains the motivation. Managers can use this knowledge to evaluate motivational factors in their own practice. The diagram of Maslow's Hierarchy may assist you in taking a systematic approach to motivation and making certain your practice is addressing the different levels of "needs" that will motivate different team members.

PHYSIOLOGICAL

- Consider this basic motivational level within your working environment: safe equipment, adequate lighting, comfortable working conditions, welcoming atmosphere, functional set-up, clean surroundings, uniforms, and adequate pay.
- Motivation ideas:
  - Provide resources needed to do the job and do it well – resources such as equipment, training, and manpower.
  - Check the physical conditions of the working area such as cleanliness, fresh coat of paint, comfortable chairs, adjustable exam tables, and so on.

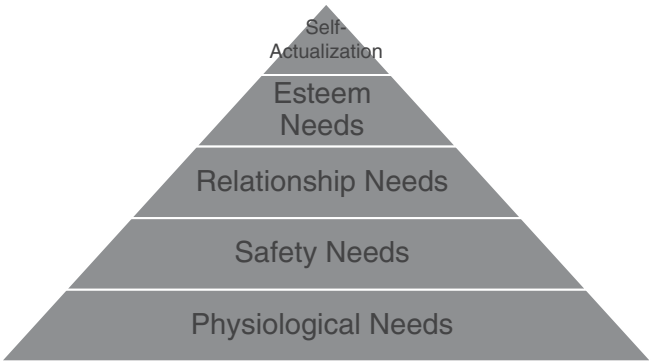

Figure 2-5-1.

Maslow's Hierarchy of Needs.

SAFETY AND SECURITY

- Safety and security of the work environment is a part of this level. Consider some of the Occupational Safety and Health Administration (OSHA)'s requirements for ergonomics and safety.
- Job security or the security of a position is another aspect of this level.
- Sometimes, if someone feels that their job security is threatened it causes that person to resist change.
- Motivation ideas:
  - Create a more transparent organization by communicating your business strategy and using open-book management techniques to keep team members informed and aware of changes (see 2.1 – Workplace Management).
  - Give constructive, regular feedback and establish goals. Do not wait for an annual review to discuss a person's performance, switch to frequent check-ins with your team members. Do not wait for months to go by, do a quick check-in and review their performance. See how they are progressing with achieving certain goals, what management can do to remove roadblocks, and what they can do to meet the needs of the patients, the clients, and the business.

BELONGING

- Being a member of a great team has a positive impact at this level.
- Community service activities may enhance the feeling of pride in being a part of a great company (activities such as helping animal rescue groups working or participating in charity events).
- Forming connections and developing a team that works well together and can collaborate with each other will address this need. Take some time to do team-building exercises to help members connect and understand one another's personalities. Assign new hires a coach to help with the onboarding process and introduction into the culture of the practice.
- Your culture will affect this level. Bonding with and belonging to the team is directed by the culture of your practice (see 2.26 – Changing Organizational Culture).
- Motivation ideas:
  - Send a hand-written note praising the employee to their home address for the family to see too.
  - Encourage community involvement by the practice and the team. Nothing says "pride" and motivates a team more than when they volunteer at a charity event.
  - Celebrate successes and accomplishments – both individual and team efforts.

ESTEEM

- More than self-esteem, this level also includes achievement, recognition, responsibility, reputation, prestige, self-respect, and respect of others.
- A recognition and rewards program will have an impact at this level.

Vet-ebooks.com

2.5. MOTIVATING THE HEALTHCARE TEAM

- The perception of fairness is very important to your employees.
- Acquiring social status is a part of having esteem – be it monetary gains via bonuses or raises, having more responsibility, or receiving a promotion.
- Motivation ideas:
  - Ask your team members for their ideas regarding an issue or project in the practice, being certain to ask because you value their input.
  - Story-telling is a great way to praise a person's effort in public, and to convey a message to the rest of team about "how we do things around here" to exceed expectations of clients, coworkers, or business owners.

SELF-ACTUALIZATION/HAVING A PURPOSE

- Mastering their world and tackling new challenges on the job describes this level. It is the highest level and signals attaining one's full potential. According to Maslow's theory, this level is never fully satisfied because there are always new opportunities for growth.
- Many employees want to see a connection between how their work fits into the big picture or business strategy, and what role they can take on to improve that connection. Seeing this connection may also lead to further opportunity for growth and development.
- Team members who feel that they are making progress toward meaningful goals are motivated to keep up the progress and help others to achieve their goals too. Hence the benefit of frequent check-ins rather than waiting for an annual performance review.
- Consider how your practice can motivate others by permitting personal autonomy, showing that someone is trusted, or allowing individuals to make decisions on their own.
- Some of your team members may be considering professional career growth options to motivate themselves and satisfy their need for autonomy.
- Motivation ideas:
  - Consider certification programs such as Veterinary Technician Specialist (VTS), Certified Veterinary Practice Manager (CVPM), or other specialty certifications, to help team members master new skills and take on other responsibilities.
  - Introduce career mapping for your team, especially during performance appraisal sessions, to discuss what areas the team member would like to grow in and how the business can help make that possible.
  - Use open-book management to demonstrate the connection between efficiently performing a task, conveying a sense of value to the client, and the financial ramifications on the business.

EXAMPLES

- Talent management is a process of attracting, selecting, training, developing, and promoting employees. Developing talent in-house is an excellent way to attain the highest level of Maslow's Hierarchy.
- Managers focusing on developing talent must ensure that their team members have the tools and resources they need to perform their jobs well, receive proper compensation, and transition to leadership roles.
- Retaining essential talent means keeping high-performing team members. This consistency of team members satisfies a basic need of clients: bonding with people they can trust to care for their pets.
- Engaged, motivated team members are often more loyal to the business and to the clients than unmotivated team members.
- Internally developed team members and leaders are a valuable asset to the practice because, over time, they develop the necessary core competencies and internalize company values.
- The culture and structure of your organization will dictate some of your motivational activities.
- Important programs affecting motivation are: performance management, training, recognition and rewards, accountability, and communication.
- Examples of motivation via extrinsic rewards are: material rewards, benefits, additional paid time off, and gift cards.
- Motivation via intrinsic rewards are: autonomy, responsibility, having a chance to help others, challenging work, gaining knowledge or a new skill, or being in charge of a special project because of their unique talent or interest.
- Having concrete goals is the best way to motivate your team. Achieving these goals is possible with the use of a program with training, tracking team members' progress and measuring key indicators.

CAUTIONS

- Motivation via rewards and punishments may foster behaviors that you do not want at your practice, such as unethical behavior or short-term thinking (e.g., selling unnecessary products or services to achieve revenue growth).
- Extrinsic motivators are not as sustainable as intrinsic motivators, and are often perceived to be entitlements by the employees (think about holiday bonuses and the year you could not afford it).
- Extrinsic motivators may undermine intrinsic motivation and lower optimal performance.[2]
- Responsibility for motivating team members does not fall on only one person. It is the responsibility of the leaders, the managers, and of the employee themselves.
- Employee satisfaction surveys may not tell you if your team is engaged or motivated. It just means they are satisfied with their current condition.
- Communication between supervisors and employees is also very important, specifically about the skills and knowledge that align with company goals. By communicating what leaders see as important, employees are more engaged and see a greater opportunity to invest in their own development.

2.6. ACCOUNTABILITY

BASICS

OVERVIEW

Accountability is a critical attribute in the functioning of a veterinary hospital. Although it might at first appear that it is the doctors that are responsible for the perception created by a practice, careful review of experiences both positive and negative show that all staff – doctors, technicians/nurses, receptionists, and managers – have an important role to play in how the practice is perceived by the world outside the walls of the clinic.

Regardless of the quality of a surgical procedure and the prowess of the surgeon, what is the perception of the public if an animal is released with fecal matter in its fur, incomplete discharge instructions, or is checked out by bickering front office staff? In most organizations it was long ago appreciated that to deliver quality care and excellent client service, everyone within the organization must realize their critical roles and endeavor to deliver on the practice's mission and vision (see 14.9 – Mission and Vision Statements). When that does not occur, the medical care may be second to none, but customers will still flock to other alternatives … and there are always alternatives.

For a hospital to function at its best, every employee must be accountable for not only their own duties, but also to deliver on implied promises to all stakeholders regarding the mission and vision of the practice. Without accepting "ownership" of all responsibilities in this regard, a practice will need to rely on only its medical skills. With competition for veterinary services increasing regularly, and with the very high cost of delivering those services, being second best can be a costly demotion.

TERMS DEFINED

Accountability: The obligation to be responsible and to act in the best interest of the organization and its mission.
Onboarding: The process of helping new employees become productive faster by providing them with documentation and training related to practice culture, vision, policies, protocols, and expectations.
Responsibility: The duty to perform or complete an assigned task.

ISSUES AND OPTIONS

• Client service experts understand that there are many experiences that clients can have with a practice, and these exposures are sometimes referred to as "moments of truth." In many cases, these moments of truth[1] may have little to do with the medical care actually being delivered and everything to do with how the clients feel they were treated or valued by the practice and its staff.
• Consider the previous examples, such as when a pet is discharged in an unclean condition. What does it say about the level of care delivered by the practice, even if the surgery went flawlessly? What impression does the client get when responding to their telephone calls is considered an imposition? All of these seemingly insignificant "moments of truth" can easily add up to a bad experience, even when all medical services are delivered with excellence.
• Although it is easy to brush off the rants of a single client, in veterinary practice this can have a decidedly bad cascading effect. Happy clients tell a few of their friends about a good experience, but unhappy clients share their displeasure with many more. Clients will only accept so many negative stories before they consider their other options.
• It is impossible to guard against any negative experience, but staff that are empowered and accountable are much less likely to create scenarios that get blown out of proportion, and can usually easily document their good-faith efforts to make things right. That is really all that anyone can hope for.
• It is important to avoid artificial boundaries within the practice so that the practice identity, vision, and mission do not become clouded. There might be distinctions between departments, issues between shifts, tension between front office and back office staff, and many other instances in which personal accountability is lost or camouflaged. This cannot be allowed to fester in a practice or it can have long-time deleterious consequences on business potential.
• To some extent, personal accountability tends to lapse in any organization in which anonymity is possible. So, the challenge with veterinary hospitals is to make accountability a scalable attribute. People voluntarily must maintain their accountability even as staff numbers grow, and everyone must tie their collective success on each other stepping up to always do the right thing, and then to be prepared to ask what else they can do to keep things moving in the right direction.
• This notion of always asking "what else can I do?" is the foundation of the Oz Principle,[2] based loosely on the premise that the characters of the book and movie (Wizard of Oz) spent their time looking for a wizard to fix their problems, when all along they had the power to make those things happen themselves. It is a simplistic but powerful premise and the Oz Principle challenges each employee to "See it, own it, solve it, and do it."
• One thing that needs to consistently happen is to unite staff in the pursuit of practice excellence by codifying the vision and mission of the practice, at least its intent (see 14.9 – Mission and Vision Statements). It helps immensely if this intent can be summed up in a short phrase that every employee can identify with and respond to accordingly. In the Oz Principle, that catchphrase reflected whether behaviors were above the line (desirable for the given organization) or below the line (undesirable for the given organization). For veterinary practices, it is best if this catchphrase is customized into something meaningful to the employees, because they will be expected to live and work to those ideals.
• Accountability is important for the organization in general, because without it, bad leaders drive out good staff and it is very easy for even high-producing teams to be reduced to mediocrity. In a very short period of time, such mediocrity can become institutionalized, and paralyze the organization from achieving strategic goals (see 14.5 – Strategic Planning and Implementation).

EXAMPLES

Suzanne is a nurse at ABC Animal Hospital, and during lunch, she overhears some of the other nurses complaining about a newly hired veterinary nurse who does not seem to be keeping the medical records at a level dictated by the practice's standard of care. Suzanne joined her colleagues in the discussion, reminding them that the clinic's motto is "We strive to be our best – every day" and that being our best means mentoring one another so everyone achieves and surpasses the practice's standard of care.

A meeting of all of the nurses was convened to discuss standards of care regarding medical record entries. In the discussions that ensued, Heather, the new nurse, admitted that what was being discussed was different from what she was used to in her previous practice. In a nonthreatening manner, the other nurses assured her that there were many different ways that medical entries could be made, but at this hospital, for the good of all pets being treated, the nurses decided to unite around best practices and codify certain practices to avoid confusion. Several nurses shared anecdotes from other practices where they had worked in which inconsistencies could have ended up harming the patient (including the use of nonstandard abbreviations,

Vet-ebooks.com

and weights and doses sometimes reported in kilograms and sometimes reported in pounds). Because all nurses needed to rely on one another to ensure pet health, several nurse duties benefited from standardization, including medical record entries.

One fact that came to light in the discussions was that when the standards of care were first proposed, there were only three nurses in the practice, and so the standardization was really just a verbal directive, shared among the existing nurses. Since that time, several more nurses and assistants had been hired and there was no official document that actually captured those standards of care for the onboarding of new employees, which is why Heather just assumed that what she was doing (and was doing successfully at her previous practice) was acceptable. Suzanne asked Heather if she would help her codify the standards of care around medical record entry into an actual document that could be shared with all the technical staff. Heather agreed, and two other nurses also expressed an interest in participating. The goal was to codify the standard into a document within four weeks, ratify the document with all the nurses, get endorsement from the veterinary director and practice administrator, and then present the new standards at the next full employee meeting. The document would then be part of the onboarding training for all professionals and paraprofessionals (see 3.9 – Staff Orientation). Heather volunteered to be the official mentor for these standards as new nurses joined the practice.

CAUTIONS

- Accountability is not an excuse to scapegoat employees for fundamental problems associated with practice models. Accountability is based on an intact leadership structure and on alignment of all staff members around clear goals and objectives.
- Employees should not be expected to be accountable for tasks beyond their appropriate job description. For example, a surgical nurse can be accountable for tracking the use and recovery of surgical sponges in a procedure and for keeping the surgeon informed of the count, but cannot be held responsible for the surgeon's activities during the procedure.
- Veterinarians are often hesitant about empowering employees, for fear that they will overstep their authority or discount goods and services to clients, but there is no evidence to support such fears. In actuality, empowering staff while making them accountable is one of the best ways of ensuring that they share the same practice vision, goals, and objectives as do the owners of the practice. Alignment and accountability are in everyone's best interests.
- Accountability only works for a practice if leadership creates an appropriate vision around the goals and objectives of the practice and its positions. Otherwise, staff become preoccupied with tasks and job descriptions (to which they can still be accountable), rather than "big picture" strategies. The easiest way to determine this is to ask employees to describe their purpose in the clinic. If a receptionist is asked about his or her purpose, and responds that it is to answer telephones, make appointments, and collect money from clients, they are clearly missing the real intent – to be the client-facing representation of the practice and all its values, to create a welcoming environment into which clients can bring their pets, and to help owners understand how the recommendations of the practice are in their best interests, and those of their pet. Clearly a properly motivated receptionist (client service representative) is much more than just someone to answer telephones, book appointments, and re-file medical records. They must realize that even if tasked to answer the telephone and perform office duties that their primary responsibility, and that of everyone else working in the clinic, is to engage clients in a friendly and professional manner, strive to create positive "moments of truth" for pet owners, and to be a champion of the practice's approach to pet healthcare and the value provided.

2.7. CHANGE MANAGEMENT

BASICS

OVERVIEW

Change is hard. Humans often resist change even before they have considered the possibilities for positive outcomes that might be associated with the change. And yet, any successful veterinary practice will need to be adept at change in order to thrive. The profession, the marketplace, and the talent pool are all shifting in multiple ways and unless there are owners and managers within a practice that can lead it through change, it will struggle to grow and prosper as it wrestles with the necessary changes. The good news is we are learning more about human behavior change every day and practice owners can use this knowledge to lead change in a systematic and consistent way that enables them to create more nimble teams and a more adaptable business. Creating a successful plan for change in your practice that is based on sound principles of human behavior can create opportunities to capture new growth and deal with less resistance and stress when making change and looking forward to continued improvement.

TERMS DEFINED

Change Management: Managing the people side of change to achieve a desired business outcome of change.

ISSUES AND OPTIONS

- Human behavior change has some necessary components such as insight and focus that help us understand and move toward any change.
- Most humans resist change done to them far more than they resist change done with them.
- For all the talk of people resisting change, remember that we all move toward changes in our life when we think they are helpful for us or create a future that we will be happier with. We have all changed houses, jobs, locations or added spouses, kids or other new things to our lives willingly when we understood the opportunities they held for us. Most of that understanding did not come from being told we should do those things.
- No change happens without people making their own choices around what they want to move toward.
- Using authority, consequences, punishments, fear, or other negative options to cause change may result in temporary movement but does not result in lasting change. Humans are conditioned to run from negative situations, but they will stop running as quickly as they can and so if we are not careful we can set up a cyclical situation where our role as a manager or leader is to constantly force people to do things they do not want to. Over time, no one leads effectively this way and the stress associated with that kind of management style is not sustainable.
- Our goal should be to paint a picture of what might be possible if we execute a change well and allow for discussion, ideas, contributions, and even challenges from the team that help us think through the possibilities and obstacles associated with any change. As a leader of change we have likely had all of these conversations with ourselves to get to a place where we think the change is a good idea. Our team members need to go through that same process to make their own choice.
- We may feel that letting our team explore the change in this way is risky and could slow, or even stop, the change, but the reality is that without the team committed to a change, it will fail. Failed change is much more costly than executing a more comprehensive process that creates successful change.
- We must ask relevant, thought-provoking questions that help create insight for our team about how the change might happen and what contributions they might make to it.
- Telling others to change because you have authority is rarely effective. It is similar to telling a kid to study harder or an employee to have a better attitude. The chance of success is severely limited.
- One unexpected outcome of collaborative change is that people often add new ideas or thoughts to the mix that help the change happen more effectively.
- Once we have allowed space for collaboration, which can cause insight, we then need to apply focus to the change process by exploring, together, what steps we might take and what challenges we need to prepare for.
- This level of tactical focus causes the human brain to build mental maps that will help it understand how to operationalize the change and also create a set of steps to help it succeed. It is the difference between conceptualizing the process of riding a bike, and thinking in great detail about steering, pumping the pedals, balance, and speed. The more detailed focus gives us a much better mental map about how to approach the change.
- Involving others in the change process causes them to connect to it, explore its positive possibilities, and approach it in a way that moves them toward it, rather than away from it.

EXAMPLES

- Use questions to help others explore and internalize the change such as: What could be better for us if we do this well? How might it help us improve our service or care? What else can we think about connected to this change that might help us deliver better care or service? How will we make sure this change works for all of us and is successful? What other ideas would make this change happen well for our team? What challenges can we anticipate and prepare for related to this change?
- Hold a series of meetings to prepare for larger changes so that everyone gets to think through the possibilities and contribute their ideas, or even concerns.
- You can also frame a change with your thoughts before letting others think about it and contribute their own. "I have been thinking about this for a while and I believe it will be good for our practice for these reasons, but I need everyone's help to make it work, what do you think?"
- Enable and support discussion, even if it is not in favor of the change. Use phrases like "That's a very important challenge for us to consider, how do we think we might deal with it together?" That acknowledges the concerns but also redirects from problem to solution.
- Once the thinking has been done to allow everyone to contribute, then move to planning and focus using questions such as: What should our first steps be in making this change happen well? How will we know if the change is working? What other signs of success might we see? How will we have to think differently to execute this change well? How will we have to communicate with each other to execute this change well? How should we follow up in meetings to measure our progress?

CAUTIONS

- Do not shut down those who might resist the change, instead learn from them and the thoughts they have about how we can address the challenges associated with the change.

Vet-ebooks.com

• Do not rush the planning process. It will save you a great deal of time in the execution phase if you have thoroughly planned for successful change.
• Avoid the temptation to just tell people to do it because you are the boss. This often creates groups of people who want to see the change fail and will oppose it behind the scenes. No change is successful in this environment.
• Forcing a change through with authority, even if it works occasionally, sets up a culture where it is you against the staff. That creates a toxic, stressful environment and a culture that most people do not enjoy working in. Your best people leave if that becomes the norm.
• If it feels like the change is struggling to be successful, pull the team back together and think through ways that we can increase our commitment to it, execute it more effectively, or change the expectations that we have for the timing of the change.
• Do not overload the team with change. Try to execute one, or maybe a few, at a time successfully so that we consistently get better at change and we do not allow the focus to shift away from a big change that needs our daily attention.
• Remember that failed change is expensive and stressful. It also creates change fatigue within the team because many things get started, but nothing ever changes. That creates disengagement and a sense of "Why should we try if we aren't ever going to succeed?"
• Remember to celebrate and reward the team that helped you make this change successful. It is difficult to stay fully engaged in an environment where it feels like the reward for change is more change. Take time to recognize success and reward effort. Remember, you might be paying them for their time but their full engagement and support is always optional and how they do their job is often more important than the hours they spend doing it.

2.8. Compassion Fatigue and Burnout

BASICS

OVERVIEW

Professional "helpers" are those people who choose to spend a majority of their time helping others, typically as a career choice. It includes helping professions such as psychology, first responders, teachers, spiritual guides, and more. Healthcare workers also fall into this category. It is widely accepted that caring for others under stress also causes stress for the helper. The term "compassion fatigue" was first used by nurse Carla Joinson in 1992 to describe the negative feelings that occur while tending to patients suffering from medical injury or illness. Veterinary medicine is no different; we spend our time caring for pets and their families, sometimes to the exclusion of our own needs.

- Compassion fatigue cannot be ignored, avoided, or cured. It can be minimized, and there are ways of coping with compassion fatigue, but denial is not an adequate solution.
- Compassion fatigue affects all positions on the veterinary team, including members of management (particularly if they worked in another role in veterinary medicine prior to becoming a member of management), front office, medical support staff, husbandry personnel, and veterinarians.
- Compassion fatigue is not specific to death or euthanasia, but instead is derived from the professional's relationship with the pet owner who could be nervous about a new puppy, fretful over a geriatric cat, or simply confused about providing adequate healthcare to their pet.
- Compassion fatigue can affect someone at any point during their career, although it is widely accepted that younger or newer helpers are more at risk.
- Compassion fatigue affects all types of practices and hospitals, including general practice, emergency practice, and specialty or referral hospitals.

Similar but distinct entities include compromise fatigue (see 2.10 – Compromise Fatigue), moral distress and ethics exhaustion (see 2.9 – Moral Distress and Ethics Exhaustion) and leadership fatigue (see 2.13 – Leadership Fatigue).

TERMS DEFINED

Apathy: Lack of interest, lack of feeling; not caring.
Burnout: A result of frustration, powerlessness, and inability to achieve work goals; the stress that evolves specifically from the interaction of the veterinary professional and the work environment.
Compassion Fatigue: Exhaustion due to compassion stress, the demands of being empathic (empathetic) and helpful to those who are suffering; the stress that evolves specifically from the relationship between the veterinary professional and the patient and client.
Compassion Satisfaction: Deriving pleasure from being a caregiver, and feeling good about the ability to help and make a positive contribution.
Empathy: The ability to share another's emotions; can take place automatically or without express knowledge due to the presence of mirror neurons in the brain.
Occupational Stress: The particular stress that arises from working in a specific occupation.
Organizational Compassion Fatigue: As a result of employing those with compassion fatigue, the effect on the organization where the personal symptoms of compassion fatigue are incorporated into the culture of the corporation; the productive mission of the organization is replaced by policies, procedures, and goals that reflect high levels of dysfunction.
Secondary Traumatic Stress: An indirect exposure to trauma through a firsthand account or narrative of a traumatic event; compassion fatigue is a form of secondary traumatic stress.
Vicarious Trauma: A set of cognitive, emotional, physical, and spiritual disturbances that result from helping trauma survivors; a painful set of symptoms that result from utilizing controlled empathy while listening to or seeing traumatic narrative content.

ISSUES AND OPTIONS

Minimizing and coping with compassion fatigue must take place on three different levels. First, the professional must take care of their own self-needs, use the opportunity to relax and recharge, and stop putting their personal needs at the bottom of an endless list. However, self-care alone will not provide long-term relief. On the next level, we also must be mindful to treat our colleagues well, to provide mentoring and support, and have conversations about the negative feelings that can arise while caring for others. The third level is the organization's responsibility to care for its workers, to create a culture where compassion is emulated and rewarded. Our compassion should be reflected in the way we treat our clients, patients, each other, and ourselves.

The causes of compassion fatigue are those personal factors that cause us to be more susceptible to the negative effects of compassion fatigue. These causes include placing the needs of others before our own, unresolved past trauma and pain, lack of healthy life coping skills, lack of self-awareness that limits growth, giving care to others under stress, lack of personal boundaries, and the inability to communicate needs.

The symptoms of compassion fatigue are those resulting behaviors that become recognizable as resulting from compassion fatigue. In veterinary professionals, the symptoms include bottled-up emotions, the impulse to rescue animals in need, isolation from others, sadness and apathy, the need to voice excessive complaints about management and coworkers, lack of interest in self-care practices, reoccurring nightmares and flashbacks, persistent physical ailments, difficulty with concentrating, mental fatigue, and proneness to accidents.

Compassion fatigue also affects professionals when they leave the workplace and go home. Symptoms of compassion fatigue in the home environment include being withdrawn, a decreased interest in intimacy, mistrust, isolation from friends, impact on parenting, projection or anger or blame, and intolerance.

When the practice employs multiple people who have compassion fatigue, those personal symptoms begin to affect the business and result in organizational compassion fatigue. The symptoms of this include excessive numbers of worker's compensation claims, high absenteeism and turnover, changes in coworkers' relationships, inability for teams to work well together, team challenges to rules and regulations, aggressive behavior among teammates, team inability to complete assigned tasks, team displaying lack of flexibility, unhealthy competition among teammates, rampant rumors and gossip, constant changes in practice policies.

When it comes to creating a compassionate culture in the workplace, and helping employees to minimize and cope with compassion fatigue, suggestions at the organizational level include providing a respite for the team, providing continuing education for the team, providing acceptable benefits to aid staff in practicing beneficial self-care, providing management and team with the tools to accomplish their tasks, providing direct management to monitor workloads, providing positive team-building activities to promote strong social relationships between colleagues, encouraging "open door" policies to promote good communication between team members, and having grief processes in place when traumatic events occur onsite.

Vet-ebooks.com

2.8. COMPASSION FATIGUE AND BURNOUT

EXAMPLES

Some veterinary professionals attempting to cope with compassion fatigue try to change jobs to improve their outlook. Although this may fix some of the work environment issues that contribute to burnout, if they remain in the caregiving profession, they will continue to experience compassion fatigue. They may quit one job, start a new one, only to ask for their old job back when they realize their emotional state has not substantially improved.

Some veterinary professionals who are part of the medical support staff may try to cope with compassion fatigue by changing careers, such as moving into "human" nursing. It is now more common than ever that our professionals are changing direction to human nursing for an improvement in working conditions, specifically hours, location, and pay. Yet they will not escape compassion fatigue by switching to caring for human patients.

Some veterinary professionals can identify that the client and/or patient interaction is a source of their negative emotions, and will choose to stay in veterinary medicine but work in a laboratory or telemedicine where they use their medical knowledge without being subjected to the relationships with clients and patients.

Some veterinary professionals who can no longer cope with compassion fatigue will leave the profession altogether, to pursue a career that does not entail caregiving.

CAUTIONS

Another condition that can affect veterinary professionals is called burnout. Often times we attribute all negative feelings to burnout because we have not been made aware of compassion fatigue. It is important to identify the cause of the feelings because treatment can be different. Compassion fatigue is thought to result from the stresses caused by the interaction of the professional with the clients and patients who are suffering. Burnout, on the other hand, is thought to result from stresses arising from the "work environment," or all of the surrounding factors of being employed in veterinary medicine. Therefore, if the environment is changed, burnout can change as well. However, if a person remains in a caregiving or "helping" profession, they will continue to experience compassion fatigue.

Compassion fatigue in the veterinary profession has also gained the attention of those working in social work or counseling. These people may be a part of our local mental health resources or attached to our health or mental insurance providers. It is important to note that they do not typically have experience doing the work of veterinary medicine, which can affect the credibility the team feels for the helper. Therefore, it is best to seek a knowledgeable helper within the veterinary profession if possible.

2.9. Moral Distress and Ethics Exhaustion

BASICS

OVERVIEW

Moral distress and ethics exhaustion are two conditions, separate from compassion fatigue and burnout, that affect healthcare workers. While these entities are better characterized in human healthcare, they clearly are recognized in veterinary medicine as well.

TERMS DEFINED

4 A's: The American Association of Critical-Care Nurses (AACN) has developed a protocol to address this "moral distress" in the workplace. It is summarized as Ask, Affirm, Assess, and Act.

American Association of Critical-Care Nurses: The AACN is **a** 501(c)(3) nonprofit association; a community of acute and critical care nurses offering unwavering professional and personal support in pursuit of the best possible patient care.

Ethics Exhaustion: Fatigue, emotional distress, and lack of will to continue to act in a way that is consistent with what you believe is the ethical thing to do.

Moral Distress: Occurs when (1) you know the ethically appropriate action to take, but you are unable to act upon it, and (2) you act in a manner contrary to your personal and professional values, which undermines your integrity and authenticity.

ISSUES AND OPTIONS

MORAL DISTRESS

The American Association of Critical Care Nurses (AACN) recognizes this concept of moral distress in human healthcare. In "The 4A's to Rise Above Moral Distress," the AACN defines moral distress as when (1) you know the ethically appropriate action to take, but you are unable to act upon it, and (2) you act in a manner contrary to your personal and professional values, which undermines your integrity and authenticity.[1] This paradox is also found in veterinary medicine.

ETHICS EXHAUSTION

What happens when we find ourselves in moral distress on a frequent basis? At the 2013 Veterinary Social Work Summit, Sonnya Dennis, DVM, DABVP, presented a session on ethics exhaustion.[2] She defined "ethics" in this regard as a code of moral conduct or rules, following duty and not convenience, and doing the thing that "I should do." The problem is, there is no universal acceptance of what is "wrong" and "right"; ethics is clearly a personal concept and will vary from person to person. Yet if we accept a position in a practice that provides a service we personally feel is immoral or unethical, we are allowing our ethics to be compromised. Dr. Dennis explains that ethics exhaustion is fatigue, emotional distress, and lack of will to continue to act in a way that is consistent with what you believe is the ethical thing to do. It is having failed to square behavior with belief so often that you no longer care to try. At times, ethics exhaustion can be having trouble defining what that right thing is, or can be a mismatch between your ethical belief and your actual behavior. "Ethics exhaustion is not a loss of compassion, but being prevented from acting on what you believe is the compassionate, caring thing to do," Dr. Dennis explained.[2]

In order to explore your personal ethics versus the practice's ethics, consider the range of possibilities when a client decides upon euthanasia. How do you feel and what does your practice do about the 17-year-old poodle with end-stage heart failure whose family is choosing euthanasia, as compared to the otherwise healthy animal whose family cannot financially bear the burden of the surgery to fix a broken leg and are also considering euthanasia? What about the client who cannot be "bothered" to give insulin to a newly diagnosed diabetic pet, as compared to the family that is moving and cannot take the pet with them? What you would like to do, and what you are asked to do by the practice owner, can be two very different things.

These are circumstances that can test our ethics, but there are many other "smaller" challenges we may face: syringes and needles being reused, and intravenous line being moved from one patient to another, "sterile" surgery packs that are used for three successive surgeries on three different patients, sick pets kept overnight in a hospital with no overnight staff, and more. How much are we asked to compromise our ethics, and at what point do we decide "enough is enough"?

Prevention is the key to minimizing moral distress, which can lead to ethics exhaustion. So how do we prevent ourselves from being put in this position? One suggestion is to more closely analyze any new position we consider accepting. When interviewing for a job, for example, the values of the organization and the values of the candidate should be expressed and discussed to see if it is a good fit of ethics.

The AACN has developed a protocol to address moral distress in the workplace. It is summarized as Ask, Affirm, Assess, and Act.

Ask

This is when you reflect on your present feelings and ask yourself questions to determine whether moral distress is present.

- Self-reflection will be required to gain awareness of moral distress and its effects on your physical, emotional, behavioral, and spiritual wellbeing.

Affirm

This is when you make a commitment to address the moral distress.

- Affirm your distress and your commitment to take care of yourself.
- Validate your feelings and perceptions with others.
- Affirm your professional responsibility to act.

Assess

This is when you contemplate your readiness to act, considering the risks and benefits.

- Identify sources of your distress.
- Under what circumstances do the signs and symptoms occur?
- Do others suffer related to these sources?
- Consider all the personal, interpersonal, or environmental factors. For example:
  - A particular patient care situation
  - A unit policy or practice
  - Lack of collaboration.
- Contemplate readiness to act.
  - If you are not ready, continue to ask and affirm; you may be ambivalent at this point.
  - If you *are* ready, take time to consider risks and benefit of making a change to rise above the moral distress.
- Use a chart to list risks and benefits, and level of potential strength (see example):
  - Add points together for each, then divide by the number of factors listed.
  - If benefits number is higher, it is time to act!
  - Hint: The best way to effect change is to diminish or remove the risks.
  - Still stuck? Consider the four R's:
    - **Relevance:** Imagine the impact your action could have: improved patient care, enhanced relationships, enhanced personal wellbeing, professional satisfaction.
    - **Risk:** What is the risk of not acting? Personal suffering, dissatisfaction with practice environment, decreased quality of patient care.
    - **Rewards:** Imagine how you will feel after you act. Recall situations in which you have succeeded in effecting positive change in the past. Imagine how you would feel coming in to work after the changes were in place.

Vet-eBooks.com

  - **Roadblocks:** Make a written list of roadblocks to help identify strategies to avoid: resistance to change, criticism, retaliation, alienation.
- Go back and answer self-assessment again!
- Are you ready to make an action plan?

Act

This is when you implement strategies to initiate changes and manage any resulting setbacks. It is also the step where you preserve your integrity and authenticity.

- Prepare to act:
  - Develop a self-care plan
  - Identify appropriate sources of support
  - Investigate outside resources for guidance.

The circle of Ask, Affirm, Assess, and Act indicates that this is an ongoing process. Turn the negative effects of moral distress into motivate to create change. You will still encounter distressful situations, but you will have the power to rise above them!

EXAMPLES

To illustrate the concept of using the risk and benefits chart, take the example of wanting to extend client visitation times so that the families can be with their pets more and for longer while the pet is being hospitalized. The level of potential strength for each statement is scored 0 for minimal potential and 5 for great potential. The chart may look something like this:

	Benefits	Score	Risks	Score
1	Positive change for patients and families	5	Some colleagues do not support open visitation	3
2	My manager supports this change	3	Doctors do not want visitors during rounds	4
3	I have prior experience effecting a change	3	Culture slow to change	4
4	Action would increase awareness of the issue	4	I lack the energy or time to take action	1
5	My personal needs would be addressed	5	Worry about losing job, loss of status, etc.	2
	Totals:	20		14
	20 divided by 5 = 4		14 divided by 5 = 2.8	

For this scenario, the benefits outweigh the risks, so action should be taken to change the client visitation policy!

Example of a Plan to Act: Distress about a Pattern of Care in Practice

- Identify a patient care situation that is typical of the pattern you find distressing.
- Request that a manager, doctor, or the practice owner debrief with staff members about the case.
- Compare the situation to information found in outside resources to help identify other ways to manage this kind of problem.
- Formulate a case study as a teaching tool.

CAUTIONS

With moral distress, your feelings about a particular issue can wax and wane, and it may be difficult to determine if you should act. One way to illuminate your need to act is to complete the Scale of Distress Severity. For a particular issue, assign a score to each where 0 is no distress and 5 is very distressed.

SCALE OF DISTRESS SEVERITY

Answer each: 0 = no distress, to 5 = very distressed

1. How important is it to *you* to try to change the situation?
2. How important would it be to your colleagues to have the situation changed?
3. How important would a change be to the patients/families?
4. How strongly do you feel about trying to change the situation?
5. How confident are you in your ability to make changes?
6. How determined are you to work toward making change?

In the moment, on a day-to-day basis, we have learned to cope with moral distress and ethics exhaustion by justifying our actions to ourselves. Reasons we tell ourselves it is okay might include being too exhausted to fight for what we believe, or believing that no one else cares, so why should we, or we might as well do the task because someone will. Likely the most common feeling is that it is not our fault, and we had no choice. Perhaps we even feel that we will suffer repercussions if we say no, by losing our job, losing our friendships, or losing face in front of our teammates. It becomes a type of "learned helplessness." Dr. Dennis uses the example of the baby elephant tied to a stake, who cannot pull free of the rope. Even when the baby elephant is an adult and weighs tons, it still believes it cannot break free even if it tries. With some of these methods, however, you can break free of the stresses on your morals and ethics.

2.10. COMPROMISE FATIGUE

BASICS

OVERVIEW

• Veterinary healthcare teams are typically primed to offer first-rate medical care for their patients, but all too often they are asked to compromise on that care when clients are financially unprepared to afford the type of care recommended.
• It can be disheartening for the entire team to regularly have to go with "Plan B," especially when a clearly superior medical option is available.
• It is important not to underestimate the negative impact such compromises have on the healthcare team, and the constant role that finances play on the delivery of healthcare to patients in many veterinary practices.

TERMS DEFINED

Compassion Fatigue: Also known as Secondary Traumatic Stress Disorder, this is the gradual loss of compassion by people who work with individuals who are ill, suffering, or victims of trauma. This includes veterinary staff working with worried clients with sick or injured animals. Signs include indifference, disengagement, withdrawal from patients and coworkers, and even physical signs relating to chronic stress.
Compromise Fatigue: Extreme sense of stress associated with repeated requests to make compromises on the basis of the medical or financial management of patient care.
Hedonic Adaptation: Sometimes referred to as the hedonic treadmill, this refers to the observed tendency of individuals to return to a relatively stable level of happiness despite major positive or negative events or life changes.
Leadership Fatigue: Extreme sense of stress associated with managing expectations regarding policies and procedures in the hospital.
Negative Stress: Also known as distress, this refers to the body's response to stress that lacks positive attributes and outcomes. Not all stress is bad, and negative stress refers to those stressors that cause anxiety or concern, are perceived as outside our coping abilities, can decrease performance, and can lead to mental and physical problems.
Plan B: An alternate strategy, often considered as a second choice to a preferred strategy.

ISSUES AND OPTIONS

RECOGNITION

• Compromise fatigue is a term first coined by Dr. Lowell Ackerman and is meant to differentiate the fatigue associated with financial compromises from the more commonly recognized compassion fatigue (see 2.8 – Compassion Fatigue and Burnout) and leadership fatigue (see 2.13 – Leadership Fatigue).
• Compromise fatigue is an insidious disorder experienced by many who work in the animal health field.
• Early in their careers, most animal healthcare workers focus on desirable outcomes, and the best evidence-based ways to achieve them. However, over time, as veterinarians and their teams are asked to compromise on those optimal outcomes to fit the budget of clients, a gradual shift in recommendations can occur, in which veterinary staff begin to recommend services based on their belief that pet owners will not object, rather than what is in the best interests of the animal.
• Through a process sometimes referred to as hedonic adaptation, people can become accustomed to either a positive or negative stimulus, such that the emotional effects of that stimulus are attenuated over time. This can mean that we tend to continually adapt to circumstances and can shift our baseline expectations over time.[1]
• Compounding the problem is that veterinary teams may be held responsible for less-than-optimal outcomes experienced, especially when they did not make or record in the medical record the appropriate recommendation, based on a belief that the client would have preferred the cheaper option provided.
• To a certain extent, compromise fatigue should be expected, since inevitably veterinary care of companion animals must be responsive to the pet owner's ability to pay. This is less an issue in production animal medicine, in which price is always a factor, and herd health is often more relevant than personalized medicine (see 4.8 – Pet-Specific Care).
• Veterinarians are experiencing less job satisfaction than in previous times. The top three stressors cited are time management, difficult clients, and clients' inability to pay.[2]
• Along with increasing job dissatisfaction, suicide rates are increasing within the profession, but the role of compromise fatigue has not really been evaluated in this regard (see 12.14 – Suicide in the Veterinary Profession).

DEALING WITH COMPROMISE FATIGUE

• Compromise fatigue should be considered an occupational hazard in the companion animal healthcare marketplace. As such, mechanisms should be put in place to deal with this issue on a proactive basis.
• The need for compromise should be anticipated in veterinary medicine, so it is worthwhile setting boundaries on where these compromises might be contemplated, and where compromise cannot be considered.
• The easiest way of creating and supporting these boundaries in a hospital setting is to determine the level of care envisioned for the hospital, and then establishing standards of care that reflect those beliefs (see 9.3 – Standards of Care and Care Pathways).
• Hospital operations manuals (see 2.21 – Operations Manuals) can formalize the process, helping to ensure that individual compromises do not adversely impact the vision for the hospital in terms of level of care being delivered.
• Ongoing discussions and hospital team meetings should be used to clarify and refine the messaging, including what standards cannot be compromised, which might be subject to compromise with a signed waiver or "Against Medical Advice" disclaimer (with suitable notations in the medical record), and in which circumstances there might be suitable lower cost alternatives that can be considered with appropriate owner consent.
• It should be possible to lessen the impact of compromise fatigue when staff know the anticipated level of care expected within the practice, and there are clear guidelines established regarding the suitability of compromise in certain predictable situations.
• Since compromise fatigue is often associated with the financial constraints of pet owners, reasonable expectations of pet care expenses should be communicated to pet owners early and often (see 4.4 – What Clients Expect from their Veterinarian), as well as the particular healthcare risk factors for the individual pet (see 5.12 – Discussing Pet-Specific Care).
• As part of setting reasonable expectations, veterinary teams should discuss risk management strategies with clients, such as pet health insurance (see 8.11 – Pet Health Insurance), payment plans (see 8.12 – Payment (Wellness) Plans), and third-party payments (see 8.13 – Third-Party Financing).
• Risk management strategies should be discussed with pet owners at the very first office visits. It is much easier discussing potential future scenarios (such as development of a chronic disorder, visit to an emergency clinic, referral to a specialist, etc.) and how they will be paid for, when there is not a crisis at hand. Clearly document in the medical record the conversation and the owner's response and have staff follow up to ensure that protection is in place.

Vet-ebooks.com

• There will always be pet owners who are indigent, so creating charitable guidelines for services, and sharing resources on no-cost or low-cost alternative services is always advisable, but you should have appropriate conversations proactively to minimize staff compromise fatigue wherever possible.

EXAMPLES

Mrs. Millie Frank presented her 11-year-old neutered male domestic shorthair, Max, for a routine office visit at ABC Veterinary Hospital. The doctor and nurse both commented on the extent of gum disease in Max, and recorded it in the medical record as Stage 3 periodontal disease. A recommendation was made for dental prophylaxis, with pre-anesthetic blood work, fluid therapy, and dental radiography, and a verbal estimate for the services was discussed with the owner. Mrs. Frank said that she would like to help Max, but could not afford it, especially the laboratory work and fluid therapy, and asked for a less costly alternative. Dr. Green wanted to help this owner, but more than that she wanted to help Max, who she believed would otherwise not receive the level of care he really needed. While Dr. Green had some reservations, in the end she consented to compromise and perform the procedure for a fraction of the typical price, and forgo the pre-anesthetic laboratory work as well as the fluid therapy and radiography.

Following the dental procedure, Max recovered without event and returned home with his owner. However, about two weeks later, Mrs. Frank returned Max to the hospital and he was moribund. Blood work and urinalysis revealed that Max was in kidney failure. Mrs. Frank blamed Dr. Green and the care that Max had received. Dr. Green reminded Mrs. Frank that pre-anesthetic laboratory testing was declined, as was fluid therapy and radiography, but the owner was adamant that Max was perfectly healthy before the procedure, and that she planned on making a formal complaint to the veterinary board. Dr. Green admitted Max to the hospital and provided supportive care, but Max died two days later.

Mrs. Green did not pay her final veterinary bill and did indeed report Dr. Green to the veterinary board. Their subsequent evaluation revealed that Dr. Green's medical records only indicated the periodontal score and the procedures performed and that there was no evidence in the record that additional recommendations had been made, but declined. Dr. Green learned the hard way that compromising standards of care as a good deed does not always have commensurate rewards.

CAUTIONS

• Even having established standards of care and care pathways will not eliminate compromise fatigue entirely, since unanticipated situations will always exist. However, the goal should be to have general guidelines that provide some context as to what an acceptable compromise might be, and where compromises are not possible.
• While compromise fatigue will typically improve when standards of care have been developed, clients may still object when veterinary team members fail to accommodate their perceived financial needs. Veterinary practices need to be prepared that they cannot meet the needs of every client's budget, and still be true to the hospital's vision for level of care.

2.11. MAKING MEETINGS WORK

BASICS

OVERVIEW

• We live in an information age, and the quality and quantity of our work depends upon the knowledge and skill of our people, the decisions they make, and the things they do.
• Meetings are one of the fundamental tools leaders and managers have to direct their teams, focus energy, and improve productivity and service. Meetings are how work gets done in today's complex, team-centered environment. And managing well-run, productive meetings has become a primary leadership/management skill.

TERMS DEFINED

Agenda: List of meeting topics to be covered for a specific meeting.
Outbound Calls: Telephone calls initiated by the practice to increase purchases of veterinary services, improve client service, and salvage lost appointments (see 6.22 – Outbound Telephone Calls).

ISSUES AND OPTIONS

MEETINGS IN GENERAL

• Meetings are a normal and necessary expense of doing business and there should be a return on the time investment. To compute the cost of a meeting, add the hourly rate of all of the attendees and multiply it by the length of the meeting. Now, add the cost of the lost revenue from taking team members away from billable work and the pizza you bought for their lunch. This is the cost of your meeting. The goal of a meeting planner should be to make sure that the meetings you are responsible for are so well planned and well run that they more than pay for themselves in increased efficiency and productivity.
• Meetings should always have an agenda showing the goal(s) of the meeting and the topics that need to be covered.
• Match the participants to the meeting goal. If the purpose of the meeting is to train the receptionists to make outbound phone calls, the technicians, associate veterinarians, and kennel attendants do not need to participate in the training; outbound phone calls, however, should show up as an information item on their agendas when they meet.
• Match the meeting time to the meeting goal. An "all hands" staff meeting will require more time than a quick department "huddle" to prioritize the day's caseload.
• Meetings are work and need to be treated as such. Do not mix work and leisure in a meeting; staff members need time to decompress, visit, and eat before the meeting starts. When the meal is over, the meeting should begin.
• Counterintuitively, meetings that last longer than 90 minutes are usually less productive than shorter meetings because participants get tired, their attention wavers, and active participation usually begins to drop.

USING AN AGENDA

• The number of agenda topics should be limited so that they can realistically be covered in the time allocated for the meeting.
• Agenda topics should be prioritized so that the most important topics can be addressed first.
• Staff and associates should be invited to suggest topics for the agenda to gain their buy-in, and so that important issues that require team attention are not missed.
• The agenda should be posted or copies handed out to meeting participants, so that everyone can see it and follow along.
• If all the agenda items cannot be addressed in the course of a meeting, then they should be carried over to the next staff meeting or addressed in some other way.
• An agenda item that should be part of all meetings is a brief report on the status or disposition of decisions and actions assigned at the previous meeting(s). This helps ensure continuity and will hold people responsible for implementation of decisions made.
• A record of all of the major decisions, deadlines, and responsible parties needs to be drafted and posted after the meeting to remind people what they need to do and so that people who were not there can stay up to date.

TIMING ISSUES

• Staff meeting schedules should be published well in advance so that staff members can budget their time accordingly. Thought needs be given to the best time to hold staff meetings so that the people who need to be there can attend.
• Staff meetings should start and stop on time. When participants realize this will happen, they are more likely to be conscientious about arriving on time, especially if there is a penalty for being late. The last one to arrive at the meeting should be asked to sing a song or tell a joke before he or she is allowed to sit down.
• The more people at a meeting, the more time needs to be allocated for the meeting. It takes more people more time to get settled in, and there are usually more questions and concerns to be addressed. Realistic meeting planning factors in extra time for larger groups.
• For meetings that must run more than 90 minutes, taking a short break after 60 or 90 minutes will help participants re-energize so they can focus more fully on the discussion.

MEETING FACILITATION

• Running a successful meeting is a great responsibility. It not an easy task, and it does not come naturally to most people. To reinforce the importance of using meetings wisely, the practice leadership/manager should first acquire the skills they need to do it well and then make sure they model the desired behavior whenever they run a meeting. They should be well organized, use an agenda, set meeting goal(s), start and stop on time, disseminate a summary of the important decisions made, and hold people accountable for what they have agreed to do.
• It is a good idea to develop and share guidelines for meetings. The guidelines should set expectations for both the meeting facilitators' and participants' behavior in meetings. Participants, for instance, should be expected to pay attention, actively listen, and take part in the meeting discussions.
• Training should be provided for supervisors, managers, and others who are expected to run staff meetings so that they will know how to use this time wisely and well. Many good books are available at libraries, bookstores, and online on this subject.

ENGAGING PARTICIPANTS

• Posting an agenda and inviting staff members to add their own topics helps engage participants.
• Staff members should be paid for the time they spend in meetings. It is an important part of the work they do and it needs to be treated as such. There may be legal pay issues to consider as well.
• Asking individuals to be prepared to present an idea or lead part of the discussion encourages participation.
• Using tasteful, appropriate humor and "learning games" help people stay focused and energized.
• Use visuals to help participants see what you are talking about and engage more of their senses.
• Using meetings to publicly praise work well done and celebrate successes goes a long way toward building morale and participants' interest in attending meetings.

Vet-eBooks.com

• Sharing important information about changes, progress toward goals, and announcements makes people want to be at meetings rather than miss out on being in the know.

FOLLOW-UP AND FOLLOW-THROUGH

• Meetings can be a waste of time if major decisions are not recorded, and assignments, responsibilities, and deadlines are not clearly assigned (see Examples).
• Meetings should have a "scribe." This person's job is to record the decisions and assignments made, the designated responsible parties, and the deadlines agreed to during the meeting.
• Meeting notes should be disseminated to all hospital employees after an "all hands" meeting, or to the appropriate parties after a department meeting.
• The facilitator's job is to make sure that decisions are followed up and that assignments and deadlines are revisited at future meetings to hold people responsible for getting things done.

TRAINING MEETINGS

• Training meetings need to be goal-oriented. Whether you or someone else, such as a vendor, leads the training session, goals should be set and published. For example, "Upon completion of the training meeting today, participants will: (1) Know how to educate clients on parasite prevention; (2) Be able to show clients how to administer the products and medication we carry; and (3) Be able to answer frequently asked questions about the importance of parasite control and the products we carry."
• There should be tests (verbal, written, or demonstrated) on the material covered in the training meeting, and employees should be expected to pass the tests as a condition of continued employment. This provides a degree of quality control and ensures that employees use their time well in training meetings.
• Training sessions do not always have to be held as separate meetings (see 3.10 – Staff Training). Short, informal training sessions can be part of any meeting, when time permits. For instance, having each staff member explain, in client terms, one item from the travel sheet ensures that all staff members have an opportunity to learn about the services your hospital provides and that they have a chance to think about the best way to explain them to clients.
• It may be possible to take advantage of technology to include employees remotely in meetings at the practice and to use online resources for training.

OTHER MEETING ISSUES

• Individual department meetings of veterinarian teams, technician teams, management teams, and reception teams are important, but there is still a need to have "all hands" meetings to build coordination and teamwork between departments.
• Thought should be given to where the meeting will be held. Is there sufficient space to accommodate everyone? Are they able to see and hear everything? Will they be comfortable?
• Decide in advance how you will cover the phones and walk-ins during the meeting time, if it is held during normal hours of operation. Having a relief staff person handle phones or assigning one or two people to this task is less disruptive to the meeting than handling interruptions "ad hoc."

EXAMPLES

• Janie will be the project leader. She will provide a project overview and timeline for review at our next meeting on [date].
• Dr. Piermont will draft the protocol per our discussion for final approval at the doctors' meeting on [date].

CAUTIONS

• A poorly run meeting is an expensive waste of time. A well-run meeting is a good investment in building your team and increasing productivity.
• Productive staff meetings are focused and have goals. Decide in advance the reason for the meeting. Is it to:
  ◦ Team problem-solve?
  ◦ Plan a project or event?
  ◦ Train the team?
  ◦ Provide information and updates?
  ◦ Celebrate success?
• If there is not a clear, good reason or reasons to hold a meeting, then don't have one.
• Not all meetings have to be long, formal sessions. Quick daily huddles after lunch with the supervisors of each department to update on the status of cases and balance the afternoon workload is a meeting.

2.12. LEADERSHIP

BASICS

OVERVIEW

• Most veterinarians were never trained to be leaders; they were trained to be technical experts in a highly technical field. Yet at some point in everyone's career, leadership skills become important.
• Whether you are being asked to mentor a new employee or plan to own your own practice, your followers expect you to function like a leader. But how well trained are you for these responsibilities? If you are like most veterinarians, the answer is not particularly well.
• If you are a team member in a veterinary practice, you likely have witnessed both good and bad leadership, even though you may not have been formally trained in management.

TERMS DEFINED

Leadership: Process by which an individual influences others to achieve a common goal.

ISSUES AND OPTIONS

PRACTICE CULTURE AND ITS IMPACT ON LEADERSHIP

• Most of us think of culture in international terms: for example, the Chinese culture or the American culture. But in a more general sense, culture is the sum of all the characteristics that describe "the way we do things around here." It is the set of rules, procedures, processes, attitudes, communication methods, training protocols, or work styles that set the tone for a practice.
• Culture is what helps a practice find and keep great employees. The owner(s) as well as the employees set this tone, either overtly or simply through continued actions over a long period of time (see 2.26 – Changing Organizational Culture). Whether a practice is establishing the desired culture depends upon how the practice leaders act and what decisions are made from day to day. For example, owners may believe that giving employees a voice in operational decisions is important and fosters employee involvement, thereby motivating them to higher performance levels. But if those same leaders establish a pattern of making most of the decisions themselves and then simply announce them to staff members, they are not "walking the talk." In that case, is the culture participative or authoritarian? The owners' failure to allow true employee participation looks a lot like an authoritarian management style when viewed by the employees.
• Can employees change the culture of a practice from within? The answer is maybe, although it is much more difficult than you might think. No matter how many great ideas bombard them, owners/managers have to be willing to change in order for any suggestion to take root or any transformation to actually occur. The sad reality is that many of them do not want the current practice culture to change. Either they are happy with the status quo or they are not aware of what might be done differently and how those changes might improve the practice overall.
• Most of us have experience with suggestion boxes and brainstorming sessions or have used other means to recommend or initiate change. But how many of the employee suggestions you have seen have actually led to action or a long-term change in procedure? Change does not come easily, even if everyone is in favor of it. Only when the current owners/managers are supportive can meaningful and lasting changes actually occur.
• Even the staunchest supporters of the status quo can change their minds. By believing that the benefits outweigh the cost, owners/managers can learn new skills. Owners/managers do not have to initiate the suggestions; they simply have to be receptive to change. Sometimes it takes a new owner or manager to stir up the pot, but sometimes the staff can convince an owner or manager to take the chance to support change and to explore the benefits of becoming a leader instead of a manager.

QUOTES ON LEADERSHIP VERSUS MANAGEMENT

Understanding the difference between leadership today and traditional management is critical. Consider these observations:
• "Leaders need to be far more concerned with determining the future than specifying how to get there" (W. Warner Burke).[1]
• "Leaders enable others to act, not by hoarding the power they have, but by giving it away. When people have more discretion, more authority, and more information, they're much more likely to use their energies to produce extraordinary results" (James M. Kouzes and Barry Z. Posner).[2]
• "I'm successful because I don't go where the puck is; I go where it's going to be" (widely attributed to Wayne Gretsky).
• "Titles are granted, but it's your behavior that wins you respect" (James M. Kouzes and Barry Z. Posner).[2]
• "One of the reasons why so many solutions do not work or cannot be implemented is because differences in thinking have been ignored. Understanding such differences is at least as essential as understanding the technical factors" (Geert Hofstede).[3]

TRADITIONAL MANAGEMENT THEORY

Many of us have worked for someone who was trained to be a manager, not a leader. Traditionally, managers had certain roles, which generally included the following:
• Planning, often considered the central function of management.
• Organizing and staffing, which involved assigning activities, dividing work into specific jobs and tasks, and specifying who has the authority to accomplish certain tasks.
• Leading or managing, defined as influencing others to achieve organizational objectives. As a consequence, it involves energizing, directing, activating, and persuading others.
• Controlling, or ensuring that performance conforms to plans.[4]

Traditional management also has certain themes. For example, traditional management teaches that leaders ought to be cool, aloof, and analytical; they ought to separate emotion from work. We have also heard that management is a tough job, and that it is lonely at the top. And we have been told that management is all about control – the control of resources, including time, money, materials, and people.

Inherent in these themes is an underlying paternalistic viewpoint. When viewed through this window, a manager's job is to plan, hire, direct, and control employees. Kouzes and Posner remind us that the root origin of manage is a word meaning "hand." At its core, managing is about "handling" things – about maintaining order and about organization and control.[2]

CURRENT LEADERSHIP THEORY

• The word *lead*, at its root, means "go, travel, guide." Leadership has about it a kinesthetic feel, a sense of movement. Leaders "go first." They are pioneers. They begin the quest for a new order.
• "The critical difference between management and leadership is reflected in the root meaning of the two words – the difference between what it means to handle things and what it means to go places. The unique role of leaders is to take us to places we've never been before" (Kouzes and Posner).[2]
• You can certainly criticize Steve Jobs' leadership techniques, but his grasp of the future and his vision for what a product should be took Apple from a garage in Silicon Valley to a multi-billion dollar company with sales and stores worldwide.[5]
• Must leaders be cool, aloof, analytical, and unemotional? No. When real-life leaders discuss what they are the most proud of in their own careers, they describe feelings of inspiration, passion, elation, intensity, challenge, caring, and kindness. That is not to say that leaders cannot

Vet-eBooks.com

also be analytical when appropriate, but it is their sense of passion and commitment to an idea that is contagious and makes us want to follow.
• Today's leaders are not paternalistic, they are empowering. Their job is to provide the overall vision and then to articulate it to those around them. Leaders provide the environment and the tools to enable their followers to reach their own individual work-related goals, goals that are closely aligned with the practice's objectives. Once a leader has provided the vision and the resources, a good one just steps back and lets people do their jobs. Leadership is not an adversarial relationship, but a mutually cooperative one.
• Why be a leader instead of a manager? Spending your time trying to control other people is highly unrewarding (picture herding a dozen cats in an open field), but enlisting the help of others in reaching your goals requires much less effort on your part. You do not have to be unerringly wise or have unlimited energy or resources. You do not have to come up with all the ideas, and you do not have to have all the answers. In fact, you will limit your practice's success if you try. If you empower your employees to deal with day-to-day problems, then you will not have to. In fact, their solutions may be far superior to yours, not only saving you time and energy, but saving you money as well.

WHAT DO LEADERS DO?

Kouzes and Posner[2] define the five commitments of leaders today as follows:
• Challenge the Process
  ◦ Search out challenging opportunities to change, grow, innovate, and improve.
  ◦ Experiment, take risks, and learn from the accompanying mistakes.
• Inspire a Shared Vision
  ◦ Envision an uplifting and ennobling future.
  ◦ Enlist others in a common vision by appealing to their values, interests, hopes, and dreams.
• Enable Others to Act
  ◦ Foster collaboration by promoting cooperative goals and building trust.
  ◦ Strengthen people by giving power away, providing choice, developing competence, assigning critical tasks, and offering visible support. Empowering employees is generally the process of depowering managers.
• Model the Way
  ◦ Set the example by behaving in ways that are consistent with shared values.
  ◦ Achieve small wins that promote consistent progress and build commitment.
• Encourage the Heart
  ◦ Recognize individual contributions to the success of every project.
  ◦ Celebrate team accomplishments regularly.

This sounds much more appealing than traditional management, doesn't it? So why doesn't everyone operate this way?

BARRIERS TO LEADERSHIP

Whenever a manager is asked why he or she continues to plan, organize, control, and direct instead of leading, a handful of answers emerge.
• One theme involves tradition. Many of the current practice owners grew up during the decades when management gurus preached this traditional philosophy. Many owner/veterinarians worked under this kind of management early in their careers and carried the theory over to their own practices when the opportunity presented itself. They likely have not given much thought to alternate leadership theories, although some of these people end up embracing new concepts and, over time, a new practice culture emerges.
• Another possible answer is the owners' view of employees in general. Sadly, some managers view their role as adversarial, meaning that they believe they must control their employees to somehow keep them from running amok. The more benevolent of these owners believe that employees simply do not have all the information or all the skills needed to work independently, but deep down they hope the employees will improve somehow over time. The other underlying paradigm is more damaging and much more difficult to change. That is an underlying belief that employees cannot be trusted – that they are out to sabotage the practice and undermine the owners, and therefore must be closely monitored and kept in their place.
• A third theme is that leadership sounds good in theory, but there is not enough time, energy, or resources to take the necessary steps toward leadership. Owners/managers who are nearing the end of their careers are more likely to maintain the status quo rather than undergo the trauma that they perceive in making substantive changes.
• A fourth category of responses sounds something like "We tried that and it didn't work." A few years back there was a big push toward developing teams within veterinary hospitals (see 1.11 – Functioning as a Healthcare Team). Some practices nominally established teams but failed to understand how to empower them and how to deal with the inherent underlying team dynamics. As a result, teams were given tasks but no resources, or they were given duties but no authority to carry out those duties. In most cases, the underlying problem was that although teams were created, they were never truly empowered. Because employee empowerment is largely owner "depowerment" and no real depowerment occurred, no long-term change actually took place.

APPLYING LEADERSHIP THEORY TO YOUR PRACTICE

In the day-to-day chaos of running a practice, it is easy to lose track of leadership ideals. Here are some steps to foster the culture you want, to develop your skills as a leader, and to help your coworkers help you grow the practice. These steps assume that you are an owner, but if not, and if the owner is amenable to change and supports your efforts, the same concepts would apply:
• Spend enough time up front to be able to define and describe your vision for your practice in 50 words or less. Write it down. Practice communicating that vision to your spouse, your siblings, your kids, your dog, and anyone else who will listen to you until it is automatic. Only when they (OK, maybe not the dog) can communicate it back to you will you know that you have succeeded in sharing your vision. Then, share that vision repeatedly with every new employee and with your coworkers.
• Include some measurable specifics in your vision. It is not enough to want to have the "highest quality practice" in your area unless you can define what that means. Does it mean the most technological? The largest? The most caring? The highest priced? The practice with the lowest staff turnover? The one that other veterinarians refer to? The one that clients recommend to their friends because of the care their own animals are getting?
• Set a goal for where you want the practice to be in one year and in five years (see 14.5 – Strategic Planning and Implementation). Write those goals down. Again, they should be well defined and measurable. They might be numerical (targeted annual revenue, number of active clients, average transaction charge, number of doctors on staff, for example), or they might also be lifestyle-related (all after-hour emergencies are referred, you take annual four-week vacations, or cut back your hours to 30 per week to spend more time with your family). They might relate to adding new services, such as developing a surgery specialty within your practice or becoming the recognized local dentistry specialist. Remember the old saying: "If you don't know where you're going, any road will take you there."
• Take the risk of opening up to your staff and letting them see you as a person who tries, but still makes mistakes. Building trust is a process that begins when one party is willing to risk being the first to open up. Demonstrating your trust in other people encourages them to trust in return. You, as a leader, must be trustworthy in order to be trusted.
• Develop reward systems that foster the behavior you want (see 3.4 – Employee Bonus Criteria). For example, consider giving no raises or

Vet-eBooks.com

2.12. LEADERSHIP

only minimal raises based on the cost of living, and only minimal raises related to longevity. Instead, reward your staff with additional compensation when they become more valuable to the practice. They can do this by becoming more efficient, by learning new skills, by taking on additional tasks, and so on. Consider team rewards versus individual rewards. Doesn't it take a lot of cooperation between the front desk and the back office to enable a hospital to run efficiently? How can you reward such group behavior? Poor performance is generally the result of poorly designed reward systems. People do what gets rewarded, so what do you want them to do?

- Share information. Knowledge is power, and the more knowledge you give your employees, the more empowered they will become. Do not be afraid to share financial information (see 2.1 – Workplace Management). Let them know how high your overhead costs are each month, and involve them in discussions about increasing revenue and monitoring costs. Develop a learning organization; that is, recognize that individuals in such a culture are always "in process." Encourage people to share the knowledge gained in outside classes, seminars, and volunteer activities. You will get maximum benefit from your continuing education dollars if part of the process of attending for everyone is developing a minicourse for the rest of the staff (see 3.6 – Continuing Education Benefits). Employees who have the opportunity to learn and grow on the job are much more likely to stay.
- Recognize the value of diversity. No matter how good you are, you do not have all the answers and you probably are not even asking all the right questions. But the people who surround you have different backgrounds, different interests, and different strengths (see 2.1 – Workplace Management). Instead of dismissing diverse opinions or feeling threatened by those who question your judgment, recognize that the best ideas often come from the places you would least expect to find them. Understand that other people take in information differently than you do, make decisions based on different criteria, and communicate them differently, but they are not necessarily wrong! Take the time to hear diverse opinions and be willing to listen. By doing so, your doctors and staff will protect you from yourself; that is, they will keep you from going down a path that will not achieve the practice's goals.
- Understand that you cannot motivate anyone who does not want to be motivated (see 2.5 – Motivating the Healthcare Team). Leaders do not motivate people – people motivate themselves. Instead, leaders provide an environment in which each individual can work toward his or her own goals, and by doing so also work toward the practice's goals.
- Do not underestimate the value of "management by walking around." Managers historically isolated themselves from their employees (remember the executive washroom concept?). But leaders foster good communication by being at the front line where the "real" work takes place, at least part of the time. Information can be shared more easily when you are face-to-face with your staff while they do their jobs.
- Be generous with praise and stingy with criticism. Praise in the presence of coworkers is the cheapest reward you can give and is one of the most valued. On the other hand, criticism should be reserved for private conversations and only when the situation truly merits it. Good employees know when they have screwed up, and you do not need to remind them. Focus instead on what caused the problem in the first place. If it is a system problem, work together to improve the system. If not, assume that it is an isolated instance and will not recur. If it does, consider whether this is an employee whose goals are truly aligned with the practice's. Not every employee should stay – some need to find a better fit elsewhere.

DEVELOPING STRATEGIES TO DEFINE, ACHIEVE, AND MEASURE SUCCESS

Leadership requires you to take a broad look at the issues facing your practice. As previously discussed, leaders need to determine how the future will look, not focus on the specifics of how to get there. The specifics are for the entire practice team to work out. On the other hand, you as a leader must develop ways to measure whether your practice is on track toward your vision. But once again, you cannot do this by yourself. You must involve everyone at the hospital.

The concept of measurement often implies a fairly narrow focus on financial indicators, such as tracking the number of appointments per day or comparing gross fees last month with revenue in the comparable month a year earlier. But that is only part of the picture. A focus on financial indicators often promotes short-term behavior that compromises long-term performance. For example, increasing the number of appointments per day by shortening each office visit may increase revenue in the short term, but it will compromise client service as your clients feel they are being rushed out the door.

A more balanced approach is to focus on four distinct perspectives, each of which impacts your ability to achieve your practice vision. Just as you must communicate your vision, you must empower the entire practice team to focus on the strategy and steps that are necessary to get there. Robert S. Kaplan and David P. Norton advocate the "balanced scorecard," which suggests that businesses should evaluate success from four different viewpoints.[6] In addition, leaders must build a "strategy-focused organization," a concept discussed later in this section. The four perspectives essential in any practice are:

- **Financial:** This is the one most frequently used to evaluate a practice's success or failure. Although important, overall financial success might be viewed more as an indicator of how well all the systems within the hospital are operating. Viewed strategically, however, the financial perspective focuses on success from the owner/investor's standpoint. Without adequate reward, who will take the risk and invest money to own and operate a veterinary practice?
- **Customer/client:** What creates practice success from the clients' viewpoint? How is that different from the owner/investor's view? How focused is your practice on client service? When did you last do a client survey and ask for honest feedback and suggestions for change? How well do your clients follow up on your recommendations and advice? If not, why not?
- **Internal business processes:** How well are the systems within the practice working to "get the job done" and still creating job satisfaction for the team members who work within those systems? What barriers exist? What procedures are unnecessarily awkward or time-consuming?
- **Learning and growth:** Just as we discussed that leaders should create a learning environment for their staff, this perspective focuses on whether the practice is actually creating a climate that supports organizational change, innovation, and growth. How well does the practice respond to outside threats and opportunities? How easy or difficult is it to suggest and/or implement change in this practice? Are there missed opportunities?

The concept of a balanced scorecard reminds us that true success lies in integrating all four of these perspectives. As the leader, you must stay focused on the vision and be the cheerleader who encourages each team member to view his or her job in light of all four perspectives. This does not happen overnight and it is never easy to do. Many a leader has lost sight of the goal in the day-to-day battles we all face, but if you as the leader do not stay focused on the future, who will?

So what is a strategy-focused organization? It is when the entire practice recognizes the need for and implements appropriate changes because they understand the vision and the practice's overall philosophy (see 14.5 – Strategic Planning and Implementation). The process of getting there requires a series of steps. Defining and communicating the vision are the most common starting points, followed by planning to develop the actual steps and procedures that work toward that goal. Practices that develop a vision can usually get this far, but the next step is often overlooked. Every action taken and every procedure developed will not be perfection; that is, something will not work right or achieve the intended result. That necessitates feedback and learning, a sort of necropsy on the process itself. What

Vet-ebooks.com

worked and what did not? What did we learn from the process? What should we have done differently, and what can we do better in the future? Too many practices conclude that change must be a bad thing and then they quit before actually learning from their results.

This feedback and learning then lead to developing new steps and processes, but occasionally they can also lead to a modification of the vision. For example, if part of your vision was to develop a strong focus on increased diagnostics, but the actual number of in-house bloodwork procedures or ultrasounds did not increase significantly, was that because of the actual steps you and the staff took (or did not take), or was it because your vision was too ambitious? Or too vague? Or because you did not have the right equipment or training? By testing the result against the vision, it becomes more apparent whether more planning is needed or whether a vision modification or better communication may be required.

Ultimately, these steps become circular – revised steps lead to more feedback, more comparison with the vision, and more communication. Successful practices do this daily, often without even recognizing the processes at work. But over time, you as a leader will observe a subtle shift. Team members begin to focus on how the practice's strategies are (or are not) leading them closer to the shared vision. This focus on the larger picture starts with you, the leader, but leads to much less conflict as each team member recognizes the role each plays in achieving overall practice success.

2.13. LEADERSHIP FATIGUE

BASICS

OVERVIEW

• Leadership Fatigue occurs as the result of leaders "negotiating" with team members and owners to carry out policies and procedures (versus team members carrying out the policy with their own initiative).
• Commonly, managers actively work to "put out fires" on a daily basis rather than having the ability to be "proactive" and prevent fires from starting.
• Leadership fatigue is generally experienced by a manager within four years of taking the position.
• Leadership fatigue occurs a large percentage of time in veterinary practices with traditional leadership styles such as "it is my way or the highway" or authoritative type of leadership styles.
• Clinical symptoms of leadership fatigue include loss of energy, passion, and motivation.
• Leadership fatigue can be overcome with strong leadership skills and the development of a positive, influential, and collaborative culture.

TERMS DEFINED

Adaptive Leadership: This framework incorporates change by challenging the status quo and adapting leadership styles to yield success.
Culture: The shared values, morals, and ethics of an organization that are used to achieve the common goal.
Emotional Intelligence: The ability to recognize one's own and other people's emotions, to discriminate between different feelings and label them appropriately, and to use emotional information to guide thinking and behavior.
Human Capital: The value of the skills, knowledge, and experience of persons within an organization.
Leadership: The means of social influence in which a person can enlist the aid and support of others to achieve a common goal.
Leadership Fatigue: An extreme experience of stress associated with managing expectations regarding policies and procedures in the hospital.
Shared Leadership: This entails sharing wisdom, knowledge, and influence through empowerment.
Teamship: The collective standard of behavior that is understood and appreciated by everyone participating on a team.

ISSUES AND OPTIONS

There is often a presumed leadership role for the owner of a veterinary hospital and a question as to how much authority and autonomy a manager has (see 2.12 – Leadership). Each business is unique in how they delineate responsibilities; however, a fundamental description of that relationship is often missing. A joint or shared leadership role should be created with the owner and manager.
• Joint leadership delineates the duties of both owner and manager. For example, an owner veterinarian would be responsible for the standard of medicine practiced in the hospital, while the manager would carry out human capital decisions.
• Shared leadership creates a balance of leadership within the practice.
  ◦ The intent is to share wisdom, knowledge, and influence through empowerment.
  ◦ Having too many leaders in the practice without planning can leave an organization confused and paralyzed.
  ◦ If the effort to identify the appropriate leadership team and responsibilities is left to chance, the results will reflect a lack of emphasis and importance.
  ◦ When results are less than what is expected, frustration sets in, which is a key contributor to fatigue and burnout.

Adaptive leadership is a practical leadership framework that helps individuals and organizations adapt and thrive in challenging environments. When it is realized that the organization's aspirations (innovations and progress) cannot be attained through current approaches, the adaptive leadership framework can be used to diagnose, interrupt, and innovate, creating capabilities that match the organizational aspirations. Adaptive leadership:
• takes on the gradual but meaningful process of change,
• diagnoses the essential from the expendable and brings about a challenge to the status quo,
• evolves purposefully in real time.

The Action Centered Leadership Theory recognizes that the leader accomplishes goals through the actions of the team.

Creating and sustaining a healthy leadership team will help to appropriately leverage all of the work and ambitions of the practice.

Fatigued leaders create a fatigued team. Conversely, inspired leaders can create an inspired team.

Emotional intelligence (EI) is defined as the ability to identify, assess, and control one's emotions (see 2.15 – Emotional Intelligence). The characteristics of EI include self-awareness, self-control, self-motivation and empathy:
• Self-awareness involves the recognition of one's emotions and gives insight into the response that follows a trigger. The more emotions are understood, the easier it is to control ingrained responses.
• Self-control aids one in managing stressful triggers, and can moderate angry responses, helping one maintain perspective and focus.
• Self-motivation is contagious to others; as a leader, use self-motivation to influence others.
• Empathy allows one to respond to others with a clear mind, judgment free. If responses included empathy, the speaker is more likely to open up, presenting information that would most likely be held within.

Leaders should be able to control their emotions, as these are behaviors that influence team members. Strong emotional intelligence is advised to manage leadership fatigue.

The use of humor is useful to reduce stress in the moment, to help resolve challenging situations, and to resolve conflict positively.

Obtaining an understanding of oneself is the first step in effective leadership, followership, and teamship. A leader creates followers; when the leader positively influences those followers to carry out the goals of the practice, a new level of cohesiveness, or teamship, is achieved.

To help motivate employees to their highest potential leaders should create three elements:
• **Autonomy:** People have an urge to direct their own lives, and micromanagers can block the vision. Do you give your people a vision and allow them to carry out that vision?
• **Mastery:** People want to get better at what they do, because it matters. What tools do your people have to get better?
• **Purpose:** People have a desire to serve something larger than ourselves. Do you allow them to serve the practice, and your clientele?

Great team leaders:
• challenge the status quo and lead to innovation (which embraces change);
• inspire the buy-in of the mission, vision, and core values of the organization (see 14.9 – Mission and Vision Statements);
• enable and empower – through collaboration;
• walk the walk;
• demonstrate how to share leadership responsibilities with the team and the owner;
• embrace the differences of team members and build on the strengths that each contributes (see 2.1 – Workplace Management);
• understand the generational differences and adapt as necessary to obtain success (see 1.13 – Generational Differences);

Vet-eBooks.com

• cultivate inclusion of all team members and incorporate all contributions; this indirectly builds accountability of each contributor, further enhancing the organization.

Create a culture that your team members respect, cherish, contribute to and help grow.

Develop mission, vision, and core values statements that resonate with owners and team members (and that supports the desired culture).

• **Mission statement:** Why do we come to work every day? What are we here for? How will we accomplish our strategic goals?
• **Vision statement:** Where is our practice going to be in 1 year, 2 years, 5 years, or 10 years from now?
• **Core values:** non-negotiable ethics that cannot be broken by any team member.

The owner will likely develop the vision statement. Allowing the team to help create the mission and core values to achieve the vision will yield better results, as they obtain a greater understanding of "why" they are important.

• Tie the mission and core values into every job description, phase training program, and performance evaluation.

When implementing policies and procedures, use a "pull" method:

• Explain "what" is happening.
• Ask the team "why" and "how" it can be fixed.
• Once the team develops the how, ask "when."

Allowing the team to understand, contribute to, and develop procedures themselves allows them to become accountable for their recommendations and make changes as necessary to yield better results. If the manager "pushes" policies on the team, the team will likely reject the procedure and the change will fail.

All leaders should "walk the talk." For example, when a mission, vision, and core values statement(s) has been developed and implemented, all leaders should practice what they preach. These actions will then be practiced by the followers. If the leader procrastinates, then so will the team. This can result in a fatigued manager who feels they must always haggle, then compromise with the leaders and team members.

EXAMPLES

Positive cultures that encourage collaboration and leadership among the team results in:

• decreased employee turnover, burnout and workers compensation claims,
• increased employee morale, leveraging and delegation of tasks,
• increased client bonding, retention, loyalty and compliance,
• increased whole team health.

CAUTIONS

When not managed, leadership fatigue results in a toxic work environment for all employees. Often managers and owners do not realize when they have reached this critical point in their career. The business becomes paralyzed, stifling client compliance, retention, and referrals.

Leadership fatigue has the potential to lead to a change in career direction for managers and suicide in owners (see 12.14 – Suicide in the Veterinary Profession).

2.14. IMPLEMENTATION: GETTING IT DONE

BASICS

OVERVIEW

One of the most frustrating aspects of running a business is the potential inability to implement new processes, procedures, and plans. It seems so difficult to carve out the time while you are taking care of day-to-day matters. Ideas may be plentiful. Action on those ideas, however, may be tenuous at best. And despite the fact that new methods or tools are often deemed important, the incapacity to put them into practice means very few real changes ever seem to be fully adopted.

Change of any kind is simply challenging, for better or for worse, intended or not. Like anything worthwhile, affecting change takes planning, with a fierce determination to manage each step in the process (see 2.7 – Change Management). The accomplishment of established milestones developed in the planning phase should serve to motivate and provide additional fortitude to push on to complete a project (see 14.5 – Strategic Planning and Implementation). But you can't stop there. To ensure the incorporation of a new policy or process throughout the organization, there has be equal attention to training and follow through (see 3.10 – Staff Training). By following a prescribed process, getting things done and done well may just become a hallmark of your success.

TERMS DEFINED

Critical Path: Succession of connected tasks that will take the longest to complete. The critical path is the longest path to complete the project. Therefore, to complete the project on schedule it is the critical path and the tasks that are part of it that must be managed most closely.
Implement: A verb – to put into effect.
Project: Temporary endeavor with a defined beginning and end (usually time-constrained, and often constrained by funding or deliverables), undertaken to meet unique goals and objectives. In contrast with "business as usual," which entails repetitive, permanent, or semi-permanent functional activities, projects are temporary in nature. The management of these two systems is often quite different, requiring the development of distinct technical skills and management strategies.
Project Management: Discipline of planning, organizing, securing, managing, leading, and controlling resources to achieve specific goals.
Risk: A hazard or chance that some aspect of the project can create damage. All projects contain risk and if you are the project manager, it is not only your responsibility to anticipate risk but it is also your job to communicate the potential impact of those risks to the project.
Scope: In project management, scope is a set of boundaries that define the extent of a project. These boundaries determine what falls inside or outside the project and what is included or not, in planning.

ISSUES AND OPTIONS

When you are busy running a veterinary practice, it is hard to see the forest for the trees. Each day you hope enough of your team shows up to carry out the scheduled work as well as the unscheduled emergencies that need to be dealt with. By the end of the day you are exhausted, two people want to talk with you and you have six telephone calls to return. It is no wonder implementing anything of great importance is so difficult.

What makes people finally change? Two scenarios are most common. You are either very organized, motivated, disciplined, and ambitious, or in enough pain to make the time to find a way to fix the issue. Sadly, the latter is most often the tipping point. If you can learn "how" to prioritize the projects, assign the right individuals to lead them, follow a prescribed set of steps, you can find a way out of your survival spiral.

Let us assume you have made a decision to finally go ahead with a particular project that you have been interested in tackling for some time. You know it will affect everyone on the team and require unanimous participation. Give ample time and thought to what you will tell the team about this change and how. If you can effectively explain the need or desire for implementation of a new system/process/policy – the change – to your employees, and get them to buy into it, your chances of succeeding increases tremendously.

WHY?

This is the primary question you need to answer for your employees. Why the need for the change? Take the time to clearly share the reasons behind what is about to occur.

- What are the reasons behind our proposed change?
- What are our goals?
- Who does the change affect?
- What are the likely repercussions of change throughout the organization?
- How will we all benefit from the change?

The goal is to create acceptance while reducing ambiguity and uncertainty. Then you need to communicate the vision – what it will look like after the implementation, so everyone can picture the end result, providing further reason to get on board with the project.

- Make sure all employees are aware of the vision.
- Reassure stakeholders that the proposed change is justified and will be properly managed.
- Praise individual contributions that boost progress.
- Address and resolve any issues that occur prior to initiation of the implementation process.
- Keep people informed as change progresses throughout the organization, recognizing that this may be a challenge with full and part-time staff where everyone is not there at the same time.
- Make it benefit oriented – what's in it for me (WIIFM).
- Describe specifically what the outcome will look like – how will we/the patients benefit?
- How are we going to get there? Provide a brief outline of the process along with an estimated timeline.
- Listen to their ideas and concerns so you can address the right obstacles to succeed.

WHEN?

The sensitivity or size of a project will determine the importance you give it relative to the team. However it would never be wrong to place this type of information on an agenda for a team meeting. If you give it personal attention, your team will understand the level of importance you have ascribed to it and be more likely to join you.

Vet-ebooks.com

2.14. IMPLEMENTATION: GETTING IT DONE

WHO?

Who will manage the project and take responsibility for the implementation? This may be a tougher question to answer than initially envisioned. A good project manager must simultaneously manage four basic elements:

- Resources – people, equipment, materials
- Time – individual tasks (steps), dependencies, critical path
- Money – costs, contingencies, risk
- Scope – project size, goals, requirements.

This may be just the right project for someone on your current staff. Or it may call for it to be outsourced. If someone on your team has the skills, time, interest, and resources to take on the implementation project, wonderful. But keep in mind you will need to accommodate for the regular work they will not be getting done as a result and the related costs. On the other hand, if this type of project is best suited for someone with more experience, do not hesitate to hire an outside expert.

PUTTING IT ALL TOGETHER

The primary challenge of project management is to achieve all of the project goals while managing the constraints of scope, time, resources, and budget. Ideally, and even more ambitious, is striving to optimize the process to meet or exceed defined objectives under time or budget.

- **Scope:** This is the definition of what the project is supposed to accomplish in detail and the budget (of time and money) that has been created to achieve these objectives. If there is any change to the scope of the project, you must have a corresponding change in budget, either time or resources.
- **Resources:** Managing the people resources means having the right people, with the right skills and the proper tools, in the right quantity at the right time. It also means ensuring that they know what needs to be done, when, and how. And it means motivating them to take ownership in the project too.
- **Time:** Any project can be broken down into a number of tasks that have to be performed. To prepare the project schedule, the project manager has to figure out what the tasks are, how long they will take, what resources they require, and in what order they should be done. Each of these elements has a direct bearing on the schedule and is part of the critical path.
- **Cost:** Each project task will have a cost, whether it is the cost of the labor hours of a vendor, staff member, or the purchase price of a piece of equipment. In preparing the project budget, each of these costs is estimated and then totaled.

There is no shortage of project management software tools. Find one that works for you. Create visual planning documents as well as standard written steps as it will help everyone responsible for the implementation or adoption of the new process to understand how you will get to completion. As you develop the plan, think about how you will know if you have been successful – based on resources, time, money, and scope.

EXAMPLES

Implementation can cover a full spectrum of projects from minor to major, but they all can easily be relegated to the back burner if you do not have a system and a plan to tackle them. Here are a few examples of simple and complex projects and the overview of steps you would want to acknowledge in the development of the plan.

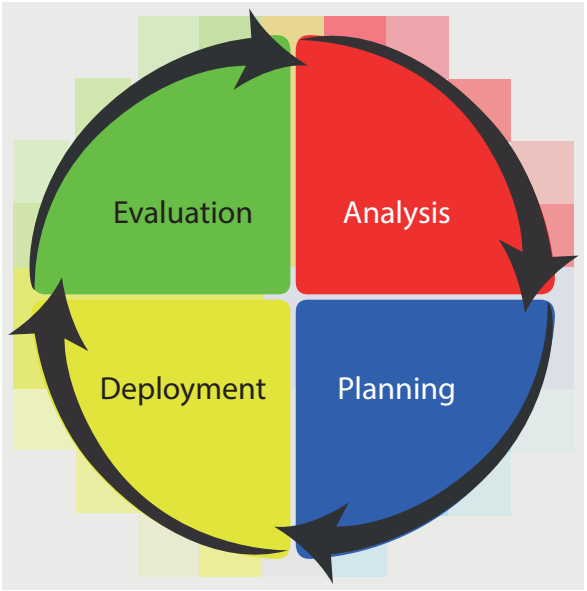

Figure 2-14-1.

One visual planning approach to project management.

SIMPLE: CHANGING THE PROCESS FOR ADMITTING PATIENTS

Perhaps you have always had your front office personnel scheduled to arrive first, open the hospital at 7 a.m., and receive drop-off appointments for the day. The procedure was to have the owner fill out a drop-off form indicating the best phone number to reach them during the day and validate that the pet has not eaten (if undergoing an anesthetic procedure). Once the pet has been checked in, the front office team member places the pet in a cage/kennel and creates a cage card for identification.

This all sounds rather benign and simple to manage, however the practice has found that many pet owners are calling throughout the day to check the status of their pet and what time they can pick them up. The volume of calls has delayed response times for the doctors to return calls and increased the hold time for all callers. The front office staff want to help the clients but are often unable to find any information on the pet because the technicians and/or doctors are busy with other patients or procedures. Thus, time is wasted running around trying to find someone who knows something, the pet owner is a bit frustrated with no information, and the backlog of unattended clients grows. The front office person feels helpless to provide real assistance and assurance that everything is ok and when they will be able to receive a more detailed report.

Proposed Change/Implementation Plan

- **Schedule:** Modify technician schedule so that at least one is on duty to open the clinic with a front office team member (depending on the number of drop-offs expected, there may be more assigned).

Vet-eBooks.com

2.14. Implementation: Getting it Done

• **Exam room:** For each drop-off, a technician brings the pet owner and pet into an exam room for a brief intake session. In addition to obtaining the best telephone number for the client and verifying NPO, the technician can walk them through the process again.
• **Provide information:** Explain the process for the pet that day.

This more personal and thorough approach can give the client much needed peace of mind. The act of taking a few minutes in an exam room, with a technician who has introduced themselves and what their role is at the hospital, explained the procedure the pet will experience that day, who will call them with an update, an approximate time they will be ready for discharge, and assurances they will be under direct supervision at all times, will greatly enhance the experience of the client. It will also free up the receptionist to tend to other drop-offs or incoming calls.

Implementing this type of change may require several people and steps:
• A manager may need to rework the schedule for both front office and technician team members.
• A protocol for the type of information to gather and share with the pet owner at the time of drop-off will need to be created and documented for future trainees and to ensure consistency of administration.
• Technicians accepting drop-off patients will require training of the intake.
• Operational systems will need to be created that flag who will call the pet owner after the procedure and at what part in the process.
• Additional follow-up activities may also need to be documented and carried out if the patient remains hospitalized beyond the day of admittance.

Other fairly simple projects requiring an implementation plan may be:
• Changing schedules – moving from five 8-hour shifts a week to four 10-hour shifts.
• Planning an open house for clients in celebration of a noteworthy milestone.

COMPLEX: GOING PAPERLESS

This is a major change for a practice and one that hinges on many people, many steps, and a sizable investment. Choosing the right vendor as your practice partner is critical so be sure to take the necessary time to evaluate many systems, visit other practices to see how they work in reality, and develop a realistic budget with the vendor after you have defined the full scope of the project.

In order to make a change as far reaching as implementing an electronic medical records system, or changing systems, it helps to define what the problems are you see with the current way of doing things. Then define what it means to go paperless – or have the problems solved if that is the primary intent.
• What is a "paperless" office?
• What are the advantages of paperless?
  ◦ Reduces waste and inefficiency
    ▪ Less storage space needed
    ▪ Less paper and office supplies
    ▪ Less time looking for charts
    ▪ Simultaneous access to the same chart by more than one person
    ▪ Staff and clients view the practice as organized and more competent.
  ◦ Increased security
    ▪ No more interpreting bad penmanship
    ▪ Notations are time stamped and coded by the individual making the entry
    ▪ Less confusion over terminology – electronic medical records contain options preselected for use for specific medications and other abbreviations commonly used
    ▪ Control over access levels which can easily be assigned by management.
  ◦ Improved quality
    ▪ Information that is entered into the practice management software can be extracted, categorized, and analyzed for better decision-making
    ▪ Reduces reliance on paper, which can travel, get lost, be misfiled, etc.
    ▪ Lab results can be managed, as well as radiography storage and retrieval, prescription dosages and dates, client communication, billing, and so on.
• Create a plan
  ◦ Determine who is on the implementation team – choose a leader (from inside the practice or an outsourced resource) and all of the other participants and define what roles they will play.
  ◦ Create a timeline with identified milestones.
  ◦ Create the new "work-flow" by mapping it out in visual terms. Use it in training documents. Begin by walking through a typical new client who is calling to schedule an appointment and every step their pet's file may go through, including all forms that will be entered into their record.
  ◦ Have doctors list the items and sequence of steps they would like to appear in the medical notes template.
  ◦ Assess your current information technology (IT) infrastructure and determine if it is adequate to support your new system. Think about workstations, storage, redundancy, etc. This step, more than any other, requires an expert – outsource to a trusted resource.
  ◦ Engage the team – what role will they play and how will they help with work-flow, training, and input into the "wish-list" of functionality?
  ◦ Integration! Inbound and outbound faxing, emails, laboratories, digital radiography, etc.
  ◦ Who needs to be informed of the change outside the practice?
  ◦ Training.
• Go live!
  ◦ Reassess the learning curve and determine what additional training is needed and how you can utilize more of the system once the basics are mastered.

Now this may seem like a huge initiative, and it is, however it is illustrative of the basic steps necessary to create an effective plan that takes into account scope, resources (people), time, and budget (money). Each step listed above can and should be broken down into many micro steps and time-lined, as well as assigned a resource (person) to oversee. Regular meetings should be scheduled along the way and an authority map followed, stating who needs to sign off on what steps in the process before moving onto the next (critical path).

Other more complex projects requiring an implementation plan may be:
• Moving to a new facility
• Integration of a new service
• Adding a new doctor.

Vet-ebooks.com

2.14. IMPLEMENTATION: GETTING IT DONE

INCENTIVES

Consider incentivizing the vendor or your team, or both, for their work toward successful implementation. This is quite common in some professions, such as construction. If a foreman completes a job on time, under budget, etc., they may be eligible for some incentive. Depending on the length and complexity of the project, you may want to consider incentives to keep staff engaged, motivated, committed, and responsible for the outcome. And certainly celebrate at the conclusion – you've all worked hard.

CAUTIONS

Assign the right person for the job, even if that means outsourcing. The higher the investment or the more dependent you are on the results of the project implementation being successful (higher risk), the greater the importance that should be applied to determine the resources. If you cannot afford to do it right, do not do it or the results could be disastrous. Thoroughly evaluate all the risks of failure and what that could mean to your practice.

2.15. EMOTIONAL INTELLIGENCE

BASICS

OVERVIEW

• Emotional intelligence (EI), also referred to as emotional quotient (EQ), has become a popular topic lately, but its roots can be traced back over a hundred years.
• Many claims have been made for EI but there is still some controversy over the validity of some of these claims.
• EI is important in the workplace, but its relationship to actual intelligence has been disputed.
• Various definitions have been proposed for EI, and various models also exist.

TERMS DEFINED

Emotional Intelligence (EI): Capacity to perceive, assess, and positively influence one's own and other people's emotions.
Empathy: Ability to appreciate the feelings of others.
Motivation: Desire to accomplish things for the sake of achievement.
Self-Awareness: Ability to know one's emotions, strengths, and weaknesses and their impact on others.
Self-Regulation: Ability to control or redirect one's disruptive emotions and adapt to changing circumstances.
Social Skills: Ability to manage relationships and direct others in a desired direction.

ISSUES AND OPTIONS

MODELS

• There is substantial disagreement among experts as to what EI is and how it is best measured, and there are often conflicting reports on its predictive ability. However, even with these issues, the topic remains important.
• The mixed model of EI, introduced by Daniel Goleman,[1] focuses on the skills and competencies that drive leadership performance. These skills include: self-awareness, self-regulation, social skills, empathy (see 5.10 – Empathy), and motivation (see 2.5 – Motivating the Healthcare Team).
• There are several tests for the mixed model, including the Emotional Competency Inventory (ECI), the Emotional and Social Competency Inventory (ESCI), and the Emotional Intelligence Appraisal (EIA); 360-degree assessments are also considered measures of this mixed model.
• The ability-based model suggests that emotions are important and help individuals make sense of social environments. The four types of abilities recognized in this model are: perceiving emotions, using emotions, understanding emotions, and managing emotions.
• The most common measure of the ability-based model is the Mayer–Salovey–Caruso Emotional Intelligence Test (MSCEIT), which has some similarity to ability-based IQ tests. These generate a total score as well as scores in each of the four branches of this model.
• The trait EI model concerns an individual's self-perceptions of emotional abilities. In many ways it considers EI to be a personality trait rather than a cognitive ability.
• There are many self-tests for trait EI, including the Trait Emotional Intelligence Questionnaire (TEIQue), the EQ-I, the Schutte EI model, and the Swinburne University Emotional Intelligence Test (SUEIT).

CONCERNS

• It is important to realize that although most researchers appreciate emotional intelligence as a recognizable attribute, there are still many questions as to what is being measured. Does EI actually reflect a form of intelligence, and is it actually predictive of social and leadership success within an organization?
• Although this debate will continue to rage on, it is likely that EI reflects social skills rather than intelligence.
• Possibly more concerning is that validation studies have not really found EI to be predictive of important outcomes, such as academic and work success.[2]
• One other concern about these self-report tests is that they are actually measuring the test-taker's perception of what would be a good response, rather than measuring some intrinsic ability.

RECOMMENDATIONS FOR VETERINARY PRACTICES

• Although academics will continue to debate the merits and constraints of EI, veterinary practices are most interested in forming functional hospital teams that can deliver exceptional medical care and customer service (see 1.11 – Functioning as a Healthcare Team).
• In this regard, whether EI is a form of intelligence or a skill is not as relevant as employees being aligned with the hospital mission, their commitment to functioning as part of a larger team, their ability to communicate effectively with clients and each other, and their willingness to be accountable in their role within the hospital (see 2.6 – Accountability).
• For most veterinary practices, the primary method of assessing EI will be to increase self-awareness with the use of self-tests (such as Emotional Intelligence Appraisal from Emotional Intelligence 2.0), or 360-degree evaluations which look at the interactions of individuals with other stakeholders.
• The Emotional Intelligence Appraisal (www.talentsmart.com) has four parts, based upon the connection of what one sees and does with oneself and with others. The answers to the self-test provide an overall emotional intelligence score along with personal competence (and contributing scores for self-awareness and self-management) and a score for social competence (and contributing scores for social awareness and relationship management).

360-DEGREE FEEDBACK

• Also known as multi-rater feedback, 360-degree evaluations include feedback from subordinates, peers and supervisors, as well as a self-assessment; in some cases it can also include other stakeholders, including specialists accepting referrals, clients, vendors, and anyone else who might provide useful feedback to an individual to help them grow as a professional.
• The feedback is not meant to be punitive but rather to provide the individual with useful information about how they are perceived by others, so that they can plan their personal development for future success (see 3.14 – Staff Development).
• The accuracy of such an assessment is somewhat affected by the length of time the rater has known the individual being evaluated, with the most legitimate ratings being for those who have known the individual for 1–3 years.
• 360-degree evaluations are valuable, but need to be used cautiously as a measure of performance because there can be weak correlation between such assessments and performance appraisals done by supervisors. The latter are measuring different attributes.

EXAMPLES

Dr. Doris Silver has been an employed veterinarian for three years at ABC Veterinary Hospital and has expressed some interest in becoming a partner. The owners of the practice have decided that a 360-degree evaluation may help Dr. Silver in her personal development and help identify strengths and areas that might need further attention.

The practice contracted with a consultant to facilitate the testing and that consultant suggested that some of the competencies to

Vet-ebooks.com

evaluate might include: customer focus, technical skills, business acumen, communication, integrity, team-building, motivating others, and managing workload.

To conduct the evaluation, Dr. Silver and the practice owners jointly selected representative receptionists, nurses, other doctors at the practice, the owners, and the itinerant radiologist and surgeon that visit the practice to work on specific cases, to participate in the process, with the only criteria being that all raters have personally worked with Dr. Silver and have been familiar with her work for at least one year.

The consultant sent an email with rater links to Dr. Silver and the others so they could complete the assessments online. Each of the participants was assigned a code of self, boss, peer, nonveterinarian, or other, and afterward the consultant prepared a report with the rating scores for Dr. Silver's self-appraisal, the average from all responses, and the responses for each of the participant groups.

Dr. Silver was pleased that her overall assessment was quite positive, with particular strengths in technical skills, integrity, and customer focus. It was illuminating that there was an apparent discrepancy between Dr. Silver's self-rating for business acumen and the owners' ratings. The owners proposed that as part of an individual development plan (see 3.14 – Staff Development and 14.2 – Professional Development Plans) that they would involve Dr. Silver in more of the management aspects of the practice. Part of her duties in the plan will be to be aware of key performance indicators and how they are impacted by the actions of the hospital team under Dr. Silver's direction. If she does wish to pursue becoming a partner in the hospital, this will be an important aspect of her development.

CAUTIONS

There are significant limitations to EI tests and the concepts are really meant to be used to foster self-awareness and positive interactions between team members. While the general perception of EI is very positive, there are some cautions worth considering:

- As individuals develop their emotional skills, it is also possible that they could enhance some abilities to manipulate others, even if unintentional. If those individuals have self-serving motives, EI can influence others in a negative way.
- Individuals who are good at controlling their emotions may also become good at hiding their true feelings and motivations.
- An emotional "pitch" may motivate people to act against their best interests, and even against the best interests of the clinic.
- By perceiving what others feel, we are also capable of using those feelings to influence or compel their actions.
- EI is not consistently correlated with job performance unless jobs actually require attention to emotions (e.g., salespeople). In certain task-based jobs, enhancing EI can actually be a hindrance to improving performance.

2.16. FINDING THE RIGHT FIT

BASICS

OVERVIEW

• Pricing in the practice must be sufficient to be able to adequately compensate all staff working in that practice. In too many instances, staff salaries are kept artificially low in an attempt to shield clients from the true costs of delivering high-quality medicine.
• Good staff members cost money. Good staff members produce money.
• Finding the right fit for the practice involves determining staffing levels, creating accurate job descriptions, identifying suitable candidates, conducting interviews, negotiating a hire, providing proper orientation, and carrying out effective training. It is a big investment put the right team in place. Getting it right is the key to practice profitability.

TERMS DEFINED

Credentialed Veterinary Technician: A team member who has graduated from a school accredited by the American Veterinary Medical Association (AVMA), passed the Veterinary Technician National Exam (VTNE), and has achieved registration (Registered Veterinary Technician, RVT), certification (Certified Veterinary Technician, CVT) or licensure (Licensed Veterinary Technician, LVT) or Licensed Veterinary Medical Technician (LVMT)) by the state in which he or she practices.
Job Description: Written summary listing elements of a particular job, including responsibilities, purpose, duties, qualifications, training, physical and mental demands, and working conditions associated with that job.
Office Manager: Administrative staff member who primarily oversees the reception or customer service team.
Practice Manager: Administrative staff member who oversees the daily operations of the veterinary practice, and fulfils human resource and legal requirements. A certification program (Certified Veterinary Practice Manager, CVPM) is available for practice managers through the Veterinary Hospital Managers Association (VHMA).
Veterinary Assistant: Title given to a team member who has received on-the-job training to provide assistance to the veterinarian and/or credentialed veterinary technician.

ISSUES AND OPTIONS

The goal of every place of employment should be to create a culture that provides a collaborative environment with open communication, allowing team members to be innovative and to help achieve practice goals (see 2.26 – Changing Organizational Culture). In order to develop and maintain this culture, every employee must be the "right fit."

Fit is also known as alignment. It is an overall measure of how the candidate will complement the culture of the hospital. For example, if the veterinary hospital values client education provided by veterinary technicians, and the technician being considered does not like to interface with clients, this candidate would not be a good choice. However, if this technician was to be hired strictly to provide patient care, this may be a good fit.

It is important to remember that the candidates in consideration are not necessarily good or bad, nor or they right or wrong in their beliefs or interests, but rather the degree in which they would "fit."

Hiring methodologies and techniques should continue to be honed, sourced, evaluated, and updated, not only to stay current with ever-changing employment laws, but also to keep you ahead of the curve in terms of employing the best personnel possible (see 3.7 – Effective Staff Recruitment). Your staff members are your practice. Practices sometimes simply view staff as an expense on the profit-and-loss statement, and do not recognize them as an asset in human capital. Rarely do practices approach the hiring and managing the staff with the same sophistication in commitment that they apply to medicine. Yet the reality is the value of the team directly translates to the success of the practice and the quality of care provided.

Ideal candidates must understand the mission of the practice and fit in with the vision and the core values established by the hospital (see 14.9 – Mission and Vision Statements). The job description should be very clear about the expectations associated with the position and include both soft skills and hard skills:
• Hard skills are those that can be trained and fairly easily measured for success. Examples may include placing a catheter, answering the telephone, or medicating a patient.
• Soft skills are those that are much harder to train and often come with the candidate. Examples include initiative, work ethic, positive attitude, motivation etc.

Screening candidates is about understanding the kind of person you need, not just finding someone who can fill the gap (see 3.8 – Screening Potential Hires). Prepare questions that are systematic and create a real picture of the "fit" individual. These kinds of questions help the hiring manager make the right decision when bringing talent into the business.

HELPFUL TIPS TO HIRE THE RIGHT PEOPLE

• Receptionist or client service representatives can be found anywhere you get good customer service, such as retail stores, coffee shops, and human medical offices.
• Technicians can be found through local veterinary medical association paraprofessional programs or recommendations from veterinary technician programs.
• Use your team to help evaluate, interview, and hire new team members. They will become more invested in their success and help them get up to speed more rapidly.

VETERINARY ASSISTANTS

Veterinary assistants are a disparate collection of veterinary employees with skill levels below those of technicians and technologists. While there are distance and onsite programs providing diplomas for veterinary systems, none are accredited by the American Veterinary Medical Association (see 1.10 – Veterinary Staff).

Veterinary assistants act as support personnel to both veterinarians and veterinary technicians. Many assistants aid in the restraint and handling of animals, feed and exercise the animals, and help in other capacities commensurate with their training.

VETERINARY TECHNICIANS

Veterinary technicians are the most important medical paraprofessionals in veterinary practice, and certified, registered, or licensed veterinary technicians in most states can legally do everything in a veterinary practice except make a diagnosis or prognosis, prescribed drugs, or perform surgery (See 1.10 – Veterinary Staff).

From both a medical and a financial perspective, veterinarians should do those tasks they alone are qualified to do – diagnose, prescribe, and perform surgery. All technical tasks, including laboratory work and radiography, can be delegated to a veterinary technician. The veterinary technician is educated and trained to support the veterinarian in surgical assisting, laboratory procedures, radiography, anesthesiology, prescribed treatment and nursing, and client education. Some veterinary technicians pursue additional credentials such as Veterinary Technician Specialists (VTS) in specialties such as emergency and critical care, anesthesiology, surgery, internal medicine, behavior, dentistry, nutrition, and others, as recognized by the National Association of Veterinary Technicians in America (NAVTA).

Vet-ebooks.com

2.16. FINDING THE RIGHT FIT

In turn, veterinary technicians can delegate tasks that do not require their skill levels to assistants, creating efficiency in the process.

RECEPTIONISTS

Receptionists, also known as client service representatives, often present the first impression that clients have of a veterinary practice. They project the level of professionalism to be anticipated, because when a client visits with a pet, the receptionist is usually the first and last person with whom the client deals. This is a critical position and should not be minimized by practices hoping to improve their customer service and profitability.

Because receptionists are so important to the effective operation of a veterinary practice, considerable time should be spent selecting candidates with excellent communication skills, a professional demeanor, and an honest desire to serve the pet-owning public. Receptionists are the gatekeepers to veterinary services in a practice, and whereas an excellent receptionist can effectively bond to clients in a veterinary practice, less-skilled individuals can cost a clinic dearly.

Professional client service representatives are in high demand in other professions. It is unfortunate that many veterinary practices continue to hire relatively unskilled individuals for the front office duty. In some aspects, the receptionist or client service representative is actually more important to the practice then the veterinarian in helping clients bond to the practice, rather than the individual doctor(s).

PRACTICE MANAGERS

Many veterinary practices continue to train existing staff (receptionist, technicians, spouses) to be management staff. This is a less expensive alternative to professional management, but can be far costlier in the long term, because small financial missteps tend to become magnified.

Even when veterinary practices hire or train practice managers, it is critical that they also engage the services of an outside management consultant to monitor processes and provide unbiased advice and support for the in-hospital manager or administrator.

INTERVIEWS

Interviewing is a form of art and one that must be developed. When hiring for the right fit be sure to focus more on the behavioral aspect versus the hard skill aspect. Recall that hard skills can be trained; soft skills are much harder to train.

When interviewing, develop a rapport with the candidate that encourages them to open up and respond more spontaneously rather than a rigorous question-and-answer format. Information gleaned in this manner will tend to reveal more behavioral tendencies.

The key to behavior questions is to get specifics that may be buried in the stories, and to look for inconsistencies or vague responses.

Working interviews can help the team determine if this person is the right "fit." Allow the team to participate in the process. If the candidate is deemed the right person, the team will help the person to "fit" in.

EXAMPLES

N/A

CAUTIONS

Managers will often hire people they like rather than people that fit the culture. Businesses thrive on the right people to complement the culture of the hospital, not people who reflect each other. Everyone should share similar values, but do not have to be alike.

2.17. NEGOTIATING 101

BASICS

OVERVIEW

Negotiating skill is one of eight business practices that are leading predictors of higher personal income.[1] It is often associated with business success.[2] Although the term negotiation may not be directly used, the process is used every day in clinical practice.

In veterinary business, the term "negotiate" is most commonly associated with rental property leases, equipment leases, extended laboratory service contracts, buy–sell agreements, and associate veterinarian contracts. The "negotiation" process takes place, among other times, with clients in the exam room discussing the provision or services and payment options; with employees regarding their work schedules; and with fractious animals reluctant to be examined.

Thus, the art and science of negotiating are skills that are truly relevant to personal and practice success.

TERMS DEFINED

Negotiation: Any communication process between individuals that is intended to reach a compromise or agreement to the satisfaction of both parties; a discussion aimed at reaching an agreement.

ISSUES AND OPTIONS

Negotiation, regardless of the context or the issues involved, is fundamentally about human interaction. However simple or complex the issues, however well-intentioned or malicious the parties, however familiar or unprecedented the challenges, the question we are always trying to answer in negotiation is this: How might we engage with other human beings in a way that leads to better understandings and agreements?[3]

Negotiation, then, is the process by which two or more parties that perceive a difference in interests or perspective attempt to reach agreement.[3] In looking at the very basic Latin definition, "an act of dealing with another person," you can see that the very basis of negotiation is fraught with challenges. The innate problem of negotiations is that, when dealing with another person, there is the built-in competitive need for a winner and thus a loser.

Small businesses with an unyielding entrepreneurial spirit can separate themselves from the competition. However, negotiating skills are an essential component of success as the ability to forge favorable relationships with customers, suppliers, employees, lenders, and partners directly affects profit margin and cash flow. That can be challenging and even stressful.

Commonly, negotiation outcomes between two parties (people or companies) are viewed as:

- win–lose,
- lose–win,
- win–win, or
- lose–lose.

There is not much intermediate in those outcomes. And if you enter negotiations seeking only a win–lose, you are setting up confrontation right from the beginning.

There are some ways to negotiate that allow for a mutually beneficial (win–win) outcome. The art and science associated with them involves asking the questions: Who?, What?, Where?, When?, Why?, and How?

WHO?

Who will be involved with the discussions? It is best to have final or ultimate decision-makers actively involved so as to avoid an interruption in negotiations as one party has to get an approval from the ultimate decision-maker.

The "who" you will be negotiating with during common veterinary negotiations might include:

- Real estate leaseholder
- Real estate seller
- Practice seller or buyer (buy–sell)
- DVM Employment Contract (associate or owner/manager)
- Staff employment (managers, key staff)
- Partnership contract
- Suppliers
- Bank loan officers
- Business representatives (accountants, attorneys, reference labs, waste disposal, etc.)
- Employees (schedules, roles, expectations, etc.)
- Clients (for the opportunity to provide care via a treatment plan and then a payment plan)
- Change (yes, just the general concept of change within the business is frequently a negotiation).

WHAT?

What is the desired outcome? The outcome is frequently an agreement that is acceptable to both parties. If both parties enter into a negotiation with an outcome in mind and that outcome is inflexible, negotiations will fail or stall. On the other hand, if negotiations start with the end in mind – a fair contract, a reasonable lease, etc. – then there is flexibility and the better possibility of a win–win outcome.

WHERE?

Where should negotiations take place? This is more relevant than you may think based upon the built-in distractions that take place during business hours of a veterinary practice. The best negotiations take place where both parties can focus on the issues at hand and are not constantly being disrupted by phone calls or people.

A neutral site can be a private room, a restaurant (make sure it is quiet), or even over coffee. Negotiating across someone's desk creates both a perceived and real barrier and an environment where there is a "home field advantage." If you negotiate at someone's place of business, choose a neutral setting where there is neither a table nor other barrier between the parties. Of course, in a restaurant or coffee shop, the table is a neutral table but still a barrier.

WHEN?

When should you negotiate? Before you enter into a negotiation, you should ask yourself whether the negotiation will meet your needs, whether you will feel comfortable negotiating to obtain your end goal and whether the negotiation will be worth the effort.

Do not mistake negotiations for battlefields. Do not enter the battlefield!

Try not to see negotiations as a zero-sum game. The type of negotiations where one party's gain is another party's loss is best avoided. It is best not to get into a negotiation at this level.

WHY?

Why do you negotiate? The answer is to come to an agreement. You do not negotiate to disagree. You are looking to give and take to come up with a mutually beneficial outcome – lease, contract, treatment plan, etc.

HOW?

The process of negotiations is about how you will get from where you are today to where you want to be. Even the most brilliant strategy for the substance of negotiations can be undermined if there is insufficient attention to process.

This is the art of negotiation. And here are some thoughts on how to negotiate with confidence:

Vet-ebooks.com

• Be positive: Successful negotiations require rapport and finding common good, not on being stubborn. Confidence and positivity go hand in hand.
• Share your vision: Accomplishing your goals, dreams, and hopes are a focus as you negotiate. Share them so that others understand your heart and emotions during the process.
• Write it dow: As you negotiate, especially in some less formal situations, make sure terms are documented. Create a document that both parties agree to and can sign to avoid confusion and misunderstandings.
• Investigate before your negotiate: Do your research and learn about the party you are negotiating with. Try to determine the strengths and challenges of the other party. Bringing insights to the table, especially common or mutual interests, provides a means of breaking down barriers.
• What is your target? What are the deal breakers? Create and determine realistic expectations.
• Strategy versus tactics: Having goals of long-term success for both parties is a strategy that will help in developing terms that are mutually beneficial. Focusing strictly on negotiation tactics without a strategy for success frequently leads to failure.

In negotiations, you should strive to bring fairness considerations to the surface, so that everyone will understand one another's needs and wants. Negotiating is rarely successful when the reason you negotiate is to win. On the other hand, allowing for emotions to interject into a negotiation can be both good and bad. A common mistake made by people is to think that empathy is what you use when you want to be nice, or that it is an instrument of the weak. This reflects a dangerous flaw in understanding. During negotiations, the reason to empathize with the other party is not because it is somehow the "nice" approach to dealing with nasty people. We need to empathize because it makes it more likely that we can achieve our own goals. In negotiations of all kinds, the greater your capacity for empathy – the more carefully you try to understand all of the other party's motivations, interests, and constraints – the more options you tend to have for potentially resolving the dispute or deadlock. Empathy does not guarantee success, but a lack of empathy usually guarantees failure.

With the "how" in mind, there is also the "how not." There are numerous mistakes that can occur during negotiations. These include:
• Viewing negotiations as a rigid focus: If the outcome is perceived to be inflexible then arriving at an outcome can be downright challenging. On the other hand, if the outcome can be a moving target, the opportunity for success is much greater. Think cooperation not competition. There are a lot of moving parts in a negotiation. Looking for tradeoffs can be a deal maker versus a deal breaker.
• Thinking too highly of yourself: If you are in a competitive marketplace and/or a competitive bidding situation, your ego can be your downfall. Level-headed rationality will go a long way in contrast to a "mine's better" mentality.
• Power plays: A take it or leave it approach will frequently shut down negotiations before they even have a chance to start. There is nothing wrong with negotiating from a position of power. There is everything wrong when you underestimate your opponent, overlook their perspective, and devalue their concerns. In the veterinary field, digging in your heels or other irrational behaviors may frequently lead to a null negotiation.
• Not knowing your desired outcome: "If you don't know where you're going any road will get you there" (Lewis Carroll). Think and know what will make you happy before you get into the negotiation. A keen understanding of what will make you happy can help you make better choices during the negotiation process.
• Do not get too caught up in the deal: There will be others. Being too committed to making a deal can lead to mistakes in overcommitting resources such as time and money that you will not be able to recover. You may win the battle but lose the war if you get too invested. You may also quit the war before you have had a chance to work a deal because you feel trapped in what you perceive to be a disappointing deal. Manage your expectations.

SUMMARY

As Sun Tzu wrote in *The Art of War*, "First rule of war: Avoid war. Second rule of war: Offer options". It is always best to remember that the people you are dealing with are not competitors, allies, enemies, or friends – they are just people who, like you, have interests, constraints, alternatives, and perspectives. As a negotiator, your job is to understand these factors and to address the situation accordingly. Rather than using sports- or war-based terms for the other party (e.g., "competition," "other team"), consider terminology such as "associate," because it reminds you to have empathy, to be open to the possibility of collaboration in even the most difficult relationships, and to shed assumptions about what is or is not possible.

Every problem wants to be solved. This is especially true in negotiation. You may not solve it today – it may not even be solvable today – but you will solve it sooner when you remember that all problems of negotiation are, fundamentally, problems of human interaction. Therefore, humans have the capacity to solve them.

EXAMPLES

NEW GRADUATE ASSOCIATE CONTRACT NEGOTIATIONS

This is probably one of the most common negotiations that take place as well as one of the more challenging. It is not always done face to face; it is frequently done via email or over the phone.

As an associate (employed veterinarian) negotiating their first contract, there is a significant disadvantage as you are a complete unknown (in most cases) and, depending upon the competition (i.e., other applicants), you may be one of many seeking the same position. As an associate it is imperative to know your strengths and weaknesses – clinically and life skills and business skills; to fully understand your financial challenges based upon student loan debt; the cost of living in the community; your other sources for income; and your personal budget (yes, you need one). As an associate, you also need to do your due diligence on the practice, tapping into all resources including websites, reviews, past and present employees, and even local specialty referral practices. Besides the practice, you need to do your due diligence on the community and the lifestyle. As an associate, your self-confidence will frequently determine your outcome since you can either take the lead (put what you want on the table) or follow the lead (be given an offer).

As an owner or manager negotiating a new employed veterinarian contract, you need to know what you are looking for from a skillset standpoint; what your budget will allow from a financial standpoint; and what your practice culture is from a team-based perspective. There may be a plethora of candidates, which puts you in a strong position, or a dearth of candidates, which puts you in a challenging position. Using your budget as a guideline, you should know what you can afford and how you want to pay (salary, pro-sal, production); you must know your benefit package; and expectations for the new veterinarian. Do you have a budget for relocation expenses or for a signing bonus? What schedule do you need for them to work? Not only do you need to know your practice you need to know your community as you may not only be negotiating for a position in your practice but for them to move to a community that they know little about.

Bottom line: Think give and take; compromise; concessions; salary versus benefits; mutual respect.

Vet-eBooks.com

2.17. NEGOTIATING 101

BUY–SELL

This is probably the second most common and possibly the most challenging of negotiations. A multitude of people may be involved – attorneys, banks, accountants, brokers, spouses, partners, etc.

All parties need to surround themselves with experts to ensure a speedy and accurate outcome. There are many possibilities for things to go wrong. But the real goal is a win–win. The seller is seeking an exit strategy and has an emotional and financial attachment to the business that they are selling. The buyer is looking for a business opportunity that will give them a return on their investment of time and money. The seller does not want to sell for too low a value. The buyer does not want to pay too much. And of course, there are tax implications for both parties.

With the number of parties involved in these negotiations, it is imperative that the buyer's representatives know exactly what the buyer is looking for, what the buyer can afford, and what the potential for the business is *and* can help temper any emotional desires by the buyer to "own" a practice. On the other hand, the seller's representatives much recognize what is fair and equitable for an owner who has invested years and years of blood, sweat, and tears in their business *and* has a very strong emotional attachment to their "baby" (practice). Of greatest concern to both the buyer and the seller is that their representatives are working for them and not for their own self interests. It is amazing how many buy–sells could be completed with a handshake win–win until a multitude of representatives get involved and fail to represent what the principles truly want.

This deal requires serious negotiation skills that include the "how to" negotiate described above plus more.

LEASE NEGOTIATIONS

There frequently is little wiggle room in commercial real estate contracts. Those areas for negotiation include: length of the lease; tenant improvements; free rent; lease increases; triple net; move in date; availability date, and so on. This is a perfect opportunity to negotiate for both short-term and long-term benefits. If you negotiate for money from the landlord for tenant improvements and/or more free rent, you will have short-term benefits. On the other hand, if you negotiate a shorter lease, you may have to pay higher rent. If during negotiations, you cannot negotiate to include the ability to easily transfer the lease this could also work against you in the long run as it may be difficult to sell your business without being able to transfer the lease. Seek a skilled and local real estate attorney and/or broker to assist you in these negotiations, recognizing that there is a tendency for the lessor to offer the same options to everybody and stick to the status quo.

In these cases, always have a plan B. Consider negotiating with two property lessors concurrently so you can truly walk away from a deal that is not a win–win.

ASSOCIATE VETERINARIAN CONTRACT RENEWAL NEGOTIATIONS

This topic will come up on an annual basis. It can be a very uncomfortable time for all parties. Was it a good year? As an associate did you feel well compensated for the work you did and the income you generated for the practice? As an owner, did the associate live up to and deliver upon expectations?

There is frequently a lot of data that can be used when entering into these negotiations. Data can be both good and bad. The data will usually support one party or the other, rarely both. Negotiations solely based upon data will frequently leave one party uncomfortable.

There is the question of the practice team and clients and where the associate fits in with them. A good fit from a practice culture standpoint is a strong negotiating position. Concurrently, a clientele that is a true fan of the associate is also a strong negotiating position. These subjective measures may allow for negotiations and compromises on the data-based discussions since the associate brings a lot of intangibles to the table. And of course, there are the questions: Is the practice better off looking for a new associate at this point in time and is the associate better off looking for a new practice at this point in time?

In these negotiations, both parties should present their positions and both parties should listen for what each other needs. In fact, both parties may be in a position where they need to "sell" themselves to the other. Is there a feeling that the associate may leave? Or that the practice may not renew a contract? Both sides know each other; both sides should know the numbers; both sides know the benefits; so the negotiations should be for the greater good of both parties. And at the end of the negotiation, you have to work together again … so be nice! You will have to do it all over again next year.

NEGOTIATING WITH CLIENTS

This is done daily and frequently multiple times daily. From presenting treatment plans to discussing estimates (healthcare plans), from discussing wellness needs to discussing whether it is time to euthanize a pet, there are constant negotiations with pet owners.

A treatment plan defines what is needed for a patient at that time and may include future needs as well. Whether a pet is ill or not, a client will frequently balk at a long list of needed services when they do not know what those services are and why they are needed. The client is frequently negotiating from a position of fear and uncertainty – they are uncertain of words they do not understand; they are afraid what might go wrong; they are afraid of what it will cost. As a veterinarian and veterinary hospital team, in many cases, we are negotiating on behalf of the pet as an educated and knowledgeable healthcare provider. It is our responsibility to educate clients to ameliorate uncertainty. It is our responsibility to mitigate risk by explaining the benefits of the treatments under discussion. We need to provide value for the services rendered and communicated to alleviate the cost barrier. In many cases, all that negotiations with clients require is listening, asking questions, answering questions, and providing time so that the client does not feel pressured or rushed. In client negotiations, a win–win outcome is the ability to provide the best care needed for the pet and affordable by the client (or at the very least having payment options as a negotiating option).

CAUTIONS

- No brief discussion can serve as a how-to guide from negotiating success. What it can do is identify certain general truths about negotiation.
- Negotiating is not an inborne gift. It is a skill that can be developed with practice, just like a veterinarian's clinical skills.

MISCELLANEOUS

Life is a constant series of actions where we attempt to influence others. We seem forever absorbed in trying to get people to agree with us. Whatever the case or cause, whenever you communicate with an objective in mind, engaging in social exchange to affect someone's attitude or behavior, you are playing the negotiating game. Like it or not, your attitude and actions have the potential to determine the nature of a relationship, the distribution of available resources and the satisfaction of those involved.

Above all, negotiation is a pervasive process in which people ultimately attempt to reach joint decisions on matters of common concern in situations in which there is initial disagreement. Thus, a negotiation always requires both shared interests and issues of conflict.

Vet-ebooks.com

2.17. NEGOTIATING 101

Obviously, without commonality there is no reason to achieve resolution. So without discord there is nothing to negotiate about.

NEGOTIATION CHECKLIST

- Listen before you speak
- Ask lots of questions
- Determine the objective
- What will you walk away with?
- What are the specific results you need?
- How do the short-term results feed into your long-term plans?
- Identify and rank the issues – yours and theirs
- List all issues
- Assign priorities to issues
- Determine which are negotiable and which are non-negotiable
- Point out common ground and shared objectives
- Decide which are musts versus wants
- Identify the other party's issues and priorities
- Set the parameters
- Is it a range or a fixed target?
- Where do you start?
- When do you walk? When do you close?
- Develop your strengths
- Know your strengths and your ability to offer options
- Know what concessions can be made
- Leverage better for what you need
- Strategically think through timing, priority, and concessions
- Brainstorm alternatives
- As many as possible
- For each issue
- What's most valuable to the other side?
- There is greater power in the number of alternatives.

2.18. When to Hire an Office Manager/Administrator

BASICS

OVERVIEW

The function of a practice administrator or practice manager is to assist the practice owners and their organizations to reduce and ultimately eliminate an otherwise chaotic environment in the practice. Those veterinary hospitals that hire a practice management professional find that the function greatly improves the overall delivery of quality veterinary care. Although the person is responsible for services unrelated to the actual delivery of medicine in the practice, their institution of protocols and guidelines allow the veterinarians and allied professionals to concentrate on care and not on the responsibility for development of business systems.

Depending upon the size and type of hospital, the practice manager's job description could include functional authority over the following areas:

- Hiring, training, supervision, and termination of employees
- Purchasing, retail display development, and inventory management
- Accounting and budgeting
- Website development and maintenance, public relations, and advertising
- Operational flow analysis and designing new protocols for service delivery.

The requisite skills for success as a veterinary practice manager include:

- A diversified business background, including employment in a professional services field (particularly medicine, but not exclusively veterinary medicine).
- Current computer knowledge such as practice management, CRM (client relationship management), and accounting programs, as well as proficiency in the use of Microsoft Word, Excel, and Outlook.
- A desire to manage employees with a diverse skill base.

Practice managers should also be able to understand and put into practice:

- Financial statements, including understanding accrual basis accounting
- Budgeting, forecasting, cash flow, debt structuring, accounts receivable, capital expenditures, fee setting, and accounts payable
- Incident reports, which you will need if an employee becomes injured or if an issue arises regarding malpractice claims
- Personnel management and developing and implementing policies and procedures, including position descriptions, organizational structure, performance evaluations, and knowledge of legal issues impacting human resources
- Regulatory and legal issues.

TERMS DEFINED

Hospital Administrator: Similar to practice manager, with more responsibility for professional and paraprofessional staffing.
Practice Manager/Hospital Manager: Similar to an office manager, but typically with more responsibility for staff supervision and human resource issues. An unregulated term, although there is a certification program (Certified Veterinary Practice Manager, CVPM) offered by the Veterinary Hospital Managers Association (VHMA).

ISSUES AND OPTIONS

A strong practice manager is not easily hired. Although there is no "perfect match," the attributes to look for when hiring a practice manager/administrator include the following.

LEADERSHIP

A practice administrator must be a good leader of both staff and veterinarians (see 2.12 – Leadership). They must gain the respect of both groups and should have a demonstrated record of accomplishment in doing so in other organizations. In a veterinary practice, leadership involves providing guidance to the veterinarians in defining a clear vision and strategic plan for the practice. The practice manager must then communicate the vision and strategy to the practice employees and obtain their tacit understanding. The practice leader must also provide a role model for both staff and veterinarians by being caring yet professional.

COMMUNICATION

A leader must strive to be the consummate communicator. They must develop and maintain a strong communication structure in the practice. This includes establishing a decision-making process among the veterinarians that provides for implementation and follow-up on a timely basis. Depending upon the nature of the issue, implementation may occur among the veterinarians, or it may occur at the operational or staff level (see 2.14 – Implementation: Getting it Done). In either case, the administrator must facilitate two-way communication between the veterinarians and the staff. Inherent but missing in most practices is the ability of the practice manager to maintain confidentiality. Veterinarians must be able to confide in the administrator, and vice versa. The administrator must develop a culture of respect for confidentiality and confidential issues within the organization. Administrators may also help veterinarians relate more effectively to one another and their staff.

STRATEGIST

A practice manager must be able to take the organization beyond its day-to-day operational focus (see 14.5 – Strategic Planning and Implementation). Otherwise, the practice becomes caught in a time warp that forces it to stay in the shadows. They must guide the practice through a process that is oriented toward the future. That refreshed vision is gained through attendance at regional and national conferences, subscriptions to trade periodicals (not necessarily veterinary-related), and membership in professional associations.

"AGENT FOR CHANGE"

Developing a vision and a plan for the practice often involves making needed changes within the organization. The practice manager's role is to manage these changes (see 2.7 – Change Management). This can be a challenging task, because most people resist change (see 2.1 – Workplace Management). This is of particular concern, for example, when veterinarians hire an executive level administrator for their practice for the first time. The veterinarians often do not understand the impact that this change alone will bring to the practice. Employees often resist the new administrator because they have become accustomed to going directly to the veterinarians for resolution of their issues. If the practice has mid-level managers or other professionals, they may also be resentful of a new "authority figure." All this poses a challenge to an administrator, who must be sensitive to the issues and handle them with a great deal of finesse.

NEGOTIATION

Negotiations occur every day in a veterinary practice. Practice administrators must be able to negotiate effectively with patient owners, vendors, landlords, referring veterinarians, regulatory agencies, and the community (see 2.17 – Negotiating 101). The complexity of today's pet healthcare market requires the ability to work with a wide variety of inside and outside forces to accomplish practice goals. An administrator who can create a "win–win" situation is a prized hire for the practice.

HUMAN RESOURCES ARBITRATOR

A good practice manager must handle employee situations with both fairness and firmness. They must be able to listen to both sides of an

Vet-ebooks.com

2.18. When to Hire an Office Manager/Administrator

issue and make a decision to benefit the organization as a whole. There is often a temptation to make decisions based on how they affect one individual in the practice. The administrator must balance the needs of individuals against the organization's needs and decide accordingly. When conflict arises, the practice manager must look for middle ground by focusing on points of joint agreement (see 3.24 – Conflict Resolution).

EXAMPLES

Finding the right practice manager is the first step in gaining delegation authority. The qualities that make up the ideal person will vary by practice size and culture. The kind of person that you need for a small practice – three or four veterinarians – is different from the person you need for a larger group.

A smaller practice might need someone with more hands-on experience who can get their hands dirty with billing, assisting with some procedures on an as-needed basis, or answering phones. A much larger veterinary practice should typically look for a classic manager (someone with possibly an MBA or MHA, with maybe a human medicine practice background) who can evaluate the big picture.

Finding a practice administrator who has to know "a lot about a lot" can be a time-consuming and complex process, particularly for newly created positions. A practice should take time with the process and ensure the candidate has the skills and attitude to lead the organization into the future. Whatever the route, the appropriate person will fit into the culture of the practice, including staff, veterinarians, and pet owners.

CAUTIONS

- It is important that the veterinarians not undermine the administrator by allowing employees to circumvent the administrator. This defeats the goal of the veterinarians becoming less involved in the practice's day-to-day activities, while also rendering the administrator ineffective.
- Veterinarians should look for managers who understand the dynamic nature of practice management. Besides managing the business side of the practice, a manager is, in essence, the veterinarian's boss. He or she must provide the veterinarians with sound advice. At the same time, of course, the veterinarians, who take all the financial risks, employ the practice manager.
- Administrators should view their role not as practice commanders but as advisors, adopting a position of "chain of command" leadership.
- Veterinarians should look for practice managers who have a managed "balance" in their lives, such as someone who enjoys spending time with family and friends and who has outside interests and hobbies (see 2.1 – Workplace Management). If an administrator spends too much time at work, this is often a sign that they have poor organizational/delegation skills.
- The practice manager must keep the owner aware of what is going on in the practice at regular management meetings, either on- or off-site. If a veterinarian acts as though the practice manager is a human "buffer" for business problems, the veterinarian may have outsourced an integral component of practice ownership, with potentially unintended consequences if the practice manager's decisions conflict with their own. And that may not be discovered until decisions are too late or costly to correct.
- Practice owners need to set goals and expect action. Veterinary practice owners need to schedule annual reviews with the practice manager. Annual review goals need to be objective, measurable, and connected to specific deadlines. An administrator must be able to build and manage a team comprising the practice's employees as well as the veterinarians. In many practices, veterinarians do not function well as a team. This is because veterinarians are independent thinkers and decision-makers both by nature and by virtue of their medical training.
- Often, there is a variety of personality types within the practice group. Therefore, veterinarians may be in the habit of making organizational decisions without consulting each other, creating an atmosphere of chaos within the organization.
- The administrator must never deviate from helping veterinarians and staff work together to solve problems. Team-building often involves conflict resolution and, ultimately, finding alternatives everyone can live with.

2.19. STAFF PERFORMANCE PLANNING

BASICS

OVERVIEW

Retaining quality team members is an ongoing challenge for most veterinary practices as staff turnover rates within veterinary medicine continue to persist at a national average of approximately 30%.

- Lack of positive feedback, lack of training opportunities, and failure of management to include staff members in the larger strategic vision of the practice are three of the most commonly cited reasons why staff members leave practices and leave the profession.
- A well-run performance planning program helps address all three of these issues.
- Historical performance appraisals can be a valuable tool for new employees, or employees in a new role within the practice. However, once an employee has mastered the basics of their role, historical reviews do very little to educate and motivate experienced staff members. In many instances, repetitive historical reviews may actually have the opposite effect, by causing employees to become unmotivated and disengaged.
- Performance dialogues (as driven by the Millennial workforce) is the hottest performance management trend. Supervisors meet with employees to discuss their performance in a more casual dialogue rather than presenting "scores" and other feedback usually perceived as one directional. Monthly intervals are the most common format. It is best for supervisors to meet with the employee off the work floor in a quiet environment without interruptions. The supervisor should take notes during each session.
- Performance planning is a performance management system that goes beyond performance dialogues. It is based upon a mutual commitment between the practice leadership and its staff members. In essence, the practice leadership helps each staff member establish and achieve specific goals throughout each year of employment. The program may also be referred to as "proactive goal setting."
- The most common format involves quarterly goal setting.
- Typically, a full-time employee might be required to develop three new goals each quarter. The requirement for part-time employees can be prorated based on their average number of scheduled hours each week. For example, a staff member scheduled for 20–30 hours each week may be required to develop two goals per quarter, whereas a staff member scheduled for less than 20 hours may only need to develop one goal per quarter.
- A performance planning program is most effective when the individual employee and his or her supervisor have equal input in the development of each plan.
- Performance planning is an effective motivator and training tool because this program is built on the theory of positive reinforcement rather than negative reinforcement.
- Basing a work relationship on positive reinforcement is more enjoyable for supervisors as well.
- Businesses with performance planning programs in place are more productive, have higher retention rates, higher engagement scores, higher customer service scores, and higher job satisfaction rates than businesses without a performance planning program.
- Performance planning allows supervisors to guide employees through job enlargement, job enrichment, and career pathing.
- Proper goal setting is best achieved by using the SMART method.
- Changes in compensation can be tied to a review and analysis of the difficulty of the goals developed throughout the year and the number of goals achieved.

TERMS DEFINED

Career Pathing: Scheduled progression of responsibilities that helps an employee achieve a higher position. For example, a technician could become a shift manager, then a technician manager, and then a practice manager.

Job Enlargement: Assignment of additional tasks similar to those the employee is already trained to accomplish. For example, asking an employee who is trained to do callbacks for one doctor to begin doing callbacks for all of the doctors.

Vet-eBooks.com

Job Enrichment: Training an employee to be able to complete new tasks in addition to her regular responsibilities. Cross-training technicians and receptionists so they are able to cover for each other is an example of job enrichment.
Roadblock: Typically an employee who works to prevent another employee from achieving his or her goal(s).
Skill Hog: Employee who has mastered a skill, but refuses to train others. These individuals are generally insecure in their position within the practice and believe that "hoarding" a specific skillset gives them job security or elevated status within the practice. For example, there is only one technician in the practice that can take dental radiographs, but they never seems to have time to teach anyone else this skill.
SMART: Acronym for Specific, Measurable, Attainable, Related to mission, and Time limited.
Trainer: Someone in the practice who has mastered a specific skill well enough to be entrusted with the responsibility of teaching it to others.

ISSUES AND OPTIONS

GOAL CATEGORIES

Most performance planning systems allow staff members to choose from many different types of goals (see 3.14 – Staff Development). Common types of goal are the following:

- Learn a new skill. Many practices require at least one goal to come from this category each quarter.
- Teach a skill. This is an excellent way to make talented staff members responsible for training others. This is part of an effective strategy for engaging and leveraging skill hogs. If they are given goals to train others, their success within the hospital (as well as compensation) is now at least in part dependent on them sharing skills with and developing others.
- Upgrade an existing skill or attend a class. The Internet is a fantastic resource for locating courses that are available for all staff members, including receptionists, technicians, managers, and doctors.
- Improve customer service. This allows someone to develop and implement an idea that improves customer service. Examples could include decreasing the number of calls put on hold or speeding up the discharge process.
- Improve client education. This could include developing new handouts or a collection of digital photographs.
- Develop a marketing program for a service or product. Pet Dental Month is a common choice, along with Spay Day USA.
- Improve practice profitability. This could include ideas to increase revenue or decrease waste in the practice.
- Simplify a process or procedure within the practice. One specialty practice reduced the number of forms a staff member needed to complete to admit an animal to the hospital from nine to only three.

ACTING SMART

- **Specific:** A goal to increase laboratory work is too vague. A more specific goal would be to increase the amount of pre-anesthetic bloodwork performed on patients admitted for routine surgery.
- **Measurable:** If relevant, it is desirable to include a measurable target in the goal so you can know when the goal has been successfully achieved. For example, increasing the client compliance rate for authorizing pre-anesthetic bloodwork from 60% to 75%.
- **Attainable:** An attainable goal is a realistic goal. Once accomplished, attainable goals help channel employee enthusiasm and build confidence. In the previous example (see "Measurable"), an increase from 60% to 100% would probably be unrealistic.
- **Related to mission:** This makes sure that the employer is getting proper value for helping to develop the employee's career path. For example, if an employee asks to attend a course on panda bear behavior, such a request would probably not relate to the practice's mission and, therefore, would not provide a payback for the practice.

Vet-eBooks.com

2.19. STAFF PERFORMANCE PLANNING

• **Time limited:** If the goal-setting plan is limited in length to one quarter, the employee should be reasonably expected accomplish their goal in 90 days or less. If, however, an employee is making sufficient effort and progress, their goal(s) can always be extended into the next planning cycle.

PREPARING A PERFORMANCE PLAN

• The supervisor should meet with the staff member prior to the beginning of each quarter.
• The supervisor and staff member should work together to develop three goals using the SMART system (if applicable).
• They should draft a plan that describes the goal and from which category it derives (see 14.2 – Professional Development Plans).
• Many practices require that the subject staff member select three different types of goals each quarter.
• Specific start dates and target completion dates should be chosen (if applicable).
• A mentor should be identified (if required).
• Any potential costs for the practice and the mode of payment for such costs should also be identified (such as registration fees for a class).
• Specific follow-up dates should be established to ensure that the employee is making reasonable progress throughout the quarter and is not waiting until Day 89 to begin working toward their goal(s).
• The supervisor and the staff member should both sign and date the plan. The supervisor should keep a copy of the plan in the employee's file.

EXAMPLES

• A supervisor meets with a full-time technician, and together they develop three goals:
  ◦ The first goal is to take an online course on how to operate a practice blood bank. The fee for the course is $99.
  ◦ The second goal is related to client education. The technician wants to author a handout for client distribution regarding dogs with minor separation anxiety.
  ◦ The third goal is for the technician to become a trainer and teach a skill to another technician. Because the subject technician has excellent laboratory skills, she and her supervisor determine that she should teach three other technicians how to perform a manual differential. This would be a manageable "training" goal.
• Establishing dates spreads the goals out evenly. Because the course is scheduled during the first month of the quarter, the technician should work on her handout during the last two months of the quarter.
• The technician will mentor one technician per month. That is, she will teach one technician how to do a differential during the first month, another in the second month, and the last in the third month. This pace will allow plenty of time for hands-on training.
• The subject technician and her supervisor determine that their first follow-up meeting should occur one week before her course begins. During this meeting the supervisor will confirm that she has registered for the course and that she has started training the first technician on differentials.
• A second follow-up meeting should be scheduled 30 days later to make sure that the subject technician has started researching information for her handout and that she has started training the second technician.
• The final follow-up meeting should be scheduled 15 days after that to make sure that technician number 3 is being trained and the handout has been submitted to the doctor for proofreading and approval before it is released to clients.
• The goal-planning cycle begins anew at the beginning of the next quarter.

CAUTIONS

• Supervisors need to master the skills associated with performance dialogues before launching a performance planning program.
• Although this program does create more work for supervisors, the practice rewards are tremendous. The practice leadership must support the program by allowing supervisors to take the amount of time necessary to administer the program effectively. If supervisors are not allocated time, the program will fail.
• Be careful to set realistic goals, especially in the beginning, to make sure the program gets off to a good start. Ninety days is not a long time. If the practice adopts quarterly goal setting, make sure the goals are small enough to be completed within the 90-day window and in addition to the employee's regular responsibilities. Initial goals may need to be broken down into several smaller components, or timelines may made to be extended into the next quarter to ensure success.
• Supervisors must be vigilant in maintaining their follow-up commitments. Supervisors should start small and build on success. One goal per quarter for full-time staff only is a reasonable starting point for most practices. If supervisors fail to execute their responsibilities, such as reliably meeting with each team member on schedule, employees will disengage from the program and it will fail. Thus, we will emphasize again, it is recommended that supervisors

Vet-ebooks.com

master performance dialogues before transition to performance planning.

MISCELLANEOUS

- The number of goals attempted, the difficulty of each goal, and the number of goals achieved can all be factored into compensation decisions for each staff member.
- Supervisors can use this tool for overcoming challenges such as getting skill hogs to share their knowledge with others.
- Performance planning is also an excellent tool for helping supervisors facilitate job enlargement and job enrichment and driving employee engagement and job satisfaction scores.
- Goals can be developed to support career pathing and career development, such as developing managerial skills in a high-potential technician or receptionist.
- Goal development should be aligned with the strategic needs of the practice. For example, if the practice wishes to grow dental revenue, receptionists and assistants can learn how to educate clients and promote dental care and technicians can learn how to perform basic dental procedures and how to assist the veterinarian with advanced procedures.
- Larger practices (50 employees or more) can benefit tremendously from performance management software. These programs typically charge a monthly fee per employee, so they are very scalable and cost-effective. Performance management software reduces the hours consumed by the performance management process and results in a far better result than is possible by managing the process manually.
- Do not become discouraged by a slow start. It often takes several complete cycles for staff members and supervisors to become proficient in managing performance plans.

2.20. STAFFING BUDGETS

BASICS

OVERVIEW

• The costs associated with staffing constitute the largest expense in virtually all types of veterinary practices.
• All practices should have a strategic operating budget (see 8.21 – Controlling Cash Flow – Budgeting). A staffing budget is an integral component of any strategic operating budget. If the idea of creating a strategic operating budget seems too daunting, a staffing budget may be an excellent place to begin developing your budgeting skills. Most individuals take 3–5 years to fully develop maximum comfort, efficiency, and effectiveness with budgets.
• In almost all geographic locations, veterinary medicine experiences some amount of seasonality. In some markets, there can be a significant decrease in workload when comparing the busiest time of year with the slowest time of year. Determining the appropriate year-round staffing level for your practice can be extremely challenging. Given the significant amount of training required by veterinary staff and their limited availability in most markets, it is not practical to lay off staff when your practice is slow and rehire them when business picks up again. Many practices are slow during the winter and holiday seasons (December through February), moderately busy during the spring and fall, and incredibly busy during the summer. Most practices, therefore, will hire sufficient staff to make the spring and fall run smoothly. They will pay overtime and hire seasonal help to get through the summer months. And in the winter, they will carry the burden of extra staff. Paying staff in the winter when business is slow could be considered a fixed expense for budgeting purposes. Paying for additional staff in the summer when business is busy could be considered a variable expense. As such, many people describe staffing as a "step" expense.
• It is important to note that it is a popular misconception in veterinary medicine that all overtime is bad. Overtime paid due to poor productivity, or poor planning should be reduced or eliminated. However, paying overtime to address a high or emergent caseload is a financially sound decision. If a technician needs to stay for 2 hours to assist with a hit-by-car that arrived at the end of their shift, the hospital will pay them the equivalent of 3 straight-time hours of pay (as overtime is 1.5 times their regular wage). This is more cost-effective than hiring another technician and paying them a full shift whether they are needed or not. If utilizing overtime properly to maximize staff efficiency, overtime should equal about 5% of your staffing budget.

TERMS DEFINED

Fixed Expense: An expense that stays the same regardless of the amount of work the practice performs. Rent is an example.
Step Expense: An expense that increases or decreases in distinctive amounts rather than in a linear fashion. Any staff member with a guaranteed work schedule is considered a step expense. This is because each staff member has the capacity to complete a specific volume of work. For example, if a new technician supports $150,000 in revenue production, the practice will not need to hire another technician until the new technician is at full capacity. The next technician represents the next "step" in staffing costs.
Variable Expense: An expense that increases as the amount of work the practice performs increases. For example, the busier a practice becomes, the more drugs and supplies it requires.
Weighted Hourly Wage: To simplify the budgeting process, many practices use a weighted hourly wage, calculated by averaging an employee's anticipated wage over the course of a year. For example, if it is anticipated that a staff member earning $10.00/hour in January is going to get a raise to $11.00/hour in July, the staff member's weighted hourly wage average throughout the year would be $10.50/hour (six months at $10.00 and six months at $11.00).

ISSUES AND OPTIONS

• It is crucial to use technology when developing a staffing budget. Spreadsheet software, such as Excel, is an excellent tool for creating real-time budgets. Some scheduling and time clock software also perform budgeting functions, but these features vary dramatically from program to program. If you are using accounting software such as Intuit's QuickBooks, make sure your budgeting software can import or export desired data automatically instead of via manual entry.
• If you are unfamiliar with these software programs, you should enroll in a local or Internet-based course to learn how to use these products. A simple beginner-level class is all that is needed to learn enough to create a staffing budget. These software programs offer so many advantages over the pencil and paper method that the latter should not even be considered as an option.
• When determining a weighted hourly wage, you must be able to anticipate all possible reasons why a staff member's level of compensation could change (see 3.1 – Compensation). Such variables could include a wage increase for a new hire that has completed an orientation period, or a wage increase for a staff member who has acquired an additional skill set, or achieved a specific certification such as passing the VTNE, or VTS examinations. Other variables include merit raises for outstanding performance, market raises to retain staff members in a competitive market (external equity in HR speak), cost of living increases for annual raises, and the completion of additional skill certifications in a skill-based compensation scheme.
• Many practices also have significant bonus programs in place (see 3.4 – Employee Bonus Criteria). If your practice has a significant bonus program, you must make allowances for such payments in the staffing table. For example, a practice may give each of its employees an additional week's pay in December as a holiday bonus. The practice should, therefore, add 40 hours to the number of hours each employee is scheduled to work during the upcoming year. Another practice offers a weekly bonus of $25 to the receptionist who creates the least number of billing errors during the week (D. Brown, Personal communication, July 1, 2004). Because the annual value of the reception staff 's weekly bonus program totals more than $1,000, it is significant enough to be included as a line item in the annual staffing budget.
• The best way to achieve staffing budget goals is to be proactive. Many practices take a passive approach to administering their budget by waiting until the end of the month to see whether or not the practice hit its goals. One way to be proactive is to utilize online scheduling software that has a built-in budget feature. For example, if the practice has a technician budget of $20,000 for the month, a schedule can be created that forecasts $20,000 or less in staff wages. If the person scheduling is not allowed to have access to staff wages, they can be given a target number of staff hours to be scheduled based on the weighted hourly wage. Therefore, $20,000 in technician wages may roughly approximate 1,000 technician hours for the month. Scheduling below the target values dramatically improves the odds of staying on budget. Some practices even offer quarterly bonuses to schedulers and or supervisors for staying within budget parameters each quarter.

EXAMPLES

• Preparing a staffing budget begins by examining the scheduling process. In order to determine your staffing needs, you should know how many staff members you need on duty at all times. Once you have enumerated all of your staffing needs, it is easy to determine the proper staffing level for your practice.

Vet-eBooks.com

• Each staff member should be identified by name. Working from left to right, each employee should have a complete profile of information entered into the spreadsheet. Because the majority of practices offer annual raises on employment anniversaries, the employee's start-date is important. It is usually the first piece of data after the name.
• The weighted hourly wage for each employee should be listed next to the number of hours an employee is scheduled to work during the upcoming year. A 40-hour/week employee is listed as 2,080 hours/year (40 hours/week × 52 weeks/year = 2,080 hours/year). A similar calculation should be completed for each staff member.
• The spreadsheet should then calculate the employee's annual wage by multiplying the weighted hourly rate times the estimated number of hours to be worked. With respect to salaried staff members, you can forgo the previous calculation and simply list the employee's annual salary in this field.
• The next few spreadsheet fields will usually represent benefits that have dollar values such as pension plan and health insurance deductions. Some of these numbers are fixed amounts month after month (e.g., health insurance), whereas others are contingent amounts based on an employee's total wage value for a particular month (e.g., pension program matches).
• State and federal payroll taxes should also be listed. These figures typically represent a percentage of the total wage value.
• For ease in reference, you can subtotal the costs associated with individual departments. You can also total the entire staffing budget including its associated costs. If you use a spreadsheet or similar software program to create your budget, you should be able to make real-time updates to the staffing table. For example, if you add a new team member to the staff list and enter their corresponding information, the spreadsheet will calculate and update all the associated expenses.
• If your practice uses a complete operating budget, the values obtained in the staffing budget can be divided by 12 and entered into each month of the operating budget.

CAUTIONS

The system of utilizing weighted averages does generate a small margin of error. In theory, early months will be estimated a little higher because raises anticipated for later in the year have not yet been given. During the middle of the year, the budget projections should be close to actual values. During the final months of the year, the budget projections may appear a little low. By year's end, however, the estimated total budget value for the year should match the actual value of the employee's wage. Most practices tolerate this nominal margin of error; otherwise, they would have to perform the extra work of calculating 12 individual monthly staffing tables.

MISCELLANEOUS

• Document all of the assumptions made throughout the entire budgeting process. Such documentation will ease the process of comparing projected budget amounts with actual budget amounts (i.e., monthly and quarterly values). Minor assumptions can be documented as comments within the spreadsheet for easy reference as needed. More significant assumptions should be detailed in a Word document, or in within a corresponding action plan if the assumption requires someone to take action. An example might be annual raises in June, or adding five staff members in May if the practice hires a new associate.
• If your practice is growing and you wish to account for staff expansion in your budget, do so by placing a staff member named "OPEN" in your budget. This fictitious individual will act as a placeholder. You can then estimate the number of work hours and corresponding wage based on the desired skill sets and experience required for the position you anticipate filling.
• Other scheduling factors that influence the cost of staffing should be included in the budget. Such factors include shift differentials (extra hourly pay for working undesirable shifts), supervisory differentials (extra hourly pay for managing staff while on duty), and so on.
• Practices that are expanding rapidly, or are experiencing high turnover rates may also factor in lead time for hiring, and/or a premium for staff training. Some practices budget as much as 25% of the employee's estimated wages during their first six months of employment.
• If specific individuals cover for other employees when the practice has a high caseload or is short-staffed, it may be prudent to add additional hours to their annual total beyond the full-time value of 2,080/year. Prior history can be a valuable guide for making these assumptions.
• If you anticipate that the practice will undertake any special projects during the year, you should include a line item in your budget named after the project, along with an estimate of hours needed to complete the project. If you have all full-time help, then you may need to account for overtime by listing your project help at an hourly rate equal to 150% of your full-time employee's average wage. Samples of special projects could include changing your computer or record-keeping systems, renovating your existing facility, or moving to a new facility.

2.21. OPERATIONS MANUALS

BASICS

OVERVIEW

- Veterinary practices are very complicated healthcare delivery systems. The majority of practices offer a plethora of services that include not only clinical medicine and surgery but also ancillary products and services.
- The employees who deliver veterinary services come from a multitude of levels of education, a variety of generations, and have huge differences in the amount of training they receive.
- The veterinary consumer is becoming more and more demanding from the veterinary practice and is expecting a large amount of value for the price that they are paying.
- The veterinary practice competes for discretionary income of the pet owner who wants their coffee customized, their shopping personalized, and their healthcare dedicated just to them.
- With a highly demanding client in a highly complex business model with a very diverse employee base, it is imperative to have a dependable and reliable manner by which services are provided.
- An operations manual clearly defines how everything is done in the practice so that things are done consistently, predictably, effectively, and efficiently.
- The ultimate success of any small business, which includes most veterinary practices, depends upon delivering or even exceeding client's expectations.
- You cannot exceed expectations if there is no system for doing things the same way each time, every time, and all the time, without fail.

TERMS DEFINED

Operations Manual: An organized resource for each of the processes that take place in delivering a business model. It includes documents that describe in detail the processes and systems that a company uses to provide its services.

ISSUES AND OPTIONS

WHAT GOES INTO AN OPERATIONS MANUAL?

An operations manual is the authoritative guide of how things are done in a veterinary practice. From cleaning a cage to answering a phone; from walking a dog to prepping a pack; from monitoring inventory of fluids to providing water for cats; the operations manual is your "how-to guide" to everything. It is an organized, available, efficient, and effective ways to communicate to the hospital team all of the procedures and processes. And with the manual in hand, employees are released to perform their jobs with optimal results having the security of the clearly delineated processes.

An operations manual is a single point of reference for all important company information. It is a place to find fixes to things that are going wrong, it is one of the first training tools that new employees are exposed to, and it teaches employees, new and old, how to do things the right way.

When considered in conjunction with a policy manual, an employee manual, a practice vision, mission and core values, an operations manual creates a significant foundation for success. While the policies, vision, mission and value are relevant to the entire team, the operations manual is both position- and department- or zone-specific. Thus, a veterinary practice will have operations manuals that are either job- or position-specific or, more commonly, department- or zone-specific.

The process of creating documentation of all of the operations systems and processes is daunting but it is critical and acts as the foundation for each manual. It is time-consuming to not only create the manual in the first place but also then to routinely update and maintain it. This will require ongoing attention. In fact, your operations manual should have a process and timeline for routinely updating the manual itself. Do not create a new way each time for a process, look to improve the existing process so that the final operations manual adds immediate value to the client, the team, the management, the owner, and eventually the buyer of the now well-organized practice. Process documentation allows for work to be done without the owner always being present. And who wouldn't want to buy that opportunity?

An operations manual may start out initially as a paper document but should eventually become digital in nature (consider Google Docs or similar) with a detailed table of contents, index, and hyperlinks between different interrelated action plans aka processes aka recipes. And do not forget to back it up and protect it from alteration with passwords.

CREATING THE OPERATIONS MANUAL

The final product is a comprehensive documentation of how your company functions. A well-written manual will lead someone who is unfamiliar with your operations through the essential procedures that you perform each day to support your business.

There are a few steps you need to perform before getting started:

- Create a template that all authors will use to document the steps in a particular process or recipe. This template should include:
  - WHAT is the process about to be described?
  - WHO (not the name of an individual but the job title) is responsible?
  - WHO do they report to?
  - WHAT resources are needed prior to initiating the process?
  - WHAT is the optimal outcome of the process?
  - WHAT are all of the steps to complete the process?
  - WHEN was this created and WHEN was it last modified?
- Determine how you want to organize your manual first. Is it going to be job description based (receptionist level 1 manual, receptionist level 2 manual, etc.) or department based (client service department manual; inpatient technician manual, etc.). I would suggest departmental.
  - The individual departments you might see in a veterinary hospital include:
    - Client service
    - Animal care
    - Technician
    - Management
    - Professional.
  - Each of these departments will be the title for an individual operations manual, such as "How We Do Things in the Client Service Department" or the "Client Service Department Manual."
- Decide whether you will have a hard copy version and digital backups or a digital version that is readily accessible on the intranet of the practice or on each computer. It must be readily available.
- Develop an organizational system for each manual. If the parent manual is the client service operations manual, what are the major systems within that parent manual? These may include, for example:
  - Maintenance
  - Telephone
  - Computer
  - Pharmacy
  - Welcome/greeting.
- With the systems identified, there will be subsystems that further breakdown the operation. For the computer system, there may be:
  - Client entry
  - Client update
  - Invoicing
  - Prescriptions
  - Scheduling.

Vet-ebooks.com

2.21. OPERATIONS MANUALS

HOW TO ...

Each employee in that department will contribute to the content of the manual. With the title of the manual noted, you have essentially created a client service system manual. Now it is necessary to get into a granular level – from 35,000 feet to 5 feet to molecular or atomic in nature. So, what are the specific individual processes within the subsystem and system?

There are many many actions by each employee every day. Some of the actions are done multiple times per day, others only once or twice per week. They are all important. It is important to capture all of the activities of all of the employees as processes that make the practice work effectively and efficiently. Ask each employee to track his or her actions throughout the day for two weeks. Tedious, I know. This will give you a general idea of the most frequently performed processes. It is these processes that must be broken down to the molecular level by the employee performing them.

If we look at the operations manual as a cookbook for practice success, each process is a recipe for success. The individual pages of the operations manual will be the recipe or process. With the recipe identified, how do you bake the brownies? What is needed? What are the needed resources? What are the steps? From start to finish. This is an individual process that makes your practice operate. How do you want your team to:

- Answer the phone for a new client seeking to make an appointment
- Prepare a spay pack
- Clean a small cage
- Invoice a hospitalized pet
- Clean the bathroom?

The process should be in sufficient detail that any employee at any level can pick up the recipe (process) and bake the brownies the same way – each time, every time, all the time, without fail.

Parts of the operations manual may be excerpted from users' manuals for equipment, such as a phone system or software training manual. However, the vast majority of an operations manual will be customized for the way *you* do everything at your practice.

As a rule, an operations manual is a living, breathing, constantly morphing document that is constantly being updated as operations change within the practice. At the very least, it should be reviewed semi-annually for updates, although monthly or quarterly will be more effective.

Once your operations manual is complete, put it to the test. Have an employee that is *not* in a particular department pick up a process and follow it step by step from start to finish. Was the outcome easily accomplished? Was the outcome what was desired? Test the accuracy. Test the ease of use. If it is accurate and easy to use that is wonderful. If not, work on the content.

Your operations manual not only ensures that your practice team will deliver a consistent client, patient, staff and management experience, it also provides an optimal training manual for new hires. Rather than depending upon word of mouth training you now have a fully documented "How we do it here" manual for all of the systems and processes that make your practice great.

EXAMPLES

SAMPLE PROCESS TEMPLATE

Title: Bathroom Maintenance
Who: PM Animal Caretaker
To whom: Manager
When: 17:30 (5.30 p.m.)
Outcome: An immaculate, fresh-smelling, ready-to-use restroom
Resources needed: Wet floor sign; toilet brush and cleanser; mop, bucket, water and floor cleanser; mirror cleaner and rag; sink cleaner and rag; toilet paper; paper towels; odor eliminator; trash bag
Steps to complete:

1 Put out wet floor sign
2 Empty trash and make sure trash bag is secure in receptacle
3 Clean mirror – see Cleaning Mirror Process
4 Clean sink – see Sink Cleaning Process
5 Clean toilet – see Toilet Cleaning Process
6 Refill toilet paper if needed
7 Refill paper towels if needed
8 Spray odor eliminator
9 Mop floor – see Bathroom Floor Mopping Process
10 Sign off on the back of the bathroom door checklist

Created: 2019, May 05 Last Updated: 2019, July 12

CAUTIONS

- An operations manual is *not* an employee or personnel policy manual.
- An operations manual is *not* a business-related policy manual.

2.22. PROCEDURE MANUALS

BASICS

OVERVIEW

- Procedure manuals and reference manuals are helpful management tools in any size or type of veterinary practice. The larger the practice, the greater the need for manuals.
- A large practice may have numerous manuals, including a receptionist manual, technician manual, exam room assistant manual, laboratory manual, anesthesia on-call, safety manual, and a doctor's manual. After catastrophic events such as Hurricane Katrina and Superstorm Sandy, many practices now have a disaster manual as well. These cover simple tasks such as how to function when the Internet goes down, when the electricity goes out, or how to call forward the practice telephones to an employee's cell phone. Large events such as floods, hurricanes, and blizzards may also be covered based on the needs of your specific geographic area.
- Manuals have three distinctive purposes:
  - They serve as a convenient reference tool to ensure that standards of care and standard guidelines are followed.
  - They serve as an instructional tool to be used for staff training purposes and should be distributed to new team members during their initial orientation period.
  - They provide a standard to which staff can be held accountable for counseling and coaching purposes.
- Putting policies and procedures down in writing forces dialogue and promotes compromise. This is an important process for multi-doctor practices to complete so that policies and procedures are consistent throughout the practice.

TERMS DEFINED

Doctor's Manual: A guide to help ensure that all doctors in a multi-doctor practice are following the same basic protocols so as to avoid client confusion that will undermine client trust in the practice. In addition to outlining such routine protocols as vaccination guidelines, these manuals also include narrative on how to interpret the practice's fee structure. For example, if a practice offers a level one, level two, and level three nursing care fee, the manual will outline the criteria used to define each level (this type of information may also be included in the reception manual). Guidelines for medical records, charge capture, and preparing treatment sheets may also be included. Some practices even have communication guidelines, for example that any client inquiry made up to 30 minutes before the end of the doctor's shift must be answered before the doctor leaves for the day.
Exam Room Assistant's Manual: Resource for those technicians and aides responsible for assisting veterinarians in appointments and other exam room procedures, ranging from pedicures to emergencies. It typically includes an index of all the practice's client education materials as well as a list of community resources for clients such as obedience schools, boarding kennels, and groomers. It may also contain guidelines for handling abandoned pets and how to manage wildlife until a certified wildlife rehabilitator can be contacted.
Laboratory Manual: A complete reference guide for technicians and doctors who may be working in the laboratory or processing samples through the laboratory. It typically includes step-by-step instructions on how to perform each in-house laboratory test, and it may describe how samples should be collected, processed, and shipped to each outside reference laboratory, as well as the preferred laboratory for each type of test. This manual also includes guidelines for less pleasant procedures, such as how to prepare a specimen to be sent out for rabies testing. The manual also includes detailed directions on how to operate and maintain each piece of equipment within the practice laboratory, including troubleshooting procedures, calibration, and quality control requirements.
Receptionist's Manual: Outlines all front desk procedures in a step-by-step manner. Examples may include processing insurance claims, third-party payment applications, and payment plans. This manual typically includes customer service policies. It also outlines a vast array of procedures from how to answer the telephone to how to arrange for a pet's cremation. Furthermore, it includes step-by-step instructions on how to operate all of the standard features of the office automation equipment, including the telephone system, voice mail, facsimile machine, the credit card machine, and the practice management software.
Safety Manual: A guide that identifies hazards within the practice and delineates procedures for dealing with them. This manual includes relatively simple activities such as how to properly use the autoclave and how to perform a daily leak test prior to using your anesthesia machine(s).
Technician's Manual: Designed to support the technicians in accomplishing their daily tasks in the back of the practice. It includes step-by-step instructions on how to operate and maintain all of the equipment in the practice from intravenous pumps to pulse oximeters. It may also provide directions on how to complete daily, weekly, and monthly quality controls for equipment such as anesthesia machines and sterilizers. Depending on your specific practice model, it may also include instructions for proper charge capture and medical record auditing.

ISSUES AND OPTIONS

DEVELOPING A MANUAL

- The first step in developing any of these manuals is to designate one individual in the practice to be the project leader. The project leader ensures that the manual will be prepared pursuant to a schedule and completed by its deadline.
- Every member of the manual's target group should be included in its development (in addition to the members of the practice leadership such as the practice owner, hospital administrator, or practice manager) and production. For example, if it is a reception manual, all of the receptionists should contribute to it.
- A brainstorming session should be scheduled during which everyone in the target group is encouraged to suggest topics to be included in the manual. This list of topics should be converted into a table of contents for the manual.
- Most of the manuals identified in the Terms Defined section will have a table of contents consisting, on average, of 20–50 topics.
- At the next meeting, the team member responsible for writing each portion of the manual should be identified. Some practices ask for volunteers to author a particular for each topic, whereas other practices assign topics to specific individuals.
- A deadline should be established for each of the authors to submit the first draft of their material. The project leader needs to review each submission for accuracy and completeness.
- It is not unusual for authors to discover conflicting protocols and/or procedures within the practice, so it may be necessary for the project leader to seek clarification from the practice manager or practice owner(s).
- It is also quite common for authors to discover that there are multiple ways in which a specific task may be completed. An experienced manager should focus on desired outcomes rather than processes. Therefore, if all the ways identified to complete a specific task are equally efficient and effective, then there may be a need to include them all in the manual and let individuals decide which method they like best. This is often the case in the reception manual,

Vet-ebooks.com

which includes topics that relate to completing tasks within the practice management software.
• A draft copy of the manual should be prepared and distributed to each participant, as well as to the practice manager and practice owner, for final review. A comprehensive final review allows the entire practice to contribute their combined experience and insight to each of the tasks that will benefit future users (it is also an excellent refresher course for everyone involved).
• The manuals should then be printed, bound, and distributed to the appropriate team members. A signed receipt should be obtained for each manual distributed, and the receipt should be kept in the employee's personnel file. As an alternative, some practices email electronic copies of the manuals to their team members. It is less expensive, less labor intensive, and more environmentally friendly to revise and maintain electronic versions rather than hard-copy versions.
• One or two additional manuals should be placed in strategic locations throughout the practice for ease of use.

EXAMPLES

• The following example represents a typical entry in a procedure/reference manual. In this example, a larger practice is making sure that everyone on staff understands how to charge the proper examination fee based on the number of pets the client has brought with them. This type of reference would actually be included in a doctor's manual, a receptionist's manual, and an exam room technician's manual, because all these team members would be required to explain these charges to a client.

XYZ Veterinary Clinic has numerous exam codes. Therefore, it is easy to understand why there has been some confusion in the past regarding the proper code to be charged for a specific type of visit. The purpose of this section is to define each type of exam code and explain its proper usage. Doctors do have discretion to increase or decrease an examination fees as they deem appropriate; however, it is important to communicate the reasoning behind any change to the appropriate receptionist. In this way, the receptionist can appear informed and be properly prepared to address client concerns (i.e., the client may question why the amount of the final invoice is different from the amount they were originally quoted).

ID	Description	Fee
107	Exam – Office call/exam	XX.00

This code is for our standard physical exam to be charged to our regular appointments.

106	Exam/per pet 2	XX.00
102	Exam/per pet 3	XX.00
112	Exam/per pet 4 or more	XX.50

These codes are used if multiple pets belonging to the same client are examined during the same appointment slot. Basically, you can think of them as multi-pet discounts. The code should be selected that represents the total number of pets in the appointment (i.e., if there are three pets, use 102, and each pet would be charged for an Exam/per pet 3). These discounts are not applied in a sequential order such as Exam, Exam 2 pets, Exam 3 pets, etc.

CAUTIONS

• Avoid reference to specific staff members by name. Instead, you should refer to them by title or position. For example, instead of "Bring the sample to Sue in the lab," it should be, "Bring the sample to the laboratory technician on duty."
• Many procedures may have a short and long version in each manual. The long version is a very detailed step-by-step version designed to support someone who has never completed that specific task before, or as a tool to aid training and/or accountability. The short version is often a bulleted refresher designed to support someone who is familiar with the task, but feels a little rusty and wants to be sure they are completing the task correctly and completely.
• Maintain an off-site computer media backup of each of the manuals (see 10.7 – Information Security: Backing Up and Archiving Your System). Many practices have made the mistake of trusting the creation of the manuals to a single individual. Unfortunately, if the designated individual absconds with the files upon his or her departure, the practice is forced to recreate all of its work in order to update their manual.

MISCELLANEOUS

• Directions need to be very specific. Vagueness decreases the value of the manual and allows subjectivity to infiltrate procedures and/or protocols.
• Establish a reminder in your practice management software to review each manual twice per year in order to keep its contents current. Each manual should have a revision date and older versions should be discarded to avoid confusion. These updates are imperative as software enhancements, equipment enhancements, new equipment, etc. will all necessitate updates in the manuals, so they reflect the most current policies and procedures.
• Before revised material is put into use, it is a best practice to have someone unfamiliar with the process (such as a team member from a different department) read through the material as a test. If they are able to complete each task without difficulty, then the manual contains all of the necessary information in the proper detail. Too often the person writing content for a manual is so familiar with the process that they skip over steps or details they take for granted that "everyone" would know.
• Screen captures, photographs, and video links can improve the effectiveness and user friendliness of a manual.

2.23. ENHANCING DOCTOR PRODUCTIVITY

BASICS

OVERVIEW

- Productivity can be defined as the ratio of inputs to outputs.
- Doctor productivity is often measured by the ratio of hours worked (input) to revenue (output).
- There are many other ways of measuring doctor productivity. Measuring these parameters assists with the management of productivity and provides motivation for production.
- A doctor's knowledge and skill level will play a role in their productivity. Doctor productivity is also dependent upon the knowledge and skills of management and support staff, the quality of materials and equipment available, technology, and hospital design.

TERMS DEFINED

Productivity: The rate at which goods or services are produced per unit of labor.

ISSUES AND OPTIONS

MEASURING DOCTOR PRODUCTIVITY

- Measurement allows management to identify potential problems and address areas of concern. It allows management to recognize and reward performance. Measurement can be used to motivate staff to higher levels of performance.
- There are several ways doctors can be motivated to perform, depending upon how performance is measured. Traditionally, doctors have been measured on revenue as a result of labor input.
- Additional measures of productivity may include:
  - Number of patients seen per doctor hour
  - Number of patients waiting ≥10 minutes per doctor per day
  - Number of spays per doctor hour.
- Analyzing trends in performance measures over time (quarterly) is more informative than analyzing the data in a given week.
- The primary reason to measure productivity is to provide motivation to doctors to increase productivity. It is based on the premise that measurement motivates.
- An example of measuring doctor productivity can be found in Table 2-23-1.

DOCTOR SKILLS AND KNOWLEDGE

- Medical and surgical knowledge contribute to a doctor's productivity, and appropriate training must be provided; however, doctor productivity is highly dependent on their communication skills. Doctors need to develop a communication style that is both productive and caring (see 5.1 – Effective Client Communication). Doctors have limited time in an exam room. They require communication skills that can direct the client through the appointment process quickly and make clients feel their concerns are being addressed caringly. It may be helpful for management (or a qualified consultant) to shadow a doctor through office appointments, identify areas of improvement, and offer solutions.
- Doctors must be willing and able to delegate nondoctor duties to support staff.

TECHNOLOGY

- Productivity improvements, even with an unfavorable economic climate, can largely be attributed to technology utilization and development.[1] These findings suggest that investment in technology can assist veterinarians through a recession and enhance productivity. Some examples of technology investments that can improve doctor productivity include the following:
  - **Electronic medical records (EMR):** Productivity benefits of these depend upon the software chosen. In general, EMRs provide quick access to a patient's chart and medical history – patient files are never lost or misfiled or inaccessible because they are physically in another area of the hospital. The medical record is quickly and easily interpreted by doctors because documents are always placed in chronological order and are legible.
  - **Digital radiographs:** These allow doctors to review radiographs within seconds (see 9.8 – Digital Imaging Systems in Practice). They can then email radiographs to specialists, resulting in faster turnaround time. Retrieving radiographs to review a case is simple – doctors do not have to search for hard copy films or wait for support staff to retrieve films.
  - **Mobile computing:** Tablet PCs with veterinary-specific software are available to veterinarians. These tablets are used by veterinarians as they travel from appointment to appointment. Productivity benefits depend upon how well the tablets integrate with your management software (see 10.21 – Technology: Redefining the Client Visit).
  - **Communication devices:** Wireless communication devices reduce the amount of time wasted in locating and communicating with doctors and support staff. Several studies have confirmed the productivity benefits associated with wireless telephones in human healthcare. Off-the-shelf wireless communication devices are economical, but sometimes insecure; users should be aware that the potential exists for third parties to overhear communications.
- The most significant productivity improvements in the future will come from the redesign of business processes between a business, its customers, its suppliers, and its competitors.[1] An example of a business process that has been redesigned using technology in the veterinary industry is the way veterinary laboratories communicate with veterinary practices. Lab results can be transferred directly into practice management software, resulting in increased productivity throughout the hospital (including doctor productivity).
- Technology investments can be expensive. Perform a cost/benefit analysis to determine if your clinic would benefit financially from the proposed technology investment; be sure to factor in the additional cost of training, upgrades, and ongoing support when performing a cost/benefit analysis (see 7.13 – Breakeven Analysis).

Table 2-23-1. Measuring doctor productivity.

Dr. / *Date*	*Average revenue per transaction*	*# of no-shows*	*New patients seen*	*Established patients seen*	*Productivity statistics*		*Average # of patients seen per doctor hour*
					Total patients seen	*Doctor hours*	
Monday							
Tuesday							
Weekly total							
Monthly total							

Vet-ebooks.com

2.23. ENHANCING DOCTOR PRODUCTIVITY

• Technology costs decrease over time, and it may be more economical to wait a few years before considering an investment. Waiting also allows more of the "bugs" to be worked out of the system.
• Do your research and always obtain references from veterinarians currently using the technology before committing yourself to an investment.

MANAGEMENT AND SUPPORT STAFF

• Management must lay the groundwork for enhanced doctor productivity. The most productive doctor will be unproductive if the environment is not supportive. Management must establish processes and protocols that allow doctors to work more productively. They must implement systems that have doctors performing doctor duties (prescribing, examining, diagnosing) and support staff doing the rest. Adequate support staff numbers and training are essential.
• Systems should minimize the amount of time doctors spend on:
  ◦ waiting for a patient to be placed in an exam room,
  ◦ waiting for an exam room to be stocked (or worse, doctors stocking the exam room themselves),
  ◦ accompanying clients to and from the reception area, the pharmacy, or the treatment area; doctors' time should be spent going to and from different exam rooms only,
  ◦ searching for technicians to assist them in an exam room,
  ◦ searching for the next appointment.
• Note: The last two problems can be resolved by implementing a system that indicates when the doctor requires a technician in a room and when a room is ready for the doctor. Some practices use a lighting system to visually indicate the status of the exam room.
• Staff interruptions are a major source of lost doctor productivity. Interruptions should be kept to a minimum during hours when doctors are seeing clients. Staff should be adequately trained and empowered to deal with day-to-day responsibilities and questions from clients. Problems that require doctor input should be addressed at scheduled intervals outside of client appointment hours. Each morning, the doctor and staff should review the schedule for the day and indicate the times the doctor will be available to answer questions and return messages. Personal calls should be avoided during office appointment hours.
• Support staff using online resources can save doctors' time by compiling differential diagnoses, determining the latest therapeutic protocols, seeking other doctors' experiences with similar cases, and so on.
• Appropriate scheduling drives doctor productivity (see 3.18 – Staff Scheduling Options). Patient appointments must be streamlined to allow doctors to move quickly and efficiently from room to room while addressing more than one client appointment at a time.

QUALITY OF MATERIALS (TOOLS) AND EQUIPMENT AVAILABILITY

• It can be difficult for doctors to be productive if they are not provided with quality materials and equipment. An x-ray machine that requires several retakes results in lost doctor productivity. Suture material that constantly breaks during surgery prolongs the time the doctor spends in surgery. Discuss quality issues with doctors and make adjustments where appropriate.
• New equipment purchases can increase doctor productivity. Conduct a cost/benefit analysis on new equipment purchases and include costs associated with training the doctor and staff.

HOSPITAL DESIGN

• Hospital layout is a key component of patient flow and doctor productivity (see 11.13 – Client/Patient Flow). Inadequate space, especially in exam rooms, will have a significant effect on the number of patients a doctor can see in an hour.
• A renovation to an existing building may be worth the investment (see 11.10 – Practice Renovations). Solicit professionals familiar and experienced with designing veterinary practices – the payoff may be increased productivity for years to come.

EXAMPLES

MEASURING DOCTOR PRODUCTIVITY

• Appointment "no-shows" can significantly impact a doctor's productivity. A large number of no-shows or an increase in no-shows may indicate inadequate appointment confirmation processes or changes in the process.[2] If you confirm appointments by telephone the night before, try confirming appointments two days before the scheduled appointment. This gives clients more time to adjust their schedules if they have forgotten about the appointment. There may be other reasons behind appointment no-shows requiring follow-up.
• Trends in new patients seen and established patients seen may also indicate a problem that requires investigation by management.[2]
• The number of patients seen per hour can provide important productivity information regarding a doctor's efficiency and effectiveness in the exam room. If this measurement indicates a problem, the doctor may need assistance with their communication skills. Shadowing another doctor with a higher measure may be the solution.[2] A way to measure doctor productivity is shown in Table 2-23-1.

CAUTIONS

With increased productivity comes the fear of reduced quality of care. Management should measure quality as well as productivity. A balance between productivity and quality can be achieved by creating performance incentives for veterinarians based on their production and customer satisfaction.

2.24. ENHANCING TEAM PRODUCTIVITY

BASICS

OVERVIEW

The productivity of the team in a veterinary practice is not always an easy thing to measure. Profitability does not always signal that your entire team is productive. However, productivity does play a role in operating a profitable practice – hence the importance of the team being productive.

One could describe productivity as applying "inputs" to produce "outputs" of value. Your team members perform the inputs in a transaction with a client or when treating a patient. You want a valuable output, valuable to the client and valuable to the practice team. When you have inputs resulting in valuable outputs, you have productivity.

Productivity is tied to your culture and employee engagement. The practice leaders and team members must have the attitudes and behaviors to focus on performing their best with every patient, every client, every time. To build the necessary attitudes and behaviors for a highly productive team you will need to focus on individuals and the entire team – productivity involves both.

TERMS DEFINED

Productivity: Productive employees are satisfied, motivated individuals working toward a common goal. A productive business is one that generates revenue from efficient inputs of resources and labor.
Team: Trained and focused group of people working synergistically toward a goal.

ISSUES AND OPTIONS

SHARED PURPOSE

- The team must have a shared sense of core values and guiding principles that offer direction when difficult decisions must be made.
- The team needs a sense of purpose, a sense of the mission, the reason why you all do what you do. Having this sense of a common purpose permits team members to focus their energy on that purpose in every transaction.
- Shared purpose and shared values mitigates the risk of rogue employees veering away from the mission or core values, and making poor (unproductive) decisions.

TOOLS TO DO THE JOB

- Evaluate the tools you are providing in relation to the productivity levels you need the team to hit for business success.
- Make certain that the team has what they need to get the job done. You would not want your team to run a blood panel without the tools to draw the blood and run the tests; much as you would not want your team to answer four telephone lines and treat patients with too few people scheduled to work.
- Tools include equipment, labor, and training. You cannot expect the team to use equipment without proper training. You cannot expect equipment to be used if not enough trained people are scheduled to operate the equipment.

STANDARD OPERATING PROCEDURES

- Quality inputs from the team can be standardized and communicated to the team as standard operating procedures (SOPs) (see 2.21 – Operations Manuals).
- Establishing standard processes helps the team deliver consistent, high-quality medical care.
- SOPs provide a clear communication of expectations and how one will be held accountable.
- SOPs provide guidance for prioritizing tasks and leveraging team members to perform services in a timely and efficient manner.
- SOPs should be written and readily accessible by every member of the team.
- Schedule regular reviews of your SOPs to remove obsolete steps or outdated procedures, and to add new processes and create steps that are more streamlined.

PERFORMANCE STANDARDS

- Management must communicate expectations to the team, how the team will be held accountable, and what the consequences are for failure to meet the standards.
- Job descriptions detailing not just duties but also skills and behaviors are useful for evaluating team performance standards.
- Use performance standards (PS) to ramp up ongoing training programs for new hires and seasoned team members by communicating productive activities for successful patient care and client service.
- Recognize that an annual review is not as productive as conducting frequent, one-on-one check-ins with the team. These quick check-ins give managers and employees a chance to review goals, address road blocks, and plan action steps. They can be compared to those tracking devices people wear to track their personal biometrics. The devices give real-time updates on the current status of the individual. Performance updates should be the same – frequent, real-time, quick check-in to assess the current performance status of the individual.

ENGAGE AND EMPOWER

- Engaged employees are more productive than the disengaged (see 3.15 – Engaging Staff).
- Encourage input from the team by creating a psychologically safe culture, which permits constructive confrontation and open discussions.
- Encourage open dialogue, taking time for brainstorming sessions and discussing continuous improvement initiatives.
- Trust is not just a word, it is a cultural priority. Building trust and incorporating it into your culture's core values is vital for a productive workforce. Those teams operating without trust spin their wheels waiting for someone to make a decision or double check their work. Productivity slows down and can come to a screeching halt when trust is lost.
- Open-book management can build trust (see 2.1 – Workplace Management). It allows for a certain degree of transparency in the activities of the business, and it allows for involvement of team members. Take the time to evaluate business initiatives and then give some of the team members the opportunity to gather data and metrics to present to the team on a regular basis – all in the interest of keeping everyone appraised of the effects their efforts are having on the business and on the delivery of exceptional medical care.

RECOGNIZE AND REWARD

- Appreciating a person, valuing their input or their efforts, adds to their emotional wellbeing, thus improving their engagement and satisfaction, translating into activities that are more productive.
- Not all recognition and reward programs are about money or giving raises. Explore all your options and survey the team for new ideas.
- Realize that what is a reward for one person does not translate into a reward for every team member (see 3.4 – Employee Bonus Criteria). Rewards are not a one-size-fits-all and it does take some investigation (and having an interest in your individual team members) to know what will have an impact on them (see 2.5 – Motivating the Healthcare Team).

PHYSICAL FITNESS

- Absenteeism and presenteeism both affect productivity. An absent employee is not very productive and may harm the productivity of those working with less manpower. An employee who shows up to

Vet-ebooks.com

work but is only functioning at 60% (presenteeism) is also not very productive due to factors (illness, etc) distracting the employee.
• Ensure that team members get a break for meals or time off the floor to rest and recharge.
• Explore options for creating an employee wellness program – perhaps providing healthy snacks, break times, fitness advice, emotional and mental wellbeing workshops, and so on. Well/healthy employees will enhance optimal functioning of the mind and body.

PERSONAL FOCUS

• Just as important as knowing the focus of the business is knowing about the personal focus of each team member.
• Incorporate into your performance appraisals a time to discuss desired career growth of each individual (see 3.14 – Staff Development). When talking about the career goals of the employee, explore ways that the business may be able to assist the employee in achieving this goal (through training sessions, continuing education conferences, flex scheduling or opportunities to lead projects in the business).
• Never underestimate the power of a buddy system, coaching, or mentoring in helping an individual gain new skills or grow in their personal career goals (see 3.16 – Effective Coaching and 3.17 – Mentoring).

TEAM FOCUS

• Create team-building workshops to strengthen the team's work relationships (see 2.4 – Working in Teams).
• Team-building fosters awareness and reinforces commitment to the mission and purpose of the team.
• Cohesive, efficient, effective, and productive teams develop when the business works on the team (not just in a team).

EXAMPLES

• Social media use is growing as a method to reach the most team members in the fastest time. Consider the use of internal messaging, texting, and web-training when looking at ways to keep team members updated (the staff bulletin board in the lunchroom is quickly being replaced by technology).
• Improve productivity of team members with a performance improvement plan created by the manager and involving the employee and perhaps a peer-to-peer teaching relationship or coach.
• On-the-job training is a technique that can be very useful in veterinary hospitals for training new hires or newly promoted individuals (see 3.11 – Structured On-the-Job Training).
• Keeping your team productive may just come down to getting a group of people together who are passionate about what they do, who are the best at what they do, and who understand what drives economic success for the business. Such a team is likely one that is committed to excellence (personal and business excellence), and delivers excellence to every patient, every client, every time.

CAUTIONS

• Do not attempt to assign a number to every aspect of team performance; some aspects of "productivity" cannot be measured.
• Benchmarking the practice to national numbers may not be beneficial in every instance. Realize that some of your best initiatives will be benchmarking your practice to last year's numbers and instituting changes.
• Improving productivity does not mean doing more with less. This only results in alienating and demoralizing the team.
• It is important that leaders recognize the demoralizing effects of perceived inequality or favoritism on productivity of the team.
• Having a member of the team not pulling their weight is a hazard to productivity. Leaders must be constantly aware of those members who are not performing and the effect being felt by the rest of the team. Take immediate action to remedy the situation through performance improvement programs and recognize/reward programs.
• Practice leaders must hold team members accountable or suffer the consequences from a lack of trust on productivity.

2.25. APPROPRIATE HANDLING OF MEDICAL ERRORS

BASICS

OVERVIEW

- Preventable human medical errors kill an estimated 44,000–98,000 hospitalized patients annually.[1] This reported range exceeds the number of deaths attributed to motor vehicle accidents and breast cancer that occur every year.[1]
- These statistics are not available in veterinary medicine nationally or globally. However, two separate 2015 reports from the United Kingdom suggest that veterinary medical errors stem from cognitive limitations, system failures, or a combination of both.[2,3]
- Retained surgical instruments, drug overdoses, and inadvertent administration of the wrong drug are commonly reported in veterinary medical insurance claims.[2]
- Reducing error requires open dialogue about the fallibility of the veterinary professional.[4]
- Full disclosure of an error is supported by the American Veterinary Medical Association (AVMA) and Professional Liability Insurance Trust (PLIT).[5]
- Acknowledging and apologizing for an error reduces the chance of litigation in human medicine by 50%.[5]
- Given that the majority of state veterinary board complaints are due to perceived deficiencies in communication, it stands to reason that more effectively addressing veterinary medical errors should improve the veterinary–client relationship and work toward rebuilding trust.[3]
- Various models have been proposed to prepare the veterinary team for bad news delivery, including CONES, TEAM, and SPIKES.[6–9]

TERMS DEFINED

Adverse Outcome: Unanticipated harm that was induced by appropriate veterinary medical care. For example, the development of fibrosarcoma at the site of a rabies immunization in a young adult cat is an adverse outcome.[8]

Cognitive Limitations: Veterinary medical mistakes that result from distraction or absentmindedness. For example, failing to count sterile gauze squares prior to closure of a laparotomy is a cognitive limitation.[2,3]

System Failures: Deficiencies in the surrounding environment that contribute to or result in a veterinary medical error. For example, lack of mentorship and oversight of house officers in a veterinary teaching hospital is a system failure that may result in rookie mistakes.[2,3]

Veterinary Medical Error: Unintentional harm that was induced by inappropriate veterinary medical care. For example, the accidental administration of one medication instead of another due to the similarity of their trade names or their packaging constitutes a veterinary medical error.[8]

ISSUES AND OPTIONS

Medicine is an imperfect profession with imperfect outcomes, yet our training provides the illusion that mistakes rarely happen. If they do, they must be the result of laziness or apathy.[4] However, this assumption creates a culture of shame and fear in which errors are silenced rather than addressed.[10] Silenced errors are more likely to recur, taking away the potential for learning from past mistakes to develop safety mechanisms for future patient care.[4]

Studies in aviation and nuclear power confirm that the majority of industrial accidents are not because of apathy, inadequate knowledge, or poor technical skill. Up to 80% stem from being human and therefore subject to fatigue, distraction, omitted actions, ineffective communication, task monotony, and faulty leadership.[4]

The human medical profession has paved the way for the veterinary profession to initiate an open dialogue about medical errors by admitting that mistakes do occur. These mistakes contribute to patient morbidity and mortality, and require risk reduction strategies.[11,12]

Failure to communicate effectively, particularly with regard to adverse event reporting and medical error disclosures, only increases the risk of litigation.[7,13–15]

In response to the impact that the silencing of medical errors has on the provider–patient relationship, the AVMA and PLIT developed a model to facilitate discussions of full disclosure.[7] The model is designed around the acronym, TEAM:[7]

- "T" stands for truth, teamwork, and transparency.
- "E" stands for empathy.
- "A" stands for apology and accountability.
- "M" stands for management.

It is the client's right to understand the truth: what happened to the patient, when, how, and why. It is important to address the short- and long-term consequences of the medical error, and to answer the client's questions with candid responses. Rather than react defensively, team members need to work together to demonstrate their commitment to the client, and work toward resolving the issue in a manner that meets client expectations.[7]

It is inappropriate for the veterinarian or the veterinary team to minimize or rationalize the medical error; it is equally inappropriate to invalidate what the client is feeling in the heat of the moment or in the immediate aftermath. Empathy is about tapping into what it is like to be that client, and how it might feel to be confronted with the same situation, understanding that you will never in fact completely know what it is like to be the client.[7]

Apologizing to the client is more than a simple, "I'm sorry." Apologizing means taking responsibility for the medical error and recognizing that we must hold ourselves accountable so that it is less likely to happen again.[7]

Appropriate management of the situation involves collaborating with the client to facilitate the client's wishes. The client may elect to have patient care transferred to an alternate facility. The client may elect to discontinue treatment or may expect financial reimbursement for care that was ineffective or inappropriate. The client may benefit from mediation to discuss financial compensation.[7]

In addition to facilitating the best outcome for the patient and client, given the circumstances, management of the medical errors implies designing and implementing a strategy for risk reduction in the future. Knowing that the system will be corrected to prevent the same harm from happening to other patients may provide a sense of relief to the client.[7]

Mistakes cannot be reversed, and the damage to the patient may or may not be undone. What can potentially be repaired is the fragile trust between the veterinary team and the client if the medical error is addressed sincerely, without the illusion of a cover-up.

EXAMPLES

Accept that members of the veterinary team are fallible: mistakes can and will happen. Foster an environment that facilitates communication about the potential for adverse events, and encourage open discussion when these events occur.

Remove the stigma associated with medical errors. Rather than focus on shame and blame, use the opportunity to come together as a team to determine how to reduce the chance that the error will happen again.

Create a culture of safety. Recognizing that to err is human, take the lead of the human medical profession and develop checklists.[4] For example, the World Health Organization (WHO) designed a surgical safety checklist to reduce risks such as operating at the wrong site, on

Vet-ebooks.com

the wrong patient, performing the wrong procedure, and implanting the wrong surgical hardware.[16] Similarly, the veterinary practice can create surgical checklists to guard against cognitive limitations by providing reminders, for instance, to count sterile gauze squares prior to abdominal cavity closure.

Strengthen the veterinary team's nontechnical skills, including communication, leadership, and task awareness. These areas are protective and have the potential to stop a medical error in its tracks before it goes to completion. For example, consider a technician who is about to administer "x" mg of "x" drug via "route x" to an inpatient. If the technician is required to confirm the dose, drug, and route prior to administration, then he or she may catch an error simply through communication.[4]

Develop a practice protocol for how to address medical errors when they arise so that team members understand the approach and what is expected of them.

Initiate morbidity and mortality rounds on a regular basis to discuss adverse outcomes or medical errors, and consider areas for improvement within the practice. These discussions may be uncomfortable; however, keep in mind that the purpose of these rounds is to unify team members in their approach to patient care.

CAUTIONS

It is imperative that you consult with your malpractice liability insurance carrier prior to full disclosure. You need to be transparent with your carrier in terms of what happened and why. Share with your carrier the results of your investigation: What did you discover about the medical error and how do you intend to reduce the chance of recurrence? Be prepared to discuss your practice's philosophy on disclosure. Be open to accepting liability and offering compensation.[7,17]

Recognize that it is normal to feel a flood of conflicting emotions when facing the reality that a medical error has occurred. These emotions include fear, blame, disappointment, shock, anger, frustration, shame, guilt, and self-doubt.[5,10] It is important to acknowledge what you are feeling and to share your thoughts and concerns with colleagues.[5] Medical errors can leave scars if they are experienced alone.

Remember that full disclosure is about your patient and client, not you. The sea of conflicting emotions that you are feeling may make it difficult to focus. However, it is critical that you separate your own emotional needs from the emotions that you anticipate in your client. You are there to help the client through this, not the other way around.[11]

2.26. CHANGING ORGANIZATIONAL CULTURE

BASICS

OVERVIEW

What exactly is "culture"? Most people would say that culture is "how we do things around here," or the "personality" of an organization. Another good definition of culture is organizational influences that affect individual behavior. Your culture makes most of the decisions in your practice no matter what you tell people to do, and it will teach new employees how to behave. People simply look around the organization for clues on how they should behave and what makes others successful. Maybe it is tenure, maybe it is performance, maybe it is protecting their turf, and maybe it is resisting change. Whatever the culture is in your practice, people take their cues from what others are doing around them. Because of this, culture is much stronger than any strategy, memo, policy, or handbook that you can ever create. The thing to remember with culture, though, is that you have a choice. You can define and create the culture you want in your hospital, or you will become a victim of the one that evolves. Culture change becomes worth all the effort when people throughout the hospital are more accountable, more engaged and more committed to success.

Although leaders throughout the practice have to work quite hard during the change effort, it is indeed possible to create an environment where owners and leaders no longer have to tell people what to do because the culture they have built sustains accountability, engagement, and commitment. Culture change is the only way to build a team of people who work together to achieve the full potential of the hospital.

TERMS DEFINED

Change Agent: An individual that serves as a catalyst for change within the organization.

Organizational Behavior: The values and behaviors that contribute to the unique social environment within an organization.

ISSUES AND OPTIONS

There are several key steps to making a culture change happen in your practice. Figure 2-26-1 illustrates a typical change curve. We walk through each stage in the following text:

DEFINE THE CULTURE

Have you ever sat down to decide exactly what kind of culture you want in your hospital and on your team? It is important to determine what the culture of your hospital should look like. Get together as a group, write down the aspects you value most in the current culture, and make decisions about the characteristics you want to build into your culture that may not be there yet. It is essential to build a collective agreement about what kind of future culture would best create growth for your hospital, the kind of service and medicine you want to practice, as well as the level of engagement and commitment you expect from the staff. Collaboratively, the hospital should build a document that defines and describes the kind of place they want to work and the kind of culture they want to be a part of creating.

This document, often referred to as "Our Vision" or "Our Culture," serves as the guiding force for change. When we make decisions in the hospital, when we coach others, when we look back on our day at work, we use this document to determine if we are moving toward this future state, or staying where we are. That is part of the reason we must be ambitious about the kind of culture we want to build. No one gets excited or works hard to achieve a modest improvement. The future culture must be compelling and one that every staff member feels connected to. Know that it can happen and that other hospitals have made it a reality.

If you follow a process that is proven, such as the one we discuss here, you can create any kind of culture change you desire.

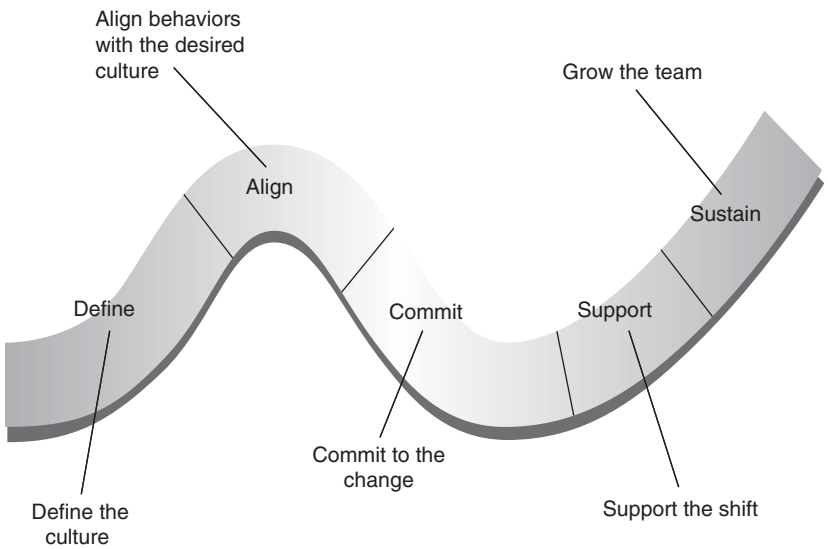

Figure 2-26-1.

A change curve.

Vet-ebooks.com

2.26. CHANGING ORGANIZATIONAL CULTURE

• This planning phase takes time, but it is important to invest time now so that you get the end result that you need.
• Be sure to develop a consensus among the staff and to cultivate ownership. Everyone should be involved in the process of defining and building the culture. It is not necessarily a democracy, but it should be a conversation.
• Ensure that there is clarity around the picture of the new culture. Everyone should be able to describe it in detail and understand how everyone will need to align their own behaviors with the desired culture.

ALIGN BEHAVIORS WITH THE DESIRED CULTURE

Review the leadership behaviors, processes, policies, and routines within the hospital, and check for alignment with the newly defined culture. Ask yourself: What are the things that we currently do that are driving us away from where we want to be? What are the things that we are already doing in the organization that will help us create a better culture? What new things do we need to do throughout the hospital to support the kind of culture that we want?

An example of this might be: We want a hospital where people refrain from gossip or negative comments about their team members. An aligning behavior for that cultural shift might be that we agree to not participate as individuals in those kinds of conversations and when we see it happening, we make people aware of what they are doing. We may talk about this in a staff meeting to determine how we handle these situations today and to collectively decide how we should handle them in order to create the kind of workplace we want (see 2.6 – Accountability). We may decide that if we see that behavior happening, we ask the question: "How would we feel if people were talking about us this way?" Or if the conversation is about a mistake someone made ask: "Have you shared this with the person you are discussing so they can improve on that next time?"

Once we have these kinds of candid conversations as a team about why the new culture matters and how we specifically work toward it together, it is much more difficult for individuals to continue with old behaviors that the entire team has decided need to shift. Awareness becomes our first ally in creating needed, impactful change.
• Work on a few key things first, and then let the momentum for positive change build. The worst thing you can do is announce a lot of major changes and then not follow through on them.
• The early changes should begin with leaders in the organization: how the leaders act, how they have conversations, how they coach others, and how they embody the new culture.

COMMIT TO THE CHANGE

At this stage, the entire organization is watching to see if this is going to be the "flavor of the month" or a lasting change. Initially there will be a lot of skeptics and people who push back against the change because they fear loss of power and influence. This is the time when leaders make believers out of people in the organization by supporting the principles that they agreed to, relative to the new culture. The bottom line is that if a leader wants to create a different culture within the hospital, the leader has to go first. If leaders in the hospital decide that it is acceptable for them to continue with behaviors that may not push us toward the new culture, it will send a strong message to the staff that everyone has permission not to change.
• Be consistent. If it is perceived that some people are held to new standards but others are not, change can stall.
• Admit that change is hard, and that mistakes can happen.
• Manage people's expectations by letting them know that this is a long-term commitment and to expect a lot of bumps along the road.
• Reinforce the potential by leading discussions about what is possible for the organization. Allow them to offer their own thoughts about why the change matters and what benefits it will have. Explain what it means for the employees, the health of the business, and the environment in which people spend so many hours working.

SUPPORT THE SHIFT

Support must always be present during a change, but it is especially critical when things look bleak and unobtainable. Look out for people who are showing continued effort and a positive approach in spite of the difficulties of change. Publicly and privately, we must thank, appreciate, and applaud those who are doing the right things to help the culture shift. Support also means helping those who are struggling with the changes. There may be people who decide they no longer want to stay with the organization, and we need to help them find their new path.
• Leaders must remain steadfast. If people see leadership waiver, it can fuel those attempting to derail the change.
• Be sure to notice the difference between someone struggling with the change, and someone discouraging it. It is fine to struggle, but if an individual attempts to sabotage the change effort, he or she ultimately must make a choice whether the fit in this hospital is the right one. If an individual is working hard to stop the change, that cannot be allowed to continue.

GROW THE TEAM

The commitment and support that you employed, the doubts you overcame, and the choices you made to keep moving forward have now created real, sustainable momentum. The change is now driven by the organization and the leader's job is to continue to support the efforts of the change agents, and to help use the new culture to grow the organization and achieve its goals. Be alert for any roadblocks or setbacks and deal with them immediately to help people continue the growth of the new culture. Also continue to reward behaviors that exemplify the new culture.
• Empower those who are leading the changes by giving them more freedom and support.
• Leaders will now have more time to leverage the new culture. They can shift their focus to things like strategic planning, changes in the marketplace, and new and improved products and services.
• Continually applaud the efforts of the organization in achieving the new desired culture, and encourage the team to build on the better environment.

EXAMPLES

Creating momentum can be the biggest challenge to creating a culture change. Learning about the "six momentum points" can help you track your momentum and ensure that you are on the path to achieving lasting change.
• **Interest:** Everyone usually likes the general ideal of improving their culture. At this stage, theories are circulating about the possibilities that culture change could bring. There is significant discussion about whether a culture change could happen in the organization, and if the organization needs to embark on that kind of journey. There is also discussion about whether culture change is even possible and whether or not we should just "execute better" in order to achieve our goals. (Many organizations try that approach but it rarely works without shifting the culture to cause better execution.) Roadblocks at this point include the following:
  ◦ Wanting to do things differently, but feeling like it may not be possible.
  ◦ A history of failed change initiatives that were not executed well.
  ◦ The current set of management and communication tools are not effectively driving change.

Vet-ebooks.com

2.26. Changing Organizational Culture

• **Novelty momentum:** At this stage there is excitement about starting something new and achieving something different. There is strong energy surrounding how we drive change and how we create new patterns, behaviors, and habits. One of the biggest challenges to real culture change is that this early excitement fades quickly once the hard work starts. The novelty creates expectations that the change will be fast and easy. People typically see some early signs of success during this phase but they are often short lived and unsustainable because they have no solid foundation. This stage is akin to the first week on a diet or exercise program. The hard work is still ahead and the change has not yet been challenged.
• **Effort awareness:** At this point, reality sets in that change is hard work. This was characterized by one practice leader in the statement "I knew this would probably be hard for the organization, but I did not think it would be so hard for me." The short-lived changes that everyone was so excited about fade and people return to their old patterns and habits. A strong resistance to the change begins to mount and a divide in the organization between those who want to continue moving forward and those who want to pull back emerges.
  ◦ You will likely hear comments like "I don't think this is working" within the leadership team, as well as the rest of the staff.
  ◦ Leadership begins to doubt that the time and investment are worth it, and even that the culture change is possible.
• **Decision point:** This is the most critical of all the momentum points and where the difference is made. Here, people and leaders make a choice to move forward or abandon ship. The difficulties that emerged during the effort awareness phase have increased. The situation has worsened relative to the negativity toward the change and the people who are leading it. This is where the status quo seems to have an unbreakable grip on the organization and change can seem hopeless. Individuals have struggled with their own internal change as part of the effort and they begin to give up. The change seems doomed and it is only moved forward by a few courageous individuals. True leaders emerge during this phase and they can, if supported, move the change to the next phase and beyond. This stage is necessary, even though it can be painful, because this is where the resolve of the true leaders in the organization is hardened and that resolve pulls the rest of the team forward.
  ◦ Leadership may consider pulling the plug on the culture change initiative.
  ◦ You will notice a few individuals who, if supported, can help others get through this stage. Embolden them by any means necessary. They are the future leaders in the organization.
• **True change:** The sustainable breakthroughs begin. There is a small contingent of individuals who are doing things differently, more in line with the future state. There are pockets of real sustainable momentum in the organization. Stories of success begin to emerge and are heralded because people had thought it was not possible. Individuals have been able to make real internal changes that have caused them to operate differently. Some have decided to lead rather than follow and they are inspiring others around them to make that same choice. People in the "this will not work" camp begin to slowly move over to the "maybe this can work" area. People who are making individual changes and driving organizational changes begin to feel better about their contribution, more comfortable with the path they have chosen, and more satisfaction about how they do their job. It is at this point that you can begin to feel the shift between pushing the new culture and the new culture pushing the organization or business.
  ◦ You may begin to hear success stories like "She has really changed and seems to be more engaged in her work."
  ◦ Business results become evident. There are stories of a client who was delighted or a process that was improved – not because it was dictated, but because the new culture, and the individuals close to the solution drove the change.
• **Sustainable momentum:** This is the point where the new culture becomes "how we do things around here." New people who enter the organization immediately adopt the new culture and begin working with those beliefs rather than the old ones. The "this will never work" crowd no longer exists; those people have either made a different choice on how to behave in the environment or left the organization. Hospital leadership can turn their attention to supporting the new culture with much less effort and are now leveraging that culture to execute more effectively in their marketplace.
  ◦ People are no longer talking about problems; they are talking about solutions.
  ◦ Problems get solved at lower levels within the organization and leadership is free to focus on strategy and the future of the hospital.
  ◦ Accountability is evident throughout the business.
  ◦ New staff members are brought up to speed faster and are more productive earlier.
  ◦ Many policies and procedures no longer exist because no one is causing the problems that create the need for more rules.
  ◦ The business is growing, changing, and adapting to become more successful on a continuous basis.

CAUTIONS

• Any organizational change can be extremely challenging because businesses are not built for change. Rather, they are built to deliver their specific product or service. And yet, your hospital's ability to execute change will ultimately determine its success.
• Most businesses that struggle with change fail to take into consideration all the vectors of organizational change. Change is harder if you allow some vectors of change to push back against the change effort. Aligning all of the vectors can help make change smoother and more consistent.
  ◦ **Clarity:** People do not resist change. They resist change that they do not understand or that they do not agree with. Leaders must paint a detailed picture of the change, so that people know what to expect and how to think and act. If people can see where they are going, they are much more likely to get there easily.
  ◦ **Communication:** The more effective communication goes beyond telling, and moves into understanding. Leaders should address challenges immediately, and have open conversations and discussions with all employees throughout a period of change.
  ◦ **Leadership:** In any organizational change, leaders must take the first step. You cannot expect your employees to change their behavior, if you are not able or willing to change your own because this will send a mixed message to the entire organization, and will create doubt that the change is here to stay.

Vet-ebooks.com

2.26. CHANGING ORGANIZATIONAL CULTURE

- **Coaching:** An organization's ability to change is only as great as the individuals who work there. Some people will find change easier than others, but consistent coaching will keep everyone on track. Businesses with great coaches adapt more quickly and achieve greater results.
- **Structure:** When an organization changes, its structure must change with it. Everyone in the organization should decide how things should be built in order to maximize success and minimize internal chaos.
- **Process:** If you want to operate differently as an organization, your internal processes must change too; otherwise they will inhibit the change. For example, if you are looking to shift to a culture of excellent client service, but many of your processes entail a lot of extra work to effectively serve clients, your employees may choose to forgo the better service in order to reduce their effort. If you align your process with the change you are hoping to achieve, the path of least resistance should lead employees straight toward the desired state.
- **Talent:** There must be a strong link between who you want to become as an organization and the talent you hire to help you get there. Your talent strategy should take into account the direction of the business, so that you are sure to hire the kinds of people you need to become the organization you are striving to be (see 3.8 – Screening Potential Hires).

2.27. PRACTICE INSURANCE NEEDS

BASICS

OVERVIEW

Veterinary practices are not immune to many of the concerns facing other businesses. A practice must be able to survive a fire, theft, lawsuit, death or disability of key personnel, and more. Veterinary practices concerned with the attraction and retention of talent may also want to offer employee benefit programs, providing health insurance, dental or vision coverage, a retirement plan, or other benefits (see 2.28 – Employee Benefit Programs). In addition, some practices may want to have a buy/sell agreement between partners, and have key-person insurance to protect the practice from lost revenue if a doctor were to become disabled or pass away.

TERMS DEFINED

Bailee: A person or party to whom goods or property are delivered for a purpose, such as custody or repair, without transfer of ownership.
Liability: The state of being responsible for something, especially by law.

ISSUES AND OPTIONS

MINIMUM RECOMMENDED COVERAGE AND PROTECTION

At a minimum insurance should cover business personal property, employee dishonesty, money and securities, accounts receivable, bailees customer, computers, valuable papers and records, general liability, professional liability, employee benefits, business auto liability, and workers compensation.

- **Property exposure** depends on the operations. For large animal veterinarians, there is very little office exposure as the veterinarian performs most services at clients' locations. On-premises storage may be limited to equipment, medicine, and paperwork. Small animal veterinarians and surgical clinics may use flammable anesthetic gases. Cleaning equipment necessary to maintain a sterile environment may be susceptible to fire, smoke, and water damage. If grooming and kenneling take place, exposures increase. Damage to property due to animal escape is also a concern. Crematories or incinerators on premises pose additional fire hazards, and fuels must be stored in approved containers.
- **Crime exposure** is from employee dishonesty, and money and securities improprieties. Hazards increase without proper background checks and monitoring procedures. Ordering, billing, and disbursements should be handled as separate duties and audits should be conducted on a regular basis.
- **Inland marine exposure** is from accounts receivable, bailees customers, computers, owned medical equipment, and valuable papers and records. A veterinarian may take equipment and tools to off-site locations to perform surgeries or other types of treatments. The bailees exposure comes from animals left in the veterinarian's care for boarding or treatment. Coverage is necessary for those animals as loss due to fire, windstorm, theft, or other physical causes of loss would not be covered under the professional liability policy.
- **Premises liability exposure** can be high if customers visit the premises. The customer waiting area must be kept clean of animal waste and loose animals in order to prevent slips and falls. Leashes and carriers should be required to protect the other customers and animals. Known problem animals should be given special hours to restrict them from interacting with other animals in the waiting area.
- **Products liability exposure** exists if the vet is selling animal food and supplies. If the veterinarian modifies or sells a directly imported product, the exposure should be evaluated as a manufacturer.
- **Professional liability exposures** are significant, particularly for veterinarians who specialize in farm animals, as a mistake in diagnosis can result in loss of an entire group of animals. Veterinarians should be well trained, experienced, and properly licensed. Employees must carry out only the procedures they are licensed to handle. Interns must be carefully supervised. The primary professional exposure is the failure to correctly diagnose and treat diseases and injuries. The problem is compounded for vets specializing in high-value animals, such as race horses or zoo animals.
- **Environmental impairment exposure** is a concern due to handling and disposal of biological waste material, and your practice must follow appropriate procedures for disposal.
- **Automobile exposure** is generally limited to hired and non-owned autos for employees running errands. If the veterinarian travels to the patient's site, as with farm or zoo animals, the exposure increases. All drivers must be licensed with acceptable motor vehicle records. Age, training, experience, and records of the drivers, as well as age, condition, and maintenance of the vehicles, are all important items to consider.
- **Workers compensation exposure** is high due to the unpredictability of even the most domesticated animal. An injured animal may cause major injury to a person by biting, scratching, kicking, or other attack. All employees must be trained in appropriate restraint techniques. Problem animals should be clearly identified so that the appropriate precautions can be taken. Owners should be required to assist as needed. Lifting injuries are common, resulting in back strains or sprains. Animals also present a communicable disease exposure. Employees should wear gloves and masks to prevent contamination from bodily fluids, particularly blood.
- **Employee benefit programs** are often offered as a tool to attract and retain talent, and may include group health insurance, dental or vision coverage, life and disability insurance, and more (see 2.28 – Employee Benefit Programs). Benefits are typically employer-paid, meaning the practice covers the cost in full or pays a portion of the premium, or voluntary, meaning that employees are responsible for the cost of any elected benefit.
- **Key-person insurance** protects a practice in the event a key team-member, such as a doctor responsible for a significant portion of the practice's revenue, becomes disabled or passes away. A key-person insurance policy is typically a life insurance policy purchased by the practice with the key person listed as the insured, and the practice named beneficiary.
- **Buy/sell agreements** are contracts among business owners which, upon the death of one of the owners, require the remaining owners or the practice itself to purchase the deceased's interest in the practice according to the agreed upon terms of the contract (see 13.9 – Buy/Sell Agreements). In addition, the deceased's heirs are required to comply by selling their inherited interest at the previously agreed upon price. Although there are many options for funding a buy/sell agreement, one of the smartest methods for doing so is through life insurance. This ensures that funds are immediately available when a death occurs; plus, the funds used to buy the deceased's share are purchased for pennies on the dollar and the premiums will likely be significantly lower than the cost of repaying loan interest. The benefits of a buy/sell agreement include the following: Establishing a valuation of a deceased owner's interest in the business for estate tax purposes, establishing a mutually agreeable price and terms, and making sure the family of the deceased owner receives cash instead of unmarketable stock.

OTHER INSURANCE COVERAGE TO CONSIDER

- **Privacy and cyber security coverage** provides protection for business owners with sensitive data stored digitally. With the enormous amount of sensitive information stored digitally today, practices need to take proper measures to ensure this data is never compromised.

Vet-eBooks.com

2.27. PRACTICE INSURANCE NEEDS

Ultimately, it is the responsibility of business owners to protect their clients' data. Failing to do so can result in a data breach, which costs companies billions of dollars every year. Understanding the risks involved with data security can help you prevent a privacy breach. Common risks include hackers, or those who exploit weaknesses in software and computer systems, and malicious code, which describes code in part of any software that is intended to cause harm.

- **Employment practices liability insurance** protects you from employment-related lawsuits, which are a growing concern for employers of all sizes. Employment practices liability (EPL) insurance is a policy used to cover your risks due to some of the most common employment-related lawsuits, including wrongful termination, discrimination, and sexual harassment.
- **Bailee coverage** protects you when you have a client's property (such as their animal) in your possession, and can cover losses to customers' property due to such things as fire, theft, burglary, robbery, earthquake, and more. This is important because customers' property is usually excluded from your commercial property and general liability policies. It is important to note that most bailee policies exclude flood coverage, so be sure to work with your advisor to ensure that your practice is properly protected.
- **Flood insurance** protects your practice from the risks associated with flooding, which can be a risk to any business, even if you are inland and not near the coast. A general liability policy will not cover flood damage, which is only available through the National Flood Insurance Program (NFIP). There are two types of commercial building flood insurance, and you can purchase one or both. The first is commercial contents, which covers inventory, merchandise, machinery, and other contents. The second is commercial building, which covers your practice's building (if you lease the building, NFIP will cover a portion of the improvements that you may have made). As always, you should consult with your advisor to ensure that you are properly protected.

EXAMPLES

- If, for example, an employee suffers a dog bite while at work, the practice's workers compensation policy will provide coverage for treatment of the wound and lost wages while the employee is out.
- Professional liability coverage would protect a veterinarian if, for example, the practice was held liable for the misdiagnosis or treatment of a family pet.

CAUTIONS

The most important step a practice owner must take is finding the right insurance professional to evaluate all needs of the business. There are many insurance agents, but only a small percentage are familiar with veterinary practices and a practice owner's needs. Ensure that the individual you are working with is qualified, has thorough knowledge and understanding of a veterinary practice's needs, is properly licensed, and represents top-rated insurance companies. Always request a quote, in writing, that identifies coverage and limits.

Before purchasing any insurance coverage, or implementing any employee benefit program or buy/sell agreement, it is recommended that you consult with your insurance agent, advisor, accountant, or attorney.

2.28. EMPLOYEE BENEFITS PROGRAMS

BASICS

OVERVIEW

• Remaining competitive in the hunt for the right job candidates who will propel your practice to success can be a struggle. Once you find the people you need, you have to convince them that your practice is a better place to work than others. A strategic, quality benefits package can help you attract and retain those top employees.
• Employees value a well-rounded selection of benefits, and health insurance, a retirement plan, life insurance, and dental coverage are a few of the plans that you can consider offering.
• Veterinary practices concerned with the attraction and retention of talent may want to offer employee benefit programs. These can be either employer-paid or voluntary (see 3.2 – Benefits). Employer-paid benefits are those in which the practice covers the cost in full or pays a portion of the premium, and voluntary benefits are those in which employees are responsible for the cost of any elected benefit.
• Benefits packages offer value to your employees and help you attract talent, boost productivity, and improve retention in a cost-effective manner.
• Developing a strategic benefits package that targets specific types of employees can help attract the right job candidates to keep your practice running at peak efficiency, and once you have these top-performing employees at your hospital, providing a tailored employee benefits package may serve as a barrier to them leaving. A great benefits package can be a huge advantage when looking at retention strategies because it holds more than just monetary value for the employee (see 3.3 – Wage and Benefit Summaries: the Whole Package). A bigger salary at another practice likely will not be as strong a pull for an employee tempted to leave if the other practice's benefits package is not as attractive as yours.

TERMS DEFINED

401(k): A tax-qualified, defined-contribution pension account for US workers, defined by section 401(k) in the Internal Revenue Code.
Health Savings Account (HSA): An account to be used in conjunction with a high-deductible health plan for individuals or families to use for paying health-related costs.
Section 125: Part of the IRS code that allows employees to convert a taxable cash benefit (salary) into nontaxable benefits. Under a Section 125 program, employees may choose to pay for qualified benefit premiums before any taxes are deducted from their paycheck.

ISSUES AND OPTIONS

Employee benefit programs usually fall into two categories: employer-paid or voluntary, and a practice will typically offer both types of benefits to create a comprehensive benefit program.

Employer-paid benefits usually require that the practice owner pays all, or a portion, of the cost of coverage for their employees. Voluntary benefits require no employer contribution, and employees that elect coverage are usually asked to pay the cost in full. Both types of benefits are commonly referred to as employer-sponsored benefits.

The most common employer-sponsored benefits include:
• Health insurance
• Retirement plans
• Short- and long-term disability coverage
• Dental insurance
• Vision insurance
• Life insurance.

Most1 of these plans are relatively inexpensive, and many can be offered at no cost to the practice. The most popular benefits, which almost always have an employer contribution to the cost, are health insurance and a retirement plan.

HEALTH INSURANCE

A group health insurance plan is typically the most expensive of all employer-sponsored benefits, but also one of the most valuable to employees. While different states, and different insurance companies, impose different requirements on an employer, in general, a practice is required to pay 50% of the cost of employee coverage (but there is no requirement that a practice contribute toward the cost of dependents' premiums), and a minimum level of participation must be achieved. Participation is the percentage of those enrolling in the plan versus the number eligible for coverage.

Group health insurance may offer many benefits to your staff, including the ability to pay for their coverage pre-tax through payroll deduction (as long as a Section 125 is in place; your accountant or payroll provider can assist with this usually), and more health plan choices than what may be offered in the individual insurance market.

RETIREMENT PLANS

There are many different types of retirement plans that a veterinary practice can implement, the most common of which in the United States is a "401k." In many cases, it will be up to the practice to decide whether or not to contribute, or "match" employee contributions. Retirement programs are a great way to encourage employees to save for retirement, and may increase employee retention. In order to establish a retirement plan for your practice, you will want to work with an experienced and licensed professional to evaluate your needs, and determine which type of plan is most appropriate.

DENTAL PLANS

Usually offered as voluntary or employee-paid benefits, dental and vision plans are very popular among veterinary practice staff as well. Dental coverage works similarly to a medical insurance plan. You (or your employees) pay premiums, and then the insurance will cover dental costs according to the benefits listed in the plan. The routine exams and cleanings are usually covered at 100%, but other services are often subject to a deductible and co-pay. The deductible is the amount you must pay before the insurance will pay. After the deductible is met, the insured may be responsible for a co-payment (flat amount) or co-insurance (percentage of cost), which is the part of the treatment cost that the member pays. For example, if you have a filling done and have already met your deductible, but you have a 20% co-insurance, the insurance will cover your filling at 80% and you would only have to pay the other 20% of the charge.

Every plan is different, so you will need to work with your trusted advisor to select the appropriate coverage for your staff.

VISION PLANS

For vision coverage, you (or your employees) pay a premium or membership fee. Then, when they visit an eye doctor or purchase corrective lenses, they pay a reduced amount for services. Eye exams will typically be covered at 100% or have a small co-pay. Corrective lenses are usually covered with a co-pay or a maximum allotted amount per year. If the plan you select provides an allotted amount, members would only have to pay if the eyewear exceeds that amount. For example, if the insurance covers eyeglass frames up to $120 and the frames cost $160, a member would only have to pay the additional $40.

Other services, such as eye surgery or treatment for eye diseases, are usually covered at a reduced rate.

Keep in mind that most plans will place limits on their coverage for eyewear. For example, a plan might cover a new set of eyeglass lenses once a year, eyeglass frames once every two years, and contact lenses once a year. Many plans will further limit coverage to either eyeglasses or contact lenses during a plan year. Plans vary, so make sure to work with your trusted advisor to select the appropriate benefit plan(s) for your staff.

Vet-eBooks.com

2.28. EMPLOYEE BENEFITS PROGRAMS

DISABILITY INSURANCE

Additional benefits that are growing in popularity are disability and life insurance, which provide financial protection for your employees and their loved ones, or those that are dependent upon their income.

When severe illness or injury strikes, the next few weeks, months, or even years can seem scary and uncertain, and your staff may worry about how they will pay their bills and afford their next rent or mortgage payment. Short-term and long-term disability insurance can ease your employees' worries and help with expenses while they are away from work if they suffer an off-the-job injury or become ill. The purpose of short-term disability insurance is to protect an individual's income during short periods of disability, while long-term disability provides financial protection for an extended period.

LIFE INSURANCE

Many people who are the primary or sole providers for their families will purchase life insurance to take care of their families in case they die and are no longer there to support their families. Life insurance can be offered as a voluntary (employee-paid) benefit or as an employer-paid benefit. The most common life insurance benefit usually has an employer-paid component, called basic life insurance, and allows employees to purchase additional (or supplemental) life insurance at their expense.

Other types of benefits that may be valuable to your staff include discounted veterinary services, contributions toward the cost of continuing education, education reimbursement programs, and voluntary worksite benefits (such as cancer, critical illness, or accident coverage).

EXAMPLES

N/A

CAUTIONS

If you are purchasing a clinic that has an existing employee benefit program, you will want to fully understand what is being offered. As the new owner, you may be able to continue coverage, or may need to terminate and/or replace existing programs. If a practice is being established or no current benefit program exists you will have many different types of benefits and insurance programs available to choose from.

Some insurance and benefit programs may shift fiduciary responsibility to the practice owner, many have administrative and compliance requirements that must be satisfied, and some benefits can be very costly. The most important step a practice owner must take is finding the right insurance professional to evaluate all needs of the business. There are many insurance agents and brokers, but only a small percentage are familiar with veterinary practices and the insurance needs of their staff. Ensure that the individual you are working with is qualified, has thorough knowledge and understanding of a veterinary practice's needs, is properly licensed, and is able (and willing) to provide hands-on support with regard to compliance, cost-control, employee education, and issue and claims resolution.

Before purchasing any insurance coverage, or implementing any employee benefit program, it is recommended that you consult with your insurance agent, advisor, accountant or attorney.

2.29. NOT-FOR-PROFIT FOUNDATIONS

BASICS

OVERVIEW

• Many pet owners are unprepared for the expenses associated with their pet's healthcare, especially when confronted with a serious or chronic issue.
• When pet owners are unprepared for the cost of care, or cannot afford such care, and when veterinarians are faced with an animal that would benefit from such care, there is a desire on the part of both parties that there be some type of mechanism for delivering such care in a subsidized fashion, especially for the poor and indigent.
• When dealing with such situations, there is often the near impossible dilemma of either treating these animals with little or no compensation, or declining to treat them (when legally permissible). In some cases, pets are euthanized for no other reason than their owners cannot afford to pay for care (economic euthanasia).
• In most areas there are not-for-profit veterinary hospitals (see 1.22 – Not-for-Profit Hospitals), often associated with charitable organizations. The mission of these hospitals is typically to deal with homeless animals, but many also provide veterinary services, often at prices below those of typical veterinary hospitals. Even so, there are many more pet owners seeking free or discounted care than could possibly be provided by any one charitable organization.
• Most veterinary hospitals already provide discounted services for clients in need, but clearly there are more people asking for such relief than it would ever be possible to deliver in a private veterinary setting.
• In a typical veterinary hospital situation, it can be difficult to discern clients who are truly in need from those that just do not want to pay for services.
• One way to add some rigor to the process is to establish a not-for-profit foundation, a charitable entity capable of providing relief for indigent clients and administered as a charitable organization.
• Such a charitable organization is able to raise money through tax-deductible donations for the purposes of providing healthcare services for pets whose owners would otherwise not be capable of paying for such care.
• Such charitable organizations do not earn profits for their owners; all of the money received is used for pursuing the objectives of the organization, such as providing care for homeless animals or those with indigent owners.

TERMS DEFINED

Charitable Corporation: A corporation that has been organized under state law as a nonprofit corporation and that meets the criteria under Internal Revenue Code Section 501(c)(3) to have its income exempted from federal income taxes and its donations tax deductible for the donors.
Disqualified Person(s): Anyone who has contributions in excess of that allowed to the charitable corporation from its inception, or persons who manage or control the charitable corporation.
Economic Euthanasia: Euthanasia of an animal as an elective procedure because the owners cannot afford to initiate or continue care.
Exclusively Organized and Operated for Charitable Purposes: A charitable tax-exempt organization must be exclusively organized and operated solely for a recognized charitable purpose. If any part of its purpose or its operation is for anything other than a recognized charitable purpose, then the corporation could lose its tax-exempt status.
Inurement: Refers to a private person or company inappropriately benefiting from a charitable corporation.
Nonrelated Business Income: Income earned by a charitable corporation from the sale of goods or services unrelated to its charitable purpose. For example, a corporation sells pet supplies to raise money to treat the pets of indigent owners. The proceeds from the sale of the pet supplies are considered nonrelated business income. A corporation that earns income from providing medical services at a discounted rate for pets of indigent owners is earning related business income because the income is related to its charitable purpose (providing medical services to the pets of those in poverty).
Private Foundation: A nonprofit organization which is usually created via a single primary donation from an individual or a business and whose funds and programs are managed by its own trustees or directors.

ISSUES AND OPTIONS

WHAT IS A FOUNDATION?

• A foundation is a nongovernmental entity that has been established as a nonprofit corporation or a charitable trust.
• The principal purpose of a foundation is to make grants to unrelated organizations, institutions, or individuals for charitable purposes.
• Foundations can be private or public organizations. Private foundations derive their money from a family, individual, or corporation. A grant-making public charity derives its support from diverse sources, which could include other foundations, individuals, or even governmental agencies. Most foundations established by veterinary hospitals are private.
• Foundation itself is not a legal term so one cannot assume that an organization with "Foundation" in its title is actually a grant-making charity.
• However, a charitable foundation is a legal category of nonprofit organization that typically donates funds and support to other organization, or provides a source of funding for its own charitable purposes.
• Not-for-profit organizations can apply for tax-exempt status, so the organization is not subject to most forms of taxation.
• Donations made to a tax-exempt, not-for-profit organization may be tax deductible to the donor.
• Once the foundation is registered and in operation, it needs to maintain compliance with the appropriate state and federal agencies regulating charitable organizations.

GETTING STARTED

• Assess the need for creating a foundation and consider other options. There will always be needy clients but setting up a charitable foundation may not be the most practical solution. Could that need be mitigated somewhat by helping clients better establish reasonable expectations for their pet's care? Other mechanisms, such as pet health insurance (see 8.11 – Pet Health Insurance), payment plans (see 8.12 – Payment Plans), and third-party payments (see 8.13 – Third-Party Financing) may be suitable for some clients.
• Also ensure that you are not duplicating the resources already provided in your community by another nonprofit. Research the situation and communicate with other charitable organizations already providing such care to see if the needs of your clients can be met without you having to create your own charity.
• Once you are committed to proceed, create a business plan and mission statement to effectively communicate the nonprofit's purpose.
• While it is not imperative to incorporate, incorporation gives credibility to the program and also can limit the liability of the organization's officers and directors.
• Within the United States, foundations apply for tax-exempt status with the Internal Revenue Service and also register with the state's agency that regulates charitable organizations and charitable solicitations.

Vet-ebooks.com

2.29. NOT-FOR-PROFIT FOUNDATIONS

GENERAL GUIDELINES

- Nonprofit status and charitable status must be granted both by the state of incorporation and by the Internal Revenue Service.
- To qualify for "charitable" status, the corporation must meet the criteria of Internal Revenue Code Section 501(c)(3), and the primary qualification of the organization must be "exclusively organized and operated for charitable purposes."
- Private foundation status has a number of unfavorable limitations, including stiff excise taxes for violations, deductibility limits for donors, and minimum annual asset distributions.
- A charitable corporation's funding comes from a broad-based public support, and the corporation must not be controlled by any disqualified person.
- Three important limitations on charitable corporations are: (1) a limit on the amount of nonrelated business income a charitable corporation can earn, (2) an absolute prohibition against benefiting a private individual or organization, except for other charitable organizations, and (3) the rule preventing such organizations from engaging in any political activities or from attempting to influence governmental decisions, policies, or legislation.
- A charitable corporation will be taxed on its nonrelated business income, and if it derives too much income or devotes too much of its resources to nonrelated business income, it will lose its exemption.
- Benefiting a private person or "inurement" is not allowed. All property and funds contributed to a charitable corporation must be irrevocably dedicated to the charitable corporation and can never inure to the benefit of any individual.
- A corollary is that a charitable corporation can never pay more than a reasonable and competitive amount for goods and services provided to it.
- Charitable corporations have been successfully used by independent organizations to solicit tax-deductible donations to provide veterinary care for strays, or for animals whose owners cannot afford to pay for proper care.

EXAMPLES

N/A

CAUTIONS

- Forming a new charitable foundation is a complicated way of meeting the needs of your community, but it is an option if your motivations are pure.
- The legal issues are so complex and the consequences of mistakes so severe, it is imperative that no person attempt to create or use a nonprofit corporation for the previously mentioned purpose without a qualified attorney advising each step of the way.
- A corporation controlled by a veterinarian who expects to be compensated by that corporation for providing medical care to needy animals may not qualify for the charitable corporation status on several grounds. First, it raises the question of whether the corporation is "exclusively organized and operated for charitable purposes." If any of the purpose in organizing and/or operating the corporation is to compensate a person who controls it, then it does not meet this requirement. Second, it raises the "inurement issue." Third, as a person in control of the corporation, the veterinarian is a disqualified person and therefore subject to additional restrictions. If the corporation has not qualified for one of the exceptions to the private foundation status, he or she would be subject to substantial excise taxes.
- Beneath a certain level of funding, private foundations can be inefficient vehicles for furthering charitable purposes.
- The corporation should be operated entirely separate from any veterinary practice that would seek compensation from the corporation.
- The board of directors should be a broad representation of the community at large and should include community leaders. It should be entirely independent of any substantial donors and of veterinarians expecting to receive compensation from the corporation.
- Charitable purposes should be defined broadly and not discriminate in favor of any individual or entity, including favoring any particular animal hospital over another animal hospital.
- There is a substantial amount of paperwork required to create a charitable corporation and a substantial amount of reporting on an annual basis, including a number of state and federal forms, procedures, and formalities to be completed and followed in the formation of the corporation and the obtaining of the charitable corporation exemption status.

3.1. COMPENSATION

BASICS

OVERVIEW

Finding and keeping good employees is always one of the most difficult tasks facing a veterinary practice. Without good employees, veterinarians cannot offer high levels of medical and surgical care, nor provide the kind of service that keeps clients returning to a practice, allowing the business to prosper financially. Thus it is essential that the compensation program be designed with the hospital staff's goals in mind, as well as those of the practice owners.

Many studies have been done regarding the components of employee job satisfaction. Employers traditionally think that money is the most important driver of employee satisfaction, but it is clear that other factors, such as appreciation of one's work or an ability to learn and grow on the job, are equally, if not more, important to employees. Sometimes this is interpreted as a license to offer very skimpy pay and benefit packages. Although it is true that a positive and employee-oriented practice culture can make up for pay levels that are not the highest in the community, it will not make up for poor pay levels. This is especially true in lower level jobs, where every dime earned is genuinely needed by the employee for basic housing, food, transportation, education, and other needs. And, as the old adage goes, "You get what you pay for."

An employee compensation package in the United States has two components: W-2 earnings (salaries/wages) and benefits. Both are important to employees and both need to be considered when reviewing or designing compensation packages. Compensation is discussed in this section, whereas benefits are addressed elsewhere (see 3.2 – Benefits). Continuing education benefits (see 3.6 – Continuing Education Benefits) and other employee-related costs (see 3.5 – Employee-Related Costs) are also discussed in their own sections.

One of the most important new concepts in determining pay and benefit packages is flexibility. Historically, companies offered the same type of pay and the same benefit package to all employees. As the diversity of employees seen in all kinds of businesses has increased, so has the range of needs and desires regarding compensation. Not everyone wants the same thing. The more flexible a company can be in tailoring pay and benefit packages to individual employees, the more success the business will have in attracting and keeping the kinds of employees it wants. Flexibility can take many different forms:

- Lower compensation in exchange for more paid time off
- Higher wages for hours worked outside those the practice has traditionally been open
- A menu of benefits from which the employee can select those desired
- The ability to work some hours off-site.

The first step in creating an equitable and effective compensation system is to develop a consistent system for setting and reviewing pay levels for each position.

In the real world of veterinary practices, there is often no consistency in how people are paid; for example, the newest receptionist may make more than the head receptionist simply because receptionists were hard to find and the practice had to pay more to get one.

Ideally, pay should equal performance and those employees who produce more and contribute more will be paid more. In order to implement a system such as this, the practice owner/manager must understand what community pay scales are for different positions in the practice, identify the skills and attributes that are most important for each position, communicate these expectations to employees, evaluate performance based on these expectations, and pay accordingly.

Associate veterinarians may be compensated by straight salary, percentage of production, or some combination of the two. There is no universal answer; each practice must determine what works best for them.

Compensation systems for owner veterinarians are different from those for associates in that these individuals are more likely to be compensated explicitly for management work in addition to their medical/surgical duties. Practice owners also receive a share of the practice's profits and although this may be paid through the payroll system, it technically is not part of the compensation package.

When the economy is less than robust, it is tempting to save money by skimping on compensation. However, any short-term gain will be easily lost by staff turnover and a lower than desired quality of medicine and client service.

TERMS DEFINED

Benefits: Generally indirect and noncash compensation paid to an employee. Examples include health insurance, paid time off, and retirement plan contributions.

Compensation: Total monetary pay given to employees for their work during a given period. The term is sometimes used to represent both the monetary and non-monetary amounts paid to employees.

ISSUES AND OPTIONS

DEVELOPING THE COMPENSATION SYSTEM

The objectives of a compensation system are to:

- attract, retain, and motivate high performers,
- maintain internal consistency in how people are paid,
- recognize and reward performance.

An employee compensation package has two components: W-2 earnings (salaries/wages) and benefits. Both are important to employees and both need to be considered when reviewing or designing compensation packages.

The procedure for developing or revising an effective compensation system is similar regardless of whether this is being done in an existing practice or for a new practice. In an existing practice, however, part of the process will involve identifying and rectifying pay inequities. Steps include: identifying the job positions in the practice and the skills and attributes that are most important for each position; understanding what community pay scales are for different positions in the practice; communicating job expectations to employees; evaluating performance based on these expectations; and paying accordingly.

Step One: Identifying Positions in the Practice and Critical Skills and Attributes for Each Position

- List all of the jobs in the practice.
- Group the jobs by major function: management, reception, technical, and so on.
- Define both the technical and nontechnical competencies valued by the practice and needed for each specific position. Do not focus just on knowledge, work experience, and technical skills; also define the critical nontechnical competencies the person must have to be successful in the job. For example, if it is a position that has contact with the public, such as a receptionist, the employee must have a friendly and sympathetic manner and the ability to both accurately gather data from clients and communicate back recommendations and other information.
- If the practice has well-defined, current job descriptions, use these as a starting point for defining these critical competencies. If not, the process used to define these skills and traits as part of the compensation process can be used to update the job descriptions. Although there are usually similarities in what a technician or receptionist does across practices, every hospital has some job nuances that are unique to that practice and these need to be identified.
- There is a good correlation between the productivity of employees and their education levels, skill sets, and work experiences, although more experience and more education do not always translate into

Vet-ebooks.com

Table 3-1-1. Example of compensation analysis.

Date: Name	Position	FT/PT	Current $/hour	Length	Last PA rating	Comment
Brandy	Reception	FT	9.25	6 months	7	Learning fast, enthusiastic
Susan	Reception	FT	12.25	5 years	7	Dr. M's wife
Linda	Reception	PT	9.25	1 year	6	Wants FT
Matt	Tech	FT	12.00	2 years	4	Good with clients, slow learner, average worker
Jennifer	Tech	FT	12.50	1 year	5	Intelligent, good skills, not team player
Andria	Tech	PT	12.25	4 years	6	1–2 days/month, 2 small children
Johnny	Tech	FT	13.50	6 months	7	Very responsible, much potential, pleasant
Angela	Tech	PT	14.00	2 years	7	Susan's sister
Heather	Tech	FT	15.50	3 years	7	Very loyal, pleasant
Joel	Kennel	FT	8.25	1 month	5	Very intelligent, lazy, has potential
Sara	Kennel	FT	8.25	1 month	6	Much potential, introvert
Chad	Kennel	PT	8.00	6 months	7	Has potential to assume additional responsibilities

better work. In salary and job attribute determination, the key is to make sure that the education, skills, and experiences being rewarded are specific requirements of the position and are contributing to better job performance.

- While technical skills can be learned, it is much harder to change or improve interpersonal skills. Veterinarians tend to make hiring and compensation decisions based on technical skills because it is something they understand well. In small businesses such as veterinary practices, strong communication skills, customer service acumen, and a good attitude are essential and should be rewarded. One whiner and one chronic gossip can destroy the work environment. These abilities should be included in the job descriptions.
- As a part of this process, prepare an analysis of your current employees' compensation in order to evaluate internal parity. Nothing demotivates employees more than seeing a colleague who does less good work be paid more. In order to keep this from happening, practices need to evaluate their internal compensation parity at least once a year as a part of the performance evaluation and raise determination.
- The analysis should contain the following information about each employee: name, position, full-time (FT) or part-time (PT), hourly wage or salary, length of employment, ranking on last performance appraisal, and any particular comments about the employee's performance (Table 3-1-1). Additional useful information includes the date of the last raise, amount of last raise, and benefits given to the employee.
- Employees holding similar positions (doctors, receptionists, etc.) should be grouped together. After the worksheet is prepared, employees in each category should be compared to one another. Inevitably, questions such as the following will surface:
  - Why does the best receptionist make less than the problem child?
  - Why does the head technician make less than the people she supervises?
  - Why does the new hire technician with unknown skills make more than all but one of the techs in the practice?
- As a part of the raise process, attempts should be made to correct the inequities. Once salaries are normalized, the practice needs to be careful when hiring to maintain the balance.

Step Two: Identifying Community Pay Scales

- Information about the compensation and benefits typically seen in veterinary hospitals is readily available from the American Animal Hospital Association's *Compensation and Benefits* book[1] and the Veterinary Hospital Managers Association compensation and benefits surveys[2–4] although it is important to remember that these figures are averages and may be higher or lower than what is appropriate for a particular geographic area. The Internet is also a great resource for salary information for both veterinary-specific jobs (such as a technician) and nonveterinary-specific jobs (such as a receptionist). Sites such as Salary.com, CareerOneStop.org, and the Bureau of Labor Statistics (BLS.gov) have pay information not only for particular jobs but also within certain cities or other geographic areas. Other sources of salary information include job listings/ads, staff members who know what counterparts are earning in other practices, and job candidates with recent experience.
- It is essential to know not only the pay ranges for veterinary practices in the area, but also the going rates for positions in other businesses where current staff members or job candidates might apply. If veterinary receptionists are making $10 an hour, but receptionists in general are paid $12, then $10 probably will not attract top candidates.
- This information can then be used as a guide in designing a pay structure for new hospitals or to verify that current salaries in an existing hospital are still competitive.
- The salary structure should be reviewed annually; once the initial development is completed, updating is relatively easy.
- The general recommendation is that all salaries in the hospital, new and old, should be in the upper seventy-fifth percentile of these local ranges. To find and keep better-than-average people, it is necessary to pay better-than-average salaries.

Step Three: Communicating Expectations to Employees

- As discussed, it is logical to pay more to those employees who produce or contribute more. The key is to know how to measure job performance and how to tie it to the practice's mission and goals. This is where defined job descriptions and a well-designed performance appraisal system come into play.
- Communication of expectations is also essential, particularly if pay has only loosely correlated with performance in the past. Employees

Vet-eBooks.com

3.1. Compensation

need to know exactly what tasks and duties their job requires and the level of competence at which these are to be performed both to maintain their current salary and to increase it.
• When new employees join the hospital team, it is critical that they be told exactly what is expected of them by means of a thorough job description and a phase training program (see 3.10 – Staff Training). They also should be given the date of their first performance appraisal and a copy of the performance appraisal form. Ongoing communication of expectations should also occur through staff meetings, staff training, and individual conversations with employees.

Step Four: Evaluating Performance Based on Expectations

• Once the skills and duties of a job have been defined, the performance appraisals should be created or updated to reflect these expectations.
• Performance appraisals should be done at least once a year and raises should be determined based on this assessment of performance.
• See more on performance appraisals in 3.19 – Staff Performance Evaluations.

Step Five: Determining Pay

• An effective performance appraisal system enables matching pay to performance. For some employees who are performing adequately but not exceptionally, a very small or no increase may be all that is warranted.
• If an employee has increased their level of responsibility, moved into a new position, or acquired new skills that make him or her more valuable, he or she should be rewarded with a "merit raise" in addition to the regular cost of living raise.
• If there were concerns about internal parity as previously discussed, an attempt should be made to correct this.
• Some veterinarians feel that salaries should have ceilings; for example, a receptionist should never receive more than $12 an hour. The problem with this thinking is that it is unrealistic. The economy never stands still, and neither should the salaries of employees. The salaries necessary to find and keep good-quality people change over time.
• Seniority is a widespread workforce sacred cow. If seniority means a top-notch employee who can work in several areas when needed, who volunteers to help out in difficult situations, who is knowledgeable, and who has great people skills, then seniority in this sense is a factor in compensation. Years spent on the job per se, however, should not be.

ASSOCIATE VETERINARIAN SALARIES

• Associate (employed) veterinarians may be compensated by:
  ◦ Straight salary
  ◦ Percentage of production
  ◦ Some combination of the two.
• There is no universal answer; each practice must determine what works best. It is also important that hospital owners understand the kind of a message the compensation structure is sending to the associates about performance expectations.

Straight Salary

• An advantage of straight salary pay is that the doctor is compensated for all of his or her work, not just medical/surgical production. All doctors will spend some of their work time on management and administrative functions, such as training and supervising employees, meeting with vendors, working on marketing, and so on.
• A straight salary ensures that they are paid for these duties without complicated formulas. Disadvantages are that it does not encourage the doctor to focus on the business side of the practice, nor does it encourage the doctor to find ways to increase production.

Percent of Production

• One advantage is that earnings are determined objectively and understood by all – they are not based on a whimsical decision by the owners or practice manager. It is attractive to doctors because they see a ready way to increase income.
• Disadvantages are that the doctor loses the incentive to do anything but work that generates production. They may sacrifice time with each client in order to increase the volume of clients, and may use inappropriate sales tactics. Further, it leaves the owners with no clear-cut way to reward for excellence in nonproduction functions.
• It can also result in some unfortunate staff infighting.

Combination of Salary and Production

• The best compensation structure is one that rewards efforts in all areas. Combinations seem to be effective. There are several options:
  ◦ Percent of production for medical/surgical work, with flat salary for other activities.
  ◦ Salary with production-based bonus. Salary is initially calculated on approximate production and then modified for other activities; the bonus is based on production.
  ◦ Salary with bonus at owner's discretion (see 3.4 – Employee Bonus Criteria). Salary is initially calculated on approximate production; bonus is based on additional work done or exemplary contributions.

Issues in Calculating Percentage of Production

• What percentage rate is appropriate for services provided and products sold? Historically the same percentage was used for both services and products but more practices are using a split rate model now with the percentage used for products being less than that used for services.
• What is the appropriate percentage if benefits given to the doctor are more or less than those typically seen? Ideally, the production percentage is increased or decreased proportionately to the cost of the related benefits.
• With a 100% production system, the production percent may be higher than with a base salary plus production methodology.
• When is production calculated – monthly or quarterly? The final decision is based on the time incurred in doing the calculations. What frequency will most motivate and reward the doctor and the desires of the associate and owner?
• How are shortfalls treated with a base system? Some practices require associates to make up the production shortfall before receiving another bonus; others do not.
• What is included in production? Does it include refills and over-the-counter products, therapeutic diets, heartworm medications, and flea/tick products, and so on?
• How should the practice allocate services done by different doctors on the same patient?

OWNER VETERINARIAN SALARIES

The compensation system for owner veterinarians is different from that for associates, in that they are more likely to be compensated explicitly for management duties. Profit distributions are sometimes included in the payroll paid to owners but these are more correctly viewed as a return on investment (ROI) rather than compensation.

Here is one example of a multi-tiered compensation calculation for owners:

• **Tier I. Personal Production:** A percentage of their medical and surgical services. The same issues apply for calculating the percent for associates (18–21% of production is most commonly seen).
• **Tier II. Management:** A percentage of gross revenues times the percentage of total time spent in management activities such as strategic planning, financial planning and tracking, training and supervising employees, meeting with vendors, marketing, and so on. Generally 2–4% of gross revenue is divided among the owners based on the split of duties performed if the practice does not have a practice manager. The percentage is smaller, usually 1.5–2.0% of gross revenue if the practice does have a manager.

SUPPORT STAFF SALARIES AND WAGES

In planning for support staff salaries, it is essential to consider the total compensation package, including benefits, when budgeting (see

Vet-ebooks.com

3.3 – Wage and Benefit Summaries: the Whole Package). Remember too, that in order to get good-quality employees, a practice must pay competitive wages. Employees will not be pacified with statements such as "We can't afford it." One of the duties of practice owners and managers is to manage the hospital in such a fashion that fair salaries can be afforded.

- **Registered and Certified Veterinary Technicians (RVTs and CVTs):** Because these employees are specific to the veterinary profession (also referred to as veterinary nurses in some parts of the world), it is important that they are paid the local market rates in veterinary practices, remembering the recommendation that the pay should be in the upper seventy-fifth percentile of these local ranges in order to attract top-quality candidates.
- **Non-Credentialed Veterinary Technicians:** Because these employees generally have skills that are specific to the veterinary profession, it is important that they are paid the local market rates in veterinary practices, remembering the recommendation that the pay should be in the upper seventy-fifth percentile of these local ranges in order to attract top-quality candidates.
- **Veterinary assistants:** Although some of these staff members choose to work only in veterinary practices, others can work in a variety of different businesses, so it is harder here to determine an appropriate rate of pay. If workers are leaving or not accepting a position because the pay is too low, or if their quality is insufficient, then the pay scale is probably wrong.
- **Receptionists:** These employees clearly have many work opportunities, and it is important to determine general area pay scales for receptionists.
- **Kennel staff:** These workers also have other opportunities. It is most useful to determine what has historically been successful in the practice in attracting and keeping these employees, and also what other veterinarians are paying.

MANAGEMENT SALARIES

- Depending on the size of the hospital and the practice's philosophy, the actual title for these positions and the related job responsibilities can vary greatly. Management personnel, for example, may be called hospital administrators, practice managers, or office managers. In the same way, the position can be a heavy-duty management position that "runs" the practice, or it can be a clerical position, or something in between.
- At its highest level of responsibility, a veterinary practice manager manages virtually all of the business activities of the hospital. This is highly beneficial because it frees the doctors for more income-producing activities.
- Top-level practice managers are not easy to find, and their compensation should be carefully designed to encourage good-quality work as well as job satisfaction and retention. Because they can work in other types of businesses, it can be difficult to determine the right pay scale. Pay research should be a combination of what other practices of comparable size are paying, and what office managers and administrators with a similar scope of duties are paid in other fields.

3.2. BENEFITS

BASICS

OVERVIEW

For many of today's employees, benefit packages are just as important as wages and salary. Salary and benefits for practice employees should be determined at the same time because they are both a part of the larger issue of effective compensation planning.

- One of the most important new concepts in determining pay and benefit packages is flexibility. Historically, companies offered the same type of pay and the same benefit package to all employees. As the diversity of employees seen in all kinds of businesses has increased, so has the range of needs and desires regarding compensation. Not everyone wants the same thing. The more flexible a company can be in tailoring pay and benefit packages to individual employees, the more success the business will have in attracting and keeping the kinds of employees it wants. Flexibility can take many different forms:
  - Lower compensation in exchange for more paid time off
  - Higher wages for hours worked outside those the practice has traditionally been open
  - A menu of benefits from which the employee can select those desired
  - The ability to work some hours off-site.
- The benefit package in a veterinary hospital can be simple or complex, and will be influenced by the overall profitability of the practice as well as the types of benefits that other comparable practices in the area offer. It is also important to consider the benefits offered by other, nonveterinary businesses in the area with which the practice competes for employees.
- As with compensation, when the economy is less than robust it is tempting to save money by skimping on benefits. However, any short-term gain will be easily offset by increased staff turnover and the resulting decline in the quality of medicine and service offered by the practice.
- Employee benefits in general are considered by the Internal Revenue Service (IRS) to be taxable income to the employee unless specific regulations issued by the IRS state differently. Some benefits offered by veterinary hospitals do not have to be treated as income to the employee; a significant exception to this is pet care benefits. The practice should consult its tax advisor for further information on this topic.
- Publications from the American Animal Hospital Association and the Veterinary Hospital Managers Association provide excellent information about the current compensation and benefits offered by veterinary practices.[1–4] This is recommended reading for anyone developing a veterinary practice's compensation and benefits program.
- Most benefits are discussed in this section. The compensation section of this book (see 3.1 – Compensation) discusses salary, wage, and other compensation-related issues. Continuing education benefits and other employee-related costs such as payroll taxes are each covered separately (see 3.6 – Continuing Education Benefits). See also 2.28 – Employee Benefit Programs.

TERMS DEFINED

After-Tax Contributions: Contribution to a retirement plan made from employee earnings that have been included in the employee's taxable income for that year. When funds are finally withdrawn from the plan, the contribution itself is not taxed because this has already occurred.

Co-insurance: Payments for medical services shared by insurance companies and individuals, usually expressed in percentages, such as 80% paid by the insurance company and 20% paid by the individual.

Co-payment: Insured individual's portion of the cost for a particular service; for example, $10 for an office visit.

Pretax Contributions: Contribution to a retirement plan made from employee earnings that are not included in the employee's taxable income for that year. When funds are finally withdrawn from the plan, the contribution is considered taxable income because it was not previously taxed.

Primary Care Physicians: Physicians who coordinate and manage the medical care of health maintenance organization (HMO) and point of service (POS) patients. They see patients for all services and refer to specialists as necessary.

ISSUES AND OPTIONS

Examples of benefits commonly offered by veterinary practices include the following:

- Health insurance
- Continuing education
- Paid vacation days
- Professional liability insurance
- Sick leave/personal leave
- Retirement plans
- Dues and licenses
- Pet care
- Paid legal holidays.

Less frequently offered benefits include:

- Dental insurance
- Life insurance
- Disability insurance
- "Cafeteria plan" benefits where employees have a certain amount of money to use for benefits and choose the benefits they want, within the plan offering.

Vet-ebooks.com

3.2. BENEFITS

One criterion that must be determined when establishing a benefit program is the number of hours an employee must work to be considered "full-time," because benefits offered for full-time employees are usually better than those for part-time employees. Full-time employees are usually defined as those who regularly work about 35 hours per week or more. With health insurance and retirement plans, the definition of a full-time employee is ordinarily determined either by applicable law or the company administering the plan, and the employer can not change it. For other benefits, the practice can themselves define the number of hours that qualify an employee as full-time; however, most practices use the definition required by their retirement or health plan for ease of administration.

HEALTH INSURANCE

Health insurance is the most expensive employee benefit and the most difficult to administer, given ongoing attempts to change healthcare policy. It is very difficult to know what the future for health insurance will look like. A good health insurance agent is absolutely necessary in order to understand the differences in plans available and to aid in controlling plan costs. It is valuable to talk with other veterinarians in the area to determine their satisfaction with both their agent and their plans.

The practice's benefits administrator should focus on:

- understanding the various types of healthcare coverage available in today's market;
- selecting the most desirable coverage for the practice (by balancing the quality and range of services offered with their costs);
- keeping abreast of rapid changes in plans and laws regarding health coverage.

Because the details of health insurance change so rapidly, the practice owner or manager must spend a certain amount of time evaluating possible plans. There is no shortcut to this; however, with some basic information about health plans, the owner or manager can let the health insurance agent do a lot of the work in locating possible plans. It is beneficial to use an agent who has several years experience in supplying health insurance to veterinary hospitals

Each owner or manager should develop his or her own checklist for evaluating plans:

- Basic type of plan (HMO, PPO, etc.)
- Extent of the coverage
- Extent of network of physicians, hospitals, laboratories, or other facilities
- Cost to employer and employee; costs for family members; deductibles/co-payments
- Employee eligibility
- Ease of administration.

PAID VACATION DAYS

Each hospital must decide how many paid vacation days it will offer each year, and to what categories of employees (doctors versus staff and full-time versus part-time employees). This should be documented in the form of a written policy and included in the employee handbook. Generally speaking, veterinary hospitals do not offer as much paid vacation time as do large corporations.

Besides the number of actual vacation days allowed, the written policy should include the following:

- The increments in which vacation days can be taken. Allowing employees to take vacation in one-hour increments is difficult to track; however, half-day increments may work well in satisfying both employee and employer needs.
- When employees will become eligible to take earned vacation: Immediately? After a three-month probation period? After six or twelve months? Traditionally, employees did not receive any vacation time during the first year of employment, but this is now changing.
- How the daily vacation pay rate is calculated, with an example (normally based on the standard work day without overtime).
- How vacation days are accrued.
- How vacation is scheduled.
- Whether or not unused vacation may be carried over into the next fiscal year.
- What happens to unused vacation upon termination.

SICK LEAVE/PERSONAL LEAVE

The issues surrounding paid sick and personal leave are similar to those for paid vacation. This policy should also be in writing and included in the employee handbook. Areas to address include:

- the increments in which days can be taken (for example, a minimum of one-half day);
- when employees become eligible;
- how the daily leave pay rate is calculated, with an example (normally based on the standard work day without overtime);
- how the days are accrued;
- the notification process when an employee wants to use days;
- whether or not unused days may be carried over into the next fiscal year;
- whether or not an employee will be paid for unused days at the end of the year;
- what happens to unused days upon termination.

PAID LEGAL HOLIDAYS

The first decision to be made is which holidays will be observed. The most common ones in the United States are New Year's Day, Memorial Day, the Fourth of July, Labor Day, Thanksgiving, and Christmas. Regardless of the general holidays observed by the practice, a policy should be in place regarding religious holidays, which may affect some employees but not all.

Vet-eBooks.com

3.2. Benefits

As with other benefits, the policy needs to address eligibility and pay calculation.

PROFESSIONAL LIABILITY INSURANCE

- Professional liability insurance is generally carried only by doctors.
- This is a particularly complex subject; liability insurance should be purchased only after a careful evaluation of the provisions of the policy.
- The AVMA Professional Liability Insurance Trust is an excellent source for information and coverage. There are other carriers as well that exist through cooperative efforts of state and national veterinary associations or directly from other insurance companies, and these may be identified and evaluated as part of the selection process. Most veterinarians choose the AVMA Professional Liability Trust for coverage because the rates are reasonable, the underwriter is very familiar with veterinary malpractice issues, and the plan provisions allow veterinarians a great deal of say in how claims are handled.
- Historically, the costs of professional liability insurance have been low and stable.

ORGANIZATION DUES AND VETERINARY LICENSES

The policy regarding dues and licenses should state:

- Items that will be covered
- Employee eligibility
- The portion of the dues or licenses paid by the practice.

RETIREMENT PLANS

- Retirement plans are offered in the majority of veterinary practices. Some employees consider them to be an important factor in the employment decision while others would prefer higher wages.
- Because of past pension plan abuses with employees' hard-earned money, retirement plans are highly regulated by the government through ERISA, the Employee Retirement Income Security Act of 1974.
- A practice should obtain advice about retirement plan options from an agent who specializes in this area; one that specializes in plans for veterinary hospitals is a plus.
- As with health insurance, it is wise to check with other veterinarians to determine their satisfaction with both plans and agents.

Types of plans most frequently used by veterinary hospitals include the following.

SIMPLE IRAs

- SIMPLE is short for a Savings Incentive Match Plan for Employees, while IRA means Individual Retirement Plan. A SIMPLE IRA is established by employers to allow eligible employees to set aside part of their pretax (see Terms Defined) compensation as a contribution to the plan.
- The employer is required to make either dollar-for-dollar matching contributions or a specified percentage nonelective contribution to all eligible employees.
- Advantages of the SIMPLE IRA are: it is relatively easy to administer, the start-up and maintenance costs are very low compared to other types of plans, and because the responsibility of funding the SIMPLE IRA is shared between the employer and employee, employees have some degree of control over how much and when their SIMPLE IRAs may be funded.

401(k) Plans

- This is a plan established by employers to which eligible employees may make contributions and defer income tax on the amounts contributed until it is distributed to them. Usually they can also make contributions on an after-tax basis (see Terms Defined).
- Employers may make matching or nonelective contributions to the plan on behalf of eligible employees, but they are not required to. It is good business to do so, not only for the tax deduction, but also for employee morale.
- Employers may also add a profit-sharing feature to the plan.
- 401(k) plans require a professional administrator and can be more expensive to administer than other kinds of plans.

PET CARE

- Most practices offer discounts on veterinary services, ranging from charging the employee only the cost of the service to giving a substantial discount off the fee charged a client. Similar discounts are given on product purchases by employees.
- Traditionally, veterinary clinics have been liberal in the quantity and amount of the discounts given because other, more traditional benefits were not offered to the extent seen in other industries or professions. Some practices have found, however, that usage of this benefit has exceeded reasonable expectations of care needed for the employee's own pets and have started to place limits on the number of pets covered and the discounts offered.
- Both full-time and part-time employees generally receive pet care benefits, though the number of pets covered may be less for part-time employees.
- Some practices purchase pet insurance for employees' pets in lieu of discounts, or give employees an allowance of a certain dollar amount from which service and product purchases are deducted at normal cost.
- The IRS has regulations governing the tax treatment of employee discounts. These regulations apply to all kinds of businesses, including veterinary practices. If the discounts offered by a practice exceed those allowed by the IRS, some or all of the benefit is to be treated as taxable income to the employee. The discounts offered by many practices exceed those allowed by the IRS, and most practices do not properly account for the excess amounts. Each practice should consult their tax advisor for more information on this topic.

Vet-ebooks.com

UNIFORMS

• Many practices provide paid uniforms for full-time veterinary staff and a more limited number of practices do the same for part-time team members.
• Uniforms should reflect the professional image of the practice, be reasonably easy to care for, and be comfortable and attractive across a wide variety of body types. The employee's name and position in the practice should be readily visible on the uniforms either through the use of nametags or through embroidery directly placed on the uniform tops or jackets. An employee team should be involved in choosing the uniforms (within cost and style guidelines) in order to avoid the large morale issues resulting from a dislike of the uniforms selected.

3.3. WAGE AND BENEFIT SUMMARIES: THE WHOLE PACKAGE

BASICS

OVERVIEW

• Employee salary and benefits summary statements are an increasingly popular tool used by the owners or managers of a business to educate their employees regarding the value of their total compensation package. Historically, employees in the United States only received information about their total salary and payroll taxes from their check stubs or W-2.
• The traditional statements of human resource professionals to employees that their benefits are "worth 20, 30, or whatever percent" of their salary have little meaning and cannot be readily translated by employees into dollars.
• A salary and benefit summary statement shows both the employer and the employee, at a glance, the value of the total compensation package. This is educational for employees because few of them know what their total benefits are actually worth, much less how to calculate them. It is also educational for employers because it helps them ensure that they are compensating their employees equitably and commensurate with their contribution to hospital goals.
• The statements are also useful when negotiating compensation packages between owners and associates or other staff members.

TERMS DEFINED

Benefits: Generally indirect and noncash compensation paid to an employee. Examples include health insurance, paid time off, and retirement plan contributions.
W-2: Internal Revenue Service (IRS) form called "Wage and Tax Statement" that reports income paid and taxes withheld by an employer for a particular employee during a calendar year.

ISSUES AND OPTIONS

THE SUMMARY STATEMENT

• Each hospital will want to develop and design its own statement form; however, certain basic information should be included by all practices (Table 3-3-1).
• It is beneficial to use the same form for all positions (including associates) because this facilitates comparison among employees.
• All possible salary (see 3.1 – Compensation) and benefit items (see 3.2 – Benefits) used within the hospital can be listed on one form, with only those areas filled in that apply to a particular employee.
• For consistency and ease in preparing the salary and benefits data, the period covered should be the fiscal year even though a discussion with an employee might not occur until some months later – for example, at the time of the performance appraisal.
• Some companies include payroll taxes on their benefits statements, and although there is no downside to this, it is important to remember that employees may not perceive these (and rightfully so) as a benefit. Not all employee-related costs paid by a company are benefits for the employees. Forty years from now, Social Security benefits may never be received by the employee; even if they are, the dollar amounts will not begin to cover the necessary costs of retirement. Likewise, many employees will never file for unemployment, and thus unemployment taxes are not of particular benefit to them. If a practice does choose to include these items on the statement, they should be realistic in their employee meetings about the real benefit to the employee.
• Some practices will also include employee events (parties, softball tournaments, etc.) as benefits on the statement. It is important to remember that not all employees consider these as benefits and they do not make up for poor compensation or a lack of the more traditional and more widely expected benefits.

Table 3-3-1. Sample summary salary and benefits statement.

Summary Salary and Benefits Statement

Date form completed:		
Period covered:		
Employee name:		
Job title:		
Date of hire:		
SALARY		
Salary (regular and overtime without vacation, sick, or CE days)	$	
Emergency compensation	$	
Bonuses	$

Professional association dues	$	
Veterinary licenses	$	
Pets – professional services	$	
Pets – veterinary supplies and food	$	
Miscellaneous	$	
Total benefits		$
Total salary and benefits		$
Benefits expressed as percent of total Salary and benefits		%

COLLECTING THE INFORMATION

• All of this information should be readily available. Wages and salary information, vacation, sick days, and time-off days are in payroll records; insurance costs, dues, licenses, and continuing education expenses are available from vendor invoices or the hospital's accounting software; and pet care costs should be in the practice management software records.
• Collecting the data and transferring it to the form for each employee should not be excessively time-consuming, especially after it has been done once and a system is in place.
• Preparation of these statements is generally done by the hospital bookkeeper or practice manager.

WHEN TO DISCUSS THE SUMMARY WITH THE EMPLOYEE

• The salary and benefits summary form should be distributed to and discussed with each employee on an annual basis. An initial summary should be given to new hires during the orientation process, and then an updated version distributed each year when the employee's potential raise is discussed.

Vet-ebooks.com

3.3. WAGE AND BENEFIT SUMMARIES: THE WHOLE PACKAGE

- Ongoing debate exists as to whether or not raises and benefits should be discussed with an employee at the time their performance appraisal is given.
  - Having these conversations at the same time may reduce the employee's interest in the appraisal discussion because they are simply trying to get to the end to find out what their raise is.
  - However, if "pay for performance" is the byword of the hospital, salary and benefits should be addressed at or near appraisal time.
- One way to resolve both these issues is to discuss performance appraisals with employees first and then several weeks later follow those discussions with a meeting regarding any raise and the value of the benefit package. The meetings should not be too far apart so that the "pay for performance" message is not lost.

DISCUSSIONS USING THE SALARY AND BENEFITS SUMMARY

- The hospital owner/manager should compare these benefits as well as salaries across employees to ensure that the right people are getting the right amount of salary and benefits and that compensation is consistent among similarly performing employees.
- It is also important to discuss the benefit information with each employee (instead of just handing them the statement) so that he or she knows and understands the total compensation package.
  - Traditionally, employees have tended to think that their compensation primarily consists of their salary; this meeting is an excellent time to educate them as to the very real costs of their benefits.
  - It is also a good time to educate employees about some of the changing realities of benefits; for example, the rising cost of health insurance and the trend toward employee payment of part of these costs.
  - Time off for salaried employees should just be shown by number of days because they do not receive any extra money for these days off in the same way that hourly employees do.
- Hospital owners/managers should be prepared to honestly and intelligently answer some hard questions that may be asked:
  - Why can't the hospital get a better deal and pay more of the health premium?
  - Why does it cost so much for my kids?
  - Why can't we have a dental plan?
  - Why can't we have a vision plan?
  - I never use sick leave/personal time off. Will you pay me for the days at the end of the year if I don't use them?
  - I'm single and very healthy, so I don't really need the health insurance; could I have a raise instead?

EXAMPLES

A sample summary statement is shown in Table 3-3-1.

3.4. EMPLOYEE BONUS CRITERIA

BASICS

OVERVIEW

A bonus program provides suitable rewards to motivate superior performance from key people who influence profitability of the company. An effective program should maximize current profitability and assist management in attracting and retaining the best technical, managerial, and customer service talent. Veterinary practices continue to discover the difficulty of hiring, and ultimately retaining, quality team members. Employers outside of the healthcare industry have discovered that many of the positive attributes gained by working in physician, veterinary, and dental practice offices are easily transferable to outside industries requiring the same high-quality, systematic customer service skills. Consequently, outside employers are willing to pay for those marketable skills.

Among professional healthcare staff, compensation programs calculated using gross production are typically employed in many healthcare industries, but these programs are generally not designed using either collections or profit-based formulas.

Veterinary practices may use incentive plans as a method of acknowledging productivity and, if well designed, potentially enhancing the entire practice operations. Bonus plans can reward individual achievement, production goals, number of new patients, referrals, or any other desired practice factor. To recruit and retain the best staff, bonus programs must be externally competitive and internally equitable. The bonus program needs to be designed globally as a component of the total compensation package.

Important elements of an effective bonus program are as follows:

- Practice owners should be aware of areas susceptible to manipulation for increasing bonus payouts. An effective internal control structure must be strong enough to support the bonus program needs and cope with bonus program pressures.
- Timely, reliable data on which bonus program decisions are made should be available. Bonus programs are most effective if the time between achieving objectives and bonus payment is shortened. Practice data must be reliable, as bonuses paid could be inappropriate for actual goals attained.
- Thoughtful, upfront design is essential.
- Sensible and equitable individual bonus awards must be included.
- There must be proper administration.

Team members must clearly understand the bonus formula. It is necessary that team members have a clear understanding of the bonus calculation and that the practice owner discuss each person's responsibility for qualifying for the bonus. Bonuses should be subject to review and may be changed each year following a review of the practice.

TERMS DEFINED

Gainsharing Program: A program through which employees are motivated to improve performance through involvement and participation

Open-Book Management: A practice whereby owners and/or managers allow staff access to select financial data of the practice, such as gross revenues, in order to ascertain projected employee bonus calculations.

ISSUES AND OPTIONS

Most human resource professionals suggest that any bonus plan incorporate the following basic attributes:

- The bonus plan should be designed to reward and encourage specific behaviors.
- Team members eligible for the bonus must fully understand the plan.
- Practices must be able to finance the bonus when achieved by staff through operational cash flow at no detriment to current operations.

Key steps in customizing the bonus plan for each individual practice are as follows:

- Determine eligible staff members
- Determine potential individual bonus awards
- Assess whether both individual and/or departmental bonus payments will be incorporated (ultrasound, pharmacy, radiology, reception, etc.)
- Schedule bonus frequency (monthly, quarterly, annual payments, or a combination of all three)
- Assess the method for bonus division (hours worked, departmental base pay, discretionary individual component, etc.).

Keep in mind the following suggestions when thinking about a bonus program:

- A positive impact on earnings and cash flow is expected if the program is properly designed and administered.
- A carefully designed bonus program will list some of the discretionary key areas considered (patient care, recordkeeping, client service, judgment, continuing education, etc.). The criteria must reinforce organizational goals and encourage behavior that leads to accomplishment of these goals.
- Base the bonus (versus salary) on actual collections rather than a production model, so employees understand the practice's global financial picture.
- Average the collection figures from one quarter up to one year to account for collection fluctuations due to season, holidays, vacations, and so forth.
- Do not guarantee bonus calculation for more than one year. Schedule bonus model review at anniversary date.
- Commit the bonus program to writing in the employee handbook. Written programs help avoid misunderstandings, benefiting both the participants and the administrators.
- Only those employees whose performance can significantly influence the company's results should be eligible for incentive bonuses. This is easier to say than to put into practice.
- The most important role the veterinary practice owner can play is to help the team understand how each person contributes to the cash flow, even if their job responsibility does not include collections.
- Practice owners should periodically communicate the current outlook for annual bonuses to bonus participants. Publish regular forecasts of bonus criteria compared to bonus targets. Participants can benchmark their bonus using the "forecasted percentage of bonus earned" for the practice. Key actions necessary to accomplish or exceed the forecast should be included in the periodic bonus update.
- One of the benefits of a bonus update is early identification of problems that require action on the part of the practice owner. By identifying problems in the bonus program as the year unfolds, it is possible to take prompt action.
- To achieve the desired objectives of the program, potential awards must be significant enough to motivate the bonus participants and be tied to the achievement of the practice's objectives.

A gainsharing program could be considered. These are programs that are instituted generally in manufacturing environments, but are applicable to the veterinary practice as well. The goal is to devise a compensation plan that is self-funding. Volunteers representing each clinical department create a "design team," and facilitators guide the team in deciding how the team should measure and reward positive performance within set parameters. Employees strive to improve the hospital's patient satisfaction scores, which in turn would increase employees' payouts and their own connection to how they impact total practice success.

Vet-ebooks.com

3.4. EMPLOYEE BONUS CRITERIA

Table 3-4-1. Example employee bonus calculation.

ABC Veterinary Hospital, Inc.	
Employee bonus calculation	
2013 Practice monthly summary: June	
Monthly cash collections	$75,000
Deemed base collection amount	$62,000
Excess driven to bonus calculation pool	$13,000
Veterinary practice annual net profit (projected):	
(excluding practice owner(s) compensation, SEP contribution(s),automobile allowances, etc.)	32%
Annual net profit on excess driven to bonus pool	$ 4,160
Contractual staff bonus percentage of annual net profit component	18%
Bonus pool for division among veterinary practice staff	$ 749

EXAMPLES

Press Ganey Associates is the hospital industry's leading independent vendor of patient satisfaction measurement and improvement services. They specialize in developing surveys and national comparative databases. The firm's clients include roughly 35% of all US acute care hospitals. One healthcare system client assigns patient satisfaction scores at 15%, weighted toward the total score used to calculate family practice physician bonus payments. The other 85% are governed largely by measures of clinical quality and other factors. Other healthcare systems give patient satisfaction up to a 100% weight based on the philosophy that the healthcare industry is a service business.

A sample calculation for determining a monthly bonus pool amount for staff, although not as highly recommended as a quarterly bonus due to potential revenue fluctuations previously noted, can be modified to calculate other periods and percentage rates (Table 3-4-1).

CAUTIONS

- The motivational aspect of bonus programs puts significant pressures on practice owners, managers, and staff (see 2.5 – Motivating the Healthcare Team).
- If the bonus is only a small percentage of salary, it is unlikely to provide a stimulus to extraordinary effort. In large sales-driven companies, normal bonus opportunities for marketing/sales/customer service staff can rise up to 50% of salary, with opportunities to earn more for outstanding results. Bonus standards such as these can generate an atmosphere of powerful motivation, but lofty results may not be annually obtainable.
- Bonus performance measures should be high enough to encourage performance, but not set too low to ensure given attainment.
- When individuals are recognized for results over and above outstanding group accomplishment, non-monetary awards such as gift certificates, vacation weekends, and other perquisites may be offered outside of cash compensation.
- Employers should acknowledge that a raise is a form of individual recognition, and that bonus payments are not a substitute for raises determined in the semiannual or annual review process. Bonuses must be structured in addition to raises and formulated to accomplish the goals of both the practice and the employee.
- There is a potential risk that bonus payments may be due when cash balances have fallen off due to expansion, new hires, equipment purchases, and so forth. The institution of a bonus program necessitates detailed cash budgeting procedures to ensure that there is no delay in paying a bonus as scheduled. There should never be even minor delays in paying staff bonuses.
- Ineffective bonus programs may cause permanent damage to a practice owner's "internal" goodwill.
- Making changes in a bonus program can be a dangerous practice and should be considered only in exceptional circumstances. Too much flexibility in adjusting targets may destroy the motivational value of the program.

3.5. EMPLOYEE-RELATED COSTS

BASICS

OVERVIEW

• Payroll costs and benefits, such as health/life/disability insurance and retirement plans, represent the largest and most obvious employee cost.
• Salary, wage, and other compensation-related issues are covered elsewhere (see 3.1 – Compensation, 3.2 – Benefits, and 3.3 – Wage and Benefit Summaries: The Whole Package). The Benefits section of this book discusses the benefits mentioned above as well as others, including dues, licenses, and paid time off. Continuing education benefits are covered separately (see 3.6 – Continuing Education Expenses, which discusses both off-site and in-house continuing education).
• Good financial and operational control, however, requires recognition and understanding of all employee-related costs.
• Other employee-related costs include:
  ◦ Federal payroll taxes
  ◦ State payroll taxes
  ◦ Worker's compensation insurance
  ◦ Employee staff meetings and events.

TERMS DEFINED

Benefits: Generally indirect and noncash compensation paid to an employee. Examples include health insurance, paid time off, and retirement plan contributions.
Payroll: The amounts paid to employees as compensation for the services provided to the practice.
W-2: Internal Revenue Service (IRS) form called "Wage and Tax Statement" that reports income paid and taxes withheld by an employer for a particular employee during a calendar year.
W-3: IRS form called "Transmittal of Wage and Tax Statements," which summarizes the information on the W-2 s and is filed with the IRS each year along with copies of the W-2 s.
W-4: IRS form called "Employee's Withholding Allowance Certificate" used to determine the amount of federal taxes the employer will withhold from a person's paycheck each pay period.
Worker's Compensation: Programs and laws that exist to protect employees who are injured or become ill while on the job by providing wage replacement and medical/rehabilitation benefits. Employees generally relinquish their right to sue their employer for negligence related to the injury.

ISSUES AND OPTIONS

FEDERAL PAYROLL TAXES

• The IRS website (www.irs.gov) is an excellent source of detailed information about payroll taxes.
• If you have employees in the United States, you are responsible for withholding federal income tax from employee paychecks and forwarding this to the IRS on a regular basis. You must also withhold the employees' portion of Social Security (Federal Insurance Contributions Act, FICA) and Medicare taxes and forward this to the IRS as well. The employer is also responsible for paying a portion of FICA and Medicare taxes to the IRS. Finally, you must pay Federal Unemployment Tax Act (FUTA) on behalf of your employees.
• The amount of federal income tax to withhold depends on the amount of an employee's salary and the number of allowances the employee is allowed to take. Various tables are available from the IRS for manual calculation of these amounts; however, almost all veterinary clinics use a commercial payroll service or purchased payroll software to make these calculations.
• Historically, both the employee and the employer have been taxed 6.2% of the employee's earnings (up to a specified salary level) for Social Security (FICA) and 0.145% for Medicare. There is no salary limit for the Medicare tax. Occasionally adjustments to these amounts are made by Congress for various reasons.
• FUTA is paid only by the employer – the rate is 0.008% of the first $7,000 of an employee's earnings.
• Payroll taxes do not have to be paid by the practice for independent contractors. The general rule is that anyone who performs services for you is your employee if you can control what will be done, when it will be done, and how it will be done. With an independent contractor, you control or direct only the result of the work done, and not the means and methods of accomplishing the result.
• Determining whether or not an individual should be classified as an employee or an independent contractor is not an easy task. Misclassification can have serious legal and financial ramifications for an employer. Federal and state regulations regarding contractor classification can differ. Consult your tax advisor for help with this issue.
• In general, all hospital staff members are employees. The only exceptions regularly seen are relief doctors and groomers.
• Whether taxes are withheld and reported by the practice itself or by a payroll service, the basic requirements for tax and wage reporting include the following actions:
  ◦ Obtain an employer identification number (EIN).
  ◦ Obtain for each employee a completed I-9 form that verifies his or her ability to work legally within the United States.
  ◦ Ensure that each employee has also completed a W-4, the employee withholding form, verifying his or her Social Security number and allowable deductions.
  ◦ Calculate and deduct employees' income tax, Social Security, and Medicare amounts each time the payroll is done.
  ◦ Make required deposits of taxes withheld within the appropriate period as determined by the IRS.
  ◦ File Form 941 (employer's quarterly federal tax return) on a quarterly basis, and Form 940 (employer's annual federal unemployment (FUTA) tax return) on an annual basis.
  ◦ Prepare W-2 s (wage and tax statements) for each employee at the end of the year, and file these and the related W-3 (transmittal of wage and tax statements) with the Social Security Administration.
• Much of this work can be done by an outside payroll service, which greatly eases the burden on a practice.
• If the practice prepares its own payroll and related tax documents, electronic filing is available for many reports, again easing the administrative burden.
• A Form 1099-MISC must also be filed for some individuals who provide services to the practice and are classified as independent contractors. This may include others in addition to the groomers and relief veterinarians previously mentioned. A practice should be familiar with these requirements and file these reports on a timely basis. See the IRS instructions for Form 1099-MISC for more information.

STATE PAYROLL TAXES

• State payroll taxes usually consist of unemployment taxes, but for some states there may be other types of payroll-based taxes as well. Requirements vary greatly by state, and the state agency governing employees should be contacted.
• Most states have electronic reporting and payment options available.

WORKERS' COMPENSATION INSURANCE

• Workers' compensation is generally designed to provide protection for workers who are injured or become ill on the job.
• Workers' compensation programs are regulated by state, not federal, government and thus regulations and benefits vary greatly among states.

Vet-eBooks.com

• Programs are generally designed to pay medical and rehabilitation costs, and replace wages during the period of recovery and rehabilitation. Additional benefits may also be available.
• State laws vary as to whether sole proprietors, partners, and executive officers are covered, so it is essential to investigate this thoroughly through the appropriate state agency as well as the potential insurance carrier.
• In a few states coverage is optional, but the general recommendation is that a business should obtain it because there are often significant protections for employers as well as for the employees.
• It is important to research available plans carefully; premium costs can vary greatly.
• Generally, the contributions that a business pays are experience-rated – that is, the number of claims filed against the business determines the rates. Obviously, good workplace health and safety practices pay off.
• Employees generally relinquish their right to sue their employer for negligence related to the injury although exceptions exist in particular jurisdictions.

EMPLOYEE EVENTS

• Most hospitals provide some kind of employee parties or events during the year, such as a holiday party in December and a softball game in the summer. Some hospitals do much more than this. Some companies (and some employees) consider these events to be a benefit, whereas other employers simply view them as a cost of doing business. Although employees may consider these events to be a fun addition to the work environment and thus a "benefit," these events will not replace compensation and other more traditional benefits in their evaluation of the compensation and benefits package offered by the hospital.
• Although hospital events can help to build relationships and teamwork, there can also be problems associated with them, such as:
  ◦ practice liability for incidents involving alcohol consumed at the event;
  ◦ resentment among employees if too many "required" events intrude upon personal time;
  ◦ an erosion of the distance that should be maintained between managers and those they supervise.
• "Events" can also develop a life of their own, cost-wise. A small December holiday staff party can gradually metamorphose into the social event of the season attended by family, friends, suppliers, the hospital accountant, and the snow-removal people. The reasons for, and benefits expected from, holding or sponsoring employee events should be carefully determined and a balance maintained between the costs and the return on investment.

3.6. CONTINUING EDUCATION BENEFITS

BASICS

OVERVIEW

• Continuing education (CE), both in-house and off-site, also known as continuing professional development (CPD), is one of the common benefits offered employees. Other employee-related costs are covered elsewhere in the book (3.1 – Compensation, 3.2 – Benefits, 3.3 – Wage and Benefit Summary: The Whole Package, and 3.5 – Employee-Related Costs).
• First and foremost, CE should be thought of as an investment in the hospital, and a way of guaranteeing its positive growth and future. If education stops after joining the practice, then a slow but steady decline in the quality of medicine and client service is inevitable. Additionally, employees value workplaces that allow them to learn and grow.
• A positive approach is to acknowledge that all education has costs associated with it, and then to identify these costs, budget for them, and track them appropriately in the hospital chart of accounts.
• Each hospital should develop a written continuing education policy that is included in the hospital employee handbook. This policy should include who is eligible for CE benefits and what CE the practice requires employees to take, how much the practice will pay for direct costs and the related time off and the types of CE that will be covered.
• A well-planned CE program will utilize both in-house and off-site opportunities.
• There are usually different policies for providing and paying for CE for associate doctors and for other team members.
• In regard to paying staff members for time spent in training, if hospital management requires the training, then employees must be paid for the training time. State law varies as to whether or not travel time to and from off-site training must be compensated.

TERMS DEFINED

Continuing Education: Also known as continuing professional development (CPD), the ongoing training of doctors and other team members through conferences, journals and texts, online programs, other live educational programs, and self-study courses.

ISSUES AND OPTIONS

CONTINUING EDUCATION COSTS

There are several types of costs associated with continuing education:
• Registration costs for in-person or online seminars.
• Travel-related costs including transportation, lodging, meals, parking, and other similar costs incurred by participants attending CE seminars outside of the practice.
• Publications, videotapes, audiotapes, and similar materials.
• Speaker honorariums for in-house seminars. Speakers may include staff members reporting on information they have learned from previously attended conferences or animal health company representatives.
• Meal costs for in-house seminars.
• Labor costs: Doctors and staff incur time traveling to conferences as well as attending either outside seminars or in-house training programs. They may also incur time in preparing for or giving in-house training programs.

Reports from both the American Animal Hospital Association and the Veterinary Hospital Managers Association provide an overview of the current amounts given in staff and doctor CE allowances.

CONTINUING EDUCATION POLICY

To avoid misunderstandings, it is essential to have a written policy regarding CE programs. This policy should address the following issues:
• Requirements for attending in-house CE programs.
• Who is allowed or required to attend outside CE programs.
• Types of courses allowed.
• Time allowed away from the practice to attend CE programs (taking state and national licensing requirements into account).
• Pay and expense policies including limits on registration fees, and travel costs (transportation, lodging, meals, parking, and other similar items).
• Expense reimbursement policy, including the form to be used, the need to keep receipts, when reimbursement requests must be submitted, and when payment will be made.
• Any occasion where a meal might include entertainment of others should be cleared with the practice manager or owners in advance.
• The process for scheduling/approval.

The Internal Revenue Service (IRS) has specific rules covering the deductibility of expenses incurred on business trips outside the United States or for "luxury water travel" (i.e., cruises). Consult your accountant for this information, if needed.

Practices may pay some of the expenses directly rather than require employees to front the money and get reimbursed later. This is a much more employee-friendly policy, particularly for those staff members with lower salaries and tighter budgets.

Practices that require CE for staff members and doctors generally pay 100% of the registration fee and reasonable travel expenses. Practices that skimp on these costs send the message that CE is not important in achieving the practice's goals and cause resentment among staff members.

Practices that require CE for employees are required by federal law to pay for the time incurred in attending CE programs for all nonexempt employees. These hours must also be counted in overtime calculations. State law may be more restrictive than federal law, and may require pay for travel time. Laws in individual states can vary considerably and a practice should be familiar with those in the state in which they are located.

Some practices make attendance at CE events optional in order to avoid paying the wages incurred, though they will often pay for registration and travel costs. The small amount of money saved is not worth the loss of education to staff members. When CE is optional, the message sent to staff members is that it is not important to the practice and not helpful in improving medical care or client service. A practice will always gain more than it spends in educating its employees, whether they are doctors or support staff members.

CONTINUING EDUCATION EXPENSES AND THE CHART OF ACCOUNTS

• Continuing education and related travel expenses should be recorded in separate accounts when paid, rather than buried in one catch-all "continuing education" account.
• The chart of accounts should contain a CE master account with subaccounts under it where actual expenses are recorded. Subaccounts might include:
  ◦ registration fees
  ◦ travel and lodging
  ◦ meals and entertainment
  ◦ staff meetings and events
  ◦ publications
  ◦ in-house training.

Registration Fees

• This account should be used strictly for fees charged to attend the conference. No travel costs, publications, or other in-house training costs should be included here.

Vet-eBooks.com

Travel and Lodging/Meals and Entertainment/Staff Meetings and Events

• The travel and lodging account is used to record transportation and hotel costs, including airfare, train fare, bus fare, shuttles or taxis, car rental, tolls, parking, and mileage reimbursement. The cost of meals should not be included in this account, as they must be shown separately on the tax return. If meals are included on the hotel bill, the meal portion should be included in the meals and entertainment account and the hotel portion in the travel and lodging account.
• The meals and entertainment account includes the cost for all food consumed during the CE trip. Most practices do not reimburse doctors or staff members for entertainment (movies, theater, sporting events, etc.) during a trip; therefore, this account is used primarily for meals. According to federal tax law, meals and entertainment costs must be "ordinary and necessary" to be deducted at all, and then are only deductible at 50% of actual cost on the practice's tax return. The practice must retain documentation (usually the receipt from the expenditure) regarding the nature of the event and its business purpose.
• The staff meetings and events account is used to record the cost of food provided by the hospital for in-house meetings or for the costs of staff parties and outings. Food provided for in-house staff meetings as well as the cost of clinic events is usually 100% deductible on the practice's tax return; therefore, these costs are kept in a separate account.

Publications

• This account should be used to record the cost of purchasing books or periodicals intended to further the education of practice members or to be used for research. Audio and video materials are often recorded here as well.

In-House Continuing Education

• This account should be used to record the cost of materials or services purchased to further the in-house training efforts.
• Examples include videos, flip charts, honorariums paid to speakers, and so on.
• Food provided to employees at in-house meetings should not be included in this account. Those costs should be included in the staff meeting and events account.

LABOR COSTS

Salaries or wages paid for traveling to conferences, attending conferences, or preparing or giving seminars should be recorded in the practice's normal payroll accounts.

EXAMPLES

N/A

CAUTIONS

All continuing education is worthwhile, but the tax deductibility of CE events is well regulated. Contact a tax professional and review the resources of the IRS (www.irs.gov) for specific and current information.

3.7. EFFECTIVE STAFF RECRUITMENT

BASICS

OVERVIEW

From determining staffing levels to creating proper job descriptions, identifying suitable candidates, conducting interviews, negotiating the hire, providing proper orientation, and carrying out training, staff recruitment is a big investment. Getting it right, however, is the key to practice success.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

Ultimately, you want to build a practice that is known for being a great place to work, that attracts applicants on a regular basis and affords you the ability to hire only when you choose to and from a pool of qualified and desirable candidates. But becoming an "employer of choice" takes time and a plan.

If you view hiring as an ongoing part of operating your practice, similar to the need to purchase inventory on a regular basis, you will have much greater success attracting, screening, and hiring the right individuals to carry out your mission. When we view an aspect of running our practice as a valuable component, we strive to employ the latest techniques available to help us get the most out of our efforts. The same should be true with human resources in general, and hiring in particular.

To help illustrate this point take, for example, how you manage inventory. You periodically shop vendors, negotiate rates for goods and services and evaluate price, customer service, delivery, ease of purchasing, and so on, to get the best margins out of this revenue-generating area of your practice.

Hiring methodologies and techniques should similarly continue to be honed, sourced, evaluated, and updated – not only to stay current with ever-changing employment laws, but to keep you ahead of the curve in terms of employing the best personnel possible. They *are* your practice. We tend to pay lip service to the notion that staff can make or break our practice, yet we often simply view staff as an expense on the profit and loss statement. Rarely do we see a practice approach the hiring and managing of staff with the same sophistication and commitment they do to the medicine. Yet the reality is the value of your team directly translates into the success of your practice and the quality of your care, and also the professional and personal fulfillment of working in your chosen profession.

Who exactly then do we want to hire and how do we find them? To answer these questions, you must first go back and revisit your mission statement and core values if you have them (see 14.9 – Mission and Vision Statements). If you have not defined these yet, do so, as it will help you write a job description that encompasses more than just a duties checklist – but an actual working job description of both the hard and soft skills required for each position that is designed to guide you in this pursuit.

If you need to hire a technician for instance, and you place an ad, receive resumes, interview candidates, and select one, you may get lucky and find a great employee. But without a defined process to attract, screen, evaluate, hire, orient, train, set goals, mentor, and manage them, your chances are significantly less. If, on the other hand, you follow these guidelines, you will greatly increase your ability get the right people for the right jobs, nearly every time.

THE HIRING CYCLE

- Identify need for a hire. There should be some defined metric by which you determine the need for another individual in your practice.
- Determine skills/level of personnel. What skill set(s) will fill the gap?
- Is there someone in-house who can be promoted?
- Is there an opportunity to shuffle responsibilities and provide a career growth opportunity for someone and look to hire something slightly different than originally intended?
- Write/review job description. Reevaluate and review job descriptions on a regular basis.
- Determine where to source candidates. Based on the type of candidate you need, determine where you can find these individuals.
- Develop a process for screening applications. Who will screen and how will you evaluate their ability to be successful in the particular job open and fit into the dynamic of your team?
- Decide if the team will be involved in the hiring and selection process, and if so, which team members.
- Create an advertisement that reflects the personality of the practice and differentiates you from others. Think about how this job should be portrayed.
- Determine where to place the advertisement that is most likely to generate the types of quality candidates you seek.
- Place the advertisement. Begin the process to attract candidates.
- Respond to applicants in a timely manner. Do not let good candidates get away. If they have applied, evaluate them and close the deal before anyone else does.
- Evaluate candidates. What is the evaluation process? Review resumes and CVs, online applications, initial screening calls, in-person interviews, working interviews, reference checking, personality tests, and drug screening. Who participates in the process? Is it uniform for all positions?
- Make offer. Offers of employment should be delivered in writing (pending reference checks and drug test if not yet completed) after making an offer in person or by telephone to clearly spell out exactly what the offer includes. Start with a clear offer and defined expectations.
- Obtain a signature accepting the position and provide a copy of the actual job description with the acceptance or on the first day of employment.
- Inform new hire of the orientation schedule. How will the new employee be integrated into the team?
- Develop a training schedule and specific goals for the new team member (see 3.10 – Staff Training). What are the expectations for how soon they can and should be productive? What is the training schedule like? Will there be materials they can use for studying. Are there tests at specific intervals?

Vet-ebooks.com

• Have a mentor program in place. Is there a point person, direct supervisor, or coworker who is assigned as a trusted guide to assist in getting the new team member up to speed (see 3.17 – Mentoring)?
• Set feedback time line. What is the feedback time line? Who will provide it?
• Inform about recruitment bonus. What incentives do you offer your staff to bring in new team members?

To help develop this hiring process, ask yourself the following:
• Who do you want to hire? Describe the behaviors, characteristics, and skill set.
• Where are you going to find them? Where are these types of individuals? Look outside of the usual spots when appropriate.
• How will you know you've found them? Can the team help develop evaluation criteria?
• How do I know what to pay them? What is fair and competitive for the highest caliber team member?
• What type of orientation should they go through? How much is their responsibility and how much the practice's?
• What and how much training should we give them? How much do we invest before we let someone go who is underperforming?
• How should we manage them and provide feedback? Who should be involved in this?

HELPFUL TIPS TO HIRE THE RIGHT PEOPLE

• Front office personnel can be found anywhere you get good service – retail store, coffee shop, hotel, human medical office.
• Technicians can be found through the local Veterinary Medical Association paraprofessional chapter, recommendations from technician instructors at local schools, Regional Occupational Program counselors in local high schools and community colleges, university teaching hospitals, as well as many online resources.
• Use your team to help evaluate, interview, and hire new team members. Staff will be more invested in the success of new members and help them get up to speed more rapidly if they have participated in the selection process.
• By following this process, which should continually be honed, you may indeed become an employer of choice. The benefits to you and your practice will be many, including:
  ◦ lower turnover – less burden on the team to cover "open" positions,
  ◦ less overtime – huge savings in money and burnout,
  ◦ lower recruitment costs – keep the pipeline primed with better staff morale,
  ◦ more consistent delivery of services – creates trust, credibility,
  ◦ stable environment – comforting to clients, satisfying to employees,
  ◦ easier to recruit and integrate new staff – you choose out of certainty, not desperation.
• Celebrate – what you are doing is working!

THE INTERVIEW

Interviewing is an art form and one that must be developed. The clearer you are about what you are looking for in a candidate, the easier it will be to determine if they are a good fit.

Preparation is critical to a successful interview. In particular, you should have detailed knowledge of the position for which the candidate is being considered. The interview itself should be private and conducted in an area without distraction or interruption. You should maintain control at all times; keep the questions on target and progress at a steady pace.

Try to draw the candidate out and encourage discourse, but do not let them ramble along tangents or take too much time in chit chat not related to the job.

Establish rapport that encourages the candidate to open up and respond more spontaneously than one would in a regimented question-and-answer format. This is important as the more comfortable the candidate feels, with confidence in the interviewer, the less guarded their responses will be. Information gleaned in this manner is likely to be more reflective of true feeling and more candid as to shortcomings.

It is important to ask many different types of questions.

Initiative Questions

• What career accomplishments are you most proud of?
• How do you feel about being closely (or loosely) supervised?
• What did you like/dislike about your most recent job? What did you do to change it?
• What do you find satisfying about this kind of work?
• What professional situation has provided the greatest challenge to your personal integrity?
• What are the three most important things to you in your next position/organization?

Motivation Questions

• What are your goals for the next two years? Next five years?
• What have you done to continue your education that is related to your career?
• What does "job security" mean to you?
• Which is more important to you, money or job satisfaction?
• If you were hiring for this position, what would you look for in a candidate?
• If you were working on two projects and could either complete one at 100% or both at 80%, which would you do? Why?

Attitude Questions

• What job values are important to you?
• How do you feel about doing routine work?
• How do you manage stress and what do you do to find balance in your life?
• How do you make important decisions?
• What characteristics do you look for in a supervisor?
• How do you deal with feedback or criticism from a supervisor?
• What do you value most in your relationships with coworkers?
• In looking at the job description, which duties would come easily to you, and which ones would be a stretch?
• What type of relationships and/or people do you find most challenging to work with?
• What is your approach to setting and keeping boundaries?

Personal Questions

• Why are you interested in working for us?
• What is your experience working with culturally diverse people?
• What do you know about the job you are applying for?

Management-Specific Questions

• What would you do in your first 30 days here?
• How would you create and nurture your relationship with other members of the team?
• What's your best strategy for acquiring new clients or building a referral base of DVMs (if a specialty practice)?

Vet-eBooks.com

3.7. EFFECTIVE STAFF RECRUITMENT

• Describe a situation in which you had to calm an irate referring veterinarian or a difficult client. What was the situation and how did you handle it?
• Which would you say describes you best: accurate, organized, or able to complete tasks?
• What do you consider the most important function of a manager/supervisor in a veterinary practice?
• Your team wants to implement a new idea that you don't like. How would you handle this situation with both management and your staff?
• How would you describe your leadership and management style?
• How would you collaborate with referring (if applicable) veterinarians, management, staff and others to meet the practice's goals?

EXAMPLES

If you have members of the team participate in the interview process, it may be helpful if they share the practice's core values and ask some situational questions related to them.

If teamwork is one of your core values, an example question might be: "Describe how you might address a team member who seemed unwilling to pitch in and help with a particularly difficult task or one that is not considered all that interesting."

If respect is a core value, an example might be: "If you felt one of the doctors repeatedly disrespected you by criticizing you in front of others or always went to others over you to assist, what would you do?"

The goal is to find out not only what that particular core value means to them, but how they would act in accordance with the behaviors it specifies. You will get to see how they think on their feet, which is akin to how they might react in a typical work situation.

More importantly, you will see an example of how they communicate, the approach they take, and how your team would react to it. It may also demonstrate their level of self-awareness and business maturity.

CAUTIONS

• **Keep staffing forecasts current:** Even if you are a small practice, you need to think down the road for the next two or three years to anticipate what your hiring needs may be. Projections should be evaluated every few months to adjust for changing conditions and the changing state of your business. Keep your eye on long-term trends within the labor market segments you will need to be hiring from. Some types of employees will be particularly hard to find, so a specific and targeted effort will be required.
• **Base hiring plans on milestones, not on time:** Never tie your staffing plans to the calendar. The passing of six months is not what will require you to hire new employees, nor will some arbitrary revenue number. Know what the triggers are in your business that will necessitate more employees. For example, it could be a certain number of clients, taking on more space, or production levels for doctors. And do not forget your need for supervisors and support staff. Know how long it will take to recruit, hire, and train new employees for each position you are planning to hire so they can be ready to work when you really need them. Hiring will take longer in a tighter market.
• **Measure your employment triggers:** Work with your bookkeeper or administrator to give you quantitative reports on your hiring triggers, and insist that you get these reports regularly. You need to have the timing of the hiring process accurate, so the chances of not having staff to support growing demand are minimized.
• **Never just hire warm bodies:** Hiring someone just to fill a role rarely works out. Mediocre hires make mediocre employees at best. This will only postpone hiring the right people and force you to get rid of the dead wood you just hired before you can hire the people you really need. This will actually hinder your ability to grow. And carrying this dead weight will pull your current staff down.
• **Keep current on wages and salaries:** The tight job market for some positions will put some upward pressure on pay due to supply and demand. Stay competitive in your pay and create opportunities for staff to take on more responsibility to earn more, either in salary or bonus.
• **Keep pricing current with increases in labor costs:** Increase prices to cover increases in labor costs. Do not let your pricing lag too much or cash flow will become a major issue as you grow due to shrinking profit margins. But remember, raising prices will not solve other issues, so do so based on market trends and actual costs, as well as a competitive analysis.
• **Don't take your team for granted:** The single best staffing tool you have is retaining the good employees you have right now. Create a culture that makes the best employees want to stay with you and encourage others to join. You may have to pay a little more than you would like to, but it is much more cost effective than constant hiring and training.
• **Never stop recruiting:** The best way to avoid being understaffed is to consider hiring an ongoing operational initiative. You want the best ones out there and there is no telling just when they will appear or make themselves available.
• **Don't let a good candidate get away:** In a tight job market especially, speed is of the essence. Good candidates are hard to come by and everyone is competing for them. Be prepared to move quality candidates through the interview process quickly. If you know they fit your needs, make an offer before they leave your practice. Do not act desperate, but do act with a sense of urgency.

COMMON INTERVIEWING MISSTEPS

• **Poor preparation:** Do your homework on position specifications before the interview. Avoid overgeneralizations about the job and the company.
• **Lack of focus:** Have a plan for focusing on specific areas of inquiry with a prepared list of questions.
• **No documentation:** Listen. Be open to hear what is said. Know what you are after and take good notes so you can properly evaluate if they meet enough criteria to warrant an offer or perhaps a second interview.
• **Leading questions:** Do not project the desired response to your questions. Keep your opinion to yourself. This is about the candidate and if you give them your opinion, the rest of their answers may to be satisfy you. Do not dominate the conversation. Be a good listener and use silence. It is difficult, but let the applicant be the first to break the silence.
• **Prejudices and stereotypes:** Set aside your prejudices and personal biases. Do not let them influence your judgment. Do not, for example, be misled by the candidate's appearance. It is an important aspect of how they present themselves but may be less important for some roles. Or, if they are qualified for the job and you would like to consider making an offer, do so along with the dress code or employee handbook so they can determine if the standards at your practice are ones they are willing to meet.

Vet-ebooks.com

• **Theoretical questions:** Do not ask too many "What if" questions. Instead, skew questions toward specific behavior patterns, responsibilities, accomplishments and methods used in getting results. You want to assess real-world situations that you know they will face at your practice.
• **Chemistry:** Interviewers do not always hit it off with candidates. Do not let poor personal chemistry cloud the interview as their style may simply be very different than yours. On the other hand, be careful when the chemistry is very good as this can sway your judgment significantly. In any case, be sure to thoroughly evaluate the candidate's qualifications.
• **Armchair psychology:** Do not take on the role of amateur psychologist and attempt to "figure out" what they are all about. How they present to you is the best you will get.
• **It is ok to be tough:** Do not shy away from asking the hard questions. Similarly, ask follow-up questions. Details should be developed rather than overlooked. "Why?" is an invaluable probe and should be used frequently. Or, "Tell me how you felt about that?"
• **Halo effects:** Sometimes an interviewer will judge by inference from answers not thoroughly given by the candidate. This behavior tends to "wish" someone into a position. Again, follow up and seek specific answers. Have data to support your assessments and conclusions. There is a tendency, if you really need to hire someone, to overlook what I call the "pink" flags. We all know what a red flag looks like, but your intuitive nature knows exactly what a pink one looks like. Listen to it and move on.

3.8. Screening Potential Hires

BASICS

OVERVIEW

• The talent you recruit into your practice will ultimately determine its success or failure. The foundation for creating a strong team and a growing business is people who are committed, engaged, effective, and accountable. There is a lot you can do as a manager, coach, and leader to help people reach their full potential, but hiring people with a lot of potential is the first component of that process.
• The screening process is designed to uncover reasons to reject a candidate and ultimately find one that gives you the best chance at bringing a superstar into your practice. It is about using a systematic approach rather than relying too heavily on gut feel or likability.
• Conducting an effective screening process for potential hires can seem like a daunting, complex task at first, but familiarizing yourself with and practicing this process will make it feel comfortable and effective over time. The investment that you make in developing, training, and practicing this kind of process in your hospital will pay huge dividends in the quality of the hires that you make and the reduced number of performance issues and turnover that you have with your staff.

TERMS DEFINED

Behavioral Interviewing: A job interviewing technique in which the applicant is asked to describe past behavior and experiences to help determine appropriateness for the current position.

ISSUES AND OPTIONS

When identifying talent for each role within an organization, hospital owners should do two things:
• Create a detailed profile for what you are looking for in each role.
• Develop a screening process that allows you to systematically identify the kind of individuals who will best fit your business and each role within the hospital.

FIT, IMPACT, AND POTENTIAL

There are three areas – fit, impact, and potential – that hospital owners should evaluate when bringing a new employee into the business. It is important to be conscious of what is needed for the specific role in each of these areas.

Fit (Alignment)

• Fit is an overall measure of how the candidate will complement the culture of the hospital, focusing more on the desired culture than the current culture of the hospital.
• This is a challenging area to evaluate, but one of the most important indicators of success.
• Fit is best measured by asking questions about the behavioral drivers of the individual and aligning them with the kind of hospital you are trying to build. Consider the following examples:
  ◦ If you are considering a technician who prefers not to deal with the clients and prefers working only with animals, and you are simultaneously attempting to build a hospital in which technicians are a critical part of the exceptional client experience, this particular candidate would not be a good fit. Many practices value experience over fit and this can lead to expensive hiring mistakes.
  ◦ If you are considering a an associate (employee) veterinarian who specializes in orthopedics but the profile you have created for the role under consideration involves someone who can create excitement around dental procedures in an effort to grow that side of the practice, this candidate may not be the best fit.
  ◦ If you need an associate in the practice who can help lead, manage, and teach others, a candidate who believes that their job is solely animal care is not a good fit.
• It is important to remember that the candidates under consideration are not necessarily "good" or "bad," nor are they "right" or "wrong" in their beliefs and interests. This is about degree of fit with your hospital. Hiring someone who does not align with your needs and your culture will ultimately lead to disappointment.

Impact

• Impact is a measure of the results the candidate has achieved in the past and the result he or she is likely to achieve in the future.
• Results can be measured in a number of ways. They can certainly be financial, but in veterinary medicine, more often than not, we are hiring people who have achieved results in areas such as technical application, execution, effectiveness, and problem-solving.
• The challenge that comes with this kind of evaluation is finding the actual results the candidate has caused, rather than the candidate's perception of the results he or she has caused, or even worse, the results the candidate would like you to believe he or she has caused.
• In order for you to understand the impact that this candidate will have as part of your hospital, you must have a clear picture of both the positive and the negative impacts the candidate has had in the past.

Potential

• Potential is a measure of the growth that an individual would be expected to experience and the increase in impact that an individual might be capable of over time.
• This is largely examined by exploring areas such as the candidate's goals, desires, and future picture of him or herself as part of a hospital or business.
• It is critical for the successful future of the hospital to hire people with significant potential, who will be able to grow as individuals and simultaneously help the business grow. It is the hospital owner's job to help employees fulfill this potential, but to do that, you have to understand what currently exists, and the possible upside for the business.

Vet-eBooks.com

3.8. SCREENING POTENTIAL HIRES

SCREENING

Screening candidates is about understanding the kind of person you need, not just finding someone who can fill the gap. You should prepare questions that are systematic and create a real picture of the individual. These kinds of questions will help you make the right decision when bringing talent into your business.

The screening process should help you find reasons not to settle for talent that will not grow your practice or make it stronger. As long as you are consistently recruiting talent, and talking to a group of possible superstars to begin with, screening is about removing candidates from consideration until you are left with the best fit for your hospital.

BEHAVIORAL INTERVIEWING

When evaluating a candidate, it is important to use a behavioral interviewing process and ask questions that will go past the surface and the picture the candidate wants to create. This will offer you a much more realistic view of the candidate's fit, impact, and potential.

Behavioral interviewing is based on questions that are difficult to prepare for, and on diving deeper than the story that candidates typically create in an interview.

The key in behavioral interviewing is to get specifics that may be buried in the stories, and to look for inconsistencies or vague responses that may indicate the initial response sounded good but did not contain any substance behind it, in which case the candidate was simply telling the hiring manager what he or she wants to hear. This is not to imply that most people lie and embellish, but the simple truth is that in an interview situation, candidates attempt to present the best possible view of themselves. Hiring managers need to make sure they are seeing the most accurate view, not necessarily the most favorable.

Consider asking questions such as "tell me an instance in which you had to work effectively as a team member to accomplish a goal," or "tell me about a time where you overcame a personal error in judgment." This can tell you a lot about a candidate.

In essence, the behavioral interviewing process is designed to focus on specific instances, and help hiring managers move past rhetoric and on to actual behaviors that can be evaluated.

WORKING INTERVIEWS

Many hospitals use working interviews for staff members, especially technicians and receptionists so that other members of the team can weigh in on their performance and their fit as a potential member of the hospital. This often involves the candidate coming into the hospital to "work" for a day or a portion of a day. Many hospitals that use this process, though, fail to get enough specifics on why the candidate might or might not be a good fit. They get responses that sound similar to "I liked her" or "I think she will do fine." It is important to apply the same kind of discipline to this part of the interview process that we do to the formal interview.

Before conducting a working interview, check with your attorney and human resources consultant to ensure that this is legal in your jurisdiction, and what safeguards might be necessary.

Those participating in a working interview should be asked to think about specifics during the interview day and complete an evaluation form that helps the hospital compare candidates and have some more objective data to work with in making a hiring decision.

Some of the questions that might be present on the evaluation are:

- What were some of the specific strengths that you observed as you worked with the candidate?
- What were some of the specific weaknesses that you observed as you worked with the candidate?
- What impressed you about the way the candidate interacted with the team?
- What were some of the specific behaviors you noticed that would indicate the person would work well with others?
- What areas do you think the candidate would struggle with in the role?
- Overall do you think this person would raise our level of value to the pet and the client, keep it the same, or lower it?

It would be even more helpful to create a rating form associated with the evaluation that would allow each person participating in the working interview to rate the candidate from 1 to 5 on specific behaviors such as greeting clients, eagerness to learn, ability to listen, comfortable presence, pleasant demeanor, confidence, and other dimensions that you would like your team to weigh in on. Although these are certainly subjective in nature, the data received from several evaluations that can be compared over several candidates will create a numerical picture that we can use to more effectively evaluate candidates and remove some of the guesswork from the process. It will also provide a glimpse over time at whether or not we are improving our selection process based on whether higher quality candidates are progressing to the working interview part of the process.

EXAMPLES

The following describes an associate veterinarian role as an example but each role in your hospital should have a complete profile created so that you have given thought to the competencies you want to evaluate and have created questions to investigate those areas of expertise. Also remember that this is merely an example and you should create role profiles that fit your hospital, your desired culture, and your vision of the team you want. The example will not delve into evaluating the medical expertise of this role because that is something that most practices fare better at and it is often not where the issues arise when there is a performance problem or a poor fit.

ASSOCIATE VETERINARIAN EXAMPLE

Role: Associate (Employee) Veterinarian

Competency Examples

In this section of the profile, you will want to create a list of competencies that you want to focus on during the screening process, and then elaborate on what each competency means specifically at your hospital. For this example, there is a sample list of competencies, and some elaboration in the "Teamwork" section.

- Fit
- Communication
- Impact

Vet-eBooks.com

3.8. Screening Potential Hires

- Patient care
- Client service
- Potential
- Leadership
- Teamwork:
  - Integrates as part of an animal care and client care team that works together to deliver exceptional medicine and service, regardless or title, role, or level of experience.
  - Looks for opportunities to support other members of the team in their duties and to help each team member develop and grow in their roles and effectiveness.
  - Continually acts as someone who improves the overall value of the team to the pet, the client, and the hospital.
  - Works to resolve differences on the team and serves as a positive role model for effective team operation.

Questions

In this section you will want to create questions that will delve into each competency. For this example, we have built questions that will measure the candidate's strengths and weaknesses for "Teamwork."

- Teamwork questions:
  - Tell me about a time when you have had to work with an ineffective support team in your job as a veterinarian. What happened and how did you overcome that challenge?
- Follow-up questions: To be used if the answer is too brief or if you do not get clarity and need to dig deeper:
  - What were the biggest issues you faced with the team effectiveness?
  - What were the outcomes of that poor performing team?
  - How did the team performance affect your individual performance?

Notice how we are creating the possibility with the questions that the candidate might elaborate on how poor the team around them was or how they might have been more effective in their role if they were surrounded by a better supporting cast. If a candidate ever places blame on others for their lack of success and does not recognize their own role in improving the outcome, it should be considered an immediate red flag and the candidate should be removed from consideration for employment. We cannot build a strong hospital with team members who focus on blame or the failure of others. Our goal for this competency is to find someone who realizes they are responsible for their own success and can also contribute to the success of those around them. We want individuals who focus on the solutions to poor team performance and become part of that solution, not just someone who is able to articulate what others did wrong.

- Have you ever had a consistent performance issue from a particular team member on a team that you have been part of? How did you handle it? What was the outcome?

Follow-up questions:

- What did you do to help them improve performance?
- How did you shift your behavior to manage the poor performance?
- How would others describe your performance as a team player?

Follow-up questions:

- What are some examples of you being a great team player?
- What are some examples of times when you didn't perform well in that regard?

Also consider other follow-up questions that you might use based on the answer that the candidate gives to your questions. An example might be if a candidate says something like "I tried to coach her to improve in that area" a good follow-up might be: "Tell me more about how you coached her and what the outcome of those discussions were." You want to be sure that you dig deep enough so that you get to actual facts and move past the generalities that are so easy to convey but give you little real data on which to make a hiring decision.

Rating Scale

For each competency you should develop a rating scale that might look like the one provided below for "Teamwork." The reason for doing this is that if do not have a systematic way of evaluating how candidates did in interview you may rely too much on what you can remember rather than an organized comparison. A rating scale also allows you to compare outcomes from multiple interviewers using some common guidelines, so you remove some of the guesswork and vagueness from the process.

Teamwork Rating Scale

1–2	The candidate demonstrates a perception that the team is there to support them as a doctor rather than them being part of a team built to support high-quality pet and client care The candidate places blame on others for effective teamwork without understanding their own role in making it better
3–4	The candidate accepts some responsibility for the effectiveness of the team but still focuses largely on the poor performance of others The candidate realizes that there are some things they might do better in the future as part of a team and is candid about mistakes they have made in the past as a team member
5	The candidate can demonstrate past specific examples of how they have contributed to strong team performance The candidate believes that their own behavior is the first place for them to look when a team is not performing well The candidate accepts responsibility for their role in helping others on the team improve and works to effectively coach, mentor, and serve as a role model for effective teamwork

CAUTIONS

- It is crucial that you practice this kind of interview before you engage in it. Working through the questions with others in the practice will be valuable for anyone in the hospital who will be conducting interviews. It is helpful for teams to role play this kind of discussion to get comfortable with follow-up questions and the experience of digging deeper into specifics with a candidate.
- Most managers hire people that they like, meaning they select people they might like to meet at a party or have dinner with. This is one of the biggest mistakes a hiring manager can make because it often means that you will hire someone because they share the same likes and dislikes, and even the same strengths and weaknesses, not because of the role profile or the hospital's needs. Businesses thrive on a collective set of people who complement one another, not people who reflect

Vet-ebooks.com

each other. Everyone should share similar values, but not necessarily have similar strengths and experiences.

- Another common mistake practice managers and owners make is waiting for a job opening before beginning the recruiting process. You should constantly be interviewing and looking for people who could help the business to grow. Spend time developing a network of exceptional individuals who might someday be part of the practice. Even if you do not currently have an opening, these networking conversations can help in two ways: (a) they create a broader picture of the talent pool, offering a different perspective on what good looks like, and (b) they prevent you from hiring a warm body in an instance where the current opening is critical and time sensitive. One of the biggest costs incurred in veterinary medicine is replacing individuals who do not fit, or worse, putting up with bad hires we made because we thought speed was more important than accuracy.
- It is more common for a hiring manager to consider what a candidate needs to be able to do to execute a job in the hospital, than to consider how a candidate needs to think. For example, experience as a veterinary receptionist gives very little indication as to how well someone will help create exceptional client service in the hospital. Yet direct experience is what most people look for when hiring a receptionist. Hiring for experience is only a small part of the equation. Many times, your next-phenomenal receptionist worked previously as a restaurant server or a retail salesperson. Having previously done the job is rarely an indication of performance on the job, it is merely a sign that the candidate was not a failure and not that the candidate was a success. Hiring managers need to look for superstars, not "adequate" employees.

3.9. STAFF ORIENTATION (ONBOARDING AND INTEGRATION)

BASICS

OVERVIEW

• Retention of employees in the United States is challenging: one in every four workers chooses to switch jobs after one year, and almost half of hourly workers exit after just four months.[1,2]
• Turnover within the veterinary profession exceeds the national average for all industries.[3]
• Veterinary customer service representatives, veterinary assistants, and kennel attendents collectively experience turnover at a rate of 44%.[3]
• Veterinary technicians experience turnover at a rate of 35% compared to associate veterinarians, at a rate of 20%, and practice managers, at a rate of 13%.[3]
• Low starting salary, minimum benefits, unmet expectations, and inability to grow within the organization are reasons that are commonly cited by veterinary employees for trading one position for another.[2,3]
• These reasons potentiate the revolving door phenomenon at veterinary practices throughout the country: employees come and go, resulting in a vicious cycle of new faces that do not last.[4]
• Successful veterinary practices recognize that hiring employees is not simply about filling vacancies: hiring is a long-term investment.[2,4]
• Team members are assets that need to feel welcomed into the fold on or before day one of employment. However, onboarding is not a one-day event.[1]
• Successful onboarding requires an extended organizational commitment to each employee to create a customized "fit" and to facilitate his or her growth within the company.[1]
• The employee that feels appreciated is more likely to experience job satisfaction and is more likely to be retained by the practice.[1]

TERMS DEFINED

Mentor: An experienced individual within the organization who is assigned to help the new employee navigate the culture and flow of the workplace, as well as manage office personalities and professional relationships.[5]
Onboarding: The process by which new employees are oriented to their role within their place of employment.[6]
Stakeholders: Individuals within the organization who contribute significantly to the integration of a new employee and set the stage for success.[5]
The Four C's of Onboarding: A memory tool used to recall four important content areas to include in the onboarding process: Compliance, Clarification, Culture, and Connection.

ISSUES AND OPTIONS

WHAT DOES ONBOARDING INVOLVE?

Onboarding is a process. It begins once the candidate has accepted the offer of employment, but before the new hire reports for duty. Reaching out to the new hire by telephone or email to welcome them aboard reinforces to the candidate that he or she made the correct decision. New hires are excited about the prospect of employment at your practice. Capitalize on their excitement by emphasizing that they are wanted.[7]

The second phase of onboarding begins on the first day of employment. This phase is your opportunity to provide the new hire with resources that are essential for him or her to succeed.

Successful onboarding translates into a new employee who feels welcome and prepared to work.[8] It is facilitated by taking care to incorporate "the Four C's"[1]: Compliance, Clarification, Culture, and Connection.

Compliance

• Compliance is the most basic task associated with onboarding: it involves educating the new hire on the practice's policies and protocols.[1]
• It is about providing training in the day-to-day operations of the practice, with emphasis on legal regulations, to which employees must adhere.[1]
• Compliance training fulfills a basic need: the new hire learns the rules of the trade. However, compliance does little to clarify the new hire's role.

Clarification

• Clarification is specific to the new hire. Whereas compliance training is similar for all new hires across the board, clarification focuses on the individual employee. It helps the new hire to understand his or her role as an individual and as a team member.
• Clarification also sets clear expectations.[9] When new hires know what is expected of them, they are more likely to feel at ease, comfortable, and confident with their assigned tasks.[9]
• Although clarification helps the new hire to understand his or her place within the practice, it does not make clear the practice culture.

Culture

• Culture is about understanding practice norms: what is typical and atypical for the practice.[1,10]
• It includes the unspoken rules as well as what is actually said about the practice's shared views and ideas.[11] Hidden agendas are a part of culture, and culture is defined by how people act:
  ◦ Which behaviors are acceptable?
  ◦ How is teamwork viewed by the practice? Is collaboration welcome or forced?
  ◦ How are leaders perceived versus followers?
  ◦ Who is the "go to" person?
• In order to fit in, the new hire must understand the organizational norms. Without this sense of belonging, the new hire will remain an outsider.

Connection

• To facilitate an understanding of culture, you should establish and reinforce the new hire's sense of connection to the rest of the group.
• Connection is about forming relationships and networks that strengthen the bond the new hire feels toward the practice.[1] New hires need to feel accepted and respected by their colleagues.
• When professional ties are not established and cemented, onboarding is more likely to fail.[1] This is because social integration is a key element of day-to-day practice.
• Social integration does not have to be elaborate. It can be as informal as arranging a meet-and-greet, over lunch or coffee, to introduce the new hire to the team.[1]
• You are responsible for initiating connections between team members; however, ultimately it is up to the new hire to actively build these bonds.[1]

When you engage all four C's of onboarding, you take a proactive role in orienting your new hire. In the veterinary profession, only about one-fifth of practices ever achieve this.[1] More often than not, culture and connection are dismissed as inconsequential when in fact they are instrumental to assisting a new hire's transition from being an outsider to a member of the team.

HOW CAN YOU FACILITATE THE TRANSITION OF YOUR NEW HIRE INTO YOUR PRACTICE?

The mnemonic "EASE" outlines an effective strategy for you to facilitate the transition of a new hire into your practice.[5]
• **"E" for encourage:** Encouragement of the new hire will increase his or her confidence. Confident employees feel more capable of performing the tasks to which they have been assigned. They may take on more responsibilities sooner because they feel ready and supported.

Vet-eBooks.com

3.9. STAFF ORIENTATION (ONBOARDING AND INTEGRATION)

Encourage new hires to have a voice. Encourage new hires to own their role. Empower them to ask questions and praise their attempts to come up with their own solutions.

- **"A" for align:** Align team members with the new hire so that the new hire is supported and everyone is on the same page. Assign projects that facilitate teamwork and encourage unity. Consider the stakeholders for the practice and involve them in onboarding. Giving them roles allows them to be an instrumental part of the process and to work toward successful integration of the new hire. Identify one or more key stakeholders as mentors. If stakeholders feel that they are a part of something, there is more likely to be buy-in.
- **"S" for solve:** Keep your eye out for potential problems and resolve them before the spark becomes a blazing wildfire. Think of yourself as a fire extinguisher. Do not allow conflict to progress to the point that it is out of control. Intervene when necessary to regain control and order amidst the team. For example, if one team member is consistently isolating the new hire, do not expect the new hire to take the heat. Intervene on behalf of the new hire and work toward resolution by addressing the issue before it becomes blown out of proportion.
- **"E" for end, as in end distractions:** Keep the new hire focused on what matters most in the moment. Think of a racehorse with blinders. We all need to block out distractions from time to time. Help the new hire to decipher what is and is not important so that s/he can focus on the task at hand.

EXAMPLES

- Consider how you treat your customers, and treat your new hires accordingly.[5,12] Just as you might ask yourself, "What is it that my customer wants?," ask, "What do my new hires prioritize?" Once you have identified their needs and aspirations, determine how you can contribute to their goals. Valued employees are more likely to demonstrate company loyalty and commitment to practice goals.
- First impressions go both ways. Just as you expect your new hire to report for duty with a positive attitude and the appropriate attire, your new hire is evaluating you and your team. Do what you can to make a good first impression.
- Day one is not about operational convenience. It is about what you can do to assist your new hire as he or she settles into the new routine. Make eye contact. Facilitate interactions with team members. Invite questions, and make the time to answer them. After all, day one impressions are long-lasting.[5]
- Meet face-to-face at predetermined intervals to "check-in."
- Provide constructive evaluations at 30, 60, and 90 days on the job to give feedback to the new hire about his or her performance and to align expectations.

CAUTIONS

- Avoid the tendency to mark a new employee as a "bad hire" as if the employee is automatically to blame. Ask yourself if it is possible that your practice inadequately trained the employee and failed to set him or her up for success.[13]
- Do not leave it up to the new hire to "sink or swim" and hope for the best. Instead, give the new hire the tools to tread water so that he or she can successfully transition into the practice routine.
- Do not dismiss onboarding as a waste of time. On the contrary, onboarding saves time. An investment in employees early on pays dividends in the form of employee retention, even if the initial input is time-intensive.[14]

3.10. STAFF TRAINING

BASICS

OVERVIEW

• On almost every practice management survey, veterinary practice owners and managers rank staff training as one of the most challenging areas of practice management. This is no surprise. Most veterinary practices are small, labor-intensive businesses. They do not have formal human resource and training departments, and yet veterinary staff and doctors need to be highly trained to provide quality patient care and client service.
• Staff training can be an overwhelming proposition. Hospital team members are usually already very busy and there are so many training needs to think about – employees in different positions have different training needs; new employees have orientation and skill training needs; experienced employees have unique developmental needs; and practice changes in products, procedures, and technology create ongoing training needs for everyone.
• On the other hand, well-done training can improve staff confidence and productivity, build employee loyalty, and provide a competitive advantage in attracting and keeping good staff and doctors. It is a good and necessary investment, and the best companies usually allocate at least 2% of their revenue back to training. Comparable figures for veterinary medicine are not available, although it is conventional for hospitals to pay for at least some ongoing continuing education for their doctors. Most also invite industry representatives to provide in-clinic seminars for their staffs. Compared to industry, however, there appears to be an opportunity in veterinary practices to make training a more formal process and to provide the budget to support it for all hospital team members.
• The best way to put together a training program for a practice is to start with the goals that the practice needs to achieve and then think through, hospital area by hospital area, what skills different team members need to have to achieve the hospital's goals (see Examples). Sometimes these are remedial skills to re-teach people to do certain tasks, such as "sizing" the appointment time to match the needs of the client and pet. Sometimes staff members need to improve their general skills, such as team-building, time-management, or communication skills, to achieve the hospital's goals.
• If the hospital needs to hire someone immediately this training may, of necessity, become the immediate priority. The job description for the position should be used as the basis for making the hire. In addition, a new hire should be capable of meeting the position duties described on a list of tasks that the employees need to master to support the hospital's goals.
• The best way to make sure that the job description is current is to ask the people who do the job to write one. They should also develop a separate list of all the things that a new person would need to be trained on so that they could do well in the position. A manager or owner would need to review their work and possibly refine it, but the people already in the position know the work best and it is usually helpful to rely on their expertise (see Example).
• Typically a department team should try to develop 10–12 tasks and protocols at a time. They will need time to meet and work on this. Once the first 10 tasks and protocols are finished, the team members should draft 10 more, and keep going in this way until all of the basic tasks for the department have been captured. (Duties can always be revised, new ones added, and old ones deleted as things change.)
• The hospital will also need a basic orientation program for new employees (see 3.9 – Staff Orientation). The orientation program should cover the practice's mission and include a tour of the hospital; all new employees, including veterinarians, should be assigned to work 1–2 days in each hospital department so that they can get to know the other hospital team members, see how things work, and see how one area of the hospital affects the others.

TERMS DEFINED

Orientation Training: Introductory training that all new employees should receive. It is informational and typically covers hours of operation, confidentiality, pay and compensation, dress code, practice mission and philosophy, overview of how the hospital works and expected interaction between the departments, hospital policy and goals, grounds for dismissal, and the "trial period" for new employees.
Travel Sheet: Also known as a tracking sheet, this is a document that accompanies the patient and on which is detailed the services to be provided and (typically) the fees for those goods and services to ensure that nothing is missed when being recorded in the medical record and the invoice.

ISSUES AND OPTIONS

• Training needs to be a budgeted item. Most hospitals provide financial support to doctors for training, but technicians, veterinary assistants, receptionists, and kennel attendants also need to have training dollars allocated for their development. A reasonable training investment is 1–2% of the hospital's annual revenue, so even a small hospital that is billing $900,000 should plan on spending $9,000–$18,000 on employee training and development.
• Your policy manual and other documentation that may become a factor used in employee dismissals should be checked by legal counsel (see 3.21 – Employee Manuals). Employment regulations differ in different states and employment laws, and regulations change. This is the only way to ensure compliance with state and federal mandates.
• To improve or develop an employee training program, start with the things that you are already doing and think of ways to improve and/or augment these training programs. For example, do you provide financial support to your associates so that they can obtain continuing education? Do you have industry representatives provide in-clinic staff training? Are you happy with the training programs that you have in place? If not, what would you change? What else do you need to do?
• There are a number of ways to tap outside training resources – the most important management responsibility is to determine what kind of training is needed, for whom, how much financial support the practice will commit, and how employees will be held accountable for using the training once they obtain it.
• Skill competencies should be stated as an employee expectation, and the practice training should identify and approve opportunities to help employees achieve the expected competencies (see 3.14 – Staff Development). For new employees, it would involve mastery of the basic skills needed to perform in their position; for experienced and long-term employees, the skill sets might provide growth opportunities to keep employees challenged and supportive of new practice goals.
• The practice budget should support a reasonable goal of "x" hours of continuing education for each position in the hospital. A log of internal and external training hours should be kept for each employee and reviewed during their performance review to ensure that they are meeting the "x" hour goal. (Employees can be charged with bringing a list and documentation of their continuing education accomplishments to the performance review.)
• Training can be expensive. If the practice sends an employee to an outside training program, that employee (or employees) should be charged with bringing back at least three good ideas to share with the rest of team and should be asked to make a presentation on the three ideas at the next staff or department meeting. The employee should also write up the ideas and bring them to their performance review. This encourages accountability for taking the training seriously, and helps share knowledge with those who could not go.

Vet-ebooks.com

• Guidelines need to be set for the kinds of training programs for which the hospital will provide financial support, the training expectation and limits for each position, the approval process to attend outside educational programs, the requirement that doctors or staff who attend an outside program bring ideas back to share with others in the practice, and other considerations, such as employee tenure or disciplinary status, which might disqualify an employee from attending outside training programs.
• Doctors, technicians, and receptionists can be asked to lead internal training sessions. For instance, a doctor might want to hold a short staff training on the new pain management protocols the hospital has decided to adopt so that everyone on the hospital team understands what, why, and when pain management is recommended for patients.
• Technicians can talk about and show techniques for brushing a pet's teeth at home so that receptionists, doctors, and kennel assistants will understand what is involved and can be better informed when they talk to clients about them.
• Receptionists may want to talk about the most common things that clients ask about and lead a brainstorming session on deciding the best way to respond to client questions, or the receptionist may want to tell the rest of the hospital team their plans for promoting client awareness on senior pet care so that everyone can support it.
• Training does not always have to take a lot of time or money, and quick training exercises can easily be included as part of most staff meetings (see 2.11 – Making Meetings Work).
• A quick communication training exercise is to hand around the travel sheet and ask each person to explain, in client-friendly terms, what an item is on the sheet. This helps team members be more consistent in their explanations. It also gives team members a chance to help one another find the best words to explain things to clients.
• New employees can be charged with watching training videos and taking a test to show that they understood what they saw. Training videos, webinars, Internet sessions, and assigned reading should be counted toward an employee's continuing education hours (see 10.23 – Virtual Team Training).

EXAMPLES

To make sense for the practice, employee training should focus on the performance needed to support the practice's goals. For example, if a technician wanted to provide dog-training classes, it would be important to first determine whether that would fit with the direction the practice wants to go. If the practice has decided to focus on building its dental services, the technician's time might be better spent in learning how to take dental radiographs, grade oral disease, and give client instructions on how to brush pets' teeth at home. These would be the better training priorities for the technician because they match the hospital's goals.

A department team can be asked to develop a task list and written protocols for a position. Once the list is built, it can be used as the basis for training a new employee. Written protocols for each task will help set training competency targets and also help hold people accountable for their job performance.

A receptionist's task list might look something like this:
• Filing patient records
• Retrieving patient records
• Creating new records
• Searching for information in patient records
• Updating patient records
• Making entries into patient records
• Checking clients in
• Checking clients out
• Answering the phone
• Making appointments
• Responding to common client questions
• Taking payments.

3.11. STRUCTURED ON-THE-JOB TRAINING

BASICS

OVERVIEW

On-the-job training (OJT) is just that; training that is provided on the job. Structured OJT is simply a more structured and mindful version.

Providing quality training for veterinary staff does not need to be difficult nor expensive. When you employ structured OJT as a method for team training, you can often save time and money and increase effectiveness by using more experienced employees, as well as your practice's current materials and training resources.

Structured OJT is a prevalent way to provide training in most industries. Jane, a more senior employee, shows John how to perform a task, shares a few words of wisdom, and later watches John do it himself. It makes perfect sense, but there are several pitfalls with OJT, such as:

- How much of the job does Jane actually know?
- How well does Jane transmit her knowledge and skills to John?
- How much does John really comprehend and how much will he be able to apply?
- How long will John remember anything that Jane said or did?

Structured OJT can work wonderfully to overcome some of these deficits. It is very applied, relevant, conducted in the work environment, facilitated by someone who really knows the tasks, can be quickly developed, and is inexpensive to implement.

The important elements of successful OJT for veterinary practices are as follows:

- The training must be closely aligned with the objectives, goals, and policies of the practice.
- You must select the most appropriate people to provide the training by considering their level of skill in the task, as well as their ability to be a "good" trainer and facilitator. Additionally select other resources, such as procedure manuals and standard operating procedures (SOPs) to support the learning process (see 2.21 – Operations Manuals).
- Successful OJT also needs to utilize and mirror the tools of your practice. These include your procedure manual, SOPs, etc.
- You will also need to create simple training manuals that outline the content and learning activities, as well as include assessments and checklists to guide the learning process. Include print and mediated job aids and tools, such as charts, tables, canned demonstrations, lists of additional, mediated, and print- and web-based resources.
- Finally, your practice needs to track employee's training and make it an important part of your performance management process. Ensure that structured OJT is not a solitary event that only happens at the beginning of employment, but is a critical element in all phases of an employee's tenure with your practice.
- Your performance management process should also feed into the goals and objectives of future employee training (see 3.19 – Staff Performance Evaluations).

TERMS DEFINED

On-the-Job Training: Method of training that focuses on employees acquiring skills within the work environment under normal working conditions. Through OJT, team members acquire both general skills that they can transfer from one job to another and specific skills that are unique to a particular job. This form of training typically includes verbal and written instruction, demonstration and observation, as well as hands-on practice. In addition, the OJT process involves one employee – usually a supervisor or an experienced employee – passing knowledge and skills on to a novice employee.

Structured On-the-Job Training: A form of OJT that is carefully defined based upon the needs of the business and structured to mirror and support the career path of employees. Structured OJT employs formal materials to support the learning process.

ISSUES AND OPTIONS

CLOSELY ALIGN YOUR TRAINING WITH THE OBJECTIVES, GOALS, AND POLICIES OF THE PRACTICE

Before you begin training a team member, clearly identify the tasks that are part of the job that they were hired to perform. Take some time now to do that for every position in your practice, if you have not already done so. For each of these tasks, identify the inputs, desired outputs, resources, key steps to follow, and any cautions or special instructions. You can probably gather most of this information from your practice's job descriptions, its procedures manual, SOPs, and other documentation. The rest you will need to develop yourself. The good news is that once you have created this documentation for each position, onboarding new employees will be much easier (see 3.9 – Staff Orientation).

Once you have this task documentation, you have most of what you will need to create your structured OJT materials. All team member training should be closely linked to these tasks and their associated detail. To stay ahead of the game, take this opportunity to identify how long you feel is reasonable for the OJT trainer to spend on each task and the relevant examples that they may use.

SELECT THE MOST APPROPRIATE PEOPLE TO PROVIDE THE TRAINING

Make sure that you have selected the "right" personnel to be OJT trainers. Select personnel that are not only competent in the job, but are good demonstrators and facilitators. Provide these trainers with the right tools, and provide them with guidance and practice in using those tools as training resources. Where possible provide trainers with mediated resources, such as canned demonstrations. Equipment, such as GoPro cameras and recorders are inexpensive and capable for such usage. Observe and certify OJT trainers as you would more formal trainers. Finally, track their performance by continuing to observe them facilitating OJT and assessing the performance of the team members they have trained.

UTILIZE THE TOOLS OF YOUR PRACTICE

Using the tools of your practice will not only decrease the time that your practice will need to invest in training, but will increase its relevance, "stickiness," and your team members' abilities to apply the training on the job. Now, take a good look at the task documentation that you generated earlier. Make sure that you have included everything. These documents are vital resources that the staff at your practice will need when they provide structured OJT. The specific documentation will differ based upon the team member they are training and the task(s) that they are training them to perform. The moment that you ask a staff member to train a new team member, ask them and make sure that they have and are familiar with the resources they will need to successfully facilitate that training.

CREATE SIMPLE TRAINING MANUALS

With all of this information at hand, identify and document the key training events required to provide comprehensive training for each job function at the key junctures of your team members' careers with your practice. Then create – or ask the OJT trainer associated with the event to create – a short training guide identifying:

- tasks to be covered,
- specific references to the necessary resources to be utilized during and after the training,
- time needed to train on each topic,
- training strategy to be utilized for demonstrating each task, providing practice, and accessing the team member's ability to perform the task.

Vet-eBooks.com

Include print and mediated job aids and tools that include charts, tables, canned demonstrations, lists of additional print, mediated, and web-based resources.

This guide should include assessments to determine if the employee has mastered the tasks they need to perform. These assessments should not only be a short-answer or multiple-choice quiz, but checklists that can guide the structured OJT trainer in evaluating the performance of the employee in independently accomplishing the tasks in their actual work environment. The trainer should sign this checklist to document that they approve the team member's performance of this task. The trainer can even use, or have the employee use, an inexpensive video recording devise, such as GoPro, to record the performance, if for some reason the trainer cannot be present. This should become part of the team member's file.

TRACK EMPLOYEE'S TRAINING

It is important to document that an OJT training event has occurred and that the employee is now certified to perform this procedure independently. Include any notes that the trainer would like to add related to the team member's performance. You might also consider building a spreadsheet that is accessible to all team members identifying who has been certified on each task or group of tasks. This can be motivating for the team members, as well as an extremely useful tool for scheduling and pulling in the appropriate resources during an emergency.

OJT can be an effective and organic tool in your training toolbox. As with most efforts, effective execution of the strategy is everything.

EXAMPLES

- Use structured OJT to train new hires as well as team members wishing to advance their skills.
- Make structured OJT a part of the performance improvement program for individuals needing additional training. Consider the benefit of an OJT coach to focus on specific skills or tasks.
- Utilize structured OJT to cross-train your team. It will provide team members with relevant and detailed training, as well as exposure to the team members and supervisors who supervise their activities.
- Instead of training an entire group of people on a new piece of equipment, train a select few and then have them train other team members using your structured OJT materials (Train the Trainer).
- Establish a training mindset in your practice. Instead of asking someone to step away from the computer and allow a more knowledgeable team member to process the activity, use this as an opportunity for structured OJT. This will get additional team members trained and productive.
- Becoming a structured OJT trainer, or developer of OJT materials, may be considered a stepping-stone for team members wishing to grow into management roles or leadership positions.
- Certifying team members for various skills or levels can be a type of recognition or reward program within your practice. Badges or pins can be awarded, pay rate changes can be issued, and status for job advancement or on-call replacement for a call-off are all possible options to consider as you develop your program.
- Consider your practice's structured OJT program as an ongoing and evolving process. Incorporate subtle improvements made to any procedure or process thus keeping the team up-to-date and operating efficiently.

3.12. IT'S NOT YOUR JOB ... IT'S YOUR RESPONSIBILITY

BASICS

OVERVIEW

In a successful business, there are personnel policy manuals, job descriptions, training manuals, operations manuals, and a variety of checklists among the tools that the practice uses to ensure the consistent management of its people as well as the consistent delivery of a product and/or service.

Job descriptions should exist for each role within the hospital and include the different skills for each job. The job description should clearly delineate the tasks and functions associated with the job as well as the responsibilities. It should also clearly define to whom the position reports. Bottom line, it should answer the question: What is your job? What is your responsibility? But what's the difference?

As a clinician, your responsibilities are broad and include a responsibility to the pet, the client, the practice team, the practice, the owner, your family, and yourself … among others. Responsibility includes values and ethics, integrity, and honesty. In contrast, in a job, you recognize accountability to the leadership and those around you. In responsibility you committed to the greater interests of the practice. On the other hand, with a job you may or may not have engagement with your role or your task, thus going about your job with no commitment and little or no job satisfaction.

TERMS DEFINED

Job: A task or series of tasks that are performed to accomplish one's occupation. It is basically a specific piece of work. Examples of jobs include cleaning a cage, answering a phone, cleaning teeth, sterilizing a pack, filing charts, creating an invoice, and so on.

Responsibility: The obligation or duty that conveys a commitment to the ultimate success of the business. Responsibilities are the results of the job, not a listing of tasks that one performs. For example, a task would be cleaning the cage, and the responsibility would be to ensure cleanliness and freedom from infectious or contagious disease to the next occupant.

ISSUES AND OPTIONS

JOB VERSUS CAREER

An employee can focus on tasks or jobs. They can look at the micro-chores of a job in the practice or the macro-responsibilities of a job. They can focus on process or outcome. Employees who focus on the jobs or tasks that they have to do rarely have a future focus on a career with the business. On the other hand, if you have an employee who is continually seeking to take on more responsibility and is constantly looking beyond their chores to the more global needs of the practice, you have a career player for your team.

How can you tell the difference between a task and a responsibility? To more clearly differentiate between jobs and responsibilities in your practice, let us look at each role individually:

Client Service Representative/Receptionist

Jobs	*Responsibilities*
Answering the phone	Exceeding the needs of the clients
Filing records	Providing a welcoming environment for the pet/owner
Creating an invoice and accepting payment	Representing the practice to the community via the phone or front door

Animal Care/Kennel Attendant

Jobs	*Responsibilities*
Cleaning litter boxes	Ensuring a clean, odor-free, and safe environment for the pets
Feeding and watering pets	Making sure the nutritional requirements and satiety of the pets is met
Bathing and brushing	Providing clean, odor-free, and parasite-free pets to their owners

Vet-eBooks.com

3.12. It's Not Your Job ... It's Your Responsibility

Licensed Technician/RVT/CVT/LVT

Jobs	*Responsibilities*
Place an intravenous catheter	Ensure a portal for the administration of fluids or other medications
Induce anesthesia	Ensure a safe and effective anesthetic process for the pet from start to finish and peace of mind for the client
Take thoracic radiographs	Ensure best-quality radiographs the first time to minimize radiation exposure for the pet and staff and the ability to create a diagnosis for the clinician

Manager/Administrator

Jobs	*Responsibilities*
Hire a receptionist	Identify a team member that will contribute to the success of the practice
Create month-end financial reports	Ensure accurate assessment of the financial status of the practice at that point in time
Order pet food monthly	Ensure that an appropriate amount of food is available for purchase and in-house use without inventory remaining for extended periods of time

Associate Veterinarians

Jobs	*Responsibilities*
Spay a dog	Ensure a safe ovariohysterectomy for the patient and client and the effective use of time and supplies for the practice
Call back a client with lab results	Communicate to the client the health status of their pet so that they, with assistance, can make a decision as to what is needed next for their pet
Diagnose an intestinal foreign body	Utilizing education and skills to diagnose the condition of the pet in the most cost-effective, efficient, and safe fashion and with it determine the subsequent treatment plan

Owner

Jobs	*Responsibilities*
Remodel the reception area	Create an environment that is comfortable for the pet and client, is easily maintained, and is an effective use of space for the practice
Establish a retirement program for staff	Provide a work environment that is supportive of existing staff and also attractive for future employees
Motivate staff	Create a work environment that is supportive of the team and thus the business

Understanding the difference between tasks and responsibilities makes for better employees. Additionally, it is important to understand that most engaged employees are also seeking not just more tasks but more responsibility to the success of the practice. The feeling of contributing to the success of a business is an important factor in staff longevity.

A practice is composed of individuals working on daily tasks or jobs to accomplish the vision of the ownership. When a practice is able to change from individuals performing tasks to a team focusing on responsibilities, it will be a successful business.

When it comes to performance evaluations, it is easy to assess whether an individual is completing tasks or not completing tasks. However, performance evaluations that focus on the more global responsibilities are a greater measure of the contribution of an individual to the practice. Team members who perform tasks should be acknowledged. Team members who focus on responsibilities should be lauded and rewarded.

A veterinary practice is more than a series of jobs or tasks delineated in an operations manual or on a checklist. These tasks are important, just as the organs of the body are to survival. However, the tasks (and organs) are part of a greater responsibility to the health of the pet, satisfaction of the owner, engagement of the team members, and success of the practice (or life of the body). A failure to acknowledge or focus on the responsibilities leaves you with a practice where the staff members do what is asked and no more, and where the clients can readily identify a lack of passion for the care of their pets.

Vet-ebooks.com

3.12. IT'S NOT YOUR JOB ... IT'S YOUR RESPONSIBILITY

Metaphorically, it is like a body on life support or in a coma that goes about its survival but without any response to the world around it.

It must be noted that the responsibility to move from a business strictly going about its tasks to one focused on more global responsibilities comes from the leadership and ownership of the practice. Because ownership/leadership sets the model for success of the business, an owner that is task oriented will hire task-oriented people to get the job done without passion, without emotion, and with the sole goal of surviving the day. Is your team a group of robots with a focus on completing the list of items on a checklist? Or is your squad a group of highly engaged, emotionally charged, and passionate team players looking to stand out in the practice and in the community?

EXAMPLES

EXAMPLE 1

A practice effectively used checklists to get staff members to accomplish their daily tasks. Unfortunately, many of those staff members arrived right on time, and left right on time, whether the workday was done or not, because they only saw the tasks as their goal for the day. They did not see how those tasks fitted into a more global responsibility to the patients or clients or owners. They had a job to do and would do no more. There was no feeling of camaraderie; in contrast, there was consistent bickering about coworkers not working hard enough or just doing enough to get by. The average employee remained employed at this practice for months rather than years.

In contrast, another practice with a dynamic leader and manager demonstrated the opposite scenario. There was almost a competition to see who would arrive first and stay last. Staff members helped one another to accomplish the outcome and they frequently enjoyed one another's company after work to celebrate a job well done. Weekend social events for the community were never hard to staff as everybody on the team saw their responsibility not just to the ownership, clients, pets, but the entire city in which they lived. And they saw an obligation to one another. The environment in this practice was one of teamwork and engagement, and the profitability of the practice reflected this as well. The leadership and ownership created a holistic focus on all stakeholders with the team and its production was celebrated rather than viewed as a list of mundane tasks.

EXAMPLE 2

In looking at championship sports teams over the years in any of the major team sports, the team and leadership reflect a common goal to win the championship. To accomplish this, valuable players will frequently sacrifice their own self-interests for those of the team. Quarterbacks will block to free up a running back; home run hitters will bunt; scorers will learn to pass; and offense players will learn to play defense. These winning teams do not focus on tasks or jobs – they focus on the championship. They have a responsibility to their fans, ownership, and teammates, and will do what is needed to succeed.

Build a championship team by creating the feeling of responsibility to the greater vision rather than simply accomplishing tasks. It takes teamwork to make the dream work.

CAUTIONS

- It is worth considering: job versus career; short-term versus long-term; global responsibility versus job satisfaction; feeling empowered versus feeling tasked.

Vet-ebooks.com

3.12. IT'S NOT YOUR JOB ... IT'S YOUR RESPONSIBILITY

• Every person in a key role should be able to respond to the question "What do you do" not with a job title but with a statement of personal responsibility: "I'm the one person ultimately responsible for x and y."
• When an employee comes to you asking what more can they do or with suggestions on how to do things better or with other initiatives, how do you respond? Do insights and ideas get shot down or are they set free to grow? Is your mantra "This is the way we do it here"? The quickest way to frustrate a team is to have them focus only on tasks at the expense of focus on a responsibility to the greater good.
• Do you encourage people to work to their potential (responsibility) or just do their work (job)? Do you encourage enthusiasm's fire or do you take out your hose at the first flicker of a new idea?
• Reward those that showcase their dedication to their responsibilities above and beyond just settling for the required work. Note that there is a direct correlation between staff retention and client retention. With responsibility being linked to a career, you can see that responsibility also includes retention for the team and also for the clients.

3.13. LEVERAGING STAFF

BASICS

OVERVIEW

• Every position in the veterinary practice plays a critical role in achieving practice goals; each must be leveraged to its maximal potential.
• Many times, practices do not utilize credentialed veterinary technicians as they should, and often use veterinary assistants with no formal training. Leadership must effectively separate the duties of each and respect boundaries. Having nontrained team members complete patient care places the patient at higher risk for poor or inadequate care.
• Having formally trained veterinary technicians complete assistant duties devalues and demotivates these team members and may result in the loss of a skilled employee.
• When staff are not leveraged according to their skill set, practice goals are not attained.
• Skills that can be leveraged are sometimes defined in the State Veterinary Practice Act (and vary by state).
• It is important to differentiate tasks that can be completed by a credentialed veterinary technician/nurse and an assistant.
• When staff are leveraged appropriately, team morale increases, and the human capital "feels" that they have a career in the veterinary practice, not just a "job."
• Good staff members cost money. Good staff members produce money. It makes sense to pay people appropriately for their skill set.

TERMS DEFINED

Credentialed Veterinary Technician/Nurse: A team member who has graduated from an American Veterinary Medical Association (AVMA)-accredited school, passed the Veterinary Technician National Exam (VTNE), and achieved registration (RVT), certification (CVT), or licensure (LVT, LVMT) by the state in which he or she practices.
Manager: Administrative staff member who oversees the daily operations of the veterinary practice.
Veterinary Assistant: The title given to a team member who has received on-the-job training to aid the veterinarian and/or credentialed veterinary technician.

ISSUES AND OPTIONS

VETERINARY TECHNICIANS/NURSES

• Veterinarians are often the limiting factor when tasks should be delegated to credentialed veterinary technicians or assistants. Ideally, veterinarians should diagnose, prescribe, and complete surgery. The remaining tasks should be delegated to the appropriate staff member, based on the task (see 1.10 – Veterinary Staff)
• In 2008, the AVMA Biennial Economic Survey revealed that, on average, for every credentialed veterinary technician a practice employed, the practice generated $161,493 more in gross revenue. This same phenomenon was not seen with non-credentialed technicians (assistants); rather there was no significant revenue improvement when hiring assistants. The conclusions of the study attributed the increase in revenue to perhaps freeing up veterinarian time by allowing qualified technicians to complete tasks traditionally requiring a veterinarian to oversee.[1]
• Leveraging appropriately increases team morale as credentialed technicians/nurses are allowed to carry out tasks learned in school. Inappropriate leveraging disengages credentialed technicians/nurses, often leading to burnout and searching for another place of employment. Disengaged team members hurt the profitability of the practice, as well as the service provided to veterinary consumers.
• Some states have a very specific Veterinary Practice Act in which tasks completed by credentialed veterinary technicians/nurses is outlined. Other states list tasks in the Rules and Regulations. Either way, you need to become familiar with current state regulations to ensure leveraging compliance.
• It is important to differentiate tasks that can be completed by a credentialed veterinary technician/nurse and an assistant, as indicated by the Veterinary Practice Act. You can then leverage staff appropriately based on regulation.

VETERINARY ASSISTANTS

• Many veterinary assistants are well trained and can complete many tasks. Veterinary assistants can increase the productivity of both veterinarians and credentialed veterinary technicians/nurses.
• The practice should provide proper on-the-job training for skills that are required of assistants, not crossing the line of credentialed veterinary technician duties.
• Veterinary assistants should be tasked with providing exceptional patient care that goes beyond cleaning cages, feeding, and walking the patient. Veterinary assistants must be allowed the time to provide TLC to patients in the hospital, provide a Fear Free™ environment (see 4.14 – Developing a Fear-Free Hospital), and be the eyes and ears for the professional staff who are busy serving client needs.

RECEPTIONISTS

• Receptionists, also known as client service representatives, often present the first impression that clients have of a veterinary practice. They project the level of professionalism to be anticipated, because when a client visits with a pet, the receptionist is usually the first and last person with whom they deal. This is a critical position and should not be minimized by practices hoping to improve their customer service and profitability.
• Receptionists must be included in team meetings, patient rounds, and have some medical training in order to project the professionalism needed. Receptionists are often challenged with relaying information to clients, but do not understand the information they are presenting. This presents a professionalism/confidence challenge that clients can "see or hear." When clients do not have confidence in the person relaying the information, the trust in the practice drops significantly.
• Receptionists control the flow of clients through the veterinary hospital, but to do so effectively, they must understand everything that occurs simultaneously in the practice.

VETERINARY MANAGERS

• It is critical for veterinary managers to identify tasks that can be leveraged to veterinary paraprofessionals. When veterinarians are completing paraprofessional tasks, the manager should be able to identify the cost of lost business due to the inefficient leveraging.
• Managers must develop effective training protocols for every position, and every new team member (regardless of experience in the industry) to ensure each team member communicates the same message to clients and upholds the highest standards of the hospital. This applies to kennels assistants, as well as associate veterinarians (see 3.10 – Staff Training). Inconsistent messaging, leveraging, and substandard care will hinder goal achievement.
• Training protocols and effective leveraging must tie into the practice goals, and each team member needs to understand how they contribute to those goals (see 2.1 – Workplace Management).

Vet-ebooks.com

EXAMPLES

Leveraging is mostly an intangible asset, meaning it can be hard to place a dollar value on it. Effectively leveraged team members are more satisfied with their jobs.[2]

To determine whether the practice is effectively leveraged, ask every team member, including doctors, to create a list of every task they do during a one-week period. Veterinarians should be doing medically specific tasks (diagnosing, prescribing, completing surgery). Credentialed veterinary technicians should be completing credentialed skill-level tasks, including surgical assisting, completing dental prophylaxis, obtaining laboratory samples, completing in-house diagnostics, treating patients, and providing client education (to name a few). Veterinary assistants should be helping credentialed veterinary technicians and veterinarians become more efficient and be completing any tasks allowed by the State Veterinary Practice Act. If the list of tasks completed by team members indicates veterinarians are doing credentialed technician tasks, and credentialed technicians are completing assistant tasks, effective leveraging is not occurring, and an improved strategy must be put in place.

The tangible aspect of leveraging (or the monetary value) is just as important as the intangible benefits. Considering the overhead costs a practice has on a per minute basis to be open (see 7.9 – Making Valid Comparisons Between Practices and Services), the most appropriate team member should be delivering services to best increase efficiency and efficacy and decrease costs as much as possible. For example, a credentialed veterinary technician should be drawing blood on a patient (not a veterinarian), while the veterinarian should be seeing the next patient. The veterinarian drives active income, which is further increased by passive income, fulfilled by the credentialed veterinary technician and other team members.

If it costs a set amount per minute for the clinic to be open and a phlebotomy procedure takes a set amount of time, then the overhead cost associated with that procedure can be calculated for various procedures (see 7.9 – Making Valid Comparisons Between Practices and Services). If the veterinarian draws 15 samples throughout the day, when that same task could have been performed by a paraprofessional team member, a substantial loss has occurred by not leveraging effectively.

More importantly, that time was not being used to see patients, so there is also an opportunity cost to this inefficiency. This could result in patients not receiving care at all, or clients visiting another practice for that service. This tends to result in the loss of significant income for the hospital. This example represents only one veterinarian, and only one year of lost revenue. Consider how much revenue would be lost in a multi-doctor practice if the team were not effectively handling their respective tasks (see Figure 3-13-1).

Leveraging is not only an employee engagement factor; it is also a patient advocacy and profitability factor.

At ABC Animal Hospital it costs the practice $10 per minute to be open

Phlebotomy = 5 minutes

$10/min × 5 minutes = $50.00

If DVM draws 15 samples throughout the day:

15 × 5 = 75 minutes per day

75 minutes/day × 260 business days in a year = 19,500 minutes/yr

19,500 minutes × $10/minute = $195,000 dollars of lost revenue

19,500 minutes per year were not being used to see other patients

Average appointment = 15 minutes

19,500 ÷ 15 = 1,300 appointments were lost over the year

Average doctor transaction = $175

1,300 appointments × $175 = $227,500 of potential income was lost

Figure 3-13-1.

The case for effectively leveraging the skill sets of hospital staff. In this example, ABC Animal Hospital has an overhead rate of $10 per minute, an average client transaction of $175, and each doctor currently draws 15 blood samples per day for laboratory analysis. The veterinarian works 260 business days per year.

3.14. STAFF DEVELOPMENT

BASICS

OVERVIEW

• Working in a veterinary practice presents some personal growth challenges for employees, because in many cases the organizational chart (see 2.2 – Organizational Charts) is relatively flat and there are not many opportunities for advancement.
• In some cases, an employed veterinarian may have an opportunity to become a partner or even buy the practice from the owner, but once paraprofessional and administrative staff reach a supervisory position, they have typically advanced as far as they can. Some receptionists and technicians might advance to management positions, and practice ownership is possible for some, but such a career path is not assured.
• To keep the very best employees, and for them to remain challenged and motivated, staff development must be part of the practice's core strategies.

TERMS DEFINED

Individual Development Plan: A staff member's individual plan for self-development that is then approved by a manager to ensure it is aligned with the organization's goals.
Presenteeism: Workers being on the job but not fully productive.

ISSUES AND OPTIONS

The financial realities for most veterinary practices are that they tend to pay employees less than comparable businesses, and often provide fewer benefits. In many cases, we try to rationalize this as a requirement of working with animals, as though working in a veterinary practice requires a charitable component, even if we then want the staff to be motivated to enhance the profitability of the clinic for its owners.

All employees deserve to be paid wages and benefits commensurate with their skills, and working in a veterinary clinic is no exception (see 3.3 – Wage and Benefit Summaries: The Whole Package). However, because there is limited room for advancement in most veterinary practices, additional attention should be paid to career development of employees.

There is one other feature of staff development that is worthy of reflection. Staff that develop skills and leave the practice to take more advanced positions elsewhere should be viewed as successes, not failures, especially if there are not appropriate opportunities for them within the practice. In too many instances, practices look at such career advancement as abandonment or disloyalty, rather than considering the big picture of our employees having their own lives and goals and that career development of these employees can definitely be a win–win situation for both the individual and the practice.

Superimposed on this career development process is that some staff turnover is natural and inevitable for a practice (see 3.20 – Staff Turnover and Retention). A practice that has been in existence for a prolonged period of time and still has all the same employees is not necessarily a model of an ideal workplace.

GOAL SETTING

• Most employees are hired for a specific job, with a specific job description, and with little thought to other strengths they might have that would or could be important to the practice.
• It is therefore worthwhile to explore strengths (and weaknesses) of employees in a standardized setting and to determine where personal development can coincide with strategic needs of the practice.
• The first step is often determining an employee's aspirations, by asking such questions as "What do you see yourself doing five years from now?" If a receptionist sees herself as a receptionist five years hence, then it is clear that she should hone her skills in customer service and communication. If an employed veterinarian sees herself in an ownership role, then it might be worth cultivating skills in practice management and mentoring her in those duties within the hospital.

PERFORMANCE MANAGEMENT

• Although many veterinary practices have informal and often infrequent employee evaluations, timely feedback is an important component of goal achievement.
• Annual reviews have many limitations, including holding people accountable for past behavior and not necessarily emphasizing current performance and mentoring others in the practice, both critical to long-term success. To better support employee development, many organizations are dropping or changing their annual review systems in favor of giving people less formal, but more frequent, feedback that follows the natural work cycle.[1]
• When managing staff performance, it is also important to be aware of subtle issues, such as presenteeism – employees being present, but for one reason or another, not being fully engaged or functional on the job. It has been estimated that this can cut productivity by one-third or more and can actually be far more expensive to a business than other health-related costs.[2] Some common causes of presenteeism include migraine, arthritis, allergies, depression, lower back pain, and many other common maladies that allow employees to come to work but not necessarily on a fully productive basis.
• Motivation is another important concept in performance management. It will probably not surprise many veterinary business owners, but if employees are not self-motivated, it is extremely difficult if not impossible to motivate them. The job of management is to create an environment in which self-motivated employees have the support they need to achieve their goals. Interestingly, even so-called "problem employees" may show evidence of motivation in other aspects of their lives. If these individuals are going to remain as valuable members of the organization, it will be necessary to find their locus of energy and leverage it to achieve needed goals.[3] Otherwise, it is exceedingly unlikely that they can be motivated to do what you are already paying them to do (but that they are not currently doing). Going round and round on the same issues is not to anyone's advantage.

CORE COMPETENCIES

• Every veterinary practice should have a mission (see 14.9 – Mission and Vision Statements) and those values should be captured in certain core competencies that are expected of employees.
• Although some core competencies will be hospital-wide, others may be specific to individual positions, such as veterinarians, nurses/technicians/assistants, receptionists/customer service representatives, and managers.
• Core competencies are important in staff development, because they can be tiered (e.g., beginner, intermediate, expert, etc.) and be considered in terms of reward-based compensation.
• Core competencies can be vague, but the actions and outcomes derived from them should actually be as specific as possible.
• Examples of core competencies might include:
  ◦ Customer focus
  ◦ Technical skills
  ◦ Accountability
  ◦ Change management
  ◦ Mentoring
  ◦ Teamwork
  ◦ Leadership
  ◦ Business skills
  ◦ Self-awareness.

INDIVIDUAL DEVELOPMENT PLANS

• Individual development plans (IDPs) are documents created by employees with the input of their managers and help define specific

Vet-ebooks.com

goals to which the employee would like to strive over a set period of time, typically one year.
- Although the plan itself is meant to support the initiatives of the employee, it is the manager's responsibility to ensure that the actual goals are aligned with the visions of the practice, so that it becomes a win–win scenario. For example, an employee might like the practice to provide time off and financial support for getting a pilot's license, but unless this can be substantially aligned with the needs of the practice, then this would be an unsuitable goal for an IDP. On the other hand, enrolling in a certificate course in human resources might be entirely appropriate for a receptionist or technician with strategic aspirations of progressing into a management role.
- The IDP is an agreement between the organization and the employee and both must be involved in its creation. Although the employee will be responsible for their part of the IDP, the manager will need to ensure that the practice supports the initiative, in time allowed and/or with financial support.

70/20/10

- A learning and development model known as 70/20/10 was introduced by Lombardo and Eichinger[4] some years ago, and different versions are often used in allotting resources for IDPs.
- The basic premise of the model is that about 70% of learning within an organization should come from on-the-job training, 20% from coaching and mentoring, and 10% from actual courses, lectures, and formal training.
- It is important to realize that there is nothing magical about the 70/20/10 rule and it is just an approximation. There is no empirical evidence that this ratio is optimal, that the three components are independent from one another, and the model prioritizes on-the-job training, which can be extremely variable in quality from hospital to hospital. The ratio is just a starting point for discussions and can be customized for each individual circumstance.

CAREER LADDERS

- As already mentioned, the organizational charts of most veterinary practices are relatively flat, and in very small hospitals all positions might report to one individual – the owner veterinarian.
- As practices increase in size, more positions become available as managers and supervisors are needed to maintain alignment and this creates opportunities for new and existing employees.
- As many veterinarians have learned the hard way, it is not always possible to promote existing successful employees to new roles and assume they will be similarly competent. Accordingly, core competencies can be extremely useful in determining the skills needed for each job description.

EXAMPLES

Karen is a certified veterinary technician who has been working for ABC Veterinary Hospital for five years. She is the most technically gifted employee in the practice and the only technician in the practice that knows how to determine blood pressure with the hospital's Doppler unit. This has been a great source of pride for her, as whenever a blood pressure reading is needed, the other technicians need to call Karen. However, Karen has been hesitant to teach any of the other technicians this skill and this has been a source of tension within the practice. The owner has announced that within a year there will likely be a need to hire one or two more technicians, and he will be considering a technician supervisor at that time for the hospital. Karen has expressed interest in the new position and considers herself a prime candidate because of her excellent technical skills.

The hospital owner and manager, in anticipation of the growth of the practice, have decided that they should develop core competencies for the hospital positions and IDPs for all of the employees, and specify which skills need demonstrated mastery before promotions can be made.

In meeting with Karen for her quarterly review, the manager assures her that her technical competencies are excellent but that the supervisor role requires expert competency in mentoring and teamwork, which are currently not her strengths. An IDP was created and as part of that Karen was tasked with creating a skills program for technicians in which she would teach several skills, such as blood pressure determination, placing jugular catheters, and dental charting, and then would supervise those technicians as they taught those skills to the others in the practice. The process was able to channel Karen's strengths into important progress for the technical workforce within the practice. Karen's new expertise in mentoring earned her the promotion to supervisor when that position became available.

CAUTIONS

Veterinary practices being what they are, small businesses, are not always able to create challenging new positions to which employees can aspire. Even in these cases it is possible to ascertain the potential strengths of employees and channel appropriate skills into outcomes that are to everyone's benefit.

3.15. ENGAGING STAFF

BASICS

OVERVIEW

Many businesses, including veterinary practices, talk about their employees theoretically as their most important asset. Yet it is rare to see this concept truly put into practice. This is unfortunate, as a huge opportunity may be missed for those clinics who do not truly engage their team. Leverage this critical asset and you can revolutionize your practice.

TERMS DEFINED

Brand Champion: Someone who advocates for and embodies your brand and enthusiastically promotes your practice with passion.
Buy-in: In management and decision-making, buy-in signifies the commitment of interested or affected parties to a decision to "buy in" to the action specified, that is, to agree to give it support, often by having been involved in the process.
Empower: To give official authority or legal power to someone (e.g., she empowered her attorney to act on her behalf).
Engaged: Involved in activity: occupied, busy; greatly interested: committed.

ISSUES AND OPTIONS

Given today's economic climate, it has never been more important to attract, nurture, and enrich the employment experience of your team. After all, they are the lifeblood of your practice and are most likely the individuals who create and deliver the majority of the services offered at your clinic.

If you are committed to developing a team that consistently performs at an outstanding level, then you must invest the same time and attention in them you would give to earn and keep a satisfied client. Your practice depends on it.

In many ways, nurturing your team and gaining buy-in from your staff are the core ingredients for a successful business (see 3.14 – Staff Development). However, this level of engagement must be a part of the service equation before you even consider reaching out to prospective clients. Think of your staff as your first and most important customer. If they are on board, you have a chance to more easily earn others' trust and acceptance. Otherwise, you could be bound to mediocrity, inconsistency, and hit or miss service depending on "who" in the practice is on duty that day.

EMPOWER THE INSIDE TO GAIN ACCEPTANCE ON THE OUTSIDE

There are hundreds of reasons why you should focus on the hiring, training, and enrichment of your team. It leads to:
- increased company loyalty and job longevity – which saves a tremendous amount of money;
- employees who are better able to service clients because they understand and embrace the practice's core reason for being and the core values it professes to lives by;
- employees who believe in the practice and its promise, work harder, and are more productive;
- employees who act as "brand champions" and create differentiation (see 6.15 – Practice Differentiation), which is difficult for your competition to replicate;
- employees who promote your practice inside and outside of the work environment, talking to friends and associates with pride about what they do and for whom, which undoubtedly brings in new clients.

Is asking the employees to have a relationship with the practice any different from asking clients? The challenge is finding the right individuals to hire, those who are able and willing to take the initiative to own their job and live your brand. The careful selection of those best suited to carry out your vision will pay off handsomely.

THE BENEFITS ARE MUTUAL

Employees who like their jobs have strong opinions and knowledge of the practice and communicate this quite naturally to clients. Rather than simply telling employees how to do their jobs, involve them in the process and let them be part of defining the vision and interpret it as it applies to their job function.

Many people feel the pay scale in veterinary medicine is not representative of the skills and compassion needed to perform these emotional and important jobs. It is clear that most people do not work in the field for the money. But satisfaction abounds for many other reasons, such as the following:
- The pure enjoyment of working with animals.
- A true sense of purpose in serving animals and their families – making a difference.
- A feeling of belonging to a community of animal caregivers. It may be easier, at times, to find acceptance in a profession where the patients and clients appreciate kindness and understanding.
- A sense that it is a calling. People are simply drawn to the field and gain satisfaction, joy, and even peace just by making sure the animals get the best care possible.

Most people yearn to feel important, to know they make a difference, and to sense that they are contributing to something bigger than themselves. Much like the herding breeds, your employees need a job – a responsibility – literally and figuratively, so let them excel by giving them the reins to perform at their highest level.

THE DOLLARS AND CENTS OF STAFF ENGAGEMENT

The benefits of a truly collaborative work environment carry financial benefits too.
- Human resources expenses for recruiting, hiring, training, overtime, and the like are much less as tenure and productivity are increased.
- Marketing costs are reduced as client retention rates are higher and word-of-mouth (WOM) referrals keep a steady pipeline of new clients entering the practice.
- Everyone is simply happier, experiences less stress, enjoys cooperation among the team, is better able to handle the daily challenges gracefully, and be a positive influence on other team members, clients, vendors, and the like. This contributes to better health, less sick days and potentially lower insurance costs.

EXAMPLES

Empowering your team to perform at optimum levels does not mean abdicating authority. What it means is to ensure they have the training and resources necessary to make a client happy. Of course, there will always be exceptions, like discounting an invoice or overriding someone else's instructions, for instance. These should be documented situations that require additional management approval. But if you give your team parameters to work within and the freedom to succeed they will take ownership of the outcome.

Rewards and acknowledgment of situations where a team member clearly embraced their role as an ambassador for the practice and remedied a situation whereby the outcome was positive should be lauded – and publicly too. Witnessing others receive praise for behaving in a manner that serves the greater purpose of the practice should serve as a motivator for others. It may also reduce the fear that some team members have of stepping up and getting creative when it comes to finding a solution to a problem. And it just may be the impetus to greater service levels for all of the team. The normal competitive nature within us likes to be part of the accolades and we

Vet-eBooks.com

will do whatever we can to obtain the recognition we feel we deserve. All of this ultimately benefits the patients, clients, and practice.

CAUTIONS

• **Responsibility and authority:** If you give someone the responsibility to perform a job, you must then give them the authority to carry it out. Nothing is more demoralizing than to be given a task with little or no control over how to accomplish it. This is one of the most common mistakes employers make. And it is even worse to be held accountable for failure to accomplish something that you had little say over during the process.
• **Proper training:** Coordinated training must be part of your culture as well as providing regular feedback (see 3.10 – Staff Training). Performing at exceptional service levels takes time and guidance. To ensure all team members receive appropriate training, written documentation should guide the learning for everyone and serve to standardize how things are done (see 2.22 – Procedure Manuals). The consistency that results will help to integrate new team members more quickly and create an environment where individuals can excel because they feel they are on a path that leads somewhere. With proper training, a well-written job description and clear direction, expectations can be established and met, leading to the job satisfaction and the superior productivity we seek.
• **Mentorship and supervision:** Developing a mentor program along with ongoing continuing education may provide the additional resources needed to help specific individuals advance in their career as well as elevate service levels across the board (see 3.17 – Mentoring). Continuous feedback by a supervisor who helps construct annual goals will serve as a check and balance toward progress. And knowing the employer cares enough to help them grow can be just the thing that keeps an employee loyal for the long haul (see 3.19 – Staff Performance Evaluations).
• **It is the behaviors that count:** If your practice has a set of core values, make sure your team members know what they are, can recite them from memory, and understand how to use them in their daily duties (see 14.9 – Mission and Vision Statements). If used properly, core values should reference the behaviors the practice promises to live by in an effort to carry out the mission. Conduct training on the core values regularly. Of equal importance, evaluating performance based on the same core values for all team members creates a level playing field. Everyone is playing with the same hand and the finish line is a happy client. Hopefully, adherence to this operational concept brings you the checkered flag!

3.16. EFFECTIVE COACHING FOR THE EXAM ROOM

BASICS

OVERVIEW

The goal of each exam room encounter is to care for the pet and the client with compassion and quality and to build a relationship based on mutual trust. The trust that is established underlies recommendations that are followed, healthier pets, and a healthier practice.

There are four components that support success in the exam room:

- Core communication skills
- Communication framework
- Hospital protocols, procedures, and standards of care
- Methods to build and strengthen communication (soft) skills through practice, feedback, and reflection.

TERMS DEFINED

Empathy: Putting oneself in the other person's shoes. An example of an empathy statement is "I can see this is a difficult decision."

Nonverbal Communication: Aspects of communication, such as gestures, facial expressions, or body postures, that do not involve verbal communication but that may include aspects of speech itself (accent, tone of voice, speed of speaking, etc.).

Open-Ended Inquiry: Questions that cannot be answered with a yes or no and require a developed answer.

Reflective Listening: Restating in your own words the content or feelings behind the client's statement.

Soft Skills: Personal attributes that enhance an individual's interactions, job performance, and career prospects. Unlike hard skills, which are about a person's skill set and ability to perform a certain type of task or activity, soft skills relate to a person's ability to interact effectively with coworkers and customers. These skills are broadly applicable both inside and outside the workplace.

ISSUES AND OPTIONS

CORE COMMUNICATION SKILLS

A basic knowledge of core communication skills and terminology is necessary before exam room coaching can be effective. Essential core communication skills include:

- Nonverbal communication (see 5.9 – Nonverbal Communication)
- Open-ended inquiry (see 5.7 – Posing Client Questions Effectively: Open-Ended Inquiry)
- Reflective listening (see 5.8 – Reflective Listening)
- Empathy statements (see 5.10 – Empathy).

COMMUNICATION FRAMEWORK

Just as veterinarians are taught to read a radiograph in a step-by-step process or to perform a surgery in a systematic manner, a methodical approach to the exam room visit is a critical component to success. This consistent practice integrates medical and communication processes, resulting in a client-centered approach to consistently build trust and encourage follow-up. A system that incorporates varying communication modalities and promotes the open exchange of information leads to a healthier pet, a long-lasting client relationship, and improved quality of life for the pet, your team, and your practice.

Here is a six-step approach to effective coaching:

1. Preparation

At this stage of the visit, review the history and presenting signs to identify as many concerns as possible. One minute of preparation saves three minutes in the exam room. Doctors need to ask their technician or assistant for the most important points from the medical history and review the record for vaccinations, fecals, heartworm medication and testing, flea control and the date last used, previous medical problems, weight changes, and so on. Most pets present with approximately three to five concerns. Some of these are the pet's and others are the pet owner's. Set specific objectives for the visit. Identify the three to five concerns on which to focus. How will you confirm or raise awareness of these? List the objectives on the record before you walk in. Make sure that each objective is SMART (Specific, Measurable, Action-oriented (action of client), Realistic, Time-bound).

2. Approach

As you greet the client, you are setting the tone for the exam room visit. Knock on the exam room door and greet the pet and pet owner when you come in the room. This will help put client at ease. As you enter the exam room, shake hands, make eye contact, and provide your name slowly enough so the pet owner can hear you. Wear appropriate medical garb with your name shown on your right side so they can see it as you talk with them. Go to their side of the exam table for this part of the exam and form the relationship. Welcome everyone to the exam room: pet owner, kids, and the pet by name. Voice tone is very important so as to not overpower the client. Give the client a task and instruct them how to help and how the exam will go.

It is important to use key pieces of information from the history or technician review to engage the client. For example, "I see that Petey has gained ten pounds since we last saw him. You have done an excellent job with his recovery." Clients appreciate compliments and to know that they are doing a good job. Ask the client for other concerns. They will have them and you want to be part of their solution. Remember the "four R's" as you make your approach:

- Rapport
  - Eye contact
  - Body posture
  - Voice tone and level
  - Use owner's and pet's names
  - Touch the pet.
- Reason
  - Restate or re-ask the reason for the client's visit
  - Ask what the client really wants.
- Response
  - Bridge to what you can do to satisfy the client's concern or need
  - Ask, "How does that sound?"
- Recruit
  - Involve the client in the process.

3. Diagnosis

At this part of the process, we are talking about diagnosis of the client, not the pet. At this stage, effective questioning and listening are vital. Effective questioning is like a funnel (see 5.7 – Posing Client Questions Effectively (Open-Ended Inquiry)). Start with open-ended questions (e.g., "Tell me about …" what, when, where, etc.) and then move to closed-ended questions to confirm information or to direct the conversation elsewhere. Effective listening is critical during the questioning process. It improves understanding of needs and helps to you to empathize and encourages clients to "open up" and be more willing to participate in the discussion.

As you conduct your physical exam, use all the tools available to you. Narrate the exam so the client feels a part of the process. Your discussion may prompt them to reveal further details or concerns that can be addressed in your recommendations. Repeat their words, and clarify their concerns rather than assuming you understand what they are saying.

4. Recommendation

In this step, veterinarians and technicians take the pet owner's concerns and connect them to a product, service, or program. For example, you might ask "Do you have your pet sleep in the bed with you?" or "How do your children interact with Fluffy?" Then you could tie recommendations for fecals, deworming, and continuous heartworm

Vet-eBooks.com

3.16. EFFECTIVE COACHING FOR THE EXAM ROOM

preventive to the client's answer. For example, "Because Fluffy goes outside and is exposed to other pets or places they have been, she needs parasite prevention to protect her and your family."

Use an exam room report card to list your recommendations. Provide clients with a timeline for when services are to be performed. Write it – show it. Pictures are worth a thousand words, so never tell what you can show. People remember less than 10% of what they hear, but 90% of what they see, hear, and do themselves. Even word pictures can be used to help the client see how treatment would improve the pet's quality of life or provide the pet owner with peace of mind. Word pictures tell what the pet owner will feel, see, hear, and watch their pet do as a result of treatment.

Make a diagnosis and give your recommendations with a timeline. Timelines, mental pictures or real pictures, models, care plans (estimates), discharge instructions, or recheck appointments all go with recommendations. What can they expect? What will you do to follow up with them? How long might it take until results are seen? Remember, clients do things for their reasons not ours.

5. Addressing Concerns

As you present your recommendations, it is probable that your client will have concerns. Welcome these discussions! If a client does not voice their concerns, you cannot resolve them or earn their trust. In general, all client concerns fall into one of two categories:

- The client does not have enough information to make the decision.
- The client does not see the need (or value) for a particular product, program, or service you are offering.

As concerns are presented, use this five-step process to listen and address the client's issue with respect and understanding.

- **Acknowledge:** This step is simply saying: I see, or I understand, or I hear what you are saying. It is important in this step to simply accept what the client is saying. This does not mean you have to agree with them. You just want the client to open up and express the real need that your hospital can fulfill.
- **Clarify:** In this step you use the client's words to rephrase or restate their concern. This indicates to the client that you are actively listening and attempting to meet their needs.
- **Answer:** Answer or match the client's need with a product or service benefit from your hospital. They need to be engaged and the proper concern identified or you could answer the wrong question. It is here that you show how the benefit of your solution far outweighs the pet owner's concerns. This answer can be supported with visuals (radiograph, models, and pictures), articles, websites and videos, etc.
- **Verify:** Check acceptance of your answer. If the client is satisfied you have done it. If the client has more concerns go back to step 2.
- **Close:** End the visit. Ask the client to make the commitment and take an action to protect the pet's wellness and give them peace of mind. If questions are still present, keep clarifying or decide to send a reminder or follow up in some way to continue the educational and trust developing process for the pet and its companion.

Commitment and Follow-up

When completing, always include the following:

- Summarize the key points/request their commitment. Make sure a plan is created, including a follow-up plan, and logged into the practice management system and/or the patient's medical record.
- Complete your records, including the charges and discharge instructions. Could another doctor in your hospital read this record and follow your plan?

Make sure you give the client a timeline in which they know when they are to return. Affirm and recognize them for bringing their pet in and for their choice of services. All pets need to have reminders, revisits, and rechecks (see 4.16 – Client Reminder Systems). Make sure everything is documented, including ears, skin, urine, weight gain or loss, medications dispensed, eye lesions, bloodwork abnormalities, and recommendations (such as dental). All need scheduled rechecks and reminders.

HOSPITAL PROTOCOLS, PROCEDURES, AND STANDARDS OF CARE

For exam room communication to be most effective, it is vital that the messages the client receives are consistent from team member to team member and throughout all communications from the hospital (see 9.3 – Standards of Care and Care Pathways).

METHODS TO BUILD AND STRENGTHEN COMMUNICATION (SOFT) SKILLS THROUGH PRACTICE, FEEDBACK, AND REFLECTION

Exam room communication skills do not materialize overnight. Improvement is gained from practice, feedback, and personal reflection. There are those that have a natural gift to build rapport, conduct the diagnostic interview, deliver a recommendation, and gain commitment. For most, it is a development process that takes focus and hard work.

There are several ways to provide coaching for communication skills:

- A consultant or coworker can shadow the doctor during exam room appointments and provide feedback after the conclusion of an appointment or a series of appointments
- Appointments may be video-recorded for later review by the doctor (for self-review or for a consultant or coworker for feedback).

When establishing a coaching opportunity, it is important to create some basic goals of the program:

- Support professional development and growth.
- Provide the opportunity to enhance exam room communication, empathy statements, and interpersonal skills.
- Provide a safe setting to observe and share resources.
- Allow the outpatient appointment experience for clients and patients to be more comprehensive and bring continuity to the level of service and quality care.

The coach (whether consultant or coworker):

- asks questions and does not criticize,
- tries to elicit areas in which the other person demonstrates strengths,
- offers feedback to assist in identifying areas to develop and grow,
- coaches on how to do something differently if asked,
- provides support.

Coaching is not:

- Evaluative
- Hierarchical
- Judgmental
- Prescriptive
- A quick fix.

THE COACHING PROCESS

Planning Conference

Prior to the scheduled observations, have a short meeting to discuss the goals for the observations. The attending veterinarian will present certain aspects of the examinations they would like to have observed. For example, they may want some feedback on the report card feedback process, coordination with the technician or assistant, effectiveness of questioning, or presenting the recommendation. After discussion, the observing veterinarian will record three to five key goals based on the observations. Refer to the "Target Exam Room Experience" worksheet (see Figure 3-16-1) as you determine certain areas to focus on because this will be the recording tool during the observation.

Vet-eBooks.com

3.16. EFFECTIVE COACHING FOR THE EXAM ROOM

The Target Wellness Exam Room Experience

Attending Vet : _____ Date: _____

Observing Vet: _____ Tech/CSR _____

Preparation	
1. Reviews check-in sheet with technician prior to entering the room; identifies 3-5 concerns.	
Approach	
2. Knock prior to entering room.	
3. Acknowledges owner and pet by name, introduces themselves, pets animal, restates technician's name and information from technician; asks if other concerns or goals.	
4. Makes eye contact, uses open body posture, stands on the same side of the table as the client.	
5. Comforts pet/client – tells client how the visit will proceed; instructs client and technician, sets the Agenda fora the visit, gain agreement	
6. Oversees gentle restraint of pet, guides client and technician toward appropriate interaction with their pet during examination (e.g., client not allowed to restrain pet, where the client should stand, how the pet may respond bnetter if they can or can not see client).	

The Target Wellness Exam Room Experience

Diagnosis	
7. Uses all instruments during exam; conducts complete head to toe exam; provides on-going narrative for client on process and findings.	
8. Effective listening – clarify, acknowledge what client is saying, paraphrase, empathizes with client	
9. Positive, Confident, Respectful attitude in the exam room.	
10. Effective questioning – Open and closed questions for all abnormal findings or areas of concern.	
11. Uses language and terminology client can understand.	
12. Follows protocols developed by the hospital for care of the pet.	
Recommendation	
13. Uses the world 'need' vs. 'recommends' or 'try'.	
14. Medical and Surgical Care Plans are prepared with hospital protocols, client care and business in mind. Verifies understanding with client. Uses timelines	
15. Passive marketing – items recommended for the pet are set on exam table for client to see/touch, told they are welcome to take the item with them from the exam room.	
16. Uses visual aids for educations purposes, e.g., heartworm, teeth, arthritis, radiographs, bloodwork, etc.	

The Target Wellness Exam Room Experience

17. Recommends medications and care for pet and pet's well being; considers clients' ability to deliver medication.	
18. Dental care: Develops a home dental care plan with client input that client can follow and th technician can reinforce with education.	
19. Client is given educational handouts/video/website with important areas highlighted that pertain to that client. One or two products are recommended vs. several options.	
20. Reinforces Technician's position for client education; reinforces value of treatment and hospital in term of the benefits to the client and patient.	
Addressing Concerns	
21. Offers client the opportunity to ask question (e.g. "We have covered a lot today. What questions do you have for me?").	
22. Uses 5 step approach to Acknowledge, Clarify, Answer, Verify, Close. Does not avoid questions. Answers clearly.	
Commitment & Follow-up	
23. Completes Record. Explains plans with timelines.	
24. Provides client written/typed summary of exam, action plan, educational materials.	
24. Takes steps or oversees the capture of digital pictures of abnormals for medical record.	

The Target Wellness Exam Room Experience

26. Follow-up planned for pet's/clients needs, e.g., follow up calls, appointments, surgeries, medical care plants, diet, etc.	
27. Ends visit on a positive note; reinforce clients care of their pet/decisions made during the visit and follow-up times.	
28. Secures that all pets seen have next steps: R^3-Reminders, Recheck, Recall.	
Other Areas Identified by the Peen Mentor / Coach Team

3.16. EFFECTIVE COACHING FOR THE EXAM ROOM

Observation

• **Attending veterinarian:** Conduct yourself professionally. Make sure you introduce the observing individual as a team member and inform the client that all of the veterinarians are participating in a hospital-wide program that will enable the practice to better serve and care for their patients and their owners. Ask for permission to be present and to observe the visit and exam.

• **Observing individual:** As the observing individual, most commonly a veterinarian or manager trained in this area, the primary goal is to observe the attending veterinarian and document what is observed as indicated on the worksheet. While in the examination room, this individual should not disrupt the appointment by conversing with the client, patient, attending veterinarian, or any other staff. The staff should be instructed not to approach the observing individual regarding their cases, calls, and so on while the observation is taking place. The observer should be inconspicuous and hold comments until after the appointment or document them on the provided worksheet in between visits. Normal business attire should be worn, and the observer should be present from the onset of an appointment through its duration.

Reflection Conference

Within a day, have a reflection on the observation session. The observer asks questions such as "What was your impression of the exam room experience?"

The observer shares their notes and then asks the attending veterinarian to reflect on them. Look for patterns. What worked well? What didn't? The observer can clarify or recreate instances that were documented. Hopefully the attending veterinarian will be able to draw some conclusions based on the data and their personal reflections.

According to the preset goals and notes, the observer asks the attending veterinarian what they would do again. What would they eliminate?

The observer confirms what the attending veterinarian has said: For example, "What you have said is that you would continue doing this, but would like to work more to develop another skill; is this correct?" Agree on what will be worked on next and when to meet again.

Structure of Program

To be of value, each attending/observing team member should review at least three or four appointments together. The accomplishment of these sessions ought to be reported to the practice manager to keep in a coaching training log. With mutual agreement, any topics that your coaching team feels might need to be addressed with general training or a procedural review should be provided to the practice manager.

EXAMPLES

N/A

CAUTIONS

To be successful, a coaching program must have management support and team engagement. There is a significant time commitment for those directly involved, and effort from the whole team is needed to help support the process.

3.17. MENTORING

BASICS

OVERVIEW

• Staff is the single most important component of any veterinary practice.
• In order to perform at their best, staff members must continually participate in staff training (see 3.10 – Staff Training) and personal development (see 3.14 – Staff Development). The magnitude of the need for staff training is tremendous. Some studies estimate that 30–50% of an employee's knowledge base is obsolete in 3–5 years. That means the typical employee needs to "refresh" 10–15% of their knowledge each year.
• Mentors can be created and/or selected for almost any task of almost any size. For example, a mentor may be responsible for overseeing the complete orientation and training program for a new receptionist, or to work with an assistant to help guide them through their personal development as they try to determine if their long-term career aspirations point them toward customer service, becoming a technician, or becoming a manager. What is important is that when you start a mentoring program, you start small and build on a foundation of successes. If you try too hard to solve all of the practice's training challenges at once, you will most likely fail. Every time a program is started and fails, it makes it significantly harder to try to start that program again and make it successful. Starting a mentoring program is like the old adage that states, "If you can't find the time to do it right, how will you find the time to do it over?"

TERMS DEFINED

Mentoring: An informal relationship where, on an ongoing basis, a more experienced individual offers guidance and/or career advice to a less experienced colleague.

ISSUES AND OPTIONS

CREATING A SUPPORTIVE CULTURE

• Mentoring programs are most successful when the practice culture supports them (see 2.26 – Changing Organizational Culture). If they are not supported by upper management, they usually fail relatively quickly.
• A practice culture can support mentoring by developing a reward system that supports and encourages a commitment to training. Rather than rewarding employees for what they know, they are rewarded for what they help develop in others. For example, if they help spark new passions in an employee, they can help drive employee engagement and employee retention.
• Changing the compensation system from one that rewards longevity to a skill-based compensation program also helps create a positive practice culture that supports mentoring. Skill-based compensation programs need to balance worker productivity goals with training and development needs, but once they have been properly established they can significantly improve a practice's productivity, morale, and bottom line (see 3.1 – Compensation).

DEVELOPING A MENTORING PROGRAM

• The first step in developing a mentoring program is to identify staff needs. Performance appraisals are an excellent source of data, and appraisals that utilize employee development goals, or self-evaluations are particularly helpful in determining needs (see 3.14 – Staff Development). As always, if you want to know what your staff members think they need (or want), you need to ask them. There are other resources available that you might not think of right away, such as customer interviews and customer service surveys. Successful businesses know what their clients want and need; they know this because they asked them. Some well-designed survey questions may identify a customer service failure that needs attention.
• Once you have a firm understanding of practice needs, it is time to begin identifying the mentors. These are individuals who have mastered their role, or a process and are able to share their life lessons with others. For example, a technician who has just obtained their Veterinary Technician Specialist (VTS) certification may be able to act as a mentor to another technician who is beginning the VTS certification process. The process takes several years to complete and requires a rigorous application and study process. Mentors can help candidates with time-management and priority-setting skills even though they may not be the best trainers of technical skills.
• Not all individuals are good teachers, and some of them may not even be motivated to teach. If, however, they would like to try, you should give them the support and opportunity to do so. Sending promising candidates to a "Train the Trainer" seminar may be a good investment.
• A good mentor recognizes their personal limitations. They may not wish to handle an entire topic by themselves, and if they wish to actively recruit others to assist them, this should be encouraged.
• Not all mentors will come from inside the practice; a good leader finds mentors elsewhere. Opportunities could include spouses of employees, consultants, or allied professionals such as accountants or lawyers. Some community colleges offer mentoring services to small business owners utilizing faculty, students, or an allied organization such as SCORE (Service Corps of Retired Executives). Members of SCORE have spent their entire life in the business world and have something to give back to younger members of the community who are starting out.
• The practice needs to support the mentoring process by scheduling time away from regular responsibilities for the mentor and the student to interact. Without a commitment from practice leadership to give these individuals time away from their duties, the mentoring program is doomed to failure. To help facilitate mentoring, many practices divide their day into client time and task time. Client time represents the time of the day when the practice is the busiest, so the focus is on customer service and patient care. Task time is when the practice is slower, so tasks such as training and restocking can take place. A common task time is Tuesday through Thursday, early afternoon.
• Good mentors are always alert for teaching moments. Teaching moments are when a task needs to be completed and a student who needs to learn that task is present. Examples could include a patient that needs an intravenous (IV) catheter placed, or a set of radiographs taken, or urinary sediment examined. Thus, the training activity results in the completion of real work that needed to be completed, resulting in maximum efficiency.
• The 70:20:10 Model for Learning and Development is a common formula within the training profession used to describe the optimal sources of learning by successful employees (see 3.14 – Staff Development). It holds that individuals obtain 70% of their knowledge from job-related experiences, 20% from interactions with others, and 10% from formal educational events. According to the model, hands-on experience (the 70%) is the most beneficial for employees because it enables them to discover and refine their job-related skills, make decisions, address challenges, and interact with influential people such as bosses and mentors within work settings. They also learn from their mistakes and receive immediate feedback on their performance. Employees learn from others (the 20%) through a variety of activities that include social learning, coaching, mentoring, collaborative learning, and other methods of interaction with peers. Encouragement and feedback are prime benefits of this valuable learning approach. The formula holds that only 10% of professional development optimally comes from formal traditional courseware instruction and other educational events, a position that typically surprises practitioners from academic backgrounds. It is worth

Vet-eBooks.com

mentioning that since it is assumed 70% of learning takes place on the job, it is critical to have confident and credible mentors available on the floor to help employees through the development process. If employees are going to be molded and shaped by those mentors, then it is crucial that practice leaders select the right people and give them the support they need, so they can then mentor the general staff.
• Mentors also need authority that goes along with their mentoring responsibility. You may think of this as latitude or flexibility. For example, if a mentor's communication style is different from yours, or if they take a different approach to teaching the subject than you would, you need to step aside and allow them to develop their own unique style. The outcome is the focus, not the process.

EXAMPLES

• If you have worked in a veterinary practice, you can probably list numerous examples of soft skills that should be mentored and developed in your staff. Therefore, it might be best to use this space to list "examples" of the many benefits of a well-run mentoring program that may be less obvious. These benefits provide the return on investment the practice needs to justify the time and resources committed to the program.
• Mentoring results in a more highly motivated staff, which can in turn more highly leverage the doctors. Doctor time and expertise is the scarcest and most valuable resource in any veterinary practice; thus leveraging the doctors increases practice productivity.
• Practices with highly motivated and engaged staff generally provide a higher level of patient care then those with poorly trained staff.
• Practices with a well-established mentoring program in place generally have a much higher percentage of team members who are cross-trained to fulfill multiple roles within the practice. This makes the practice less vulnerable to the impact of vacations, turnover, and long-term leaves of absence.
• Increasing staff training increases staff satisfaction and productivity, which in turn decreases staff turnover. This is an important factor in improving client retention rates.
• Practices with a well-developed mentoring program in place find it substantially easier to recruit new team members. During even the worst market conditions when some practices had lead times in excess of a year to fill vacant positions within the practice, some practices with a mentoring program in place had waiting lists of candidates who wished to join them.
• A highly trained staff is more capable of providing a higher level of customer service than a poorly trained staff. This results in greater practice profitability as well as an accelerated practice growth rate due to increased word-of-mouth referrals from existing clients.

CAUTIONS

• Mentors should be available for team members at all levels of skill and tenure. It is a mistake to think that only new employees can benefit from a mentoring program.
• There is no role for punishment or negative consequences in a mentoring program. Positive outcomes should be celebrated by the entire team. Negative or poor outcomes need to be evaluated and a different approach taken. It is important to celebrate the attempt to encourage continual effort and commitment on the part of both the mentor and the student.
• Always develop clear goals and expectations with everyone involved. This is one place where an ounce of prevention is really worth more than a pound of cure.
• Establishing deadlines or target dates for specific milestones is important. Even if deadlines are not met, knowing there is a deadline is a motivator for most individuals.
• Do not overwork or burn out your mentors. Mentoring can be emotionally draining work as an individual tries to complete his or her regularly assigned tasks at the same time as being a resource available to others. The strategic development of deadlines can help by giving excellent trainers periods of down time so they can recharge.
• Sometimes, after attempting to mentor several employees, experienced and excellent team members who look like they will be good mentors keep coming up short. It may be time to relieve them of mentoring responsibilities. The practice leadership will need to determine how much time and resources can be committed to developing a mentor before it is decided that he or she is not well suited to this role for whatever reason.

MISCELLANEOUS

• Just as supervisors can receive a supervisory differential in their pay, many practices pay mentors a differential while they are mentoring someone. In many cases, the financial incentive pales in comparison to the value of recognizing the efforts put forth by the mentor.
• Everyone involved in the mentoring program (the mentor, the student, and the leader) should make use of technology to help them achieve their goals whenever possible. The mentor can use various media sources, including DVDs, as well as Internet resources, to help offer guidance. Students can utilize the Internet for research and they can utilize software for making notes and charts. Digital photographs can also be helpful for everything from learning to identify parasites under the microscope to how to prepare an instrument pack for the autoclave. Leaders can utilize software to keep development records and to keep track of important things such as skill charts and deadlines for training objectives.
• Procedure and protocol manuals can be excellent tools that help mentors and students alike by ensuring that topics are taught to the standards the practice leadership has established.

3.18. STAFF SCHEDULING OPTIONS

BASICS

OVERVIEW

• One of the most critical and challenging functions of a practice manager is to design a proper staff schedule.
• A properly designed staffing schedule can maximize practice productivity, because it can make it possible for the staff to deliver a consistently high level of customer service and patient care while concurrently managing staffing costs for maximum efficiency.
• Schedule flexibility is one of the most desired benefits by Millennial and Generation X staff members and so it is a key component in staff morale, productivity, and retention. Schedule flexibility may include shift length, ability to trade shifts, split shifts, and enabling staff to work remotely.
• Following the lead of their younger peers, over the last five years more Baby Boomers have expressed a desire to work a flexible schedule.
• Although a properly designed and administered schedule can produce all the previously mentioned benefits, a poorly designed and administered schedule can have the opposite effect on practice operations and bring a seemingly great practice to its knees.

TERMS DEFINED

Exempt: Specific employees may be exempt from the minimum wage and overtime requirements of the Fair Labor Standards Act. Doctors are typically exempt employees.
Fixed Schedule: The scheduling of staff members, their duties, their workday, and workweek are the same (fixed) week after week and do not change.
Hybrid Schedule: This schedule has characteristics of both a fixed and rotating schedule. A typical hybrid schedule may include a fixed weekday schedule with a weekend rotation.
Nonexempt: Staff members covered by the Fair Labor Standards Act minimum wage and overtime regulations. Technicians and receptionists are typically nonexempt employees.
Per Diem: Staff members scheduled one day at a time as needed by the practice. For example, a former staff member hired on a per diem basis may be called in to cover operations during a staff meeting.
Presenteeism: Term that refers to employees who wish to work a large number of hours each workweek, or employees who refuse to take sick or personal time when they are ill.
Rotating Schedule: The staff, their shifts, and their responsibilities rotate. The rotation may be always the same (fixed) or random in nature.
Seasonal Staff: Staff members who work only during a specific season of the year. The most common example is that of college students who have returned to the practice during the summer months and/or holidays.
Skill-Based Scheduling: A method of scheduling based on the known skill sets of individual employees and the needs of the practice. Skill-based scheduling is just beginning to appear in veterinary medicine. The more skill sets an employee has developed, the more flexible their scheduling options. Examples could include ensuring there is at least one assistant with client education skills, restraint skills, and phlebotomy skills in order to support appointments. This type of scheduling ensures all typical tasks can be completed by the staff on-hand, instead of just ensuring an appropriate "body count."
Split Scheduling: This is when an employee works for more than one business unit within a single workday or workweek. For example, a receptionist on a split schedule could work in the general practice from 4 p.m. to 9 p.m. and then move to the emergency practice from 9 p.m. to 11 p.m. to finish her shift.
Split Shift: A shift that contains at least one break that is larger than a meal break. For example, an employee on a split shift may work 8 a.m. to noon, then 4 p.m. until closing. The advantage to the practice is it schedules employees during greatest need, so it uses payroll dollars very efficiently. However, an employee typically needs to live near the practice and have other ways to utilize their time between shifts in order for this arrangement to be a win–win for both parties.
Template: Standard layout of a schedule that can be used to schedule into the future (such as a month in advance) or to speed up the creation of the fixed component of a schedule. Templates simplify schedule creation and allow staff members with fixed or standard rotations to predict their future work schedule in advance.
Workweek: Most often defined as the range of time between pay periods. Sunday through Saturday or Monday through Sunday are the most common workweeks in veterinary practices. By monitoring a nonexempt employee's workweek, you can reduce the necessity for overtime.
Workday: Individual states may define a workday differently. Some refer to it as a 24-hour period that includes a specific block of time away from the workplace, whereas others refer to it as a single contiguous work shift.

ISSUES AND OPTIONS

TOOLS

• There are numerous tools available in the workplace today to assist with the development and maintenance of schedules.
• Handwritten schedules should be obsolete for any practice larger than two staff members.

Vet-eBooks.com

• Schedules developed in a word processing program such as Microsoft Word are easier to read than handwritten schedules. Tables can be created, and names can be substituted more easily, but this is still a cumbersome format.
• Calendar software creates easy-to-read schedules and allows for quick and easy revisions.
• Spreadsheets offer all the previously listed features along with the added capability of calculating the number of hours for which a staff member has been scheduled. This feature is important for monitoring the hours of nonexempt employees and employees that have negotiated a minimum number of hours to work.
• Time clock software is available with a wide range of features in a wide price range. Many veterinary practice management software packages include some level of time clock software. Better software packages facilitate the development of the work schedule, and are therefore able to identify tardy employees, potential overtime shifts, and other scheduling trends. Time clock software associated with the practice payroll provider can dramatically reduce the labor involved in payroll processing as well as potential errors.
• Today, practices of all sizes find scheduling software economical and easy to use. Internet-based programs (e.g., www.whentowork.com) are scalable, allow the use of multiple scheduling templates, allow 24-hour access, automatically alert employees of schedule changes, ensure proactive staff budgeting compliance, and support shift trades and time off requests. They also support blanket email communications such as announcing staff meetings, or sending out text blasts to fill open shifts. Most scheduling software facilitates the use of skill-based scheduling and split scheduling as standard features.
• Benchmarks and rules of thumb are valuable tools to aid the scheduling process. A practice can develop their unique numbers based on their history, or they can consult numerous national resources that are readily available. Common benchmarks include full-time equivalent (FTE) support staff/FTE doctor ratio, revenue per FTE support staff member, wages as a percentage of revenue, the number of transactions per employee, etc. Collectively they can help the scheduler determine if existing staff members are stretched too thin, or if they have additional capacity to manage and increased caseload.

EXAMPLES

SAMPLE STAFFING GUIDELINES

• To begin a schedule, it is best to first outline the specific needs of the practice. Your practice may have four exam rooms, for example, which will accommodate two veterinarians each during appointments. How many people are needed at each position within the practice to support customer service and patient care?
• Once you have determined the specific needs of the practice, you should establish guidelines to accommodate those needs. For instance, the number of desired receptionists per shift may equal one more than the number of doctors on duty. The number of exam room technicians may need to be equal to the number of doctors on duty. Taking into account the aforementioned guidelines, if two doctors are on duty, you will need three receptionists and two exam room technicians to support them. You may also wish to have a treatment technician on duty in case any patients are admitted for procedures.
• Staffing guidelines are best developed during staff meetings and not in the middle of busy times. A guideline created during a crisis may be unique to that particular scenario and therefore not helpful to general operations. Staff members tend to remember busy days when they were understaffed; practice leaders tend to remember slow days when they were overstaffed. The real scheduling target should be the sweet spot in the middle.
• Other guidelines may limit the number of new employees in training that can be scheduled during each shift or in each department.
• Staffing budgets may generate guidelines as to how many employee hours can be scheduled each week to efficiently meet practice needs.
• Although most practices do not use true skill-based scheduling, employee skill sets are often figured into the scheduling mix. For example, you might schedule one receptionist with strong computer and telephone skills and one technician with good restraint skills on each shift.

Vet-eBooks.com

3.18. STAFF SCHEDULING OPTIONS

• Formal deadlines for posting the schedule and submission of the staff's time-off requests should be communicated to the entire staff; moreover, the entire staff should agree with and comply with established deadlines. For example, a monthly schedule should be posted by the 15th of the previous month. Vacation and continuing education requests should be submitted no less than one month in advance.

CAUTIONS

• Always post written or printed schedules. Avoid verbal schedules.
• Require employees to submit in writing all requests for schedule changes and requests for time off and grant approvals in writing as well.
• To avoid the perception of favoritism (i.e., questions regarding why some requests are approved and others rejected), implement a written protocol that explains how time-off requests are processed and approved. Typical criteria would include the date the request was submitted, the operational needs of the practice, how recently the employee had other time off, and the staff member's length of service at the practice.
• Keep these written requests in each employee's personnel folder for the same length of time you are required to keep their payroll records and time cards.
• If scheduling different departments or groups separately, schedulers should have access to the other related schedules. For example, if scheduling nursing staff, the scheduler should know if one or more doctors are scheduled to be away from the practice during a specific period of time. Staff members that typically work with that doctor should be reassigned to other doctors or functions (such as training) in order to maintain productivity.
• Making schedules work in a busy practice is an art form. Savvy schedulers have very positive relationships with their coworkers in order to get schedule flexibility and buy-in. In many practices the scheduler is not the same person who is in charge of performance management or disciplinary actions as it is hard to issue someone a written warning, then ask them if they can work Saturday morning!
• Offering increased schedule flexibility is a great benefit for staff, but it can dramatically increase the supervisor's workload. Always try to find a balance with which both parties are comfortable.
• Offering scheduling options to staff members is becoming an extremely popular practice and is generally well received by staff. Such options might include five 8-hour days, four 10-hour days, or three 12-hour days with a 4-hour morning or evening shift. Please check with an attorney first to see if there are any state laws that regulate such schedules.
• Plan for contingencies as best as possible. Per diem staff members and employees on call can be two excellent tools to help maintain schedule integrity.
• Presenteeism is a relatively new concept in the business world that actually has two different and distinct meanings:
  ◦ The original definition of presenteeism refers to those employees who wish to work a large number of hours each workweek. They are always asking to cover extra shifts and are the first to offer to work overtime for reasons other than financial need. These individuals are usually workaholics or individuals who are avoiding dealing with specific personal problems such as an uncomfortable personal relationship at home. They tend to be unproductive given the amount of time they are present in the workplace.

Vet-ebooks.com

◦ Presenteeism also refers to those employees who refuse to take sick or personal time when they are ill. Instead, they show up at work and try to perform their duties. Research has shown that a team is generally more productive if they are short one worker who is sick, because everyone pitches in to complete the work at hand. If the sick person comes to work, he or she generally performs at a lower level of both work quality and work volume. They also spend time describing their maladies to coworkers and clients, which further decreases productivity in addition to being contagious and therefore likely to infect their coworkers, causing additional disruption to practice operations.

MISCELLANEOUS

• Remember that scheduling needs and scheduling templates should be reviewed on a regular basis to ensure that they continue to meet the needs of the practice as it changes and evolves.
• Because seasonality affects scheduling in most areas, remember to increase staff numbers during the busy season(s).
• Twenty-four-hour practices may have trouble filling specific shifts, such as Friday or Saturday overnights. During these times, a financial incentive called a shift differential is often employed to entice staff members to volunteer to work these shifts. Currently, shift differentials average between 10 and 20% of the employee's regular hourly wage and may be expressed as a percentage of their wage, or as a flat dollar amount per hour.
• If a work group needs leadership during a time when their supervisor is not scheduled, many practices will designate an individual as a shift supervisor. This individual may receive a financial incentive called a supervisory differential, which is similar to a shift differential.
• If your practice is trying to fill a position that requires weekend or evening hours, it is best to state this in the job posting (advertisement) to avoid wasting time with potential candidates who cannot meet practice needs. Many practices have applicants complete a schedule availability form as part of their employment application. Candidates must list when they are not available to work and why. This avoids hiring someone who states they can work anytime, then states they are unavailable due to a prior obligation when they are scheduled to work an evening or weekend shift.

3.19. STAFF PERFORMANCE EVALUATIONS

BASICS

OVERVIEW

• The major responsibilities for setting performance appraisal tone and climate rest with managers and the human resources department. However, even when managers and human resources do their jobs well, employees who come at the process with a negative or defensive approach are not likely to gain from the process or to prosper over the long term. The constant key is for employees to participate actively and assertively, but to keep a problem-solving mindset, and keep focused on how things can be improved in the future. No matter who initiates it, performance appraisal is about positive, open communication between employee and manager.

• Managing employee performance starts before a new person walks through the door. Your applicants and candidates form opinions of your organization, for better and for worse, all through the application and interview process. People who apply to your company and never receive a response form an opinion about you as an employer, and this public relations experience can color the interaction the ignored applicant has with many other people about your organization.

• Clarity about goals and direction, frequent feedback, and the chance to grow and develop new skills create what the Gallup organization calls an "engaged" employee, and the "engaged" employee is hard to find in organizations these days.

• Gallup's research suggests that you need to hire people who have the talents, skills, behavioral characteristics, and drive that you need because "a person's talents do not change much after he is hired, and a person will improve the most in his areas of greatest talent." Gallup suggests these two criteria will "serve as the blueprint for a new kind of organization. It will be an organization that selects for talent, holds people accountable for performance outcomes, challenges people to reach these outcomes by capitalizing on their greatest talents, and offers people a way to build their careers by building on their greatest talents."

• There are four disciplines necessary for effective performance management:

  ◦ Hold all employees accountable for their local performance outcomes.

  ◦ Teach all employees to identify, deploy, and develop their strengths.

  ◦ Align all performance appraisal and review systems around identifying, deploying, and developing employee strengths.

  ◦ Design and build each role to create world-class performers in the role.

TERMS DEFINED

Performance Appraisal: A system of determining how well an individual employee has performed during a period of time. The appraisal may include some form of a development plan to address insufficient performance and to reward appropriate and exceptional efforts.

ISSUES AND OPTIONS

For a performance appraisal program to work, the system must be designed to give employees clear goals and rate their progress objectively. The most successful rograms typically combine four elements:

• **Regular, informal feedback from supervisors:** Once-a-year evaluations are not enough; employees should receive regular input from their supervisors. These discussions typically focus on day-to-day performance objectives rather than concentrating on the employee's past mistakes or failures. This approach requires supervisors to observe and evaluate their employees regularly and to work closely with individual employees as needed.

• **Performance goals set by employees and supervisors:** Goals may be both short and long term and can cover a wide variety of objectives, depending on the employee's current job responsibilities and future aspirations (see 2.19 – Staff Performance Planning). Identified core competencies should be used to determine future performance goals (see 3.14 – Staff Development). Goals should be specific and quantifiable where possible, such as the completion of a specific project within a set period of time. To help employees meet their goals, supervisors should offer additional training or other necessary support. New performance goals should be recorded, reviewed regularly, and modified as needed.

• **Action plans to address performance or disciplinary problems:** Action plans can be helpful when an employee is experiencing performance problems that need correction. The supervisor should identify and discuss the problems with the employee as they occur and suggest a course of action that may improve performance. The plan should detail the nature of the problem, the steps that both the employee and the supervisor will take to help solve the problem, and the time within which the plan will be implemented. The employee should have input on the plan and suggest changes. Once a plan has been agreed upon, it should be reviewed regularly to make sure the employee is able to implement it successfully.

• **Formal reviews that accurately document the "big picture:"** Ideally, these formal reviews should be done several times a year, although if informal meetings are conducted regularly, you may be able to get away with an annual or semiannual review. Generally, they should not be used to deal with ongoing performance problems. The employee should have been alerted to these during the informal discussions and should be following an action plan to correct them. Instead, the purpose of these meetings is to assess whether goals and any action plan have been met and to determine if the employee is following the right path for career development.

Performance appraisals are not fun. A lot of the time they are agonizing because managers do really dumb things and end up destroying a process that is (or should be) important to everyone. Here are some of the pitfalls that you should avoid when responsible for employee performance appraisals:

• **Pitfall 1:** Spending more time on performance appraisal than performance planning or ongoing performance communication. Performance appraisal is the end of a process that goes on all the time – a process that is based on good communication between manager and employee. So more time should be spent preventing performance problems than evaluating at the end of the year. When managers do good things during the year, the appraisal is easy to do and comfortable, because there are no surprises.

• **Pitfall 2:** Comparing employees. Be careful with this. Although ranking systems and peer reviews are a great component in a review process, having this as your sole review system is a recipe for disaster.

• **Pitfall 3:** Forgetting that appraisal is about performance and not blame. We do appraisals to improve performance, not find a donkey to pin a tail on or blame. Managers who forget this end up developing staff who do not trust them, or even cannot stand them.

• **Pitfall 4:** Stopping performance appraisals when pay is no longer tied to the appraisals. Lots of managers do this. They conduct appraisals so long as they have to do so to justify or withhold a pay increase. When staff hit their salary ceiling, or pay is not connected to appraisal and performance, managers do not bother. Performance appraisal is for improving performance; it is not just about pay (although some think it is only about pay). If nothing else, everyone needs feedback on their job, whether there is money involved or not.

• **Pitfall 5:** Believing the manager is in a position to accurately assess staff. Managers delude themselves into believing they can assess staff

Vet-eBooks.com

performance, even if they hardly ever see their staff actually doing their jobs or the results of their jobs. This is not possible – most managers are not in a position to monitor staff consistently enough to be able to assess well. And besides, what manager wants to do that or has the time? And what employee wants their manager perched at their shoulder, watching their every action? That is why appraisal is a partnership between employee and manager.

- **Pitfall 6:** Canceling or postponing appraisal meetings. This can happen a lot, perhaps because nobody likes to do them, so managers will postpone them at the drop of a hat. Why is this bad? It says to employees that the process is unimportant or phony. If managers are not willing to commit to the process, then they should not do it at all. Employees are too smart not to notice the low priority placed on appraisals.
- **Pitfall 7:** Measuring or appraising the trivial. Actually, the easiest things to measure or evaluate are the least important things with respect to doing a job. Managers are quick to define customer service as "answering the phone within three rings," or some such thing. That is easy to measure if you want to; what is not easy to measure is the overall quality of service that will get and keep customers. Measuring overall customer service is hard so many managers do not do it. But they will measure trivial things.
- **Pitfall 8:** Surprising an employee during the appraisal. If you want to really waste your time and create bad performance, this is a guaranteed technique. Do not save up mistakes made during the year and then suddenly reveal them at the appraisal meeting. Far better to talk to staff during the year and deal with mistakes as they occur.
- **Pitfall 9:** Thinking all employees and all jobs should be assessed in exactly the same way using the same procedures. Some people need specific feedback; some do not. Some need more communication than others. And, of course, the jobs are all different. So, why do some managers insist on evaluating the receptionist using the same tools and criteria as the veterinarians in the office?

3.20. STAFF TURNOVER AND RETENTION

BASICS

OVERVIEW

• No matter how competent a veterinarian you may be, your success as a doctor and/or as a practice owner depends on the staff around you.
• Locating, interviewing, and training new staff members represents a significant cost – one not measured solely in dollars, but also in time spent that takes productive employees away from doing their regular jobs.
• There can be many reasons why team members choose to leave a practice, and the reason given may not be the real explanation.
• Identifying the most likely causes of staff turnover helps you avoid and/or solve staff problems before they lead to the loss of good employees.
• Many of the factors most critical to staff retention are low-cost or no-cost motivators.

TERMS DEFINED

Emotional Intelligence: The ability to sense, acknowledge, and value feelings, in ourselves and in others, and to respond appropriately to these feelings.
Expectancy Theory: An explanation of employee behavior based on the belief that people choose behaviors they see as leading to outcomes (pay, recognition, self-satisfaction, etc.) that are attractive to them at the time.
Job Enrichment: A method of making work more satisfying by expanding the tasks to increase not only their variety, but also the employee's responsibility and accountability.
Motivators: Factors that create change in an employee's behavior, making his or her actions more consistent with or complementary to the practice's needs.
Staff Turnover: The rate at which workers leave a workplace and need to be replaced by new employees.

ISSUES AND OPTIONS

• Motivating other people is an exercise in frustration – people motivate themselves. You cannot motivate somebody else; you can only provide the opportunity and the environment to enable them to choose different behaviors in anticipation of an outcome they see as more rewarding (see 2.5 – Motivating the Healthcare Team).
• Promoting self-leadership describes creating an environment that puts people in control of their own lives, based on the notion that leaders become more powerful when they give their power away.

WHAT DO EMPLOYEES VALUE?

• If you answered "money" as your first choice, you are only partially right. Money is at best a neutral factor. A severely underpaid employee who constantly cannot make ends meet may have to find another job or profession just to survive. Yet many long-term employees in veterinary practices across the country have been underpaid for years, even in relation to their peers in other practices, yet they stay. Why?
• Maslow identified a hierarchy of needs and suggested that people's needs change as each level is satisfied, much like climbing the rungs of a ladder (see Figure 3-20-1).

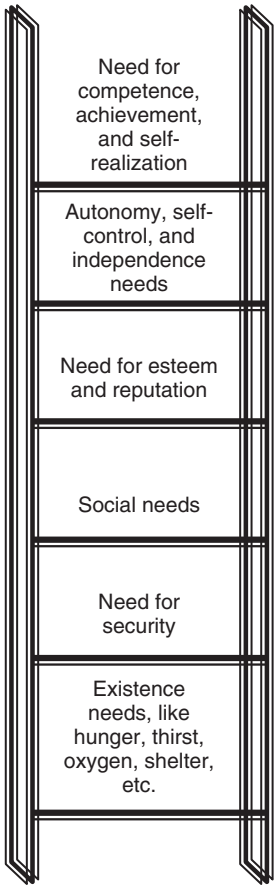

Figure 3-20-1.

Climbing up the Ladder of Human Needs, based on Abraham M. Maslow's needs hierarchy.

• Unless an employee's lower level needs are met, he or she will not be particularly interested in self-realization. But once basic needs are satisfied, the rungs further up the ladder become more inviting. For some employees, satisfying existence and basic security needs takes far more money than for others. But once a level of financial security (as defined by the employee) is reached, respect, autonomy, and self-realization become more effective motivators than money.
• Stated differently, a satisfied need is not motivating. Once you have eaten enough food to feel satisfied, the opportunity to obtain more food will not be motivating. Similarly, giving a raise to an employee who already feels financially secure will not motivate that employee for very long, if at all.
• A study by the Society for Human Resource Management (www.shrm.org) relating to job satisfaction in the United States found that employees place the most importance on job security.[1] That was true for 63% of all employees, both male and female, who rated that factor "very important." Just a few years ago, work-life balance was at the top, and now ranks only tenth, with only 38% rating that factor "very important."
  ◦ The aspect rated second in the same survey was having opportunities to use skills and abilities. Employees often have talents that are not required for their position, but they would like to be able to use those in the workplace.

Vet-eBooks.com

◦ Financial stability of the organization and relationship with the immediate supervisor were tied for third, with 55% of respondents labeling these as very important. Especially in turbulent times, employees value the comfort of having a steady job. But even during periods of prosperity, many staff members find comfort in staying out of the job market. But equally important was having a strong relationship with their supervisor, noting that those employees are more engaged in their work.
◦ Fourth on the list was compensation/pay. No doubt money and benefits are important, but do not lose track of the fact that three other factors were more important to the survey participants.
◦ What is more, employees who quit will often cite money as the reason even when that is not the real cause. It is easier to give notice and resign purportedly because of money than over lack of respect, unequal treatment, harassment, lack of trust, and other more sensitive issues.
◦ Nearly half of employees surveyed (49%) mentioned recognition by management as a source of job satisfaction. As a leader, catch someone doing something right and praise them for a job well done. Even if you are not in management, you can still commend a coworker for handling a difficult client well or pitching in during crunch times. Everyone likes to be appreciated; just do not do it so often and so flippantly that your comments seem forced or insincere. Say it when you really mean it!

THE VOLUNTEER PHILOSOPHY

• An interesting way of viewing staff motivation and retention is hypothetically to remove the concept of money as a reward. If you were running a volunteer organization and you needed people to offer their time to further your goals and mission, how might you recruit them and thank them for their efforts? A couple of thoughts come to mind:
◦ First, you would have to be able to describe your group's mission and purpose in a way that encouraged volunteerism; that is, describe how the work would improve humanity, result in better health or welfare, and increase the opportunities available for the targeted public, for example. The same is true for a veterinary practice's mission, and your staff already believe in the human–animal bond, animal welfare, and quality medical care. As a leader, you need to understand and communicate the connection between those goals and the daily work in your practice.
◦ Second, you would have to offer non-monetary rewards that would encourage continued participation in your volunteer group. Those might include verbal appreciation, a plaque or a certificate, or a letter acknowledging the time and effort the volunteer has committed – all fairly inexpensive rewards. If you had some additional money, you might consider a pin or pendant with the organization's logo or an annual pizza party.
◦ Third, you would try to be very creative about acknowledging your staff's efforts as frequently as possible while using the least amount of money. For example, finding ways to make the workday fun by posting cartoons or sharing humorous stories might increase volunteer enthusiasm. You would also understand that if your workers felt unappreciated or disengaged, they could just as easily volunteer their time elsewhere.
◦ Finally, you would know that if you violated their trust, made their work lives too difficult, or belittled their efforts, they would move on without hesitation. Therefore, you would be sure never to do that.
• Consider how these same principles apply to a veterinary practice. In reality, employees are volunteers – we outlawed slavery long ago. Even though you pay them for their services, they always have a choice, and the best employees have the most choices. Be sure you acknowledge their efforts in a meaningful way; a paycheck alone won't do the job.

INTERVIEWING TO REDUCE TURNOVER

• Reducing turnover starts in the interview process (see 3.7 – Effective Staff Recruitment and 3.8 – Screening Potential Hires). Be honest when you describe the job. For example, some applicants apply because they love animals, but quickly become disillusioned when they find out that even the best veterinarian cannot cure all diseases and repair all damage.
• Be realistic about the practice's expectations for the position. If the job requires carrying heavy bags of dog food, say so. If promptness is required because the employee will often be the first to arrive in the morning, stress that in the interview.
• If employees are required to wear smocks or polo shirts with the hospital's logo, or if they are required to wear name tags at all times, tell the applicant that in the interview. But also tell them why doing so improves the practice's image.
• Look for people in other service positions (wait staff, retail clerks, cashiers, etc.) who demonstrate strong customer service skills. Ask them to apply at your hospital.
• Prepare a list of interview questions ahead of time. Try to ask open-ended questions; that is, questions that require more than a "yes" or "no" response. For example, ask what the candidate liked best about their last job. Or ask them to describe a circumstance where they had to deal with an angry client or customer and how they handled the situation.
• Interview for emotional intelligence (see 2.15 – Emotional Intelligence). Every veterinary practice needs employees who are empathetic – people who understand and manage their own feelings and can recognize and respect the client's and coworkers' feelings as well.
• Interview to find people who understand and can describe the human–animal bond and who feel strongly about providing quality medical care and exemplary client service.
• Keep in mind that skills can be taught, but attitudes are harder to change. Nonveterinarian candidates with strong customer service orientations who demonstrate reliability and enthusiasm can be trained to do most of the tasks in your practice. Similarly, veterinarians who have strong technical skills may lack the interpersonal skills needed to succeed. Be wary about how much you can change an employee who does not want to change.
• Encourage team members to participate in the recruiting process. That might include recommending friends as potential candidates, designing interview questions, defining job expectations, interviewing potential employees, and ranking competing candidates. Employees who participate in the recruiting process and have a hand in selecting their coworkers are much more likely to help the new person succeed in the job.

TRAINING AND INTEGRATING NEW EMPLOYEES INTO THE PRACTICE

• Develop and implement a thorough training program (see 3.10 – Staff Training). Trial by fire (an all-too-common training approach in veterinary practices) does not help new employees succeed. Expect to spend a minimum of several weeks of ongoing training on different topics, with each new skill, task, or procedure a logical extension of what has already been learned.
• Consider assigning a mentor to each new employee (see 3.17 – Mentoring). Encourage the mentor to explain each task, demonstrate it, and then allow the new employee to take a turn. He or she should be available to assist, if needed, or to answer questions, but do not let the mentor do the new hire's job forever! Some people learn by watching, and others only learn by doing.
• Do not overlook the importance of sharing the owner(s)' vision for the practice (see 14.9 – Mission and Vision Statements). Effective leaders take the time to describe their vision of the practice's future in such clarity and with such regularity that their followers want to go along. That requires regular interaction with both new and existing employees.

Vet-ebooks.com

3.20. Staff Turnover and Retention

• New employees going through training likely bring experience from other hospitals or other jobs. Encourage questions and observations about the practice's policies and procedures, and be open to suggestions. The best veterinary practices are always trying to improve themselves, and often good ideas come from outside the practice. So do not discount suggestions solely because they come from a new hire.
• Encourage new employees to critique the training process itself. If there are gaps in the training or if a different approach might have worked better, these are the people who will know.
• Rotate the mentoring process among employees. Do not expect one receptionist or one technician to be responsible for training all their coworkers. Different people have different training styles and will find a comfortable fit with different new hires. There also is no better way to learn something than to teach it, so mentoring offers a great way to brush up on skills and review existing procedures.
• Do not overlook the benefit of cross-training employees. That means having receptionists work in the back periodically and having technicians/nurses spend some time up front. Front office/back office conflict is rampant in veterinary practices as each group feels that the other one is making their lives more difficult. Cross-training allows each group to experience what the other group's workday is really like. Although practices sometimes hesitate to take the time to cross-train team members, the benefits are great. Not only can different employees cover for one another when needed, but they also develop a much greater understanding of the difficulties each group faces. There are no easy jobs in a veterinary practice.

BUILDING AND RETAINING KEY EMPLOYEES

• Once training is complete, do not allow good employees to become bored with repetitive tasks, lack of recognition, and a scarcity of challenges. Consider job enrichment, which might be achieved by putting a technician in charge of a task force to investigate a new equipment purchase, having a receptionist "secret shop" the competition, or asking a doctor to develop a training program for technicians about identifying dental or skin problems.
• Empower employees by sharing information, involving them in practice issues, and encouraging them to improve internal procedures. Do not lose track of the fact that empowering employees generally means depowering owners. Do not be afraid to give up both the responsibility and the authority in selected areas, and do not expect a team member to take ownership of a task if someone in management is constantly second-guessing them.
• Beware of the annual performance review (see 3.19 – Staff Performance Evaluations). Historically, these consist of a written evaluation form that purports to measure the employee's overall performance since the last review, followed by a face-to-face discussion of the form. In reality, the people filling out the form must rely on their memories (not a good idea) or on notes made at the time of a specific event (a better idea, but likely to focus on bad behavior). The reviewer's comments, therefore, tend to highlight recent events (given the short memories we all have) and negative events (which, while memorable, should have been dealt with in a timely fashion and do not need to be rehashed months later).
• There should be nothing in the performance review process that comes as a surprise to the employee. Problems should not be allowed to drag on, and issues with attendance, client service, and communication within the hospital are too important to go unchanged for days or weeks, let alone months.
• Good employees will only remember the negative comments or "suggestions for improvement" in the performance review. Given that some reviewers believe that everyone needs suggestions for improvement, it is not surprising that many employees dread the annual review.
• Praise in connection with an annual review is nice, but it does not have the impact that immediate feedback would have had. Consider using performance review interviews not to focus on past performance, but to explore the employees' expectations of themselves and of the practice for the next year. Encourage feedback about job satisfaction, barriers to efficiency, or new opportunities to explore.
• Work with the employee to develop a timeline for learning new skills or taking on new tasks (see 3.14 – Staff Development). Consider having the employee outline these in writing and then have the hospital administrator mail a copy to the employee's home halfway through the year. This serves as a reminder and an opportunity for the employee to assess his or her progress toward the goals.
• Encourage team members to set goals that will answer this question: How have I become a better person and a more valuable team member over the last year?
• Develop a reward system that rewards the behavior the practice actually desires (see 3.4 – Employee Bonus Criteria). Historically, businesses have rewarded longevity; that is, each year an employee stays with the company, a raise is given. Viewed somewhat differently, that system is actually rewarding team membership and/or attendance by showing up for work for another year. Just because an employee has stayed does not necessarily mean that that employee is more valuable to the business than before. In fact, in the absence of job enrichment, long-term employees tend to get bored and may actually coast from year to year. A better reward system is one that offers raises when employees master new skills, get new credentials, or take on additional responsibilities – all things that can be negotiated and planned for as part of the review process.
• Consider implementing wage bands in the practice – that is, a system whereby each position (front desk staff, for example) has a low and high compensation level, with intermediate steps in between. New hires generally start at the bottom of the range and then work up as they earn raises over time. At some point, however, each will reach the top end of the bands for that position, in which case only overall cost of living raises will increase pay. To continue to get increases, an employee must learn new skills and take on new tasks, effectively moving into a different position with its own wage bands. That avoids the all-too-common scenario of a long-term employee who is doing the same job as 10 years earlier, but is now very highly paid and perhaps very stagnant.
• Include staff members in the decision-making process about issues that will directly affect them. For example, if you are changing practice management software, put together a task force to explore the options, determine the needs and costs, and make a recommendation to leadership. Doing so permits the employees to "buy in" to the entire process and allows them to become champions for the new system by being knowledgeable about its features.
• Encourage team members to offer suggestions for improving their jobs and the practice overall. They know what works and what does not work well within the practice, perhaps better than leadership ever can. Team members are full of good ideas and valid suggestions, but they need to understand that their ideas are respected and encouraged.
• The most valuable employees are those who are reliable, communicate well with coworkers and clients, and are capable of working independently. For leaders, that requires setting high expectations for team members as well as for themselves. Expectations subtly become realities, which can be both good and bad. If the practice is willing to settle for average employee effort, that is likely just what will happen. Fortunately, the opposite seems to be true as well: expecting high performance encourages it.
• Leaders get the best performance from others when they hire good people, give them good training, and then get out of the way. A key part of leadership's job is to remove barriers that impede efficiency, not to create those same barriers.
• The best veterinary practices demonstrate a sense of teamwork that is almost palpable when you walk into the hospital (see 1.11 – Functioning as a Healthcare Team). The atmosphere is relaxed, but not

Vet-ebooks.com

sloppy; each person knows what needs to be done and does his or her part in making it happen, and everyone puts the client's and the patient's needs above their own. Over and over, the employees at those practices state that they enjoy coming to work, they feel appreciated, and they believe they are making a difference day to day in someone's life. When that is what it is all about, it is no wonder that turnover is low.

3.21. EMPLOYEE MANUALS

BASICS

OVERVIEW

• Employee manuals or handbooks are commonly used by employers in businesses of all sizes to serve as a positive employee relations and communications tool. Although employee manuals are often a necessity for large employers, smaller employers should carefully weigh the costs versus benefits of undertaking the creation of an employee manual.
• Costs of creating an employee manual include the initial time involved in creating a manual and legal review of the manual. Legal review is not mandatory for an employee manual; however, if the manual is not reviewed, another cost must be considered – the cost of a lawsuit arising out of unlawful policies or wrongful termination.
• The biggest benefit of constructing an employee manual is positive employee relations. Employees know what is expected of them and what they can expect from the employer. A well-drafted employee manual can also reduce the number of lawsuits arising from employees because there are no surprises in the employment relationship.
• Employee manuals should be written in clear, concise language that is easy for employees to read and understand.
• Employee manuals should avoid an authoritarian tone. Remember, the true purpose is to create a positive employee environment and outline clear expectations through communication of policies.
• Each employee should be provided with a copy of the employee manual upon being hired. Additionally, any time the employee manual is revised the employee should be given a new copy of the manual or a copy of the revisions to be inserted in his or her original manual.

TERMS DEFINED

Employment-at-Will Relationship: The most common form of employment relationship between an employee and an employer. Under this type of relationship there is no contract between the employer and employee; the employee may quit at any time or the employer may fire the employee for any reason that is not illegal. For example, an employer may fire an at-will employee for poor performance, to cut costs, or because the employer simply does not like the employee, but may not fire an at-will employee for discriminatory reasons, to retaliate against the employee for reporting harassment, or because the employee exercised a legal right.
Family and Medical Leave Act (FMLA): Federal law that allows certain employees to take up to 12 weeks of unpaid, job-protected leave each year for the birth and care of a child, for placement with the employee of an adopted or foster child, for the employee's own serious health condition which causes them not to be able to work, or to care for a serious health condition of a child, spouse, parent or next-of-kin military service member.
Just-Cause Relationship: A relationship between an employer and employee in which the employee can only be disciplined or terminated for a sufficient reason (some examples are misconduct, negligence, or theft). In a few states and in some situations employers must at least show just cause for terminating an employee. For example, if an employer punished an employee without just cause, a Court can order the employer to compensate the worker. Just cause is legal jargon for a legitimate business reason, such as wrongdoing on the employee's part. Just cause is often a matter of interpretation by the courts. (There are also three major exceptions to the at-will relationship. States have chosen to adopt none or any number of these exceptions. For example, the majority of states have a public policy exception which protects employees from being fired for such things as refusing to break the law or filing a workers' compensation claim.)
National Labor Relations Act (NLRA): Federal law that grants employees the right to organize and bargain collectively with their employers (the most common means is through a labor union).

ISSUES AND OPTIONS

The following policies and statements are typically included in an employee manual:
• Introduction to the company and its mission, vision, and values (see 14.9 – Mission and Vision Statements). This section may also include a history of the company.
• Disclaimer of contract relationship. This states that the employee is an at-will employee and the employee manual is not intended to create a contractual employment relationship between the employer and the employee.
• Equal Employment Opportunity (EEO) statement. A statement by the employer that employment decisions are not based on race, age, sex, religion, national origin, color, veteran status, marital status, gender information, or disability.
• Performance standards and professional behavior standards including:
  ◦ Attendance and punctuality
  ◦ Hours of work
  ◦ Personal appearance
  ◦ Standards of appropriate conduct
  ◦ Social media standards of behavior
  ◦ Health and safety rules
  ◦ Drug- and alcohol-free workplace policy
  ◦ Smoking policy
  ◦ Harassment and discrimination policy (sexual harassment policy is required for all employers)
  ◦ Workplace violence
  ◦ Discipline procedures.
• Employee pay and benefits including:
  ◦ Vacation, sick time, holidays, personal days and/or paid time off
  ◦ Retirement and pension
  ◦ Health and life insurance
  ◦ Timekeeping procedures and overtime policy.

  Note: Be sure to distinguish any differences between full-time and part-time eligibility for benefits.
• Acknowledgment of receipt. A statement signed by the employee acknowledging the receipt of the manual and agreeing to abide by the company's policies. The employer should ask that the employee sign the acknowledgment upon receipt of the manual; the signed acknowledgment should be kept in the employee personnel record (see 3.27 – Personnel Records). This may be combined with the employment-at-will disclaimer.

Employee manuals also need to include certain policies as required by state and federal law. Such policies include: Family Medical Leave Act (FMLA), nondiscrimination, and sexual harassment reporting procedures. Legal counsel should be consulted to determine which policies need to be included in employee manuals in any particular state and for your organization. For example, FMLA does not apply to private employers with fewer than 50 employees.

Vet-eBooks.com

EXAMPLES

The following is sample language of a receipt of acknowledgment combined with an at-will disclaimer:

> *I have received and read a copy of the [company name] Employee Manual. I understand that the policies, rules, and benefits described are subject to change or may be revised based on the company's particular circumstances or a given situation. I understand that [company name] is an "at-will" employer. What this means is that the company is free to end the employment relationship at any time, with or without notice, with or without cause, and that my employment is for no specified period of time.*

CAUTIONS

EMPLOYMENT-AT-WILL VERSUS JUST-CAUSE

• One of the most common issues employers run into when creating an employee manual is unknowingly creating an employment contract or "just-cause" relationship. In other words, the employer creates an obligation to terminate employees only for a sufficient reason. Unfortunately, the courts and employers do not always agree on what constitutes a sufficient reason. Maintaining an at-will-employment relationship decreases the potential number of lawsuits that could be filed by terminated employees.

• While most employers do not terminate employees for anything other than what they view as a sufficient reason, it is important that an employer maintain the right to terminate an employee if the employee is not working out as well as anticipated. This is especially important for smaller employers where flexibility and a cohesive work environment are essential.

WAYS TO AVOID CREATING A JUST-CAUSE RELATIONSHIP WHEN DRAFTING AN EMPLOYEE MANUAL

• It is important not to fall into the trap of creating a just-cause relationship when drafting an employee manual. The easiest way to do this is to draft a disclaimer at the beginning of the manual and on the Acknowledgment of Receipt (see "Examples"). By including this disclaimer, the employer reserves the right to terminate the employee for any reason that is not illegal, without notice.

• When describing the disciplinary and termination process in the manual, avoid stating that employees may be terminated only for cause. Avoid using terms such as "for cause," "just cause," "proper cause," or "good cause." Use of these terms can turn an employment-at-will relationship into a just-cause relationship.

• Avoid referring to probationary periods in the manual. By referring to probationary periods, the employer implies that after the probationary period, the employee can only be terminated for cause.

OTHER CAUTIONS

• Employers should use care in following the policies outlined in the employee manual. Policies and manuals that are not adhered to and practiced in day-to-day operations are not worth the paper they are written on and will do little to protect an employer if litigation arises. Alternatively, a well-drafted manual that is followed in everyday practice can offer some protection against employment-related lawsuits. An example is sexual harassment cases involving supervisors. If the company has the legally required, well-drafted, well-communicated workplace harassment policy (see 13.15 – Workplace Harassment), the law provides an affirmative defense to employers who can show that such policy is maintained and followed.

• Different states have different laws governing employee manuals. Careful consideration should be given to state and federal laws when constructing or revising an employee manual.

• Employee manuals should not contain any prohibition on employees discussing wages, benefits, or terms or conditions of employment with other employees or non-employees. Such prohibitions have been found to be in violation of employees' rights under the National Labor Relations Act, and are therefore unlawful.

• It is a good idea to reserve the right to modify the manual, because it is impossible to anticipate every situation that may occur in the future. Labor and employment laws are constantly changing. All employee manuals should be reviewed on a regular basis by legal counsel to determine whether revisions or updates should be made. It is important to remain flexible and be open to modifications as needed. The employee manual should include language that reserves the right to make changes. When changes are made and new manuals or supplements are distributed, the employer should ask employees to sign a new or updated Acknowledgment of Receipt.

3.22. MEASURING YOUR HUMAN RESOURCE (HR) PERFORMANCE

BASICS

OVERVIEW

• Human resource (HR) management is about people – attracting potential employees to the practice, hiring the right ones, training them, retaining them, and, when necessary, letting them go without creating unnecessary trauma for either the employee or the practice.
• In virtually every kind of business, on some occasion or another, the top executive stands in front of the assembled workforce and says, "Our people are our greatest asset!" Cliché though this is, it is 100% true.
• Veterinary medicine is no exception. Its employees are the primary key to success in both medical/surgical care and in profitability.
• People management, however, is often the area in which small business owners make the most mistakes. Managing people well is a difficult job, and one in which most veterinary practice owners receive little to no training.
• Solid HR management begins with effective leadership.
• The HR function can be loosely divided into five areas, each of which needs its own scorecard to determine its effectiveness:
  ◦ Basic workplace policies
  ◦ Staffing
  ◦ Compensation and benefits
  ◦ Training, developing, and retaining employees
  ◦ Regulatory issues.

TERMS DEFINED

Human Resources: Also called human capital, the people who work for and operate an organization.
I-9: A US Citizenship and Immigration Services form called the "Employment Eligibility Verification" form to confirm employment eligibility in the United States.
W-4: Internal Revenue Service (IRS) form called "Employee's Withholding Allowance Certificate" used to determine the amount of federal taxes in the United States that the employer will withhold from a person's paycheck each pay period.

ISSUES AND OPTIONS

IT ALL STARTS WITH LEADERSHIP

• Are all management personnel within the practice committed to the importance of good employee management? This is a top-down commitment. First and foremost, the practice owners must believe in the value of every member of the hospital staff and be dedicated to managing fairly and effectively (see 2.12 – Leadership).
• Have all practice owners, doctors, managers, and supervisors received training in effective leadership, communication, and management skills? Is this training updated regularly? For most people these are learned, not innate, behaviors; good technical skills do not translate into good management skills.
• Do all management personnel have the time and resources to deal with HR issues effectively? HR activities and issues take time. On every manager's job description, "HR Management" needs to appear as a major topic, with the specific HR functions required of that position detailed.

THE HR SCORECARD

The following questions provide a scorecard for evaluating the state of HR in the practice. You are doing a good job if you (1) know the reason for the questions in each of the following sections, and (2) can readily provide the answers or the required information. Zeros on the scorecard indicate the areas for immediate attention.

Basic Workplace Policies

Just as written protocols and procedures are essential to the medical side of the practice, written HR policies and procedures are essential to the employee side.

Questions to ask and answer include the following:

• Does the practice have a written, complete, up-to-date employee handbook that describes all HR policies and procedures (see 3.21 – Employee Manuals)?
• Does the practice have signed compliance statements from all employees indicating they have read and understood the manual and agree to abide by the policies of the practice?
• Is a review of the handbook scheduled every six months or whenever a major policy change occurs? Updating is easy when it is done frequently.
• Is the handbook attractive, something you would want to open and read – no worn out copies of copies? Produce only the number of copies you will need at present and within the next few months and make it easy to read and understand.

Staffing

In staffing, it is much, much better to get it right the first time than to have to deal with an employee who is not qualified for his or her position or lacks the personal skills to fit into the practice (see 3.7 – Effective Staff Recruitment).

Termination is not only stressful for everyone, but it is very expensive, especially when you consider that you will have to start the hiring process over and duplicate the investment that you made in the departing employee (see 3.28 – Terminating Staff).

Questions to ask and answer include the following:

• Do you have current, accurate job descriptions? Job descriptions are invaluable in the hiring process as well as in future management of the team. A job description is essential for every position in the hospital. It includes the title of the position, the title of the position to which this position reports, the major duties of the job, and the education, skills, and abilities (technical and interpersonal) necessary for successful performance of the duties.
• Do you ensure that job descriptions are updated annually or when the job duties change, and that the people who do the job participate in writing the description?
• Does the practice have an effective method for attracting potential employees to the hospital (see 3.7 – Effective Staff Recruitment)? This could be through local newspaper adverts, college recruitment offices, online resources, local veterinary association publications, word of mouth, and so on. In general, the more of these sources a practice uses, the more likely it is to find good candidates.
• Who does the hiring in the hospital? What training have these individuals had in effective interviewing and hiring skills and in the laws governing hiring and the hiring process?
• Are standard forms in place to help with the hiring process? In addition to job applications, interview documentation and candidate comparison forms help make the selection process more effective.
• If pre-employment testing is used (see 1.15 – Personality Profiling), are the tests nondiscriminatory, administered to all candidates, and related only to job skills?
• Are references checked on all candidates? Has the person who checks references been trained in how to effectively collect this information?
• Are a completed W-4 (Employee's Withholding Allowance Certificate) and I-9 (Employment Eligibility Verification Form) collected from each new employee? If the state has new-hire reporting requirements, are these adhered to?
• Do you maintain personnel files for each employee in which all important hiring and employment information is kept?

Compensation and Benefits

Compensation and benefits become increasingly complex each year (see 3.1 – Compensation, 3.2 – Benefits, and 3.3 – Wage and Benefit

Vet-eBooks.com

3.22. MEASURING YOUR HUMAN RESOURCE (HR) PERFORMANCE

Summaries: The Whole Package). It is important to stay current with what is going on, not only in local veterinary practices, but also in other businesses in your area.

Questions to ask and answer include the following:

- Is the compensation structure based on specific principles designed to attract and retain the right people, or are salaries and raises decided haphazardly?
- Are compensation and benefits competitive not only with other veterinary practices, but with other businesses in the area?
- Is there a correlation between job performance and pay?
- Is the compensation structure reviewed each year to ensure the appropriate people are being paid the appropriate amounts?
- Are compensation policies in line with state and federal law?
- If the practice gives bonuses, are they accomplishing what they are meant to accomplish (see 3.4 – Employee Bonus Criteria)?
- Is the benefit package successful in attracting and keeping the type of people the practice needs?
- Has information about the benefits offered by the practice been communicated to all employees?
- Is there a designated person in charge of administering benefits? Does this person have a detailed working knowledge of the various benefits the practice offers, when employees are eligible, and the legal requirements for administration of the benefits?
- Are up-to-date, accurate records kept for each employee listing the benefits they are eligible for, sick time and vacation time used and accrued, and other details?
- Does a knowledgeable person review the benefits offered each year to evaluate their cost and usefulness in attracting and keeping employees?

Training, Developing, and Retaining Employees

In addition to pay and benefits, employees are also looking for other things in their work environment: opportunities to learn and grow, reasonable job security, pride in the company and their contributions, recognition, fair and open treatment, and a friendly work environment (see 3.14 – Staff Development and 2.1 – Workplace Management).

Questions to ask and answer include the following:

- Does the practice have an organizational chart (see 2.2 – Organizational Charts)? Even a small practice will find this very useful in making reporting relationships clear. Most people who work in a veterinary practice have more than one boss. The first is the owner of the practice (or perhaps a practice manager), but they are also expected to do what the doctors ask them to. Who is the primary person the staff member reports to? Who mediates conflicting demands on the employee?
- Has the practice performed a formal assessment of the skills it needs its employees to learn and how best to accomplish this?
- Does the practice offer a solid new-hire orientation program as well as formal new-hire training (see 3.9 – Staff Orientation and 3.10 – Staff Training)?
- Does the practice offer regular in-house and off-site training programs for all staff members?
- Are employees given the time and resources necessary to do their jobs to the best of their abilities?
- Does management regularly praise and encourage employees?
- Does the practice give performance evaluations on a regular basis (see 3.19 – Staff Performance Evaluations)? Do the employees know how they will be evaluated and what the most significant criteria are? Have they seen a copy of the evaluation form?
- Is employee satisfaction measured?

Regulatory Issues

This is the legal side of HR and it is what local, state, and national governments require from your business. Employment law covers everything from employee payroll taxes to nondiscrimination requirements to Occupational Safety and Health Administration (OSHA) to profit-sharing plan requirements.

Questions to ask and answer include the following:

- Are all management employees knowledgeable about the basic HR-related laws and regulations?
- Does the practice administer its benefits in accordance with the law and benefit plan regulations?
- Does the practice properly withhold and submit to the appropriate government agency both employer and employee payroll taxes?

3.23. OFFICE POLITICS

BASICS

OVERVIEW

- Whenever there are more than two people in a workplace, office politics result, whether you are aware of it or not.
- Office politics usually involves covert power plays, such as hoarding or distorting information for the purpose of getting "in" with the boss, or with other employees, for advancement of a personal agenda.
- The symptoms of office politics are usually manifested as sly personal attacks, hurtful gossip, barbed humor, passive resistance, lack of respect, lack of cooperation between team members, and poor morale.
- People need time to socialize a little at work, and affinity subgroups of employees naturally form. This becomes "office politics" when the subgroups become exclusive or engender a "them versus us" mindset that divides the hospital team.
- Practice policies that promote team values, fairness, and open communication can do a great deal toward minimizing office politics.
- Ignoring office politics or failing to address it only encourages it.
- It is the veterinarians' and the management team's responsibility to role-model the desired professional behavior and to be consistent and fair in their treatment of all employees.
- Showing favoritism encourages office politics. The "favored" employee may abuse his or her power; other employees are certain to resent the unfair treatment and may retaliate by showing noncooperation, or by secretly causing problems for the "favored" employee.
- Office politics are particularly treacherous because they are often covert and difficult to pinpoint. They usually take the form of rumors or lack of cooperation rather than overt sabotage, which also can occur.
- Office politics are all but impossible to eradicate, but can be managed. The goal is to foster a healthy, fair, working environment. Start with preventive medicine:
  - Is there a hospital policy stating that teamwork and cooperation are practiced here? Office politics have a difficult time thriving in a teamwork environment where people value each other and treat one another with respect.
  - Discuss appropriate ways for employees and associates to put forward ideas so that employees feel welcome to contribute and have a method of dealing with grievances, rather than feeling shut down. Some practices have successfully used suggestion boxes, but a better way is to create an open environment in which staff members feel comfortable sharing problems and asking for help.
  - As a first line of defense, set the expectation that individuals will calmly work out their differences with one another and confront poor behavior from other employees in a professional way.
  - If this fails, provide a procedure to document the problem in writing so that staff members can take it to their manager. If the problem is the manager or the practice owner, provide a procedure so that the employee can be safely heard. Failure to do so encourages employees to find less responsible ways to address problems, or they may become frustrated and leave.
  - Set leadership expectations that the doctors and managers must act as role models for constructive behavior. They must follow the guidelines consistently in their own conduct and in how they treat others who bring issues to their attention (see 3.24 – Conflict Resolution).
- Consistently reward appropriate behavior, and punish behavior you do not want in order to build the culture that you want.
  - To reinforce the workplace values you desire and to build the culture you want, it is important to discuss specific examples of desired behavior and celebrate successes that support the values you desire in your workplace. For instance, individuals should be commended when you see examples of employees successfully working out differences rather than gossiping about them. When the hospital team accomplishes a goal together, celebrate the successful teamwork accomplishment at staff meetings. This lets employees know the kind of behavior that is valued in your practice.
  - It is important for the leadership team to be consistent in addressing problem behavior. This can be a challenge. For instance, it is not unusual that a highly trained individual, or group of individuals, may start to feel "above the law." Symptoms of this are evidenced when the individual or group starts breaking rules or abusing privileges – disappearing for long periods of time, coming in late, refusing to work on weekends or holidays, and/or showing disrespect to others whom they perceive to be less important than themselves. No matter how "important" the individual is, this behavior cannot be tolerated and must be addressed even if you risk losing the employee or group members who are perpetuating it.

TERMS DEFINED

Office Politics: When an individual or group tries to circumvent the system to gain privileges or power by manipulating events or other people to their advantage, usually in an underhanded manner. This works against teamwork and fairness in the workplace.

ISSUES AND OPTIONS

- Office politics flourishes in environments where it is ignored and/or where employees feel they have no options or do not know how to achieve their goals other than to gossip or try to manipulate the system.
- Generational differences and department differences often contribute to office politics by creating misunderstandings and mistrust that pit people against one another, creating a "them versus us" attitude.
- The antidote to office politics is to put a proactive, positive policy in place that affirms an open, fair teamwork culture that values all its employees.
- The leadership team needs to support the policy through their own behavior, and by addressing breaches and bad behavior in a timely manner when they occur.
- Training is important to ensure that employees have the tools to constructively deal with differences and promote their ideas (see 3.14 – Staff Development). If they do not know how to do this, they will feel they are justified in "going underground."

EXAMPLES

Giving employees the opportunity and means to improve teamwork sometimes requires forcing the issue, as the following example illustrates:

You are the practice manager and you notice that the younger staff members seem to congregate and talk, excluding older members of the hospital team. They have their own TV shows, music, and interests, and they appear to have little in common with the more settled, older employees.

You drop by the staffroom during lunch one day to let the younger team members know that you have noticed their cliquish behavior and that you are concerned that it is dividing the hospital team into separate groups. You tell them this is not the way things are run here, and that it is important to foster an attitude of teamwork and inclusiveness. They tell you that the other employees are welcome to join them, but that they do not appear interested and seem to prefer to have lunch on their own. You then visit with some of the hospital's older, long-term employees, who shrug and say, "You know how kids are."

Vet-ebooks.com

There is also a difference in these two groups' reactions to the news that you are installing a new computer system. The young employees are highly critical of the current computer system and were delighted to learn that it was to be replaced. The older staff members, on the other hand, were concerned about the new computer system – skeptical about how well it would work and worried about their own performance and how good they would be at using the new system.

You call a staff meeting to review hospital policy on teamwork. You give the staff installation and training schedules for the new computer system and ask for their ideas to make the transition successful. In addition, to encourage teamwork, you set up staff partners to master the new system, matching one young employee and one older employee. The partners' goal is to help each other identify and work through transition problems so that the whole hospital can quickly get up to speed on the new system. You hold weekly staff meetings to air progress and frustrations, using these as opportunities to praise behavior that shows mutual respect, resourcefulness, and progress in achieving the goal of a smooth transition to the new system.

You are amazed at the resourcefulness that your employees show. One partnership develops an "old" and "new" code sheet so that anyone can quickly reference the new codes they now need to use. Another partnership develops "cheat" sheets to list the new commands they will use for most routine procedures, such as opening a new client record, changing client information, and taking payments. They share their ideas with the rest of the hospital team at the weekly meetings, and the younger hospital team members start feeling more valued and part of the team. Because old and new employees are working together to achieve a common goal, they are getting to know each one another better. After only a few weeks, you see the clique behavior begin to break down and genuine rapport among team members develops as they master the new computer system.

This solution can be used for other opportunities that might lend themselves to "forcing" employees to work together to achieve a common goal. These include such things such as improving compliance and patient care (see 4.11 – Compliance and Adherence) or solving a problem such as lost patient records or missed charges, among others.

3.24. CONFLICT RESOLUTION

BASICS

OVERVIEW

• Conflict is a natural byproduct of the workplace. Properly handled, conflicts can stimulate new thinking, progress, and growth. Unmanaged conflicts, however, can divide staff members, interfere with patient care, and erode team morale. This is especially true in veterinary practices, where team members are not often trained in constructive ways to handle conflicts or may not have learned how to share a different opinion in a positive, professional way.
• A practice without conflicts is not without problems. No conflicts may mean that staff members are afraid to speak up, or that they work in a culture where they have learned to just do as they are told, or that they all think so much alike that there is little creative tension to promote innovation and change. This kind of environment saps the staff's enthusiasm and initiative. It can also encourage passive resistance, because open conflict and differences of opinion are not permitted.
• People need a way to constructively resolve conflicts. Muffling conflicts only makes them go underground; it does not make them go away.
• Unmanaged misunderstandings can easily escalate into unprofessional behavior. The symptoms of conflict usually manifest themselves as avoidance of the other person(s), personal attacks, hurtful gossiping, barbed humor, and lack of cooperation among team members.
• According to an article in *Veterinary Economics*, employees welcome leadership's intervention in staff conflicts and want management to quickly address personnel problems, improve team communication, deal better with staff issues, hold more information-sharing meetings, and fire problem employees.[1]
• According to the same article, the top three areas that cause flare-ups among team members are: gossiping, lack of communication, and lack of knowledge/training for positions.
• It is just as uncomfortable to avoid conflict management as it is to address it, and it is difficult for many people to confront bad behavior, especially if they lack the disposition and skills to do so. The cost of unmanaged workplace conflicts is real, however. "Bottled-up" anger can explode in unpredictable ways or cause depression, which in turn depresses productivity and work enjoyment for angry individuals and the people around them.
• Workplace conflicts cannot be banished, but they can be managed. The following steps may help:
  ◦ Start with preventive medicine.
  ◦ Discuss appropriate ways to offer conflicting opinions such as, "That's an interesting idea and here's another way to think about it. What if …."
  ◦ Coach individuals on how to calmly work out their differences or confront poor behavior, such as, "I felt so bad that the client had to come back for her dog's prescription. How can we smooth the process better so that we can make sure that clients go home with everything they need after their appointments?"
  ◦ Develop a procedure for constructive confrontation and train team members to use it. The procedure should fit whether a staff member needs to work out a misunderstanding with a superior, a coworker, or someone they supervise.
• Hospital leaders must act as role models for constructive conflict resolution if they expect it from their team members.
• Hospital leaders and managers should call bad behavior as soon as they see it, and speak to the perpetrator in private. If hostile behavior is occurring between two staff members, the manager should hold a conflict intervention meeting and ask the employees to resolve their differences (see "A Manager's Plan for Conflict Intervention and Resolution").
• For productive meetings and to stimulate creative problem-solving and fresh thinking, staff members and associates, not just practice leaders, should be encouraged to express different ideas in meetings. It is the leaders' job to make it safe for employees to express contrary opinions and to teach team members how to put forward their ideas without attacking the ideas that others have proposed.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

Medical resolution is defined as the subsiding or termination of an abnormal condition, such as a fever or inflammation. That is a perfect description of what constructive conflict resolution can do in a practice. The steps necessary to achieve it are as follows:
• Acknowledge that a certain amount of conflict is normal and necessary. People will have disagreements – the important thing is how they handle them. Set the expectation that your team will handle conflicts wisely and well.
• There needs be a proactive, positive process in place to resolve disagreements so that your team knows how they should deal with conflicts and disagreements, and how they should not.
• Conflicts should be viewed as "misunderstandings" rather than as deliberate bad behavior. This is important, because it depersonalizes the problem and takes the focus off hurt or angry feelings. Reframing the conflict as a misunderstanding implies that there may be different ways of looking at a situation and this, in turn, leaves room for compromise and resolution.
• Most conflicts are caused by communication breakdowns, which can encourage polarization of positions and heightening of bad feelings. The individuals must talk to each other to resolve the conflict; more importantly, they must LISTEN to each other to find a solution, or at least to find a compromise position, that they can both live with.

A MANAGER'S PLAN FOR CONFLICT INTERVENTION AND RESOLUTION

Besides providing staff training on conflict resolution and modeling the desired behavior, leaders and managers should be prepared to intervene in staff conflicts. The following outlines a four-step method for successful intervention that is borrowed from behavior therapists. It works well to achieve conflict resolution in practice and encourages behavior change:
• **Confront the behavior:** Call the two employees into your office. (If whole departments are at war with one another, call the supervisors into your office.) Tell them how unhappy you are about their behavior and that you expect them to turn things around.
• **Talk it out:** Remind them that they are professionals, and tell them that you expect them to listen to each other and work out a solution. Ask one of the parties to begin by explaining his or her issues. Tell the other party that they need to listen, and that they may not interrupt. When the first employee finishes, reverse their roles. It is very difficult to misrepresent things when an outside party is listening. The technique forces the two parties to listen to each other's perspectives, and therein usually lays the seeds of solution.
• **Hold employees accountable for the solution:** Once the two have heard each other out, tell them that you have a lot of confidence in them and that you expect them to come up with a plan to resolve their differences (see 2.6 – Accountability). Tell them that you expect them to work well together from this point on. Give them one or two days, and set an appointment for them to come back and tell you how they plan to turn things around.
• **Follow-up and feedback:** After your initial meeting, you will need to hold short weekly "check-ins" to ask each employee, in front of the

Vet-ebooks.com

other, how things are going. This ensures that they remain accountable for the new behavior and that you will not have to "police" them, because they are monitoring their own behavior.

Gradually phase out the meetings as the new, positive behavior takes hold. During this process, make sure to compliment the employees when you see evidence of cooperation. Tell them you appreciate the good examples they are setting for the rest of the staff. This rewards and reinforces the desired behavior. It also signals to the rest of the staff that this is the kind of cooperative culture you expect in your practice.

Give the process time to work. It takes time, but it is amazing how often employees are able to solve their problems when you put the responsibility for professional behavior back where it belongs, on the employees themselves.

EXAMPLES

EXAMPLE 1

Employee A and employee B are always complaining to other staff members about each other's behavior. The two do not cooperate and their gossiping distracts other staff members from their work.

You call the two employees into your office for an intervention, following the four steps previously described. As each employee listens to the other, they realize it was, in fact, a misunderstanding. They apologize and leave your office with goodwill restored and a plan for how they will professionally confront issues with each other in the future.

You schedule a series of follow-up meetings with them to hold them accountable for the new behavior they have decided upon and to give them a chance to work through new issues to help them cement the healthier behavior.

EXAMPLE 2

You are one of two partners and your partner conflicts are causing a rift in your team, whose members feel compelled to pick sides. Your practice manager has given notice, citing the perpetual conflict between the two of you as the cause. She says she does not know how to please you both and she can no longer deal with the stress.

This opens your eyes to your own behavior and you feel a responsibility to correct the situation. You and your partner barely speak to each other, however, and you do not know how to initiate a discussion on this sensitive subject. You decide to write a note.

You let your partner know that you miss the good old days when you both shared the same vision for the practice and enjoyed working together. You let him know that you would like to try to repair the relationship, which not only hurts the two of you, but that may now cause the practice to lose a valued employee. With your partner's agreement, you bring in a consultant to help you get back on track to rebuild the relationship and team morale.

3.25. DEALING WITH DIFFICULT EMPLOYEES

BASICS

OVERVIEW

In a hospital team, you often find that 10% of your employees are self-motivators and high performers, 80% are the core of the team who perform on a satisfactory level, and the remaining 10% of the team are low performers and can be your difficult employees. Unfortunately, more time is usually dedicated to the low-performing employees rather than the rest of the team. Ideally, time should be dedicated to (a) rewarding the high-performing team members to develop long-term loyalty and (b) motivating the core team to become high performers.

Lack of employee accountability and poor coaching will result in lack of improvement in difficult employees and will lead to high employee turnover. Veterinarians and managers are often uncomfortable with confrontation and discipline, especially with issues such as frequent lateness, calling in sick, saying negative things, and refusing to help. When developing programs for employee accountability and coaching, you want to be sure that they are designed to be objective and set clear expectations. You want a program that is measurable and clearly explains what the outcomes, such as disciplinary acts, might be.

TERMS DEFINED

Coaching: An ongoing approach to managing people by creating a motivating environment. It improves employee performance and increases their success by providing timely feedback, recognition, clarity, and support.

No Fault Point Policy: Generally, an employee accrues a point per absence with a tracking policy. Once the employee has accumulated a set number of absences, you would then subject the employee to increased levels of discipline. Also known as a progressive disciplinary policy. If the employee does not change course, he or she could be terminated.

ISSUES AND OPTIONS

GENERAL

Effective coaching for a difficult employee might include the following steps:

- Remember to listen. When it comes to any type of communication, there are always two sides to every story. When we are dealing with difficult employees we often get frustrated and stop paying attention to what is actually going on or become irritated because changing the situation feels hopeless. We may have already decided what we think of the person. However, the best tool in coaching is listening.
- Change your perception first. Find out by listening whether there is an underlying problem that can be solved. This "difficult employee" may start acting differently once they know they are heard. Get curious. The more questions you ask, the more you might get responses that help change your perception of the employee.
- Give timely feedback on specific behaviors rather than commenting on an employee's overall mental state. As mentioned in the overview, managers and veterinarians are often uncomfortable with confrontation and giving feedback. When communicating with difficult employees, we sometimes cite a mental state as an example, such as "you have a bad attitude." Phrases like this can make a situation worse and make the employee feel defensive. Giving behavior feedback means you give specific examples of what was seen or heard with dates and times. Was there a specific comment that was made (when and to whom)? Is the employee frequently late (give exact dates)? An employee may not necessarily recognize that what they did was wrong. This is why you need to be specific on when your example happened and be as timely as possible with discussing the situation with the employee. If you wait until the next performance evaluation to mention any bad behavior, the employee will likely not remember.
- Once you have given feedback on the employee's behavior, get some clarity. Simply ask: "I need clarity about …? Can you give me some feedback about what you really meant or what was going on there for you?"
- A powerful phrase that any manager or veterinarian can use is, "I need your help." This phrase can then lead to asking the employee what you can do differently as a manager to improve their behaviors. Again, sometimes a difficult employee just wants to be heard and they may require a different leadership approach.
- Get a commitment. A commitment phrase can be said like this: "In the future, I'd appreciate if we could do …, or if you would consider …. Would that work for you?"
- Be sure to continue giving timely feedback on the employee's behavior and performance. A common mistake made by managers and veterinarians is they only follow up if there is still a problem or if a situation happens again. You need to be sure that you are giving feedback when an employee is showing satisfactory behavior too. This way the employee knows that they are performing to your expectations.
- Be consistent. If you are not OK with a behavior, do not sometimes be OK with it. Employees look more to see what you do than what you say. For example, if you say lab work needs to be prepared for pick-up by a certain time, do not then sometimes get upset and sometimes appear not to care when it is not done. Only set standards you are actually willing to hold your employees to.
- Set consequences and document. An employee will not change if they do not believe their behavior will have a negative impact on them. A phrase can be: "I still believe you can turn this around. Here's what turning it around will look like. If I don't see that behavior by X date, here's what will happen." Always be sure to document everything, even if it is just a coaching session. There is still a strong chance that this employee is not the right fit for your hospital's culture. Documentation will support that you exhausted every effort to improve the employee's behavior.

EXAMPLES

- If a hospital has continuous problems with employees being late, calling out sick, abusing cell phones, etc. incorporating a point system might be a helpful solution for employee accountability.
- Incorporating a point system (also called a no fault policy) is a great tool that can help with employee challenges. Point systems can be incorporated in efforts to maintain high levels of productivity and achieve the hospital goals. A system like this can be used for much more and not just tardiness.

HOW DOES A POINT SYSTEM WORK?

In order for it to be successful, it is important to lay the foundation that being punctual and having good attendance at the workplace are essential components to your hospital's core values and also to make sure that these factors are emphasized during any new employee orientations. This should also be highlighted in a job description that is introduced at a job interview. The employee should understand that tardiness or absence will cause problems for your fellow employees and supervisor. When an employee is absent, their work needs then to be assigned to and performed by others.

For the employee, implementing a point system provides a structure that reflects the importance of paying more attention to attendance rules and procedures in an effort to encourage good behavior and reduce infractions. For the management, this system provides vital information that can be utilized while performing periodic employee

Vet-eBooks.com

3.25. DEALING WITH DIFFICULT EMPLOYEES

reviews to determine whether expectations are being met and whether further coaching is needed. Additionally, employees can be confident that every employee is treated fairly – that is, rewarded or disciplined according to the company's attendance policies, thus helping build better employee–employer relations, trust, and communication.

A point system also records attendance activity, allowing supervisors to see the bigger picture. Managers can then identify attendance trends within their team, and reinforce positive behavior or appropriately discipline attendance problems. Over a period of time, a point system can build an employee's attendance history, which can contribute in part to their performance review or professional development plan, if the hospital chooses.

It is a good idea to have a point system that allows employees to "erase" points if employees work a consecutive number of days. For example, if an employee has seven points on their record the employer may allow them to remove four of the points by having a perfect attendance record for six months.

A point system that can be used to help make an employee be accountable for tardiness and/or unexcused absences might have the following structure:

- Each absence = 1 point (no multi-day occurrences)
- Each late in (tardy) or early out = $^1/_2$ point (5 minutes or later)
- Each no-show for work = 2 points
- Each employee starts fresh, with no points, each year.
- The start of a new year is determined by:
  - For current employees: The date the policy is set into action
  - For new employees: The date of hire

Employees will be subject to disciplinary action when the total points accumulated from absence and tardiness reaches the following levels during any 12-month period:

- 2 points = verbal warning
- 3 points = first written warning
- 5 points = second written warning
- 6 points = third written warning
- 8 points = termination.

CAUTIONS

Be sure to stay current with all HR laws that a point system may conflict with, such as the Family and Medical Leave Act (FMLA) or Americans with Disabilities Act (see 13.16 – Fair Labor Standards).

3.26. EFFECTIVE DISCIPLINARY PROTOCOLS

BASICS

OVERVIEW

• Effective discipline begins with leadership, setting clear expectations, and good communication.
• Every team member must be disciplined equally to prevent the perception of favoritism or discrimination.
• Effectively disciplining team members develops respect for the manager/leader.
• Open communications and team collaboration develop employee accountability, easing the difficult nature of implementing effective discipline protocols.

TERMS DEFINED

Discipline: Training people to obey rules and codes of behavior, using punishment as a deterrent for misconduct.

ISSUES AND OPTIONS

• Effective leadership decreases the need for discipline, as a well-managed team holds themselves accountable (see 2.6 – Accountability). Great leadership starts at the top by modeling behaviors for the team to follow (see 2.12 – Leadership). Leaders must walk the walk, not just talk the walk.
• Collaboration among the team enables problem-solving. In order for successful collaboration to occur, leadership must establish and share the mission and vision of practice (see 14.9 – Mission and Vision Statements). When the entire team collaborates to develop practice values, they can better live up to the standards that they developed.
• Collaboration occurs all the time, but effective problem-solving collaboration occurs during weekly team meetings. Waiting for a month to collaborate and problem-solve allows issues to go unresolved too long.
• Open communication and safe, friendly work environments encourage collaboration and make employees comfortable to address issues/problem-solve professionally. Leadership creates these environments. When team members are uncomfortable making suggestions, are afraid to speak up or collaborate, leadership initiatives should be investigated.
• A3 = P3: When team members are given Authority to make decisions (based on the mission, vision, and core values), they become Accountable for themselves and their decisions. People that are accountable and are allowed to make decisions can work Autonomously (not be micromanaged). When the 3 A's have been established, team members become Productive, Problem-solving Producers.[1]
• Micromanagement stifles team members, decreases team moral, and increases unnecessary disciplinary actions.
• State clear expectations through the development of an employee manual and specific job descriptions. Employee manuals serve as an accountability piece for both the practice leadership and the employee. Manuals should outline (among other things) code of conduct, professionalism, and expectations of both parties involved. Both leadership and team members must adhere to policies, procedures and expectations defined in the employee manual. Labor disputes often center around the establishment of (or lack of) an employee manual; when policies are defined but not adhered to, the result is a faulty case on behalf of the practice.
• Job descriptions must be very detailed and list both hard and soft skills expected of the team member. Job descriptions should be linked to phase training programs; team members must be properly trained to be held accountable for skills.
• Job descriptions and training programs must be linked to performance evaluations. If a task/behavior is expected of the employee, and they have been trained on it, they should be evaluated on it.
• Coaching employees to greatness should not occur only once a year during performance evaluations. Coaching should occur throughout the year (perhaps daily or weekly), addressing performance or behavior issues immediately before they become bigger problems. Coaching sessions should not be delivered as warnings, but rather should be open discussions about goals desired and areas for improvement.
• When repeated coaching sessions have not produced desired goals or improvements on performance the process for termination should begin.
• Discipline procedures should be established by the practice and outlined in the employee manual. The law does not regulate how many times an employee should be disciplined prior to termination. What is important, however, is that the same protocol is used for every employee every time.
• Most commonly used discipline protocols allow two written warnings; the third violation necessitates termination. All warnings must be documented at the time of the discussion and contain the signature of the manager. In addition, the employee should be asked to sign the documentation – not stating that they agree, but rather that they received the warning. If the employee refuses to sign the document, indicate as so in the document and have a witness (if available) sign the document.
  ◦ Documentation presented to the employee should state the problem and be represented by facts (not emotions). A resolution should be determined by both the employee and the management member and written on the document. Consequences for not abiding by the resolution should also be stated (i.e., second written warning, followed by termination).
  ◦ Any disciplinary action documents must create a pathway for resolution by providing the employee the opportunity for change and identifying how the employer can help the employee change (continuing education, training, etc.).
• The overuse of warnings or the threats of disciplinary action undermines management and their authority. Use them sparsely and seriously.
• Any disciplinary action that occurs must stay confidential, and not be discussed with any other team members except leadership.
• Often, team members will bring personnel issues to leadership that must be addressed. Management/leadership must investigate the claim and interview all parties involved.
  ◦ The team member bringing forth the concern must understand that further action will not be discussed with them, as disciplinary action is confidential.
  ◦ The investigation must occur immediately. Should the investigation be delayed, issues could potentially escalate.
  ◦ Delayed investigation results in decreased respect from the team, as they feel their concerns are not important.
• High turnover within the team resulting from discipline issues indicates a leadership issue.

EXAMPLES

LEAD BY EXAMPLE

The policy of the veterinary hospital is that every employee taking radiographs must wear the protective collar, gown, gloves and eye

Vet-eBooks.com

protection. Ensure that the owner also abides by this policy. If not, the team member perception is that the policy is not important.

TARDINESS

Team member tardiness is often an issue in veterinary practices, especially those within large cities that experience heavy traffic. Late team members affect team moral and decrease the performance of the team when it comes to client service and patient care.

Team members must understand the effect they have on others when they are tardy. Encourage them to plan for traffic appropriately.

You could brainstorm options that work for both the employee and practice for employees who are frequently late. Identify what the cause is, and potential solutions (later shift, less hours, altered work schedule). This effort shows the employer's diligence in offering a solution. It is then up to the employee to comply, and should termination result, the practice would likely be covered against an unemployment claim.

BEHAVIOR

Poor behavior exhibited by team members can often be hard to document, as it often triggers emotions in fellow employees. Documenting how a particular behavior makes a person "feel" is difficult. However, not correcting poor behavior results in poor team morale, decreased expectations, and low job satisfaction among other employees.

Discuss poor behavior with the employee immediately (they may not realize they are exhibiting poor behavior) and identify the cause. It may be an issue completely unrelated to the practice, or may result from the actions of others. Regardless of the cause, a change in behavior must be addressed; however, an effective resolution results from identifying the cause of the behavior.

MISCONDUCT LEADING TO IMMEDIATE DISMISSAL

Some instances need to result in immediate termination, without warning. These instances should be documented in the employment manual.

- Breach of trust or dishonesty
- Dishonesty
- Conviction of a felony
- Willful violation of an established policy or rule
- Falsification of company records
- Gross negligence
- Abuse or neglect of animals
- Insubordination
- Violation of the anti-harassment and/or equal employment opportunity policies
- Time card violations, falsifying time worked
- Undue and unauthorized absence from duty during regularly scheduled work hours
- Deliberate nonperformance of work
- Larceny or unauthorized possession of, or the use of, property belonging to any coworker, visitor, vendor or client
- Unauthorized possession, use, or copying of any records that are the property of the practice
- Unauthorized posting or removal of notices from bulletin boards
- Excessive absenteeism or lateness
- Marring, defacing, or other willful destruction or waste of supplies, equipment, or property of the practice
- Failure to call or directly contact your supervisor when you will be late or absent from work
- Fighting or serious breach of acceptable behavior, including making threats of, insinuating intent to, or committing violent acts
- Violation of the alcohol or drug policy
- Theft or accessory to theft
- Violation of the company's conflict of interest/outside employment policy and/or confidentiality policy
- Gambling, conducting games of chance, or possession of such devices on the premises or during work hours
- Leaving the work premises without authorization during work hours
- Inappropriate computer or Internet use
- Sleeping on duty.

This list is intended to be representative of the types of activities that may result in disciplinary action. It is not exhaustive and is not intended to be comprehensive and does not change the employment-at-will relationship between the employee and the company.

3.27. PERSONNEL RECORDS

BASICS

OVERVIEW

• Personnel records must be maintained by every employer for business and legal reasons. It is important to understand what should be included in personnel records, how long records should be kept, and who may have access to them.
• In the United States, many states have laws governing personnel records. It is a good idea to consult legal counsel or your state's Department of Labor if you have questions about the laws regarding personnel records.
• It is a good idea to review personnel records on a regular basis to make sure they are current, complete, and organized. The best time to do this is a designated time annually and/or when employee evaluations are conducted.

TERMS DEFINED

Age Discrimination in Employment Act (ADEA): Federal law that protects employees over 40 years of age from discrimination in employment practices based on the employee's age.
Americans with Disabilities Act (ADA): Federal law that prohibits discrimination in employment practices based on an employee's disability. The law also requires accommodations for disabilities in certain instances.
Fair Labor Standards Act (FLSA): Federal law that establishes minimum wage, overtime pay, recordkeeping, and child labor standards affecting full-time and part-time workers.
Family and Medical Leave Act (FMLA): Federal law that allows certain employees to take up to 12 weeks of unpaid, job-protected leave each year for the birth and care of a child, for placement with the employee of an adopted or foster child, for the employee's own serious health condition which causes them not to be able to work, or to care for a serious health condition of a child, spouse, parent or next-of-kin military service member.
I-9: Immigration Naturalization form to confirm employment eligibility in the United States.
Title VII of the 1964 Civil Rights Act: Federal law that prohibits discrimination in the workplace based on an employee's sex, race, religion, color, veteran status, marital status, genetic information, age, disability, or national origin.

ISSUES AND OPTIONS

WHAT SHOULD BE INCLUDED IN PERSONNEL RECORDS?

All documents that can legally be used to make decisions in hiring, firing, promotion, demotion, and other employment-related decisions may be stored in the personnel record. Examples of such documents would include:
• Employment application and/or resume
• Job description
• Interview report forms and/or notes
• Background verification forms
• Copy of certifications, licenses, diploma, or degree
• Offer of employment letters
• Tax withholding forms (W-2)
• Performance evaluations
• Education and training records
• Record of skills evaluation completion
• Emergency contact information
• Records of attendance
• Disciplinary actions
• Leave of absence documentation (except FMLA documentation)
• Employee action forms (change of pay, status, position)
• Any contracts or noncompete agreements between the employer and the employee.

WHAT SHOULD NOT BE INCLUDED IN PERSONNEL RECORDS?

Any document that cannot be legally used to make decisions in hiring, firing, promotion, demotion, and other employment-related decisions should be stored separately from personnel records. Examples of documents that should be stored separately include:
• Equal Employment Opportunity documents
• I-9 forms
• Documents that contain information about the employee's gender, gender information, race, religion, veteran status, disability, or national origin
• Notes, letters, or forms from references solicited prior to employment
• Garnishment orders
• Credit reports
• Testing or examination material used solely to determine individual qualifications for employment, when disclosure would compromise the objectivity or the fairness of the testing or examination process
• Investigative reports, memos, and other information concerning the investigation of possible criminal actions of an employee, until the investigation is completed and no criminal action taken, or until the criminal action is concluded
• Information that might identify an undercover law enforcement officer or a law enforcement informer
• Medical records. Some examples of medical records that should be kept separately include: life insurance application forms, health insurance claim forms, drug screening records, requests for a medical leave of absence, accident or workers' compensation reports, medical exam documentation, and OSHA injury and illness reports.

GRANTING ACCESS TO PERSONNEL RECORDS

All employee and personnel records are considered confidential. It is important to understand when and to whom access to records should be granted.
• Many state laws grant an employee access to his or her personnel record. Therefore, it is a good practice to establish a policy stating that any employee wishing to review his or her personnel record will be granted access within a clear and reasonable stated time frame (somewhere between two and five business days is normal practice). However, employees are not automatically guaranteed the right to have copies of everything in their personnel records.
• In most states, personnel records are considered to be the property of the employer. Therefore, the employer controls the amount of time and location in which an employee can review his or her personnel record.
• It is a good practice to have an employee sign a written authorization for release of information for purposes of future employer inquiries, mortgage applications, and credit applications. Such authorizations typically contain verification of employment and salary. The employer should release only the information that the employee has authorized.
• Government officials, such as Department of Labor officials, may be granted access to records within the normal course of their business or in response to a legal subpoena or court order. Because I-9 forms must be presented to government officials upon demand, it is a good practice to keep I-9 forms in a separate and convenient file.
• An employee's immediate supervisor may be granted access to personnel records on a need-to-know basis. An example is a review in order to make an employment-related decision in a discipline or a promotion. Supervisors should not have access to employee information that is not job related.

Vet-eBooks.com

3.27. PERSONNEL RECORDS

Table 3-27-1. Recommended number of years to keep personnel file documents (time frames given are from date of employee termination, unless otherwise noted).

Three years	Basic employee information such as I-9 forms and work permits
	Hiring records, such as job applications, resumes, and refusal to hire
	Job advertisements
	Results from employment tests
	Employment actions such as hires, separations, rehires, demotions, transfers, layoffs, promotions, and training opportunities
	Requests for accommodation of disability
Four years	Tax records
(Discard on a rolling four-year basis, as opposed to four years after termination)	Payroll records such as name, address, Social Security number, date of birth, job classification, pay rate, overtime payments, annuity and pension payments, and deductions
Five years	Job-related injuries or illnesses
Thirty years	Medical exams, toxic substance exposure records, and blood-borne pathogen exposure records

STORAGE AND RETENTION OF RECORDS

- Many states have strict laws governing the privacy of personnel records. Records should be stored in a secure location and should not be left unattended or unsecured even during business hours. Keys to the secured storage area should be given only to business owners, business office managers, and/or human resource managers.
- Federal law outlines requirements for the retention of personnel records. Many states, however, have time limitations that exceed the federal requirements, specifically in lawsuits that may be brought by an employee against the employer.
- In the case of Title VII of the 1964 Civil Rights Act (nondiscrimination), Americans with Disabilities Act (ADA), and Age Discrimination in Employment Act (ADEA), the requirement for record retention is one year from the date of termination.
- In the case of the Family and Medical Leave Act (FMLA) and Fair Labor Standards Act (FLSA), the time limit for filing a claim can be up to three years for wilful violations. Therefore, records pertaining to these laws should be kept for three years after the employee's termination.

EXAMPLES

Table 3-27-1 shows the recommended number of years to keep personnel record documents. (Time frames given are from date of employee termination, unless otherwise noted.)

CAUTIONS

- ADA and FMLA require that medical records be kept separate. Therefore, all medical records should be stored in a separate area with only one person having access to the area.
- Some states have requirements for record retention that are longer than federal requirements. Additionally, some time limitations for employment-related lawsuits may dictate that employers keep records for a longer period than recommended. Legal counsel should be sought before establishing guidelines for destruction of personnel records.
- Consult a tax advisor before destroying tax records. In some cases, payroll records may need to be kept longer than four years (an example would be in order to respond to an IRS audit).
- When the employer has determined that certain records are no longer needed, the records should be shredded to maintain employee privacy.

MISCELLANEOUS

A well-maintained personnel record serves several purposes. Personnel records can provide accurate information in a handy and organized manner any time that information is needed. Personnel records can be the key to one's defense in a lawsuit or claim, such as discrimination. And finally, federal and some state laws require certain files to be maintained in a personnel record. In order to be in compliance with these laws, the personnel record is a necessity.

3.28. TERMINATING STAFF

BASICS

OVERVIEW

• The hardest thing most managers ever have to do is fire an employee, because more often than not, we have to tell a decent person that they no longer have a job.
• A focus on candid regular conversations with every employee creates an environment where many performance issues can be dealt with long before they reach the stage where termination is necessary.
• There are occasions where someone deserves to lose a job because they have done something ethically wrong, but many times it is simply a poor fit with the role or the culture and we are forced to terminate a good person doing a bad job.
• In order to grow a successful business, we need great talent, which means we should constantly be evaluating our current talent, and making changes when appropriate (see 3.8 – Screening Potential Hires).
• Termination is not always about the individual, it is about equating your business with success. Are your employees making your business stronger or not? If not, firing may be necessary.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

• How do I know when it is time to fire someone? And how do I actually do it? These are the most common questions managers have when it comes to terminating employees.
• If you are coaching correctly and having regular conversations with your employees, you will be dealing with employee termination much less frequently.
• Consistent coaching allows people an opportunity to make a choice as to how they are going to operate as part of your team (see 3.16 – Effective Coaching). If it is not clear what "good performance" looks like, no one can understand how to execute good performance. This kind of clarity is only possible with effective coaching conversations during which people are allowed to voice their own definition of "good performance" and any ambiguity is removed through discussion. This is the first step to improving performance, and it should precede the termination process.
• It is important to have a process that begins with noticing poor behavior or performance, and ends in termination. The process should be consistent, transparent, and systematic so that everyone knows what to expect and clearly understands what the path from here to another job looks like. Most people who are terminated had no idea they were close to being fired and also had little clarity around the severity or specifics of their performance issues.
  ◦ The first step is to establish clarity that today's behavior or performance cannot be tomorrow's. Hospital staff members are often left to guess where they stand because managers are uncomfortable having a candid conversation about it. The tone of the first conversation should be positive and encouraging. Consider the following language for this conversation:
    ▪ "I believe in you, otherwise you would not be here."
    ▪ "I want to help you perform at a higher level."
    ▪ "I know that you can help us move forward as a team and as a business, but you will have to decide if you want to do that or not."
    ▪ "I need people here who can help us grow, and who care about building a strong successful hospital. How do I help you get there?"
    ▪ "Currently, you are not performing at the level that I believe you are capable of and I want to help you grow and improve. I will need your commitment to make that happen and you will need to make the choice to become a bigger part of the success of this hospital."
  ◦ If you do not see a behavioral shift or a change in the individual's approach to his or her job, the next conversation should change appropriately. The individual's behavior is becoming a critical situation, and it should be clear that the perception is that he or she would rather continue operating the same way and is refusing to change in order to become more successful. At this point, a manager should begin talking about the possibility of finding a different job that might be a better fit. Here is an example of the kind of language that can be helpful during this conversation:
    ▪ "Are you unhappy in your work here?"
    ▪ "How do I help you find a place where you are happier and more fulfilled than you are here?"
    ▪ "I will give you some time to look at other opportunities, attend interviews, etc."
    ▪ "Let me know what you need because I want you to be successful somewhere, even if this is not the place."
    ▪ "I want you to stay here, if you are willing to make the changes that will cause you to be successful, so you need to let me know how we spend the rest of our time together today – should we work together on an exit plan for you, or do you want to make some shifts and grow so that you can remain a part of our team?"
  ◦ The final conversation is one where the manager must put a plan into place, either because the employee has failed to do so, or because the employee has obviously made the choice to exit his or her current job but has yet to voluntarily leave for another place of work, sometimes referred to as "presenteeism." The manager must quickly and effectively separate this employee, and replace him or her with one of the superstars that the manager has been actively recruiting all along.
• Throughout the coaching process, you as the manager should constantly be evaluating how long it will take, and how much investment it will require to help this person change their behavior, shift their habits, and engage differently. If you come to the realization that it is not feasible, or not worth the time and investment, it is time to move toward termination. At the end of the day, you need to make decisions about your talent based on what is healthy for your business, and what will help you grow.

EXAMPLES

• The fear of conflict is one of the main reasons employers avoid termination. Using the process outlined in the previous section can help avoid conflict, because it approaches challenges and areas of concern in a gradual but systematic way. Conversations must always be direct, but there is not a moment during which a manager "blows up" at an employee, or vice versa, because problems are brought up and discussed long before an incident has occurred and even before emotions can build. When and if you reach the final conversation, and you terminate an employee, he or she should be well aware of why it happened and aware that there were multiple opportunities to shift behavior and avoid termination.
• Guilt is another reason employers decide not to terminate someone. Many managers develop friendly relationships with their employees, and it can be difficult to fire someone knowing that it will hurt their feelings, destroy their career, make it difficult for them to support their family, and so forth. As you consider the termination of an employee, ask yourself if you are helping or hurting them by allowing them to stay in a role in which they are not expected to do their best, learn, or

Vet-ebooks.com

get better. A poor performer is probably not happy with their work, so it may not be fair to let them stay.
• Some managers worry about the cost of replacing an employee, which can include disrupted customer service while a position is vacant, time spent recruiting and interviewing, training costs, and emotional costs such as low morale and increased workload for remaining employees. The cost of replacing an employee can range from 25 to 200% of the employee's annual salary, depending upon the level of skill. Managers also need to take into account the cost of keeping a poor performer, which can be substantial if the employee causes loss of clients or other valuable employees.

CAUTIONS

• If you retain employees who are not contributing and helping the business grow for too long, you are punishing your best performers and sending the message that mediocrity is acceptable. In this way you are the one holding the business back, not the poor performers.
• It is unfair to blindside someone and fire them without ever having a prior candid conversation. This will often result in conflict and drama and may cause your other employees to wonder if they might get fired one day without expecting it. This is not the kind of culture you want to create at your hospital. Rather, you need to use coaching and a clearly defined process to keep everyone informed about their performance, which will create a culture of open communication, trust, and accountability.
• Some managers get to a point where they wish they could simply fire everyone and start over in their business. As a leader you need to have a willingness to begin coaching and evaluating your talent, and an understanding of how to terminate employees properly. There will be employees who need to leave your business, but there will also be employees who need a coach to help them make a change and reach their potential. It is our responsibility to create a business where coaching happens effectively and everyone has the support they need to be successful.
• Labor laws vary from state to state, so it is wise to consult with a local lawyer with expertise in employee relations before terminating an employee.

Client Relationship Management

Vet-ebooks.com

4.1. The Basics of Client Service

BASICS

OVERVIEW

Veterinary medicine is a profession in the service industry, just like hotels, airlines, and restaurants. These other organizations provide customer service, whereas veterinary hospitals provide client service. The distinction between clients and customers is relevant because client service involves a long-term relationship that is more personal than the relationship most businesses have with their customers. Hotels, airlines, and restaurants desire repeat customers, but their employees do not typically develop close relationships with the customers. The client–veterinary relationship can be very personal and span the lifetime of multiple pets.

- Providing excellent client service enhances the long-term relationship with clients.
- Long-term relationships with clients and client service are built on a foundation of trust.
- Client service encompasses every interaction that takes place between a client and the veterinary hospital.
- Clients cannot easily judge the quality of medical care; instead, they judge a veterinary hospital based on the quality of service.
- Client service is related to value. The higher the level of client service, the more value the client perceives.
- Clients often switch veterinary practices because they do not see value in the service offered.
- Client service needs to be consistent for all clients.
- The quality of client service offered is related to the culture of the practice. Practices characterized by a positive culture of effective teamwork and motivated employees will provide higher quality service than a practice with a culture of negativity and distrust of management.
- Team members of the veterinary hospital are the primary providers of client service.

TERMS DEFINED

Client Service: Meeting the needs of individuals with whom you hope to maintain a long-standing relationship.
Customer Service: Assistance to individuals who are purchasing a product. Typically, the interaction involves one transaction.
Practice Culture: The attitudes, motivation, values, role expectations, and beliefs that employees have about their daily work environment.

ISSUES AND OPTIONS

SERVICE CHARACTERISTICS

- Services are consumed immediately and cannot be stored for future use; veterinary hospitals offer services that are gone once the service is provided.
- Clients participate in the service process – they interact with service providers and make decisions that affect the service received.
- Providing service is labor intensive. Employees are responsible for providing service. As a result, the morale and social skills of employees are critical and will affect the perceived quality of service.
- Service can be variable. Because the circumstances associated with providing service can change with each client interaction, it is challenging to consistently provide excellent client service.
- Services are intangible and consequently difficult to measure. Clients do not have a product to feel or hold when they leave, but instead are left with a memory regarding an experience.

GENERAL CONCEPTS ON CLIENT SERVICE

- Clients will not give a practice high marks for client service if there are inconsistencies in the service offered by different team members or on different visits to the practice.
- Clients want to feel special. Team members need to show a genuine interest in clients.
- Clients want to feel the veterinarian and staff care about their pet. Clients appreciate the attention given to their pet when they visit the veterinary hospital. Examples include recognizing and calling the pet by name, remembering the pet's gender, showing an interest in the pet's name and unique personality, making comments about the beauty of the pet, showing affection toward the pet, offering treats or promotional items, and empathizing with any discomfort the pet may feel.
- The service experience at your veterinary hospital should be such that clients want to come back and to look forward to their visits. In order for this to occur, client service must be seamless; every impression and personal contact must be positive.
- Every client has different needs and desires. Clients may also have different needs relative to different pets or at different times over the course of their relationship with the hospital.
- Sometimes it is a challenge to recognize the primary need a client is experiencing. The perceptions of the veterinarian and the client may be different, as in the case of a veterinarian focused on discussing diagnostic testing while the client wants a discussion on possible euthanasia.

ESTABLISHING A FOUNDATION FOR CLIENT SERVICE

- The commitment to client service starts with the leadership of the practice. Owners or shareholders of a veterinary hospital have the ability to either enhance or undermine efforts aimed at providing client service. Owners must not only emphasize the importance of quality service, but also serve as role models for employees to enhance client service efforts. A veterinarian owner who consistently leaves early or is not available to talk to clients on the phone sends a message to the team that client service is not always a priority.
- Ideally, a focus on client service should be developed as part of the strategic planning process. An emphasis on client service should be reflected in the mission statement, vision, and core values of the practice (see 14.9 – Mission and Vision Statements).
- The management team, which may include owners, associate veterinarians, hospital administrators, office managers, and senior technicians, must believe in the importance of client service.
- The leadership and management of the practice must develop a culture for the practice that is motivated to provide excellent client service. This starts by hiring the right people. Hire employees who possess a positive attitude and who enjoy interacting with people (see 3.7 – Effective Staff Recruitment).
- To develop a practice culture dedicated to providing exceptional service, employees must feel they are treated fairly, that their concerns are validated, and that they are appreciated. Employees who do not feel valued are less likely to make clients feel valued.
- Define client service in a written document provided to all staff. The purpose of this employee handbook is to emphasize the hospital's commitment to service and attempt to create a visual image of what exceptional service looks like to clients. The handbook should provide details related to how employees are expected to interact with clients, and should include the following: specifics on telephone skills, examples of positive communication with clients, specifics on how pets will be treated, and details about tasks that employees do to assist clients.
- Again, remember that client service involves meeting the needs of clients to enhance a long-term relationship.

Vet-ebooks.com

4.1. THE BASICS OF CLIENT SERVICE

MEETING CLIENT NEEDS

Clients' needs typically fall into three basic categories: medical care for their pet (patient care), desire to establish a relationship, and perceived value associated with veterinary services (see 4.4 – What Clients Expect from Their Veterinarian). Pay attention to client service with respect to these three areas.

Patient Care

- Client service involves flexibility and offering clients choices. Different clients desire different levels of care. Hospitals dedicated to providing quality service offer the finest medical care for all pets, but recognize that alternative options will be desired by some clients.
- Clients want to know you are a patient advocate for their pet. Clients perceive excellent client service at hospitals that make recommendations for medical care based on the needs of the pet and explain how the care will improve quality of life or longevity.
- Clients want to be confident that you will handle their pet in a compassionate manner.
- Veterinarians should offer high-quality medical care to all clients, and doctors should stay current on medical advances and technology by attending continuing education seminars.
- Hospitals should provide a wide range of medical services and be familiar with referral options for medical treatment beyond the practice's capability. Many clients are interested in referral to specialty hospitals and appreciate the expertise that is offered in veterinary medicine.
- Practices should offer pet owners information on all aspects of the pet's medical care, including noncore topics such as nutrition and behavior.
- Veterinarians and staff should be open-minded and responsive to clients who desire alternative medicine – they will appreciate veterinarians who discuss the lack of scientific evidence associated with alternative therapies, but are still willing to facilitate a referral.
- One of the most important and valuable medical services veterinarians provide is euthanasia. Clients are grateful to those practices attentive to their emotional needs, and veterinary personnel should be educated on the grief process in order to provide the best client support. Sympathy cards should be sent to all clients who lose pets, and additional gestures are greatly appreciated such as phone calls, poems, flowers, memorial donations, and paw prints.

Building the Relationship

- Remember that clients have multiple relationships with individuals at a veterinary hospital. Clients value the relationship they have with receptionists, office managers, technicians, groomers, and animal caretakers, as well as their relationship with the veterinarian, because different employees fulfill different needs for the client.
- Veterinary hospitals can provide the foundation for a long-lasting client relationship by demonstrating an appreciation for the bond clients have with their pets. Hospitals that take joy in celebrating the human–animal bond will provide higher quality client service than practices with employees who do not understand this connection (see 1.19 – Importance of the Human–Animal Bond).
- To build positive relationships, treat clients with respect; their decisions must be discussed in a nonjudgmental manner.
- Veterinarians should provide honest and realistic information regarding treatment and prognosis.
- Train everyone in the practice to understand and validate client emotions.
- Communicate with clients in a professional and caring manner. Be sure to explain medical illness, prognosis, and treatment options in terms that owners can understand (see 5.4 – Making Clear Client Recommendations).
- The entire healthcare team should truly listen to clients. Clients want to know you value their opinions and input regarding both their pet and your client service.
- Build strong relationships by being responsive to client requests. Clients should never hear "No, we can't do that." Instead, make efforts to accommodate client requests or to explain alternative options.
- Give clients individualized attention. This can be done by acknowledging clients with personal greetings, using their name, remembering their pet's name and gender, showing an interest in personal aspects of their life, and making sure clients do not feel rushed.
- Clients appreciate knowing you have not forgotten about them once they leave the practice. Follow-up communication with clients includes: thank-you notes, acknowledgment of client referrals, reminders, phone calls to check on their pet, newsletters, surveys, and sympathy cards.

Perceived Value Associated With Veterinary Services

- Client service must be provided in a timely manner. Clients appreciate practices that understand the value of their time and do not keep them waiting for extended periods of time.
- Clients enjoy visiting a clean, attractive hospital. There is perceived value associated with visiting a hospital that has attractive landscaping and a nicely decorated reception room free of clutter and odors.
- Clients perceive value associated with print and online educational tools of the practice, such as client education handouts and brochures.
- Seek client input and feedback about hospital services. Clients appreciate having the opportunity to offer their opinions.
- Hospitals can add value to clients by making them feel part of the practice. Examples include having a bulletin board featuring pictures of clients' pets and sending clients thank-you cards or a small gift for referring their friends and family to the hospital.
- Add value by offering clients comprehensive pet healthcare, including services such as obesity management programs, wellness plans, dental programs, nutrition counseling, behavior consultations, grooming, pet care products, and training classes.

Vet-ebooks.com

4.1. The Basics of Client Service

STAFF EDUCATION AND TRAINING ON CLIENT SERVICE

• Facilitate dialogue about client service with team members so they can offer feedback about their challenges and training needs. Empowerment of team members is a key element of training employees to provide excellent client service. Empowered employees typically have more job satisfaction, are more motivated, and are more capable of quickly making decisions to satisfy clients. (See the Examples section.)
• Include protocols or policies related to client service in an employee handbook or job descriptions.
• Telephone skills are critically important, because this is often the first client service impression that clients have regarding the practice and it is also an ongoing form of communication with clients (see 4.18 – Telephone Service Management). Many practices simply assume this is a skill employees have, and ignore training in this area.
• Focus training on communication skills for all team members. Communication skills training may include the following areas: dealing with difficult clients, handling clients who are emotional or cannot afford medical care, nonverbal communication, voice tone and expressions, eye contact, conveying empathy and compassion, and grief counseling.
• Monthly staff meetings can provide an opportunity to reinforce the importance of client service, discuss breakdowns in client service, and address any staff concerns.

EXAMPLES

EFFECTIVE CLIENT SERVICE FOR A NEW CLIENT

After moving to a new city, Mrs. Hadley called several local animal hospitals. She needed to refill medications for her golden retriever, Maddie, and also needed to make an appointment soon for her cat, Max, who was due for his annual wellness visit. She chose to make an appointment at Friendly Veterinary Hospital because the receptionist was very nice, expressed interest in her pets, explained some details about the hospital, and sent her a hospital brochure. Upon arrival at Friendly Veterinary Hospital with Maddie and Max, Mrs. Hadley noticed the professional building was attractive with lovely landscaping. When she entered the reception room, she was warmly greeted by the receptionist, Stephanie, who asked if she was Mrs. Hadley and welcomed her to the hospital. While efficiently completing the paperwork for her pets' visit, Stephanie chatted with Mrs. Hadley about her recent move and commented that Maddie was a beautiful golden retriever.

Next, Mrs. Hadley met the technician, Kim, who escorted her to an exam room. She noted that Kim was very affectionate toward Maddie and Max. Kim reviewed the medical records Mrs. Hadley brought with her, explained the services that were due for both pets, and then asked questions to make sure Mrs. Hadley was familiar with preventive healthcare recommendations for them. She was also present to assist Dr. Kate Thompson with her examinations of both pets. Mrs. Hadley was impressed with Dr. Thompson's knowledge, compassion, and interest in Maddie and Max. At the end of the examination, after drawing blood for annual chemistry profiles on both pets, Dr. Thompson asked if Mrs. Hadley had any questions and assured her that she would call the next day to review the lab results. The veterinary assistant, Jennifer, then arrived to offer Mrs. Hadley a tour of the facility and gave a treat to Maddie. When Mrs. Hadley checked out, Stephanie explained the service fees and verified that she had all the medications she requested. Another assistant, Jeff, offered to help Mrs. Hadley take Maddie, Max, and the food she had purchased to the car. Jeff petted Maddie and assured Mrs. Hadley that they would take excellent care of both Max and Maddie when they boarded the following month.

As promised, Dr. Thompson called the next day to review the lab results. Mrs. Hadley also received a welcome card from the hospital within five days. She told her husband that he should go with her next time they visited the hospital so he could see for himself that this was a wonderful veterinary hospital.

EXAMPLES OF CLIENT SERVICE INVOLVING EMPLOYEE EMPOWERMENT

Example 1

Ms. Johnson picked up her sheltie, Miranda, who had been scheduled for diagnostic tests, an ear cleaning, and a bath. After arriving home, Ms. Johnson realized that Miranda had not received her bath. She was quite upset over this omission, because Miranda really needed the bath and company was coming in three days. When she called the veterinary hospital, Sheila answered the phone. Upon hearing Ms. Johnson's concern, she quickly realized the new receptionist had forgotten to enter the service request, and indeed the bath had not been done. Sheila apologized profusely, validating that she understood this was a considerable inconvenience for Ms. Johnson, and offered to get Miranda back in for her bath any time during the next few days. She also assured Ms. Johnson there would be no charge and that they would also provide a courtesy bath for Miranda the next time she scheduled this service.

Vet-ebooks.com

Although Sheila realized the two courtesy baths would create expenses for the hospital, she felt it was important to offer some consolation to Ms. Johnson for her inconvenience and to demonstrate the hospital's dedication to offering excellent client service. Sheila was also confident that the office manager and owner of the practice would approve of her decision to take action to please Ms. Johnson.

Example 2

Mr. Howard, who had recently moved to the area, brought his two Labrador retrievers, Oreo and Nestle, in for routine wellness exams. When checking out at the reception desk, Mr. Howard remembered that he wanted to talk to the technician, Michelle, about nutrition. Oreo and Nestle had been on a specific veterinary diet for several years, and he was very happy with how well the dogs had thrived on this diet. Unfortunately, the hospital did not carry this line of diets, Michelle explained to Mr. Howard, but she quickly told him they could order the food and receive it within a few days. Although the hospital had limited space, Michelle felt it was important to accommodate Mr. Howard and his desire to purchase the veterinary diet at this hospital. She was confident that, even if the practice owners did not agree with her decision, they would still be supportive and listen to her rationale.

CAUTIONS

- Remember each client interaction is unique and important to that individual. Veterinary personnel must not become immune to the emotions clients experience when making decisions for their pets' healthcare.
- Clients often experience emotions of anger, fear, or sadness when their pet is sick or they have financial concerns. All members of the veterinary healthcare team must be prepared to interact with these clients in a professional, caring manner without becoming defensive.
- All new employees must be educated about the practice philosophy regarding client service and receive training to provide quality service.
- Do not forget that your employees are also clients. It is not reasonable to expect employees to offer excellent client service if you do not treat them and their pets with the same compassion and respect as your other clients.
- Monitor your client service and immediately address any client concerns.

MISCELLANEOUS

One of the best ways to appreciate veterinary client service is to become a client with your own pet. This can be a humbling experience. Veterinarians who are not in practice have had the experience of taking their pets to colleagues for medical care. In these instances, they experience the client perspective with respect to discussing medical options, trusting someone to provide high-quality care, hoping that staff will treat their pet lovingly, and paying for services.

4.2. CLIENT SERVICE STRATEGIES

BASICS

OVERVIEW

• It is obviously important to focus on the quality of pet care, but it is equally important to focus on the level of client care. Understanding the importance of client care is the first step toward building a hospital that delivers phenomenal client service.
• Creating a noteworthy client experience is as much a mindset as it is a process. Your team must care deeply about the client experience and their role in making it incredible if you are to ever develop a competitive advantage around client service.
• For your service to be recognized as exceptional, it cannot be "somewhat" better than other businesses; it has to become a stark contrast to the service your clients receive anywhere else. Often, practice owners fail to realize that their hospitals are not only being compared to other veterinary hospitals when it comes to client service. You are being compared to dentists, doctors, retail stores, restaurants, and other service providers. People will judge their experiences based on all of their interactions, not just the industry or kind of service. This means that it is not enough to be considered the hospital that offers the best veterinary service in the area. Set your standards higher, and find ways to offer the best client experience possible even when compared to other nonveterinary businesses.
• In veterinary medicine, the level of client service is possibly the most important component of a hospital's success because pet owners cannot effectively judge the quality of medicine. Rather, pet owners evaluate the hospital based on their own experience when their pets are in your care. Clients are not able to see if the surgery was done well, but they can and do judge hospitals on the level of service they receive. The assumption is that if the service is exceptional, the animal care is exceptional as well.
• Ultimately, client service is part of the choice we make about how strong we want our business to be. Our client service capabilities will determine how fast we grow, how well we weather tough economic conditions, and the amount we can charge for our services. If we are operating with mediocre service to our clients then we will ensure mediocre growth and mediocre client retention. It goes far beyond just telling our staff to deliver great client service though if we are truly going to raise our own bar. We must build a team engaged in and committed to exceptional service to the point where they are raising their own bar, not waiting for "management" to tell them how to deliver that additional value to the client.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

• Exceptional client service has to be a goal and a mission for the hospital as a business, and although that is often stated, rarely is it executed as well as it needs to be (see 4.3 – Exceptional Client Service). When you walk into a typical veterinary hospital and observe the service, it is often good but rarely is it exceptional. Many hospitals believe great service means answering the phones quickly, or smiling in the front office, and although this is certainly part of it, there is much more to creating the level of service that sends people away from the hospital completely satisfied and excited to share their wonderful experience with others.
• Our clients do not connect with the hospital itself – they connect with individuals within the hospital. We must make certain that every hire we make brings talent into our hospital that is fully committed to client care as well as pet care. The veterinary industry is full of individuals who would rather spend time with animals than with people, and although that certainly helps us achieve effective pet care, it can put our client care, and ultimately our business, at risk.
• Hospitals should have equally high standards for client care and pet care because client care is what will drive referrals and retention of current clients. There is no more powerful form of marketing or advertising than word of mouth.
• Exceptional client service begins with the entire staff creating a vision of what it could and should be, and then taking complete accountability for making it incredible. Hospitals have to recruit, hire, train, reward, coach, and support with client service in mind. Exceptional client service is only possible with teams of people who are engaged and excited about what they do, and who are focused on delivering service second to none – not because management told them to, but because it is important to them.
• In order for a hospital to successfully build a culture of client service, three things must happen:
  ◦ **Define the difference:** Before you can offer an excellent client experience, you have to know what that means for your practice. More importantly, your staff has to know. What specifically is good service, and what is bad service? Everyone can tell you when they have experienced one or the other, but you will need to dig deeper and be able to talk about specifically why the service was good or bad. What are other businesses doing well, and what could they be doing better? Once you can define good client service, you need to apply the concept to your hospital. How can you, in your industry, offer an amazing client experience? What does excellent client service mean at a veterinary hospital?

Vet-eBooks.com

- **Understand the path:** Once you have established a vision for where you want to be in terms of your client service, it is important to map out how you will move from your current state to that desired future state. What changes do you need to make in the way your hospital does business? How are you going to make those changes, and how are you going to sustain them?
- **Become a catalyst:** As you guide your organization from the current state to the future state, it is the owner's job, and the manager's job, to create excitement about the initiative, build momentum within the hospital staff, and be the first to embody the change.

• Creating a phenomenal client experience begins with understanding excellent client service and how your hospital can offer it, but a challenge for many practice owners is creating a process that will cause lasting change, and building a culture that revolves around client service. It is crucial that this process involves everyone in the organization, so that all staff members take accountability for making it a success. Use the following six-step process as a guide as you map out a plan for your hospital:

- **Learn:** All staff members should begin by taking some time to research client service. Look into your own personal experiences as you interact with other businesses, and collect data on what makes a client experience great. Ask everyone to make notes as they go through the next week or so about when they encounter exceptional client service from other businesses they patronize and how it felt. Have them also recognize mediocre or poor service when they encounter it and talk about what decisions they will likely make about doing business at those establishments in the future. Encourage all staff members to come to the next meeting with a list of thoughts and ideas, and ask that everyone expect to participate in the discussion.
- **Brainstorm:** Devote a series of meetings to brainstorming and defining what amazing service means for your practice. It is important to put forth as many ideas as possible and then think about how we might implement them for our clients. Everyone should be involved and engaged in the process. This is a time to think without censoring, and to let all ideas come to the surface.
- **Discuss:** Comb through the list of ideas from the brainstorming meetings. Begin to challenge ideas and beliefs, strengthen convictions, and add shape and context to the discussion. Prioritize ideas based on the ones that will add the most value to the service level of the hospital. There will be many that can be done for little or no cost and that could be implemented immediately. Others may take some time, require staffing considerations or other financial investments and may need to be slated for the future. Some should be discarded because they do not apply to our business or because they are nearly impossible to implement. It is important to select high value options and focus on implementing them flawlessly rather than trying to put 50 new things in place and not doing any of them very well. The goal is to build a strong foundation for client service and continuously build on it, not to transform our service level overnight. That can lead to false expectations and "change fatigue."
- **Decide:** The entire staff needs to come to a consensus. The final decision should not be made behind closed doors by management alone. If everyone in the organization has a seat at the table, everyone will engage when it comes time to execute. Ask yourself and your team: What will make the most impact? What is possible to implement? What do we believe we can sustain? Review your vision for what exceptional client care means at your hospital, and how each person can contribute to it.
- **Implement:** Creating a detailed picture of where you want to be is only half of the battle – getting to that desired future state is the other half. When it comes time to implement a change, you will need to take into account culture, structure, and process, among other things (see 2.14 – Implementation: Getting It Done). Behavior changes, at all levels, as well as physical changes and investments, will be needed to sustain the success of the project. This will require regular meetings to evaluate progress, examine roadblocks, and ensure that the staff has ownership for moving forward. Not because management says so, but because people are fully engaged in continuing to improve service in our hospital.
- **Sustain:** Even as the organization arrives at a point where client service is taking on its new and improved form, there is still work to be done. Leadership must remain strong by offering coaching and support. Accomplishment must be celebrated, and those who are leading the change must be rewarded and empowered.

EXAMPLES

Every policy, choice, rule, or guideline must be considered from the perspective of the client and how it will affect their perception. This does not mean that we give anything away or "cave in" on client demands, especially when it comes to price. Our level of service should be such that clients fully commit to us for their pet care, and even pay more sometimes because we provide service they simply cannot receive anywhere else. When they get charged for a nail trim at our hospital it is not an issue because the level of service they have received and the value they have felt is much higher than it might be elsewhere. We no

Vet-ebooks.com

4.2. Client Service Strategies

longer need to think about reducing our fees or compromising on our profitability because we have increased our value to the pet owner.

Here are some questions to ask yourself about your current level of client service:

- When staff members in our hospital make a choice between following a "policy" or creating a phenomenal client experience, which do they choose?
- Do we have policies that make things easier for us, but more difficult for the client?
- Do we have a process for routinely asking our clients how we could serve them better and for using that feedback to implement changes?
- When we recruit new hires do we base it on their level of experience or their ability to provide an exceptional client service environment?

SPECIFIC AREAS

Here are some specific areas that you should consider when thinking about your client experience:

Structure

This is the physical layout of the hospital and it can either provide barriers to effective service or it can help create an environment where it happens naturally.

- Are ramps and steps easy to navigate, even while carrying a pet?
- Is it easy for reception or technical staff members to interact with clients? Are there ways we could make this even more natural?
- Are there unnecessary artificial barriers between our hospital staff and the clients, such as walls or sliding windows … or the exam room table?
- Are there ways to make our structure more open, bright, and inviting?
- How often do we walk in the front door and look around our physical space to see if there are ways we can improve it? Better yet, can we arrange to have a friend, job candidate, or neighbor come in and give us their opinion on ways to make the space more welcoming and inviting? There may be some seemingly small things that we do not notice that negatively affect our client experience. For example, are there mostly dead and dying plants in the lobby area? What assumptions do you think the clients made about the quality of care in that practice?

Flow

- How do we move animals from the front to the back? Is it easy, natural, and connected, or does it feel like a hand-off?
- Where do clients wait most? In an area with other pets that could be confrontational, or in a secure setting where they can let their pet explore, which decreases client and pet stress? Waiting with a pet is typically more stressful than waiting in a human physician's office, where the client can relax and read a magazine. Are there ways we can make this experience easier?
- How do clients move through the checkout and exit procedure? Are there ways we can streamline it so that people are not trying to write checks while dealing with excited pets that are ready to bolt out the front door? Are there logjams where we currently create pet confrontations?
- Do clients have a safe environment where they can discuss payment options without being embarrassed because others are listening?
- How do we handle unexpected wait times due to emergencies or other unforeseen circumstances? Do we make it a point to talk with each client, make them aware of the situation and give them updates as things progress or do we just let them assume we are overbooked and too busy to care about their day and their time?

New Clients

How new clients are treated on their first visit sets the tone for their perception, and the first impression is important.

- Do we sit down with them and explain the mission of our hospital and why we believe our care and service are different?
- Do we ask them what they value most in a pet care facility and how we can make their experience here everything they would like it to be?
- Do we give them a tour of our hospital, explain what happens when we take their pet to the "back," and let them see the area where we perform different kinds of treatments?
- Do we share information about our doctors, such as their interests and expertise?
- Do we explain that they may see different doctors, depending on their animal's condition and needs, so that we can provide the very best care?
- Do we have any kind of welcome packet that introduces them to our hospital and to our team?
- Do we call them back after their first visit and ask them about their experience and welcome them again to our hospital?

Daily Client Care

- Do clients get calls after visits asking about their pet and their experience? Do they get additional calls after a surgery or invasive procedure to check on the recovery process? Do they get calls after purchasing a wellness plan asking if they have any additional questions or offering additional information? Do we get email information so we can alert them to upcoming opportunities to keep their pet healthy and protected? In addition to a personal telephone call, do we use email to communicate test results in detail? Do we use text (SMS) messaging to our advantage?
- How are people greeted when they enter the hospital? Do they feel like they entered a friend's house or their physician's office? When was the last time you heard anyone rave about the service at his or her physician's office?

Vet-ebooks.com

• Do we help people to their car with pets, food, or other items?
• Do we grab an umbrella and walk them out on rainy days?

Social Media and E-presence

• An increasing number of people have their first experience with us long before they enter our hospital. How are we shaping that experience? Does it complement and align with our exceptional client care or does it fall short of setting us apart as a hospital?
• Is our social media platform interactive and inviting? Does it make people want to become part of our client family? Do we communicate there regularly so that people feel connected to us?
• Do we build a presence that shows people that we are a thriving and growing business with engaged and happy clients?
• Do we promote specials and savings so that people can take advantage of them and use our services more cost effectively throughout the year?
• Do we educate our clients on pet conditions, risks, and preventive measures so that we are viewed as a reliable source of pet care information?
• Do we use videos, polls, and other means of interacting with our clients to keep them engaged and build a discussion, rather than a one-way form of communication? People no longer just consume on the computer, they interact, and we want them to become connected to us, not merely to review our material.
• Does our website share our mission and our "why" for being in business? Does it help people make a positive decision to choose us for their pet's care over other options that they might have? Does it let them connect to our team and our staff in a way that makes them feel a connection to us as individuals?

CAUTIONS

• Ownership for incredible client service cannot rest solely or even largely with the practice owner or practice manager. Everyone who touches the client in any way is responsible for providing excellent service.
• Client care is not something that hospital owners and managers can define and then hold others accountable for. If we try to mandate good client service, we will merely get compliance, not commitment. Without commitment, our service will become mediocre at best.
• It is essential that you have a dedicated training process that focuses on exceptional client care. If you look at organizations that have built a brand on their exceptional client service, they stress service from day one in how they train their employees. Ritz Carlton and Nordstrom's are two examples of businesses where the training that employees receive stresses client service as part of the businesses' identities and why they exist. Most people would agree that service stands out at these businesses and the training programs are part of that competitive advantage. It should be part of ours as well.

4.3. EXCEPTIONAL CLIENT SERVICE

BASICS

OVERVIEW

Exceptional client service is more than exceeding expectations. It is delivering service in a manner that so far exceeds expectations that it becomes truly memorable, and worth telling other people about.

Very few businesses are known exclusively for their outstanding service, mostly because it is extremely difficult to execute consistently at such a high level, across all departments and/or locations. Regardless of the size of the company, exceptional client service requires a systematic approach to ensure all members of the team understand what is expected of them and exactly how to perform within finely detailed standards. Selective screening and hiring, continuous training, and development of talent must be part of the ethos of the company, if it is to become known for service beyond the norm.

TERMS DEFINED

Exceptional: Unusually good; outstanding.
Expectation: A strong belief that something will happen or will be the case in the future.
Service: The action of helping or doing work for someone.

ISSUES AND OPTIONS

If we look at some of the companies that have mastered the art of service and become well-known for it, we see that they have a few things in common:

• They have built a culture of trust. This culture of trust is the foundation for a company that people want to work for. Your team has to believe in your mission so strongly that they embody it in all they do, and simply working for you gives them pride and fulfillment. So, is your company a place where people want to work?

• They have a clear sense of who they are, what they stand for, and how they wish to be perceived. This is the essence of a strong brand identity. It results in strong goodwill, meaning it increases the value of the company.

• They are extremely selective in their hiring. This is essential for any company that wants to provide exceptional client service throughout the organization, and not only by its client-facing team members. An aggressive, proactive recruitment strategy is employed to go out and find these individuals in some cases. However, being a company that people want to work for also results in a steady supply of interested candidates.

• They never stop training. They want their team to have the most up-to-date information and to be able to utilize every skill they can, in order to shine.

EXAMPLES

Today, client service comes in many forms – in person, by telephone, online, etc. With fewer in-person interactions taking place due to the prevalence of the Internet, the importance of exceptional service has increased tremendously. Most of today's well-known businesses have most if not all of the following strategies in common:

• **They connect:** Have you ever noticed the Dove commercials, portraying women of all shapes and sizes? This is to show they understand you, know you, and therefore, know how to provide real products to real people. There is no Photoshopping here – authenticity is the way they connect, by making their models relatable. Do: Tell a story about one of your team, and how they navigated a difficult diagnosis or treatment of a pet. Help your audience see that you, too, love your pets and understand the emotions and challenges in caring for a sick animal.

• **They engage:** L.L. Bean, the outdoor lifestyle brand, is known for engaging its customers online in support of the outdoors. In fact, for its 100-year anniversary, L.L. Bean asked customers to share their "outdoor moments" via social media. More than a million people responded, so the company donated $1 million to the National Park Service. The pictures are adorable, and most of them have nothing to do with L.L. Bean. The customers are willing to spend time and share – for a cause. Together, they contribute to the world. Do: Whether it is a contest to show how you enjoy time with your pet through photo submissions (creating great content for your Facebook page), or enlisting your clients in a cause, you can create community and do more together.

• **They stay true to core values:** Have you ever met a Southwest Airlines employee who was not pleasant or did not have a good attitude? Most have a fabulous sense of humor. I am sure a few have a bad day now and then, but by and large they hold true to their core values. Southwest believes there are no excuses for the person who does not play by the same set of principles that everyone else must play by. They simply do not hire them, or if they do, they do not stay very long. Do: If teamwork is one of your practice's core values, do not allow one of your team to bring negativity into the workplace or, worse still, spread it by gossiping, getting involved where they do not belong, or undermining leadership. Manage and reward employees for demonstrating behaviors that align with your core values. Those values then actually have meaning beyond the nice poster on the wall.

• **They empower:** There are not many companies that can inspire you to get off the couch and "just do it." No matter your athletic ability or desire to compete, Nike has empowered athletes and everyday people to go out there and move! Using professional athletes in their advertisements shows that with the right equipment and effort, you too can be your best you. Do: Delegate and give your team the opportunity to solve problems. Give them ownership and allow their creativity to create solutions. Having responsibility for something that they can improve is sure to bring satisfaction and enjoyment to everyone in the process.

• **They listen:** Sainsbury's, a popular grocery chain in the United Kingdom, has taken this concept seriously. One of its customers, a three-year-old girl, thought their product called "tiger bread" looked far more like "giraffe bread." In 2011, she wrote the company a letter about it. Yes, an employee replied, "that's a brilliant idea" – and then the supermarket actually changed the name of the bread. Sainsbury's proved that bottom-up change works in the corporate world, too. Do: Be open to change and solicit feedback from clients and staff – a suggestion box of sorts. When you receive a criticism or suggestion that you decide warrants a change in protocol, let the submitter know about it – and all your clients too, if appropriate. It is nice to be acknowledged publicly for doing something that helps others. And of course, that can encourage others to chime in too. You might just start a chain reaction of innovation.

Vet-ebooks.com

It is easy to see how the approach these companies take can be translated to veterinary medicine. Exceptional service can bring an enormous return on investment in many ways, both inside and outside the practice. Find a company you admire and study it. Determine what makes it successful and follow its lead.

CAUTIONS

One bad egg (or team member) can ruin the whole experience for a pet owner or referring veterinarian. Conversely, do not let one strong team member carry the weight of the entire team. Because exceptional service must be delivered consistently, training and accountability has to be a priority. In fact, if the leaders are not leading by example, no amount of training will rally the team from routinely delivering mediocre service.

4.4. What Clients Expect from Their Veterinarian

BASICS

OVERVIEW

• All hospital income is provided by willingly paying clients. Because most consumers are value shoppers, it makes sense to concentrate on providing clients with the value they seek.
• Although every client is different, there are some basic rules to providing goods and services that exceed the expectations of our clients.
• However, to consistently meet expectations, it is first important to appreciate what those expectations are.

TERMS DEFINED

Disposable Income: Income remaining after all taxes and mandatory expenses have been deducted that can be spent or saved at one's prerogative.
Omnichannel Consumer: Consumer exposure to information and marketing messages, preferably seamlessly, through a variety of different channels, including bricks-and-mortar stores, the Internet, apps, etc.
Risk Management: The identification and assessment of risks and minimizing their impact, such as with insurance or reducing risk factors.

ISSUES AND OPTIONS

DETERMINING EXPECTATIONS

• There are some expectations regarding clients that can be readily inferred as being standards. All clients will want to be treated fairly and with respect. This should be foundational in all offerings provided. All clients also expect that if they are visiting a licensed veterinarian that they will be receiving competent medical care.
• To better understand what clients expect, hospitals should have methods in place to actually determine this information directly from clients. In the most basic method, regularly ask clients if their needs are being met, and if your team is consistently meeting and even exceeding their expectations.
• Customer service surveys are also critical in this regard, especially surveys that allow you to benchmark against others in the industry, with metrics such as the Net Promoter Score (NPS). (Net Promoter, NPS, and Net Promoter Score are trademarks of Satmetrix Systems, Inc., Bain & Company, and Fred Reichheld.) These surveys are a great way to not only determine if clients are satisfied with your services, but also to ensure that their expectations have been met to such an extent that they would willingly promote you to friends and relatives (see 4.19 – Measuring Client Satisfaction).
• If nationwide surveys are any indication, then most veterinary practices need to re-evaluate how well they are doing in the eyes of their clients. In one large study, there were three client-driven factors that seemed to contribute to a decrease in the number of client visits veterinary hospitals were experiencing:[1]
  ◦ Clients did not see the need for, or the value of, regular veterinary visits for an animal that appeared otherwise healthy.
  ◦ Clients thought veterinary costs were too high.
  ◦ Clients found it to be a stressful experience to take their pet to the veterinary hospital.
• From the same study,[1] pet owners indicated that they would likely visit the veterinarian more in the following instances:
  ◦ If they knew such visits could prevent problems and more expensive treatment later.
  ◦ If they were convinced it would help the pet live longer.
  ◦ If each visit was less expensive.
  ◦ If they really believed the pet needed to be examined as often as recommended.

CLEAR COMMUNICATION

• It is not only important that pet owners receive directions from hospital team members in a clear manner, but consistency of the message is also important, ensuring message integrity from all staff members, the clinic website, brochures, and other resources that may be provided to the client.
• Improving communication skills of the veterinary healthcare team is one of the most important things that hospitals can do to help meet client expectations. Obviously, if the intention is to meet and even exceed client expectations, then the first part of the solution is to understand exactly what those client expectations are.
• This is best achieved through shared decision-making, so the client is intimately engaged in the decision-making process.[2]
• Clients that are active partners in the care of their pets are more vested in the process, and are also more likely to be compliant with mutually determined recommendations.[3]
• Although some individuals may have inherently better communications skills than others from the outset, what is clear is that those skills are very trainable and all hospital members can improve their communication skills with appropriate training.
• Some of the most important skills in this regard are the following:
  ◦ Learning to speak as a professional (see 5.3 – Speaking as a Professional).
  ◦ Making clear client recommendations (see 5.4 – Making Clear Client Recommendations).
  ◦ Speaking in a form that is easily understood by clients (see 5.5 – Translating Medicalese: Client-Centered Communication).
  ◦ Engaging the client in coming to a mutually agreed-upon conclusion regarding the care of their pet (see 5.6 – Shared Decision-Making).
  ◦ Asking questions effectively to collect the most important information needed for diagnosis and prognosis (see 5.7 – Posing Client Questions Effectively (Open-Ended Inquiry)).
  ◦ Actively listening to clients to determine their concerns, the full history, and their expectations (see 5.8 – Reflective Listening).
  ◦ Ensuring that posture and "body language" are conveying the same sentiments as our words (see 5.9 – Nonverbal Communication).
  ◦ Appreciating what such conversations mean to the client (see 5.10 – Empathy).

VALUE DELIVERY AND AFFORDABILITY

• Pet owners spend a lot of money on their pets, more with each passing year, and in most cases the money spent is a reflection of the human–animal bond[4] (see 1.19 – Importance of the Human–Animal bond).
• Most consumers are value shoppers and look for the ultimate value in their purchases, rather than merely the price. Whether it is the car they drive, the neighborhood in which they live, or the brand of watch on their wrist, clients want to receive at least as much value as the amount of money they are prepared to pay (see 9.6 – Value-Added Analysis).
• When consumers believe that there are a variety of products or services that are very similar in utility and value, these are regarded as commodities, and decisions are then made on the basis of price and convenience. For example, if a veterinarian dispenses a human generic medication for a medical condition when a similar or even identical product is available from a human pharmacy at much lower price, then even if the client purchases it from the veterinarian, the price differential (if they are aware of it) may cause those clients to question the pricing for all services provided at that hospital.
• Clients will only willingly pay a premium at a veterinary hospital if they perceive they are receiving commensurate value.
• Most pet owners today are omnichannel consumers and use many different retail channels (including a variety of online and

Vet-ebooks.com

bricks-and-mortar alternatives) to evaluate products and services and make decisions before they buy. It is natural that they also review their options for veterinary products and services, and clinics should expect this type of client behavior.

- Because most pet expenditures are made with disposable income, it is critical that veterinary hospitals detail the amount and type of expenditures that a pet owner might encounter over the life of their pet (see 5.12 – Discussing Pet-Specific Care). In this way, clients can understand the costs of such care and can plan accordingly, either by saving money, buying pet health insurance (see 8.11 – Pet Health Insurance), considering payment plans (see 8.12 – Payment (Wellness) Plans), or other risk management strategies.
- Two services that were found to offer substantial promise for attracting pet owners to a practice were full-year health plans (see 4.9 – Lifelong Excellence in Healthcare) and providing monthly installments for routine services (see 8.12 – Payment (Wellness) Plans).[5]

ADVOCACY

- Clients appreciate that veterinarians run hospitals that need to make money, but they also want to be confident that the recommendations being made are evidence-based, in the best interests of their pet, fairly priced, and not motivated by profit.
- This is best achieved by creating appropriate standards and protocols within the hospital (see 9.3 – Standards of Care and Care Pathways) and helping the client to appreciate the needs specific to their pet (see 4.10 – Personalized Pet Profiles).

EXAMPLES

Rocky Goodwin is a young Doberman pinscher and his owners are keen for him to live a long and healthy life. Following his examination, it was concluded that Rocky was a healthy pup, and a personalized health profile was recommended to help him remain that way (see Figure 5-12-1 in 5.12 – Discussing Pet-Specific Care). Mrs. Goodwin was particularly concerned about one of the risk factors that had been identified as associated with his breed – cardiomyopathy – and was especially anxious as her father recently died of congestive heart failure. The opportunity was taken to learn more about this experience, including her remorse that the diagnosis had not been made earlier when more could have been done.

The veterinarian was empathetic and suggested that although the risks cannot be eliminated with Rocky, the team would be committed to early identification of problems, should they exist. The first step would be to perform a genetic test for the risk of cardiomyopathy, as a positive result would indicate that Rocky is more likely than other Dobermans to be affected; a negative result means less likelihood, but the risk still does not drop to zero. It was explained that cardiomyopathy is an adult-onset disease, and although perhaps most commonly first detected around 5–6 years of age in affected animals, it can be quite variable and may even be diagnosed as early as at one year of age in some dogs.

Based on the information provided, the owners agreed that the genetic test made sense as a first step (along with the other genetic tests that are part of the recommended panel, including von Willebrand disease, narcolepsy, and malignant hyperthermia) and they indicated they would also appreciate learning more about these conditions at home if resources could be provided. Given the facts presented, a lifelong healthcare plan would be created for Rocky that would take into consideration all of his determined risk factors, not only for genetic diseases, but also for environmental and lifestyle risks.

Although the owners were understandably concerned that their healthy new family member could possibly develop a devastating disease later in life, they appreciated being apprised so early in the process, being provided with so much supporting information, and having such a credible action plan already in place. The owners were committed to their role as Rocky's "parents" and were also prepared to investigate pet health insurance (see 8.11 – Pet Health Insurance) and other mechanisms for being able to afford Rocky's care. Before leaving the hospital, they once again indicated their appreciation for such customized care, and asked if it would be acceptable if they recommended the hospital to their family and friends.

CAUTIONS

Each client is an individual, with their own perceptions and their own expectations. It is not reasonable to assume that any one veterinary practice can meet the needs of all potential clients. The goal should be to practice excellent medicine, deliver uncompromising customer service, and strive to honestly meet the needs of clients, given the practice's mission and vision. In some instances, the needs of individual pet owners might be better met elsewhere. Just as not all consumers shopping for a car are looking for a luxury brand, not all pet owners are necessarily looking for the same brand of veterinary care, so meeting expectations is all about first understanding what those expectations are.

4.5. MEETING THE NEEDS OF PET PARENTS

BASICS

OVERVIEW

The last decade has seen a dramatic change in how we view companion animals. And it is no secret that spending on pets continues to grow. There are many reasons why the pet sector is on a seemingly endless climb.

- We have an insatiable appetite for technology, and people want to stay connected to their pets.
- Baby Boomers are the second largest population of pet owners after Millennials. As empty nesters, they have the time and resources to care for a pet.
- The human–animal bond is powerful! The humanization of pets means that more pet owners now view their animals as members of the family.

When providing products or services to these dedicated pet owners, it is important to understand that their needs and expectations differ from those of people who hold a more traditional view of animals. These are the people who see themselves as pet "parents." This deepening relationship with pets is driving several new sectors in the general pet market. Being able to adapt and incorporate new technologies and methods of care delivery will be essential to veterinary practices that want to thrive.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

The humanization of pets requires veterinary practices to incorporate new ways of thinking to satisfy pet owners who deem themselves "parents." Just like parents of human children, the notion of "doing whatever it takes" sets a higher bar when it comes to service. Pet owners actively search for resources and information to help them best care for their pets and often obtain advice from nonveterinary professionals. The respect and esteem once held by older generations for those with a medical degree has become a bit diluted with such easy access to advice, be it sound or otherwise. If veterinarians want to keep their clients and maintain a trusted relationship, it is necessary for them to provide much more wellness education.

Connecting with clients more frequently, in the manner they prefer, is also essential. Clearly, if you do not make it easy for them to see you as the optimal resource, you can bet they will find the advice they are looking for elsewhere. With the proliferation of review sites and the influence these have over purchasing decisions, it does not take long for word to spread, positively or negatively. Commit to staying current, listen to your clients, and ask your staff what they believe clients want from you. They are on the front line and often hear things a pet owner will not say to a veterinarian. Be open to change and be willing to adapt a lot faster than in previous decades. Your profession is counting on it, and so are the pets.

EXAMPLES

There are dozens of examples of how the humanization of pets has manifested itself. Consider the huge range of pet-centered products and services available, such as cat cafes, luxury boarding facilities, dog walking services, connectivity products such as custom apps, cameras with two-way audio and video, remote treat dispensers, and high-end bedding, clothing, and carriers. When it comes to pet health, we have seen an explosion of new products, including wearables to track health and behavioral activities, GPS tracking devices to find lost pets, seat belts and vehicle restraints, at-home diagnostics, and more mobile services. More hotels now cater for those traveling with pets, because as family members, they accompany their families on vacation. Pets even have a role in many weddings!

Perhaps the biggest growth area has been in natural products, mainly pet food. Natural products now dominate the market and account for the majority of all pet specialty retail sales. Add in those who cook for their pets and give them supplements, much as they do for themselves, and you can see why the challenge to satisfy these quality-conscious owners can be so daunting.

It is important to understand the relationship each client has with his or her pet, so you can tailor your care recommendations to the pet's role in the family (see 5.12 – Pet-Specific Care). When speaking with a client who views him- or herself as a parent, acknowledge the importance of the animal in that client's life. Simply validating the bond they share will go a long way toward building trust. Offer to support that bond by assuring your clients that you work together with them as a team in their pet's health care and that your goal is to help every pet live a long and happy life.

- Be the resource pet owners need for all things pet-related – instead of the closed social media group where they can go for advice from the masses, or their breeder who espouses exactly when their pet should be spayed or neutered, or the groomer who has a recipe to combat allergies and skin conditions.
- Stay ahead of the curve when it comes to technology and communication tools (see 4.17 – Maintaining Regular Client Contact). Even if your current clientele is not currently heavily weighted to Millennials, you still want to be able to attract new clients from the largest group of pet owners don't you?
- Demonstrate your value by proactively educating pet owners about the things that are important to them (see 6.2 – Giving Clients What They Want Most). Feature a blog on your website with educational information. Have handouts in the clinic and available for download from your website on wellness topics. Create a wellness calendar for every pet that is shared with the owner at each visit, reminding them of the benefits and potential savings of preventive care (see 4.10 – Personalized Pet Profiles).
- Be accessible. Utilize texts and instant messaging, or whatever their preferred method of communication may be, to communicate with clients (see 5.12 – Discussing Pet-Specific Care). Consider some alternate clinic hours to meet the needs of busy people, with late evening hours, early morning hours, or a sixth day of the week.

Vet-eBooks.com

• Finally, build a team of individuals who genuinely enjoy helping people and are natural caregivers. Then train them to deliver to your standards, consistently, with well-documented protocols that allow them the autonomy to do what is right and in the pet's best interest (see 9.3 – Standards of Care and Care Pathways). Reward the team for positive feedback and reviews (see 4.19 – Measuring Client Satisfaction). Being appreciated and knowing you have made a difference in a pet's life and the life of the pet's entire family is often all the satisfaction a team member needs to come back and do the same thing all over again tomorrow.

CAUTIONS

The cost of pet care, especially advanced and/or specialized care, also continues to rise. It would be wise for veterinarians to better educate owners about the importance of preventive care and to encourage more to purchase pet health insurance as a way to manage costs (see 8.11 – Pet Health Insurance). If not, veterinarians run a greater risk of being accused of "being in it for the money," or "letting pets die without upfront payment," or worse. When the attachment to pets is this strong, pet owners want to do whatever it takes to care for them. But that does not change the fact that not all can afford the best care. As a profession, we must somehow find a way to satisfy the desire to "parent" while helping pet owners afford the care that is needed.

4.6. CLIENT PERCEPTION AND LEARNING

BASICS

OVERVIEW

To succeed as a veterinarian or as a practice, technical or medical excellence is not enough. We must earn our client's trust, help them learn about their animal's health, and work with them to keep their pets well. This means:

- listening to clients,
- giving clients what they want,
- helping clients learn what their pets need and how you can deliver it,
- building a relationship with clients so they trust you to care for their family pets.

TERMS DEFINED

Gamification: The integration of game dynamics and design to nongame applications, such as learning tools, to make them more engaging.

ISSUES AND OPTIONS

THE IMPORTANCE OF CLIENT PERCEPTION

- Client perception is vital for veterinarians in daily practice and in growing their businesses. To build a strong, successful, and well-regarded practice you need your clients to:
  - know, like, and trust you and your practice,
  - view you as someone with expert knowledge who is there to help them,
  - consider you a trusted advisor or partner in pet care, rather than a provider of a commodity product or service,
  - feel connected to your practice and willing to recommend you to others.
- You can help create a positive perception among clients by:
  - providing needed assistance whenever possible,
  - focusing on their needs and those of their pet (see 4.8 – Pet-Specific Care),
  - being consistent and reliable – doing what you say you will do,
  - offering a personal touch with factors such as eye contact, good listening, and positive feedback.
- Demonstrating authority has a subconscious effect. Build your credibility by displaying:
  - qualifications and awards, such as your degree,
  - a consistent and professional dress code,
  - an attractive and professional clinic environment,
  - leadership in public forums such as local or industry newspapers and magazines.
- Your practice marketing and positioning affect client perception by:
  - offering value – being cheap is not always the best: people often assume higher fees mean higher quality,
  - being "in-demand" – this implies value (think of specialists with whom you cannot get an appointment for months),
  - producing printed promotional and branding material such as business cards for each staff member (see 6.13 – Branding).
- Digital branding is increasingly important. Aim to have:
  - a modern and attractive, professionally designed website (see 10.13 – Websites),
  - active, popular social media channels (see 10.16 – Social Media),
  - a voice in important online communities where your customers spend time, such as forums or groups.

CLIENT PERCEPTIONS DIRECTLY IMPACT BEHAVIOR

If your clients perceive your products and services as generic commodities they will attach no value to your brand or expertise, and display little loyalty, being highly price-sensitive. Further, they also will not be receptive to longer term strategies such as preventive healthcare (see 4.9 – Lifelong Excellence in Healthcare).

CREATING POSITIVE CLIENT PERCEPTIONS

- Animal owners hold veterinarians in high regard – veterinarians consistently rank among the most trusted professionals alongside firefighters, nurses, and so on.
- Historically, veterinarians were the main source of expert information about pets and particularly detailed medical knowledge. Now, thanks to the Internet, clients have access to endless information and "expert" opinion on any animal health question or medication.
- Veterinarians still enjoy a high level of authority but should work toward creating positive impressions and relationships with their clients. Through this relationship they can demonstrate their expert status and knowledge.

Vet-ebooks.com

4.6. Client Perception and Learning

WHAT MAKES A GOOD VETERINARIAN OR A GOOD PRACTICE?

Clients' perceptions of what makes a good veterinarian are often based on subjective factors such as personality, manner, and word-of-mouth reputation (see 4.4 – What Clients Expect from Their Veterinarian). Clients have to rely on subjective factors such as age and personal characteristics to guess a veterinarian's knowledge, qualifications, or technical skill, which they are otherwise unequipped to interpret. Consider the impact of these factors on client perception:

- Body language, voice tone, responsiveness, positive feedback, and other aspects of good communication and likeability help clinic staff to connect with clients on an emotional rather than a purely transactional level (see 5.1 – Effective Client Communication).
- Managing clients' expectations is critical. One of the key reasons clients can become dissatisfied is that they have not been sufficiently involved in the treatment process or they do not understand the costs or the rationale for the treatment (see 6.2 – Giving Clients What They Want Most).
- The way a veterinarian interacts with patients, such as their ability to get names and genders correct, can play a disproportionate role in client's perception of their expertise.
- Be sure to keep clients advised of costs, possible adverse outcomes and likely prognosis.
- Equally important is the way in which you frame options and outcomes.
- For example, if test results come back negative, this should be presented as "great news" for the pet – not an expensive waste of the client's money or an incorrect decision in the first place.
- Customer loyalty depends on your relationship with them. Show interest in your clients and their animals. Keep them informed of current and upcoming milestones and health concerns and look for ways to solve their problems.
- Small but important gestures, like opening doors, remembering pet names, and thanking clients can make a huge difference.
- If you can also save them money that is great, but excellent pet care and great customer service should be your primary concerns.
- Positive feedback is powerful and essential.
- Respond to clients' own perceptions and show that you value their observations.
- Listen to them, acknowledge their concerns, and be sure to offer a solution for the initial problem, even if you find something more serious during your examination.
- Never dismiss or ignore client concerns, even if the problem will get better by itself. Affirm them for bringing their pet in, even if it was not necessarily a critical issue.

WHY YOU NEED TO EDUCATE CLIENTS

- Client education is central to veterinary practice. Veterinarians and other clinic staff spend much of their time educating clients.
- Client education is key to moving toward becoming a trusted advisor or a family healthcare partner.
- Investing time in client education offers these real benefits:
  - It shows you care about the pet and its health.
  - It teaches clients the science and rationale behind treatment recommendations and the value of compliance, and counteracts any adverse perceptions associated with what the client paid for the service.
  - It increases bonding with the veterinarian and practice.
  - A client's understanding pet healthcare needs enables prevention, early detection, and treatment of illness (see 5.12 – Discussing Pet-Specific Care).
  - It leads to improved communication and rapport.

These factors all build your status as a caring expert who is there to help the client to learn and care for their animals.

CLIENT PERCEPTIONS START WITH STAFF PERCEPTIONS

You cannot expect to convince clients that you are a high-quality clinic if your team does not agree. You also will not be able to provide high-quality care if your staff do not believe in it.

HOW PEOPLE LEARN

- Learning is a complex process influenced by many factors. Learning is often context-dependent, which means that people learn differently depending on their situation and their feeling about and relationship to the content.
- Learning encompasses a wide range of sensory and information types. Different people vary in how and what they learn best:
  - Sensory modality – some people learn better when they see or visualize things. Others learn better using sound, feeling, or thinking.
  - People often have a preferred sensory channel. It is important that you present material through multiple channels, media, and contexts. This can help reinforce the learning.
  - Learning presented across different channels helps reinforce the material.

Vet-ebooks.com

4.6. Client Perception and Learning

- People learn best by doing, teaching, or demonstrating. Do not just talk to a client, utilize other media such as pictures, models, and stories. Get the clients involved: For example, if you are teaching a client how to give an insulin injection, tell them about it, show them an example, get them to do it and then send them home with some written material and an example video. Arrange a follow-up visit or telephone call to check on how they are doing.
- Teaching opportunities are fantastic for building loyalty toward the practice.
- Repetition is critical in learning. Use natural opportunities in practice to repeat key messages. For example:
  - Repetition during a conversation helps reinforce learning.
  - Extend this by having other staff members repeat the message.
  - It is rare that you can complete client education on most topics (e.g., diabetes management, osteoarthritis, allergies, or even parasite control) in one visit.
  - Have a consistent message to clients at every interaction.
- Use multiple client contacts to build rapport and increase learning:
  - Reminders via letters, brochures, email, or website
  - Inbound calls to reception
  - In-clinic reception greeting
  - Veterinary greeting
  - Veterinary consult
  - Veterinary handover to receptionist
  - Receptionist discharge
  - Follow-up call after visit
  - Recheck after visit
  - Follow-up reminders.
- People learn best when things are emotionally charged, personal, or applied. People learn by direct, neuro-emotional response, then justify using reason.
- As veterinarians, we spend a lot of time teaching, and making sure that we present the information in a manner and a time suitable for the best learning experience will improve uptake and retention rates:
  - People respond to reward and feedback. If learning triggers positive feedback, then it is reinforced. The growing use of gamification in online training takes advantage of this trend.
  - Adding something tangible to an interaction can help cement your message.
  - For example, follow up dental care discussion with a demonstration of tooth brushing. Reinforce this by selling or giving the client a home dental care pack with a toothbrush and a dental diet or treats.
- People are more likely to listen, learn, and act on the advice of people with authority:
  - Make sure the practice staff match or exceed professional expectations for uniform, manner, and behavior.
  - A professional and attractive premise and waiting room help establish credibility.
- Every practice communication is an opportunity to educate and be helpful. Use the following strategies to build the authority of your practice and your team:
  - Give each team member his or her own business card and develop his or her skill or specialty area.
  - Introduce each member of staff in a positive way: "This is Jane. She's our weight-loss expert; she'll help you get Fido down to his ideal weight."
  - Send reminders even for smaller pet care issues such as deworming. This helps educate clients on the importance of compliance.
  - Use third-party resources, especially those that are independent, client focused, and authoritative.
- Online resources and interactions are increasingly important in communicating with clients:
  - Use your website, handouts, and other in-house resources to educate clients.
  - Guide clients toward reliable online information sources.
  - Highlight the importance of thorough physical examination and required testing focused specifically on their pet rather than unreliable and general information from the Internet (see 4.10 – Personalized Pet Profiles).
  - Emphasize the importance of reliable information, and print or email relevant articles to clients.
  - Use in-house educational resources such as visual atlases of normal and abnormal anatomy (e.g., models or a clinical atlas).

4.7. The Client's Buying Journey

BASICS

OVERVIEW

One of the most important challenges that a veterinary practice faces is the ability to attract new clients. The landscape of the buyer's journey has evolved since the arrival of the digital age, but while we communicate digitally, there are deeper psychological needs that we are still looking to satisfy. If a veterinary practice achieves a working understanding of these underlying mechanisms, it becomes easier to attract the ideal clientele.

When a pet owner looks for a veterinarian, they are consciously asking logical questions. "Who are you, what do you do, and where do you do it?" But underneath there is a much more basic question in their subconscious mind: "Can I trust you?"

Your customer acquisition strategy should be based on the science of relationships – how and why they work. Your business imperative is to design a system and environment in which people feel safe, feel trust, and feel comfortable to take the next step.

The biological systems that guide our decision-making were developed for an environment that existed tens (or even hundreds) of thousands of years ago. Today, although we may dress smarter, have better hygiene, and have an incredible and growing body of knowledge that we are privileged to tap into, these same biological systems still guide our decision-making.

When we are walking alone in a dark alley, when we are dealing with a mechanic who we feel may have dishonest motives, or when an unwelcomed gaze lingers just a bit too long, it makes us feel wary. Why? Cortisol. When trust is absent, our brain feeds us a dose of cortisol. Cortisol has one job: to make us wary of our environment. To tell us to watch our backs. When we are on a website and something just feels off, it is not the website you are feeling – it is cortisol. Your brain is using its early warning system to tell you something is not right, and to be wary of your environment.

We are uniquely attuned to forming relationships because of its anthropological imperative for our ancestors. Finding people and groups we could trust, who would watch our backs, was literally a matter of life or death. As humans, we constantly look for safety in our environment and our social groups. It deeply motivates much of our behavior, whether we realize it or not. If our backs are not being watched by a social group, we feel deeply uncomfortable.

TERMS DEFINED

Archetype: A recurrent symbol or motif in literature, art, or mythology.
Buyer Journey: A framework that acknowledges a buyer's progression through a research and decision process, ultimately culminating in a purchase.
Meta Description: A snippet of text that summarizes a page's content, used primarily for search engine results purposes.
Sales Funnel: The system or process that companies lead customers through when purchasing a product or service.
Thin Slicing: The ability to find patterns in events based only on "thin slices," or narrow windows, of experience.

ISSUES AND OPTIONS

At each successive stage, the prospect will be subconsciously assessing their comfort levels to go a level deeper with you. Your success depends upon your ability to take them through each stage successfully so that you can begin building a real relationship with them inside the practice.

DISCOVERY

The first step in the buyer's journey is the search and discovery phase. This occurs when we realize we have a problem, such as needing a veterinarian, and look to solve that problem. It is still common to ask friends for referrals once we have reached this stage, but behavior is increasingly shifting to digital research.

Typically, this begins with a search engine query, such as "veterinarian near me." The variables that determine the likelihood of the progression down your sales funnel are your prominence on the search engine results page, your review score, and your copywriting strategy for your page's title and meta description (see 10.13 – Web Sites).

It is common for modern consumers to investigate multiple options simultaneously.

CONSIDERATION

Most of the time spent on the buyer's journey occurs on your veterinary website. The initial fraction of a second on your website is disproportionately important. We make decisions about our social relationships quickly – often in a fraction of a second. We are also surprisingly effective at it. This is commonly referred to as "thin slicing." We are so uniquely attuned to this because in our ancestral past this ability was a matter of survival. If the first impression of your website is not warm, modern, and compelling, you will be fighting an uphill neurochemical battle.

Because we are hard-wired to take a small amount of information and extrapolate larger general conclusions about our social groups, it is important that the presentation and quality of your website is very thoughtful. Moreover, you need to be deeply sensitive to the way humans prefer to learn about our world and to communicate: through storytelling.

Your story is not about what you do. Your story is about what you believe. And it is about relating how what you do every single day offers proof of you following through on your beliefs. This is how we are wired to build trust. It is when we find a person or social group that shares deeply held values with us that the bonds of trust and community are built. This underlying biology does not change even though the tools we use to connect do change.

These are the real, needle-moving questions a pet owner is asking on your website. "Do you care about the same things I do? Will you love my pet the way I do? Are you capable of being my pet's caregiver?" You must be thoughtful about the way you present your beliefs, and how they act as your internal motor in everything you do. It may be helpful to learn more about archetypes in branding, such as "the hero" or "the caregiver" to refine your message.

A powerful signal into whether we can or should trust you is whether our community trusts you. Our social group's opinions have a tremendous impact on the way we perceive the world. This is why it can be powerful to strategically place emotional and powerful testimonials throughout your website.

The principle of social proof is exactly why word of mouth has been such an effective driver of business for so many veterinary practices, and it is why online reviews will continue to redefine and shape the landscape of the modern buyer's journey. Many buyers will not only look at your overall score but will also go through the highest ranking reviews to get a better sense of the scope, depth, and magnitude of the issues raised. It is important to solicit positive reviews on peer-ranking platforms from your best clients, and to respond empathetically to negative reviews.

ACTION

Once the prospective client feels motivation to act, it is imperative that there is a clear and easy path to action. Humans are wired to balance motivation with energy. All things equal, the harder something is for us to accomplish, the less likely we are to accomplish it (see 6.4 – Attracting New Clients).

Vet-eBooks.com

4.7. THE CLIENT'S BUYING JOURNEY

There are also different paths that consumers may want to choose to act. While most pet owners still prefer to call directly, some may prefer to submit forms, and others may prefer online chat for quick and easy help. Make sure your website has a "sticky header" so that your phone number follows the user wherever they go. And strategically place multiple calls to action so they are never far from their experience. The mobile version of your website should have a "sticky" call button in one of the corners of the screen.

If a pet owner progresses down your funnel, but does not act, they may still be interested. The timing may just not be right. We live complicated lives, where multiple tasks are on our mind at any one moment. It is smart to adopt similar techniques to the major online retailers and utilize retargeting technology. When a user visits your site, they will soon after begin seeing advertisements for your veterinary practice around the web. It is important to gently but persistently remind them that they have a problem and that you can fix it.

CEMENTING THE BOND

The initial experience your new client has in your practice is formative for their future decision-making. They should be greeted warmly by your front desk staff as soon as they enter. This makes us feel welcome within our new social surroundings and will release positive chemicals (serotonin and oxytocin) in our brain.

Once you meet the client in the exam room, shake their hand firmly and look them in the eyes. This communicates your interest and trustworthiness. The handshake has been practiced for so long because physical touch is an important way that we reinforce bonds with our social community. It is an important opportunity to begin to shape a strong bond with that client for years to come.

4.8. PET-SPECIFIC CARE

BASICS

OVERVIEW

Pet-specific care, also known as personalized medicine and several other terms (see below), involves approaches that allow predictions to be made as to an individual's susceptibility to disease, the course of that disease, and the disease's likely response to treatment. Pet-specific care involves all the steps needed to keep a pet healthy for as long as possible (so-called "healthspan" rather than lifespan), and then early detection of problems when there are the most options for management, rather than waiting for disease before veterinary intervention occurs.

The goal of pet-specific care is to prevent disease, if at all possible, or to decrease the impact of the disease on the patient, thereby improving the pet's quality of life over its entire lifespan. This is typically accomplished by identifying risk factors so that veterinary teams and pet owners can be proactive in instituting lifestyle modifications and increased veterinary surveillance so that problems can be detected at the earliest opportunity, hopefully while they are still subclinical, and when there are typically the most options available for successful management.

Pet-specific care is also known by several other names, such as:

- Personalized medicine
- Lifelong care
- Pet-centric care
- Client-centric care
- Best medicine
- Precision medicine
- Stratified medicine
- Predictive medicine
- Genomic medicine.

TERMS DEFINED

Checklist: A list of things to be accomplished and/or verified.
Healthspan: The portion of lifespan that the pet remains in good general health.
Life Plan: A proactive personalized schedule of care and intervention for pets, based on risk factors identified and prioritized.
Pet-Specific Care: An approach that tailors veterinary care to individual pets based on their predicted risk of disease and likely response to intervention.

ISSUES AND OPTIONS

RISK FACTORS

- Pet-specific care is all about managing risks and focuses on health management rather than disease management.
- All animals have certain risks that pertain to their individual circumstances (see 5.12 – Discussing Pet-Specific Care). By acknowledging and prioritizing risks, we can craft meaningful personalized pet profiles for our patients (see 4.10 – Personalized Pet Profiles).
- For most pets, family history or breed predisposition is a significant contributor to disease susceptibility. This is true whether the pet is purebred or mixed-breed, dog or cat. In many instances, when a pet is mixed-breed and the parents have not been identified with certainty, it may be difficult to discern any type of predisposition without performing breed composition genetic testing. Whether purebred or mixed-breed, dog or cat, both genotypic and phenotypic testing can be done for disease susceptibility (see 4.10 – Personalized Pet Profiles).
- Exposure risks constitute another significant contributor to disease susceptibility. For example, a pet exposed to many other pets will be at increased risk for infectious diseases and, potentially, parasite transmission. A pet that is taken for walks in wooded areas may be exposed to ticks that are enzootic to the region, and may introduce tick-related infections to the pet.
- Susceptibility to medical problems is also influenced by life stages (see 5.12 – Discussing Pet-specific Care). For example, an umbilical hernia is more likely to be congenital and evident in a juvenile pet, while most cases of hypothyroidism present during adulthood.
- A pet's gender, as well as its neuter status also influence risk. Some diseases are sex-limited in nature (such as prostatic disease in males, or pyometra in females), but there are also sex predispositions for a variety of disorders. For example, there may be a modest sex predisposition to females regarding cutaneous lupus erythematosus, while adrenal sex-hormone imbalance may be more commonly diagnosed in males. This is different from disorders that are transmitted genetically on the sex chromosomes. For example, hemophilia is more often clinically evident in males because the condition is transmitted on the X chromosome as a sex-linked recessive condition, and since males only

Vet-ebooks.com

have one X chromosome (the other is a Y chromosome), they manifest the condition; in females, with two X chromosomes, it would take two copies of the hemophilia mutation before the condition would be apparent. Neuter status also affects risk. Bitches spayed before their first estrus have a reduced prevalence of mammary cancers; neutered males have a lowered risk for prostatic hyperplasia.

- Geography also plays a significant role in disease susceptibility, partially because it influences infectious diseases that are present in the area, or the vectors that are associated with their transmission. Accordingly, when creating personalized pet profiles, it is important to take into consideration whether or not the pet may travel outside of the region (see 4.10 – Personalized Pet Profiles).
- Even conformation and nondisease traits can be associated with predisposition to disease. For example, cats with white fur may be at higher risk for developing squamous cell carcinoma; color dilution alopecia is more common in dogs with diluted coloring patterns, such as "blue" Dobermans.

GENOTYPIC AND PHENOTYPIC TESTING

Since pet-specific care and personalized medicine is about anticipating problems before they happen, typically through surveillance, screening tests are paramount to the process. The main categories of screening tests are based on phenotypic and genotypic assessment.

- Genotypic tests are ones that assess a genetic variant (mutation) or marker to determine disease susceptibility (see 9.3 – Standards of Care and Care Pathways). Such genetic tests measure either the presence of an actual genetic mutation, or genetic markers that appear to be associated with conditions. Genetic tests typically measure a specific variant associated with disease, while genomic tests may be used for more complex diseases in which there may be interactions among genes, and between genes and the environment; information may be assessed for disease susceptibility, prognosis, or likely response to therapy. It has now become cost effective to run genetic panels rather than individual tests.
- Phenotypic tests are those that measure a detectable abnormality or variance from normal, rather than a genetic variant. This includes most of the tests we routinely use, such as hemograms, biochemical profiles, urinalysis, radiography, etc. For example, while genotypic tests can identify some variants of primary open-angle glaucoma susceptibility at birth, phenotypic tests that rely on measurements of intraocular pressure (IOP) identify glaucoma when IOP increases above an established reference range for the breed and also can be used by monitoring therapy.

HISTORY

Collecting relevant information from pet owners is critical to being able to provide truly personalized or customized care for pets. Since pets spend much more time with their owners than with veterinary staff, pet owners much be engaged in the process and aware that such information sharing will ultimately benefit their pets.

- Every hospital visit provides an opportunity to learn more about the pet, the pet owner, and how they interact with one another.
- In many cases, it is most efficient to use questionnaires to standardize the information collection process (see 4.9 – Lifelong Excellence in Healthcare).
- Important topics include understanding what other pets may coexist in the house, activities and exposure, diets being fed, prescription and nonprescription medications being administered, etc.
- It is also important to realize that pre-existing conditions may be associated with increased risk for other disorders. For example, a pet that has been diagnosed with Cushing's syndrome likely has an increased risk for diabetes mellitus. A pet with excessive skin folds is likely predisposed to skin-fold dermatitis.

CHECKLISTS

- Checklists have proven to be very beneficial in human medicine, where they have helped reduce medical errors, improve patient safety, enhance teamwork, and ensure that steps were not missed.
- Without mandatory adverse event reporting, or morbidity and mortality investigations, it is difficult to tell how often medical mistakes occur in animals (see 2.25 – Appropriate Handling of Medical Errors).
- Checklists can also be used for more basic functions, such as history taking, pre- and postsurgical checks, and even to ensure that certain topics are addressed in client educations (see Figure 4-8-1).

EXAMPLES

Mrs. Finnegan presented Seamus, an eight-week-old border collie for examination. Seamus had an uneventful physical examination, but given his breed and family history, a few recommendations were made.

Mrs. Finnegan was surprised to learn that border collies were at increased risk for hip dysplasia, as she had mistakenly assumed it was only a large-dog disease. Seamus' parents had not been screened for hip dysplasia, so any family history was uncertain. A recommendation was

made to do a preliminary assessment of hip laxity at six months of age during neutering surgery, and then a more complete radiographic evaluation at two years of age.

A sample was also collected to submit for genetic testing. The single panel was capable of screening Seamus for a variety of disorders, including black-haired follicular dysplasia, cobalamin (vitamin B12) malabsorption, collie eye anomaly, degenerative myelopathy, malignant hyperthermia, hereditary myotonia, ivermectin sensitivity (*mdr1* mutation), neuronal ceroid lipofuscinosis, primary lens luxation, trapped neutrophil syndrome, and others. The staff discussed other testing that would be done in the future, and provided a link to the website where Seamus' Personalized Pet Profile would be created.

The staff also discussed pet health insurance options with Mrs. Finnegan, and reiterated that it would be important to select a policy in the very near future if they wanted to ensure that there would be no pre-existing problems that could get excluded from coverage.

CAUTIONS

In many cases pet-specific care and personalized medicine may save clients money, but it also has a tendency of front-loading expenses, since surveillance is such an important part of the process. Because of this, and because problems tend to be identified at an earlier age when there are more opportunities for management, clients may need advice on how best to manage this risk. Some of the more effective ways of addressing these issues are with pet health insurance (see 8.11 – Pet Health Insurance), payment plans (see 8.12 – Payment (Wellness) Plans), and third-party financing (see 8.13 – Third-Party Financing).

4.9. LIFELONG EXCELLENCE IN HEALTHCARE

BASICS

OVERVIEW

Many clients acquire a pet without a good understanding of its long-term healthcare needs. Accordingly, this lack of understanding translates both to poor compliance/adherence and to improper planning for a lifetime of healthcare. Veterinarians would be well served to spend time with clients, understanding their needs and concerns, explaining in advance what the likely healthcare process will be, including expenses to be anticipated along the way and when changes in healthcare requirements will likely occur (see 4.8 – Pet-Specific Care).

TERMS DEFINED

Adherence: The extent to which patients take medications as prescribed, which involves the pet owner in filling and refilling the prescription; administering the correct dose, timing, and use; and completing the prescribed course. Adherence is a term applied specifically to medications; it does not refer, for example, to recommendations for wellness checks, diagnostic screenings, and so on.

Advocate: Someone who speaks or takes action on behalf of another.

Compliance: The extent to which pets receive a treatment, screening, or procedure in accordance with accepted veterinary healthcare practices. Compliance involves veterinary staff performing and/or recommending treatments, screenings, and procedures, and pet owner follow-through.

Pet-Specific Care: An approach that tailors veterinary care to individual pets based on their predicted risk of disease and likely response to intervention.

ISSUES AND OPTIONS

ACQUIRING A PET

• Most veterinarians play little or no role in the acquisition of a pet, so clients often begin and complete this process without veterinary advice. It might be humorous to veterinary staff when clients come in with a purebred "cockapoo" that they purchased for a considerable sum (with papers?) and evidence of ear mites, luxating patellas, and an umbilical hernia, but most would-be pet owners have no idea how to do a better job with the process. Interestingly, these new pet owners rarely price-shop for their new pets – they typically pay at time of acquisition, and they often make the purchase on impulse.

• In a much better process, veterinarians or trained staff could interview would-be pet owners and help them select an animal that would best fit their lifestyle (see Table 4-9-1), and then counsel them on where they might find suitable animals, health guarantees that should be requested, and terms that include a no-questions-asked money-back guarantee following veterinary examination.[1] Veterinarians could even provide adoption questionnaires that inquire about health issues in the animals or their parents, and genetic testing that might have been done to mitigate healthcare risks (see Figure 4-9-1).

• Unfortunately, this is not the way the situation typically evolves, so the veterinarian and client are sometimes engaged in an almost adversarial relationship in trying to determine how best to deal with the current situation. It is a much more positive relationship when the veterinarian acts as the client advocate, but for that to happen, veterinarians need to assume a much more proactive role in the acquisition of pets.

• Preselection counseling is not only medically relevant, but it also makes good business sense. In the United States, more dogs and cats are euthanized for behavioral reasons than for all medical causes combined.[2] Accordingly, helping prospective pet owners understand the ramifications of pet ownership before they actually take on the responsibility of pet ownership is in everyone's best interest.

RISK (NEEDS) ASSESSMENT

• To truly appreciate an animal's need for appropriate preventive care, it is important to first discern which factors may impact an animal's healthcare risks, either positively or negatively. Some of these risks can be determined very early in an animal's life (some even before birth) by evaluating genotypic and phenotypic assessment of the animal, its parents, and/or close relatives (see 9.3 – Standards of Care and Care Pathways).

• Other assessments can be made based on the local risk factors in the particular geographic area in which the animal lives. Location typically impacts the prevalence of many infectious diseases, environmental risks (snake bite, heat stroke, frostbite, toxicities, etc.), and other factors of significance (see 4.8 – Pet-Specific Care).

• Assessing lifestyle information helps a practice determine the relative risks of one animal versus another in the same locale (see Figure 4-9-2).

• Given a pet's risk factors from genetics, family history, and lifestyle, it is possible to discuss a lifelong customized healthcare plan (see 4.8 – Pet-Specific Care and 5.12 – Discussing Pet-Specific Care) that can be shared with the pet owner, so they can better anticipate the veterinary intervention that will be needed throughout a pet's life. A personalized pet profile can then be created to customize care for animals on an individualized basis (see 4.10 – Personalized Pet Profiles)

RISK MANAGEMENT

• Once owners can appreciate the veterinary care that will be needed by animals over their anticipated lifespan, they can also better plan how they are going to pay for such services.

• Owners can use several risk management strategies to financially prepare for such veterinary care, including pet health insurance (see Section 8.11 – Pet Health Insurance), Payment Plans (see 8.12 – Payment Plans), and third-party payers (see 8.13 – Third-Party Financing).

It is important for veterinarians to reiterate that if pet owners want the most benefit from pet health insurance that it be initiated as

quickly as possible, typically by eight weeks of age, before there are any issues that could be considered pre-existing.

THE FIRST VISIT

• Ideally, the first veterinary visit might be made even before the new pet is acquired. If a specific breed has been selected, the veterinarian should be able to counsel the owners on possible breed-related conditions to be aware of, and what documentation would be worthwhile from the provider of the animal (e.g., hip joint certification of parents, DNA testing of parents, etc.). Armed with this information, the situation is established where the veterinarian is the healthcare advocate and this helps cement an appropriate doctor–client bond.
• The veterinary practice will also want to evaluate the previous healthcare that the animal received. For example, many young animals are "dewormed," have had some initial vaccinations, and perhaps other

Canine risk assessment form.

treatments. As the healthcare advocate, the veterinary practice will want to safeguard the owner from any zoonotic conditions, protect any animals at home from infectious diseases (quarantine may be needed), and determine the appropriateness of any treatments to date.

• Apart from the thorough physical examination, the first visit is a great time to discuss overall healthcare strategies for the months and years ahead. Sometimes this is easier to discuss if the subject matter is broken down to routine healthcare, breed-related concerns, behavioral counseling, neutering, dental care, nutrition, life stage issues, and unexpected care (emergencies, specialist consultations, etc.). Providing a written healthcare plan (see 5.12 – Discussing Pet-Specific Care) streamlines the process and means that the client can listen to instructions without trying to take notes. Although this might seem overwhelming to the client at first, it does set the stage for the

anticipated care of the pet that will span a lifetime. This also helps owners budget accordingly and consider other ways to manage the costs of pet healthcare such as buying pet health insurance (see 8.11 – Pet Health Insurance).

• Many pet owners have unrealistic expectations of pet care because they have never been exposed to optimal care and never had anyone detail pet-specific care guidelines for them. Most are appreciative of these clear-cut guidelines and the ability to plan in advance for realistic costs to be incurred as well as which risk management strategies might be most appropriate.

SUBSEQUENT VISITS

• Subsequent visits are opportunities to reinforce the healthcare plan and make any alterations needed on the basis of those visits, diagnostic testing, or treatments. Healthcare plans are dynamic and flexible and may be changed to reflect the realities of the situation. For example, if a Doberman pinscher is screened for von Willebrand disease and found to be at significant risk, this will likely change the process at the time of surgery, as well as the charges associated with such surgery. The identification of cardiomyopathy will change the previous plan regarding the interval between scheduled clinical examinations, and recommendations for ongoing monitoring.

EXAMPLES

Mrs. Stewart came to visit ABC Veterinary Hospital after hearing from a friend that the hospital offered pre-adoption counseling. She and her husband had a four-year-old child, and they were thinking of getting a Siberian husky (they had seen a cute puppy of this breed in the pet store, but resisted the temptation to buy it at that time). From the selection counseling session, it was determined that the Stewarts lived in a two-bedroom apartment, both adults worked long hours, and their lifestyle was decidedly sedentary between work and childrearing. By the end of the session, Mrs. Stewart had acknowledged that a Siberian husky might not be the best breed for their circumstances and narrowed their choices to a miniature schnauzer or a bichon frise, and would make the final decision with her husband while armed with the breed information provided.

A staff member also provided some resources for finding an appropriate dog of either breed, including local breed rescue, online breed-specific adoptions, and a list of breeders available from a national breeders' registry. The hospital provided a frequently asked questions (FAQ) document regarding pet adoption and basic care, forms for the prospective puppy seller to complete (see Figure 4-9-2), and forms the practice would need once the final decision was made. A new puppy kit was provided, along with a container that the owner would use to bring a fecal sample on the first actual visit. Mrs. Stewart was also invited to visit the Thursday evening "puppy kindergarten" class that was offered by one of the technicians, and they would introduce her to their basic temperament-testing regimen and go over the socialization and training classes offered. A quick introduction was made to Dr. Smith, whom she would see at the first scheduled visit, and she was invited to call back with any other questions. Mrs. Stewart was assured that although it was not quite as involved as raising a baby, ABC Veterinary Hospital would be there to help her through the process every step of the way. The client-to-be left the practice armed with a much better understanding of dog ownership and with an already considerable loyalty to ABC Veterinary Hospital.

About three weeks later, Mrs. Stewart came in with Schnitzel, an eight-week-old miniature schnauzer, and dutifully brought in a fecal sample in the container previously provided. Schnitzel was a fine, healthy specimen, with only a minor umbilical hernia that could be fixed at time of neutering. Mrs. Stewart had read most of the material that was provided and had some questions about which indemnity insurance plan might be best for Schnitzel. Dr. Smith started Schnitzel out on a sensible dietary regimen and reiterated some of the breed concerns, such as pancreatitis and calcium oxalate urolithiasis. The discussions of vaccination schedules, genetic screening, parasite control, and proper socialization ensued, and then the long-term healthcare plan was reviewed.

CAUTIONS

It is not possible to predict all health outcomes for pets, and this needs to be explained to owners. The purpose of planning is to detail anticipated needs and expenditures and to allow owners to plan accordingly. It is also possible that some clients will be overwhelmed with the information provided and elect to only do a very basic level of service. This does not negate the value of informing clients about what to logically expect but it might serve as a reminder that different approaches might be needed for different clients.

MISCELLANEOUS

Pet owners are at a disadvantage compared to parents of children, who tend to have a large variety of resources at their disposal for the anticipated care and expenses of child dependents. Armed with this knowledge, emphasis is placed on routine medical visits, preventive care, proper socialization, education, and risk management to mitigate the costs of medical care. For too many years, pet owners have been trained to expect that a one-time neutering surgery, occasional vaccinations, and periodic veterinary visits are all that is needed unless their animal is ill. Ensuring continued excellence in pet healthcare requires engagement of pet owners and a veterinary team committed to pet-specific care, education, and advocacy.

4.10. PERSONALIZED PET PROFILES

BASICS

OVERVIEW

Conventional veterinary medicine sometimes considers all pets to have the same needs on a species basis. So, by this reckoning, all dogs might warrant the same medical approach based on life stage and where they reside, and the same might be considered true for cats. However, this does not even begin to appreciate the differences between mixed-breeds and purebreds, between different breeds, and even between individuals of the same breed.

Today's pet owners are educated consumers, and with access to the Internet, it does not take much time for them to discover that the medical needs of a golden retriever are significantly different from those of a shih tzu, or a Siberian husky, or a cavalier King Charles spaniel. It is time for the profession to realize that pets deserve personalized pet profiles for their pet-specific care. Owners value them and practices can profit from providing the customized care that pets need and deserve.

TERMS DEFINED

Adherence: The extent to which patients take the medications prescribed, which requires the pet owner to fill and refill the prescription, administer the correct dose, timing, and use, and complete the prescribed course. Adherence is a term applied specifically to medications; it does not refer, for example, to recommendations for wellness checks, diagnostic screenings, and so on.

Compliance: The extent to which pets receive a treatment, a screening, or a procedure in accordance with accepted veterinary healthcare practices. Compliance involves veterinary staff performing and/or recommending treatments, screenings, and procedures, and pet owner follow-through.

Epigenetics: The study of heritable changes in genetic expression caused by mechanisms other than those attributable to underlying DNA sequences.

Mixed-Breed: An animal of unknown or mixed parentage. Mixed-breed dogs are sometimes referred to as mutts or mongrels; mixed-breed cats are sometimes referred to as moggies or mutt-cats.

Off-Label: Pharmaceuticals prescribed, dispensed, or administered for an unapproved indication. Also referred to as extra-label drug use.

Pedigreed: An animal whose ancestry is recorded by a registry organization.

Pet-Specific Care: An approach that tailors veterinary care to individual pets based on their predicted risk of disease and likely response to intervention.

Purebred: An animal bred from parents of the same breed or variety; one whose ancestry contains members of the same breed.

ISSUES AND OPTIONS

PREMISE OF PET-SPECIFIC CARE

All pets have risk factors pertaining to their specific circumstances.

- Pets have genetic risks associated with their genotypic predispositions to a variety of disorders.[1] In many cases, genetic testing is available (see Figure 9-3-2: Canine genetic disorders for which DNA testing is available). Like humans, pets can also have family histories in which there are breed predilections, even if genotypes cannot be identified (see Table 4-10-1). The environment can also affect expression of traits, and certain environmental "shocks" can leave imprints on the genetic material in eggs and sperm, which can be passed on to future generations (so-called epigenetics). Epigenetic marks can switch genes on or off affecting disease risk and they can be passed on to offspring.[1]
- Lifestyle also plays a role in determining risk for pets, including the part of the country in which they live, their exposure to other animals (boarding, grooming, social activities, etc.), the protection they are already being provided (e.g., parasite control, vaccination, etc.), and their role in the family (pets in close contact with family members need more rigorous preventive care (for parasite control, etc.) than animals without such contact. This is often best determined by risk assessment (see 4.9 – Lifelong Excellence in Healthcare).
- Testing can also identify risk. In some cases, it is genetic testing as previously mentioned, but in many other cases we rely on phenotypic testing to identify risk. Thus, if we perform radiographs as part of routine patient screening and identify that a pet has hip dysplasia, we know this increases the risk that the pet will develop osteoarthritis later in life.
- Armed with all this information, the veterinarian is in a much better position to determine pet-specific care that is relevant to the pet and client and allows for earlier intervention, when the best clinical outcome is typically achievable (see 5.12 – Discussing Pet-Specific Care).

4.10. PERSONALIZED PET PROFILES

Table 4-10-1. Some common breeds and a few of the conditions to which they are predisposed.[1] An * indicates that DNA testing is available.

Breed	*Breed predispositions*
Labrador retriever	Centronuclear myopathy*, cystinuria*, degenerative myelopathy*, elbow dysplasia, exercise-induced collapse*, hip dysplasia, nasal parakeratosis*, osteochondrosis dissecans, progressive rod-cone degeneration*, skeletal dysplasia type 2*, tricuspid valve dysplasia
German shepherd dog	Acral lick dermatitis, elbow dysplasia, degenerative myelopathy*, exocrine pancreatic insufficiency, hemophilia A*, hip dysplasia, hyperuricosuria*, masticatory myositis, perianal fistula*, renal cystadenocarcinoma/nodular dermatofibrosis*
Golden retriever	Atopy, elbow dysplasia, hemophilia a, hip dysplasia, hypothyroidism, ichthyosis*, juvenile cellulitis, muscular dystrophy*, patella luxation, progressive retinal atrophy (GR_PRA1 and GR_PRA2)*, progressive rod-cone degeneration*, sensory ataxic neuropathy
English bulldog	Anasarca, brachycephalic syndrome, entropion, factor VII deficiency, fold dermatitis, hip dysplasia, hyperuricosuria*, hypothyroidism, laryngeal paralysis, multifocal retinopathy (CMR1)*, pulmonic stenosis, sacrocaudal dysgenesis, ventricular septal defect
Beagle	Cataracts, cryptorchidism, diabetes mellitus, factor VII deficiency*, glaucoma (POAG)*, hip dysplasia, juvenile polyarthritis, Musladin–Leuke syndrome*, night blindness*, patellar luxation, pulmonic stenosis, pyruvate kinase deficiency*, retinal dysplasia
French bulldog	Atopic dermatitis, brachycephalic syndrome, cataracts*, corneal ulcers, factor VIII deficiency*, factor IX deficiency*, histiocytic ulcerative colitis, necrotizing meningoencephalitis, hyperuricosuria*, multifocal retinopathy*, cone-rod dystrophy I*
Poodle	Cataracts, epilepsy, factor VIII deficiency, Legg–Calve–Perthes disease, mucopolysaccharidosis*, neonatal encephalopathy*, organic aciduria, oxalate urolithiasis, progressive rod-cone degeneration*, sebaceous adenitis, von Willebrand disease*
Rottweiler	Cervical vertebral instability, cruciate ligament rupture, fragmented coronoid process, gastric dilatation/volvulus, leukodystrophy, membranous glomerulopathy, myotubular myopathy*, patent ductus arteriosus, polyneuropathy and neuronal vacuolation*, short tail*
Yorkshire terrier	Atlantoaxial instability, cataracts, cryptorchidism, L2-hydroxyglutaric aciduria*, lymphoproliferative disease, necrotizing meningoencephalitis, patellar luxation, patent ductus arteriosus, primary lens luxation*, progressive rod-cone degeneration*
Boxer	Brachycephalic syndrome, cardiomyopathy*, cystinuria, factor II deficiency, hyperadrenocorticism, neoplasia, progressive axonopathy, pulmonic stenosis, short tail*, sphingomyelinosis, subaortic stenosis, ulcerative colitis

PRACTICE PET POPULATIONS

• To personalize care for your clients, it is first necessary to determine the breeds most represented in your practice, and this can be achieved through appropriate fields in the practice management software system. In the United States, approximately 54% of dogs are purebreds, and 46% are mixed-breeds.[2] Although many purebred animals might be pedigreed and have their family lineage documented with a registry organization, many others are purebred in name only and are without such documentation. Others might have documentation from a breed registry, but bear little resemblance to the breed standard.

• Among the mixed-breed dogs in a practice, it is often tempting to identify them based on perceived physical characteristics (e.g., beagle x) but this practice is to be discouraged because it is wrong at least as often as it is right, and it might lead to inappropriately associating risk factors that do not belong, and missing ones that do belong.[3] Within the medical record, if the owners do not know which breeds contributed to their pets and if DNA testing has not been done to determine heritage, then the pet should be recorded as a mixed-breed or other suitable term. This should only be done proactively with new pets, and the medical record not changed for existing clients unless DNA testing has been done and there is a valid reason to change the medical record, with a copy of the DNA results maintained in the medical record to substantiate a medico-legal reason for amending the record.

COMPONENTS OF PERSONALIZED PET CARE

• Prevention is the cornerstone of personalized pet care and fundamental to the concept is that diseases should always be prevented whenever possible, on a risk/benefit basis (see 4.8 – Pet-Specific Care). Not only is it easier to prevent problems than it is to treat them, but from a client perspective it is also more cost effective to prevent

4.10. Personalized Pet Profiles

disorders than to try to manage them. For example, heartworm can be effectively prevented with either injectable medications (with ensured compliance) or with monthly oral or topical medications (which practices should remind clients to administer to improve adherence). Compliance and adherence are critical in this regard, because prevention is only as good as the assurance that the pet has received the medication as directed.

- Vigilance refers to the early detection component of our personalized pet care. As a wellness initiative, vigilance involves reviewing the risk factors for an individual pet and performing diagnostic tests to identify problems while still subclinical and before more permanent damage has taken place. For example, in an animal with a family history of hip dysplasia, radiographic assessment is warranted, typically by two years of age at the latest, to determine if the animal is affected. An animal with a breed predisposition for von Willebrand disease (vWD) would benefit from DNA testing during puppyhood, and certainly before any surgeries might be performed. For all animals, it is worth performing routine testing from time to time (e.g., hemogram, biochemistries, urinalysis, radiography, blood pressure, etc.) just to be aware of unanticipated risks that might be developing, even if still subclinical.
- Management of conditions must also be personalized. Practices should have protocols for dealing with the most common entities treated and care pathways for sensible management of chronic disorders, such as diabetes mellitus, osteoarthritis, atopic dermatitis, and others (see 9.3 – Standards of Care and Care Pathways). However, for many conditions, treatments are customized to the needs of a particular patient. For example, for a pregnant English bulldog, natural delivery may not be possible and cesarean section is often needed. Avermectins could be considered for the management of chronic demodicosis, typically off-label, but should be used only cautiously in animals with multi-drug resistance (*MDR1*) genetic mutations.

EXAMPLES

Rocky Goodwin is a young Doberman pinscher and his owners would like to plan for his anticipated healthcare needs. As part of your assessment, you create a personalized pet care profile for Rocky (see 5.12.1 – Example of a Personalized Pet Profile). The owners are impressed, but also a bit worried, because there seems to be a lot that could go wrong with Rocky that they had not considered.

You explain that most of the issues are fairly routine and common for all pets, such as parasite control and vaccinations, but that each pet does carry some unique risks for health issues, and that the best way to deal with these is to diagnose them as early as possible, when there is the best chance for effective management. The owners consent to a lifetime of optimal care for their pet, and decide that pet health insurance is a good mechanism for managing some of their concerns regarding the costs of Rocky's healthcare (see 8.11 – Pet Health Insurance).

CAUTIONS

No matter how vigilant, it is impossible to identify all risk factors for an animal, and it is important not to misrepresent this situation to clients. Personalized pet profiles are meant to address the most common disorders likely to affect an individual. Routine veterinary visits and vigilant screening and monitoring are critical to ensuring that even unanticipated disorders can be diagnosed and managed with some expediency.

4.11. COMPLIANCE AND ADHERENCE

BASICS

OVERVIEW

• Compliance is a self-governed quality assurance (QA) process that promotes consistent quality of care for each patient, each time the pet is seen.
• Compliance improvement has been shown to improve the quality of patient care and practice revenue in practices that implement compliance improvement programs.
• Compliance is driven by a practice's commitment to standards of care, which is self-determined based on standard practices and recommendations from recognized veterinary organizations, such as the American Animal Hospital Association (AAHA), the American Association of Feline Practitioners (AAFP), the American Heartworm Society (AHS), and the Companion Animal Parasite Council (CAPC), among others.
• To improve compliance, veterinarians need to put their standards of care into writing (see 9.3 – Standards of Care and Care Pathways). Written standards should at least cover the high-volume, routine healthcare services they provide, such as therapeutic diets, heartworm disease prevention, parasite control, dental prophylaxis, wellness testing, spay and neutering, and pain management, among others (see 4.9 – Lifelong Excellence in Healthcare).
• All hospital team members need to understand the standards of care well enough to be able to explain to clients what each standard is and its benefits.
• Practice management needs to track and monitor whether the hospital team is consistently recommending services to their standard of care: For example, did the veterinarians recommend dental prophylaxis every time they saw patients that matched their standard of care for dental prophylaxis? In addition, did the support team perform or schedule the recommended procedure before the client left the practice? Did they schedule the patient's next regular visit and recheck for laboratory follow-up?

TERMS DEFINED

Adherence: The extent to which patients take the medications prescribed, which requires the pet owner to fill and refill the prescription; administer the correct dose, timing, and use; and complete the prescribed course. Adherence is a term applied specifically to medications; it does not refer, for example, to recommendations for wellness checks, diagnostic screenings, and so on.

Compliance: The extent to which pets receive a treatment, screening, or procedure in accordance with accepted veterinary healthcare practices. Compliance involves veterinary staff performing and/or recommending treatments, screenings, and procedures, and pet owner follow-through.
Standards of Care: Statements of what a practice believes in and recommends for its patients for wellness testing, pain management, nutrition, senior pet care, and other aspects of patient care.

ISSUES AND OPTIONS

• Several different recognized veterinary bodies promote guidelines for patient care within their areas of expertise, such as the AAHA and its vaccine guidelines. Other standards of care are left up to the discretion of practitioners. Standards of care may be affected by geographic issues, such as risk of Lyme disease or the prevailing standards of care commonly practiced within the veterinary community in a certain region of the country.
• Compliance is really a quality of care issue that cuts to the heart of why most veterinarians choose this profession. It is about helping pets live longer, healthier lives. Compliance calls on the profession to track and measure quality of care; the data they track, in turn, provide the information they need to manage quality of care for patients.
• Until the profession implements universal diagnostic codes (AAHA has problem and diagnostic codes mapped to Systematized Nomenclature of Medicine (SNOMED) codes, but they are not widely implemented at this time), it will be difficult to collect comparison data and other meaningful information for different patient groups. For example, have senior pets whose blood and urine were tested beginning at age seven lived longer than senior pets that were not tested? Is age seven too early or too late to test pets in order to discover early-stage disease onset? Over time, the information collected will help the profession set standards of care for patients, not just for wellness issues, but for the treatment of diseases. Veterinarians are urged to adapt and use standardized diagnostic codes when feasible to do so.
• Computers can be useful in tracking and measuring compliance. For example, a no-cost code can be entered to track how often recommendations were made for dental prophylaxis, but the computer cannot tell you when a recommendation should have been made, but was not. Just as sound inventory management demands a physical count, so does sound compliance management demand at least a

periodic "dipstick" test of a small amount of patient charts, perhaps 10 per week, to see what was missed that should have been done. An added benefit of physically auditing patient records is that incomplete or unclear records can be immediately called to the veterinarian's attention and then caught up. Feedback from the record check provides the medical team with information on how they are doing, which encourages better records and helps veterinarians, technicians, and receptionists do a better job for their patients in the future.

• We live in an information age, and the AAHA's compliance studies point the way to use data to improve patient care. This, in turn, may well turn out to be the biggest driver of practice success in the millennium: AAHA's compliance studies clearly show that the keys to improved patient care and practice revenue are driven by objective, data-driven analytics. Practitioners who have embraced compliance improvement have already shown that the analytics can be used to successfully design and monitor practical quality of care improvement in their hospitals. In other words, better information equals better patient care for those who capture and use the data.

QUALITY ASSURANCE FOR PATIENT CARE

• Before 2003, most veterinarians guessed at the level of care they provided their patients because they had never been asked to track and measure it.

• The landmark 2003 AAHA compliance study, The Path to High Quality Care, audited 1,400 patient records, which showed that most veterinarians overestimated compliance by at least 25%, and that the level of care they provided their patients was not as high as they thought it was.

• The follow-up AAHA compliance study, Taking Quality Care to the Next Level, published in 2009, suggested ways in which practices could incorporate effective strategies for involving members of the pet's healthcare team in ensuring healthcare recommendations were made and followed.

• The AAHA compliance studies looked at dog and cat health issues in general veterinary practice, but there are compliance implications for specialty practices, emergency practices, equine practices, and food animal practices as well.

• Veterinarians have much control over the level of compliance in their own hospitals (Figure 4-11-1). They can improve it by:

  ◦ putting written standards of care in place for routine, high-volume procedures such as the six audited in the AAHA study (vaccinations, heartworm testing and prevention, dental prophylaxis, pre-anesthetic laboratory screens, therapeutic diets, and senior pet testing),

  ◦ ensuring that all members of the hospital's medical team make clear and consistent recommendations,

  ◦ following through to schedule appointments and helping clients remember to keep them,

  ◦ tracking and monitoring performance to hold themselves accountable.

• Patient records may need to be revised to make it easy to quickly find and record information that corresponds to the hospital's standards of care.

• Patient records should be internally audited at regular intervals to see how well the hospital team is doing in consistently recommending and following through on recommendations in accordance with its written standards of care.

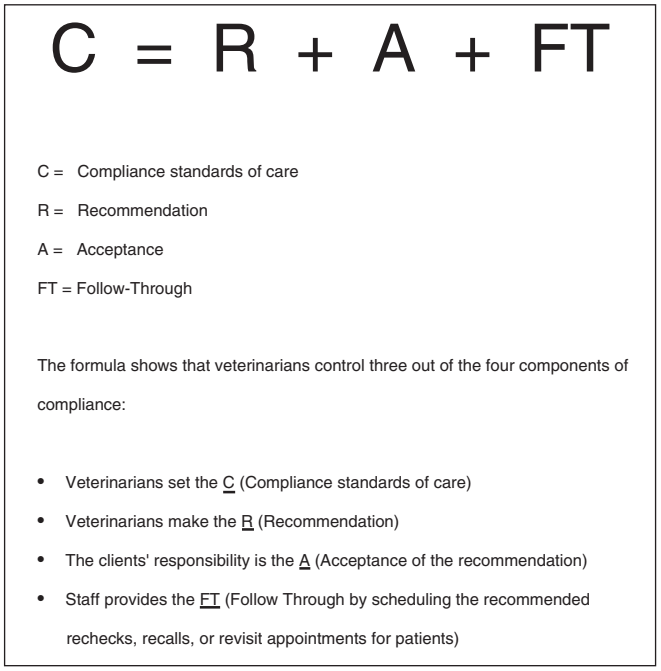

Figure 4-11-1.

The American Animal Hospital Association's "CRAFT" formula for compliance. Adapted from The Path To High-Quality Care with permission from the American Animal Hospital Association.

4.11. Compliance and Adherence

• In an average veterinarian practice, even a 10% increase in compliance for the six healthcare issues studied in the AAHA study would result in an annual increase of almost 1,300 additional patient treatments and substantial revenue increase.
• It takes a team to improve compliance, and training is crucial to compliance success:
  ◦ Veterinarians and support staff need to know what the hospital's standards of care are and all of the doctors and staff members consistently need to follow them.
  ◦ Veterinarians and staff must know why their hospital recommends the standards of care and be able to explain the benefits so that clients can understand them.
  ◦ Veterinarians and staff members must all know what their individual responsibilities and roles are in supporting the hospital's standards of care and be trained to perform them.
  ◦ Veterinarians and staff must be provided with feedback on how they are doing. This comes from tracking and measuring compliance performance indicators, such as whether a procedure, such as a dental prophylaxis or laboratory work, is recommended in accordance with the hospital's standards of care.

EXAMPLES

Following are two sample standards of care that a hospital medical team might put into writing. These standards state what the hospital believes is the best care for pets, and is what they recommend for all pets they see that fit the protocol.

THERAPEUTIC DIETS

• These are recommended 100% of the time for patients that have conditions that could benefit from nutritional therapeutic support, such as allergies, diabetes, weight loss, gastrointestinal (GI) disease, renal disease, bladder disease, and other conditions.
• Clients are educated on learning the health benefits of the new diet and how to transition to using it; then they are sent home with the appropriate diet.
• Clients are provided telephone support at home. A staff member will call within 36 hours to see how the pet is doing and, if needed, offer advice to the client to help them with home care for their pet.

SENIOR PETS HEALTH RECOMMENDATIONS (FOR PETS AGE 7 AND OLDER, AND FOR CERTAIN BREEDS AGE 5 AND OLDER)

• Annual senior pet screens are recommended 100% of the time.
• Twice yearly wellness exams are recommended 100% of the time, and the pet's reminder notification is set up for six-month intervals.
• Clients are sent home with a wellness checklist to help them recognize health problems early and to monitor their pet's health at home.

4.12. CREATING A CLIENT-CENTERED HOSPITAL

BASICS

OVERVIEW

Being client-centered means making decisions based on what the client needs, expects, desires, or feels, rather than on what the veterinarian or veterinary team member needs or desires. It puts the customer at the top of the organizational pyramid, making client satisfaction the guiding principle of the practice.

- It takes a strong commitment to customer service to be truly client-centered.
- Each client is unique. Flexibility is required if you are to keep many different individual customers happy and meet a variety of their wants and needs.
- Client-centered practices usually aim for high touch, great service, and higher than average transaction fees.
- Intention is nothing, perception is everything. A person's perception is their reality (see 4.6 – Client Perception and Learning).
- In a client-centered practice, thought is given to the perceptions of clients. How does the experience in the hospital feel, smell, look, and sound to the client?
- The client is treated like part of the team. There is a working relationship with the client to develop the best possible healthcare plan for the pet (see 4.8 – Pet-Specific Care). Time spent teaching clients about good pet care means better health for the patients and more income for the practice. Because client education is important in a client-centered practice, it is an obligation of the entire clinic team to make the visit an educational experience for the client.
- The client's wishes and opinions are respected. Surveys, questionnaires, or focus groups may be used to determine what clients want from the practice and how they want it delivered.
- Technology used by and in the practice is up-to-date and works well for clients.
- The client's time is respected. Clients are informed of how long they will have to wait and why. Wait times are kept as short as possible.
- Being client-centered means the client is listened to. Team members focus on, and pay attention to, both the verbal and nonverbal messages the client is sending.
- Careful questioning allows the team to determine how best to serve the client and the patient.
- Team training is essential in a client-centered practice (see 3.14 – Staff Development). Clients get consistent information – team members have scripts and cue cards for common client interactions and should all be giving the same advice.
- The veterinary team receives training in communications, including using tone of voice, phrasing, and body language.
- The team is trained to handle questions and problems so the client does not have to wait while another person is found to take care of a problem.
- Decisions belong to the client. It is not the job of the veterinary employee to decide what level of care the client wants. The client has the right to make healthcare decisions about their pet. Not offering a certain level of care to a particular customer means the practice has made the decision as to what care the pet receives. In a client-centered practice, the goal is to educate the clients and let them decide.

TERMS DEFINED

Focus Group: A group of clients who are asked to participate in a discussion about a particular topic or issue. The information from the group is used to develop programs, improve service, or solve problems in the practice.

High Touch: Refers to client service above and beyond the norm, or exceeding expectations.

Organizational Pyramid: A charted structure that usually puts the front-line workers at the bottom or base of the pyramid, with increasing tiers of management levels ascending to the owners or executives of the company at the apex.

4.12. CREATING A CLIENT-CENTERED HOSPITAL

ISSUES AND OPTIONS

• Many practice owners want to decide their hours and policies based on their own wants and needs. It takes a deep commitment to customer service to truly run a client-centered business.
• It takes more time and effort to do things this way. It is not easy, and perhaps it is impossible, to be both high volume and client-centered.
• Employees of client-centered businesses report higher levels of job satisfaction and lower turnover, because fewer displeased clients means less stress for employees.

EXAMPLES

Being client-centered means the client comes before other tasks – they get a smile and a greeting immediately.
• Client service is quick and efficient.
• Schedules and appointment times are based on what clients want: Check-ins and checkouts are smooth and efficient, and adequate time is allowed for each client appointment.
• The clinic website and apps allow clients to fill out paperwork or make appointments online, saving them time.
• Scheduling of team members is based on convenience for clients. More team members are scheduled for busy times of the day.
• There are enough parking spaces and chairs in the waiting room available for customers.
• Materials and files are prepared ahead of time, so clients don't have to wait.
• Clients are called with laboratory results, progress reports, and updates in a timely, friendly, and professional manner.
• It is noted when clients prefer a particular doctor, time of day, or day of week for appointments.
• Clients are consulted about what reading or viewing materials they prefer in the waiting area.
• There are toys, books, or videos for children.
• Refreshments for clients and pets are provided.
• Fear Free™ Certification ensures that patients are treated gently so that fear and stress are minimized for both patients and clients (see 4.14 – Developing a Fear Free Hospital).
• Sufficient telephone lines ensure clients will not hear a busy signal.
• Clients wear an invisible sign that says, "Notice me. Make me feel important." Make sure these signs are not ignored or overlooked.
• Clients are treated as individuals and asked for feedback. For example, some clients want to receive information from the veterinary team and then make their own decisions. Some want the veterinarian to advise them what to do (as if it were their own pet) and will follow any recommendations made, and another set of clients want to discuss information with the veterinarian and then decide together. The team needs to discover what each client wants and needs and then fulfill those wants and needs.
• Patients are also treated as individuals, with healthcare recommendations created specifically for each pet according to its species, age, breed, lifestyle, and overall health (see 4.9 – Lifelong Excellence in Healthcare and 4.10 – Personalized Pet Profiles). One size does not fit all.
• Clients are surveyed regularly to determine their preferences for appointment times, needed services, or preferred products. Client satisfaction is monitored and reviewed.
• Successes by the team are celebrated and missteps discussed to make sure they are not repeated.

WHAT IS THE PERCEPTION OF THE CLIENT?

• While you are sitting in the waiting room and exam rooms, look around. Are they clean? Do they smell good? Can you hear laughing or talking from staff? What needs to be improved?
• Are pets sent home neat and clean? Are they handled gently? Can the client tell you care?
• How friendly and helpful are team members on the phone? Do they answer clients' questions patiently and completely?

4.12. Creating a Client-Centered Hospital

TREATING THE CLIENT AS PART OF A TEAM

- The client is taught as much as he or she is willing and able to learn about pet care so that he or she understands the veterinary team's recommendations and is able to make good treatment decisions for their pet.
- The client is informed ahead of time as to what will happen to the pet, and why.
- The client is informed in a timely fashion of changes in the status of the pet or the amount of the bill.
- The practice maintains a library of handouts, articles, books, and videos for clients to use.

THE CLIENT IS LISTENED TO AND UNDERSTOOD

- Attention is paid when clients speak. What needs do they have? What fears or worries are influencing their pet care decisions? What could be done to help them understand or to reassure them? It is necessary to hear the client out, and to let them say what they think is wrong and what they want.
- Ask clients open-ended questions and encourage them to express concerns; ask for more information and provide feedback.
- Client opinions are sought for the assessment of specialists, groomers, boarding facilities, trainers, and other professionals to whom other clients might be referred.
- Clients are often anxious or frightened in a veterinary hospital, especially if their pet is ill or injured. Anxiety decreases the client's ability to listen, learn, and care for the pet. It is important to address the client's concerns and validate their feelings. The most common client anxieties are these:
  - Will I say or do something stupid? Clients do not want to let on they do not have a clue what we are talking about. If they have a blank look or their questions do not make sense, you need to try to explain again in a different way. They also may not tell you if they are not able to treat the pet properly. Learn to put the client at ease. Clients come to the vet to talk to an authority figure. Assure them you will take care of them, show them how to pill the cat or administer the eye ointment, and answer all their questions. However, never sound patronizing.
  - Will my pet behave? We are used to pets peeing on the floor or pooping in the waiting room, but this is embarrassing to the owner. Pulling on the leash, hissing, growling, barking, and other natural pet behaviors may be embarrassing to the client as well. Be sure to clean up messes without a fuss and reassure the client that it is not their fault, or help them find ways to lessen the problem.
  - Am I doing the right thing? Tell clients "It's a good thing you brought Fluffy in today because …." Validate their actions. This also makes it easier for them to report back to a parent or spouse.
  - Can I do what's expected of me (give pills or other meds, etc.)? Be sure they can do what you recommend without injuring themselves or the pet. Teach them, support them, praise their efforts, and follow through with callbacks or rechecks.
  - Can I remember what I'm told? Write everything down so they do not have to.

GOING HOME ANXIETIES

- Was it my fault?
- Will it happen again?
- What about the children or other pets?

These fears must always be addressed for every medical problem. Be sure you cover these issues whether the client asks about them or not.

TEAM TRAINING

Team members can be taught phrases and value statements for common things that clients need to hear, such as the following:

- "I can see that you are worried about Fluffy. I promise we'll take very good care of her."
- "Your appointment is with our new veterinarian, Dr. Jones. She's very nice; I'm sure you will like her."
- "Please read this information over. The doctor will want to talk with you about it when she comes in."
- "Does Fluffy go outdoors? The doctor will want to talk to you about feline leukemia if she spends time outside."

4.12. CREATING A CLIENT-CENTERED HOSPITAL

CAUTIONS

- If the practice leaders are not truly committed to customer service, they will not be able to pass this commitment along to the veterinary staff. Without buy-in from both groups, being client-centered will not be achievable.
- Do not survey your clients, and certainly do not hold focus groups, if you do not intend to change according to what you learn. If you ask what clients want changed and then fail to change anything, your clients will feel disillusioned and deceived.
- Listen to your team as well. They often understand what clients want.
- Do not judge people or their decisions.
- Your clients' needs will change with time. You should continually survey and reassess their needs.

4.13. CREATING A FELINE-FRIENDLY FOCUS AND FACILITY

BASICS

OVERVIEW

According to the American Veterinary Medical Association (AVMA) *U.S. Pet Ownership and Demographics Sourcebook*[1] survey of 50,000 US households, at the end of 2016 just over one-quarter of US households owned at least one cat. This is a decline from 30% five years earlier, and a 7.4% decline from 2006. The current *Sourcebook* also estimates the population of cats in US households to be 58.3 million, down from 72 million cats in 2011. The reported decline may be as a result of a change in methodology of sampling, or a trough in the cycle of ownership. The apparent decline in the US household cat population (along with a reported increase in the number of dogs) makes the need to have a feline-friendly focus in every veterinary practice even more important.

The barriers to feline care are varied, ranging from cat owners expressing a belief that cats "do not need medical care,"[2] that cat owners and even veterinary team members are unaware of cats' needs (for example, heartworm prevention in endemic areas where heartworm is found in dogs even when cats are reported to be indoors-only), to barriers in transportation as reported in the 2011 Veterinary Care Usage Study, where 58.2% of cat owners surveyed responded they think their cat hates going to the veterinarian.[3]

As stated, "a cat-friendly practice promotes the health and wellbeing of cats while encouraging and reinforcing the bond between owner, cat, and veterinarian. To do this, several obstacles must be overcome."[4]

Although overcoming obstacles is common across many workplaces, including veterinary practices, and changing how cats are cared for may seem overwhelming in the context of a 15-minute office visit, the opportunities to provide an acceptable and even advanced level of care for cats by veterinary teams are numerous and worthwhile.

TERMS DEFINED

Handling: The manner by which cats are visualized, approached, and touched. Strive to replace the word "restraint" and its analogous thought process with "handling."

ISSUES AND OPTIONS

Client perceptions, veterinary team offerings, the perceived value of cats by the public, media, and veterinary teams have all played a role in the unfortunate state of cat welfare and health as we know it today. With education, understanding, and practice, those perceptions will change, and cats will be able to receive the care they deserve.

WHAT TO DO

As with any protocol or procedure, creating a cat-friendly hospital or clinic is far more than a single decision and subsequent checkmark. It is imperative to have the agreement of all team members, particularly practice ownership and management. Different team members will be motivated by different values. Some people will appreciate that other ways of understanding cats and their owners is good and the right way to proceed. Some may feel that cats are deserving of tender loving care, which may be less than optimum in their practice. Others will see the business benefits of becoming more feline-friendly by showing "what if we …" scenarios from a financial aspect. In the latter case, developing spreadsheets of some achievable practice key performance indicators (KPIs) (see 7.7 – Data You Should be Reviewing Regularly) or goals will illustrate increased revenues by providing better care for cats. Some indicators and target goals might include:

- increasing feline visits by 5% over the next three months,
- microchipping five cats per week, starting immediately,
- increasing compliance of feline parasite prevention by 25% within six months.

The most important action toward achieving a feline-friendly hospital is to take any first step in a feline-friendly direction! To accomplish that, five practice sectors are listed below with topics and tips related to each area. Some overlap exists and the best tips and their sequence may be different for any given practice from what is listed. Some points may warrant a simple, "I never thought about that …" or "What a great suggestion" and they then become standard operating procedure (SOP) immediately. Others take planning, practice, and time. Trying to do all or most of what is listed can lead to a frustrated and overwhelmed team. A better approach is to consider the points, develop an initial strategy with specific tactics, and implement them. Then measure, report, and celebrate! What is most important is that team members work together to achieve their common feline-friendly goals!

MANAGEMENT, MEASUREMENT, AND MARKETING

- Confirm all owners' and practice managers' commitment to change.
- Hold doctors' meeting to listen, understand, and establish agreement.
- Retrieve and report practice management data, such as:
  - number of cat visits in past year,
  - total and average expenditures,
  - expenditures on and frequency of various services and products (e.g., number of microchips or number of dispensed doses of parasite preventives),
  - percentage of cats over nine years of age with wellness screening laboratory work.
- Assess team members regarding compliance to the practice's standards of care for their own pets (see 9.3 – Standards of Care and Care Pathways). Compare their cat compliance to that for their dogs.
- Identify team members who are less comfortable with cats and cat owners and listen to their reasons. In the cases of fear of handling, the proposed programs can be tailored to address that concern. In cases of "I just don't like cats," further inquiry may be required.
- Identify current and needed protocols to address strengths and opportunities for cat friendliness.
- Coordinate team education, engagement, training, and assignments (see 3.10 – Staff Training).
- Evaluate cat medications and products.
- Ensure service and billing codes are current, with the appropriate follow-up actions (i.e., reminders).
- Survey clients at point of care, by email, via telephone, or by mail. Some of these surveys even ask similar questions of both staff and clients so any gaps can be identified and addressed (www.partnersforhealthypets.org).
- Speak with pharmaceutical, nutrition, and distributor representatives to benefit from special product pricing, schedule training, or otherwise enhance the relationship to the benefit of all.
- Ask every dog-owning client if they have a cat (41% of dog owners also own a cat).
- Ask each cat client if they need help getting their cat in its carrier.
- Provide resources for cat transport assistance:
  - Embed informational videos, such as CATalyst Council's "Cats and Carriers, Friends not Foes" on your practice's website (http://catalystcouncil.org).
  - Suggest appropriate use of synthetic facial pheromone in carrier, client clothing, and car.
  - Send client handout on cat transport
- Connect with local shelters and rescue organizations to learn about their challenges with cats. In most communities there are far too many of them and they are in need of many more homes.
  - Discuss ways you can collaborate. Many shelters celebrate Adopt-A-Shelter-Cat Month each June, and by working together, more cats can be adopted into the community and additional new patients can result.

4.13. CREATING A FELINE-FRIENDLY FOCUS AND FACILITY

- Offer cat seminars to shelter teams.
- Collaborate on joint sessions for staff education on cat-friendly handling.

• Social media efforts for cats can be rewarding and fun! Photos, contests, surveys on Facebook, and other outlets provide a virtual "dog park" for current cat clients, which in turn can lead to new cat clients.

TEAM TRAINING

• Designate a cat-friendly leader and/or team within the practice and empower them as leaders in this effort: for example, "Cat Champions."
• Support each leader by providing access and resources to obtain American Association of Feline Practitioners' Cat-Friendly Practice designation.
• Commit to regular, periodic staff meetings and training sessions.
• Develop Feline Wellness Standards of Care for different feline life stages tailored to your own practice. Review *2010 AAFP/AAHA Feline Life Stage Guidelines*[5] and *Partnership for Preventive Pet Health* (https://www.partnersforhealthypets.org/) for consistency across the profession.
• Compare your practice's current Canine Wellness Standards of Care and identify and address gaps in corresponding feline standards.
• Review and adopt *2011 AAFP/ISFM Feline-Friendly Handling Guidelines*.[6]
• Understand normal cat behavior and preferences. Cats are unique in that they are both predator and prey and, as such, have innate needs to both hunt and hide. Typically, as we are the larger species, an unfamiliar person may be viewed as a predator to a cat, creating arousal and fear.
• Understand what causes arousal in cats, and that many of cats' responses are fear-based.
• In a team setting, discuss current situations that might cause anxiety, stress and fear, and ways to prevent and treat them.
• Consider the risk-to-benefit ratio regarding who holds a feline patient. The more familiar, patient, and calm the "holder," the more compliant the cat patient will be (see Figure 4-13-1). Many practices that historically never allowed an owner to hold their cat, or always had an assistant in the exam room, have changed protocols to the doctor or the client being the only people in the room and handling the cat. Personal safety must remain paramount.
• Engage and empower each team member to commit to a "Cat-Friendly Tip of the Week or Month" where they would be responsible for education, implementation, and reporting successes.
• Minimize and mitigate stimuli to which the feline patient may be aroused, afraid, and subsequently aggressive. These include:
  - sounds, particularly loud noises such as barking or howling dogs, human voices, alarms, appliances, and electronic equipment;
  - unfamiliar scents from people, animals, common chemicals and even unfamiliar foods; alcohol is a noxious odor and may cause a cat to withdraw or retreat;
  - rapid movements that will cause alarm and arousal in cats; the adage "slow is fast and fast is slow," is important to remember in this regard;
  - uninvited or unwelcome touch which can cause arousal and fear, and that may lead to aggression.
• Hold team discussions and develop sample scripts and phrases that can be used by team members. For example, "Do you have difficulty getting Tortie into her carrier?" Follow-up offers of resources have been shown to increase favorable client perception of the practice.[7]
• Replace "restraint" thinking and verbiage with the word "handling."
• Discuss and eliminate common negative stereotypes and descriptors around cats and their owners. "Crazy cat lady" and even "cats are independent and can take care of themselves" are frequently used without thought to the messages being reinforced and perpetuated.
• Remove negative notations from medical records, such as "This patient is aggressive," or similar commentary, and replace with words such as "Fearful," "Easily aroused," and/or "Move slowly," or other positive and helpful suggestions.
• Schedule hands-on practice of feline-friendly handling and promote understanding that each situation is different, and each patient is an individual.
• Commit to and budget for feline-specific continuing education.

Figure 4-13-1.

Blood pressure measurement is best taken in the examination room, in this case with the owner holding his cat. Photo courtesy of Cat Hospital At Towson.

FELINE-FRIENDLY FACILITY AND ENVIRONMENT

• Provide space for cats to promote quiet and calm surroundings. Some practices offer separate cat entrances or waiting areas. The use of interior floor screens, large plants, and segregated seating will help prevent arousal.
• Provide elevated space on which to rest carriers such as dedicated carrier tables with nonskid pads.
• Use synthetic facial pheromone diffusers.
• Escort the client and the cat into an exam room instead of the reception area to allow the cat to acclimate and reverse arousal that may have occurred during transport.
• Designate a "cat-only" examination room with reduced lighting, ambient noise, and synthetic facial pheromone diffusers.
• Place a pad or a towel on the exam table. Yoga mats provide a cushioned surface and infant changing pads offer curved sides that some cats seem to prefer.
• Stock each examination room with a box or basket of cat treats and toys.

4.13. Creating a Feline-Friendly Focus and Facility

Figure 4-13-2.

The preferred method for inviting a cat out of its carrier. Photo courtesy of Cat Hospital At Towson.

• Use a clean towel for each cat to cover the whole cat to aid in minimizing visual arousal.
• Add a towel warmer outside the exam rooms and keep filled for use with each patient.
• House cats separate from dogs.
• Provide hiding areas in cages if the cat chooses to have seclusion. Cats should have the choice to hide or look out, so a towel over the cage should provide some open area.
• Consider if leather handling gloves are necessary; in most cases, cats are better managed by covering their eyes.
• Understand that any article used for cat handling needs to be free of other animal scents to prevent arousal. Leather gloves are porous and should be laundered between uses.
• Avoid use of muzzles when cats are fractious as they may escalate the arousal and cause harm to the patient and/or the team. Using muzzles or other snug head covers may be effective in reducing visual stimulation in mildly aroused or nervous patients. Head covers should be thoroughly cleaned and disinfected to remove pathogens and residual scents between each use.

FELINE-FRIENDLY EXAMINATION

• Consider "cat-only" examination rooms or appointment blocks.
• Open the carrier to allow the cat to come out on its own (see Figure 4-13-2).
• Assess the cat's interest in treats or toys and use them throughout the examination as positive reinforcement when the cat is exhibiting unthreatening postures and facial expressions.
• Begin the exam with open-ended questions giving the cat time to acclimate. "Describe a typical day in Callie's life" or "tell me about her litter box."
• Avoid staring at feline patients because it may be perceived as a threat.
• Observe the cat to obtain its respiratory rate while it is still in the carrier.
• Assess level of arousal by glancing intermittently at its body posture and facial expression.
• If the cat chooses to stay in the carrier, disassemble the carrier instead of pulling or dumping the cat out.
• Approach cats at their level – that is, do not tower over them. Being seated in the exam room may be perceived as more welcoming to both the cat and its owner.
• Extend your pointer finger and allow the cat to approach, sniff, and deposit its facial pheromones.
• Practice scalp and head massage of the cat.
• Consider whether taking a temperature is necessary.
• Replace use of a fecal loop with dispensing of a pre-paid container for obtaining routine fecal samples.
• Examine the cat where it wants to be, which may include in the carrier, on the floor, in the examiner's lap, or the in the client's lap or on the client's shoulder.
• Obtain blood and urine samples in the examination room. As team members see the more positive patient response and become increasingly comfortable doing sampling with the owner present, the benefit to patient, team, and client becomes obvious.
• Especially with older cats and undiagnosed arthritis, when it is unclear if a cat is showing signs of aggression due to pain or fear, administer a rapid-acting opioid, and monitor the response.
• Prescribe anti-anxiety medication for feline patients if needed in advance of transport. Oral sedatives should be avoided and, if needed, various combinations of injectables can be administered in cases where heightened arousal may cause harm to the patient or people.
• Encourage pleasant veterinary visits and encourage people to bring their cats in for a weigh-in and treat.
• Consider free nail trims for cats to allow them to become habituated to the practice.
• Implement virtual care opportunities to educate (tele-advice), and where conditions exist and laws allow, manage certain conditions remotely (telehealth).

FELINE-FRIENDLY CLIENT COMMUNICATION

Specific and appropriate dialogue is key to the success of any healthcare plan. In particular, cat owners will benefit by being shown how medication is administered in addition to receiving verbal and written instructions.
• Review current handouts and brochures.
• When providing information to owners, remember the "3R" rule: review, recall, remind.

EXAMPLES

N/A

CAUTIONS

Understanding the obligation and implementation of cat-friendly attitudes and actions is crucial to success. Even if you "sign up," you still have to do it. While the concepts are simple and straightforward, they require constant and continued commitment.

MISCELLANEOUS

Adopt a practice-wide mindset of cat friendliness as a core value beyond "the front office." It must be everywhere.

4.14. DEVELOPING A FEAR FREE HOSPITAL

BASICS

OVERVIEW

Dr. Marty Becker, "America's Veterinarian," created the Fear Free℠ initiative. The mission of Fear Free is to alleviate fear, anxiety, and stress (FAS) in pets during veterinary visits, and to educate and inspire the people that care for them.

- FAS is a major factor that keeps clients from visiting the practice. When pets hate going to the veterinary practice, owners hate bringing them to the veterinary practice. Fearful, anxious, and stressful visits result in less preventive care and more "fire engine medicine."
- Every team member has a responsibility to recognize and reduce FAS.
- Key concepts in implementing Fear Free include communication, considerate approach, gentle control, and touch gradient.
- Creating a plan of action for each patient can be a quick process that saves time and creates a more pleasant experience for the veterinary healthcare team, the patient, and the client.
- Pets are capable of developing long-lasting memories. Negative experiences they have in the veterinary hospital can stay with them for a lifetime.
- Experiences that result in an adrenaline release also result in long-term memory storage. Just "getting it done" regardless of the stress level of the pet can result in a pet that is no longer able to be attended to medically at the veterinary hospital or at home due to irreversible, severe psychological damage.[1]
- Adapting Fear Free protocols and reducing anxiety at visits does not require a massive financial or time investment.

TERMS DEFINED

Anxiety: The anticipation of future danger that may be unknown, imagined, or real. It can result in physiologic responses similar to those associated with fear.

Considerate Approach: Encompasses the interactions between the veterinary team, the patient, and inputs from the environment while veterinary care is being administered.

Fear: An emotion that induces an animal to avoid situations and activities that may be dangerous. Pets may perceive danger where none exists. Perception is key.

Gentle Control: Utilizing comfortable and safe positions for patients while administrating veterinary care with minimal restraint.

Phobia: Persistent and excessive fears of certain things or situations that are usually out of proportion to the actual threat that they present. Examples include fireworks, thunderstorms, and fire alarms.

Stress: Any chemical, physical, or emotional force that threatens an organism's homeostasis.

Touch Gradient: Method used to touch canine and feline patients to minimize FAS during veterinary procedures.

ISSUES AND OPTIONS

WHY FEAR FREE?

The focus of Fear Free is to prevent FAS in every patient.

- Young and inexperienced animals are generally happy. This is a great time to prevent FAS.
- Patients that are afraid and displaying avoidance or aggression must be handled with care. They are scared, likely due to previous negative experiences.
- **Better care:** When Fear Free techniques are incorporated, patients learn to trust the team who are then able to provide better medical care.
- **Better medicine:** Patients that are more relaxed and calmer during diagnostic tests have more accurate results. Stress-induced adrenaline and noradrenaline release alters biochemical tests, orthopedic exams, and pain assessments.
- **Happier team members:** When patients are eager to visit the hospital, team members are relaxed and calm, making it easier to provide needed veterinary care efficiently and effectively.

CHANGING THE CULTURE

Veterinarians and veteran staff members may be more reluctant to embrace the importance of Fear Free than our clients. Changing the practice culture and "how we have always done things" can be difficult.

- Clients get it. They may not be able to visualize obesity or dental issues, but they know when their pet is stressed or experiencing anxiety.
- It is easier to stay within a comfort zone than to make change. Challenging the status quo can create a sense of chaos and discomfort.
- Many times, team members will use their energy voicing concerns about why something will not work versus problem-solving and trying to create solutions that will work.
- Change management starts with defining the perceived problem with facts (see 2.7 – Change Management).
- Step back and observe patients that experience FAS. Track observations and tally results at the end of the day and week.
- Review surveillance camera footage to evaluate FAS with the entire team to begin creating culture change.
- Identify the gap between what is going on now and what the desired outcome should be (gap analysis) and identify causes of the gap. The analysis should then be presented to the team (at team meetings, not individually) to ask for input and clarification.
- Ask the team to acknowledge that the veterinary profession has formerly created FAS in patients.
- Patients experiencing FAS have two choices: fight or flight:
  - If they fight, team members restrain them
  - If they try to escape (flight), team members restrain them.
- FAS may have been created by:
  - pulling dogs onto the scale,
  - pulling cats out of their carriers,
  - tech-o-mania restraint for a canine nail trim,
  - scruff-o-mania restraint for a feline patient.
- When team members discuss Fear Free patient experiences and give their opinions on how a policy or procedure can be updated, they are more likely to accept and implement the change. Collaboration among team members may result in ideas or methods to better implement the change.
- Collaborated points should include (at minimal):
  - Creating separate dog and cat waiting areas and exam rooms (and if this is not possible, consider cat-only hours)
  - Keeping doctors on time to reduce client and patient waiting times in exam rooms
  - Having the appointments begin at home with the client by bringing pets hungry, de-stressing the carrier and ride, and using calming tools
  - Considering administering anti-anxiety medications sooner rather than later
  - Decreasing the potential for pets to slip on flooring in the practice by using anti-slip mats when walking dogs from one place to another.
- There are a few common reasons for staff resistance to change. Leadership must explore these reasons for resistance, address the reasons, and add solutions into the plan of implementation.
  - **Informational resistance** is defined as team members not knowing that a problem exists, how the problem affects the practice, and where potential changes could occur.
  - **Personal resistance** is due to loss of familiar patterns.
  - **Cultural resistance** includes a personal view that change is not possible within the practice, or leadership is not capable of carrying out the change.
- Once the importance of a Fear Free experience has been accepted among the team:
  - create a summary of the notes and distribute to team members,

4.14. DEVELOPING A FEAR FREE HOSPITAL

- follow up discussions at the next team meeting and in coaching sessions with individual employees,
- evaluate progress and make further changes as needed, to achieve Fear Free practice goals,
- encourage all team members, from the doctors to the receptionists, to become Fear Free Certified.

• Change often fails due to poor planning and communication or failure to act or follow through by leadership.
- Put the Fear Free plan in writing with due dates, action items and task lists.
- Ensure all leaders (owners, associate veterinarians and managers) are on board with the plans; any hesitation will be likely mimicked by the staff.

TEAM ROLES

Receptionists

• Educate clients regarding travel to the veterinary practice in a stress-free environment with the following suggestions:
- Leave carriers out for cats at all times (preventing the association of the carrier with the veterinary office).
- Wipe down carrier with pheromones wipes.
- Play calming music for the car ride.
- Bring pet to the hospital hungry (if case permits).

• When patients arrive in the hospital, assess for FAS and alert the technician team if needed.
- Get patients in rooms as soon as possible.
- Separate dog and cat patients (if a separate reception area is not option).

Veterinary Technicians

• Educate owners how to recognize and reduce FAS at home and how the team reduces FAS in the hospital using:
- pheromones,
- Thundershirts®,
- calming music,
- considerate approach, gentle control and touch gradient,
- pharmacologic therapy.

• Allow the patients to acclimate to exam room (and explain to clients why).
• Control pets by minimizing stress instead of using maximal restraint.
• Weigh cats in the exam room.
- Stabilize the scale while the cat is on the platform.

• Place a yoga mat or similar nonslip table covering on exam room table.
• Examine dogs on the floor when possible – on their level.
• Use distractors to obtain vitals.
- Have a smorgasbord of treats and document what the pet likes best (examples available in the examples section).
- For NPO patients, utilize frozen broth in paper cups for pets to lick.
- Use tricks to make the exam fun for the patient. Animals associate tricks with treats.
- Make notes of tricks and treats in medical record.

• Address fear of instruments, such as nail trimmers, stethoscope, oto/ophthalmic scopes, syringes, with treats.
• Use considerate approach, gentle control, and touch gradient.
• Stop the procedure when pet responds with fear (and explain to owner why).

Veterinarians

• Use considerate approach, gentle control, and touch gradient.
• Use pharmacologic intervention sooner rather than later.
• Stop the procedure when pet responds with fear (and explain to owner why).

Practice Manager

• Provide training for all team members.
• Develop the website and provide Fear Free training for clients.
- Provide examples of feline-friendly carriers.
- Describe the importance of pheromones and calming music.

• Develop Fear Free protocols with the team.
• Hold team members responsible for adhering to Fear Free protocols.

COMMUNICATION

• Recognize FAS throughout the examination. Just because a patient is relaxed at the beginning of a visit does not mean they will remain relaxed the entire visit.
• Listen to what the patient's body language is saying and adjust the conversation accordingly to prevent the patient's fear from escalating. Offer a treat or pause for a second to let the patient acclimate to touch before proceeding.
• Maintain an "emotional record" alongside the "medical record." Document which techniques worked best for the patient during the visit so the same techniques can be incorporated into the next visit:
- Rewards that were effective.
- Where the patient preferred to be examined.
- How a procedure was performed.

CONSIDERATE APPROACH

Considerate approach encompasses the interactions between the veterinary team, the patient, and input from the environment while veterinary care is being administered.
• Avoid direct eye contact or leaning over the pet.
• Turn sideways to appear less threatening.
• Move smoothly and calmly.
• Allow the pet to approach first and toss or hand treats to the pet (when medically appropriate to do so).
• Consider the pets' perception of the hospital, and make changes to create a stress-free environment, such as:
- Providing nonslip surfaces for patients
- Incorporating calming scents and/or pheromones
- Minimizing loud noises
- Using calming sounds
- Utilizing LED (rather than fluorescent) lighting
- Utilizing disinfectants with low odor.

GENTLE CONTROL

• Use comfortable and safe positions for patients while administrating veterinary care with minimal restraint.
• Incorporate distraction techniques while providing gentle guidance and support allows many procedures to be performed safely with minimal restraint and fewer team members.

TOUCH GRADIENT

This encompasses both gentle control and considerate approach:
• Maintain continuous hands-on contact with the patient through the entire procedure or examination (when possible).
• Acclimate a patient to an increasing level of touch intensity while continuously measuring the patient's acceptance and comfort.
• Some patients respond well to gentle brushing (use soft brush).

CREATING AN ACTION PLAN FOR EACH PATIENT

Before starting a procedure, take a moment to create a plan of action.[1] This will help make the experience more successful for everyone. Creating an action plan for procedures includes the following:
• Assess the patient:
- Observe and note body language and behavioral indicators of FAS.
- Continuously reassess throughout the procedure.

• Assess yourself:
- Are you using considerate approach?
- Ask for help if you are feeling uncomfortable.

• Assess the environment:
- Set up the environment to be patient friendly.
- Remove stressors from the environment.

• Create a veterinary plan for care
- Identify reinforcers.

4.14. Developing a Fear Free Hospital

- Rank most to least important procedures.
- Plan least to most aversive procedures.
- Identify stopping or pause points: three tries for dogs, two tries for cats. At this point, sedation or rescheduling procedure would be recommended
- Consider the 3 W's:
  - Where will the procedure be performed? Wherever the pet is most comfortable
  - Who will be present? Usually best for owners to be present
  - What items are needed to make the environment more comfortable? Have everything ready before starting.

CONSIDER HOSTING PUPPY SOCIALIZATION CLASSES

- Puppies that have been socialized have a 1.6 times reduced risk of showing aggression to people outside of the home.
- Puppy class benefits extend into various areas of the dog's life, including their comfort level with people.
- Consider hosting puppy classes in the hospital where young pups can create a positive play and training experience within the walls of the veterinary hospital. This allows acclimation to the practice environment, like stepping on a scale for treats or associating the clinic smells with training and play.

EXAMPLES

COMMON BEHAVIOR SIGNS OF FAS IN CATS AND DOGS[2]

- Cowering/crouching
- Lowering or flattening of ears
- Growling
- Hiding
- Hissing
- Lifting lip/snarling
- Tucking tail
- Trembling.

SUBTLE SIGNS

- Avoiding eye contact
- Blinking slowly or squinting
- Dilated pupils
- Eye contact diversion
- Eye squinting
- Showing hypervigilance/inability to settle
- Licking lips
- Chattering jaw
- Closing mouth tightly or pulling mouth back
- Pacing
- Panting
- Freezing
- Lifting paws
- Raised hackles
- Self-grooming
- "Shaking off"
- Shifting eyes
- Sneezing
- Sniffing the ground
- Staying close to the owner
- Tail flicking or thrashing (cats)
- Taking treats roughly, being picky about treats, or refusing treats
- Turning head away
- Wet dog shake
- Yawning.

FAS SCALE (REPRINTED WITH PERMISSION FROM FEAR FREE.COM)

Action by veterinary team	*Signs*
GO	Rapidly accepts treats, toys, and/or attention
If mild FAS present, consider nutraceutical intervention	Appears relaxed, or only shows mild signs of FAS
Use CAUTION	Moderate interest/disinterest in treats, toys and/or attention
Consider nutraceutical/ pharmaceutical intervention	Fidgeting, difficulty settling
STOP	Little to no interest in treats, toys, and/or attention Fight, freeze, or flight response
Consider sedation and pharmaceutical/ nutraceutical consideration	

Low FAS

- **Level 0:** No signs of FAS. Pet is relaxed and solicits interaction with team members.
- **Level 1:** Displays 1 or 2 mild signs of FAS, such as lip licking, avoids eye contact, turns head away without moving away, lifts paw, or partially dilated pupils, and/or panting but commissures of lips are relaxed, occurring less than four times a minute. Interested in reinforcers (treats, play, attention) and chooses to interact with the team members.

Mild FAS

- **Level 2:** Displays 1–2 moderate signs of FAS, such as ears slightly back or to the side, tail down, furrowed brow, slow movements or overly attention seeking, and/or panting with a tighter mouth (dog), occurring four or less times a minute. Readily accepts reinforcement (treats, toys, and attention). Still soliciting social interactions with team members.
- **Level 3:** Displays more than 2 moderate signs of FAS occurring more than four times in a minute. May refuse reinforcements for brief moments. Might take treats roughly at times. May also be hesitant to interact with team members but not actively avoiding team members.

High FAS

- **Level 4:** Severe signs of FAS without aggression, such as immobility, fidgeting, escape behavior, dilated pupils, excessive panting (dog), increased respiratory rate, trembling, tense closed mouth, ears back, tailed tuck or thrashing (cat). May or may not be accepting any types of reinforcers. Not interested in interacting with team members and may be showing active avoidance (moving away).
- **Level 5:** Severe signs of FAS with aggression such as growling, lunging, barking, hissing, snarling, and/or snapping. Intolerant of procedures.

POSSIBLE DISTRACTORS OR REINFORCERS FOR CATS AND DOGS

Every pet has individual treat preferences. Discovering what a pet enjoys allows us to associate desirable things with experiences, thus creating a positive and pleasant memory. The following are examples of potential reinforcers.

Treats

- Commercially available cat and dog treats, including crunchy, semi-moist, and freeze-dried
- Canned cat or dog food
- Meat-based baby food (no onions or garlic)
- Canned cheese
- Green olives (cats)
- Bonita flakes
- Deli meat.

Toys

- Wand toys for cats
- Long tug toys for dogs
- Plush toys
- Balls of appropriate size
- Paper balls for cats
- Food storage toys (caution: for some dogs, such a toy may be a long-lasting resource in their possession and may evoke a need to guard it from people).

Other

- Catnip
- Brushing
- Petting
- Happy talk (caution: human anxiety is often communicated through intonation; pets can pick up on this and become more nervous).

BENEFITS OF FEAR FREE CERTIFICATION

- Online certification course Level 1 (9 hours of RACE-approved continuing education)
- Online implementation guide (3 hours of RACE-approved continuing education)
- With renewal, access to online Level 2 certification course (7 hours of RACE-approved continuing education)
- Fear Free educational library
- Fear Free toolbox: downloadable marketing tools, drug charts, and more
- Private Facebook group
- Fear Free podcast series with RACE-approved continuing education
- Welcome kit
- Monthly newsletter
- Preferential pricing on select products
- Additional RACE-approved continuing education courses offered on a complimentary basis or at discounted rates.

4.15. CLIENT APPOINTMENT SCHEDULING

BASICS

OVERVIEW

The management of client appointments is a major part of daily practice operations, yet most practices take a very passive approach to managing their appointment system.

- Practices should aggressively manage their appointment systems by analyzing and revising them on a regular basis.
- Multiple scheduling systems are available to practices. Practices should examine each system to determine which system best suits their needs. Practice philosophy, market position, doctor preference, competition, and client base composition are just a few of the factors that help determine which scheduling system is the best choice for a specific practice.
- The professional expertise of veterinarians is the most valuable resource within the practice. How effectively you leverage this resource often determines the success level of your practice.

TERMS DEFINED

Anybody: Generic term used by many practices to identify a client that scheduled an appointment but did not request a specific doctor. Therefore, "anybody" can see this client.

Bonding Philosophy: There are two primary bonding philosophies in multi-doctor practices. The first is to bind clients to the practice. In this instance, receptionists try to rotate the doctor that the client sees so that the client establishes relationships with all of the doctors in the practice rather than with one specific individual. The advantage of this philosophy is that if a doctor leaves, there will be minimum disruption in the client base; the disadvantage is that clients may not like one or more of the other veterinarians. Patient care may diminish due to decreased continuity of care. An alternative philosophy is to schedule clients with the same doctor always. This approach bonds the client to a specific doctor, and the relationship that develops over time can result in improved patient care. The disadvantage here is that if the doctor leaves the practice, numerous clients may follow.

Bonding Rate: Practices that encourage clients to bond with a specific doctor typically calculate that doctor's bonding rate. For example, if a doctor has six appointments scheduled in a morning appointment block and in three of those appointments, the doctor was requested by name (in the other three no request was made ("anybody")), the doctor has a 50% bonding rate. Ideally, new doctors should achieve a 25% bonding rate by the end of their first year at a practice, whereas most tenured doctors strive for a 70% bonding rate, and exceptional doctors can have bonding rates approaching 100%. If a tenured doctor has a bonding rate significantly less than 70%, it would appear that that doctor is not compatible with the client base and that the doctor's long-term fit in the practice should be re-evaluated.

E-slots or Same Days: Two of the many terms practices use to describe appointments that are held open until that day to accommodate emergencies, walk-ins, or other situations that require a doctor's immediate attention.

Fill Rate: Percentage of available appointment slots scheduled during a specific period of time. If, for example, a doctor is seeing 15-minute appointments from 8.30 a.m. to 10.00 a.m., there are 10 available appointment slots. If six of these slots are scheduled, the fill rate for this appointment block is 60%. Most practices calculate fill rates by shift and by veterinarian each quarter, and adjust the practice's scheduling guidelines accordingly.

High Density: Refers to any scheduling system where the doctor has access to more than one examination room. Common examples could be a doctor and technician working two exam rooms simultaneously; or a doctor, a technician, and an assistant working three rooms simultaneously. High-density scheduling requires a well-trained and well-choreographed staff that can leverage the available doctor's time and expertise, resulting in increased productivity.

Request: Generic term used by many practices to indicate that a client has requested a specific doctor when scheduling an appointment.

Straight 15s: Historically the most common scheduling system. The staff schedule a steady stream of appointments at 15-minute intervals (e.g., 8:00, 8:15, 8:30, etc.). Currently, it is estimated that 10–15% of companion animal practices still use this system.

Straight 20s: A popular expansion of the straight 15 s approach. Appointments are scheduled at 20-minute intervals (e.g., 8:00, 8:20, 8:40, etc.). Currently, it is estimated that approximately 40% of companion animal practices use this system.

Straight 30s: A popular time-scheduling option in very competitive markets and perhaps the schedule of choice for new practices trying to bond clientele. It is estimated that only 5% of companion animal practices use this system.

Ten-Minute Flex: The fastest-growing scheduling system in the industry today for companion animal practices. It is estimated that 35–45% of companion animal practices use this system. It allows the user to determine the appropriate amount of time for the appointment based on the number of 10-minute blocks that are combined. Therefore, an appointment could be 10, 20, 30, or 40 minutes, as needed.

ISSUES AND OPTIONS

Typically, each client/patient encounter has a fixed number of tasks. Examples could include introducing yourself to the client, eliciting the client's chief complaint, taking an appropriate history, performing a physical exam, formulating a treatment plan, performing necessary treatments, answering client questions, preparing for future encounters, documenting the encounter, and assisting with any billing or follow-up procedures.

Time/motion studies indicate that the majority of veterinarians can complete the above tasks in approximately 12 minutes. In a straight 15-minute appointment system, this leaves three minutes of quality client education time (unless other care is sacrificed). Given that the average companion animal visits the veterinarian two or fewer times per year, this gives the veterinarian six minutes or less to educate the client on all healthcare issues and/or husbandry needs relevant to their pet. Most veterinarians find this amount of time woefully inadequate.

- Implementation of a standard 20-minute appointment system increases a veterinarian's quality education time per encounter from three minutes to eight minutes. These five additional minutes represent a more than 250% increase in the amount of time a veterinarian has to educate and bond with his or her clients. Although a veterinarian will only be able to see three patients per hour (instead of four), productivity per visit typically increases so dramatically that productivity per hour is greater with fewer patient encounters. Decreased client volume has multiple benefits, including reducing stress on the support staff, and generally improves a practice's on-time performance (a significant customer service goal).
- Utilizing 30-minute appointments is rarely an effective strategy in the general practice setting. They can be effective if used on a very limited basis, such as a new client initial visit to bond a client to a practice, or a second opinion. If used as a default scheduling preference, most veterinarians are unable to fill the additional 10 minutes with quality client communication and education. Therefore, clients perceive these longer appointments to be inefficient and poor customer service. Veterinarians rarely increase their productivity enough so that two patient visits per hour can be as profitable on a per-hour basis. Appointments of 30 minutes (or longer) do work well

for consultations at referral practices where a much larger fee is obtained, and additional substantial revenue is typically expected.
• The 10-minute flex system allows the staff to capitalize on the advantages of each of the systems described without being locked into one specific time block.

EXAMPLES

• Ten-minute flex scheduling starts by breaking your appointment book into 10-minute slots. The number of slots utilized for each patient encounter depends on the needs of the client, patient, and/or veterinarian (or all three). In a typical practice, a 10-minute appointment could be a suture removal or a simple recheck exam. A 20-minute appointment could be the majority of routine appointments or more complex rechecks, and 30-minute appointments can be for two pets that belong to the same client, more involved procedures (second opinions, for example), or new client visits.
• Typically, it takes 2–4 weeks for most practice staffs to transition smoothly and efficiently to 10-minute flex scheduling. Once introduced to a 10-minute flex scheduling system, rarely does a practice choose to revert back to its previous scheduling system.

CAUTIONS

• During the transition to a new scheduling system, staff members will inevitably make mistakes. Teamwork and communication can minimize the impact of these errors on the clients as well as on the staff.
• Selecting the proper scheduling system to meet the needs of your practice is an individual decision that balances staff efficiency and productivity with customer service and profitability. In the end, a practice must settle on a system that most closely supports their practice philosophy.
• Appointment books have historically been set up at least six weeks in advance, so clients could schedule follow-up visits at the time of checkout to improve client compliance. Contemporary best practice supports that a full forward booking program be adopted by every practice, as is customary in the dental industry. Thus, six-month or annual visits are scheduled in advance to drive compliance. If a doctor's schedule changes, it is easy to reschedule the client and maintain compliance.
• Most customer service studies indicate that clients regard on-time performance to be a more important factor in the decision to use a certain practice than the practice's fee structure.
• Surgeries, dentals, day-cases, ultrasounds, and emergencies may each have their own column in the appointment book. This allows for faster reference while scheduling. It also helps to organize schedule data for analyzing trends, staffing needs, and practice productivity.
• It is a common misconception that meeting the needs of a single client by treating their pet in the exam room (taking radiographs, running extra laboratory tests, etc.) is providing good customer service. Unfortunately, it may only result in providing good customer service to that client and providing poor customer service to those waiting to be seen. Therefore, it is best to reschedule pets that need extensive work-ups, with the exception of those in need of life-sustaining treatment.

MISCELLANEOUS

• On-time performance is a key component of all customer service programs. Ten-minute flex scheduling offers most practices enough flexibility to improve their on-time performance dramatically.
• Missed appointments are missed opportunities for production that are lost forever. Therefore, many practice management software programs now have features built into their appointment book to track the reason for a missed appointment and flag habitual offenders.
• Confirming appointments two days in advance can dramatically decrease missed appointment rates. Some software systems are able to send email and/or text (SMS) confirmations to clients to help improve compliance. Confirming one day in advance rarely allows clients to alter their schedule if they forgot about their appointment. However, confirming appointments two days in advance allows clients an opportunity to alter their schedule, or notify you of the cancellation far enough in advance that you can fill the open slot.
• Contacting missed appointments and rescheduling them can dramatically improve client compliance, patient care, and practice profitability.
• The use of an Internet portal system allows clients to log onto the Internet and request, check, or confirm their appointments online. These portal systems offer clients 24-hour convenience for little monthly cost (see 10.18 – Patient Portals).
• Improving the appointment fill rate is a critical function to ensure practice resources (staff) are used efficiently. A single open appointment each day can cost the typical associate over $5,000 per year in lost wages (assuming that doctor's compensation includes a production component).
• Almost every practice tries to accommodate emergencies during the workday. Adding e-slots or same days to the schedule book helps to create a structured block of time for treating these cases. If a practice records the time of day each emergency has arrived, the practice can identify trends in emergency caseload and determine the number of slots they need to handle the typical emergency load for that time of day, or day of the week. For example, a practice may need six emergency slots for a Monday, but only two for a Tuesday.
• Many practices now schedule the use of practice resources as part of the appointment. Ultrasound, blood pressure machine, tonometer, and other assets may be scheduled with an appointment to avoid clients having to wait for shared equipment to become available.
• Having reading material, wi-fi or Internet-enabled public use computers, children's play areas, complimentary beverages, television, or multimedia available in the waiting area decreases by two-thirds a client's perception of the amount of time they waited to be seen.

4.16. CLIENT REMINDERS SYSTEMS

BASICS

OVERVIEW

• Timely, relevant, personalized, and hyper-targeted communications receive the highest response rates. By leveraging the data within their practice management systems (PMS), veterinary practices can empower owners to take the best care of their pet.
• Client recall systems are the most effective tool for driving client traffic back into practice – a major factor in generating practice revenue.
• It costs between five and twenty-five times more to attract a new client than it does to retain an existing client.
• Technology has had, and will continue to have, a massive impact on this area of practice life with automation, falling costs, and additional communication channels (text/SMS, email, apps, live chat, and web portals) supplementing "traditional" postal and telephone reminders.

TERMS DEFINED

"Call To Action" (CTA): A request within a communication for the recipient to initiate a desired behavior, such as phone, email, or visit the practice to make a purchase or book an appointment.
Compliance Reminders: A reminder for a pet owner to apply a treatment (usually for prevention of parasites) when due rather than to simply repurchase it.
Customer Relationship Management (CRM): Strategy for managing all a practice's relationships and interactions with customers and potential customers. It helps to improve a practice's profitability.
HTML (Hyper Text Markup Language): Standard markup language for creating emails and web pages.
Short Message Service (SMS): More commonly referred to as text messages. Limited to, and charged at, 160 characters per message, including spaces. Smartphones enable up to four SMSs to be strung together.
SMS API: Allows PMS to directly integrate with SMS software, either to send messages or collect inbound responses (e.g., "reply 'YES' to confirm appointment or 'NO' to cancel").

ISSUES AND OPTIONS

• Traditionally, veterinary practices have low penetration of email addresses and mobile phone numbers for clients, which undermines the effectiveness of recall systems. A continual focus must be made by the front office team to collect and then validate contact information at least every 12 months.
• When selecting a communication channel, it is essential to consider the advantages and disadvantages for each medium.

SMS (TEXT MESSAGES)

• Texts are low cost and have an extremely high open rate – almost 100%, usually being opened within minutes of being sent. Practices are instantly notified of incorrect phone numbers, enabling them to take alternative action.
• Volume discounts are available for practices sending larger volumes by negotiating with your SMS provider (circa $0.04 per SMS).
• Due to the increase in popularity of mobile number portability (MNP), clients are highly likely to keep the same mobile phone number for many years which increases deliverability of messages.
• Although limited to 160 characters per SMS, messages can include a web link for further info and a call to action (CTA).

EMAIL

• Email is very low cost, either plain text or via full HTML. Practices can incorporate branding, embed video, links to supplementary information and imagery.
• Emails have a relatively high open rate due to the implicit trust and relevance of receiving a healthcare communication from your local veterinary practice. Emails are usually opened within 48 hours of being sent.
• Effectiveness will depend on the percentage of client records with a valid email address.
• Clients are four times more likely to change their email address than their mobile phone number so contact details must be checked regularly to maintain deliverability.

MAIL/POST

• This is a medium cost option, comprising postage, materials and fulfillment time.
• Full-color digital personalization via a fulfillment/mailing house enables a high level of personalization, such as pet name, species-specific images, and messaging.
• Post has the longest lead time of all channels, with a lead time of 4–7 days between the communications being generated by the PMS and receipt by the client.

PHONE CALLS

• Phone calls are the highest cost option due to the cost of labor but are also potentially the most effective due to the uniquely personal nature. Several attempts may be required in order to speak to the client. The most effective time to phone clients may be outside of traditional practice hours (e.g., weekends and evenings).

APPS AND PUSH NOTIFICATIONS

• This is undoubtedly the direction recall communications are heading post 2020. Apps and push notifications require PMS data to be cloud based (rather than server based) with seamless two-way integration into web-based pet owner portals and smartphone apps. This technology is almost certainly beyond the realms of veterinary practices to develop themselves but will become available via third-party technology companies as is currently the case in numerous other industries.

A multi-channel approach using a combination of the channels above will always be the most effective, and protocols should be regularly monitored and reviewed.

EXAMPLES

• Effective recall communications should always contain: a greeting, the pet's name, the action required and date, a CTA (include the practice phone number) and, where possible, a web link to respond online.
• Automation must be implemented wherever possible. In a busy practice one of the first tasks that will be neglected is recall communications (which can often result in lower client traffic the following month). Sending reminders daily spreads out inbound call volumes, email enquiries, and walk-ins over a more manageable time frame.
• Automation of recall communications via the PMS allows practices to schedule communications to be sent on a daily basis at a fixed time. To select the most appropriate time of day to send messages consideration should be given to each of the following in this order of priority: (a) What is the most convenient time for the client to act on the communication? (b) When is the practice team most able to respond to the resulting enquiry? (c) What other communications are

scheduled for your practice throughout the day and what is their impact on the front office team's ability to respond to enquiries in a timely manner? This process may lead you to reconsider shift patterns, resource planning and practice opening hours.

RECOMMENDED PROTOCOLS FOR CLIENT RECALL

- The following protocols are based on the author's own experience in recalling 400,000 pets for appointments, annual vaccinations, examinations, and application reminders while grappling with limits of existing technologies. They are intended as a starting point for the reader to build upon.
- It is essential that response rates to the recall communications below are measured and monitored on a regular basis; small changes to these can make a huge impact on their effectiveness (it is possible to both increase and decrease success rates) and thus client traffic into your practice and the health of the pets under your care.

Annual Vaccinations/Boosters

- SMS/text and email 20 days before due date.
- SMS/text and email 5 days before due date.
- Phone call 10 days overdue.
- Phone call 100 days overdue.
- If there is no mobile phone number on the PMS for the client a postal reminder must be sent instead.
- The same process can also be followed with canine cough and rabies vaccinations for dogs.

Appointments

- SMS/text 2 days before appointment date.
- Phone call 1 day after for missed appointments.
- Missed appointments should be regularly reviewed and monitored. Factors influencing the percentage of missed appointments include: type of appointment, recency of booking, practice (certain team members have a higher instance of missed appointments usually as a result of poor communication skills which should be addressed by training), external factors (e.g., weather, public holidays, economic climate).
- Consider introducing an additional phone call prior to the appointment for appointment types with a high value to the practice and a high percentage of missed appointments.

Neutering/Desexing

- Phone call once the pet reaches five months of age.
- Consider the emotional state of the owner before selecting your communication channel for this recall; a text message may be inappropriate, however a longer form email with advice, education, and further reading will increase effectiveness of recall.

Parasites/Flea and Worm Treatments

- Consider whether reminders are (a) to repurchase once all the doses of treatment have been used – known from here on as "reminders to purchase" or (b) to apply, ensuring the pet receives all the doses required as they fall due. This may involve sending a series of reminders monthly/quarterly/half yearly until the quantity of treatments dispensed has been used – known from here on as "adherence reminders." Much will depend on your PMS's ability to be configured and these communications to be automated.
  - Reminders to repurchase: SMS 2 days before due date and phone call 7 days after.
  - Compliance reminders: SMS on day of each treatment date. Due to the frequency of these reminders SMS volumes will increase significantly.

Treatment Advised

- These may include: dental health check advised; SMS and email 2 days before clinician's desired date, weight check advised; SMS and email 2 days before clinician's desired date or senior pet clinics; email and phone call on the pet's 7th birthday).

Diet/Food

- While desirable for the revenue of the practice, recall communications to repurchase pet diets can be challenging due to the number of variables (e.g., weight of pet, other diets fed by the owner, size of bag, activity levels, and portion size). There are already some companies offering monthly payment plans to clients by attempting to control this (e.g., https://tails.com/ and https://butternutbox.com/).

CAUTIONS

- All put-to-sleep (PTS)/euthanized pets must be suppressed from recall activity. This feature is already designed into most PMS.
- Once a recall has been completed the PMS overwrites the reminder with a new recall date in the future.
- For older clients, ensure recall systems are inclusive and function for clients without access to technology, there must always be a backup protocol and the value of a personal phone call should not be underestimated.
- It is important to note that recall messages should avoid being overtly sales-oriented. Their main aim is to empower the pet owner to take the best possible care of their pet. This approach will also ensure that all communications from the practice are compliant with local data protection legislation.
- While collecting email addresses and mobile phone numbers in practice ensure clients have separate opportunities to opt out of marketing communications and recall communications.

MISCELLANEOUS

4.17. MAINTAINING REGULAR CLIENT CONTACT

BASICS

OVERVIEW

Most practices encourage wellness visits at least once per year for each pet, keeping in mind age and overall health conditions. But 12 months is a long time to go without any contact with your clients. Some might even say that is just enough time to find another veterinarian. Your clients need more from you than the annual examination. Help them see the value in regular communication with your practice. You might just increase your revenue while enhancing the health and wellbeing of your patients.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

PET OWNERS NEED YOU

Why? Because they are not veterinarians is the simple answer and they do not possess the knowledge, ability, or access to the type of care we know is best to keep an animal healthy for as long as possible. The more complex answer is that you have a responsibility to become their resource for all things pet related. Simply having a credential or post-nominal after your name only buys you so much. Credibility and trust is earned. We know through various studies that veterinary visits have been declining over the years, and many pet owners fail to see the value in wellness care for their pets. This means as veterinarians and veterinary practices, we have a lot of work to do to improve our communication skills.

In order to provide the greatest opportunity for companion animals to experience superior health, undertaking the role of educator, communicator, advisor, and advocate needs to be part of the job of veterinarian. Let's face it, nearly everyone now has access to Dr. Google. And much of what a pet owner can find online is information put out by individuals without credentials and unsupported by facts. Your goal should always be for your clients to turn to you *first* when seeking information or guidance for their pet.

Pet owners also need you to fulfill the following:

- Inform them of new products that may enhance their pet's health and wellbeing.
- Provide tips and reminders regarding vaccination schedules, flea, tick, and other parasite prevention.
- Educate them about seasonal and yearly household hazards to avoid such as toxic substances, plants and even foods common to the average home.
- Announce product specials to take advantage of unique savings opportunities.
- Inform them of any changes in practice hours, services, personnel, and anything else that may be deemed a courtesy and convenience.
- Invite them to an open house to tour the facility, demonstrate new equipment, meet a new veterinarian, view a remodel/expansion of the clinic.
- Acknowledge milestones that they may want to participate in, such as a big anniversary of serving the community, the tenure of a veterinarian, etc.
- Dispel the many medical myths commonly sourced on "Dr. Google" and other unverified information sources.
- Provide a list of resources that you recommend for credible information.
- Inform them of food/product recalls and medical alerts if an outbreak of a particular condition should be watched for (canine influenza, flea/tick-borne diseases, etc.).
- Make them feel important by acknowledging their pet's birthday, thank them for a referral or even send them a personal note after a visit.
- Provide pet-specific information and education on certain health conditions they may be prone to as an individual (see 4.8 – Pet-specific Care).

YOU NEED YOUR PET OWNERS (CLIENTS)

You need your pet owners for many reasons:

- **Revenue:** they are your life blood and each team member should view clients as the ones who really provide their paycheck.
- **Referrals:** The most cost effective and easiest method to grow your practice is through referrals.
- **To keep you sharp:** Inquisitive, engaged, and devoted pet owners will constantly challenge you, your medicine, your service, and your advice in order to remain confident that you are the best caregiver for their pet.
- **Motivation and inspiration:** The unique and special bonds that many people have with their animals may very well be the key to getting you out of bed in the morning and the fuel to acquiring the deep sense of satisfaction you receive by serving as the healer, listener and caregiver to so many.

You have been convinced that staying in regular touch with your clients is a good idea, but how do you do so effectively when your clientele is so varied and utilizes many different means of communication? You incorporate them all! A practice that is made up of many generations and serves just as many needs to stay flexible and reach out to all segments of the audience.

Passive Outreach

- Keep your website fresh, current, updated frequently, full of good information and list resources to seek more information if desired (see 10.13 – Websites). Encourage interaction by requesting testimonials, comments, submission of their pet's photo, etc. Don't forget to let clients know they can find helpful resources on your website at each visit.
- Have attractive, professionally designed and written materials on hand in the reception area and exam rooms for your clients to read and take home (see 6.18 – Client Education Tools). Chances are they are not familiar with all of your services – use this as an opportunity to cross promote all of the wonderful products/services you offer and it may bring them back sooner or open the door to a new discussion entirely.
- Have a robust social media presence and engage with your clients – but have a plan (see 10.16 – Social Media)! Create a strategy and goals for your digital presence. Determine how frequently you want to post, how you will respond to positive and negative postings, what types of information you will be sending to "followers." Include postings of events you will be attending, encouraging followers to come by and see you. Most importantly, assign this "job" to someone specific in your practice that you trust has the skills and ability needed, or outsource it to a firm who has the expertise to maximize the reach through search engine optimization (SEO), targeted advertising, boosted posts, and the like. Make sure the password is protected and only known by the owner, manager, and/or individual in charge.

Active Outreach

- Customize your reminder cards/emails. For example, if the client has a black Labrador retriever, for instance, on the reminder card for a wellness exam and vaccines, include a photo of a black Lab and use their pet's name.

4.17. MAINTAINING REGULAR CLIENT CONTACT

• Find out pet owners' preferred means of communication – telephone, email, text, snail mail – then use it.
• Send out periodic newsletters (print and/or electronic) with a variety of information from educational to fun, community oriented, success stories, acknowledgments of referrals, team member highlights, and so on.
• Handwritten notes may be the least utilized, least expensive, most effective means of staying in touch and communicating with clients outside of visits. Use branded, professionally designed notecards to offer thanks, a kind word, or an acknowledgment. The personal nature of this effort goes a long way.
• Community events – get out there in the community. Be visible, attend charity walks, have a dog wash to benefit a local shelter – most of all have fun and work with your team to decide how often and where you want to participate.
• Use the media to help tell your story. Share a particularly newsworthy patient story with the owner's permission through a press release, announce a new and/or unique service offering not found elsewhere in your region, celebrate a grand opening. Local publications both in print and online are always looking for good content.

Your clients need you, you need your clients. Create an outreach plan that is as intuitive and automatic as the weekly inventory order. Your practice depends on it and so do your patients.

Consistency is key. Just when you think you have sent one-too-many messages to your clients, this is typically when they start noticing or absorbing the information. To avoid feeling like you are overwhelming them, be sure that every piece has a distinct purpose, is well written and designed, and contains a call to action. Recipients will need to know what you want them to do with the information presented. If it is important enough to send out, then it is important enough to act upon. Give them instructions for "what to do," "when to do it," and "how it will benefit them and/or their pet."

EXAMPLES

N/A

CAUTIONS

Social media is not FREE. Just because it does not cost to have a Facebook page or Twitter account, does not mean it is free. As social media companies' business plans have evolved, "paying to play" through ads and boosted posts is the main way to reach more than just a handful of people. On top of that, having a social media presence without a plan can fail miserably. Staff time is not without costs either. Like any other outreach initiative, craft goals, a schedule, and an overarching objective to your practice's presence online and then monitor it over time. Once you dive in, encourage clients to "Like" your page and stay in touch.

Electronic communication in general can seem like a gift to save on marketing costs. And it can be a great tool. However, be advised that poorly designed email blasts, newsletters, overcommunicating, inappropriate content, etc., can all backfire. The myriad email services provide templates and back-end support to assist you in staying in regular touch, but you may still want to work with a professional to create, design, and disseminate the messages. Marketing and all types of outreach will always be most effective if the messaging, design style, look, and feel are consistent and born from the core purpose of the practice.

4.18. TELEPHONE SERVICE MANAGEMENT

BASICS

OVERVIEW

Some telephone calls should be made exclusively by veterinarians, such as calls to share bad news with clients about their pets, calls to discuss medical choices clients need to make for their pet, or calls to discuss medical issues with a specialist or another veterinarian. Almost every other kind of call to or from the practice can be handled by trained staff members to free the doctor's time to see patients, do surgery, complete patient records, and do other things that require the veterinarian's direct attention.

The telephone is the lifeline of the practice. It is the primary means of making appointments for both new and existing clients:

- When a staff member answers the phone, his or her voice creates the first impression about the human side of the practice. A lot depends on that audio interaction. Based on voice alone, pet owners determine whether this sounds like a friendly place and whether the hospital's staff seems knowledgeable, competent, caring, and compatible with the pet owner's values.
- The telephone is the primary tool for scheduling appointments. Usually, a client's or potential client's telephone call to the practice is the first human contact they will have with the hospital. How they are treated will determine whether they decide to come in or not.
  - When a client calls with a health question about their pet, it is inappropriate and a malpractice risk for a staff person to offer healthcare advice over the telephone. If the client is concerned enough to call, the best thing to do is to invite the owner to make an appointment for their pet as soon as possible.
  - When prospective clients call, it is always a good idea to invite them to make an appointment for their pets. They are calling because their pets need something, so why not solve their problem by inviting them to let you set up an appointment, rather than just respond to the fee information they may have asked about?
- To make a good impression and handle callers efficiently and well, telephone contact protocols need to be developed for the most frequent types of telephone contacts (see the Examples section). Such protocols may include:
  - Answering the telephone properly
  - Putting callers on hold
  - Responding when the caller wants to speak to the doctor
  - Giving estimates
  - Responding to frequently asked healthcare questions (FAQs)
  - Giving directions to the hospital
  - Making appointments
  - Handling prescription refill/therapeutic diet requests
  - Managing pet emergency calls
  - Responding to "price shopper" calls
  - Confirming upcoming appointments/surgeries (see 6.22 – Outbound Telephone Calls)
  - Checking on the pet at home (see 6.22 – Outbound Telephone Calls).

TERMS DEFINED

Frequently Asked Questions (FAQ): In the context of telephone service management, these would be commonly asked client questions that anyone who works in a veterinary practice should be able to answer fluently and well, such as the hospital's policies on spay and neutering, vaccinations, and parasite control, among others.

Protocol: The form and etiquette observed for a specific event or procedure.

ISSUES AND OPTIONS

- Most patient visits are still scheduled by telephone. Delays in answering the telephone, inappropriately answered questions, leaving callers on hold too long, and not inviting the caller to make an appointment all negatively impact the practice. "Preventive medicine" in the form of telephone protocols and staff training are the best way to avoid these problems and provide good client service.
- Sufficient telephone lines are important for good telephone service management. Your telephone company can run a "busy signal" audit to tell you how many calls were dropped due to busy signals. This will help you determine if you have enough lines.
- Sufficient staffing so that receptionists can handle phone calls and check clients in and out during peak morning and evening hours is important for good service.
- Staff training for new hospital team members should start by asking the new employees to read the hospital's "Telephone Protocols" and "FAQs" notebook to familiarize themselves with the hospital's service expectations. Next, the new employee should listen to the best staff members answer the telephone and talk to clients. Finally, the new employee should answer the telephone in the presence of a fellow employee "coach" who will give them tips and feedback to help them hone their telephone communication techniques and skills.
- Year after year, consumer polls show that people dislike automated answering machines and menu options. Your clients dislike them too. In addition, an automated answering "attendant" puts barriers between you and your clients, who need to talk to a real person to get their problems solved, their questions answered, or make appointments. New callers in particular may get the impression that a practice that has an automated answering attendant is too big and too impersonal to care about them and their pets.
- The "gold standard" for client service is the personal touch that comes from the warm, welcoming voice of a trained, competent professional at the other end of the line, not an answering machine with menu options.
- Voicemail options for doctors need to be carefully managed:
  - Voicemail can easily turn into an abuse of veterinarians' time – compare the pink paper note explaining what the caller wants, the caller's name, the pet's name, and the caller's telephone number clipped to the patient chart for the doctor to use to make his or her callback versus listening to a long-winded, rambling message in which the caller mentions the pet's name but forgets to leave his or her name and telephone number. No file is attached to the voice message. Which scenario sounds better to you?
  - Voicemail options should be guarded like a hospital's private line. Only callers who are family members, or those for whom the doctor has given explicit clearance, should ever be put through to the doctors' voicemail. Most clients should never even know this option exists.
  - The voicemail rules for specialists are different. Doctor-to-doctor communication is difficult because of their demanding schedules, and a veterinarian may prefer to leave a voicemail message for a specialist, or vice versa, rather than just an abbreviated written message or callback number.
  - In all cases, when voicemail messages are accepted, doctors and staff members must make callbacks in a timely manner, lest they break trust with their clients and harm the reputation of the practice.

• It is not unusual today for practices to receive calls from "price shoppers" who want to know the cost of services before they commit to making an appointment. Today, many pet owners believe that vaccinations, heartworm preventive medication, spay and neuter surgeries, and routine wellness exams are "commodity" services and that the only difference is the price. The best way to handle a price shopper is to show your interest in them and their pet to demonstrate the kind of care and attention they can expect if they choose to come to your hospital. (See the Price Shopper example in this chapter.)

EXAMPLES

SAMPLE TELEPHONE PROTOCOLS

Sample Telephone Protocol for Answering the Phone

• Answer at least by the third ring or sooner.
• Greet the caller by saying, "Hello. [Hospital name], this is [receptionist's first name]. May I help you?"
• Actively listen to what the client needs and help him or her in the best way possible.

Sample Script for when a Client Wants to Talk Only to the Veterinarian

• If the client asks to talk to the doctor and the doctor is busy, say, "Dr. ___ is tied up right now. Perhaps I can help you. What is your pet's name? Could you please tell me a little more about what's going on with (pet's name)?"

Sample Telephone Protocol for Putting a Caller on Hold

• Answer the phone as in the previous example and, if a caller must be put on hold, ask, "Could you please hold for a moment?" Then wait for the answer before you hit the hold button. It could be an emergency, but even if it isn't, good manners dictate that you wait for the client to agree before you put them on hold.
• Check back with the caller within 60 seconds. If you still cannot talk to them, ask if you can put them back on hold, or if they would prefer to have you call them back. If the latter, make sure to get their name and phone number and, most important, do call back.

Sample Call to Check on a Patient at Home After a Routine Procedure That Went Well

• If possible, call the client at a time when they most likely would be at home, such as on Saturday or Sunday or in the evenings between 7.30 p.m. and 9.30 p.m.
• If you do not reach the client, leave a message, your name, and the hospital's telephone number. Repeat the number twice for clarity.
• In both live and recorded messages, make sure to give your name and the hospital's name; i.e., "This is [your name] from [hospital's name]. Dr. [veterinarian's name] asked me to call and see how everyone is doing at home. Is [pet's name] eating and drinking all right? Is he/she going to the bathroom normally? How is [pet's name]'s activity level? I also wanted to check to see if you had any questions about [pet's name]'s home care and to let you know you can call us if you think of anything later."

Sample Price Shopper Response

• Ask the pet's name, and use it in your conversation with the caller.
• Gather information about the pet so that you can give a thoughtful, personalized response to the price shopper:
  ◦ Ask the pet's sex, age, and weight.
  ◦ Ask if the pet is experiencing problems, such as itching, ear scratching, coughing, difficulty eating or drinking, or slowed activity.
  ◦ Ask if the pet owner has any special concerns.
• Use all of this information to respond to the client's request for fee information. For example, "Because Sunshine is already six months old and she has gotten out a couple of times, it is important to bring her in to make sure she is not already pregnant and that there are no other issues going on before we set up her surgery. A spay is equivalent to an ovariohysterectomy and the doctor would need to see Sunshine before we can give you an exact quote, but for a dog Sunshine's size and age, you can usually expect to pay between $_____ and $ _____. The fee includes [list everything the fee includes]. May I set up an appointment for you and Sunshine? We have an opening on …."

4.19. MEASURING CLIENT SATISFACTION

BASICS

OVERVIEW

• A dissatisfied client will tell between 9 and 15 people about their experience. Around 13% of dissatisfied customers tell more than 20 people. In contrast, a happy client will tell about 4–6 people about their experience. Identifying underlying issues early provides the opportunity to rectify any issues.
• Veterinary practices must ensure they are providing what their clients actually want rather than what they think they want (see 6.2 – Giving Clients What They Want Most).
• Implementing a continuous feedback loop ensures that client satisfaction can be regularly measured and that actions can be immediately taken to address areas where the practice has performed below the clients' expectations. Factors that can impact client expectations are: changes in team members, poor communication skills, cleanliness of the practice, outcomes of clinical cases, local competition and perceived differences in services received, and costs incurred.
• Following a predefined survey format such as Net Promoter Score (NPS) can enable comparisons between branches or against noncompeting practices in the wider veterinary community.
• Technology has made it much easier for practices to collect data on client satisfaction quickly, at low cost and in greater volumes than ever before via web-based platforms, email, SMS (text messaging), and electronic point-of-sale units.
• Insight from clients often prove to be the most powerful catalysts for change and are important to any practice aiming to adopt a client-centric approach.

TERMS DEFINED

Net Promoter or Net Promoter Score (NPS): A management tool that can be used to gauge the loyalty of a practice's client relationships. It serves as an alternative to traditional client satisfaction research and is correlated with revenue growth. www.netpromoter.com
Quantitative and Qualitative Research: Quantitative research generates numerical data or information that can be converted into numbers, whereas qualitative research generates non-numerical data.

ISSUES AND OPTIONS

TYPES OF SURVEY QUESTIONS

There are many types of survey questions, and each has pros and cons. The type of information you need, the depth of information you need, and the amount of time your respondents have available will all influence your choice of survey type. This guide will introduce you to some of the most common types of survey questions.

Closed-Ended Questions

The most commonly used types of closed-ended questions are: rating scale, forced choice, and dichotomous. It should be noted that by making sure that the scales of a question are the same for all questions, the ratings can be directly compared with each other (e.g., a score of 3 out of 5 is not the same value as 3 out of 12).

Rating Scale Questions

Respondents assess the issue based on a given dimension. Two frequently used types of rating scale questions are Likert-type scales and semantic differential scales. When using a rating scale, you may want to use the balanced scale method. A balanced scale gives the respondent an equal number of positive and negative choices, with each point holding the same amount of weight. Balanced scales allow respondents who have no strong feelings about the question to select a neutral response, instead of forcing them to choose a response that does not match their feelings.

Likert-Type Scales

Respondents are asked whether they agree or disagree with a statement. Each option is given a score, which can be used to analyze results.

For example, using a scale of 1 to 5 where 1 means strongly agree and 5 means strongly disagree, how much do you agree or disagree with the following statements:

	1 *Strongly agree*	2 *Agree*	3 *Neither agree nor disagree*	4 *Disagree*	5 *Strongly disagree*
I enjoyed my visit to White Cross Vets					
I felt that the team members were polite and helpful					

• Pros:
  ◦ Very flexible – you can measure broad areas or look at specific facets of your practice
  ◦ More precise than "yes/no" or "true/false" questions
  ◦ Easy to compile and understand results.
• Cons:
  ◦ Does not address the issue of "why"
  ◦ Requires development work before the survey to identify the most important facets to measure.

Semantic Differential

In a semantic differential scale, each end of the scale marked is with different or opposing statements.

For example, "On a scale from 1 to 7 where 1 is short and 7 is long, how would you describe the amount of time you had to wait for your pet to be seen?"

• Pros:
  ◦ Can assess an intuitive or conceptual response to a product or service
  ◦ Easy to compile results.
• Cons:
  ◦ Depending on the number of options, it can be difficult for respondents to choose a response
  ◦ Can be hard to gauge the meaning of responses – one customer may classify a two-minute wait as "long," another could classify the same wait time as "short"
  ◦ Does not address the issue of "why."

Multiple Choice Questions

Multiple choice questions ask the respondent to choose between two or more answer options. Questions can be as simple as "yes/no" or can give a choice of multiple answers.

For example, "What factors influenced your decision when rating your visit to White Cross Vets today?"

A. The respect with which we treated your pet
B. The warmth of greeting at reception
C. Cost
D. Cleanliness of the practice.

• Pros:
  ◦ Easy to answer
  ◦ Allows you to easily compile and analyze results.

4.19. MEASURING CLIENT SATISFACTION

- Cons:
  - May not give the respondent the answer they want
  - Does not address the issue of "why."

Rank Order Questions

Rank order questions require the respondent to choose among a set of alternatives.

In paired comparisons, respondents must choose between two alternatives. For example, "When you are deciding which veterinary practice you are going to visit, which is more important: price or quality?"

- Pros:
  - Can assess rank ordering of objects and identify degree of difference between objects
  - Forces discrimination among alternatives.
- Cons:
  - Limited number of options
  - Does not address the issue of "why"
  - Tends to have decreased reliability for mid-range responses.

In forced-preference rank order, respondents must choose among several alternatives. The forced-preference ranking approach requires sequential ranking from high to low until all factors are ranked. For example, "Look at the list of ways we can communicate with you and your pet and rank them from most useful to least useful."

- Pros:
  - Enables identification of "best" and "worst"
  - Forces discrimination among alternatives.
- Cons:
  - Limited number of alternatives
  - Does not address the issue of "why"
  - Can be fatiguing for respondent.

Dichotomous Questions

Respondents must choose between two alternatives.

For example, "In the past 30 days, have you seen or heard any promotion for White Cross Vets? Yes or no?"

- Pros:
  - Quick
  - Does not allow for ambiguous answers.
- Cons:
  - Does not allow for a certain degree of sensitivity and differentiation.

Open-Ended Questions

Open-ended questions ask respondents to supply their own answer. No predefined answers are given, so respondents are free to write what they want.

For example, "What could we do to make your experience of our practice more enjoyable?"

- Pros:
  - Allows respondents to define central issues
  - Addresses the issue of "why."
- Cons:
  - Can be time consuming for respondents
  - Can be difficult to compile and analyze results
  - Asking more than one question at once can confuse results
  - Asking leading questions can makes results less reliable.

ALTERNATIVE ENDINGS

Based on the outcome of the client survey, best practice suggests respondents are handled differently:

- Clients with a very low overall satisfaction score should receive a phone call from the practice (ideally a senior manager) to address their concerns and offer a solution.
- Clients with extremely high overall satisfaction should be provided with a direct link to leave a customer review on a review site.

EXAMPLES

The three biggest factors influencing the likelihood of a client completing a survey or questionnaire are the following:

- **Relevance:** Using automation to deliver the survey in a timely manner after a clients' visit, via SMS or email, when the experience is still fresh in their mind will improve accuracy of data and the likelihood of completion.
- **Simplicity:** The easier the survey is perceived to be the greater the response rate – this is one of the benefits of the NPS format.
- **Incentives:** Offering an incentive in exchange for a clients' time and insight will increase the number of responses. Incentives can take the form of prize draws, credits, or money-off coupons for future veterinary services.

POST-VISIT SURVEYS

- By harnessing data within the practice management systems (PMS) and with integration into third-party software, veterinary practices can send timely and relevant surveys to pet owners in the hours after a visit to the practice.
- Surveys can be sent via SMS or email, a suggested template is: "Thank you for visiting White Cross Vets today, please take a moment to complete our short client satisfaction survey < insert survey link > ."
- Care must be taken to exclude PTS/euthanized pets and to suppress multiple surveys if the client has been in to the practice several times within a short space of time.

Example for a Post-Visit Patient Satisfaction Template

1. How likely is it that you would recommend your provider to a friend or family member?

Not at all likely							Extremely likely			
0	1	2	3	4	5	6	7	8	9	10

2. Overall, how satisfied or dissatisfied were you with your last visit to our practice?

□ Very satisfied
□ Somewhat satisfied
□ Neither satisfied nor dissatisfied
□ Somewhat dissatisfied
□ Very dissatisfied

3. How easy or difficult was it to schedule your appointment at a time that was convenient for you?

□ Very easy
□ Somewhat easy
□ Neither easy nor difficult
□ Somewhat difficult
□ Very difficult

4. How convenient was the appointment time you were able to get?

□ Extremely convenient
□ Very convenient
□ Somewhat convenient
□ Not so convenient
□ Not at all convenient

5. In your opinion, how convenient is the location of our practice?

□ Extremely convenient
□ Very convenient
□ Somewhat convenient
□ Not so convenient
□ Not at all convenient

4.19. MEASURING CLIENT SATISFACTION

6. Overall, how would you rate the service you received from the team at White Cross Vets?
□ Excellent
□ Very good
□ Good
□ Fair
□ Poor
7. How comfortable was the reception and waiting area?
□ Extremely comfortable
□ Very comfortable
□ Somewhat comfortable
□ Not so comfortable
□ Not at all comfortable
8. Did your appointment with your Veterinary Surgeon / Veterinary Nurse start early, late or on time?
□ Very early
□ Somewhat early
□ On time
□ Somewhat late
□ Very late
9. Overall, how would you rate the care you received from you White Cross Vets?
□ Excellent
□ Very good
□ Good
□ Fair
□ Poor
10. How much do you trust White Cross Vets to make medical decisions that are in your pet's best interests?
□ A great deal
□ A lot
□ A moderate amount
□ A little
□ Not at all
11. How well did your Veterinarian/Veterinary Nurse listen to your needs?
□ Extremely well
□ Very well
□ Somewhat well
□ Not so well
□ Not at all well
12. How well did your Veterinarian/Veterinary Nurse answer your questions?
□ Extremely well
□ Very well
□ Somewhat well
□ Not so well
□ Not at all well
13. How well did your Veterinarian/Veterinary Nurse explain your treatment options?
□ Extremely well
□ Very well
□ Somewhat well
□ Not so well
□ Not at all well
14. How well did your Veterinarian/Veterinary Nurse explain your follow-up care?
□ Extremely well
□ Very well
□ Somewhat well
□ Not so well
□ Not at all well
15. How satisfied or dissatisfied were you with the amount of time your Veterinarian/Veterinary Nurse spent with you addressing your needs?
□ Very satisfied
□ Somewhat satisfied
□ Neither satisfied nor dissatisfied
□ Somewhat dissatisfied
□ Very dissatisfied
16. Is there anything we could have done to improve your last visit?

ONLINE SURVEYS

• You can create and publish online surveys in minutes and view results graphically and in real time.
• SurveyMonkey (www.surveymonkey.com) provides both a free online questionnaire and survey solution and a paid monthly subscription offering additional features and customization.
• Templated questionnaires are available depending on the specific requirement of the practice; these are often a useful starting point for a practice to build upon.
• Logic can be built into surveys to channel participants down different pathways based on answers to their questions (e.g., cat/dog ownership, reason for visiting the practice).
• Surveys can then be distributed by a web link via which can be incorporated into SMS, email, Facebook, and Twitter.
• All response data can be exported into various formats such as Microsoft Excel or as a PDF.
• Alternative services are available from Type Form (www.typeform.com) and for free from Google Forms (https://docs.google.com/forms).

ONLINE FEEDBACK

• Using Happy or Not (www.happy-or-not.com/) electronic point-of-sale units real-time feedback can be gathered in an approachable, anonymous, and easy-to-use format in all areas of the practice.
• Via web-based reporting you track and manage your practice's performance by transforming your feedback into data analytics that are clear and actionable.
• Charts and graphs help to pinpoint issues and uncover causes, while trending data makes it possible to measure and validate your improvements.

ONLINE REVIEWS

• The most popular and influential websites hosting client reviews are Google, Facebook, Yelp, TrustPilot (https://www.trustpilot.com), and Feefo (www.feefo.com), but there are dozens more that clients may use on their own.
• Public reviews provide a valuable insight into client satisfaction based on their experiences within your practice.
• All client reviews on a public forum should be responded to in order to acknowledge receipt of the comments and reassure other potential clients that your practice values all feedback as a top priority. Inflammatory comments and potentially libelous remarks should be handled with the upmost care.
• Be aware that once a review has been left on a review section it will be almost impossible for you to remove it (see 10.19 – Protecting and defending your online reputation).

CAUTIONS

• Measures must be built into automated systems to ensure clients are protected from receiving surveys multiple times (e.g., logic should be incorporated into the post-visit questions to only send once every six months).
• Feedback the changes and improvements you have made to your practice as a result of client insight. Knowing that their ideas and feelings have helped to shape your practice will make clients more likely to share their experiences in the future.

• Be careful to avoid bias in surveys by inviting a broad selection of your client base to participate. The ability to complete surveys anonymously will provide a greater degree of insight as clients will be more willing to express their true feelings.

MISCELLANEOUS

4.20. CLIENT REWARDS PROGRAMS

BASICS

OVERVIEW

Client loyalty presents a paradox. Many see it as an attitude-based phenomenon that can be influenced significantly by marketing strategies and initiatives, such as the increasingly popular loyalty and affinity programs.

Most, if not all, industries are being inundated with various forms of loyalty programs. The notable ones include the airline, hotel, restaurant, and fast-food industries. The veterinary industry is now starting to follow suit.

Originally, loyalty programs were designed to track and measure the buying habits of customers. This was/is especially important in businesses that do not have their clients registered on a client database and so cannot track clients' purchasing habits easily. In large part, this original purpose is less important and valid now than it once was.

Many veterinary practices have followed this trend and either currently have a loyalty program in place or are considering having one. There are currently businesses marketing loyalty programs to the veterinary industry and promoting these programs as loyalty and sales-generating tools, which will result in an increase in practice income and profits. Most practices have not really thought this step through and they generally enroll in such a program (or develop one themselves), because "someone else is," or because the idea has been effectively marketed to them.

The question is, have these programs been adequately researched and tracked in the veterinary industry (or in any other industry for that matter), so as to ensure that they: (1) do create actual client loyalty and (2) are actually price effective (i.e., do they in fact cost the practice more to run than is received in returning patronage benefits to the practice from these loyal clients?).

Conversely, in lean economic times, can a practice afford not to have a loyalty program in place, especially if competitors (veterinary and nonveterinary) have one?

Even though there are subtle yet distinct differences between the terms "rewards program" and "loyalty program," these terms are generally used interchangeably and indiscriminately with little regard to these differences by the industry as a whole. Because from a practical viewpoint it is not necessary to differentiate between the two, the term loyalty program will be used here.

TERMS DEFINED

Loyalty Programs: Structured and long-term marketing efforts that reward and encourage loyal buying behavior from the client.

ISSUES AND OPTIONS

A well-designed loyalty program does not necessarily rely on monetary compensation to the client. However in many instances, there is no real thought as to the rewards that may be given, and so the natural default becomes a discount or monetary reward.

AIMS

Loyalty programs generally are designed with either one of two aims in mind:

- to increase sales revenue and/or
- to increase the client–practice bond and thus decrease customer attrition to other pet-serving businesses.

Advocates of these programs contend that loyalty programs are beneficial because:

- the costs to the business of serving loyal clients are less,
- loyal clients are less price-sensitive,
- loyal clients will spend more with the practice,
- loyal clients will actively refer their family and friends.

Seemingly, these benefits are very alluring, but there is little well-documented empirical research to substantiate these claims.

In general, a well-designed loyalty program will be more focused on the delivery of high-perceived-value/low-delivery-cost gifts, extras, or bonuses to the client. On occasion, a discount strategy may be employed. This latter strategy is, unfortunately, by far the most commonly utilized one in the veterinary industry. This is unfortunate, because giving a discount has the most propensity to cost the practice a substantial proportion of its profits. A low-cost, high-perceived-value gift or similar strategy is much more likely to cost the practice less in terms of actual profit dollars.

In general, practice profitability (after all expenses) commonly falls below 10% in many hospitals. There are certainly practices that have profitability of over 10%, and most practices should aspire to profits of 20% or greater (see 7.11 – Understanding Practice Profitability). If a discounting strategy is truly to work (to drive client loyalty) then a discount of 10% or even more is needed. Lesser discounts are much less likely to work. Discounting strategies such as this also commonly induce a client to price-shop, whereas loyalty rewards that are not discount based (they are value-adds) do not generally induce a price-shopper mentality in clients.

Is a practice netting 10% profit able to give away a 10% discount to a certain proportion of clients in order to gain their loyalty? This is unlikely, and studies show that this loyalty is definitely not assured and that many clients will still (in spite of being part of a loyalty program) shop elsewhere for similar or better deals.

DO LOYALTY PROGRAMS WORK?

There has been little to no specific veterinary research with respect to the effect that loyalty programs have on actual client loyalty. However, research results in other industries indicate that consumers perceive a significant amount of value in loyalty programs and use them often to earn rewards, but that, realistically, these programs have very little effect on increasing actual loyalty. An interesting contradiction!

This situation has been made worse by the plethora of loyalty programs that are now available in every industry. Most clients are members of between 5 and 15 programs, many being duplicates (especially hotels, airlines, grocery, various coffee-type shops, etc.) – polygamous loyalty. Certainly, there are unlikely to be a plethora of veterinary-specific loyalty programs for a client to join. However, clients certainly can and do join loyalty programs associated with other pet care type providers. These include pet stores, supermarkets supplying pet care products, retailers, pharmacies, Internet-based stores, groomers, and others.

It is true that some of our clients will remain loyal because of various loyalty or rewards-type programs; however, for most clients it is the softer, more subtle aspects of good client service, the little things, which are more likely to bond them to the practice. These include:

- recognizing the client and the pet and calling them by their names,
- referring to the pet by the correct sex,
- providing ample and easily accessible off-street parking,
- ensuring that clients always see the same veterinarian,
- going the extra mile or doing something special for the client (special orders, delivering medications to their home, sympathy cards after euthanasia, SMS appointment reminders, etc.),
- making sure appointments run on time.

Various extras can also be given to members of a VIP or loyalty program. These include:

- dedicated/preferred appointment slots,
- a special silent, dedicated, or private phone line – allowing immediate access to practice personnel,
- email or SMS exchange (for advice or questions),
- value-adds from various partners such as manufacturers or distributors, other local businesses, etc.

4.20. CLIENT REWARDS PROGRAMS

Loyalty programs cost a business, on average, between 2 and 10% of a client's total spend. Can a veterinary practice afford this revenue loss? From the other perspective, truly loyal clients are 15 times more likely to increase their spending. A 5% change in customer retention leads to 25–100% increase in profit.[1]

So, the unanaswered questions remain:

- Does a loyalty program really generate more loyalty in our clients or not?
- Will the benefits documented in the preceding paragraphs really flow through?

EXAMPLES

Some examples of loyalty programs include the following:

- Payment plans that might offer certain packaged benefits to the pet owner (see 8.12 – Payment (Wellness) Plans)
- A discount on all products (and or services)
- Purchase a certain number of the same product (say six bags of a certain line of food) and get the next one for free
- Spend over a certain dollar amount (either at one time or over a limited period of time) and then receive a percentage rebate.

ABOVE AND BEYOND

Loyalty programs that directly support the value proposition and positioning of that particular veterinary practice will better fit the goals of loyalty marketing.

CAUTIONS

A proportion of clients who are entered into a loyalty program are hard-core, loyal clients who would only ever frequent that one practice. As such, a loyalty program is not necessary to keep these clients loyal and therefore the costs of doing so (in terms of lost profit) with these particular clients are huge indeed.

Every practice needs to carefully weigh and consider the cost of implementing such a program versus the perceived benefits that will result. Remember, the costs are not just that of the discount or rebate or benefit being given. There are a large number of hidden development, implementation, and especially administration costs that need to be taken into account, versus the realistic assessments of the benefits of such a program. These costs, especially that of administration, are generally overlooked.

Clients who join a loyalty program and for whatever reason are unable or unlikely to achieve any level of loyalty reward are much more likely to become disenchanted with the program and the practice itself and are more likely to transfer their loyalty to another practice.

Client members of a loyalty-based program need to be made aware that they need to qualify or requalify every 12 months. If this is not done, then the program will be taken for granted and become analogous to an entitlement program.

Having a requalification process will also ensure that (when and where required), the generosity afforded by the practice can be rescinded without causing client resentment.

Competitive forces tend to quickly erode any differential gains that such a program may make for a practice.

Remember: Reward research suggests that designing a loyalty program that can disrupt established patterns of behavioral loyalty in any industry sector is difficult. This is especially true in an established marketplace. Despite these difficulties, many schemes have been launched in recent years in many industries including veterinary.

MISCELLANEOUS

The true measure of client loyalty has to consider the commercial objective and what is offered to the client in order to bring about the desired behavioral change, based on the client insight that is available. Loyalty should not be thought of simply as a marketing objective but rather as a structured platform and initiatives that are approached on the basis of understanding and managing the components of loyalty.

ABBREVIATIONS

SMS: Short message service
VIP: Very important person

4.21. CLIENT RETENTION

BASICS

OVERVIEW

• A practice exists for the purpose of meeting client needs. Consequently, client development and retention comprise a critical element of a successful practice.
• The cost of attracting a new client is significantly higher than the cost of retaining an existing client. Therefore, client retention should be an ongoing, active process requiring effort from all team members within the practice.
• Competition among veterinary practices increases the amount of money an individual practice must invest in order to retain its clients. However, knowing your competition can help you develop a competitive advantage within the marketplace, thereby turning potential threats into opportunities.
• A certain percentage of clients will leave your practice for reasons beyond your control, such as death, relocation, and the decision to stop owning pets.
• Another portion of clients will leave your practice for reasons that may be within your control. For example, you may make philosophical decisions regarding practice operations that render your practice incompatible with the needs or tastes of certain clients. These decisions may include: hours of operation, commitment to on-time performance, staff customer service training, and/or staff accountability.
• The average companion animal practice loses 10–15% of its client base each year. In light of such figures, most practices should aim to retain 70–75% of their clients over a three-year period.

TERMS DEFINED

Defections: Clients who choose to leave the practice during a specific unit of time (e.g., one year).
Lifetime Value: The total potential value of each individual client within a practice. Although formulas and assumptions vary from author to author, client values are always quantified in thousands of dollars. Many of the specific values required for the calculation are available from demographic research companies. You can generally determine a client's lifetime value by multiplying the average number of pets owned by the client × the average number of times each pet visits the practice × the average value of each transaction × the number of years a client is expected to own pets × the number of friends each client might refer to the practice during his or her lifetime, etc.
New Client Target: Population characteristics affect the number of new clients each practice needs to maintain its transaction volume. The general rule of thumb is 30 new clients per month per full-time equivalent (FTE) veterinarian. These 30 "new" clients represent replacements for the 10–15% typical client attrition. If a practice wishes to grow, it must exceed this number.

ISSUES AND OPTIONS

WHY YOU SHOULD KNOW YOUR CLIENTS

• Clients choose to stay with a practice (or leave a practice) based on its ability to meet or exceed their needs (see 4.4 – What Clients Expect From Their Veterinarian). In order to meet your client's needs, you must know who they are in order to identify what factors are important to them (see 6.2 – Giving Clients What They Want Most).
• If your client base is composed primarily of senior citizens, then offering daytime hours, senior discounts, and a pick-up/drop-off service for seniors who can no longer drive would likely increase the popularity of your practice.
• If your client base is composed primarily of young parents, then the inclusion of a children's play area and children's programs would likely improve the success of your practice.
• If your practice is located in an area with a high percentage of double-income parents, evening and weekend hours could provide your practice with a competitive advantage over other area practices.
• Knowing the age of your clients should help drive many practice activities. Each generation has its own preference for communication style, communication technology, client education, how treatment recommendations are presented, etc. Having a practice team that understands the preferences of each of the four generations that make up the majority of your client base is another driver of client retention.
• Creating positive experiences for your clients creates client loyalty. Simple measures such as having an appropriate selection of reading material in the waiting area, or a complimentary beverages area can make a difference. Client wi-fi was once a luxurious novelty item, but is now considered a standard requirement for any practice.
• Hospital design can have a dramatic impact on client satisfaction and retention (see 11.12 – Designing with the Patient in Mind). Open circulating spaces, ample natural sunlight, separate cat and dog waiting areas, sound and odor control along with proper heating and cooling and have a tremendous impact on the client experience. If your client areas have not received a substantial facelift within the last 3–5 years, it is time for at least some new paint and new furniture.

HOW YOU CAN LEARN ABOUT YOUR CLIENTS

• The easiest and least expensive way to learn about your clients is to engage them in informal conversation. This is an excellent assignment for reception staff. After the client has been greeted and checked in for their visit, the reception staff could engage the client in informal conversation. This activity is fun for the staff and decreases the client's perception of waiting time, particularly if the doctor is running behind schedule.
• Customer satisfaction surveys are another excellent tool for gathering data about client perception (e.g., their likes and dislikes). Some practices prefer to mail surveys to clients; others hand them to clients

to complete while their invoice is being prepared (see 4.19 – Measuring Client Satisfaction). There are also online options available through websites such as www.surveymonkey.com, or via veterinary-specific vendors. Whichever method your practice chooses, keep the length of the survey brief so that it is not a burden for clients to complete. Topics and formats can be rotated to obtain a variety of data.

- Local Chambers of Commerce, business associations, or similar groups often compile data about the community (demographics, recent trends in the economy, etc.) for the benefit of their members. Much of this data may be relevant to your practice.
- Municipal governments are also an excellent data resource. Many communities have an economic development committee or similar group that is charged with attracting new businesses to the community.
- Monitor your competition for trends that may be impacting your client retention rates. Have competitors offered new services, extended hours, or remodeled their practices to create a better value or overall experiences? You may need to match or exceed their changes in order to retain your share of the market.
- Veterinary-specific secret shopper services are available. Many cutting-edge practices employ these services to learn about the customer service experience they are offering. However, you can also hire them to shop your competition to really learn how your practice compares to the one down the road.
- Monitoring social media sites and Internet reviews are excellent ways to obtain candid feedback from clients. Monitoring your competitors' reviews may provide you with insights as to how well they are doing retaining their clients.
- Demographic research companies have an enormous amount of data available for a price. Many veterinarians only consult a demographic research company when they start up or purchase a practice. It is, however, an excellent business practice to conduct a complete demographic study every five years as communities change and your clients' needs evolve (see 1.4 – Veterinary Trade Areas and 6.8 – Demographic Assessment). A practice that can adapt to these changes will prove successful.

EXAMPLES

BENCHMARKS AND INDICATORS

- There are numerous indicators that should be monitored on a regular basis. Doing so will provide an early warning of prospective problems.
- The key to client retention is a high level of customer satisfaction that can be achieved by providing exceptional customer service and value (see 6.2 – Giving Clients What They Want Most). The best overall indicator of customer satisfaction for a general practice is the percentage of new clients referred to the practice by existing clients. A practice providing only average customer service will obtain about 50% of its new clients from the referral of existing clients. Practices providing exceptional levels of customer service can achieve numbers as high 85–90%. Satisfied clients become advocates for the practice and actively recruit their friends, relatives, and coworkers on your behalf.
- Positively reinforced client referrals result in an increased number of new client referrals and higher client retention rates. Many practices have a graduated referral program that rewards clients for sending acquaintances to the practice. By sending clients gifts ranging from handwritten thank you cards to dinner and gift cards, the desired behavior is reinforced.
- Another way to identify problems that are damaging client retention is to analyze client defections. A receptionist or veterinarian should always ask clients why they have requested a copy of their pets' records, and then record the clients' responses in a spreadsheet for analysis.
- In a companion animal practice, approximately 70% of scheduled appointments are generated in response to client reminders for recommended care (see 4.16 – Client Reminder Systems). By tracking the response rate to these reminders, a practice can discern whether or not a client has decided to return to the practice.
- Clients who fail to respond to two or three consecutive reminder notices should be called to determine the reason why they have not scheduled an appointment. Because the majority of reminders are for

4.21. CLIENT RETENTION

annual events, a sharp drop in your reminder return rate may signal that your practice had a customer service challenge up to one year ago. A poor customer service experience one year ago will impact your bottom line today as clients elect to not return to your practice.
• A structured customer satisfaction program can yield huge dividends. According to certain studies, only 4–6% of clients that have had a negative experience will make the business aware of their dissatisfaction. The remaining 94–96% simply choose not to return the following year without offering any explanation as to why. If you receive a client complaint, it is likely that 20–25 other people have had a similar experience. Armed with this knowledge, you can intervene and remedy the problem. By tracking and analyzing complaints, you can identify and resolve barriers to customer service excellence (e.g., team members not performing at the level you desire).
• Staff turnover rates (or lack of staff retention) impact customer retention, because long-term staff members establish bonds with long-term clients (see 3.20 – Staff Turnover and Retention). Retaining client-facing staff (assuming they are performing well) should be a priority as clients place tremendous value on these relationships and familiarity with their family and pets. Given the lack of relationship opportunity in big box retail and online commerce, the value of these relationships is expected to continue to increase over time.

CAUTIONS

• Earlier, we emphasized the value of making small talk with clients to learn about their likes and dislikes. Many practice owners and practice managers make the mistake of ignoring the feedback they receive from their practice team, believing that somehow, they know better. The practice leadership should be receptive to all feedback with an open mind and make decisions only after they have obtained sufficient data.
• Some practices go too far in the name of client retention. "The customer is always right" used to serve as a universal business maxim; however, savvy business owners understand that sometimes the staff members, not the customer, are right. If a staff member has been abused by a client, the client should be fired. You may have thousands of clients, but only a few staff members. Individual staff members often contribute more to the success of the practice than an individual client (particularly one that does not respect your staff). Supporting a staff member will further the staff member's trust in the practice leadership, which, in turn, improves staff morale and productivity. Many practice owners give their staff members a unique holiday bonus: they let them fire one client each year who they feel does more to undermine the staff's efforts than they contribute to the practice's success.

MISCELLANEOUS

• Providing exceptional customer service is hard work. If it were easy, everyone would be able to do it, thereby reducing the competitive advantage it provides to successful practices. It is best to always under-promise and over-deliver, even in regard to the simplest services. For example, have your staff members offer to carry diet food out to every client's car. Or, if laboratory results should be back in two days, have your staff tell the client that it will take three days so that you can contact the client early and exceed their expectations.
• Many veterinarians receive the greatest amount of client gifts after performing euthanasia. While this may seem counterintuitive at first, the reason is because the practice helped the client through the most difficult time in their relationship with their pet. Therefore, extended visiting hours and special visitation or "comfort" rooms with comfortable accommodations for an entire family and a discreet entrance/exit are a must to help drive true client satisfaction which leads to client retention.
• Customer service is important to every type of business; it is not specific to veterinary medicine. As such, there are an extraordinary number of ways for your staff members to get the extra training they need, want, and deserve (see 3.10 – Staff Training). Countless webinars and classes are offered online via the Internet. Educational CDs and

DVDs are also available. In addition, almost every community college with a business curriculum or business association offers educational courses. Utilizing basic quality controls, such as establishing detailed policies and protocols, procedure manuals, checklists, and training to the proper standard, help ensure a consistent customer service experience (see 2.22 – Procedure Manuals).

• Most customer service problems are rooted in poor communication. Incorrect, incomplete, or untimely communication initiates an escalating chain of events that can cost your practice valuable clients. Work to improve communication on an ongoing basis. If you currently communicate something verbally, put it in writing. If you have it in writing, add a picture or an illustration. If you wait for the client to contact you, call them first. In client retention, an ounce of prevention is worth a pound of cure.

• A robust social media program can be a very effective tool for helping retain clients (see 10.16 – Social Media). Social media can facilitate real client engagement by encouraging client posts and keeping them aware of happenings at the practice. Soliciting photographs for pet picture contests, sharing patient success stories, celebrating pet birthdays and anniversaries, encouraging pets-on-vacation photo posts are only a few of the ways social media can drive client engagement and bonding to your practice, all of which drives client retention rates. Savvy practice leaders prepare a social media calendar six months or a year in advance and assign a tech-savvy team member to oversee the program to ensure that it stays on schedule.

4.22. HIGH-TOUCH AND HIGH-TECH CUSTOMER SERVICE

BASICS

OVERVIEW

High touch refers to high-quality service and ambiance. High tech refers to practicing on the cutting edge, using highly technical or advanced equipment and procedures. These two concepts are not mutually exclusive; in fact, customers often crave high-touch service the more they have to deal with a high-tech society. High touch and high tech both communicate value to the client, but in different ways.

Modern technology is expensive. To invest in advanced equipment requires charging fees high enough to justify the expenditure on such equipment. In order for clients to feel comfortable with these higher fees, it helps to deliver high-tech medicine in a high-touch atmosphere. This ensures that clients will feel that the services provided justify the cost.

TERMS DEFINED

High Tech: Refers to practicing on the cutting edge, using highly technical or advanced equipment and procedures.
High Touch: Refers to high-quality service and ambiance.

ISSUES AND OPTIONS

• In a veterinary hospital, emotions often run high. For clients who are upset it is calming when everything seems to run perfectly, the clinic smells good, there is soothing music, and the staff seem superbly trained and helpful. Skillful use of technology and a faster diagnosis also are reassuring to worried pet owners.
• It takes more time and energy to attract a new client than it does to keep one you already have (see 4.21 – Client Retention). A high-touch practice often retains more clients because those customers probably will not get the same level of service from the competition. In any business, when competitors are evenly matched, those that stress customer service will win. This is especially true in a field like ours, where customers are by and large unable to judge the quality of our work. A spay is a spay to the consumer. Because many decisions made by clients in a veterinary hospital are based on emotion instead of price, quality, or product features, building a strong connection with the client and fostering a personal bond with both client and pet usually leads to success. High-touch service is one way to achieve this connection.
• A great ambiance fosters trust. Trust is particularly at risk when clients feel vulnerable, and they feel this way when they are powerless to help their pet themselves. When the power to make the pet right again is in our hands and in our control, the client feels helpless, and often defensive. High-touch service helps to remedy these feelings, and gives clients the following:
  ◦ **Information:** About what is happening, how long it will take, and how the pet is doing.
  ◦ **Expertise:** Reassurance that the pet is in good hands and that the doctor and staff are capable of taking care of the problem.
  ◦ **Options:** The client is involved in treatment decisions and is made to feel part of a team. They can also be confident that if better care is available elsewhere, they will be referred.
  ◦ **Respect:** Clients want to feel that their wishes, fears, thoughts, and feelings are respected. No matter what happens, the staff is always helpful and never condescending.
  ◦ **Empathy:** Clients want to feel that we are validating their relationship with their pet and that we understand the emotional component of pet healthcare.
  ◦ **Comfort:** They want themselves and their pets to feel safe, accepted, and comfortable.
  ◦ **Attention to detail:** The best customer service leaves nothing to chance. Even small things are done thoughtfully and with care. Flowers, desserts at the comfort station, a telephone for clients to use when their cell phone battery is dead – these and other little touches make the veterinary experience more relaxing and enjoyable.

High touch is most effective when you remain professional, but with a personal touch. That means staff cannot confuse off-the-job personal friendships with on-the-job, friendly, professional transactions.

High tech is most effective when the technology is used and presented in a customer-friendly, accessible way. High touch and high tech both offer a way to differentiate your practice from the competition.

EXAMPLES

HIGH TECH

Investing in a high-tech image really impresses clients. Instead of being average, highly technical practices seem way above the ordinary – more on a par with clients' experiences with their own human medical specialists. Those clients who want the absolute best for their pets, and are willing to pay for it, demand a high level of diagnostic and treatment ability. However, too much high tech without enough customer service, client education, or perceived value leaves a cold, impersonal feeling. Notice how high tech is best linked to high touch in practice, which then fosters the human–animal bond (see 1.19 – Importance of the Human–Animal Bond). Examples of high tech include the following:
• **Advanced imaging:** Ultrasound, computed tomography (CT), magnetic resonance imaging (MRI), and digital radiographs, usually reviewed with clients days before they would get that information back if they were waiting for human physicians and specialists.
• **High-end computer equipment:** Tablet computers that allow personalization of handouts for immediate printout for the client, websites and apps that let clients schedule their own appointments, and webcams in the boarding suites so clients can watch their pets while they are away.
• **In-house laboratory equipment capability:** For quick diagnosis of ill pets.
• **Use of cameras and video equipment:** Videomicroscopy, intraoral cameras for up-close pictures of a pet's fractured tooth or cameras that allow clients to see what is going on in surgery make veterinary medicine more understandable for pet owners.
• **Digital images:** Used in the exam rooms, on dental discharge forms and reminders, or sent via the Internet to specialists.
• **Newer specialties:** For example laser surgery, rehabilitative services, and oncology that are not available in the typical veterinary hospital.
• **Client education:** Using video, the web, email, up-to-date handouts, and messages on hold.

HIGH TOUCH

High-touch service leaves a positive, lasting impression on clients. It means being easy and pleasant to do business with, and delighting a client with more than they expect. It also can mean great word-of-mouth promotion for your hospital. Notice that you do not need high tech at all to offer high touch. Examples of high touch include the following:
• Espresso or lattes in the waiting room.
• An easel or board welcomes clients by name.
• Pets' pictures are on file and are posted on the practice website and printed on receipts, reminder cards, etc.

• Stuffed animals, comfy beds, and toys in the kennels with the patients.
• Cases of the month or pet success stories are posted.
• Exceptional clients are recognized or acknowledged in public areas, on social media, or on your website (being careful to obtain permission before using names or other personal information).
• Notes are made in the file about new babies, marriages, etc., so you can mention them at the client's next visit.
• Time is taken to educate clients and explain everything, then send it home in writing as well (see 6.18 – Client Education Tools).
• Direct telephone lines to dedicated technical staff are available to allow clients to find out how their pets are recovering in the hospital.
• Text (SMS) with photos of the pet recovering after surgery or dentistry are sent instead of just a phone call.
• Team members have their own business cards listing their areas of interest, and are encouraged to bond with and get to know the clients.
• A curbside service or drive-through window is available to pick up food or medications.
• Exclusive post-surgery monitoring can be provided. The client pays extra for a veterinary nurse to stay with their pet, and only their pet, before, during, and after a procedure.
• A team member, called a greeter, is stationed in the waiting area to welcome clients, help them fill out forms, and assist them back out to the car.
• A file manager prepares files before visits and checks them again afterward, to ensure that handouts are given, services are not missed, and follow-ups or reminders are present and correct.
• Pets' birthdays are acknowledged or celebrated.
• Euthanasia is made more special and personal, using:
  ◦ handwritten sympathy cards
  ◦ clay paws, angel pins, or flowers to memorialize a pet
  ◦ donations to pet-related causes in the name of the client and pet.
• The high-definition computer screen or a photo viewer in the waiting room shows portraits of clients' pets in a continual slide show, or a simple binder of photos in each exam room.
• The practice uses community involvement to build connections with its clients.

CAUTIONS

• Customers are more and more demanding nowadays. No one seems to have enough time. They do not like to wait, are used to instant service and lots of options, and often are happy to take their business elsewhere if you do not satisfy them. Keeping ahead of the curve is hard work.
• Courtesy is not a substitute for competence or skill. No matter how nice your waiting room is or how good your coffee is you still have to meet clients' expectations for care of their pets.
• Companies that shine in service take pains to hire people capable of providing good service and also to train and motivate them.[1] Realizing that "customer relations mirror employee relations," they invest heavily in their people.[1]
• You cannot provide superior service without a manager who is fanatically committed to service. You cannot provide high tech effectively without someone in the practice being genuinely fascinated with, and skilled at using, highly technical equipment. These concepts require hard work, sincere interest, and dedication to implement.
• Anyone on the veterinary team can make or break the high touch atmosphere. Expecting only the receptionist or client service representative to deal with customer service will result in failure. High touch must become the philosophy and the guiding principle of everyone in the hospital.
• Similarly, high tech must not be relegated only to the doctors. If the staff cannot utilize that technology and explain it to the clients, high tech equipment will not be fully utilized.
• Companies that take high touch seriously constantly assess their own performance and solicit opinions and feedback from their clients. Good customer service must be managed, or it will cease to satisfy the client. Satisfaction on the part of customers comes only when their perception of the service they received exceeds what they expected to receive. If we do not understand our customers' expectations and perceptions, we cannot succeed in their eyes.
• Financial tracking, budgeting, and an understanding of equipment use and payback times are needed for a high tech approach to be successful. Buying equipment that is overpriced or underutilized creates a huge financial drain on a practice.
• Technology is a two-edged sword. Using more technology to serve customers carries the risk of alienating them and tarnishing their perceptions of service quality. The fast-growing use of technology in medical care has gone hand-in-hand with a demand for more personalized service from the family doctor.[2] Machines are a cold substitute for the warmth of human interactions.[3] Concentrating on the computer screen or MRI film and not interacting effectively with the client – making eye contact and watching for facial expressions or body language – is off-putting to people (see 5.8 – Nonverbal Communication). For the customer, technology often provides more confusion and frustration than service.
• High touch/high tech can become your practice's signature. It can also be a road to financial success. Veterinary teams that utilize these traits have found that it is also energizing to feel that you are bonding more effectively with your clients and doing everything possible for their pets.

4.23. The Extended Hospital Team: Making Referrals Work

BASICS

OVERVIEW

With the increase in availability of veterinary specialists and pet owner interest in referrals, the importance of enhancing communication and improving the working relationship between referring veterinarians and specialists has never been greater. To create a positive referral experience for pet owners, primary care veterinarians, and specialists, the focus should be on promoting a team approach to veterinary care for pets.

TERMS DEFINED

Client: Veterinary referral practices have two clients: the pet owner and the referring veterinarian. The referring veterinarian is considered to be the primary client.

Referring Veterinarian: Generally the primary care veterinarian for the pet, usually a general practitioner.

Referring Veterinarian Liaison: A staff member such as a technician who works with the hospital manager and specialists to facilitate improved relationships with area practitioners. Duties include oversight of follow-up referral reports, fielding phone calls from referring veterinarians, organization of incoming medical records, assisting specialists with follow-up phone calls to area veterinarians, and clinic visitations.

ISSUES AND OPTIONS

COMMON COMMUNICATION CHALLENGES

- As the number of specialists and specialty hospitals has grown, specialists find it increasingly difficult to know all their referring veterinarians and to find the time to devote to phone consults.
- Primary care veterinarians may have multiple specialty hospitals to send cases to and do not always take the time to get to know all the specialists in town.
- When specialists and referring veterinarians do not have an established relationship, misunderstandings and critical attitudes are more likely to occur.
- Both parties find it frustrating when trying to reach each other by telephone to discuss cases.
- Some specialists express frustration regarding the quality of medical records sent by referring veterinarians. The most significant complaint is that records often do not include a medical case summary. Other concerns include illegible handwriting, incomplete records, voluminous medical histories that are not relevant to the referred problem, missing laboratory data, and missing radiographs.
- Referring veterinarians are frustrated when there is a lack of timely follow-up from specialists regarding referral cases. Referring veterinarians often have clients who call them to discuss their pet's condition and they want to be prepared to talk to the pet owner.
- Inconsistency in desired follow-up communication makes it difficult for specialty hospitals to develop policies to satisfy all area veterinarians. Some referring veterinarians want to be called soon after a case is referred and request daily progress reports, whereas others are content to receive a report and updates only when the status of the case changes or becomes critical.

FOCUS ON CLIENT SERVICE

- To ensure a positive referral experience for pet owners, specialists and their teams need to provide outstanding client service. Team members should be trained in the following areas: communication with emotional and grieving clients, comfortably talking to clients about money, and helping clients achieve peace of mind by making decisions that are right for their family.
- Specialty practices need to survey their referring veterinarians regularly to ensure they are providing exceptional service.
- Primary care practices can help ensure a positive referral experience by striving to enhance communication with both pet owners and members of the specialty team.

ESTABLISHING CLIENT EXPECTATIONS

- When pet owners do not clearly understand what to expect when they visit specialty practices, they may become frustrated and feel the veterinarians are not communicating effectively. This situation can reflect negatively on both practices.
- Common complaints regarding client expectations are misunderstandings regarding the cost associated with referrals, the need to repeat tests at the referral practice, the severity of the pet's condition, and delayed scheduling of surgeries or procedures.
- One of the most difficult client communication challenges occurs when specialists inform pet owners that their pet has a different condition or prognosis than the referring veterinarian diagnosed.
- Communication problems arise when general practitioners refer patients for a specific test or procedure rather than a specialty consult. If the specialist determines the pet does not need the procedure for which it was referred, clients can become confused and angry.

PRACTICE PROTOCOLS AND TOOLS TO IMPROVE COMMUNICATION

The best way for specialty and general practices to address some of the communication challenges and referral relationship issues is to develop tools, policies, and protocols that will facilitate enhanced communication and collaboration.

- Dialogue characterized by mutual respect and understanding is the foundation for any good relationship. To facilitate open lines of communication and positive dialogue, specialists and referring veterinarians need to get to know one another.
- Hospital visitations and face-to-face meetings are the best way to achieve long-term, friendly relationships.
- New specialists joining a practice should spend time visiting area hospitals to get to know the referring veterinarians.
- For established practices, specialists can visit referring practices to meet veterinarians, discuss new services they offer, address specific concerns of the practice, and to improve or enhance existing relationships. Visits can be done during slow times to facilitate busy work schedules.
- An organized, regular schedule of visits to area practices should be established by the specialty practice manager or hospital administrator. Managers or referring veterinarian liaisons can do routine clinic visits but practice owners and/or specialists should visit practices to discuss medical or surgical topics or to address concerns related to the working relationship.
- Primary care referring veterinarians are encouraged to visit area specialty practices so they are familiar with the services offered and can get to know specialty teams.
- Have the referring veterinarian liaison or coordinator handle all phone calls from referring veterinarians that cannot be quickly addressed by the front office staff.
- Primary care veterinarians can use a checklist to be sure they have advised pet owners about what to expect when their pet visits a specialty practice (see 9.3 – Standards of Care and Care Pathways).
- Specialty hospital brochures can be given to pet owners to give them more information about the referral practice.
- An ideal way for specialty practices to build relationships with area veterinarians is by offering continuing education seminars. Specialty practices can survey referring veterinarians to determine the preferred time and location for seminars.
- Smaller group meetings such as rounds, study groups, and lunch and learns are an effective way for specialists to build relationships and communicate with referring veterinarians. These smaller group events

allow for more personal interactions and the opportunity to engage in more in-depth dialogue regarding case management.

• Increasingly, one of the best ways for referring veterinarians and specialists to communicate and stay connected will be through the use of digital platforms and software. Multiple companies now offer referral management solutions and the use of apps for veterinarians to share information. With digital applications, specialists can provide their expertise as well as patient updates to referring veterinarians.

WRITTEN TOOLS TO IMPROVE COMMUNICATION

Mailed letters, transmitted memos, and newsletters are an excellent means to keep in touch with referring veterinarians about relevant issues. Although these tools are not a replacement for face-to-face meetings, they can serve as an opportunity to deliver consistent messages and enhance communication.

• For example, specialty practices could send out a letter to area veterinarians reviewing the importance of receiving complete and relevant medical records in order to provide the best medical care to patients. The letter would outline specifics regarding the format and content for medical records desired by the specialists including encouraging practitioners to use referral forms. As the old saying goes, "You don't get what you don't ask for."

• Use electronic newsletters. Include information in the specialty practice newsletter on medical and surgical topics as well as topics such as timeliness of referrals. Articles written by specialists on medical topics can include specifics regarding clinical signs or prognosis that affect when a case should be referred.

• Specialty practices can leverage the use of their websites to communicate with referring veterinarians. Referral forms, articles, case studies, newsletters, referral guidelines, hospital policies, and a calendar of continuing education events can all be posted on the website. Specialty practices can also provide links to other websites that are credible resources for further information on a variety of medical topics.

• Surveys to gather feedback from area veterinarians on client service or other relevant issues can be posted on the referral practice website.

• Use email to communicate. Email is particularly desirable because specialists can often copy and paste medical findings from their software into emails to veterinarians. In addition, email allows specialists to respond to practitioners outside of regular working hours (see 10.11 – Electronic Communication – Email and Texting).

EXAMPLES

N/A

CAUTIONS

• Economic challenges and fear of loss of income should not dictate referrals or case management. Rather, focus should be on patient advocacy and offering options that are best for the pet and the pet's family.

• Care should be taken to be timely when referring pets to specialists. If patients do not respond well to initial treatments, it is prudent to call specialists about case management.

• Adherence to professional ethics should guide decisions about whether a referral to a specialty hospital is appropriate. Ethically, veterinarians must give clients honest assessments regarding their pet's condition and advise them of all their alternatives for medical care.

• Veterinary teams should be careful not to pre-judge a client's willingness to pay or their ability to afford specialty care. Referral to a specialist should be discussed whenever appropriate, regardless of whether the general practitioner thinks the client might have financial constraints or be reluctant to agree to advanced diagnostics or treatment. The use of third-party payment plans (see 8.13 – Third-Party Financing) and pet health insurance (see 8.11 – Pet Health Insurance) has helped increase the affordability of specialized care for many clients.

• The person who will be responsible for case management after a pet has been discharged from the specialty hospital needs to be clearly established. Specialists and primary care veterinarians should communicate regarding individual practice preferences and capabilities as well as pet owner wishes to reach agreement on who will provide ongoing patient care.

4.24. TELEHEALTH

BASICS

OVERVIEW

• Today's consumers want their healthcare on their own schedules, and at their own convenience. Since most have smart devices, they typically have access to online messaging, images, and even video.
• Telehealth (or virtual care) is the umbrella term used for healthcare consulting delivered remotely, and can be subdivided based on the parties involved in the consultation.
• Veterinarians providing telehealth must comply with all laws and regulations associated with their license to practice veterinary medicine.
• The standard of care is the same regardless of whether telemedicine or in-hospital care is provided.
• Telehealth has the potential to enhance animal care and the delivery of veterinary services, and regulations are evolving accordingly.

TERMS DEFINED

Electronic Prescribing (E-Prescribing): The use of digital electronic prescriptions rather than providing a printed prescription or faxing a prescription.
Mobile Health (mHealth): Subclassification of telehealth in which mobile applications (apps) and wearables are used to provide healthcare information for pets.
Teleadvice: Subclassification of telehealth in which only general advice is provided that is not specific to a particular patient's situation.
Teleconsulting: Subclassification of telehealth in which the consulting takes place between a primary care veterinarian and a specialist.
Telehealth: Broad term to describe healthcare consulting delivered remotely. Sometimes referred to as virtual care.
Telemedicine: Telehealth delivered between a veterinarian and an animal-owning client, under the auspices of a veterinary–client–patient relationship.
Telemonitoring: A form of telehealth in which patients are monitored remotely.
Teletriage: Subclassification of telehealth in which assessment is made remotely regarding the need for urgent veterinary visitation. Teletriage does not include rendering any diagnosis, just advising regarding the potential urgency of the situation based on the information provided.
Veterinarian–Client–Patient Relationship: A legal relationship between veterinarian and animal owner in which the veterinarian has assumed responsibility for making clinical judgments and the clients has agreed to follow the veterinarian's instructions, the veterinarian has sufficient knowledge of the patient to make such judgments, continuing care is provided or available, the veterinarian provides oversight of treatment, compliance, and outcome, and patient records are maintained.

ISSUES AND OPTIONS

• Telemedicine has had a place in veterinary medicine for decades, and yet recent changes in technology and advances in human medicine have changed the landscape in recent years. Regulatory changes, however, have not always kept pace.
• Human medicine functions on a different business model than does veterinary medicine, and consumers may see programs in human health that have telemedicine more completely integrated into overall care. Thus, there might be programs integrated with insurance groups, public health, and other endeavors that increase patient access and lower healthcare costs. Technologies can also be used to establish a valid physician–patient relationship in human medicine without the requirement of an in-person examination.
• It is important to realize that most veterinary regulations do not permit the establishment of a veterinarian–client–patient relationship by electronic means alone. Clients may be exposed to such human programs and infer that it should be possible for those same services to be provided by veterinarians. It should not be inferred that because a type of service is available in human health that it is legally permissible to provide the same or similar service in the veterinary business space.
• Veterinarians have often given advice by telephone, email, and even text (SMS) for years; most of this has occurred within the bounds of a veterinarian–client–patient relationship (VCPR), but some advice is likely to have also been offered to prospective clients with which such a relationship may not have been legitimately established.
• Older veterinarians were likely introduced to teleconsulting years ago with trans-telephonic electrocardiography, and consultations with specialists are somewhat routine now.
• Veterinarians with a valid VCPR have professional discretion to confer with specialists and consultants, but they remain the physicians of record and do not transfer that VCPR to the specialist or consultant.
• Most telehealth services are not a replacement for specialist referral, but may increase accessibility, and may possibly be the only alternative for some clients who do not have a specialist within a reasonable referral area.

THE MARKETPLACE

• Most demographic groups have embraced technology that allows instant gratification and do-it-yourself (DIY) applications.
• There is a growing trend among pet owners to access information online, purchase products online, encourage the monitoring of their pets with wearable technology, and to seek medical opinions online.
• Pet owners want applications that allow them to be in contact with veterinary professionals at the time and medium of their choosing, even if veterinary practices have some qualms with this, may have concerns about the legalities of such actions, and have even more concerns about how to get compensated for such services.
• Clients may attempt to contact veterinary hospitals by email or text (SMS), through social media and through online resources, including sending images and video; veterinary hospitals need to have a strategic plan for how to deal with such contact.
• Clients may have reasonable or unreasonable expectations that the veterinary hospitals with which they do business should be responsive to such contact. In some cases, it may be a follow-up question to services that have already been provided (e.g., "Sheba chewed out one of the stitches from the procedure she just had, but it isn't bleeding. Do I need to bring her in?"). In other instances, it might be an attempt to save money or avoid the necessity of bringing a pet into the hospital ("Lily has had a bout of vomiting. Can I just give her the medicine I use when I have an upset stomach, and I'll bring her in if she doesn't get better?").

PROFESSIONAL CONSIDERATIONS

• Telemedicine consultations should only occur within a valid VCPR. This is true regardless of whether the consultation occurs by telephone, email, or other medium. If it is allowed by a jurisdiction to create a virtual VCPR, it is still important to check with the appropriate authorities if prescribing is allowed under such a telehealth relationship.
• Veterinary hospitals should be careful not to inadvertently provide telemedicine, since there is legal liability when a legitimate VCPR is absent.
• In the United States, there is considerable variability between states as to laws for the provision of telemedicine services, so veterinarians should consult with their state licensing boards about what is permitted in the state Practice Act. It is particularly important to be aware of jurisdictions that require a physical examination or temperature/pulse/respiration notation for visits, or every time a

patient is presented for a new clinical problem. These rules can make telemedicine extremely challenging.
• If no VCPR exists, it still might be possible for veterinarians to answer basic questions that would not constitute providing specific medical advice for any specific pet (e.g., "What is mange?" "Can dogs get chicken pox?" "My cat is bleeding. Should I bring her in there, or go to an emergency clinic?" etc.).
• Consultations with pet owners for which a VCPR has not been established are generally considered as either teleadvice or teletriage, rather than telemedicine. Both are still a subset of telehealth, even if they are not telemedicine. Teletriage might include providing advice for a pet that has consumed poison, whether that involves having them call a poison control hotline, or advising them to go to the nearest emergency clinic. There are also now a variety of applications for pets using wearables, including remotely measuring pulse, respirations, temperature, position, and activity level.
• Veterinarians providing telehealth must be legally authorized to practice veterinary medicine. Depending on the local jurisdiction, licensing requirements, and Practice Act, they may also be required to be licensed to practice in the specific state where the patient is located.

IMPLEMENTATION

• Most veterinarians are already providing some forms of telehealth, but it is worthwhile to create hospital guidelines regarding the delivery of such services. It is also important to ensure that all aspects of the telehealth consultation are recorded appropriately in the medical records.
• Other than teleconsultations, the most common forms of telehealth relate to things like provision of prescriptions based on VCPR, recheck evaluations, after-hours care, patient monitoring through wearable devices and other technologies, and even following up on hospice care patients and others where in-hospital visits are not possible or not convenient.
• Telehealth can be provided directly by a hospital (e.g., telephone, teleconferencing, email, etc.), but there are now several different companies, programs and applications that facilitate the interaction and monetization of the process.
• Pricing for telehealth services will vary depending on how the telehealth service is to be integrated into the practice workstream, vendor-associated charges, and the costs associated with offering telehealth solutions.
• Telehealth pricing can be used to drive other health-related services. For example, it might be included with payment (wellness) plans (see 8.12 – Payment (Wellness) Plans) as a less costly way of honoring the ongoing provision of services in a bundled care plan. It could also be pricing in an à la carte fashion based on a time-based teleconsultation (either the length of the consultation, or how quickly the response is needed). As a variation on a bundled service, teleconsultation could also be subscription priced. The opportunities are only bounded by one's imagination and clients' requests for services.
• For clients with pet health insurance (see 8.11 – Pet Health Insurance), pet owners should check with the insurance provider to determine telemedicine coverage.

EXAMPLES

N/A

CAUTIONS

• Telehealth solutions are still evolving, and regulations have not caught up with many of the applications that are possible with today's technologies.
• Without a valid VCPR, any advice provided should be considered general and not specific to any patient, and should not imply any intended diagnosis or treatment recommendation.
• Veterinarians considering being telehealth providers should be prepared to present their particular credentials, provide any service disclaimers, and specify what services they are able to provide, and the limitations of such telehealth consultations.
• Practices preparing to offer telehealth solutions should seek legal advice before providing such services, or affiliating with companies providing those services. It is also worth checking with the insurance provider regarding any liability issues that could be associated with telehealth solutions.
• The majority of human physicians engage in different forms of telehealth. It should be anticipated that this same trend will eventually happen with veterinary medicine as well.

Section 5

Communication

5.1. EFFECTIVE CLIENT COMMUNICATION

BASICS

OVERVIEW

• The clients of today's veterinary practice present clinicians with new challenges for accurate and time-saving communication (see 1.5 – Today's Pet Owner). We live in a "sound bite" world and information overload is all too common. Concise and clear communication is appreciated by clients and will save you time, money, and hassle.
• Much can be learned about concise client communications when you make a very brief study of media communications techniques.
• The issue of compliance can be greatly improved with clear communication between doctor and staff and the pet owner (see 4.11 – Compliance and Adherence). Poor compliance is primarily a communication failure. This is also especially true in human medicine. Getting clients to accept your instructions and recommendations relies heavily on the clear understanding communicated to the client by you and your staff at every visit. Much of the failure in communications here comes from the assumption that someone else has communicated all the important points. This can only be corrected when the entire team makes sure key points are communicated.
• With increasing negative attention on hot topics by members of the media, communication with clients takes on a new dimension. You may have to counter incorrect news, "fake" news, or even frightening news with the credibility, authority, and personal relationship you have with your clients. This is done only with excellent communication skills and techniques. Because most of us do not speak in succinct message points, such skills need to be revisited and rehearsed on a regular basis.
• Concise communication with clients can also improve your time efficiencies and your client satisfaction. The "information age" has caused an overload of questions that are off subject and that seriously occupy the time you have with the client. Learning how to focus, control, and command communication with clients will dramatically improve efficiency, and clients will be happier.
• Today's world presents the veterinary practitioner with an increasing number of annoying distractions that can detract from accurate and clear communication. Such distractions can block and confuse good communications. Daily distractions can be controlled, but this requires your direct attention and management and taking control in a plesant and professional way.
• Reviewing and renewing your client communication skills will decrease confusion, and a confused client will make either a "no" decision or at least exhibit poor compliance.

TERMS DEFINED

Bridging: A communication technique in which the discussion is redirected from its current path to a more appropriate one. Learning just a few bridging techniques is all you need to masterfully control and redirect a conversation toward a more positive outcome.
Compliance: The extent to which pets receive prescribed treatments, a screening, or a procedure in accordance with accepted veterinary healthcare practices. Compliance involves veterinary staff performing and/or recommending treatments, screenings, and procedures, and pet owner follow-through.

ISSUES AND OPTIONS

GOALS IN GOOD CLIENT COMMUNICATION

• **Display a professional appearance:** This is a visual form of communication that helps set you apart from other service professions. An outstanding professional appearance begins with the walk-up appearance of your parking area, hospital building, and entryway, all of which should be neat, clean, and professional. The reception room should be neat, professional, and inviting. Once a year you and your staff should "declutter" both the walk-up and the reception areas. Far too many things get hung on the wall and, over time, only add to the busyness and cluttered messy appearance of an otherwise nice reception area. A good idea is to have a friend or family member who does not visit your hospital every day, do a walk-up and walk around with the goal of identifying clutter and messy things you would likely ignore.
• **Pay attention to personal appearance:** Another key part of visual communication is your personal appearance. Our society has become far too casual in our dress. In many human hospitals, you cannot tell a nurse from a janitor or a doctor from a cafeteria worker. Yet patients and clients still expect a professional experience, and that begins with visual impressions. A veterinary hospital should be a place where clients can expect to find professionalism, pride, neatness, and cleanliness. Hire a laundry service and make sure that doctors' coats and staff smocks and scrubs always look their best. Choose colors that are easy on the eyes and go with the hospital décor. Be casual but neat, workable but professional. Let it be known to staff, from the first day, that uniforms are worn and establish a hospital policy of how they are to be worn and enforce it. Do not tolerate sloppiness.
• **Project authority and credibility:** This is also a nonverbal form of communication that helps set clients at ease about their choice of a veterinary professional (see 5.3 – Speaking as a Professional). Your confidence and demeanor has much to do with the projection of authority and confidence, but there are also many small things you can do to help in this area. Place your framed degrees on a wall where every client can see them. Wear solid colors and embroider doctors' names on their jackets. Stay away from cartoon prints on scrubs and staff shirts. Know the name, sex, age, and breed of the pet before entering the room. Know something personal about every client in your hospital, and be interested in their lives. Invest one to two minutes to get to know them, and keep that information in the record. Connecting emotionally is an important part of projecting your credibility and enjoying your practice.
• **Be concerned, interested, and compassionate:** A very busy day can destroy this key element of communication, much of which comes from your body language (see 5.9 – Nonverbal Communication). Be open, make eye contact, smile, call them by name, get out from behind the table and use a stool, or kneel down if necessary. Experiment with various ways to remove barriers to good communication. Avoid nervous body language, and do not cross your arms or constantly stare at the medical record. Life experience is invaluable in accomplishing this key method of connecting with clients. This is especially true when delivering bad news (see 5.20 – Delivering Bad News), or in any end-of-life setting (see 5.22 – Discussing Quality of Life and End of Life Issues).
• **Be positive:** Find some good news in every case. Be reassuring and compassionate. If the conversation is turning negative, bridge over to something positive. Use an upbeat tone and positive words. Clients want to feel good after seeing you.
• **Offer fewer choices:** No one likes to feel stupid, but the more details and choices you give, the more confused the client will be. Do not let a client choose from a long menu list of items; a confused client is almost always a "no" decision or certainly leads to bad compliance. It is better to offer three choices to the client, and then guide them to your recommendation from the three. Three is a magic number. Three options sound doable to clients and are easy to understand and accomplish.
• **Detect confusion and correct it early:** You simply observe the client's body language, anticipate his or her questions, and answer them in advance to forestall confusion. This is being proactive. Try to get the client to repeat back to you key points. This helps them focus

on the issue and improves their compliance. Many people will simply "zone out" when they have too much information. So make three points, get them to repeat them back to you, and then stop.

• **Control the conversation:** Do not be sidetracked by too many off-point questions. Answer a client's question briefly, but then bridge over to your main points about the subject at hand. This helps you stay on track. Use visuals such as models, pictures, and even the pet to help control the conversation, and then hand the client a checklist or fact sheet that you have written about the topic. Clients will only remember a few things anyway. Our goal is not to try to impress them with everything we know, so focus the conversation on those key points. Don't be shy about controlling what goes on in your exam room. Send your clients home with a brochure on the subject and your website address so that they can read more details on your approved site.

• **Give positive examples to reassure clients:** But never assure them of a positive outcome, of course – that is not possible. Clients want information and hope about their pets, so it is acceptable to offer positive examples in which cases similar to theirs did well. Remember, clients want to know that you understand their feelings and they want to invest confidence in your abilities. Perhaps the positive thing to say is, "We are doing all we can, and I assure you she is getting excellent care." It is important to stand out as positive in a fairly negative world.

• **Redirect misguided questions:** This is especially important with clients who are all over the place and simply ramble. When giving an interview for the media, this is called "bridging." You use the technique when questions turn negative or aggressive, or when you see you are losing control of the conversation. You basically turn the conversation from that which you do not want to talk about to that which you do want to talk about. The technique works well with unfocused, rambling clients. Here is an example: "I can't address what's on every Internet site, but what I can tell you is …" or "That considers only one aspect of the issue. In our experience we …." Use bridging statements like this to get back to the important issue.

• **Control your time:** We all know clients who take up two or three appointment slots. We do not want to rush them, but we cannot afford the wasted time. Control the conversation by asking focusing questions, getting the client to begin repeating back to you key points, asking them to fill out checklists, and handing them fact sheets or brochures on the subject.

• **Give them more in less time:** All clients should leave feeling they got more than they expected when they came in. This does not necessarily mean more of your time, but it does mean more of your attention, your caring, knowledge, compassion, handouts, samples, reassurance, confidence, professionalism, and so on. The entire experience will be rewarding for the client if you will excel in all these areas of improved client communication.

EXAMPLES

N/A

CAUTIONS

• Set some rules about distractions in your hospital's communication environment. Cell phones, for example, are an ever-present distraction. Simply construct signs and place them prominently in the reception room and in all exam rooms that say: "Medical equipment in use, please turn off your cell phones."

• For the noise and distractions caused by children, try to create a safe play area where children may focus their energy.

• Try not to use loudspeaker paging. These are usually annoying and only add to the noise and distractions in a busy practice. Use phone station intercom paging and messaging instead.

• Make sure you and your staff have delivered all the aftercare instructions before bringing the pet back out into the reception room. Happy reunions are no place for focused instructions.

• Clients truly appreciate frank discussions about costs (see 5.13 – Discussing Finances). In general, you will see greater acceptance of your proposed work if you will do this. So, become comfortable with discussing fees and detailing an estimate with your clients. They are likely to be very appreciative!

5.2. IDENTIFYING CLIENT COMMUNICATION STYLES

BASICS

OVERVIEW

Communication style and behavior assessments can be very powerful tools to better understand and communicate with people (in this case, your clients and team). Often, however, hospital teams will take these assessments to learn about themselves but not fully understand how these tools can be used to better communicate and read other colleagues and clients.

Although there are several assessments available (see 1.15 – Personality Profiling), here we will highlight the DiSC assessment and how to educate your team to use this theory in reading clients and how to better communicate with them. When dealing with a challenging client, we have at some point told ourselves "some people just communicate better than others." However, if you can identify one's communication style, there is no reason you cannot change your approach to better address a client.

Tone and body language are both influential factors for reading your clients. The belief in nonverbal communication has always been based on the theory that communication is composed of 7% spoken word, 38% tone and 55% body language. For example, you can identify what a person is thinking sometimes just by the direction of their eyes. If they are looking left, they are trying to remember, if they look to the right, they are trying to be creative. With that said, people might be more visual, auditory or kinesthetic. If you can identify better with these nonverbal cues, you can mimic with this person better and even highlight their learning styles a bit more.

TERMS DEFINED

DISC: DISC is a behavior assessment tool based on the DISC theory of psychologist William Moulton Marston, the original process focusing on four different behavioral traits: dominance, inducement, submission, and compliance. In more contemporary applications, the letters can also signify basic tendencies such as directing, influencing, steadiness and compliant, or they can also stand for the following personality types: dominant, inspiring, supportive, and cautious (or conscientious). DiSC® is a branded form of the DISC assessment.

ISSUES AND OPTIONS

THE DISC ASSESSMENT

Before discussing how to incorporate DISC assessments into your hospital, it is important to first explain the four different traits that make up DISC (Figure 5-2-1):

- **D:** This trait is usually in a person who communicates and behaves more as a director.
  - They want: Immediate results
  - They act: Decisively
  - Characteristics: Determined, assertive, unemotional, not easily discouraged
- **I:** This trait is in a person who communicates and behaves more as an influencer.
  - They want: Contact with people
  - They act: Enthusiastically
  - Characteristics: Motivated, people focused, emotional and a story teller
- **S:** This trait is in a person who communicates and behaves more with steadiness.
  - They want: Stability
  - They act: Systematically
  - Characteristics: Loyal, slower, plans things out, easy going, quiet but witty, doesn't like change
- **C:** This trait is in a person who communicates and behaves more compliant.
  - They want: Accuracy
  - They act: Cautiously
  - Characteristics: Precise, reserved, sensitive and idealistic

Clients with Visual, Auditory, and Kinesthetic Cues/Characteristics

- A person who is more visual will have the following characteristics:
  - Eyes tend to look up
  - Their voice and tone is typically higher and louder
  - They use their hands more when talking
  - They start sentences with "I see."

These are clients that you would want to have a higher voice and tone and offer more visual demonstrations with.

- A person who is more auditory will have the following characteristics:
  - Eyes tend to be more straight forward and they lean in more from the direction of their ear(s)
  - Their voice and tone is more monotone
  - They start sentences with "I hear."

These are clients that you want to be more monotone with. For client education, give them more tools such as videos (great opportunity to discuss the hospital's YouTube channel or educational videos on the hospital website).

- A person who is kinesthetic will have the following characteristics:
  - Eyes looking down
  - Holds their hands together or want to touch/hold something (like their pet)
  - Voice is more slow and low.

You definitely do not want to be too overbearing with a client like this in the way you use your voice and body motion. You will want to sit or stand more at their level and even alongside them (even do the same with their pet). When educating them on a product, give them something to hold or touch, such as the product itself or a handout/brochure.

EXAMPLES

Let us look at an example of how another industry, such as car sales, might use this assessment to read and communicate with their customers. A car salesperson will want to identify these traits in their customer first and then know how to approach and communicate with them.

- If a customer has more of a "D" trait, they will arrive at a car lot wanting instant gratification, have an idea already of what they want and want it quickly. A salesperson would approach this person by asking what they want and how soon they want it. If the salesperson takes up too much time with this person discussing other cars or options, they will lose the interest and even the patience of this customer.
- If a customer arrives with an "I" trait, they want this to be a fun experience. They probably arrive with a few other friends, want more time to hear stories about what others drive, and would want their picture taken with the new car, balloons, and all the excitement that comes with the purchase.
- A customer with an "S" trait will not want much change from their previous car. They might have more of a difficult time understanding why they would need something different and will look to the guidance of the salesperson for their advice and suggestions. A salesperson will probably look at what this person currently drives and wont suggest anything too different.

5.2. IDENTIFYING CLIENT COMMUNICATION STYLES

What to look for in a Client !!!!			
D:	**I:**	**S:**	**C:**
Director	Influencer	Steadiness	Compliant
They Want:	**They Want:**	**They Want:**	**They Want:**
Immediate Results	Contact w/ people	Stability	Accuracy
They Act:	**They Act:**	**They Act:**	**They Act:**
Decisively	Enthusiastically	Systematically	Cautiously
Characteristics:	**Characteristics:**	**Characterisitics:**	**Characteristics:**
Determined	Motivated	Slower	Precise
Assertive	People Focused	Plans things out	Reserved
Unemotional	Emotional	Easy Going	Sensitive
Not easily Discouraged	Story Teller	Quiet but Witty	Idealistic
Visual:	**Auditory:**	**Kinesthetic:**	
Eyes go up	Eyes straight forward	Eyes go down	
Eye to left, Remember	Eye to left, Remember	Eye to left, Remember	
Eye to right, Creating	Eye to right, Creating	Eye to right, Creating	
Voice, High	Voice, Monotone	Voice, Slow & Low	
Metaprograms: What does the Client Want?			
#1 Detail Or	Big Picture	#3 Pain Or	Pleasure
#2 Process Or	Outcome		
Work on These all the Time !!!			

Figure 5-2-1.

DISC overview.

• A customer with a "C" trait will want to make more of a precise decision by doing research ahead of time, will probably make a spreadsheet of different makes/models and the pros/cons of each and will make more of a cautious decision which might take a few visits to the dealership.

Now, think about certain clients that you have and how you would identify/approach them differently.

INCORPORATING THESE COMMUNICATION TOOLS INTO YOUR HOSPITAL

First, have everyone on the hospital team take the DISC assessment. This will give them the opportunity not only to learn what their communication styles are, but also to understand what approaches they need to change when communicating with someone that has different traits. When doing these assessments, you will usually identify what traits you identify in yourself as well as what others identify in you.

Have some kind of chart near exam rooms to remind your team about the different traits to identify in the clients. It is also a good idea to make a note in the client record with a D, I, S, C about the client's traits so the next team member to communicate with this client will also know the best approach.

Have some good opening questions to ask a client that will help identify their communication traits, such as "What is most important to you today?" Does your client want more detail or want the big picture? Are they more concerned about the process or the outcome? Is it the pain/comfort of their pet that they are concerned about or their pleasure of not worrying or being distraught?

5.3. SPEAKING AS A PROFESSIONAL

BASICS

OVERVIEW

The definition of professional includes an individual who adheres to high ethical standards (a code of ethics), possesses specialized knowledge and skills in a widely recognized, organized body of learning derived from education and training at a high level, and is prepared to exercise this knowledge and skills in the service of others.[1]

A veterinarian is a professional who solemnly swears to use his or her scientific knowledge and skills "for the benefit of society, through the protection of animal health and welfare, the prevention and relief of animal suffering, the conservation of animal resources, the promotion of public health, and the advancement of medical knowledge."[2]

The core characteristics of the veterinarian as a professional are as follows:

- Specialized knowledge and skills
- Responsibility and accountability
- Credibility
- Integrity and honesty
- Leadership
- Caring and compassion
- Effective communication with clients and members of the veterinary team
- Commitment to lifelong learning communication.

TERMS DEFINED

Accountability: Entails the procedures and processes by which the clinician justifies and assumes responsibility for his or her actions.
Credibility: The extent to which a clinician is perceived as believable, expert, genuine, and trustworthy.
Integrity: A sense of commitment to open and honest communication, inclusiveness, and high standards in discharge of professional responsibilities and actions.

ISSUES AND OPTIONS

The veterinarian as a professional facilitates effective communication through his or her unique characteristics, which include the following:

SPECIALIZED KNOWLEDGE AND SKILLS

Veterinary medicine is a dynamic discipline characterized by a constant proliferation of information, new technologies, and the need for enhanced skills. To maintain a level of knowledge and skill commensurate with the challenges of the veterinary medical practice, the effective clinician:

- reads the literature extensively,
- attends professional conferences and workshops,
- maintains a required level of continuing education,
- consults with professional peers on regular basis.

RESPONSIBILITY AND ACCOUNTABILITY

As a member of a licensed profession, a veterinarian is legally required and morally expected to justify his decisions and actions to self, clients, community, and profession (see 2.6 – Accountability). To adhere to these proscriptions, the responsible clinician:

- is aware of self-limitations and means for improvement,
- initiates self-improvement and/or educational activities,
- asks for help when needed,
- conducts self appropriately amid adverse and trying circumstances,
- adapts to changes and pressures caused by external circumstances,
- owns up to and takes responsibility for errors and shortcomings,
- requests and accepts constructive feedback and criticism, and makes changes accordingly,
- manages personal affairs in a way that does not interfere with professional activities.

CREDIBILITY

Client and healthcare team confidence in the veterinarian is a function of the degree to which the veterinarian is perceived as genuine, trustworthy, skillful, caring, compassionate, and communicative. The credible veterinarian demonstrates:

- effective communication behavior,
- approachability,
- client-centeredness,
- use of clear and simple language when providing education to clients,
- best practices of the profession,
- attentiveness.

INTEGRITY

As a member of a recognized profession, the veterinarian is expected to act in accordance with the highest ethical standards as prescribed in the Code of Ethics for Veterinarians. Each veterinarian is expected to:

- answer questions directly and tactfully,
- accurately represent data and circumstances,
- make accurate self-representations of identity, position, or status,
- admit to personal errors and not cover up the errors of others,
- conduct research activities with integrity,
- address confidential information discreetly and appropriately,
- balance authority and humility,
- inspire trust in clients, colleagues, coworkers, and subordinates,
- maintain professional autonomy,
- act in the best interests of clients and patients,
- use power appropriately,
- maintain proper personal, emotional, and professional boundaries with clients and coworkers,
- resolve problems with the people involved.

LEADERSHIP

As the recognized authority in the practice setting, the veterinarian is responsible for creating an environment that fosters a sense of common purpose in achieving satisfaction for staff and clients and health positive outcomes for patients (see 2.12 – Leadership). In this capacity, the veterinarian:

- provides constructive approaches for conflict resolution,
- acts as a role model for staff and clients,
- builds consensus,
- enlists others in a common vision,[3]
- praises others for work well done,
- follows through on promises,
- practices consistency between words and actions,
- fosters collaboration,
- creates a climate of trust,
- learns from mistakes.

EXAMPLES

EXAMPLE 1: SPECIALIZED KNOWLEDGE AND SKILLS

The importance of the veterinarian maintaining currency of technical knowledge, best practices, and effective client communication is known to enhance client satisfaction and patient health outcomes:

> Client: *"I don't understand how my dog could seem so healthy yesterday and today you're telling me he's seriously ill."*
>
> Veterinarian: *"I can understand how confused and upset you must be. A colleague recently shared a similar experience with a collie in her practice. I'm going to consult with her this afternoon to discuss what options might be available to you and Rusty. In the meantime, we can talk about ways to keep Rusty as comfortable as possible. How does that sound?"*

EXAMPLE 2: RESPONSIBILITY/ACCOUNTABILITY

The assumption of responsibility and accountability by the veterinarian extends beyond technical knowledge and skills. The effective veterinarian appreciates the importance of translating and communicating clinical findings to meet the informational and affective needs of the client:

Client: *"She started to limp yesterday and she seems to be in a lot of pain. I'm concerned that there is something seriously wrong here."*

Veterinarian: *"Yes, it's hard to see Lady in pain. From what I can tell, she seems to have a very common condition called laminitis, which is a disorder of her foot. This explains the limping and can have a variety of causes. I have a handout that goes over this and common causes of this condition. If it's okay, I'd like to go over this with you to see if we can identify what is causing Lady's limp."*

EXAMPLE 3: CREDIBILITY

The veterinarian's credibility is critical to client attentiveness and adherence to recommendations. The establishment of credibility is a function of the client's perception of the veterinarian's knowledge, skills, sensitivity, and responsiveness to the client's needs and concerns:

"I know how difficult it is for you to give pills to Tony. Fortunately, there is medication that comes in a liquid and is as effective as the pill form."

In this example, the veterinarian communicates in a manner that reflects an understanding of the unique preferences of the client.

EXAMPLE 4: INTEGRITY

Client satisfaction and positive patient health outcomes are contingent on the veterinarian's commitment to maintaining high standards of ethical conduct. Implicit in these standards is recognition of the importance of open and honest communication as the foundation for effective veterinary practice:

"I think we've come to the point where further testing is unlikely to reveal any new findings. Although I believe there has been some improvement in Pretty's condition, I am recommending that we consult with the veterinarians at the teaching hospital."

In this example, the veterinarian is forthright with the client and indicates that she has exhausted their resources in determining the etiology of the animal's medical condition. Therefore, in the interest of maintaining high ethical standards, the veterinarian presents a recommendation of extending the system to include veterinarian specialists.

Client: *"I think I understand what you are recommending for Skippy's hip dysplasia. I don't want to offend you, but since we're talking about surgery, I was just wondering how many of these operations you have performed successfully?"*

Veterinarian: *"I really appreciate you asking a question that I don't believe is asked often enough of professionals. I can assure you I would not perform any procedure unless I knew that I was qualified. In this case, I am recommending that we consult with Dr. Brown who is a specialist in performing this type of surgery on Goldens."*

In this example, the veterinarian is comfortable with making a referral to a specialist who he knows has more experience and expertise in this type of recommended treatment, given the client's expressed concern about the surgery. This example illustrates the veterinarian's honesty with, and ability to meet, the needs and concerns of the client.

Client: *"Doc, what's up with Cecilia's dog, Lucky? She seemed upset when she left. I didn't get a chance to ask her what the problem was. What happened?"*

Veterinarian: *"Cecilia is very concerned about Lucky, as you are about Skippy. I can't really say more because, like in healthcare for people, doctors are not permitted to discuss cases with other than the client. It's really nice of you, and not at all a surprise to me, that you would be concerned about Cecilia and Lucky, or for that matter any other person's pet."*

In this example, the veterinarian limits her response to the obvious. While adhering to strict standards of confidentiality, she engages the client and concludes the exchange with positive statements about the client's compassion.

EXAMPLE 5: LEADERSHIP

The veterinarian, possessing specialized knowledge and skills, a high level of credibility, and commitment to responsible and ethical practice, serves as a role model who encourages clients and staff to work collaboratively in the patient's best interest:

"Let's move to the customer service item on the agenda. Glenda has brought the feedback received from the clients for the week. One of the letters came from a client who complained of being rushed off the phone. Let's open this up for discussion and see what we can learn from this experience."

In this example, the veterinarian has established a procedure to review client feedback. He has implemented this procedure in accordance with a philosophy that client satisfaction is a responsibility of the healthcare team and a critical element in positive healthcare outcomes. By conducting regularly scheduled staff meetings to address issues of communication, he has effectively institutionalized this practice philosophy.

CAUTIONS

- A veterinarian must appreciate the fact that he or she serves as a role model for the behavior of the healthcare team.
- It may be necessary to provide the healthcare team with training in client relations.
- It is the responsibility of the veterinarian to create a practice environment that encourages clients to ask questions and voice concerns.

5.4. MAKING CLEAR CLIENT RECOMMENDATIONS

BASICS

OVERVIEW

The path to making clear client recommendations begins before your client enters your hospital. To maximize the strength and clarity of recommendations, you and your entire healthcare team must be speaking from one playbook. Make sure that recommendations are being delivered to your clients consistently. This means you have standards of care (see 9.3 – Standards of Care and Care Pathways) for things such as heartworm testing, senior screening, therapeutic diet recommendations, pain management, and the control of external and internal parasites and infectious diseases. This consistent message must extend to all touch points or client exchanges with the hospital, including:

- Website, pet portal, social media, apps
- Telephone interaction
- Building entrance
- Reception area
- Exam rooms
- Brochures and forms
- Boarding
- Reminder systems
- Marketing plans.

To achieve this level of clarity and consistency in interactions with your clients, you need to have a system in place that will support your team by taking care of the process so they can concentrate on identifying the client's and patient's needs, and working to assure that recommendations focus on adding value, solving problems, and promoting health.

All recommendations need the following key elements to be successful:

- A personal message – connect it to the pet's/client's life and needs or concerns.
- A third-party reference or a visual model or picture.
- A timeline with reminders – create a clear path for action for when they need to act.
- A care plan or estimate they can review and discuss.

TERMS DEFINED

Benefits: How the features of a product or service can improve a situation for the client. Benefits answer the question: "So what?" This needs to answer the client or pet's need.

Closed-Ended Inquiry: Questions that have a restricted range of answers, such as yes or no.

Features: The characteristics of products, services, or programs you offer. Features answer the question: "What does it do?"

Nonverbal Communication: Aspects of communication, such as gestures and facial expressions or body postures, that do not involve verbal communication; this may include aspects of speech (accent, tone of voice, speed of speaking, etc.).

Open-Ended Inquiry: Questions that cannot be answered with a yes or no but require a developed answer.

ISSUES AND OPTIONS

How do we achieve clear client recommendations? It is important to let the framework or system help guide the process, which typically has five components (see Figure 5-4-1).

1. IDENTIFY THE CLIENT

Client identification will be based on various program criteria (e.g., age, animal breed, program, etc.) or reminders set from prior visits. It could be a program targeting new clients. Suppose a potential client calls the practice. The customer service representative asks questions about the pet – age, breed, and needs. The customer service representative integrates information in the conversation about their new client program and wellness programs, sets up the appointment, and sends an email appointment reminder to the prospect ("We are looking forward to meeting you and Fluffy …"). This can also direct them to your website and, if possible, a tour of your facility in person or in a video.

2. UNDERSTAND THE NEEDS OF THE CLIENT AND THEIR PET

To understand the needs of the client and their pet, you use a questioning funnel, moving from open-ended to closed-ended questions (see 5.7 – Posing Client Questions Effectively (Open-Ended Inquiry)). For example, when the client enters the practice, the customer service representative has reviewed the client information, and, in conversation, asks about family activities with the pet, etc. A technician takes the client through a needs assessment of the pet (see 4.9 – Lifelong Excellence in Healthcare). Then, the client could be asked questions about diet, favorite foods, exercise, health, history, behavior, grooming, fleas, boarding, etc. The doctor would continue the questioning to further clarify client concerns and identify health issues to address as well as the agenda of the visit.

3. SOLVE THEIR PROBLEM

You have questioned, listened, and identified concerns and needs of the client and their pet. Now it is time to make the recommendation. A recommendation has two parts: a feature and a benefit. A feature (the care) is a characteristic of a product, program, or service you offer (in-house testing, heartworm testing, radiographs, etc.). The benefit (value added) is how these characteristics (or features) can improve a situation for the client (for example, provide peace of mind). A benefit always answers the question: "So what?" For example:

- In-house heartworm testing (feature) – So what?→Decreased waiting (feature) – So what?→Instant peace of mind (benefit).
- Radiograph (feature) – So what?→Noninvasive picture of the pet's insides (feature) – So what?→Correct diagnosis that is visible (feature) – So what?→Peace of mind that the client can see an answer (benefit).
- Therapeutic dry food diet for cats (feature)– So what?→Pet maintains healthy body weight (feature) – So what?→Risk of developing diabetes significantly reduced (feature) – So what?→Cost of annual treatment for diabetes (medicine, supplies, special diet, medical monitoring) approximately $1,400 annually versus $100/year cost for preventative plan.
- Parasite preventive (feature) – So what?→Pet protected from intestinal parasites (feature) – So what?→Family members protected from parasites, especially if pet sleeps with family (benefit).

Use an exam room report card to list your recommendations. Type it. Show it. Pictures are worth a thousand words so never tell what you can show on a whiteboard, or with a book, radiograph, computer, or tablet. People remember less than 10% of what they hear, but 90% of what they see, hear, and do themselves. Some visuals to use with your recommendations would include pamphlets, atlases, books, pictures or videos on an iPad or computer, resources from websites, as well as the pets themselves.

Client testimonials from pets with similar disease or illness can also help. Word pictures can also be used to help the client see how treatment would improve the pet's quality of life or provide the pet owner with peace of mind. Word pictures tell what the pet owner will feel, see, hear, and watch their pet do as a result of treatment.

Make a diagnosis and give your recommendations with a time line. Timelines, mental pictures or real pictures, models, care plans (estimates), discharge instructions, or recheck appointments all go with consistent recommendations. What can they expect? What will you do

5.4. MAKING CLEAR CLIENT RECOMMENDATIONS

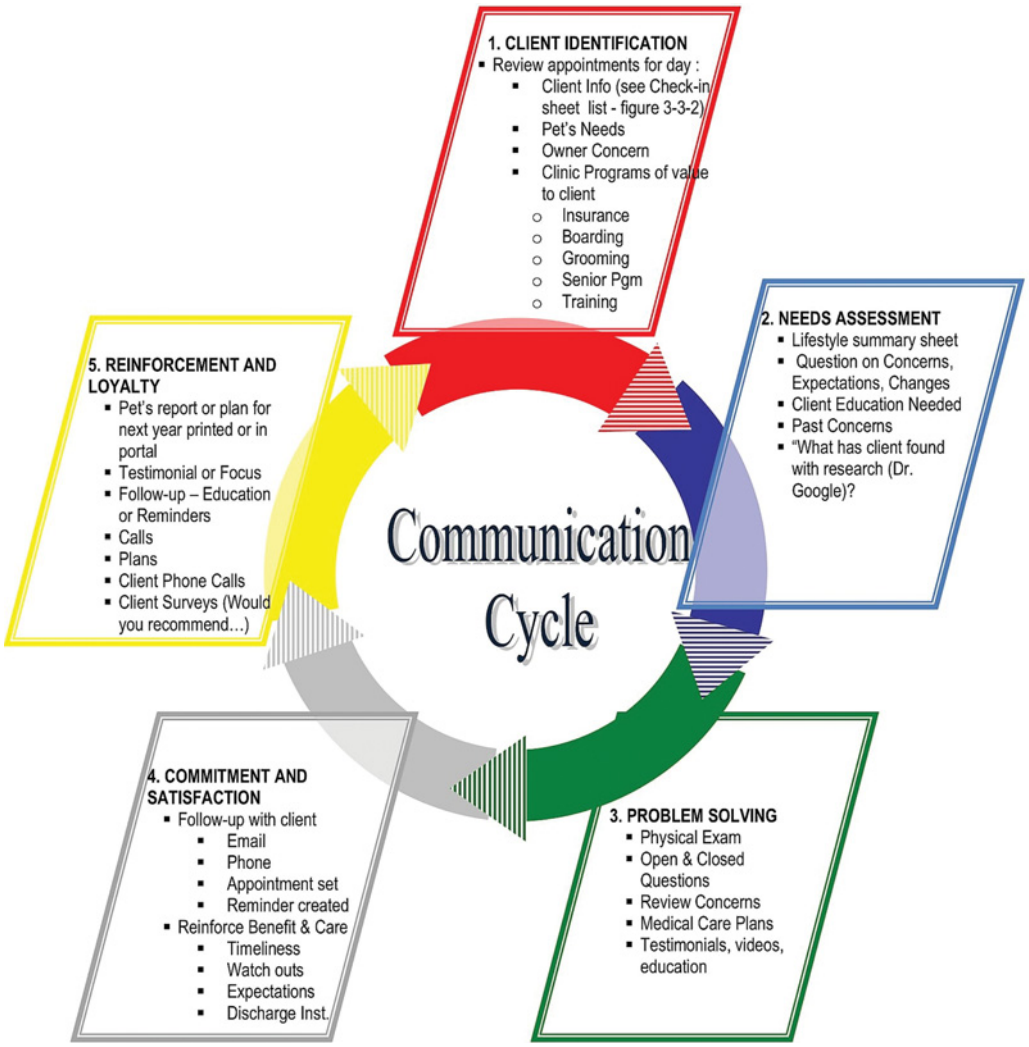

Figure 5-4-1.

The communication cycle for making clear client recommendations.

to follow-up with them? How long might it take? Who do they call if a problem arises?

Addressing Concerns

As you present your recommendation, it is probable that your client will have concerns. Welcome these comments! If a client does not voice their concerns, you cannot resolve them or earn their trust. Generally, all client concerns fall into one of two categories:

- The client does not have enough information to make the decision.
- The client does not see the need (or value) for a particular product, program, or service that you are offering.

As concerns are presented, use this five-step process to listen to and address the clients' issues with respect and understanding. Remember, the concern is theirs. No judgment or guilt is needed – just actively listen.

- **Step 1. Acknowledge:** This step is simply active listening with empathy – the "I see," "I understand," or "I hear what you are saying." It is important in this step to simply accept what the client is saying. This does not mean you have to agree. You want the client to open up and express the real need that your hospital can fulfill or where they are concerned or need more information.
- **Step 2. Clarify:** In this step you use the client's words to rephrase or restate their concern (see 5.8 – Reflective Listening). This indicates to the client that you are actively listening and attempting to meet their needs. For example, "You are interested in knowing an indoor dog's risk for heartworm disease if no heartworm preventive is used – correct?"
- **Step 3. Answer:** You show how the benefits of your hospital and treatment suggestions far outweigh the pet owner's concern, or you answer their concerns for more information. Answer or match the client's need with a product or service benefit of your hospital. They need to be engaged, and the proper concern must be identified, or you could answer the wrong question. This answer to the client can be supported with visuals (radiograph, models, and pictures), articles, reference books, materials and websites.
- **Step 4. Verify:** Summarize. If the client is satisfied, understands the benefits, and is capable of making an informed decision, then you have achieved your goal. For example, "Are you clear now on the risks for an indoor dog's risk of heartworm in this region?"If the client has more concerns, return to the second step and reclarify.
- **Step 5. Close:** End the visit. Ask the client to make the commitment and take an action to protect the pet's wellness, and give the client peace of mind. If questions are still present, keep clarifying, or decide

5.4. MAKING CLEAR CLIENT RECOMMENDATIONS

Information to have populated on Check-In Sheet or Check In Screen

Time Room _____
Time Tech _____
Time Doctor _____
Time Check-Out _____

- Patient's Name
  - Age
  - Last Weight
  - Breed
  - Medical Alerts
  - Dental Grade
  - Pain Score
  - Previous Sx
  - Previous Diagnosis
  - Body Condition Score
- If new patient, have records from prior doctor No / Yes. If NO, records requested by (initials)
- Microchipped? No/Yes/Unknown Microchip Number in Record Yes/No
- Vaccinations Due
- Date of Last Parasite Exam
- Date of Last Heartworm Test
- Date of Last Diagnositic Blood Work
- Date of Last Urinalysis
- On Parasite / Heartworm prevention No/Yes/Unknown
  - When was last dose given?
  - How is medicine being given?
- Current Diet
  - If prescription, need more?
- Current Medications
  - Refills needed soon?
- Aside from vaccinations, upcoming / overdue reminders
  - Do the other pets in the family have any overdue reminders? No / Yes
  - If yes, which pet (s) and for what are they due?
    - Owner alerted by (initials)
  - Do they have Cats?
- Surgical patients
  - Vaccines up to date? No/Yes/Unknown
  - Is patient due for blood work prior to procedure? No / Yes
- Does this patient need breed specific packet or back page?

Figure 5-4-2.

Information to have populated for check-in sheet or check-in screen.

to send a reminder or follow up in some way to continue the education and trust-developing process for the pet and its owner.

In summary, all recommendations need these key elements to be successful:

- Explain the benefit to the pet and the client personalized to their need.
- Provide a third-party reference or a visual or model or picture.
- Create a timeline for action with reminders.
- Provide a care plan or estimate.

4. GAIN COMMITMENT AND SATISFACTION

The fourth component is commitment and satisfaction. The staff reinforce the veterinarian's recommendation and provide further information and support so the client feels assured in the decision. When the client commits to the recommendation, it is written down or printed from the electronic medical record, prioritized, and the client is taught how to perform the treatment plan needed.

5. MAINTAIN CLIENT LOYALTY AND TRUST

Reinforcement is the final component. For example, a medical update is emailed to the client or the client receives a folder with Fluffy's healthcare notes in it. The folder has the practice name on the cover and has other pertinent information: emergency numbers, medical information, product coupons, etc. The customer service representative makes the next appointment for re-evaluations, vaccinations, dentistry, laboratory, etc. A summary of the finding is then sent to the client with

a personalized thank you included. One to three days later, the client is called to see if they have any questions or concerns.

EXAMPLES

Example of a check-in sheet is shown in Figure 5-4-2.

5.5. TRANSLATING MEDICALESE

BASICS

OVERVIEW

A veterinarian learns thousands of discipline-specific words during training and a language that requires a high level of literacy significantly above that which is possessed by the average client. In many instances, the client is unfamiliar with this medical jargon (medicalese) and the literacy level at which health information is presented.

- According to the Agency for Healthcare Research and Quality, only 12% of adults have proficient health literacy. In other words, nearly 9 out of 10 adults lack skills to manage health and prevent disease.[1]
- Studies have shown that even people who are college educated and who can understand complicated words prefer to have health information presented simply.[2]
- Health information needs to be communicated to clients in plain language, and in a manner that is relevant to the client's capacity and background and sensitive to their culture.
- In American populations of those 65 and older, inner-city minorities, immigrants, the poor, and those with chronic physical or mental health conditions, almost two out of five read below fifth-grade level.[3]
- Clients with low literacy skills often rely primarily on listening skills to learn and often have limited vocabularies.[4]
- There are numerous areas in veterinary practice where the ability of the client to communicate and understand health information messages are important to successful health outcomes, such as:
  - Navigating the system: locating an appropriate veterinary service
  - Completing forms: client–patient intake and contact forms
  - Understanding mail correspondence: responding to reminders sent in the mail for preventive and/or follow-up care
  - Providing informed consent: reading and understanding the informed consent document
  - Communicating with the veterinarian: possessing appropriate language and communication skills
  - Providing accurate information for assessment and diagnosis: verbal and observation skills and recall needed for clients to articulate their concerns about the animal
  - Understanding directions: ability to read and comprehend verbal and/or written instructions
  - Following regimens (adherence): personal commitment to implementing the veterinarian's recommendations.
- The advantages of a client-centered communication approach in translating medicalese include:
  - greater likelihood that the client will make use of preventive and routine care practices,
  - presentation in earlier stages of disease,
  - greater understanding of condition and treatment,
  - higher adherence rates to medical regimens,
  - greater client and veterinarian satisfaction,
  - improved diagnostic accuracy,
  - promotion, maintenance, and enhancement of veterinarian's credibility,
  - reduced client complaints,
  - improved health outcomes,
  - more efficient client–patient care,
  - more likelihood of responding to veterinary reminder notices for preventive or follow-up care.

TERMS DEFINED

Client-Centered Communication: An interaction with a focus on the client's needs, concerns, ideas, expectations, and preferences for the purpose of achieving a shared understanding between veterinarian and client.

Functionally Illiterate: Lacking basic reading and writing skills.

Health Education Methods and Strategies: Various ways for delivering health education to clients, such as providing written information sheets, showing educational videos in the waiting room, providing verbal information during the visit, and so forth.

Health Literacy: Level of understanding that is required by the client to access, utilize, and follow through on recommendations to maintain the health of an animal in their care.

Literacy Sensitive: Providing health information in a manner that considers the health literacy level of the client.

Marginally Literate: Possesses the most basic of reading and writing skills.

Medicalese: Terminology used within the profession that may not be familiar to the client.

Normalizing: Providing a verbal message to the client that indicates the acceptance and normalcy of their preferences, thoughts, feelings, ideas, concerns, behaviors, and/or responses. For instance, "A lot of clients have trouble reading and remembering these materials. How can I help you?"

ISSUES AND OPTIONS

ATTITUDES, VALUES, AND SKILLS

To facilitate a client-centered approach, the veterinarian should do the following:

- Create an environment conducive to the normalization and acceptance of clients' literacy needs.
- Be aware of possible client cues that suggest challenges to literacy, for example:
  - Excuses given for not reading the material (i.e., client states they forgot reading glasses, are too tired, or suggests they read it later)
  - Vague and/or unresponsive to questions
  - Limited vocabulary
  - Nonverbal cues of confusion, disinterest, and frustration
  - Holding materials in incorrect position
  - Resistance to requests for summarization or evidence of understanding
  - Repeated failure to adhere.
- Assess client needs and preferences for delivery of health education (i.e., verbal, written, or video):
  - Normalize: Inform the client that there is a range of ways that the veterinarian can provide health education.
  - Assess the client's preference and/or needs: Ask the client what health education modality would be most effective for them to understand the relevant information they need.
- Translate the language of the world of animal health into the language of the client:
  - Listen carefully to the language of the client and use the client's language as often as possible.
  - Use clear and simple language.
  - Where technical language must be used, define terms in a manner that is understandable to the client.
  - Speak slowly, and adjust the pace of your speech.
  - Tailor preprinted health education materials.
- Provide health information in manageable amounts:
  - Break down complex instructions into concrete and specific tasks.
  - Use multiple health education modalities such as verbal, written, or video.
  - Use the resources of your healthcare team to reinforce health education messages.
  - Use repetition to reinforce messages.
- Allow adequate time to accommodate the clients' needs, preferences, and concerns.

• Emphasize and demonstrate the desired behavior rather than medical facts:
  ◦ If appropriate, allow the client an opportunity to practice and demonstrate the desired behavior.
  ◦ Use praise and reward to reinforce client performance.
• Provide additional resources to enhance learning and accommodate learning styles.

Ask–Tell–Ask

Ask–tell–ask is a communication model that emphasizes a discussion between the veterinarian and client, instead of the veterinarian sharing information with the client in a one-sided manner. It is based on the belief that client education is not successful until the client has an understanding of what the problem or issue is and learning has taken place. Thus, it is important to assess the client's understanding of the problem, diagnosis, treatment discussion, etc.

"Ask–tell–ask" is a practice-friendly interactive tool that provides the veterinarian with the client's perspective before information is delivered, and checks for understanding in a more thoughtful and complete manner. Starting the conversation in an open-ended way and listening to the response can help you to tailor the information you provide to align with what they have told you.

• **ASK:** Begin by asking open-ended questions about the client's understanding of their pet's health condition.

> *"Before we start, I'd like to ask you what your understanding is about Fluffy's kidney condition?"*

This will help to elicit the client's view of the situation in their own words. Listen carefully to the client's response.

• **TELL:** First acknowledge what the client shared. Then, share the critical information in simple, non-medical language.

> *"You are correct that this is a common condition seen in our senior cats like Fluffy. Fluffy had been responding well to her treatments and you've been so committed to her care. From the results of our most recent blood tests, unfortunately it seems that Fluffy's kidneys are starting to fail. This means that her kidneys are not getting rid of extra fluid and waste in her blood as they should. As a result, there are dangerous fluids and waste levels in her body. I'm sorry to say that the treatments may no longer be helpful for Fluffy."*

• **ASK:** Assess the patient's understanding of the new information by asking them to share what they understand based on the conversation. Use statements such as:

> *" I know this is upsetting news. (Pause). I imagine you will be sharing his with your husband, Jeff when you go home. It would be helpful for me to hear what you will be sharing with him just to be sure I covered what is most important?"*

This will allow the client to explain in their own words what their understanding is and it will allow you to provide clarification as needed.

In addition, it is useful to assess whether the client understands the importance to act upon, and what needs to be done to address the problem.

• Provide opportunity for questions and clarification.
• Ask if the client has asked all the questions they want to. Give permission to ask:

> *"We've talked about a few things now. I'm wondering what questions you have for me."*

• Rather than ask "Do you understand?" instead ask, "What will you tell your wife (husband, partner, roommate), about this when you get home?"

TIPS FOR CLEAR COMMUNICATION

Use visuals and models when possible. This is particularly helpful to emphasize key points.

• Provide literacy-sensitive forms and written materials:
  ◦ Prepare written materials at no higher than the fifth-grade reading level
  ◦ Prepare written materials in the appropriate languages
  ◦ Advocate for the creation of proprietary written materials in multiple languages (i.e., speaking with vendors)
  ◦ Simplify forms (intake, consent, etc.) to the extent feasible.
• Verify client adherence and understanding by using follow-up phone calls to the client from the veterinarian or designated healthcare team member.
• Use consistent terms to avoid unnecessary confusion.
• Use concrete examples.
• Keep the pace slow to allow time for the client to absorb the information. Provide the information in manageable chunks.

EXAMPLES

EXAMPLE 1: NORMALIZATION AND ACCEPTANCE

When creating an environment conducive to the normalization and acceptance of clients' literacy needs, it is important to keep in mind that it is not always clear which clients have difficulties with health literacy and translation of medicalese. The fact is that many clients with low literacy are embarrassed and often will not reveal their deficit to even their significant other.[5] Clients with low literacy are unlikely to raise the issue. Therefore, it makes sense to create an atmosphere where no assumptions are made (creation of a shame-free, safe environment, for example).

For instance, how often have you handed some literature to a client to read about a condition, or have given written instructions to take medications without clear oral instructions? We know that oftentimes for the sake of efficiency practitioners rely on written information or present health education with their client without considering whether the client is able to adequately understand the information. Because varying levels of health literacy are quite common, it is advised that veterinarians ask the client, in a normalizing fashion:

> *"A lot of people I see have trouble reading or remembering these materials about heartworm medication. How can I help you with them?"*

> *"Many of my clients have a hard time understanding how their cat can look well and yet suffer with a serious illness. What might be helpful for you to better understand Chloe's condition?"*

EXAMPLE 2: ASSESS CLIENT NEEDS

Assess client needs and preferences for delivery of health education. Effective communication between a client and a veterinarian is essential for positive health outcomes as well as client and veterinarian satisfaction. Communication depends on successful transfer (sending, receiving, and processing) of information. Studies have shown that individuals differ in how they prefer to receive and process information. An opportunity to improve communication arises if the veterinarian recognizes that clients receive and process information differently.

Assessment within a limited time frame consists of three components: (1) familiarity with the variety of learning styles (visual, auditory, kinesthetic, and tactile); (2) possession of the accompanying resources to accommodate those learning styles; and (3) an inquiry regarding the client's needs and preferences.

5.5. Translating Medicalese

Use visuals and models whenever possible to emphasize key points in health education with clients. Ideally, the practice examination rooms should have access to pictures or models to complement your verbal discussion. In addition, educational videos can help clients absorb any new information or reinforce important instructions, and are especially useful when used to complement the verbal and written components of your message:

"In our practice, we appreciate that clients have a variety of ways of understanding health information about their animals. Some clients prefer written material, others prefer graphic illustrations, whereas others learn best with a hands-on demonstration – and some prefer a combination of the three styles. What might be most helpful for you in understanding Jake's problem with diabetes and the care he will require?"

"The test results have come back and, as we expected, Jake's problem with diabetes has progressed and he will require additional care. In helping you understand Jake's healthcare needs, would it be helpful if I provided you with written material, some visual materials and explanation, or time spent teaching you how to effectively provide additional care?"

EXAMPLE 3: TRANSLATE INTO THE CLIENT'S LANGUAGE

The task of providing health education to clients includes discussion of clinical and biomedical issues, oftentimes presenting a challenge to the veterinarian. A veterinarian learns thousands of discipline-specific words during training. This training requires a literacy level that is significantly above that which is possessed by most clients. In many instances, the client is unfamiliar with this medicalese and the literacy level at which health information is presented. Given that the client is responsible for the health and welfare of the animal, it is imperative that the client has a clear understanding of the precise healthcare needs of the animal.

To facilitate the client's understanding, the veterinarian must possess the ability to convey complicated explanations and instructions in a language appropriate to the client's capacity to assimilate. Regardless of the client's capacity, it is recommended that instructions be conveyed in the simplest possible, nontechnical language:

"The blood tests we conducted show that Kirby has a condition called hypothyroidism, which I believe is responsible for his weight gain and the other problems you've noticed. It's a very common condition in giant schnauzers, and it is something that is very treatable. As in humans, the thyroid gland, a small sac that is located in the throat area, makes a chemical that helps the body change food into energy. In Kirby's case, his thyroid is not working as it should, and so the food he eats is not being changed into energy. Instead, he gains weight that could lead him to develop other problems if we do not treat him."

It is also recommended that, in translating medicalese, the veterinarian use every opportunity to incorporate the client's words or phrases into their explanations. For instance, this veterinarian attempts to explain and prepare the client by using a phrase that the client uses ("do his business"):

"One of the things that we need to talk about is the possibility that Rusty may become incontinent. What this means is that he will lose his ability to control his bladder and bowel. He will no longer be able to let you know when he needs to go out to 'do his business.' This can be a very difficult situation; one that will require a great deal of patience and special care."

From a practical point of view, it is also helpful to discuss, or even demonstrate when feasible, what the desired treatment behavior is rather than just giving the medical facts. For instance, instead of saying: "Give the medication in the morning," say:

"When getting Buddy's food ready in the morning, take the powder and mix a teaspoon into his food." (Demonstrate with a teaspoon in the exam room.)

EXAMPLE 4: USE "TEACH-BACK" OR "SHOW-ME"

Ask the client to relate understanding using the "teach-back" or "show-me" method. It is not unusual for the veterinarian to spend a fair amount of time conveying relevant information to clients but then neglects to check with the clients to assess whether they understand what has been discussed. A specific protocol can be used in conveying the health information, which should also include asking clients to share their understanding:

"I've gone over quite a bit of information with you. It's often difficult to take it all in at once. Before I continue, I'm wondering if you could share what your understanding is of what we've discussed so far?"

In addition, the veterinarian needs to understand what the client already knows and expects. There may be no need to educate if they already know a great deal about a certain illness or treatment. For instance:

"What is your understanding of Jesse's hip dysplasia?"

Open-ended inquiry needs to take place to assess client understanding (see 5.7 – Posing Client Questions Effectively: Open-Ended Inquiry). It is not sufficient to ask, "Do you understand?" One effective technique is to ask clients to report what they will tell their significant others (if applicable). It is important to inquire several times if there are any more questions and to say that you are available to answer questions.

"I'm wondering if you'd like to go over what you'll tell your husband about Simon's treatment for Lyme disease. By going over it together, I can help you understand it better."

"What questions do you have for me?"

"I'm glad we are taking the time to go over this so you feel more comfortable with your decision about having the surgery done for Ruben. What other concerns do you have?"

EXAMPLE 5: PROVIDE LITERACY-SENSITIVE WRITTEN MATERIALS

It is imperative that the forms are written with minimum literacy levels (no higher than third- to fifth-grade reading levels). Likewise, written materials should also be available in appropriate languages to the client population served. Whenever possible, you should advocate for the creation of proprietary written materials in multiple languages (and speak with vendors who supply written preprinted materials, for example). Simplify forms, such as the intake or consent forms, to the extent feasible.

Preprinted materials should also be provided as one form of health education in conjunction with verbal education during the medical visit. Review the practice's preprinted written materials to assess whether the language is understandable to clients with the most basic literacy levels.

"We have written information and pamphlets that explain and show how people care for dogs with diabetes. I can get those pamphlets for you to read or I'd be happy to have one of our healthcare staff review it with you."

There are many written forms that veterinary practices use in providing high-quality veterinary care. Some practices ask all new clients to complete an intake form, which may include contact information, pertinent health information about the animal brought in for care, and other relevant information. In addition, if clients are

bringing in their animal for surgery or other treatment that requires informed consent, oftentimes a written consent form is read, reviewed, and signed. Providing options to clients for assistance in completion of these forms is advisable given the uncertainty about literacy levels and comfort in revealing literacy deficits:

"Our technician, Carla, is available to assist you in completing this intake form."

"This consent form is a written explanation of how we are going to treat Jasper's ___ (condition). It includes details about the treatment and its possible problems and benefits. So, it is very important for you to have a clear understanding of everything on this form before it is signed to ensure that you and I both have the same understanding. Can we go over this together?"

CAUTIONS

- Providing effective health education to clients includes awareness and sensitivity to their diverse literacy needs and preferences.
- Client literacy needs and preferences are not often revealed to the veterinarian.
- Veterinarians can create an atmosphere where the client's needs and preferences will more likely be acknowledged, supported, and addressed with multiple educational delivery strategies.
- Regardless of the client's literacy capacity, it is recommended that instructions be conveyed in the simplest form possible, using nontechnical language.
- Effective health education requires time, commitment, and effective communication skills on the part of the veterinarian and healthcare team.

5.6. SHARED DECISION-MAKING

BASICS

OVERVIEW

- Shared decision-making involves a process of interaction with clients who wish to be involved with their veterinarians in screening, evaluation, or treatment decisions.
- Given the complexities of veterinary care and the progress in medical technology, it is not unusual for clients to experience difficulty making decisions about healthcare for their animal. This difficulty is referred to as "decisional conflict."[1]
- There are communication strategies and techniques that the veterinarian can use to facilitate this component of the interaction and assist clients who are in decisional conflict.
- The goal of the effective interaction with clients who are in decisional conflict is not to persuade but rather to encourage shared discourse and deliberation about the decision at hand by helping the client to:
  - comprehend relevant clinical information about their animal,
  - clarify and communicate his or her own personal values,
  - engage with the veterinarian in arriving at a decision that is consistent with the client's personal values and preferences.
- Decisional conflict may occur in the following situations:
  - When an option can lead to risky, uncertain outcome (e.g., extensive and specialized surgery).
  - When a value judgment is inherent in the decision (e.g., agreeing to costly and time-consuming treatment for an animal).
  - When there is anticipated regret (e.g., euthanasia decision).
- Clients will manifest the decisional conflict in a number of ways including:
  - talking excessively about uncertainty and concern about potential outcomes,
  - wavering between options, resulting in delay in making the decision,
  - demonstrating signs and symptoms of distress such as tension or panic,
  - failing to come in for scheduled appointment to discuss the decision.
- The likelihood of treatment-related decisional conflict rests partly on whether the treatment under consideration falls into one of the three following categories:
  - **Standard of care:** This is where there is strong evidence for the effectiveness of the treatment and strong agreement among clients that these are valued interventions (e.g., insulin for type 1 diabetes, antibiotics for ear infection, etc.).
  - **Guidelines:** This is where there is strong evidence for the effectiveness but less agreement among clients about the value of the possible outcome. (e.g., Lyme disease vaccine, etc.).
  - **Options:** Both the evidence about the effectiveness in terms of achieving or avoiding particular outcomes in unclear and the agreement on values is highly variable. (e.g., experimental treatment for canine lymphoma, etc.).
- As a consequence, different treatment or screening decisions tend to fall at different points on an "uncertainty continuum." Those situations in which there is inherently more uncertainty are more likely to generate decisional conflict in clients.
- In addition to the inherent difficulties of the situation, there may be client factors that can create or generate additional decisional conflict:
  - Lack of knowledge or unrealistic expectations about the treatment and potential outcomes.
  - Inaccurate assumptions about what others have done in similar situations.
  - Lack of support or pressure from others to decide in one way over another.
  - Lack of self-confidence or ability to engage in the decision.
  - Lack of resources (e.g., financial, time at home for after care, etc.) needed to put the decided action in place.
- There are communication techniques or skills related to decision support that the veterinarian can engage in to assist the client who are experiencing decisional conflict.
  - Assess client's decision needs.
  - Provide individualized decision support.
  - Evaluate the effectiveness of the support.

TERMS DEFINED

Decisional Conflict: An experience whereby a client has ambivalent thoughts and feelings, which tend to both accept and reject a given course of action.[2]

Decisional Support: Skills and behaviors of the veterinarian to assist clients who are in decisional conflict.

Goals of Care: Discussions about goals of care are often framed when considering a veterinary treatment. For some clients, the primary goals may not necessarily be focused on medical issues and instead on personal goals such as how they want their pet to live or if they are enjoying life as fully as they can considering their health status. When client's goals of care are identified, this allows for a more intentional discussion for considering treatment options that can meet the needs which are most important to the client in making healthcare decisions for their pet.

Shared Decision-Making: Shared decision-making addresses the ethical need to fully inform clients about the risks and benefits of treatments, as well as the need to ensure that clients' values and preferences play a prominent role.[3]

ISSUES AND OPTIONS

When decision-making is indicated, there are multiple opinions that can contribute valuable data to inform the decision. This occurs through shared decision-making involving the following three elements:[2]

- **The veterinary medicine evidence:** During each step of the decision process, clients rely on their veterinarians to communicate information based on the most up-to-date veterinary research evidence.
- **The veterinarian's expertise:** The clinical experience and training offered by the veterinarian certainly informs the decision-making, which is amplified by the level of trust, rapport, and confidence the client has in the veterinarian.
- **The client's goals and concerns:** Veterinarians rely on clients to share their own experiences, goals and concerns so that together they can reach a "shared mind" about the course of action

Many advocacy groups and consumer health organizations encourage consumers to initiate the process with their clinicians by asking a few key questions such as:[4]

- *What are my options for my pet's care?*
- *What are the possible benefits and harms of those options?*
- *How likely are each of those benefits and harms to happen to my pet? Including "What will happen if I do nothing?"*

When clients come into the visit with such questions, this naturally carries the conversation through important elements of the shared decision-making process. Yet, **shared decision-making requires veterinarians to be prepared to guide the conversation using understandable language, eliciting the clients' feelings, thoughts and preferences and checking for understanding.**

GOALS OF CARE

Initiating a discussion about the client's goals for care for their animal is beneficial for you as the veterinarian and for the client. The client may not have considered this more general question about "goals of care" when their pet is newly diagnosed or experiencing a change in

their health condition requiring a treatment decision. In addition, **knowing what is important to the client specific to goals of care helps the veterinarian and the care team to validate and support the client** in realizing those goals as decisions are made together.

Discussions about goals of care are often framed when considering or reevaluating a veterinary treatment. For some clients, the primary goals may not necessarily be focused on medical issues and instead on personal goals such as how they want to live with their pet. When the client has an accurate understanding of their pet's health condition, he or she may be ready to have a conversation about options for treatment. It is important to start by **first identifying the client's goals of care prior to making any recommendations or presenting the options** for treatment. When client's goals of care are identified, this allows for an intentional discussion about treatment options that can meet the needs that are most important to the patient.

Useful phrases include:[5]

"Given what you know about Oscar's illness, what's most important to you?"

"As you think about Oscar's future health, what concerns you?"

In addition, it can be useful to ask the client to consider situations that would be perceived as unacceptable. It might sound like this:[4]

"As you think about the future, are there situations or things that you want to make sure we avoid?"

It is equally important to reflect and summarize what you have heard to the client. This will serve to assure that you have heard accurately and provide the client with the opportunity to correct or clarify. For example[5]

"It sounds like quality of life for Oscar is the most important issue for you right now. Did I get that right?"

"I understand that you want to make sure to avoid the following things …."

Keep in mind that it may require more than one conversation to clarify goals of care, so the client has time to reflect and perhaps talk with family or those closest to him or her. In addition, goals of care may change over time depending on the health condition, progression, and client preferences through the pet's illness trajectory; checking in with the client to revisit is recommended to clarify treatment options.

EXAMPLES

"Now that we've gone over the extent of Zack's injuries, I'm wondering if you'd like to discuss the options we have?"

In this example, the veterinarian focuses on the client's readiness to engage in further discussion.

Client: *"It just seems so serious. I just don't know if there's anything that you can do other than put him to sleep? I hate the thought of watching him continue to be in such pain."*

Veterinarian: *"I understand. You and Zack have been through so much these last couple of days. It's been extremely hard to watch him suffer. We can certainly talk about the option of euthanasia which would be a humane and compassionate decision at this point."*

In this example, the topic of euthanasia is introduced by the client with the veterinarian providing assurance through the use of reflective listening and empathy that the client's suggestions are accepted without judgment.

5.7. POSING CLIENT QUESTIONS EFFECTIVELY: OPEN-ENDED INQUIRY

BASICS

OVERVIEW

How can we increase a client's perception and understanding of our medical expertise and services during a typical hectic day? The answer lies in understanding the needs of the client and their pet. Let us examine for a minute why we purchase a product, program, or service. Would you buy season tickets to the symphony if you did not enjoy or understand music? It is not likely. Would you invest in a trip around the world where each night was a fascinating new place if you loved to fish in a quiet mountain stream? That, too, would be unlikely. Clients, just like each of us, do things for their reasons – not ours. The challenge lies in gaining a shared vision of the pet's health with clients. The skill that opens this vision to the veterinarian is the ability to use questions.

TERMS DEFINED

Closed-Ended Question: Questions that have a restricted range of answers.

Nonverbal Communication: Aspects of communication, such as gestures and facial expressions or body postures that do not involve verbal communication; this may include aspects of speech (accent, tone of voice, speed of speaking, etc.).

Open-Ended Question: A question that cannot be answered with a yes or no but requires a developed answer. These questions help identify opinions, attitudes, and beliefs.

ISSUES AND OPTIONS

To determine your client's needs and wants, ask questions. How does your client care for their pet? What activities do they do together? What is the pet's lifestyle: indoor, outdoor, hunting, or community service? Questions can assist and guide the owner to see and understand the medical concerns. Through understanding the medical concerns, the client can better value the comfort and quality added to their pet's life delivered by the treatment. By asking questions and listening to the client, a team earns the client's trust and commitment. Then the visit and the treatment become "the client's idea" and vision for a healthy pet, and the team is the partner that assists them.

There are two types of questions that help us gain trust and valuable information, so we may know our client's expectations and encourage compliance: open-ended and closed.

OPEN-ENDED QUESTIONS

The question process is like a funnel. The beginning of the process is very open and broad. It is here that we use questions beginning with How? What? Where? These are called open-ended questions. They are designed to identify the client's perspective: Ideas and beliefs, concerns and feelings, expectations, the effect on life, and the relationship of the pet and owner.

Let us look at examples of open-ended questions about dentistry for Marty (the cat) and Ms. Vickers (his owner). They progress from general to more specific.

"What concerns you about Marty today?"

"How would you describe Marty's chewing and general grooming?"

"What changes have you noticed to Marty's movie-star smile?"

"How are you currently caring for Marty's teeth?" or "Tell me how you care for Marty's teeth."

From asking open-ended questions you tap a client's insights into the health of their pet. This allows the veterinarian to see gaps in the client's understanding of a disease process, such as dental disease, and the pet's current health status. Or stated another way, where does the client see their pet's health versus where do you, the veterinarian, see the pet's health? By carefully listening to our clients we can give them information and ask questions that close gaps in healthcare understanding (see Figure 5-7-1).

Questions, and gaining concerns early in the exam, saves time and builds engagement. One study found that the chance of a concern surfacing during the end of an appointment were four times as great when the appointment did not begin with a veterinarian asking for issues and concerns at the start.[1] Additionally, agreement of client and physician on the nature of the problem will improve the chances of a satisfactory result.2

CLOSED-ENDED QUESTIONS

How do we close these gaps? There are closed-ended questions. These are yes or no questions that determine facts and specific information. They can also direct or limit a conversation. Here are some examples of closed questions on dentistry for Marty and Ms. Vickers:

"Have you noticed the brown discoloration on Marty's teeth?"

"Does Marty sleep with you? Does he have a different odor?"

"There is a chatter of pain when I touch this tooth. Have you seen this while he is eating?"

"Has anyone ever talked with you about cleaning Marty's teeth?"

5.7. POSING CLIENT QUESTIONS EFFECTIVELY: OPEN-ENDED INQUIRY

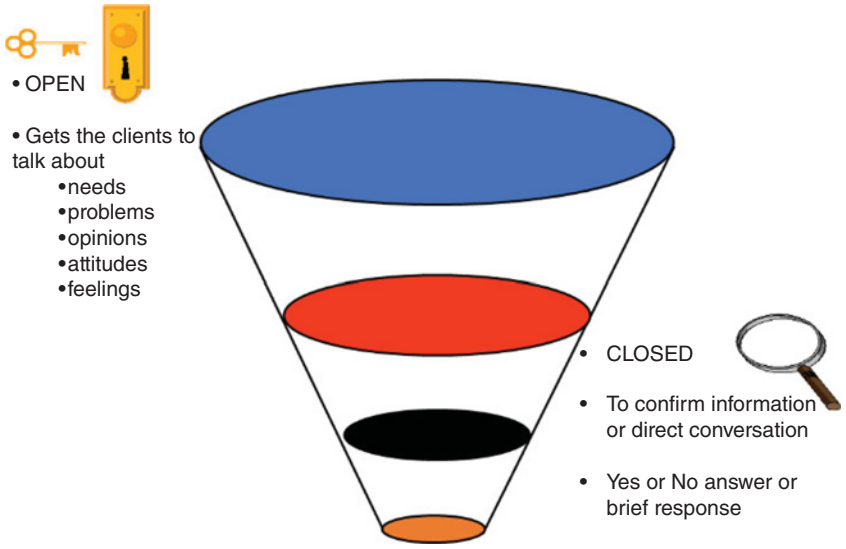

Figure 5-7-1.

Questioning funnel.

Closed-ended questions following open-ended questions allow the owner to track with the doctor step by step through the disease process. Some short explanations with the questions are helpful; however, explanations are best understood if accompanied by a visual (such as a cat dental model or a picture of the cat's mouth before and after cleaning). The goal is a shared understanding of the disease with the client as well as a shared vision of their pet disease-free if treated. How much should the veterinarian be talking versus the pet owner? The rule of thumb is that 70% of the time the client is talking and sharing. The remaining 30% of time is yours to question, explain, and reinforce the healthcare vision and strengthen the client trust.

POSING CLIENT QUESTIONS EFFECTIVELY AS A TEAM

As the team asks questions and collects data to assist in the development of a diagnosis, it is important to step back for a moment and review the information that the client has already supplied. People do not feel heard if they have to tell the same story several times. Build on what they have already provided. Before entering the exam room, take a minute to review the electronic medical record, note the client's concerns as well as your top-three items to investigate.

Before you ask the first question, take a moment to set the stage and establish rapport with the client. Introduce yourself, welcome the client, and greet the patient. Transition to the questioning funnel by indicating you have reviewed the patient's chart. For example, "I understand that you are here today because Fluffy has been vomiting. Please tell me more about when this started and what you are seeing and hearing with Fluffy's illness."

EFFECTIVE QUESTIONING AND LISTENING

When the client responds to your questions, it is critical that you listen to their words and to their nonverbal cues. Effective listening is an active process. The goal is to "listen for understanding." The process is crucial for building the relationship that will grow the client's confidence to trust and follow your recommendations for their pet.

When you listen for understanding rather than listening reactively, you will gain a greater understanding of the client's needs. Your active listening may encourage the client to "open up" and provide more complete information. Also, your willingness to take the time to listen and respond often results in improved client listening and ultimately in compliance.

5.7. Posing Client Questions Effectively: Open-Ended Inquiry

What does empathetic listening look like in the questioning process? The listener is focused on the words, inflection, facial expressions and body postures of the client. The listener gives verbal and nonverbal feedback to communicate understanding, clarify information, or to encourage the client to continue.

Effective listening is challenging (see 5.8 – Reflective Listening). There are many pitfalls poised to push you off track. Examples of obstacles to effective listening include the following:

- Distractions from thoughts outside the exam room. To listen effectively and completely, you must put aside the other business of the day and focus on the here and now.
- Preparing your response while the client is still talking. If you are busy formulating your answer or follow-up while the client is still talking, you are not fully listening.
- Preconceived judgments of the client.
- Noise and activity: Acknowledge the disturbance and, if possible, isolate your conversation from the commotion and invite the client to continue.

EXAMPLES

Mr. and Mrs. Jones are a recently married couple who live in a retirement community with their 18-year-old domestic shorthair (American shorthair), Samantha. Samantha has been a constant companion to Mr. Jones and has been an indoor/outdoor cat all her life. Over the years, Mr. Jones has generally been a good pet parent to Samantha, although he has often declined or missed vaccination appointments.

Today, Mrs. Jones and Samantha are in your hospital for a checkup. Samantha has been eating well, but she seems to be losing weight. The technician has just completed her history with Mrs. Jones. Samantha is now due for vaccinations, a fecal, and a deworming. Samantha has never been on heartworm preventative and has terrible teeth and an easily discerned heart murmur.

We started with open questions designed to get opinions, attitudes, and beliefs about the needs of the pet and the owners.

"I see that Samantha has lost weight since her last check up. Tell me about her eating habits. Have you noticed any changes?"

"Tell me about Samantha's activity level?"

"What concerns you the most about Samantha's changes?"

When the client was asked her concerns about Samantha she produced the weekend paper with a feature article on hyperthyroidism in cats. She feels Samantha has all the signs that are listed in the paper.

At this point it is simple to talk about your shared concerns and your appreciation of her taking action to assist her pet. You also know from her answer that the knowledge gap has been greatly decreased by her exposure to the article and the question she has asked. If Samantha's physical exam proves a positive confirmation of all of the symptoms described by Mrs. Jones, an appropriate laboratory profile with thyroid panel will be an accepted recommendation and need. Mrs. Jones will have felt heard and respected and Samantha will get the diagnosis and help she needs.

Open questions unlock the clients mind to see the pet's symptom and how your plan will create a positive change or clear diagnosis. They also break the diagnostic and therapeutic part of the visit into chunks the client can comprehend and take action toward.

CAUTIONS

Effective questioning is a skill and an art that solidifies and builds client relationships. Be aware of opportunities to build and improve this critical diagnostic tool in your exam room process.

5.8. Reflective Listening

BASICS

OVERVIEW

Elliot Mishler,[1] a sociolinguist who studied physician–patient communication, described two distinct voices in the clinical encounter: the voice of the clinician and the voice of the patient. These distinct voices are also found in the veterinarian–client interaction.

- The veterinarian voice is that of a professional who has unique expertise in pathophysiology and treatment modalities related to animal care – the "find it and fix it" voice (see 5.3 – Speaking as a Professional).
- The client voice is a voice that reflects their unique expertise with their animal based upon experience and continuous observation.
- In the clinical encounter, both voices are valid, and both need to be heard.
- The two distinct voices may approach the same situation differently:
  - The client wants to tell a story, a narrative. This is the voice of personal experience. It is related to the personal meaning of the animal's clinical signs or presenting problems. Consequently, this voice responds to open-ended questions or inquiry (see 5.7 – Posing Client Questions Effectively: Open-Ended Inquiry). In part, this voice reflects the human–animal bond (see 1.19 – Importance of the Human–Animal Bond).
  - The voice of the veterinarian is the voice of the professional. Typically, this voice is interested in obtaining a history of the situation as quickly as possible. In order to do so, it tends to focus on close-ended questions to get the facts of the situation. The goal is the development of an accurate differential diagnosis so that an appropriate care plan can be recommended.
- These voices must function in harmony. The veterinarian can help to bring these two voices into harmony by using at least two basic communication techniques:
  - Open-ended inquiry (see 5.7 – Posing Client Questions Effectively: Open-Ended Inquiry)
  - Reflective listening.

TERMS DEFINED

Open-Ended Inquiry: Asking questions that allow for a spontaneous, unstructured response. For instance: "Tell me what brings you in today" or "What are your concerns?"

Reflective Listening: Communication technique whereby the veterinarian demonstrates to the client that his or her interests and concerns have been heard. It focuses completely on what the client is saying and confirms understanding of the message content and the underlying emotions to ensure an accurate understanding.

ISSUES AND OPTIONS

The veterinarian–client interview can be thought of as funnel-shaped.[2] The veterinarian begins at the widest mouth of the funnel and invites the client to tell the story in the client's own words, inviting the narrative of the reason for the client's visit and what concerns there are. Listening to the voice of the client, the veterinarian hears the personal experience of the bond that exists between client and animal.

BEGIN WITH INQUIRY

Most clinicians communicate in ways that produce simple one-word or limited responses from clients which provide limited diagnostic value or insight into the client perspective. While closed-ended communication is viewed as a time saver, it reduces clarity and discourages clients from sharing information that may be valuable. It also fails to encourage relationship building and trust.

In contrast, open-ended questions invite the client to provide detail and to clarify, add or elaborate on or describe feelings, concerns, symptoms, impact, and attitudes. They convey to the client that the veterinarian is willing to listen and value what they have to offer to establish a two-way interaction.

Most clinicians have been traditionally trained to use closed-ended questions, which can limit the information that may be needed to understand a client's perspective or experience. Open-ended questions invite a narrative and send a message to the client that their perspective is valued and important to the conversation. In the context of veterinary clinical care, eliciting perspective and inviting the client to share their concerns and challenges is vital.

A guiding point is to learn to ask more than tell, so begin with an attitude of discovery and curiosity. Let us look at some ways to start the discussion by asking some questions that invite the client to provide important information.

- Framing questions in an open-ended manner invites the client to respond with more than "yes" or "no," providing a more useful description of his or her perspective. Open-ended questions beginning with "what," "how," or "tell me" are particularly useful to gain essential insights.
- As the veterinarian listens, he or she must notice what values and priorities are being voiced. Listening and learning also means being alert to body language and letting the person talk until finished. It is important not to interrupt unless it is to acknowledge what is said (see 5.7 – Posing Client Questions Effectively: Open-Ended Inquiry). The goal is to understand the experience of the client and the meaning that the client attributes to that experience.

5.8. Reflective Listening

• There are two concerns that many veterinarians share when using open-ended inquiry. The first is that they will miss something if they do not use the traditional closed-ended inquiry protocols. The second is that the client will ramble. Neither concern is justified. Inquiry protocols using the closed-ended inquiry can still be used to fill in the blanks after the client has told their story. It is only the rare client who rambles incessantly.
• When the narrative is complete, the veterinarian can then ask specific close-ended questions that are more narrow and focused on specific information that they pick up during the narrative. This is the narrow part of the funnel-shaped interview.
• Open-ended and close-ended questions both have merit. Open-ended questions encourage patients to provide essential narrative information and closed-ended questions elicit further details to fill in any informational gaps.
• Reflective listening is a valuable skill for responding to the client's experience. The veterinarian tries to clarify and restate what the client is saying. The client not only hears what he or she said, but also hears it through the reflecting statements of the veterinarian. In response to the veterinarian's reflections, the client knows they have been heard. Furthermore, the client can confirm the accuracy of the reflections and elaborate on the story with additional information.
• Reflective listening is essential in all communication in which we are trying to understand another person. We can move beyond this understanding of the situation that the client experiences and move into an appreciation of what the experience was like for the client.
• Reflecting back means that the veterinarian acknowledges that he or she has heard and understood the client. It demonstrates deep listening and provides an opportunity for the client to continue with more information and/or to clarify what he or she is saying.
• Although reflective listening has its roots in the field of counseling and psychotherapy, this is not to suggest that the veterinarian should become a therapist. Rather, this one therapeutic skill can be very useful in many everyday practice situations.
• To listen reflectively, one has to first think reflectively. Be curious, wonder, explore. Drop assumptions and seek to clarify and understand.

REFLECTIVE LISTENING SKILLS

There are several ways to use reflective listening with clients.
• **Prompting or cueing:** This includes telling the client that you want them to continue speaking, to provide you with more information. This can be done with words (verbal prompts) or without words (nonverbal prompts).
  ◦ Verbal prompts: The use of such phrases such as "Really?" "Go on," "Like what?" "Can you tell me more?" and "That's interesting." The purpose is to keep the client engaged and involved in providing necessary information regarding their animal and the caretaking involved. The words used in a verbal prompt and the tone should be congruent, reflective of a genuine desire to hear the client's story.
  ◦ Nonverbal prompts: These can be tremendously motivating and especially useful to a client to elicit important information and facilitate rapport (see 5. – Nonverbal Communication). They can include a smile, raised eyebrow, head nod, body tilted toward the client, an appropriate laugh, and/or a facial expression that matches the message of the client, such as concern.
• **Repetition:** Repeating what the client has said, oftentimes in his or her own words can be useful. For example: Client: "Rusty is acting very different." Veterinarian: "Different?"
• **Short Summaries:** It can work to provide short mini-summaries of what you have heard and understood the client to be saying. For example: Client: "I got a little nervous when my young niece was visiting and Mollie growled a few times." Veterinarian: "So, you're concerned about Mollie's behavior around children."
• **Explore unspoken meaning:** This is a way of using reflective listening that requires practice. Attempt to reflect the deeper meaning of what the client is trying to convey. For example, in the previous example of the client who shared the concern about the dog's behavior around children, the veterinarian could say, "So, when Mollie growled at your niece, you really got scared, especially now that you are expecting your own child."

5.8. Reflective Listening

EXAMPLES

EXAMPLE 1: PROMPTING OR CUEING

The use of verbal and nonverbal prompts indicates that the veterinarian is attentive and interested in what the client is saying. This can be accomplished with minimal use of words or no words at all. What may seem like a simple communication technique is actually a powerful engagement tool that affirms the value of the client's communication. For example:

Client: *"I really have been so worried about Jasper."*

Veterinarian: *"Really?"*

Client: *"I don't think getting this kitten was a good idea."*

Veterinarian: *"Hmm, I see. How so?"*

Client: *"Peanut really hasn't been herself lately."*

Veterinarian: *"Tell me more."*

In each of these examples, the veterinarian sends a signal (verbal and nonverbal) to the client that he or she is interested and wants the client to continue.

EXAMPLE 2: REPETITION

Another way of demonstrating reflective listening is to repeat the words that the client has used. Often, the veterinarian can repeat the words while raising his or her voice tone at the end of the statement, turning it into a question form.

Client: *"He is just not eating."*

Veterinarian: *"Not eating?"*

Client: *"She threw up twice last night."*

Veterinarian: *"Threw up twice?"*

EXAMPLE 3: SUMMARIZE

The third form of reflective listening provides a short summary of what the client said. This may include a change in the words that the client uses so the veterinarian is sure that she or he truly understands what is being said:

Client: *"In the last few days, Zack seems to be eating less, and I'm also not sure if he is as active."*

Veterinarian: *"So you've noticed some changes in Zack, particularly in his eating habits lately."*

Client: *"I'm not sure if I can work this into my budget right now."*

Veterinarian: *"It sounds like you are interested in talking about the costs of this surgery."*

In each of these examples, the veterinarian reports to the client, in their own words, a summation of what they heard from the client. The client then has the opportunity to confirm to the veterinarian that the summary is accurate, provide further information, or refine to more accurately reflect the intended message.

EXAMPLE 4: TESTING A HYPOTHESIS

In the fourth kind of reflective listening, the veterinarian is testing a hypothesis. This means that he or she is reflecting back something that the client may not have said outright, but something that the veterinarian suspects the client may be thinking or feeling:

Client: *"The last time I had a cat who threw up was with Snowball, who died from cancer."*

Veterinarian: *"Given your recent experience with Snowball, I'm wondering if that's what you're worried about with Friskie?"*

Client: *"I can't imagine having to give Tiny three different pills four times a day, and work and take care of my kids too."*

Veterinarian: *"It sounds to me like you're feeling very overwhelmed right now."*

Client: *"I don't remember being told that the lab work was not included in the cost of the surgery."*

Veterinarian: *"It sounds like you're angry about what happened."*

In each of these examples, the veterinarian makes his or her wondering transparent, which then allows the client to confirm, modify, or reject the hypothesis.

5.8. Reflective Listening

CAUTIONS

- Reflective listening is a core communication skill that belongs with every client interaction and through every veterinary encounter.
- Veterinarians bypass many opportunities to demonstrate reflective listening with clients. This is often because they hear the first couple of cues from a client of what might be wrong with the animal; they quickly adapt to the role of technical expert and move into the diagnostic and treatment mode.

5.9. NONVERBAL COMMUNICATION

BASICS

OVERVIEW

It has been estimated that as much as 80% of all communication between individuals is nonverbal and is generally involuntary.[1] Twenty percent is verbal and voluntary, and represents only a small proportion over which we have conscious control.

Any problems a client is having with their animal's care will be signaled in the nonverbal channel. Similarly, any problems the veterinarian is having with the client will be signaled nonverbally as well.[1] It is important to be aware of nonverbal clues manifested by the client, which may indicate confusion, anxiety, or other emotions. These clues may be apparent in client facial expressions, shifts in eye contact, or overt body mannerisms. The veterinarian's own nonverbal cues, including eye contact, posture, tone, and volume of voice, can enhance or inhibit the interaction with their clients. General categories of nonverbal communication are:

- Kinesics
- Proxemics
- Paralanguage
- Autonomic shifts.

One of the goals in working with clients and patients is to help them feel safe, trusting, and confident of the veterinary care being provided for their animal. This requires careful attention to the verbal and nonverbal messages that are sent to and received from the client.

TERMS DEFINED[1]

Autonomic Shifts: Physiological manifestations that reflect individual response, emotion, and reaction (for example, flushing, blanching, tearing, sweating, piloerection, changes in breathing and pupil size, swallowing, and dry mouth).
Kinesics: Individual communication through facial expressions, body tension, gestures, use of touch, body position, posture, and angulation.
Nonverbal Communication: Behaviors, mostly involuntary, that indicate how a particular interaction is proceeding, within context.
Paralanguage: Range of voice tone, rhythm, volume of speech, degree of emphasis, and rate of speech.
Proxemics: Spatial relationships or distance between individuals when communicating, including barriers that may inhibit the communication process.
Shaping Space: Arranging the physical space and nonverbal content of the veterinary encounter for enhancing the quality of care for the client and patient.

ISSUES AND OPTIONS

- A basic human need is to feel safe. This translates into veterinary care through the client's need for safety in the veterinary interaction to expose real concerns, fears, and vulnerabilities related to the care of the animal.
- Nonverbal communication is often the primary mode that clients use to communicate their feelings. Observing clients in the four nonverbal categories, the veterinarian can quickly read overall patterns of behavior to determine the degree to which the client feels safe.
- A client who feels safe often will present with their body engaged, relaxed, and usually in an open stance. There is more variety to both the gestures and the voice, as the sense of safety gives rise to freer expression.
- A client who feels unsafe will present with a defensive, rigid posture of disengagement and withdrawal. Specific manifestations often include forward stance, jutting jaw, clenched fists, squinting, tense mouth, facial flushing, flared nostrils, increased voice volume, deeper breathing, crossed arms and legs, averting eyes, or turning the head away.
- There are specific skills and techniques that the veterinarian can employ to enhance the quality of the nonverbal interaction with their clients:
  - **Improving sensory acuity:** Appreciation of the importance of nonverbal communication will increase attentiveness and perceptibility to self and clients' nonverbal messages.
  - **Addressing mixed messages:** Inconsistencies between verbal and nonverbal communication sent to the client can serve as obstacles to the promotion of trust, credibility, client adherence, and patient outcomes, and increase client uncertainty and anxiety.
  - **Shaping the space of the encounter:** The arrangement of spatial relationships in the office environment frequently reflects one's views about interpersonal relationships in the form of client–veterinarian proximity, vertical height differences (such as standing, leaning against the examination table, sitting with the client, or sitting on the floor with the animal), presence of physical barriers (such as charts, exam tables, computers), and angles of facing one another (full face, shoulder-to-shoulder, angles in between).

EXAMPLES

EXAMPLE 1: ADDRESSING MIXED MESSAGES

A mixed message on the part of the client may indicate his or her fear in communicating honestly with the veterinarian, especially in instances of disagreement with diagnostic and/or treatment recommendations. In instances of incongruency, the nonverbal message more accurately reflects the person's feelings and will predict his or her behavior in response to the situation at hand. A nonverbal "no" message from a client may be observed through his or her furrowed brow, slight shaking of the head, a strained voice, breath holding, slightly increased pallor of the face, or tensing of the muscles. This nonverbal "no" message, even if the client has agreed verbally, indicates that the veterinarian's communication responsibility is not finished. If mixed messages are left unaddressed, client adherence to treatment recommendations will be either inconsistent or diminished.

The first step is to take notice. Noticing helps the veterinarian be even more respectful of what clients may be experiencing in the care of their animals. Further, it can guide the veterinarian in providing empathy and enlistment of the client as a partner in the care of the animal. The two strategies described here are actually verbal.

Acknowledge the Discrepancy

> *"Mr. Jones, although you say you agree with the recommendation about starting the medication to control Simon's diabetes, I sense you have some hesitation, which is not at all uncommon."*

In this example, the veterinarian provides Mr. Jones with an open invitation to speak about his concern. If, instead, Mr. Jones nonverbally withdraws or turns away, the next strategy may be more useful.

Use the Language of the Third Person[2]

This avoids direct reflection to the client through linguistic distancing, to increase the feeling of safety or "saving face."

> *"I had someone in the office earlier in a similar situation to yours who was also concerned about starting this kind of medication. They found it helpful to discuss their hesitation."*

Here the veterinarian observes the client closely to see if the nonverbal parameters of agreement are present, such as head nodding, deeper breathing, return of facial color, or muscle relaxation. Most clients

would feel a definite strong invitation to bring up their concerns at this point.

EXAMPLE 2: SHAPING THE SPACE OF THE ENCOUNTER

Veterinary practices are constantly sending communication messages, through the arrangement of physical space, about their quality of care, including the degree to which it is client-centered. In addition, the nonverbal and verbal messages sent by the veterinarian and the healthcare team can reinforce, negate, or enhance the client-centered message of the practice. There are five important components to keep in mind:

- **Setting the stage:** This relates to messages in the practice environment that invite, welcome, and are sensitive to the client. (For example, providing an alternative exit through the back or side door following euthanasia to avoid the waiting room and maintain privacy.)
- **Vertical height difference:** At the start of an encounter, many clients are already feeling vulnerable and at a disadvantage relative to the veterinarian. This feeling can be reduced by being willing to be at the same level or below the client whenever possible. For example, make use of seating for veterinarian and client(s) during distressful or difficult conversations.
- **Interpersonal (or horizontal) distance:** If the veterinarian is too close during an interview, the client will feel that his or her space has been encroached upon. In that case, he or she is likely to behave in ways intended to restore the proper distance, such as looking or turning away, crossing arms and legs to put up a "frontal barrier," or flushing. Being too far away, on the other hand, discourages true engagement and may convey a sense of disinterest to the client. However, cultural preferences should be considered as well.
- **Physical barriers:** These can be crossed arms and legs, a desk, a chart, an exam table, a cage or crate, computer monitor in examination room, restraints/retainers, or the animal itself. (For example, place a computer monitor in a location that does not obstruct eye contact with client.)
- **Angles of facing:** When veterinarian and client disagree and are facing directly opposite each other, their physical position can cause them to experience the difference as more of a confrontation than is actually intended. A verbal cue in this instance is the client saying "Yes, but …." Once the veterinarian is aware that such a situation exists, he or she can begin to defuse it by slowly changing the angles at which they are facing. Just a slight angulation can begin to ease the tension. If the veterinarian moves even further into a side-by-side position with the client, the configuration will more clearly support a collaborative effort between them in spite of the disagreement. The animal's position in between the two humans during the encounter can modulate this experience. Its presence will diminish the confrontative aspect by serving as a barrier to the direct, frontal experience of another person. In addition, if both humans are touching the animal, there is another message sent of connection and "touching" between the persons through the medium of the animal.

CAUTIONS

- It is important to read the overall pattern of nonverbal responses rather than to rely on any one sign. Clients will sometimes cross their arms and legs because it is cold, or because there are no arms to the chair, or as a convention of etiquette, yet their body may be relaxed and engaged and their voice melodious, indicating an overall sense of safety in the encounter.
- Nonverbal behavior varies from culture to culture; however, there are two basic distinctions that are important to keep in mind, particularly as a helping professional:
  - Cultural differences are often expressed through varieties of gestures, eye gaze, interpersonal distance, and touch.
  - Issues of safety tend to be cross-cultural and are expressed through body tension, autonomic responses, and universal facial expressions of joy, anger, fear, grief, surprise, and disgust.[3]

5.10. EMPATHY

BASICS

OVERVIEW

Although empathy might be considered a right brain activity, it is far from being a touchy-feely topic. At its core, empathy is the oil that keeps relationships running smoothly. The fact that empathy is an important component of effective relationships has been well documented. Medical patients who had damage to part of the brain associated with empathy showed significant deficits in relationship skills, even though their reasoning and learning abilities remained intact.[1]

As in human healthcare, in the veterinary sphere the doctor–client relationship is central to the practice of excellent veterinary patient care and is essential for the delivery of high-quality healthcare and the diagnosis and treatment of disease.

Most of us have a concept of what constitutes a "caring" veterinarian (and his or her practice team) who has an empathetic and gentle bedside manner somewhat akin to the characters of James Herriot and his staff. Did this type of veterinarian ever really exist except in fantasy, and if they did, could they function now in this much more modern and totally different society?

More important: How important is this type of veterinarian and this model of veterinary communication to the modern client? Many veterinarians (and staff) are now accused of having no or little (apparent) empathy and concern for the patient (or for the client). The "old family doctor" analogy is considered one of a bygone era.

Consider the following questions:

- Does building empathy and rapport with the client really matter to the modern client?
- Is this an innate skill or a learned one?
- If it is a learned skill, then why is there not more emphasis placed on this skill at a veterinary student level or at a new-hire level?
- Does not showing empathy affect practice profitability?
- Does not showing empathy affect patient outcomes (does better rapport lead the client to choose a different level of care for their pet)?
- Does lack of empathy create a situation where a practitioner is more likely to have a (legal) complaint raised against them?
- Can a less empathetic veterinarian be overridden by overtly highly caring nonveterinary staff?

TERMS DEFINED

Empathy: The ability to understand and share the feelings of another.
Sympathy: Feelings of sorrow for someone else's misfortune.

ISSUES AND OPTIONS

Empathy forms an important fundamental component of what is commonly called bedside manner, and it is critically important in client communication and satisfaction.

A good bedside manner is typically one that reassures and comforts the client while remaining honest about the various diagnosis and treatment options. Vocal tones, body language, openness, presence, and concealment of attitude are all part of bedside manner. Poor bedside manner leaves the client feeling unsatisfied, worried, frightened or alone. Bedside manner becomes difficult when a veterinarian must explain an unfavorable diagnosis while keeping the client from being alarmed. Since between 60% and 90% of all communication is nonverbal, everyone's communication will be improved when they learn body language communication skills (see 5.9 – Nonverbal Communication). This one simple skill set can significantly improve someone's perceived empathy.

The terms "empathy" and "bedside manner" will be used (to some degree) interchangeably here. Sympathy is a related term in which a hardship is acknowledged and supported, but does not necessarily have the emotional aspect of putting yourself in someone else's shoes (so to speak).

There have only been a very small number of studies into empathy in the veterinary industry. Because of this, much of what we know about empathy in veterinary medicine has been transposed from allied healthcare industries or comes by implication, insinuation, or cross-contextualization. This may make us wonder whether what we think we know about empathy in the veterinary industry is true and valid.

Is there a difference (to the client) between the importance of a professional approach and professional rapport and an empathetic approach and a good bedside manner? Some veterinarians and some team members are naturally more empathetic, others less so. Yet these are skills that are transferrable and can be learned. There is actually no excuse or reason why every staff member cannot be trained to have at least an acceptable level of skill in this area. Many veterinary colleges now include at least some training on empathy, rapport, and effective communication in their curriculum. Similar training now also occurs in nursing, technician, and receptionist training programs. We also need to consider the following:

- The increasingly fast pace and depersonalization of society has resulted in a fracturing and weakening of personal one-on-one relations in all areas, including business among staff members and between staff members and clients.
- The rapid increase in the importance of social media supports the premise that we are social creatures. Why then do so many veterinary practices ignore the importance of theses soft skills in day-to-day client interactions when simple solutions are available?
- Soft skills are critically important in the healthcare sector, including our relationships with our doctors, dentists, and veterinarians.
- Many consumers believe that they are being treated as a number (i.e., impersonally) by many of the businesses that they frequent (this includes veterinary care).
- Many practitioners believe that a high level of skill is all that clients look (or should look) for in a veterinarian and that empathy and bedside manner do not factor significantly into the client's choice of veterinarian. This is, in fact, wrong, and many clients actually rank empathy and good bedside manner far higher than knowledge, skills, equipment levels, or price when researching or looking for a veterinarian.
- The huge increase of various veterinary practices promoting bedside manner and one-to-one care on the Internet suggests that at least some veterinarians are aware of the importance of empathy and bedside manner in gaining and retaining clients.
- The quality of the doctor–client relationship is important to both parties and the pet patient. The better the relationship in terms of mutual respect, knowledge, trust, shared values, and perspectives on pet care, the better will be the amount and quality and understanding about the pet's disease and the best possible treatment.
- Empathy seems to be a more common and natural trait in older practitioners – substantiating the notion that it is just as much a learned skill as a natural one.
- Considering the importance of empathy/bedside manner, are the veterinary colleges and other training organizations devoting enough time to this topic in the current curriculum?

ABOVE AND BEYOND

From a previous position of total, almost detached professionalism, 25 years and more ago, veterinarians have evolved into the caring and empathetic pet-doctor that the modern client is seeking today. An improved level of empathy on the part of the doctor contributes to:[2]

- Improved veterinary, client, and patient outcomes
- Client adherence

- Patient health
- Client and veterinary satisfaction
- Long-term veterinary–client–patient relationships
- Fewer complaints.

EXAMPLES

Empathy is an emotional and thinking muscle that becomes stronger the more we use it. Try some of these practical tips and suggestions to help you show empathy and watch the reactions of those you work with.

- Listen – truly listen to people. Listen with your ears, eyes and heart. Pay attention to others' body language, to their tone of voice, to the hidden emotions behind what they are saying to you, as well as to the context.
- Don't interrupt people, don't dismiss their concerns offhand, don't rush to give advice, don't change the subject; allow people their moment.
- Tune in to nonverbal communication (body language). Much of communication occurs through body language.
- Practice the "93 percent rule." When communicating about feelings and attitudes, words account for only 7% of the total message that people receive. The other 93% of the message is contained in our tone of voice and body language.[3] It is important, then, to spend some time to understand how we come across when we communicate with others about our feelings and attitudes. It is also important to learn body language skills.
- Use people's names. Also remember the names of people's pet(s), spouse, and children so that you can refer to them by name.
- Be fully present when you are with people. Do not check your email, look at your watch, take phone calls, or interrupt the appointment when an employee comes to talk to you. Put yourself in their shoes. How would you feel if someone did that to you?
- Smile at people.
- Encourage employees, especially the quiet ones, when they speak up in meetings. A simple thing like an attentive nod can boost people's confidence.
- Give genuine recognition and praise. Pay attention to what people are doing and catch them doing the right things. When you give praise, spend a little effort to make your genuine words memorable: "You are an asset to this team because …"; "This was pure genius"; "I would have missed this if you hadn't picked it up."
- Take a personal interest in people. Show people that you care and have genuine curiosity about their lives. Ask them questions about their hobbies, their challenges, their families, and their aspirations.

CAUTIONS

- There is a fine distinction between demonstrating and having empathy for the client and/or the pet and actually getting caught up in the emotion oneself. This latter scenario is all too commonly seen in many healthcare providers, including veterinary staff.
- Some veterinarian and team member care providers find it more stressful than others to deal with their work conditions and feel worn out inside, as if they were burning up from within. This is what is commonly referred to as compassion fatigue or burnout (see 2.8 – Compassion Fatigue and Burnout). It strips people of their vital energy, leaving them feeling empty within their own bodies.
- Because compassion fatigue may not be recognized or managed effectively, many of those affected will leave our industry. With appropriate training and recognition, this attrition is something that could be better managed, ensuring that valued and valuable people are retained within the industry.

5.11. HARNESSING THE POWER OF NEGATIVITY

BASICS

OVERVIEW

• Being told "yes" can make for a less angst-filled immediate life, but long term it can sabotage your chances for success.
• Being told "no" can weaken your self-confidence. Saying no to oneself is even more detrimental.
• The anxiety that no/failure can engender is one of the most potent methods of bringing clarity and focus to your life.
• It is not that we do not have the ability to succeed, it is that we do not believe we can and that stops us.
• "A pessimist sees the difficulty in every opportunity; an optimist sees the opportunity in every difficulty" (Winston Churchill).
• When told no – take a breath, say thank you, be curious, learn, listen, ask, move on. Harness the power of no.

ISSUES AND OPTIONS

THE CHALLENGE OF NO

We are wired to avoid pain, to focus on the positives of life and cajole ourselves into believing that it will all work out. But this is not reality and "no" happens to the best of us often at the worst of times. How we deal with no/failure is an accurate indicator of how we will handle success.
• No is a fear-based statement.
• Why do we say no to ourselves so often? We often doubt our competency or worthiness. We need to not fear no. Conquering no and success are more closely related to confidence than intelligence.
• Being told no and failing helps to build confidence. We need to view no's as challenges and learn to value the growth that comes from failure.
• The person saying no to you who has the greatest impact on you is you.
• "Psychologists have found that over time we usually regret the chances we missed, not the chances we took."[1]
• If you never hear no, you are not testing the boundaries and risking enough.
• No is not the problem. It is how we view the situation and our reaction to the setback.
• No has negative connotations. The immediate response can be disappointment, complacency, and the emotions of shame, envy and anger. Do not try to justify these feelings. Understand them. Look at the big picture.
• No forces us to manage expectations. What we want, what we deserve and what we need are not always what we get. You need to realize you will be OK. The only variable you can control is you.
• People in the early years of their careers may be unaccustomed to being told no. Their lives may have been one success after another and are accustomed to being bathed in the accolades of family and teachers assuring them that they were exceptional and they could have/do anything they wanted.
  ◦ Artificially elevated self-esteem can cause a crash of confidence when no is encountered. Cautiously internalize the praise of others.
  ◦ Be self-confident not arrogant.
  ◦ Fear of no, especially in early salary negotiations, can cost millions over a career. Do not be afraid to ask for what you are worth and what you need. All they can say is no.
• Say no to the effort trap. Do not gauge your worth or productiveness by the level of exhaustion. Prioritize what you say yes and no to. Work smarter not harder.
• No enables options that may not have been appreciated previously. "Every new beginning comes from some other beginning's end" (Seneca).

THE POSITIVE FORCE OF ANXIETY

Embrace no and the uncomfortable – don't fear it, process it. Do not be a victim of the negatives that occur in your life, rather take responsibility for your own actions. Understand that failure allows you to consider options that you could not have imagined without it.
• Attempting to only focus on the positive is a quick fix to happiness. Telling yourself that everything will work out is great until it doesn't.
• When you consider the worst-case scenario you can determine how to avoid it and develop better life strategies.
• The Ancient Greek Stoics taught the philosophy of "premeditation of evil." By focusing on the negative, you prepare yourself for failure, decreasing the anxiety when/if it occurs and increasing the gratitude for what you have at the moment.
• If you prepare for failure, you are ready for success.
• Recognize what you decide to focus on and the meaning you apply to it. This is self-awareness.
• Appreciate negative thoughts but also know when to let them go. By letting go and subsequently ignoring the feelings that arise from no/failure, you are disassociating yourself from the situation.
• People tend to ruminate on failures, especially women. Learn from no's. Focus on solutions.
• No is a better teacher of success than yes. The best lessons are garnered from constructive criticism.
• Feedback can sting. Lessen the effect by gauging how you respond to it (see 5.19 – Giving and Receiving Feedback).
• No's/obstacles need to be seen as challenges.
• The most successful people are those with a keen sense of self-awareness and able to make the proverbial lemonade out of lemons. Life needs to be journeyed with a sense of wonder and a healthy dose of the "what ifs."

THE JOY OF FAILURE

Believe that you can learn from failure. Recognizing that you don't know it all and you need help is not a sign of weakness but one of strength.
• Understand that by needing help, others need it also and this facilitates you helping others more. In the long run, this helps you.
• Failure puts a spotlight on weaknesses and strengths. The hyper focus that failure puts on strengths allows one to see more opportunities in which use can use them.
• Failure makes you more open and less defensive.
• Cognition of your weaknesses enables you to have more tolerance and empathy for others. It also changes the way in which you view yourself as one who matters.
• Fear of negative outcomes leads to hesitation which can lead to failure by failing to try. When in doubt, act.
• Build up your tolerance of failure by starting with small failures – fail fast and move on.
• More is learned from colossal failures than successes because we dissect and analyze them more.
• Here is a team-building exercise for a proposed project. Inform the team that the project has failed even before it has launched. Scrutinize all the ways it could have failed and address them, so when the project is ready, all the potential faults have been corrected.
• Conduct weekly morbidity and mortality rounds. Determine what went wrong and develop ways to keep them from happening again.
• Life is a series of yin and yang events with positives tending to emphasize the future. If you appreciate the positive side of no, you will find your current successes are more highly cherished. Things could always be worse. Anyone can bask in the pleasure of positivity but it takes courage and self-confidence to take a negative and see opportunity.

5.11. HARNESSING THE POWER OF NEGATIVITY

EXAMPLES

• An optimist is often defined as a person who tends to be hopeful and confident about the future or the success of something. On the surface, it sounds better than being a pessimist, that is, one who tends to stress the negative or unfavorable or to take the gloomiest possible view. Your chances of avoiding failure and achieving success depends on having a healthy balance of both.
• Failure can be psychologically and financially difficult. Obsessing on what went wrong, not using the situation as a time of introspection and growth is a missed opportunity.
• Winston Churchill twice failed to be accepted to the Royal Military Academy and was defeated in his first attempt to get elected to Parliament. His view on failure was "Never give in. Never, never, never, never – in nothing, great or small, large or petty – never give in, except to convictions of honour and good sense."

CAUTIONS

• Gain control in life by harnessing the power of no.
• Always succeeding, like perfection, is overrated and impossible to achieve.
• Learn how to say no. If you say yes to something that you wanted to decline it weakens you. You have a choice as to when and how to say no. Set your priorities. What is important to you? Although it may be more convenient and present less angst at the moment, the long-term effect on your self-assuredness will be weakened. Resentment toward those who asked, and toward yourself for agreeing, is to be expected.
• Saying no requires listening respectfully, and being honest with yourself. Periodically reassess your decisions. Allow yourself some time to think before responding.
• Saying no is not selfish. You need to take care of and respect self because if you don't, no one will.
• When told no it is not the end. Take a breath, say thank you. Learn from the situation. Listen. Be curious. Ask how did you come to that conclusion. Ask if not now – when? Get over it.
• Learning to live with no takes courage. You have the choice as to how you will respond. You have the power over no.

5.12. DISCUSSING PET-SPECIFIC CARE

BASICS

OVERVIEW

Although each visit to the veterinary hospital occurs as a discrete encounter, it is actually part of a larger continuum of care that may extend from even before the birth of an individual animal (with preselection counseling, breeding evaluation of the parents, or genetic testing of the sire and dam) to the time of its demise, or even later.

- Each episode of veterinary care must therefore be considered as part of an overall strategy for pet-specific care rather than just an isolated event (see 4.8 – Pet-Specific Care).
- Very much like purchasing a car or a piece of equipment that comes with a maintenance schedule, creating a personalized schedule of care for individual animals reinforces the concept that there is a plan in place for a lifetime of care, and that it has been created specifically for the needs of a particular pet (see Figure 5-12-1, and 4.10 – Personalized Pet Profiles).

TERMS DEFINED

Adherence: The extent to which patients take medications prescribed, involving the pet owner in filling and refilling the prescription, administering the correct dose, timing and use and completing the prescribed course. Adherence is a term applied specifically to medications; it does not refer, for example, to recommendations for wellness checks, diagnostic screenings and so on.

Compliance: The extent to which pets receive a treatment, screening, or procedure in accordance with accepted veterinary healthcare practices. Compliance involves veterinary staff performing and/or recommending treatments, screenings, and procedures, and pet owner follow-through.

Dental Calculus (Tartar): Hardened dental plaque, often caused by the accumulation of minerals from saliva.

Dental Plaque: A biofilm consisting of bacteria, mucus, and food particles that adheres to the surface of teeth.

Epigenetics: The study of heritable changes in genetic expression caused by mechanisms other than those attributable to underlying DNA sequences.

Vaccination: Inoculation with a killed or attenuated microbe with the purpose of preventing disease caused by that microbe.

Zoonosis: Disease that is transmissible between animals and humans.

ISSUES AND OPTIONS

GENETIC RISK FACTORS

- All pets, whether purebred or not, may be predisposed to certain diseases, based on family history or certain genetic (or epigenetic) traits that they carry.
- There are now literally dozens of genetic tests that allow the genotypic determination of physical and disease traits in both dogs (von Willebrand disease, progressive rod-cone degeneration, narcolepsy, etc.) and cats (polycystic kidney disease, spinal muscular atrophy, hypertrophic cardiomyopathy, etc.)[1] (see 9.3 – Standards of Care and Care Pathways).
- Some of the genetic tests employ actual detection of the disease-causing variant (mutation) and therefore are very predictive of being at risk, whereas others detect genetic markers that may be associated with increased or decreased risk of disease. Superimposed on the actual genotype are a variety of environmental factors that impact disease or trait expression.
- There are many more conditions that rely on phenotypic testing, such as hip dysplasia, diabetes mellitus, and atopic dermatitis.
- The environment can also affect expression of traits, and certain environmental "shocks" can leave imprints on the genetic material in eggs and sperm, which can be passed on to future generations (so-called epigenetics). Epigenetic marks can switch genes on or off, affecting disease risk, and can be passed on to offspring.
- It is important that veterinarians embrace genetic testing and its opportunities related to preventive healthcare, or the profession might find itself lagging behind. Because most genetic testing can be performed with a cheek swab, testing is not restricted to veterinary professionals, and in many areas, the majority of genetic testing is being performed by nonveterinarians. Veterinarians have not been early adopters of genetic testing, and may be less informed on developments than some owners and breeders. This trend must be reversed if veterinarians want to remain in the vanguard of preventive care for dogs and cats. At the current time, there are over two hundred genetic tests currently available to identify conditions,[1] and yet most of that testing is being requested by nonveterinarians (see 9.3 – Standards of Care and Care Pathways).

LIFESTYLE MANAGEMENT

- Veterinarians must be cognizant of many factors that can affect pet health and educate pet owners as to how best to prevent problems.
- Some issues can be attributable to geography, including the prevalence of various conditions and toxins (e.g., blastomycosis, risk of rattlesnake bite, risk of heat stroke or frostbite, etc.).
- Pets can also be at increased risk based on exposure to other animals (such as at a boarding facility, groomer, or even within the veterinary hospital) or environments (e.g., drinking or swimming in ponds, walking in wooded areas, access to disease vectors, etc.), travel outside of the home area to another area in which a condition is enzootic, or through owner indiscretion (accidental ingestion of chocolate by pet, sand box not covered to prevent fecal contamination, yard debris not cleared, which serves as point of entry for ticks, etc.).
- It is important that veterinarians use a consistent risk assessment protocol to help determine risk factors that might not be evident on physical examination (See 4.9 – Lifelong Excellence in Healthcare).
- Veterinarians must counsel owners on both medical and lifestyle issues if the goal is to prevent healthcare issues from occurring, and make recommendations that are relevant for the needs of each pet and owner (see 4.10 – Personalized Pet Profiles).
- When it comes to medications to be administered for either prevention or management, it is important to consider compliance and adherence (see 4.11 – Compliance and Adherence) challenges and to favor routes of administration that make it convenient for clients to follow veterinary directions precisely.

LIFE STAGE MANAGEMENT

- Although pets need personalized and individualized care throughout their lives, breaking down requirements by life stages is often useful in discussions with owners.
- Because not all animals reach the same life stages by the same age, life stages may be designated on the basis of certain characteristics, albeit arbitrarily.
- Proposed life stage guidelines for dogs have been developed by the American Animal Hospital Association (AAHA) and include: puppy (period until reproductive maturity); junior (reproductively mature but not fully grown); adult (physically and socially mature); mature (from 50–75% of expected lifespan); senior (from 75–100% of life expectancy); and geriatric (at life expectancy and beyond).[2]
- Proposed life stage guidelines for cats have been developed by the American Association of Feline Practitioners (AAFP) and the American Animal Hospital Association (AAHA) and include: kitten (< 6 months of age); junior (7 months to 2 years of age); prime (3–6 years of age); mature (7–10 years of age); senior (11–14 years of age); and geriatric (15 + years of age).[3]

5.12. Discussing Pet-Specific Care

Personalized Pet Profile: Rocky Goodwin

Age(Dog)	*Human Age (Approx.)*	*Needs*
2-8 weeks		Fecal parasite testing; Parasite Control
8 weeks		Fecal parasite tesing; Start monthly parasite prevention
6-16 weeks		Initial vaccination series; inspection for juvenile cataracts, heart murmurs, umbilical hernia, luxating patellas, malocclusion
12 weeks		Genetic testing for von Willebrand disease, cardiomyopathy, narcolepsy, and malignant hyperthermia; genetic testing of proposed breeding animals for short tail
26 weeks	5 years	Neutering surgery; microchipping; dental evaluation; fecal parasite testing; inspection for persistent pupillary membranes, persistent primary vitreous, oligodontia, supernumerary teeth
1 year	10 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; baseline hemogram, biochemistry, thyroid screening, urinalysis, and electrocardiogram
1.5 years	15 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
2 years	20 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; radiographic evaluation for osteochondritis dissecans (stifle), hemivertebra, and cervical vertebral instability;
2.5 years	24 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
3 years	27 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; baseline hemogram, biochemical profile, thyroid screening, and urinalysis
3.5 years	30 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
4 years	33 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy
4.5 years	36 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
5 years	40 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; baseline hemogram, biochemical profile, thyroid screening, and urinalysis
5.5 years	44 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
6 years	48 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; baseline hemogram, biochemical profile, thyroid screening, and urinalysis
6.5 years	52 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
7 years	56 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; senior hemogram, biochemical profile, thyroid screening, and urinalysis
7.5 years	60 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
8 years	64 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; senior hemogram, biochemical profile, thyroid screening, and urinalysis
8.5 years	68 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
9 years	72 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; senior hemogram, biochemical profile, thyroid screening, and urinalysis
9.5 years	75 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
10 years	78 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; senior hemogram, biochemical profile, thyroid screening, and urinalysis
10.5 years	81 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
11 years	84 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; senior hemogram, biochemical profile, thyroid screening, and urinalysis
11.5 years	87 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
12 years	90 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; Cardiac monitoring for dilated cardiomyopathy; geriatric hemogram, biochemical profile, thyroid screening, and urinalysis
12.5 years	93 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
13 years	96 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; geriatric hemogram, biochemical profile, thyroid screening, and urinalysis
13.5 years	99 years	Mid-year evaluation; dental evaluation, radiographs, cleaning as needed
14 years	102 years	Primary re-evaluation; vaccine boosters or titers as needed; parasite check; geriatric hemogram, biochemical profile, thyroid screening, and urinalysis

5.12. Discussing Pet-Specific Care

• Separate senior guidelines have been proposed for both dogs and cats.[4]
• Risk factors, environment, behavior, nutrition, parasite control, vaccination, dental care, zoonotic disease control, safety, and reproductive health should be addressed regularly with pet owners throughout a pet's life.

PARASITE CONTROL

• Parasite control is not only an important element in preventive care for pets, but it is also a critical public health issue with potential legal liability for underestimating its significance.
• Many common forms of fecal testing used in veterinary offices have relatively low sensitivity, especially when samples tested are not fresh, so standard fecal testing alone may not fully predict parasite burdens and thus may not ultimately protect the public from parasites spread in pet feces.
• Integrated parasite control should be considered, evaluating the best combination of products to provide control for both internal and external parasites.
• Because many parasite control products are available over the counter and without a prescription, veterinarians must be aware of all products being used in pets, whether prescribed or not.
• Control protocols should target local parasite prevalence and take into account individual lifestyle characteristics that might increase or decrease risk.
• The Companion Animal Parasite Council (www.capcvet.org) provides guidelines for parasite control in North America, and advice for mitigating risk of zoonotic transmission of disease. Recommendations include year-round control of internal and external parasites in dogs and cats, routine testing and deworming, and minimizing the risk of humans contacting animal feces and disease vectors.
• Public health is everyone's concern and clients should understand their role in protecting everyone in the community. Those clients that choose not to follow the hospital's recommendations for parasite control should be informed of their potential liability, and the hospital should consider the use of a signed waiver in these instances. Preventing the spread of such parasites within a community is everyone's responsibility.

VACCINATION

• Vaccinations have been important in controlling a variety of diseases in the dog and cat population, including fatal diseases such as rabies.
• There are many considerations to be made in creating a vaccination schedule for a hospital, including governmental mandates, local disease prevalence, safety of the vaccine, efficacy of the vaccine to prevent disease, duration of immunity, any risks posed by the vaccine itself, and any animal-specific issues to be considered (including age, state of health, concurrent problems, etc.).
• In general, vaccines are divided into core products that should be used on all animals serviced by the hospital and noncore vaccines that are used based on appropriate risk assessment (see 4.9 – Lifelong Excellence in Healthcare).
• In general, vaccines are to be avoided in animals less than six weeks of age, where interference with maternally-derived protection would be anticipated.
• Most vaccines are given as an initial series every 2–4 weeks as indicated on label recommendations and then periodically as needed. For some agents, a titer can be used to determine relative protection, whereas for others, there will be reliance on a sensible vaccination schedule.
• Guidelines have been developed for both canine vaccination[5] and feline vaccination[6] within North America, but both rely on veterinary judgment because not all generalizations can be supported by currently available scientific studies.

ORAL CARE

• Despite the fact that dental care is needed in dogs and cats as much as it is in humans, most pets do not receive the level of oral care required.
• Because preventive care is often not sufficient, dogs and cats commonly develop periodontal disease in which dental plaque adheres to the teeth, and bacteria within the plaque irritate the gum tissue and may even result in infection of the underlying bone. By three years of age, most dogs and cats have some evidence of periodontal disease (see 5.16 – Discussing Oral Health).
• Although owners are often most concerned with offensive breath odor, or with unsightly calculus (tartar), it is actually the progressive nature of periodontal disease that poses the most risk for pets.
• Periodic dental cleaning should be performed by veterinarians and general anesthesia is required. Scaling the teeth without anesthesia is not recommended by most dental professionals.
• In between dental prophylactic procedures in which cleaning and polishing are performed, home care is extremely important. This might include regular brushing with pet-specific toothbrushes and toothpastes (dentifrices), oral rinses with specially formulated antiseptics such as chlorhexidine, and diets and chews specifically created for this purpose.

DISCUSSION

• The goal of pet-specific care is to provide healthcare advice that is relevant for the individual pet, and the emphasis is to prevent problems whenever possible, to embrace early detection so problems can be dealt with when there are the most options available, and finally to provide treatment or intervention according to evidence-based principles.
• Pet-specific care cannot be delivered in a vacuum. It requires client engagement, and it is best to start that engagement during puppy and kitten visits when the veterinary hospital team can serve as advocates of pet care from the earliest possible opportunity.
• To accomplish pet-specific care, hospital teams need to be capable of soliciting information from the pet owner, either by standardized questionnaire, or direct inquiry, as a typical history collected during an office visit may not uncover all needed information on which to base recommendations. Pet owners also need to be aware of why compliance is so important to the care of their pets, and what will be expected of them in the personalized medicine process.
• The message needs to be conveyed to pet owners that the veterinary hospital team has the expertise to be a resource for quality of life issues for pets, and to attempt to guide the process of keeping the pet as healthy and happy as possible, for as long as possible.
• Early detection is an important part of pet-specific care, and pet owners need to understand the importance of such surveillance systems. Such early detection includes not only things like parasite testing and routine laboratory profiles, but potentially also genetic screening, orthopedic screening, geriatric screening, etc.
• While many pet owners have heard of the tremendous medical breakthroughs that have been made in genomic medicine, and that there are many genetic tests available for use in dogs and cats, it is important to convey that genetic testing is an important aspect of pet-specific care, but not sufficient on its own to answer all questions about risk, so a more balanced approach of genetic and nongenetic screening is indicated.
• In many hospitals, it is the veterinary team (especially nurses and client service representatives) that drives pet-specific care programs, including initiating questionnaires, discussions with pet owners, collecting samples, and maintaining contact to ensure compliance. Accordingly, it is imperative that staff be appropriately trained to accomplish these tasks.
• In conversations with pet owners, it is also important to communicate that such pet-specific care may front-load some expenses, even though prevention tends to save money over treatment

in the long run. Such conversations should take place during puppy and kitten visits, so it is possible there will need to be some financial discussions as well. This is important so the clients can be fully aware of when such care should be initiated, and how much it is likely to cost. This is also the ideal time for pet owners to consider whether pet health insurance will help mitigate such risks and better allow them to follow hospital recommendations (see 8.11 – Pet Health Insurance).

EXAMPLES

Mrs. Green arrived at ABC Veterinary Hospital with her new eight-week-old coton de Tulear puppy, Pierre, and she was interested in commencing a lifetime of sensible healthcare for her new family member.

The doctors at the hospital did not have much familiarity with the breed (the receptionists and technicians had originally thought it was a bichon frise, havanese, or poodle), so before engaging the client in any healthcare discussions, they first did some research on the subject.[1]

In addition to their regular discussions of vaccination, nutrition, training, and parasite control, they informed the owner that the breed actually had a few health concerns, and that it would be worth performing genetic testing to determine any potential risk for canine multifocal retinopathy (I and II), neonatal cerebellar ataxia, primary hyperoxaluria-1, and von Willebrand disease.

Pierre had an uneventful physical examination, other than finding a mild umbilical hernia that would be repaired at time of neutering, and appeared to be in good health. The doctor laid out plans with the owner for how they were going to keep Pierre healthy over the breed's potentially long lifespan, in a step-by-step approach, starting with the immediate pediatric needs. The doctor assured Mrs. Green that even though it might seem a bit daunting initially, ABC Veterinary Hospital would be there every step of the way to help guide them through the process.

CAUTIONS

When discussing lifelong care with pet owners, it is impossible to anticipate all problems that might potentially occur, and the intention is also not to alarm the owner unnecessarily. Attention is typically focused on risks that pose the most concern and for which prevention or successful management might be attained.

5.13. Discussing Finances

BASICS

OVERVIEW

• Most veterinarians are uncomfortable discussing money-related issues, whether with clients, staff, or even their own accountants.
• Money is an emotionally charged topic, so discussions about it can tap into sensitive areas and produce unexpected results.
• Just as the veterinarian is uncomfortable discussing money, so is the listener uncomfortable hearing it, as financial issues often are accompanied by other bad news.
• Clients sometimes feel guilty that they do not have unlimited resources that allow the veterinarian to treat their animals without having to deal with money issues.
• Veterinarians often have to discuss finances at a time when the client or staff person is already emotionally fragile; that is, when a pet is ill or when other financial issues are looming.
• Avoiding or postponing discussions about money, which is always tempting, can actually aggravate a situation and make matters worse. No one likes to be surprised when money is involved.
• Understanding how to communicate financial matters can make the process easier for the veterinarian or practice team members, and also improve the listener's ability to understand and comprehend the information being provided.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

DISCUSSING FINANCES WITH CLIENTS — GENERAL INFORMATION

• When discussing finances, the fewer technical terms used, the better.
• Explain the situation in clear, concise language, avoiding both medical and financial jargon (see 5.5 – Translating Medicalese).
• Encourage your listener to be active; that is, to ask questions and to rephrase your message in his or her own words to confirm understanding.
• Much as we might wish it were otherwise, the animals we serve come with people associated with them, and your success as a veterinarian or a veterinary team member depends largely on your ability to deal with those people.
• Clients often feel vulnerable and at a disadvantage when discussing medical issues related to their animals, and that feeling carries over into discussions about the related finances.
• Whether the veterinarian or a practice team member is discussing finances, the same basic rules apply, so teach your staff how to communicate financial issues.
• Do not apologize for discussing finances. Unpleasant though it might seem for both parties, you have a right to be paid for your services and the client has a right to understand the cost and the choices concerning the medical and financial side of their animal's care (see 2.10 – Compromise Fatigue). Ignoring these issues only makes it worse for everyone.
• First, assess the owner's current emotional state. Is the person focused on the discussion, or is their attention directed elsewhere? If the client is distracted, use your compassion and empathy to draw them into the discussion by first addressing their emotional state (see 5.10 – Empathy).
• If the clients are distracted by their animal or by their children, take the time to acknowledge those distractions before beginning the discussion.
• If this is a long-time client, you may already know how he or she reacts to discussions about finances. If this is a new client, watch the person's body language for clues as to whether and how they are receiving your message (see 5.9 – Nonverbal Communication).
• Be direct. Know what you want to say, and then say it. But be sensitive to the client's responses, both verbal and nonverbal.
• Whenever possible, give the client financial information in writing.
• Be sure your clients have information about pet health insurance (see 8.11 – Pet Health Insurance), third-party payors (see 8.13 – Third-Party Financing), and similar payment options. Consider putting this information on your website, and then refer clients to that site in advance of their appointment.

USING ESTIMATES EFFECTIVELY

• Estimates should be used routinely for hospitalized patients, whether or not the client asks about fees. Many practices use estimates for non-routine outpatient services as well.
• The purpose of an estimate is to ensure that the client understands the work that will be done and the approximate cost of those services. By giving the client this information, both the practice and the client have the opportunity to raise questions, increase or decrease the amount of services, and reach general agreement on these issues.
• Do not make choices for the client about the level of service their animal can receive. Your responsibility is to explain all the various options and then let the client make the choice.
• Estimates also provide the opportunity to discuss payment terms. If consistent with hospital policy, a deposit can be collected as well.
• Be sure all team members understand the practice's medical policies and take those into account in providing estimates. For example, does the practice require pre-anesthetic blood work or is that done at the option of the client?
• Hospitals with computer systems frequently generate an estimate using a template built into the system. Doing so minimizes the chance of math errors as well as reduces the likelihood of forgetting part of a bundled package of services.
• Estimates given in advance should show a range of possible fees, not a single figure. Giving clients more detail helps them understand the uncertainties the practice faces up front, because neither you nor the client knows what you might discover as the result of the work you are being asked to do.
• Recognize that clients automatically hear and focus on the lower end whenever you give a range of possible fees. That is especially true if you only give verbal estimates.
• Give the client the opportunity to ask questions and to express any concerns by asking specifically if he or she has any questions.
• Asking the client to sign the estimate is a good way to ensure that he or she actually understands your explanation. Be sure the client gets a copy of the estimate.
• Keep the practice's copy with the travel sheet or as part of the patient's file so that each team member knows what services the client has agreed to and what cost estimate the client has been given. The estimate should remain in the medical record even after the patient is discharged.
• Be sure the front desk staff confirms and documents how to reach the client on the day of the service if the patient is being dropped off.

MONITORING ACTUAL SERVICES AGAINST THE ESTIMATE

• Actual fees that exceed the estimate are a major source of client dissatisfaction. Knowing that, you should make every effort to give accurate estimates. Consider having an uncertainty factor built into the estimate; that is, an additional 5% or 10% of the total to cover some level of uncertainty. If the actual fee ends up being less than this estimate, the practice will seem efficient and the client will undoubtedly be pleased.

• At the start of the appointment and as the services are provided, train yourself and your staff to review the estimate given to the client. If the client has been quoted a fee that does not cover all the required services, you must deal with the issue quickly. Then, after the client has left, make a point to determine why the estimate was incorrect: a math error, a misunderstanding about the scope of the services, a failure to include the cost of bundled services? Improving the estimate process will help avoid such problems in the future and will do much to improve client trust and loyalty.
• At the first indication that an actual fee may exceed the estimate, discuss the situation with the client (outpatients) or contact the client by phone or email (inpatients), depending on the client's preferred communication method. Explain what you have discovered and why the actual fee will be higher than originally thought. Most clients will accept your explanation if it seems reasonable and is based on medically sound care.
• If you cannot reach the client by telephone, leave a message asking the client to call back as soon as possible, but reassure the client that their animal is not in danger. Consider giving the client the name of another team member who is also knowledgeable about the case and who can be called if the person leaving the message is likely to be in surgery or otherwise unavailable later in the day. Playing telephone tag is frustrating and time-consuming, both for the client and the practice's doctors and staff. Text messaging and email can provide more efficient communication if the client is comfortable with these methods.
• Be sure that any text message (SMS) or email sent to a client looks professional: no misspellings and minimal jargon (see 10.11 – Electronic Communication: Email and Texting). If your message needs to be lengthy, ask clients to call into the hospital instead.

PRESENTING THE INVOICE

• Presenting the invoice requires you to explain to the client what services or procedures were actually performed, as well as highlighting any differences from the estimate.
• Generally, clients respond better to more rather than less detail. Again, avoid jargon but be specific as to what was actually done, and why.
• Consider the words you use to describe a service on the invoice. For example, an "ear exam" to a non-medical person sounds like a quick look into an animal's ears. But an "otic cytology" indicates a more complicated procedure and one deserving of a higher fee.
• Do not be defensive if the client questions an estimate or a bill. The client has a right to understand what is being purchased. Asking questions is not the same as challenging your care, techniques, or fee schedule (even if it feels the same to you).
• Offer to have a technician/nurse or a doctor clarify issues you don't have first-hand knowledge about. If at all possible, do this before the client leaves the practice. Delaying such discussions ("I'll have the nurse call you this afternoon") only allows clients to focus on their concerns for an extended period of time.
• Know the options available for payment. Advise clients in advance, including all new clients, that payment is due when the services are provided. Any exceptions must be discussed in advance with the appropriate person (owner, hospital administrator, etc.)

5.14. Discussing Behavior

BASICS

OVERVIEW

It is essential that veterinary practitioners recognize when a pet's behavior deviates from normal because any change in behavior can have either a medical or psychological cause. Desirable behavior is also essential for maintaining a healthy human–animal bond (HAB). Undesirable behavior weakens the bond, leading to a decreased owner commitment to healthcare and an increased likelihood of relinquishment. If pets are fearful, anxious, stressed, or aggressive at the veterinary clinic this will greatly decrease the quality and frequency of veterinary care, the ability of the veterinarian to safely and fully evaluate the pet, the diagnostic findings including complete blood count (CBC), heart rate, respiratory rate, blood pressure, body temperature and blood glucose (in cats) as well as the owner's commitment to veterinary care (see 4.14 – Developing a Fear Free Hospital).

- Each year approximately a quarter million pets are euthanized at veterinary clinics for behavioral reasons alone.
- Up to 90% of dogs and over 60% of cats have behavioral problems that their owners would like to improve.
- Dog owners who report high overall satisfaction have dogs that tend to be friendly toward family members, other people, and other animals.
- Over 75% of dogs and cats demonstrate fear, anxiety, or stress at some point during the veterinary visit and 28% of cat owners and 22% of dog owners would visit more frequently if it was less stressful.[1] A coordinated team approach, utilizing a variety of resources, is the best way to educate the new pet owner.

TERMS DEFINED

Relinquishment: Giving up a pet for adoption or euthanasia.

ISSUES AND OPTIONS

WHY OFFER BEHAVIOR-COUNSELING SERVICES?

There are many reasons why it makes sense for a practice to offer behavior-counseling services:

- It addresses the needs of the pet and strengthens the human–animal bond.
- A healthy bond can lead to a greater commitment to pet healthcare (see 1.19 – Importance of the Human–Animal Bond).
- It encourages increased veterinary visits and clinic bonding.
- Practice image can be enhanced by offering and promoting these services and a new profit center established.
- The veterinary clinic should serve as the primary resource for both health and behavioral advice.
- It ensures early diagnosis of medical conditions by screening for behavioral signs.
- Because stress can have profound effects on both mental and physical health, veterinarians must integrate behavior into both their diagnostic and treatment protocols.
- It allows for more cost-effective delivery of services because staff members can provide many of the behavioral services.
- Staff members' sense of self-worth and job satisfaction can be enhanced with new opportunities to apply their skills.

BEHAVIOR SERVICES: ENHANCING PET CARE AND ADDING NEW SERVICES

Preselection Consultations

- Schedule a consultation to provide guidance on selecting an appropriate pet for the household and preparing for the new arrival (see 4.9 – Lifelong Excellence in Healthcare).
- Insufficient knowledge of the expectations of ownership is a major risk factor for relinquishment.
- Helping owners have realistic expectations of the behavior and learning abilities of their potential pet can help them accept normal behaviors and minimize dissatisfaction with their pets.

Many owners need advice about how to safely and successfully integrate a new pet into their household:

- **Breed selection:** Help guide the selection process to match the pet with the family and household based on physical and behavioral traits. (see 4.9 – Lifelong Excellence in Healthcare and 4.10 – Personalized Pet Profiles). Help owners understand that breed standards describe the typical and not the range of individual behavioral differences (temperament). Meeting adult animals of the desired breed may help in the selection process.
- **Age and sex:** Puppies and kittens can be most readily shaped and adapted to fit into the family home and lifestyle, provided the owners have the time and commitment required. Since the dog's sensitive period for socialization is up to 12 weeks of age, obtaining a puppy

before this age provides an opportunity to socialize and habituate to environmental stimuli. In fact, homing puppies at eight weeks of age may lower risk for aggression and avoidance.[2] An adult pet may be preferable for families that are unable to commit to the needs of a puppy or kitten; however, the behavior of adult pets may be more resistant to change. Discuss physical and behavioral differences between males and females and the potential effects of neutering.

- **Where to obtain:** Obtaining a puppy from a quality breeder provides an opportunity to assess the health and behavior of the parents, related animals, and view the environment in which the pet was reared.
- **Temperament testing:** For puppies, temperament testing is not predictive of adult behavior, except perhaps for signs of fear and reactivity. Predictability might increase as pets mature, although most testing protocols do not provide predictable results. For cats, assessment might help to determine if the cat is (1) sociable and easygoing; (2) timid, and unfriendly; (3) outgoing and aggressive.

Behavioral Advice for New Pet Owners

- Preventive behavior counseling at the first puppy visit reduces the risk of housesoiling, mounting, mouthing, begging for food and fear of unfamiliar people.[3] Preventive counseling at the first kitten visit can reduce the risk of climbing on furniture and curtains, vocalization, disturbing owners when resting and improve compliance with body handling.[4]
- Give advice on normal behavior and development; socialization; reward-based training; avoiding punishment; positive handling; meeting the pet's behavioral needs; environmental enrichment including social play, object play and working for food; structure and consistency; establishing a safe haven; housetraining and litter box training; and setting up the home for success. For cats, also discuss meeting needs for perching, climbing, scratching and outlets for predation and play.
- At each visit owners should be asked if they have any behavior concerns so that they can be diagnosed and dealt with promptly. For minor problems it may be sufficient to provide a few minutes of counseling within the visit and additional support using resource materials and recommendation for trainers. However, for problems that require more in-depth discussion and counseling such as housesoiling, play biting, and destructiveness, schedule a separate visit with a member of the behavioral team.
- Identify resource material that best meets your clients' needs and provide these as handouts and links on your website.

Puppy Classes, Kitty Kindergarten, and Training Classes

- Advising owners to keep their pets away from other animals until completion of vaccinations might be prudent to reduce illness; however, this is an age when socialization and habituation to new stimuli are critical (see avsab.org).
- Puppy and kitten classes should be recommended to provide early and positive socialization and habituation.
- Attending puppy classes prior to 12 weeks reduces the risk of fear and aggression to unfamiliar people and unfamiliar dogs, improves trainability, decreases relinquishment, and provides for early behavior problem intervention.
- Offering puppy and kitten classes in the hospital can ensure that pet owners receive accurate and appropriate advice on socialization, reward-based training, managing emerging problems, as well as positively conditioning the pet to the hospital environment, equipment, handling, and procedures.
- If it is impractical to offer these classes in your hospital, consider having an initial class and open house in your clinic, after which the pet should continue classes with a reinforcement-based trainer recommended by the clinic.

Behavior Management Products and Medication

- Having behavior products in the clinic for demonstration and sale provides an opportunity to discuss their use in the prevention, management and treatment of behavior issues.
- Consider feeding toys and object play enrichment; pheromones to help pets adapt to stress and encourage desirable scratching; odor control and cleaning products for house training; control devices such as head halters, front control harnesses, and cat harnesses; and products that might aid in managing problems including pressure wraps, head covers and muzzles.
- Drugs, natural supplements, pheromones and therapeutic diets should be recommended when indicated for the prevention and treatment of behavior problems.

Surgery

- Ovariohysterectomy eliminates estrus behavior.
- Castration reduces sexually dimorphic male behaviors such as urine marking, mounting, and roaming in most dogs, and roaming, marking, and fighting in most cats.[2]

Behavioral Screening

- Questioning the owner at each visit as to whether there is a change in behavior helps to ensure early detection and prompt intervention.

5.14. Discussing Behavior

• Because behavioral signs may be the primary or only signs of medical conditions including pain, sensory decline, and cognitive dysfunction, behavioral screening is a critical component of healthcare.

Behavior Problem Counseling

• Provide counseling or referrals to effectively address behavior problems.
• Problems arising from normal but undesirable behaviors might be managed with a short visit with a member of the behavioral team. However, pets with emotional disorders, refractory problems such as soiling or destructiveness, compulsive disorders, impulse dyscontrol, over-reactivity, aggression, and problems arising from fears, phobias, and anxiety, require a behavior consultation with the veterinarian. These generally require 1–2 hours for initial consultation followed by ongoing follow-up and support.
• For behavior problems that are beyond the practitioner's expertise, referral to a board-certified veterinary behaviorist is recommended. If the referral is to a behaviorist that is not a veterinarian, the practitioner must take an active role to diagnose and treat underlying medical issues, dispense any drugs that might be indicated, and ensure that the treatment advice is sound.

OFFERING BEHAVIOR CONSULTATIONS

• **Diagnosis:** Determine whether there are medical issues that might be causing or contributing to the behavior problem, and whether the pet's behavior is normal but undesirable or an emotional/mental health issue with history, examination, laboratory diagnostics, and recordings where available. Samples of history questionnaires can be found in the reference literature.[5]
• **Prognosis:** Owners will need to be given realistic expectations of what might be possible to achieve and what is impractical. With cases involving aggression, risk assessment is the first step to determine if safety can be ensured.

The treatment program has four components (4 M's):

• **Management:** Identify all triggers so that strategies can be implemented to prevent recurrence and ensure safety. Each recurrence is not only a safety issue, but also a welfare issue for the pet and a further learning experience in which the problem continues to intensify.
• **Modification:** Behavior should be modified with reward-based training together with management tools that can aid in getting immediate, focused, and calm outcomes to set the foundations for positive exposure to controlled levels of the stimulus (desensitization and counterconditioning).
• **Medication:** When indicated, medication should be dispensed to reduce fear and anxiety, improve focus and attention, and improve mental and emotional health.
• **Monitor:** Ongoing follow-up is needed to make modifications to the behavior program and medication based on outcomes.

EXAMPLES

• A veterinarian who offers behavior consultations wishes to expand the hospital's behavior services. A new multipurpose room is added in which puppy and kitten classes, cooperative care classes, training classes, and follow-up visits are offered. Open houses are scheduled to display the facility and services to clients and to the community.
• Using a behavioral technician/nurse as team leader, a Fear Free hospital environment is established, puppy and kitten classes and training services are offered, counseling services are added including pre-adoption counseling, counseling for emerging behavior issues, and follow-up counseling for behavioral visits.
• The client base increases as the range of behavioral services offered, and the training facility attract new pet owners and increase retention of existing clients.

CAUTIONS

• Ensure proper education and training of veterinarians and staff. Outdated or incorrect information can lead to inappropriate, inhumane, or counterproductive advice.
• For pets with aggression, safety and liability are a priority. Practitioners should only see cases for which they are comfortable in evaluating risk (see esvce.org) and offering guidance.
• When dispensing drugs, be familiar with any literature on indications, dosing, withdrawal, contraindications, and potential adverse effects. Also ensure informed owner consent for drugs that are not licensed for pets. A sample release can be found in the reference literature.[5]

5.15. DISCUSSING DIET AND NUTRITION

BASICS

OVERVIEW

• Diet can profoundly impact health and disease. Therefore, nutrition plays a key role in the medical management of all pets, both in states of health and disease.
• Nutritional fads and diets for humans are commonly covered in the popular media and are marketed extensively to the public. It is a natural progression for clients to want to apply these ideas to the feeding strategies they use for their pet.
• The veterinarian should strive to serve as an informed source of unbiased nutritional guidance. Opportunities to assist the client's diet selection should not be limited to cases that require therapeutic diets, but should include all cases.
• Successful nutritional counseling can be implemented as a vital component of a preventative medicine program.
• Nutritional counseling should progress through four main components: diet history, diet assessment, client education, and diet plan and monitoring (see American Animal Hospital Association (AAHA) Nutritional Assessment Guidelines[1] (the source for the guidelines below) and World Small Animal Veterinary Association (WSAVA) Global Nutritional Guidelines[2] for additional guidance).

TERMS DEFINED

Bioavailability: The degree to which a nutrient is actually available to be absorbed into the body and is utilized.
Body Condition Score: System of assigning a number to indicate a pet's degree of adiposity based on visual and tactile cues.

ISSUES AND OPTIONS

The following nutritional assessment guidelines are based on those of the AAHA.

SCREENING EVALUATION

This is performed on every animal, and if healthy and no risk factors, then no additional nutritional assessment is needed. Diet history should be collected on all animals.

Risk Factors

• Altered gastrointestinal (GI) function
• Previous/ongoing medical conditions/disease
• Medications or dietary supplements used
• Unconventional diet fed
• Treats/human food > 10% total calories
• Inadequate information about or inappropriate feeding management or housing.

Physical Examination Findings

• Body condition score (BCS) < 4 or > 5 on 9-point scale (or any score except 3 on 5-point scale)
• Mild, moderate, or marked muscle wasting
• Unintended weight loss > 10%
• Oral or dental disease
• Poor skin or hair coat
• New medical conditions/disease.

EXTENDED EVALUATION

This is only performed when risk factors above are suspected or identified.
• Complete blood count: concerns anemia
• Urinalysis: concerns related to conditions/diseases that have nutritional management strategies such as proteinuria, glycosuria, crystalluria, urine specific gravity (very dilute or concentrated)
• Biochemistry profile: concerns electrolytes and albumin
• Special tests: such as plasma or whole blood taurine, plasma amino acids, thiamine (clinically relevant in cats but challenging to identify analytical laboratory), vitamin B12, iron; feces rarely but consistency may be a focus
• Many minerals, especially calcium and trace minerals, are difficult to assess with laboratory analysis; therefore, diet evaluation is often crucial to assess.

DIET

• Energy or caloric density mismatch (i.e., feeding a lower or higher energy density food to pet having trouble maintaining an ideal BCS)
• Other source of nutrients (e.g., treats including chew toys, table (aka human) food including food used for administering medication, and supplements)
• Condition that might indicate toxicity, spoilage, or contamination (e.g., mycotoxin, microbial infection); contact local government entity for guidance as well as for known recalls/issues.

Commercial Food Evaluation

• **Purchase information:** Specific type (enough detail to buy an exact match with only the information recorded), when and where purchased, and storage conditions used by client.
• **Data to collect:** Full label information, especially nutritional adequacy statement, guaranteed analysis, ingredient list, lot code and expiration date, and manufacturer contact information.
• **Purpose of nutritional adequacy statement:** Complete and balanced or "intermittent or supplemental use only," the latter may be acceptable for a therapeutic diet such as one intentionally deficient in phosphorus for renal disease or if instructions to add something to make complete & balanced; otherwise not appropriate for long-term feeding.
• **Correct species and life stage for pet:** Feeding trials versus formulated to a specific nutrient profile; latter is now much more common but raises concern regarding bioavailability; at same time per AAHA "the use of feeding trials does not guarantee the food provides adequate nutrition under all conditions."
• **Reputation and experience** with company and/or products; any objective data available.

Suggested questions for manufacturer include:
• Do you have a veterinary nutritionist or some equivalent on staff? May I speak with them?
• Who formulates your foods and what are their credentials?
• How do you determine the nutritional adequacy of your foods?
• How do you ensure food quality and safety?
• Where are your foods manufactured? Can the facility be visited?
• Can you provide a full nutrient analysis and any digestibility data for products?
• What is the caloric content of your product?
• Do you have any published data on your products, and is it peer-reviewed?

Homemade Food Evaluation

• Always evaluate unless from a Board Certified Veterinary Nutritionist.
• Contact Board Certified Veterinary Nutritionist service.
• Gather diet history including specific recipe, preparation instructions, storage conditions, recipe rotations, if any, as well as any ingredient substitutions used.

Feeding Management and Environmental Factors

• Identify primary feeder as well as method, location, and frequency.
• Assess issues with multiple pets leading to competition for food.
• Identify if other food providers or sources of calories as well as any environmental enrichment.
• Activity (type of exercise, amount, etc.) and energy level.

5.15. Discussing Diet and Nutrition

• Environmental stressors (e.g., recent changes including with household members, outdoor stimuli).

INTERPRETATION, ANALYSIS, AND ACTION

• Determine energy needs and compare to current intake; recognize variation can be as great as ± 50% from calculation based on body weight with best equations.
• Create a monitoring plan include teaching client BCS scoring and weighing and use to better match caloric intake to needs over time as needed.
• Adjust any supplements or get assistance with them, especially if used in homemade diet.
• A diet change may be needed; if changed, slowly transition over 7- to 10-day period.
• Per AAHA Guidelines, "Determine if current amount and type of food are appropriate, based on life stage, lifestyle/activity, disease, body condition, concurrent medications and/or medical procedures."
• If not appropriate, develop a new plan for food and treats that includes all food sources.
• Final recommended feeding plan should be specific with regard to food, treats, any table food, feeding method, frequency, and location. Client should be educated on rationale(s) and expectations to improve compliance.

Feeding Management and Environmental Factors

• Assess whether ad libitum (free feeding) or portion-controlled meals would be better for case.
• Confirm that measuring device (especially if volume used) is accurate for meal portion measurement.
• Consider feeding toys and methods to reduce food competition.
• Enhance environmental enrichment with play and exercise, and for cats play that specifically mimics different aspects of predatory behavior (e.g., stalk, chase, bite, etc.).

Plans for Hospitalized Patients

• Create monitoring plan (see below)
• Offer usual or preferred food; avoid introducing novel food that may need to be used long-term to avoid learned aversion
• Determine route for feeding:
  ◦ Voluntary oral feeding
  ◦ "Coax" feeding (warming food, moving to more secluded area, concurrent petting by owner, etc.)
  ◦ Forced feeding with syringe (generally should be avoided given stress, risk of aspiration and aversion)
  ◦ Assisted feeding, such as tube feeding (if inappetence greater than 3–5 days) or parenteral nutrition (in GI or neurological dysfunction preventing tube feeding).

Plans for At-Home Patients/Pets

• Create monitoring plan (see below)
• Clearly communicate with client to improve compliance; include rationales for any changes
• If active weight loss plan, specific amounts for all calorie sources and exercise plan should be included with scheduled follow-up for assessments and adjustments as needed to achieve weight loss at a rate of 1–2% of body weight per week
• Get specialist, especially Board Certified Veterinary Nutritionist, help where needed.

MONITORING PLAN

Healthy Pets

• Reassessed at every visit especially for changes in BCS or weight
• Certain life stages require more frequent reassessment, such as growth, reproduction/lactation, and senior
• Clients should watch food intake and appetite, BCS and body weight, GI signs (e.g., fecal consistency and volume; vomiting), and overall pet appearance and activity.

Hospitalized Patients

• Fluid balance, feeding orders effectiveness in delivering needed calories and nutrients.

At-Home Patients with Disease Conditions or Recommended Diet Changes

• Subject to extended evaluation more frequently
• BCS and muscle condition and body weight can be vital in assessing caloric intake appropriateness over longer periods
• Specific strategies that can affect blood count, biochemistry, and/or urinalysis and should be assessed by analysis and adjusted based on findings.

CLIENT EDUCATION AND COMMUNICATION

Rechecking pets/patients allows the veterinarian to address client concerns and/or patient issues that may be leading to poor compliance. The importance of including clients in decision-making and defining expectations cannot be overstated.

5.16. Discussing Oral Health

BASICS

OVERVIEW

Discussions about a pet's oral health should continue from the first puppy or kitten visits to comprehensive care during senior years. A complete dental program includes regular oral examinations, professional care, and home care with the pet owner, veterinarian, and staff all taking part. While many times we deal with advanced dental issues, oral care should be considered as part of a preventive or wellness program. Providing a lifetime of good oral care can make a significant difference in the quality of life, and likely the quantity of life as well, and can help preserve the human–animal bond.

The prevalence of oral and dental disease is extremely high in pets and is encountered daily in a small animal practice. While periodontal disease is certainly widespread, other issues such as broken teeth, tooth resorption in cats, and oral tumors require attention as well.

TERMS DEFINED

Periodontal Disease (PD): Disease of tissue surrounding the teeth – attached gingiva, alveolar bone, periodontal ligament and cementum of the root.

Tooth Resorption (TR): Any resorption of tooth substance, most commonly seen in cats (feline odontoclastic resorption lesion (FORL)). Type 2 odontoclastic or replacement resorption is seen radiographically as roots are resorbed with loss of the periodontal ligament and replaced by bone. Lesions in the crowns are often filled with hyperplastic gingiva and can be painful.

ISSUES AND OPTIONS

SMALL DOG DENTAL ISSUES

- When a pet owner brings in a small breed puppy, let them know that dental issues will be likely, from early issues with retained deciduous teeth and slow-to-erupt or unerupted teeth.
- Since there is a known increased incidence of periodontal disease in both small dogs and older dogs (and small dogs tend to have longer life spans than larger breeds), it is important to stress a lifetime of care (see 5.12 – Discussing Pet-Specific Care).
- Recommend first dental cleaning, examination, and intraoral radiographs by 1–2 years of age. Moderate to significant problems are not uncommon at this age, including bone loss, infection, and even unerupted or abnormally formed teeth.
- If no problems are encountered, then the preventive cycle has started, with annual dental cleaning and examinations, and, it is hoped, regular, effective home care.

PAIN AND INFECTION

- There are two words to which owners can relate – pain and infection – and these are often present with oral and dental disease.
- While antibiotics and pain medications may help, the underlying issues must be addressed, often with necessary extractions or oral surgery.
- Educate the owner about the peri-operative analgesia: pre-operative sedation and analgesia, intra-operative regional and local blocks, and post-operative medications.
- Beyond the potential of oral bacteria entering the bloodstream and causing a "metastatic infection," the systemic effect of a chronic inflammatory process likely has a greater impact on general health. It is not just the transient bacteremia, but also the ongoing influence of the inflammatory mediators that can result in distant organ stress and dysfunction ("metastatic inflammation").
- Many patients and owners will experience the positive outcomes of complete dental therapy – seeing that "he's like a new dog" at the two-week recheck, due to the removal of pain, infection, and inflammation both locally and systemically. It is best to prevent the disease from happening in the first place!

ANESTHESIA CONCERNS

- Concern about anesthesia will always be a major topic. With newer analgesia and anesthesia protocols and state-of-the-art monitoring, the risks of anesthesia can be minimized.
- Managed correctly, these risks are far outweighed by the benefits of complete dental care (see 5.18 – Discussing Anesthetic Risk). To help with their concerns and to communicate the potential benefits, let them hear "pet parent testimonials" from other clients who had similar concerns, but were amazed at how much better their pets felt after treatment.
- Good pre-operative analgesics and local/regional blocks can allow you to minimize general anesthesia.
- General anesthesia is necessary to use a cuffed endotracheal tube that will protect the patient's airway. It will also allow for a complete examination, periodontal probing, required intraoral radiography and treatment.
- For longer procedures, a good option is staging the procedure: cleaning and removing extremely loose teeth at the first visit, with more advanced oral surgery (advanced extractions) or periodontal surgery at a later date.
- Monitoring through the post-operative period is essential as well, particularly with smaller, older patients or brachycephalic ones.

CLIENT COMMUNICATION

- To help manage concerns and to keep the client well-informed, up to three phone calls may be made on the day of procedures:
  - The first call is at the time of the pre-anesthetic injection for analgesia and sedation. After time for the injection to take effect, then catheter placement, induction, and monitoring, the initial assessment with radiographs and charting will be done.
  - A second call will discuss the findings and any adjustments to the treatment plan or estimate. This call is critical because in most cases additional problems will be found in the oral cavity, and client permission to perform previously unknown treatment is essential.
  - A third call is placed when the animal is recovering, to give an update and to schedule the time for discharge.
- A two-week recheck visit is recommended to evaluate how the pet has responded to treatment. This is also a very good time to discuss home care.

A reminder system to set up recall reminders for oral exams based on the level of dental disease could comprise the following:

- Uncomplicated stage 1 periodontal disease (PD) patients get a 12-month reminder.
- Stage 2 patients will be encouraged to visit at nine months. If they have been doing a good job with home care, then next procedure could be delayed that extra three months.
- Stage 3 patients should be rechecked at six months, because if any advanced periodontal work was done to salvage teeth, more frequent maintenance or retreatment can be critical.
- Stage 4 patients in theory should be checked at 3–4 months, but considering that stage 4 teeth were likely extracted, the remaining teeth could be more stable. Efforts should be made to keep them so.

HOME CARE

- Successful home care can have a big impact. Brushing is still the gold standard but takes patience with the pet. The form of home care should be selected for the patient–client relationship/aptitude, doing as much as possible, but not overstepping boundaries that could injure the pet or client.
- Do a "taste-test" with the flavors of toothpaste you carry. You will be surprised at how many dogs have a preference. If there is no preference, let the owner decide. This is usually not effective in cats.

• For smaller dogs and cats, approach them from behind instead of from the front, which can be a dominant move. Scratching the chin or rubbing the face can precede any home care efforts, from introducing tooth paste or a dental wipe on a finger, to brushing.
• Encourage whatever home care you can but understand that compliance may not be the best. If home care is not possible, then more frequent dental exams and cleaning may be needed.
• Anything provided for dental chewing should pass the "thumb-nail" test: you should be able to indent the chew with your thumb-nail, and it should be flexible or compressible. Objects that are too hard (cow hooves, bones, antlers) can break teeth!
• The Veterinary Oral Health Council (www.VOHC.org) provides a website with products intended to help retard plaque and tartar on the teeth of animals.

SENIOR DENTAL CARE

• Many of our dental patients are older, and the cumulative effects of periodontal and oral disease result in an increased incidence of problems in this population, including oral tumors. There are added concerns of comorbidities and anesthesia, but the benefits of care outweigh the risks in the great majority of patients. Providing a reasonable quality of life includes good dental care.
• Use general senior care and dental care collaboratively:
  ◦ If a pet has just had a senior care profile and examination, that is a great time to consider dental cleaning and treatment, if the diagnostic parameters are stable.
  ◦ The need for dental care in an older patient can be a good reason to finally get the bloodwork, urinalysis, and even thoracic radiographs done for a patient that is overdue.

FELINE DENTISTRY

• Problems that can occur in cats' mouths may be a good reason to get them into your clinic if overall feline visits have declined.
• On oral exam, the mandibular third premolar should be examined, as that is the most common place for tooth resorptions (TR – formerly known as feline odontoclastic resorptive lesions (FORL)) to occur. If one is present, the entire mouth needs radiographs and one or more extractions may be necessary.
• The presence of plaque or calculus, often heaviest on the maxillary fourth premolar, should be pointed out to the owner. However, the "thumb-nail flick" to remove a large chunk of calculus does not constitute a dental cleaning! Follow up with a complete dental procedure, under anesthesia.
• Areas of intense inflammation or ulceration may alert you to the potential of stomatitis (feline chronic gingivostomatitis (FCGS)). With any painful cat, it may be difficult to examine the entire mouth, so a complete dental exam and cleaning under anesthesia is necessary. Evaluation of the caudal mouth is a critical step: presence of inflammation ulcerations in this area (caudal stomatitis, not faucitis) is a typical sign of type 2 FCGS, and most patients benefit from at least caudal mouth extractions.

EXAMPLES

HANDLING PET PARENT QUESTIONS

"I don't want any extractions/how will he eat without those teeth?"

• While we like to preserve any tooth we can, any persistent infection or pain is not worth keeping a diseased tooth in the mouth. Most patients eat better after the teeth are extracted – even with full mouth extractions.

"Can't you do dentistry without anesthesia?"

• No. Backed by position statements from several organizations, non-anesthesia dentistry (NAD) can never give the level of care the patient needs. A full anesthetic event protects the respiratory tract with an endotracheal tube, allows intraoral radiographs and full examination including dental probing, and provides immediate capability to handle disease that is often found.
• Despite assurances of NAD providers, "gentle" handling even with a calm patient is apt to cause anxiety and some level of discomfort, which could be considered a wellness concern for the patient.

CAUTIONS

BUILD THE VALUE OF WHAT YOU DO

• When it comes to "phone shoppers" – beware! If you are doing good-quality dental procedures with excellent anesthetic protocols and monitoring, dental radiographs, and complete subgingival evaluation and management, you will not be able to match a low-cost clinic.
• A dental estimate should not be given out over the phone, because even the initial alert exam will not be able to determine all the problems present. Encourage a dental exam, even make them complimentary, so you can show the client your initial assessment of the oral and dental problems. Give them a tour of your clinic and dental facility and point out the aspects of your practice to build the perception of value of what you provide.
• A photo album or electronic photo frame can walk a client through the myriad steps and procedures accomplished during a complete dental assessment, cleaning, polishing and radiographs, not simply a "prophy" or a "dental."

BE CAREFUL OF ESTIMATES

• The biggest surprise in dentistry is when there are no surprises – a straightforward dental cleaning with no hidden lesions!
• The alert oral exam can only begin to provide a preliminary estimate or treatment plan. It is not until the complete assessment with radiography is finished that all information is compiled and the treatment plan can be updated (that second call to the owner).
• While many owners will want some indication of financial expectations at the beginning of the procedure, good communication will help them understand that hidden problems are quite common.

MISCELLANEOUS

ABBREVIATIONS

FCGS: Feline chronic gingivostomatitis
FORL: Feline odontoclastic resorptive lesions
NAD: Non-anesthesia dentistry
PD: Periodontal disease
TR: Tooth resorption

5.17. Discussing Pain Management

BASICS

OVERVIEW

• Treatment of pain and suffering in animals is probably the single most fundamental and essential requirement of veterinary practice.
• Human healthcare providers have invested significant time and money into researching and using methods, drugs, and techniques, both invasive and noninvasive, conventional and alternative/complementary, to treat and resolve pain as a pathologic entity. Pet owners relate to pain and do not want their pets experiencing it.
• As society has become increasingly aware of animal suffering and animal welfare in daily practice life, veterinarians have recognized that control of pain and suffering, though largely symptomatic and oftentimes palliative, is not only a major moral and ethical imperative, but is largely necessary to treat disease and heal the patient. It is also almost always economically feasible through some means, regardless of the client's economic status or the animal's physical condition.
• Pain management also makes business sense because our clients want to ensure that their pet is not suffering, nor in pain or disabled. Clients may not understand the specifics or scientific terms involved in many or most of the diagnostics and the treatments we provide; however, they can easily relate to hurt and the desire to not hurt. So simply assessing pain, and explaining consequences to the owner, often brings about consent to better treatment plans.
• In the past, many veterinarians believed that pain was a natural, inevitable, acceptable, and even a harmless consequence of disease, surgery, and trauma. There was even belief that animals did not experience pain – that they were incapable of feeling pain as we knew it. We now know that animals can and indeed do experience pain and suffering similar to our pain and suffering; they simply cannot verbalize or communicate what they feel. Suffice to say, pain scoring and recognition are critical in *all* medical and surgical patients.
• Unmitigated pain is not only a physiologic stressor, but it affects numerous aspects of emotional and physical health, from convalescence and healing through disease progression to behavioral consequences. Despite medical and surgical treatment of disease, pain often persists. Although this may seem to be a large problem, it also offers a unique opportunity for veterinarians to acknowledge, prevent, and treat a classically overlooked aspect of animal health.
• Pain treatment can be methodically addressed via validated acute or chronic pain scoring and quality of life assessment tools.
• Over the course of the last decade, diversion of both veterinary and medically prescribed opioids has resulted in their reduced intra- and extra-hospital use. This, however, has increased opportunities to treat pain using nonpharmacologic and nontraditional medications, techniques, and modalities, many of which have promoted a focus on provision of pain management and quality of life for companion animals. Training of staff in these areas, and offering of these services can offer opportunities for increasing client traffic and revenue.

TERMS DEFINED

Complementary Therapies: Therapies used to augment conventional medical and surgical remedies versus alternative therapies, those used *instead of* conventional medical and surgical remedies.
Diagnostic Local Blockade: The use of local and regional perineural block and peri/intraarticular techniques to confirm the presence of pain by the reduction of pain response once administered.
Integrative Medicine: The use of complementary and conventional diagnostics and therapies in health and disease.
Interventional Pain Management Techniques: The use of invasive interventions such as joint injections, epidural or spinal injections, perineural or local/regional blocks, infusion therapies usually preceded by or using advanced imaging techniques (computed tomography (CT), fluoroscopy, magnetic resonance imaging (MRI), ultrasound).
Myofascial Trigger Point Diagnosis and Therapy: The diagnosis and treatment of hyperirritable soft tissue (fascial, tendon, ligament, muscle) areas which are a source of pain, decreased healing, and altered function.
Pain Score: The application of an objective rating to a subjective acute physiologic, psychological hurtful experience.
Palliative Care: The use of multiple sociologic, psychologic, medical techniques to provide symptomatic relief, comfort, and pain management with or without cure. Hospice care utilizes the same when no known cure is available or intended.
Quality of Life Score: The objective rating of criteria that determine how well an animal lives and daily functions long term, usually with a chronic disease, impairment, or pain.
Regenerative Medicine: The process of creating and implanting living, functional tissues to repair or replace tissue or organ function lost due to age, disease, damage, or congenital defects.
Rehabilitation Modalities and Therapies: Techniques and tools used to enhance and restore functional ability and quality of life to those with physical impairments or disabilities via focus on connective and nervous tissues.
Spinal Manipulation: The use of high-velocity low-amplitude joint manipulations to treat neuromusculoskeletal pain and dysfunction in order to restore mobility within a particular musculoskeletal area.

ISSUES AND OPTIONS

ACUTE PAIN TREATMENT

• Acute pain treatment follows initial assessment and triage of almost every patient that enters a veterinary hospital. It may be the one vital parameter that most owners seek to address regardless of their animals' problems.
• Acute pain therapies tend to elevate the status of a general practice to more of an emergent center. They are one of the stabilizing therapies in triage, and they will evolve into a plan for daily care that owners truly recognize, and that which staff utilize to integrate "care" into the diagnostics/therapeutics of a medical/surgical problem list.

CHRONIC PAIN THERAPY

• Management of chronic pain is a means to improve client relations, involve nursing and technical staff in long-term patient care, address the "big picture" (not just the abscess, fracture, or the inflammatory bowel disease but the quality of life of the pet), practice higher quality medicine and surgery, and, via all these things, increase revenue.
• New(er) means of diagnosing via advanced imaging, and treating soft tissue and orthopedic pain such as regenerative medicine, interventional pain therapies, palliative and symptomatic treatments, supportive care of multi-problem cases, and rehabilitation are tools that enhance a practice's ability to care for their chronic need patients.
• If a practitioner seeks to increase office calls, rechecks, revenue, and business, simply using the words "pain," "suffering," "hurt," or "disabled" with the implication that we seek to "resolve" the issue is often enough to bring clients through the door repetitively.

BASIC PHYSIOLOGY AND RATIONALE FOR TREATMENT

• Pain is detected (transduced) in peripheral nociceptors, transmitted into the spinal cord by A and C nerve fibers, the signal modified in ganglion and spinal cord (dorsal horn interneurons), projected via specialized spinal cord tracts, and perceived (felt and processed) in many higher areas of the brain, including the thalamus, cortex, and amygdala. These A and C nerve fibers, if blocked or "treated" early

enough and proximal enough, are key building blocks of sound acute pain therapy, and a prudent means to prevent acute pain from becoming chronic pain. Examples of therapies that do this are locoregional blocks, which seek to pre-emptively treat surgical pain. Drug therapies that we associate most frequently with acute treatment of pain (opioids, dexmedetomidine, infusions) intervene by blocking this same continued transmission of pain at the level of the dorsal root ganglion and dorsal horn interneuron pool.

- Chronic pain therapies such as nonsteroidal anti-inflammatory drugs (NSAIDs), seizure medications, antidepressants, physical rehabilitative therapies, interventional blocks, and stimulation units, have their mode of action largely in the dorsal horn interneuron pool, ascending and descending pain pathways, and higher centers of pain processing.
- Because the pain pathway is complex, many chances for neuroplasticity occur. Neuroplasticity is a term that implies multiple parts of the pathway can be changed biochemically, depending on the intensity, duration, and frequency of initial and ongoing painful stimuli. It is responsible for acute pain enhancement and the establishment of chronic pain.
- Historically, chronic pain was perceived as pain that happened within a set time period of an obvious insult, trauma, or infliction. Time changes and it is now defined as that pain which can occur within hours or days of a perceived or actual insult, especially if the inflammatory "soup" in the spinal cord is already "boiling" (there is already inflammation or wind up present) or especially if the pain relief from the acute insult is insufficient (if we do not treat acute pain well enough).
- Some pathologic changes resulting from acute and chronic pain include: increased sympathetic output, increased thyroid and adrenal function, heightened pituitary output, hyperglycemia and insulin resistance, impaired neutrophil/overall immune system function, and abnormal protein catabolism. These are the fundamental physiologic and medical reasons why any pain should be (a) prevented to the best of our ability, (b) treated initially very aggressively, and (c) addressed regularly to be sure treatment is effective.
- Anything we can do to minimize, or better yet prevent, acute pain will reduce chronic pain, suffering, illness, disease, and disability. By treating pain, we improve our patient's chances of healing and health, regardless of what chief complaint, presentation, signalment, or medical/surgical issues we are dealing with.
- These premises describe why use of an opioid, NSAID, and/or alpha agonist in a "premed" for ovariohysterectomy or neutering surgery will not only prevent the pain of the surgery, it will also help prevent pain in the next few days following surgery. Most importantly, it will prevent ache, itch, irritation, cramping, discomfort, and abnormal posture weeks to months following the surgery.
- Treating acute pain allows a practice more efficient workflow, controlled schedule, less stress, and overall better patient-focused, versus goal-focused, care. Think of what one screaming animal and inefficient treatment of its stress, pain, and convalescence does to a day's schedule for surgery and appointments, let alone staff emotions and productivity.
- Treatment plans for chronic pain set precedence for follow-up appointments within minutes of its diagnosis. Once the owner is engaged that the veterinary team is "interested in assuring that no pain or suffering occur" for their family member, return visits seem reasonable, meaningful, and rational in light of the money spent on even somewhat academic diagnostics and even partially/possibly successful treatments.

HOW DO WE RECOGNIZE PAIN AND HOW WOULD A PRACTICE MAKE MONEY FROM THE DIAGNOSIS/TREATMENT OF PAIN?

Acute pain is usually obvious to the owner and the veterinary team. Once the terms "pain," "discomfort," and "suffering" have been stated/explained to the owner, the veterinarian's primary goal is to "score"/grade and then accordingly address the pain and suffering of the patient. Based on several different validated scales, scoring for acute pain is via:

- Heart rate
- Respiratory rate and character
- Gross behavioral signs of pain (vocalization, anxiety, protective movements, focusing, protectiveness, escape maneuvers)
- Mobilization or lack of mobilization (species dependent)
- Presence of abnormal posture.

Treatment of acute pain should/could commence before even most of the diagnostics become available and include a combination of:

- Opioids
- Alpha-2 agonists
- SPICE (stabilization, protection, ice, compression, and elevation) of wounds
- Emergent supportive therapies (fluids, temperature control, oxygenation, glucose, electrolytes)
- Locoregional blockade
- Continuous rate infusion(s)
- If patient is cardiorenal stable, injectable steroids or nonsteroidal anti-inflammatories
- Comfort (cage care, recumbency care, clip and clean, thermal support).

Each one of the options to treat acute pain may carry its own nominal charge (itself incorporating assessment and possible/absolute repeat within a set time period) or be incorporated into an initial "triage," "stabilization," or "admittance" charge. This charge can also be incorporated into "basic nursing," "intermediate care," or "intensive/critical care" charges, or alternatively, a "daily pain management" fee can be charged which includes any and all of above.

Chronic pain may not be as obvious to the owner or the veterinary team, but still is evident as "something awry in the daily life of the pet." Frequently, this can best be addressed and scored best during routine visits with quality of life questionnaires.

- Quality of life assessments have become useful tools in evaluating the presence or absence of chronic pain/suffering in our patients, the effectiveness of treatment (whether palliative or therapeutic), and the need for altered care (see 5.22 – Discussing Quality of Life and End of Life Issues). If these issues are addressed with every patient, they lead to a plan for symptomatic or complaint-based quality care that easily generates not only solid medical care, but also income, as well as recheck parameters/appointments which incorporate the owner's chief concern – the need to make sure the animal is comfortable.
- Essentials of chronic pain or quality of life scoring include: evaluation of the animal's emotional state, appetite, mobility, hygiene, ability to interact with people and other pets in the animal's life, sleeping habits, cognizance, intestinal issues, and dermatologic issues. Regardless of the problem or chief complaint, the owner/guardian/caretaker should be questioned as to how they feel the disease process has affected the animal's overall "normal functioning" with respect to each of these issues. All these answers coalesce to form a template that helps the clinician not only address the patient's primary problem, but also the owner's interests, both of which are ultimately linked to sound medicine, transaction fees, and return visits.
- Treating chronic pain involves the ability to always offer the owner alternatives to euthanasia. In fact, hospice care is treatment of chronic pain through illness or toward a natural, not enforced death (euthanasia) (see 1.24 – Hospice and Palliative Care). This problem-based, symptomatic, or palliative philosophy can act as a major marketing draw for alternative therapies such as acupuncture, chiropractic, injection therapies, infusion therapies, and even advanced imaging and interventional therapies.
- Treatment of chronic pain is via a multimodal approach which often includes conventional anti-inflammatory and opioid medications,

5.17. Discussing Pain Management

novel calcium-modifying agents, sodium and potassium channel agents, regenerative therapies such as mesenchymal stem cells and platelet-rich plasma, rehabilitative modalities and techniques, integrative therapies, appropriate diet and care techniques, interventional injection and infusion techniques, and palliative and hospice care.

TOOLS

• Scoring or gauging acute pain is important. These scores are usually performed by doctors, technicians or assistants in concert with owner's commentary. Validated scores for feline and canine patients (Glasgow, Colorado) exist.
• Chronic pain or quality of life scores for gauging chronic pain are usually performed through questionnaires via technical staff, reviewed by the doctor prior to entering the exam room, and then used as a tool to streamline care and rechecks for the multi-problematic but stable patient.[1,2]
• Activity monitors have become available as objective means to track multiple vital parameters, behaviors, motion, mobility, and intensity of activity. These monitors, along with means of gait analysis and advanced imaging changes, help to objectify chronic pain and its successful or unsuccessful treatment.

A variety of other tools can be very helpful in facilitating the management of pain in companion animals:
• Drugs: Narcotics/opioids, including more potent mu-opioid receptor agonists (e.g., fentanil, alfentanil, and oxycodone); alpha agonists (e.g., dexmedetomidine); NSAIDs; corticosteroids for acute injectable use and chronic use; local anesthetics (e.g., bupivacaine and lidocaine); ketamine; antidepressants, behavioral modification drugs; support products (e.g., fish oils and PSGAGs, vitamins, supplements); antiepileptic drugs; joint injectables (e.g., corticosteroids, hyaluronate, medical silicone, PSGAGs, sedatives, and tranquilizers).
• Digital radiology unit.
• Triage area and intermediate hospitalization area for more critical or intensive patients requriing acute pain stabilization.
• Nerve block needles, epidural needles, indwelling local and epidural catheters.
• Infusion and fluid pumps for continuous rate infusions.
• Neurostimulation locator, needles.
• Ultrasound with 7–12 MHz transducer for soft tissue/nerve diagnostics and location.
• Rehabilitative therapy equipment including ice and heat packs, cold circulation units, exercise balls, therapeutic ultrasound, laser therapy, underwater treadmill, variety of harnesses and lift devices, electrostimulation (TENS and NMES) units; water flotation and exercise poole, land treadmills, solid rubber exercise flooring.
• Simple casting materials for bracing and orthotic/prosthetic casting.
• Carts and mobility devices.
• Acupuncture needles, electrostimulation units.
• Extracorporeal shockwave unit.
• Ultrasound, thermography, fluoroscopy, magnetic resonance imaging, computed tomography.
• Overhead lift unit to mobilize larger downed patients.
• Use of a compounding pharmacy and good pharmacologic working knowledge.

FINANCIAL BENEFITS OF ANALGESIA

• Increases in indirect revenue streams stem from contented staff who take pride in better handling of cases, overall improved quality of acute and chronic care, relieving patient's pain, and better client satisfaction.
• Overall workflow improves as in-hospital patients get better quicker and more efficiently. Clients who recognize your commitment to relieve their animal's suffering are likely to return, and likely to refer.
• Direct revenue increases arise from charging for medications and service provision, as noted above. Some of the most profitable sources of pain management stem from NSAIDs and other drug options offered, advanced imaging necessary to diagnose sources of pain, alternative therapies such as acupuncture, myofascial techniques, interventional pain treatments, rehabilitation modalities home programs, supplements/nutraceuticals and food-based treatments, locoregional c blockade, and chronic care follow-up visits.

EXAMPLES

N/A

CAUTIONS

• You and your staff 's training in pain scoring, newer analgesic techniques and drug accounting requires time, repetitiveness, patience, and a certain amount of trial and error.
• Very little financial investment is required to assess, prevent, or treat pain or to improve upon this within our practices. Training is available through multiple online sources, websites, standards (AAFP, AAHA, WSAVA) and is rarely wasted.
• Rehabilitation workshops and certification courses may require initial investment in training and equipment but income is generated through packages often added onto hospitalization for critical cases or surgical post-op care.
• Human pain treatment centers provide multi-specialty care for human patients who are in pain, disabled, living with cancer or other chronic disease. Visiting one of these "centers" or "clinics" can open a veterinarian's eyes to what we regularly are not providing to our patients – but certainly could.
• Identifying whether pain is present in each of our patients is a must. Gauging that pain and treating it is a means of improving one's practice. This requires training and equipment, which are balanced by increases in revenue generation.

5.18. Discussing Anesthetic Risk

BASICS

OVERVIEW

- No anesthesia is without risk.
- Anesthetic risks range from minor sequelae, such as nausea, to major complications, such as cardiopulmonary arrest.
- The primary anesthetic complications in veterinary medicine include intra-operative hypotension,[1–3] opioid-induced dysphoria,[4–6] cardiac dysrhythmias,[3] post-operative regurgitation and vomiting,[7] aspiration pneumonia,[8] cerebellar dysfunction,[9] blindness or deafness in cats,[10–12] and death.[13]
- The risk of anesthetic death in veterinary patients is greater than in people: healthy dogs and cats carry a risk of 0.05% and 0.11%, respectively, compared to 0.02–0.05% in human patients.[14–17]
- Many veterinary clients are fearful that their pet could die under anesthesia.[18]
- Fearful veterinary clients may be reluctant to pursue medical or surgical care that requires anesthesia.
- Fearful clients may require hand-holding by the veterinary team to reduce anxiety.
- Addressing client concerns is an important step toward transparency: clients need to fully understand the risks involved before adverse outcomes arise.
- If clients know what to expect and what precautions you will take, then they are more likely to trust the practice.

TERMS DEFINED

Anesthesia: A medically induced state that is characterized by the patient's loss of sensation and/or awareness.
General Anesthesia: Drug-induced loss of consciousness to conduct invasive medical or surgical procedures.
Local or Regional Anesthesia: Drug-induced loss of sensation that targets one or more body parts without rending the patient unconscious.
Sedation: Administration of one or more drugs to reduce anxiety and improve patient tolerance of a medical or diagnostic procedure.

ISSUES AND OPTIONS

ANESTHESIA IS ROUTINE FOR US, BUT NOT FOR OUR CLIENTS

- It is common to use anesthesia in veterinary medicine to perform diagnostic and surgical procedures.
- Because anesthesia is familiar to us, we may forget to consider our clients' concerns or reservations.
- These missteps lead to missed opportunities to engage in an open dialogue with clients about anesthesia: what it is, what it involves, and what can go wrong.
- Consider what your practice does before, during, and after anesthesia to reduce patient risk.
- Initiate conversation about anesthetic risk and what your team is doing to maximize patient safety.

HOW CONCERNED ARE CLIENTS ABOUT ANESTHESIA?

- A 2016 survey questionnaire by Englar et al. asked dog and cat owners to rank their level of concern with regards to their pet undergoing general anesthesia.[19]
- Pet owners that scored their level of concern as an eight or higher on a scale of 1–10 gave the following reasons:[19]
  - They considered their pet to be their child.
  - They were aware that their pet had one or more risk factors.
  - They were afraid of the unknown.
- Those that scored their level of concern as a three or lower explained that they had anesthetized their pet before with positive results, or they trusted the veterinary team implicitly.[19] That trust stemmed from an honest, open conversation about what could possibly go wrong and if that happened, how the veterinary team would intervene. Trust was in place bcause there was a plan.

HOW MUCH IS CONVEYED TO CLIENTS ABOUT ANESTHESIA?

- According to dog and cat owners, one-in-three veterinarians and one-in-two veterinary technicians do not mention anesthetic risk during pre-surgical consults.[19]

5.18. Discussing Anesthetic Risk

• Although the majority of dog and cat owners are required to sign paperwork that acknowledges the potential for anesthetic risk, many clients either do not understand what they are signing or do not take the time to read the form.[19]

WHAT DO MOST CLIENTS WANT TO KNOW ABOUT ANESTHESIA?

• Clients want to be informed.[19]
• Clients want to understand the "why" factor:
  ◦ Why is bloodwork needed before surgery?
  ◦ Why is the patient fasted prior to surgery?
• Clients want to know who will be administering the anesthesia to their pet.
• Clients want to know who will be monitoring the pet when it is under anesthesia.
• Clients want to know what precautions will be taken to maximize patient safety.
• Clients want to know if their pet will be in pain during the procedure.
• Clients want to know how long it will take after the procedure for the pet to recover, both from the anesthesia and from the procedure itself.

EXAMPLES

ELICIT YOUR CLIENT'S PERSPECTIVE BEFORE THE PET IS ANESTHETIZED

• Ask your client if he or she has ever experienced anesthesia before, either in him/herself or in a pet, including this one.
• If your client has experienced anesthesia before, ask him or her to share the experience with you.
• If you find that your client is particulary distressed about the prospect of the pet undergoing anesthesia, it may be that the fear is grounded in a previous negative experience.
• Use reflective listening to facilitate this discussion (see 5.8 – Reflective Listening): "It sounds like you are afraid that Darcy will have a bad reaction to anesthesia. Have you experienced something like that before?"
• Revealing the concerns that are hidden beneath emotion is time well spent: you need to understand what is weighing on the client's mind if you are to convince him or her that anesthesia is in the best interest of the patient. You also need to know what is bothering the client in order to effectively address it.

DISCUSS RISKS BEFORE THEY HAPPEN

• Acknowledge that anesthetic risks do occur, although they are rare.
• Identify what anesthetic risks are, including death. Although it is uncomfortable to mention this, particularly during pre-operative discussions for elective procedures, clients need to know in order to provide informed consent.
• Identify patient-specific risks. These may include:[20]
  ◦ Age
  ◦ Breed
  ◦ Temperament
  ◦ Abnormal vital parameters
  ◦ Abnormal physical exam findings
  ◦ Abnormal diagnostic test results
  ◦ Comorbidities
  ◦ Concurrent medications
  ◦ Prior anesthetic history
  ◦ Type of procedure
  ◦ Type of anesthesia.
• Be specific about which type of anesthesia you will be using (general, local/regional, or simply sedation). Explain how this choice may impact the patient.
• Determine the patient's American Society of Anesthesiologists (ASA) status (https://www.asahq.org/resources/clinical-information/asa-physical-status-classification-system) and discuss the implications of this with the client.
• Establish the level of detail that your client desires and gear the conversation toward that level of understanding. Keep in mind that not every client wants to know every means by which risk is reduced. However, these have been provided below as potential discussion points for the appropriate client.

5.18. Discussing Anesthetic Risk

- Explain how your practice reduces anesthetic risks:
  - Each patient undergoes pre-anesthetic evaluation.[20] This consultation includes a physical examination and diagnostic testing as determined to be appropriate by the veterinarian, client, and practice. The purpose of the consultation is to identify patient risk factors prior to the patient undergoing anesthesia so that the veterinary team can be prepared and take precautions.
  - The patient is stabilized, if necessary, prior to undergoing anesthesia.
  - The anesthetic plan is tailored to the patient based upon the patient's anesthetic risks.[20]
  - Those who are administering and monitoring anesthesia to the patient are experienced and well-trained.
  - The patient is monitored by means of one or more of the following anesthesia monitoring tools:[20]
    - Heart and respiratory rate
    - Temperature
    - Pulse oximeter (SpO_2)
    - Capnograph
    - Electrocardiogram
    - Blood pressure.
  - Patient monitoring does not end when the procedure is over. Patient monitoring continues through recovery.
- Determine the patient's cardiopulmonary resuscitation (CPR) code.

CAUTIONS

- Do not let medical jargon be the source of miscommunication: use easy-to-understand language to facilitate your discussion about anesthetic risk.
- Do not assume what the client does or does not know.
- Do not assume what the client wants or does not want to know.
- Do not downplay the risks.
- Do not use euphemisms about anesthesia that may be confusing such as "put to sleep." Be direct and clear.

5.19. GIVING AND RECEIVING FEEDBACK

BASICS

OVERVIEW

There are two broad forms of feedback in veterinary practice:

- One-on-one feedback between work colleagues – accidental or deliberate, formal or informal; often taking the form of a performance review.
- Feedback from client to the practice. Either solicited or unsolicited, sometimes asked for, often not.

Feedback is a form of communication in which people provide specific information about each other's behaviors (actions and performance) and how this affects them.

One of the most valuable contributions anyone can make to another person's learning is constructive comments or feedback. Similarly, one of the greatest gifts (to help them change/improve) that a veterinary business can receive is feedback.

Feedback may be positive or negative in nature, or simply an observation made without any judgment intended. Whether as a student or as a teacher, each one of us has the capacity, and in fact the obligation, to provide information to others that will help them improve (personally or business-wise) as well as being willing to accept feedback for our own or our business' betterment.

In a veterinary practice, feedback commonly occurs

- between staff members (generally from someone in a more senior to someone in a more junior position),
- from bosses to employees or team members,
- from veterinarians to nonveterinary staff,
- from staff members to clients, and
- from clients to the practice owner or manager about the practice's staff or service.

GIVING AND RECEIVING FEEDBACK

One may typically receive feedback from superiors, coworkers, and clients. Learning how to effectively give and receive feedback is critical for personal growth, team growth, and success.

- The way that feedback is delivered may be supportive or destructive in nature. However, even negative feedback can be delivered in a productive and supportive way.
- Typically, feedback is not properly thought through and therefore is often unintentionally destructive in nature.
- As important as giving feedback appropriately, is receiving feedback and taking it in and then using it constructively – no matter how it was delivered or intended to be delivered.

TERMS DEFINED

Criticism: Negative feedback that is generally destructive in nature. Often focuses on the person rather than the behavior or the task. Delivered in this way, many recipients feel attacked, reject the feedback, and hence no behavioral change ensues.

Negative Feedback: Feedback pointing out what someone has done incorrectly so that they can change it. This form of feedback should still be framed positively; however, in many cases it is not and becomes criticism.

Performance Review: A formal individual performance appraisal and/or review process. Generally performed by a more senior staff member on or about a more junior employee.

Positive Feedback: Feedback that is supportive of what someone has done, and framed positively.

ISSUES AND OPTIONS

PRACTICE FEEDBACK

- Many practice owners and/or managers assume that clients will voice a concern or complaint if they have one. This is not generally the case and perhaps only one in every seven or eight client complaints will ever get voiced.
- Many clients will actually leave a practice for another without ever complaining. Because of this you should view every complaint as an opportunity to keep a client.
- Veterinary practices may solicit feedback from their clients with respect to any and all client-related matters, including: waiting time; service levels; preferred opening hours; satisfaction with staff performance; range of services offered; staff communication skills; levels of understanding of the patients' problems; areas for improvement; products and services required; and products and services not-required. This is, in effect, carrying out a very inexpensive and very targeted research campaign that when acted upon can be a very powerful tool for growing the practice. This last phrase, when acted upon, is very important.
- Unfortunately, many practices will carry out all manner of surveys and then fail to act on the results obtained. This inaction obviously fails to generate any benefit from the work, effort, time, and money invested in the project.
- More importantly, clients noting this lack of change and this inaction will be much less likely to provide feedback when asked for it in the future. They may even feel slighted and are thus more likely to start considering other practices.
- When change is implemented based on client feedback (especially if the change made is more covert than overt), clients (especially those who gave feedback relating to or inciting this change) should be notified via email, mail, blog, newsletter, and so on, advising them of the changes that have been made, spelling out specifically the benefits inherent in these changes for the clients themselves, and thanking all those who provided feedback that led to the changes.

PERSONAL FEEDBACK

Constructive feedback is a conscious distinction between the person and particular acts of specific work, which may be subject to critical comment. This distinction emphasizes that the person is not personified by that which he or she does.

There are many characteristics associated with good feedback:

- The most important is the manner in which it is given. The style, tone, and content should be consistent and provide a constant message: "I appreciate you and what you have done and whatever else I say should be taken in this context."
- Comments should be addressed toward matters on which the person can act. Generalizations are particularly unhelpful. Comments should be timed appropriately. The person giving feedback should describe their views, be consciously nonjudgmental (use "I feel … when you …" phrasing; say what you mean and say what you appreciate; be explicit).
- Contemporaneous (at the time the action is observed) feedback is the most effective – it is also the hardest to do.
- Feedback should be given in person (not written) and in private. Many people are embarrassed by both positive and negative feedback given in public.
- Specifics should be prepared.
- The person giving the feedback should receive feedback openly themselves. It is important to regard feedback as the gift that it truly is.

5.19. GIVING AND RECEIVING FEEDBACK

EXAMPLES

CLIENT SURVEYS

Simple client feedback surveys can be carried out in all manner of ways:
- A simple question at reception as the client is leaving; "Mrs. Smith, on a scale of one to ten with one being very poor and ten being excellent, could you please rate your experience today?" Be aware that many clients may not be forthright when not allowed to be anonymous in their responses. If the score received is less than a certain value – say 8 – then the receptionist could dig deeper with something along these lines; "Wow, thank you for that feedback. Can you share with me what we could have done to earn a ten?"
- Simple, short surveys that change on a weekly basis will allow a practice to very quickly assess (and hopefully address) client satisfaction with key client service areas from waiting time to car parking to satisfaction with their veterinary experience.
- Another way to carry out a verbal, informal-type survey is for a receptionist or paraprofessional to ask the questions previously detailed as part of the post-visit courtesy call follow-up process.
- More formal surveys can be carried out through the mechanism of online surveys using a free tool like Survey Monkey (www.surveymonkey.com) or through various paid sites. In general, getting a client to go to these sites in their own time to fill in a survey is challenging. Most clients are in fact too busy. Inducements of various types (lottery tickets, movie passes, contributions to pet charities, etc.) certainly do assist in increasing response rates. The key here is to ensure that the survey is kept short (5–6 questions) and that the client is told by the receptionist that the practice *wants* the client's opinion and will act on it. When the client receives a short email or text (SMS) contemporaneously after the visit (within an hour), survey completion rates will typically be around 50–60%.
- Sending the client home with a questionnaire or emailing them a survey form are other options. These are more likely to be completed by the client than is an online survey. Again, response rates will be improved if the client receives a small thank-you gift in return. If the client needs to return the survey to the clinic, ensure that a postage-paid, self-addressed return envelope is included for the client to use. Including the thank-you gift with the survey form, or including it in with the email, or in with the newsletter, etc. (in anticipation of completion and return of the survey), will result in higher response and return rates than the alternate scenario where the client is advised that they will receive something if they complete the survey.
- Consider electronic surveys that can be conducted while the client is still in the hospital, but that give the client the option of remaining anonymous if they so choose. This can be completed on a variety of smart devices.
- Even more formal "surveys" take the form of client focus or advisory groups or "boards." These groups allow the deeper exploration of various aspects of practice performance (see 6.21 – Client Focus Groups). In order to obtain the best benefits, they must be led by an experienced facilitator. They do take time and effort to implement, but when carried out properly they can provide huge benefits.

A key area on which the modern practice needs to focus is client reviews – Yelp, Google and Facebook being the main ones at the time of publication. The modern veterinary client pays as much credence to these reviews as to personal recommendation. Ensure that you ask every client to complete a review for you.

What is the best form of client survey? The best overall simply-obtained survey results will be from a focus group combined with short verbal customer feedback gathered at reception or at the courtesy call.

INDIVIDUAL PERFORMANCE REVIEWS

Individual performance reviews are mandatory to the continued improvement of all team members, but they are rarely carried out with consistency in veterinary practices. Reviews need to be conducted often enough so that they relate contemporaneously to the performance under review (see 3.19 – Staff Performance Evaluations). If they occur only at wage-review time, they lose much of their benefits.

Many reviewers assume that if/when they give an employee a poor review the person will know the needed action/behavior change required in order to improve. This is often not the case and it is therefore better that the desired behavior be specifically detailed (see 3.14 – Staff Development). Forms of reviews include:
- self-review,
- peer review,
- supervisor to employee,
- 360-degree review in which supervisors, peers, and subordinates all get to provide feedback,
- combination of some or all of the previous.

All forms have their advantages and disadvantages.

CAUTIONS

CLIENT SURVEYS

- Ensure that action is taken in response to client feedback, otherwise some form of client backlash (which may vary from never offering feedback again all the way through to switching to another practice) may occur.
- Ensure that all surveys are carried out on a representative sample of clients. If this is not done, then you may get a very unbalanced and nonrepresentative result. Any action and/or change that is pursued based on these results may not result in the practice improvement that was envisioned.

STAFF REVIEWS

- These need to be carried out regularly and consistently – every three months is a mandatory minimum, every month or two is more desirable but harder to do logistically.
- Ensure they are not just negative in nature but also focus on what specifically the person under review needs to achieve/do in order to receive a better next review.
- In order to get the best results, involve the reviewed person in the review process and show them the benefits that will ensue for them – either personally or professionally.
- Consider carefully before you link a review to a salary increase or other form of bonus.

5.20. DELIVERING BAD NEWS

BASICS

OVERVIEW

Some of the most challenging conversations that veterinarians must have with clients involve sharing bad news. While sharing bad news is often quite distressful for the client and family, it can also be distressful for the veterinarian and care team. Many veterinarians do not feel competent or comfortable about delivering bad news.[1] While it will never be easy to be the bearer of distressing news, veterinarians can gain confidence and competence by mastering specific communication techniques for navigating these emotionally charged interactions.[2] Strong communication skills bolster the veterinarian–client relationship and foster collaboration.

Although veterinarians are often the primary deliverer of bad news with clients, other veterinary professionals such as nurses and technicians can contribute to how the discussion is perceived by the recipients of the news (client and/or family).

Consider that the news and information that you share will assist clients and families in moving forward with the best strategy or treatment plan for the care of their pet. The approach and manner in which you present the news has the potential to shape the experience for the client. Studies in medicine show that people repeatedly reflect on these conversations, for instance, the setting, the words that were used, the perceived emotional connection felt or not with the clinician(s) all being critical to how the person may adapt to the news and treatment or next steps.

In veterinary medicine, the degree of bad news perceived by clients is associated with the role that the animal has in the client's life. The human–animal bond varies along a continuum that ranges from strong emotional ties to one where the client feels little or no attachment to the animal (see 1.19 – Importance of the Human–Animal Bond).

As stated, delivering bad news is often distressful for the client, yet can also be distressful for the veterinarian who delivers the news (see 2.8 – Compassion Fatigue and Burnout). This is an important and routine part of the veterinarian's role, and most veterinarians practice the task of delivering bad news and performing euthanasia several times per week.

Forms of bad news in veterinary medicine include the following:

- Unexpected loss
- Euthanasia decision
- Chronic illness
- Terminal illness
- Treatment failure
- Disease recurrence.

There are many sources of hesitation and fears shared by clinicians regarding the discussion of bad news. You may have experienced some of these which often are increased in situations when we do not know the client or family. This is often the case if working in emergency care or inpatient settings.

Common clinician fears regarding delivering bad news include:

- Client reaction
- Fear of failing the client and patient
- Not knowing all the answers
- Showing emotion
- Destroying client's hopes
- Lack of confidence and/or skills in delivering the news
- Feeling unprepared
- Confusion over how much information to share
- Limited time to share the news and tend to emotions.

Similarly, we also know that clients and families also experience fears and challenges when receiving bad news including:

- Fear
- Anxiety
- Cultural differences and preferences
- Level of comfort
- Lack of understanding
- Helplessness, loss of control.

There are specific skills, competencies, and communication protocols that veterinarians and care team members can learn and integrate into the practice setting to increase the effective delivery of bad news.

TERMS DEFINED

Bad News: Any news that is likely to be perceived by the client as distressful, unwanted, or unexpected.

ISSUES AND OPTIONS

There are a number of core communication skills that facilitate the effective delivery of bad news. These skills require that the veterinarian follow a protocol for helping us to remember the principles and techniques for sharing bad news with clients. This protocol was first introduced as a six-step model by Dr. Robert Buckman and was reintroduced in 1998 using the S-P-I-K-E-S acronym to prompt easier retention for clinical practice:[3]

- S = Setting
- P = Perspective
- I = Invitation
- K = Knowledge
- E = Emotions
- S = Summarize and strategize.

SETTING

Setting includes a mental rehearsal and creation of the physical setting that makes it conducive to the effective sharing of bad news. This also involves reviewing the plan for informing the client and responding to the anticipated emotional reactions and questions.

Create a setting with no distractions that allows for a focused discussion. ensure privacy to the extent feasible. In the absence of a separate room, the most private space with seating in the practice or hospital should be utilized. Tissues and seating should be accessible.

Allow adequate time. The chances are, you will need more than the usual 15–20 minute visit slot to connect effectively, address emotions and assure understanding.

Decide who is to be present? In emergency or inpatient setting, having more than one member of the care team such as a technician present provides continuity when the veterinarian returns to emergency care. If notifying a client about a death, it is vital that a member of the team accompany the veterinarian. Using this team-based model, the medical information needs and emotional needs are addressed. The client should be encouraged to bring along someone involved in the pet's care (e.g., family member, friend, etc.). Check for their preference for including others in the discussion.

Make sure you limit distractions. Cell phones should be turned to vibrate and "no interruption" instructions relayed to the care team so the client realizes that he or she is considered of utmost importance.

PERSPECTIVE

Steps P and I of the SPIKES protocol are based on the premise of "Asking before telling." In this case, before discussing the bad news, pose open-ended questions to find out the client's perspective and knowledge of his or her pet's health situation – what it is and whether it is serious or not. Numerous studies inform us that patient confusion contributes significantly to the distress commonly felt after receiving bad news, often due to the clinician's use of technical words and jargon.

Asking before telling builds a strong case for establishing what the client and family may already know and understand about the condition and perceived seriousness. For example, if the family thinks

their 10-year-old dog's limp is probably arthritis and the veterinarian highly suspects osteosarcoma with a recommendation of amputation, this information is going to require full concentration and listening skills before sharing the serious news of osteosarcoma. It is unwise to begin sharing information without first having a sense about the client's current understanding.

Start where the client is. Use open-ended questions (see 5.7 – Posing Client Questions Effectively: Open-Ended Inquiry) to explore:

"Tell me what you have been thinking might be causing Jake's limp?"
"What is your understanding of Jake's limp?"

If referred or seen by another doctor:

"Tell me what you took away from what Dr. Johnston told you?"
"It would help me to know your understanding about Jake's limping problem."

Once this question is asked, pause for the client to process the answer. He or she may respond in various ways:

"I'm really not sure but my last dog had arthritis and we gave him pain medication which helped."
"I think it might be just age."

Pay particular attention to the person's vocabulary and specific words used to help you determine the level of understanding and literacy level important in communicating effectively.

Reflect back on the information that was shared. This is referred to as active or reflective listening (see 5.8 – Reflective Listening):

"So, at this point you are wondering if it's arthritis like your other dog."

INVITATION

As mentioned in the previous section, invitation also requires asking the client before telling. In any conversation about bad news, the most important issue is not whether the client wants to know but at what level he or she wants to know the information. This is true for delivery of bad news, such as serious new diagnoses and situations in which prognosis may be known.

It is important to check in with the client first. Assess how much or to what degree the information will be given. Take comfort in knowing that there is very little chance of doing any harm in asking the client for their preference. Omitting this step will leave you unsure of whether you are providing too much or too little information.

Although full disclosure of bad news may stir a host of negative emotional reactions in the short run, most individuals do adjust in the long run. Uncertainty is a major source of emotional distress for individuals and gaining relief from uncertainty can be therapeutic.

While this assessment step can seem awkward, it is particularly important:

"Are you the kind of person who would rather focus on the big picture, or who wants all the details?"
"There are different ways I can share these lab results with you. I can give you many of the details. Or, I can give you the basics and spend more time discussing next steps? What is your preference?"

Will the client retain the information? Once people have heard bad news, they tend to not retain much of the information they are told after that. If this is true, it certainly provides a sound rationale for providing less detail when sharing bad news. Yet, many clients may ask for the details. Keep in mind that sharing bad news must be accepted from the outset as a process and may require more than one visit. We know that after people leave that first visit of hearing the news, the reality will eventually set in accompanied by anxiety and stress. As a result, accurate retention of the information shared at the visit is compromised. Thus, providing less information, avoiding complex language and conveying more empathic connection may be quite useful approaches to consider.

KNOWLEDGE

Knowledge refers to the actual words and manner of sharing the bad news. Begin with a forewarning or cautionary statement to the client. It gives the person a chance to prepare themselves to receive the bad news:

"I have some difficult news to share with you about the results of Ruby's blood test."
"I am sorry that I have to share some bad news with you now, is it ok for me to go on?"
"Mrs. Ellison, I wish I had better news to share about Stella."

Use opening statements such as "I wish I had better news" or "I am sorry to have to tell you this."

Throughout, use language that is understandable to the client, and be as honest and straightforward as possible. Use consistent and definitive terms to avoid unnecessary confusion. Avoid euphemisms such as "tumor," "growth," or "illness." If the patient has cancer, then this word should be used:

"Mr. Stoler, I'm afraid the news is not good. The growth on Spencer's neck turned out to be cancer."
"The latest blood test shows that Quincy has developed diabetes."

Pause. Give some time for the client to absorb this information.

When people hear serious news, adrenaline floods their bloodstream and they often will respond with strong emotions and vulnerable or confused thoughts. Be aware that adrenaline may take a few minutes to dissipate. Pausing is necessary before moving to a careful explanation of the facts or a discussion of the future. Allow a bit of time until the other person is in the right emotional state to participate.

This is new information and most likely distressful at that. Less is more. Use phrases that are easy to understand, such as "an infection in the blood" rather than "sepsis" or "spread" instead of "metastasized," "sample of tissue" rather than "biopsy," etc. Check to be sure they are ready to move on for additional information. If the person starts to cry, stop and be sure that they are once again ready to move forward. Be prepared to react calmly to what may be a very emotional response.

Remember that less is more. Deliver the information in small digestible bites, as people may shut down and not remember much else after the initial statement of bad news.

EMOTIONS

Typically, bad news triggers a strong emotional response in the receiver of the news. They may be shocked and speechless, or very matter of fact and unconcerned. Listening allows you to learn about the concerns and emotional response from the client. They will often express what matters to them or what is bothering them or at least give clues. Even though you may consider a prognosis to be excellent, all the client can think about is a previous pet or someone else's pet who died unexpectedly from the same illness.

Provide time and space. Support silence and allow the client or family to process and express what may be a set of confusing and conflicting emotions. At times, emotions may not be clearly expressed, such as when the client is silent. Supporting silence may be extremely difficult. It can be painful to sit through. However, it is a signal that you are willing to be patient and be present with them.

"I can see that this news I've given you is very distressing."
"I so wish I had different news to report. I can imagine how upsetting this is for you."

Empathic communication is your most versatile skill in addressing these emotions (See 5.10 – Empathy). While you may often feel a sense of empathy with patients, do not assume that because you feel it, clients will recognize it. It is important to demonstrate or show it through words and through body language.

Until an emotion is acknowledged, it is difficult to go on to discuss other issues. Addressing the emotional response does not have to take inordinate amounts of time. There is evidence that even conveying

5.20. Delivering Bad News

empathy with only a few words can reap benefits beyond satisfaction and ease but also improving how much information is retained. Speaking at a lower tone can reduce the level of anxiety – yours and the clients.

The following are all expressions of empathy that provide a deeper connection with the client and/or family:

- Validating statements: "It's understandable for you to be shocked and upset."
- Naming (tentatively) the emotion the client is expressing: "I understand you're angry about this turn of events."
- Normalizing statements: "Many families have difficulty making these kinds of decisions for their pets."
- Gesturing: Offering a tissue, while saying "Please take your time."
- Conveying support: "We will be with you all the way. You will not have to face this on your own."

Asking the family what they need and offering to be helpful are additional strategies that convey both empathy and compassion.

Finally, check your own feelings to ensure you have sufficient emotional control and readiness to address the next client sensitively. Attending to feelings of the client as well as your own in the interaction can really help the client not only in the moment, and can also influence his or her feelings, beliefs and attitudes about the veterinary team and overall experience.

SUMMARIZE AND STRATEGIZE

We have come to the final portion of our SPIKES model – S is actually two SS's – strategy and summary.

Briefly summarize the conversation that just took place and articulate a plan for the future. As in all client encounters, it is important to check in to assess their level of understanding of what has been discussed thus far. This will serve to reinforce the information that is important for them to know, and provide you with assurance that the news was shared and absorbed effectively.

"Can you tell me the most important points of our discussion today?"

Hearing the client's understanding in their words also provides you with a chance to fill in any gaps and address any misinformation or concerns that may have been left unspoken.

Be alert for signs of distress and assess the client's resources for support. This is also the benefits of working closely with your care team for assistance in calling someone to provide support and needed resources.

It is important that the practice has resources in the healthcare system and community for clients to be referred to for emotional and other needed guidance and support.

"Your main concerns at the moment seem to be …. Have I left anything out?"
"Is there anything else you would like to discuss before we finish today."

Emphasize the importance of a follow-up visit once the information has settled in, if appropriate, and schedule it prior to leaving the office. We know that patients who have a clear plan for the future are less likely to feel anxious and uncertain. Provide the patient with needed instructions at the end of the visit.

"Janice will schedule a follow-up visit before you leave today."

Allow time and attention to process these feelings. Acknowledging this stress and taking active steps to cope, which may be as simple as taking a breather before and after difficult client conversations, can enhance your effectiveness and allow you to focus fully on the informational and emotional needs of the client during such conversations.

Finally, document the information and be concise on discussions and important decisions. The documentation should include who was present. Documenting will ensure that consistent information is available to all of the healthcare team.

EXAMPLES

EXAMPLE 1: SPIKES – P = PERSPECTIVE

Assessment of client perspective is necessary for determining level of knowledge and understanding about their animal's condition, perceived seriousness, and feelings. This includes finding out how much the client knows and starting from there:

Client: *"I don't think that test did very much for Buddy."*
Veterinarian: *"What is your understanding of the reasons for Buddy's biopsy?"*

In this example, the veterinarian can elicit information from the client and correct any misinformation while tailoring the news to what the client understands. It can also serve the purpose of ascertaining if the client has unrealistic expectations, wishful thinking about the animal's illness, or overlooking important but adverse details of the illness.

EXAMPLE 2: SPIKES – I = INFORMATION

This includes finding out how much the client wants to know:

"How would you like me to give the information about the lab results? I can give you all the details, or I can give you the basics and spend more time discussing what the treatments are for Jasper?"

In this example, the veterinarian makes no assumptions about the amount of information that the client wants regarding Jasper's laboratory results and diagnosis. In the event that a client did not want to know any details, the veterinarian can then offer to answer any questions they may have in the future or to talk to someone else that the client designates (i.e., a relative or friend).

EXAMPLE 3: SPIKES – K = KNOWLEDGE

Giving bad news is the one-way part of the veterinarian–client dialogue in which information and knowledge possessed by the veterinarian is shared clearly and compassionately. It is imperative to avoid medical jargon and euphemisms when breaking the news to the client (see 5.5 – Translating Medicalese). Instead, use clear and simple language, speak slowly, and offer the client some positive words and statements when at all possible:

"I have some difficult news to tell you about Skippy's lab results. And, I'd like you to keep in mind that regardless of what I tell you about his results, I want you to know that the situation is serious but not hopeless."

In this example, the veterinarian prepared the client in forecasting the difficult news while framing the information with a sincere yet reasonable degree of optimism.

EXAMPLE 4: SPIKES – E = EMPATHY

Responding to clients' emotions empathically can be one of the most difficult challenges of breaking bad news. Emotional reactions can vary from silence to disbelief, crying, hysteria, denial, or anger. At times, emotions may not be clearly expressed, such as when the client is silent:

"Can you tell me how you are feeling about hearing this news about Tiger?"

In this example, the veterinarian asks the client an exploratory statement before making an empathic response. The veterinarian can then offer support and solidarity to the client by making an empathic response.

Following the disclosure of bad news, the veterinarian can observe the client for nonverbal expressions of emotions and let the client

know that their feelings are acknowledged by making an empathic and connecting statement.

> Veterinarian: *"Martha, I'm really sorry to tell you that the x-rays we took show that Luke's radiation treatment is not working. His tumor continues to grow."*
> Client: *(tearful) "I had a feeling this was going to happen."*
> Veterinarian: *(Moves closer and offers a tissue) "I know that this was not what you wanted to hear. I really do wish the news were better."*

In this example, the veterinarian acknowledges that the news is unpleasant and distressing. Further, the veterinarian adds a message that reflects his or her own emotional response, while attending to the client nonverbally.

CAUTIONS

- Ineffective communication skills can result in the veterinarian feeling uncomfortable and unable to effectively give bad news to the client, leading to a major source of distress for both.
- Poor communication in the delivery of bad news can cause client confusion and dissatisfaction that may negatively influence adherence to treatment recommendations.
- The quality of the veterinarian–client interaction in the delivery of bad news can have profound effects on the overall veterinarian–client relationship and, ultimately, the client's opinion of the practice.

5.21. DEALING WITH AN ANGRY CLIENT

BASICS

OVERVIEW

- Roughly 30% of interactions between human healthcare providers and patients are considered "difficult"and require the physician to step outside of his or her comfort zone.[1]
- There are no equivalent studies in veterinary medicine. However, if the average veterinarian participates in 100,000 consultations in a lifetime and up to 30% of these encounters are "difficult," then veterinary professionals weather a significant number of stormy encounters.[2]
- Most difficult interactions involve poor outcomes and unfulfilled or unrealistic expectations.[3]
- Emotions, such as anger, intensify difficult interactions.[4]
- When a client's anger is directed at the veterinary team, the veterinary team may react defensively or offensively.[5] Either reaction works against resolution of the situation.
- To effectively manage an angry client, the veterinary team needs to listen rather than react.
- It is essential that the veterinary team consider the client's perspective and create the opportunity for productive dialogue.[5]
- The mnemonic "ADOBE" provides clinicians with a step-by-step guide to diffusing anger.[6]

TERMS DEFINED

ADOBE: A mnemonic that was created by the Bayer Animal Health Communication Project to facilitate the management of an angry client. ADOBE stands for:[6] Acknowledgment of the issue; Discovery of meaning; Opportunity to demonstrate compassion; Boundary clarification; Extension of the relationship to include a neutral third-party.

ISSUES AND OPTIONS

WHAT TRIGGERS ANGER?

Anger is an emotional response to a circumstance or a situation. The following situations may trigger an angry response in a veterinary client:[4]

- Having unrealistic expectations about the outcome of a clinical case: for example, believing that a terminal patient can be cured.
- Hearing unexpected bad news about the health of the patient: for example, learning that a coughing dog has heartworm disease rather than a respiratory infection.
- Discovering that a medical error was made and has impacted the patient: for example, the patient was overdosed on a nonsteroidal anti-inflammatory drug and is now exhibiting renal dysfunction.
- Clients receiving estimates that exceed what they are expecting or what they can afford.
- Miscommunication that impacts patient care.
- Lack of flexibility with regards to scheduling. For example, the client may be unable to take off from work on a week day and may require weekend-only care; however, the clinic may not offer weekend services.
- The client not understanding the patient's diagnosis, prognosis, or treatment plan.
- The client not feeling welcome to contribute to decision-making with regards to patient care.
- Anticipatory grief: knowing that a beloved pet is dying and/or will be euthanized.

Nonveterinary situations may also trigger anger that then spills over into the veterinary clinic.[4] For example, on-the-job pressures or ongoing feuds with family may set the stage for a reactive client.

Anger may be an emotional substitute.[4] It may mask shock, guilt, shame, sadness, fear, confusion, and grief.

THE CONSEQUENCES OF ANGER: HOW IT IMPACTS THE CLIENT

The body reacts to anger as it would to stress: the autonomic nervous system is primed for a fight rather than a conversation.

- It may be difficult for the client to think straight and to articulate concerns.
- It may also be difficult for an angry client to distinguish reality from perception. What an angry client hears and what is said to the angry client may be very different.
- Misperceptions may corrode the veterinarian–client relationship and invite legal action.[1,6,7]

THE CONSEQUENCES OF ANGER: HOW IT IMPACTS THE VETERINARY TEAM

When a client is angry, he or she directs the emotion toward someone. Anger needs a target. When that target is the veterinary team, the veterinary team may struggle to defuse the situation. Being targeted is uncomfortable. In response to the discomfort of the situation, the veterinary team may respond by:

- Becoming silent and withdrawing from the conversation.
- Becoming reactive and sparking a fight.

Retreating from an angry client may be self-protective in the moment, but it does little to bring you and the client closer together. Reacting to anger with anger is equally ineffective: now there are two angry parties fighting to overpower the other.

ADDRESSING AN ANGRY CLIENT EFFECTIVELY

The ADOBE mnemonic outlines an effective strategy for managing an angry client:[6]

- Acknowledgment of the issue
- Discovery of meaning
- Opportunity to demonstrate compassion
- Boundary clarification
- Extension of the relationship to include a neutral third-party.

Addressing the elephant in the room is the first step: acknowledge that a problem exists. The following may be indicators that your interaction with the client is becoming difficult:[6]

- The conversation increases in volume or develops an edgy tone.
- Your client's nonverbal cues reflect a "closed off" posture.
- You start to talk over your client or vice versa.

If you pick up on one or more of these exchanges, then chances are that the client may be feeling the same way. Consider how the visit is progressing from the client's perspective. Ask yourself:

- Do the client's expectations align with your own?
- What is your client feeling and why?
- What can you do to help?

Use reflective listening to acknowledge the client's distress (see 5.8 – Reflective Listening):

"I can sense that this conversation is upsetting to you."

"From what you've shared, you had hoped for different news about your dog's condition."

Acknowledge that you are having difficulty with the interaction without casting the blame onto the client. Elicit the client's perspective:

"Please help me to understand what about your dog's condition is causing you the greatest concern."

"Please help me to understand how best I can help you."

Once the problem has been acknowledged, find common ground with the client. The majority of the time, that common ground is the patient. What you both want is what's best for the patient. Offer partnership to demonstrate your willingness to work together:

"I want to work with you so we can find a solution that is acceptable."

"I need your input so that together we can plan the next steps."

Express empathy. Envision yourself in someone else's shoes, understanding that no matter how hard you try, you will never fully know what it is like to be him/her (see 5.10 – Empathy). Empathy can begin with an apology, but goes beyond saying "I'm sorry." Empathy is deeper than sympathy. Sympathy is finding a way to say "I care about your suffering" whereas empathy is finding a way to say "I feel your suffering." Empathetic statements include:

"I can't begin to imagine how I would feel if I were in your position."

"I can appreciate that I would also be frustrated if that had happened to me."

Boundaries may need to be clarified or adjusted. Ask what the client expects of you and the practice. Ask what the client wants to accomplish with this visit. Be honest about what you and your team can and cannot provide, and explain why. Determine if the client is able to meet you halfway.

It is equally appropriate for you to convey your own expectations for the client. Just as clients have rights, they also have responsibilities. Although the veterinary profession is service-oriented, this does not give clients the right to treat us any way that they feel. Explain to clients what is expected of them with regards to their behavior, and be consistent. If a client is unwilling to abide by your rules, particularly if the client is verbally abusive or physically threatening, then it is within your right to ask him or her to leave.

Accept your limitations: recognize when you need additional support. You may need to refer the patient elsewhere. You may also need to look to the client's network for support. Ask the client if he or she has anyone else that you should reach out to. This could be a significant other, family member, neighbor, or friend.

Support may also come from outside of the client's network: for example, a pet loss support hotline or a community-based suicide prevention hotline. It is important to ask the client what resources are available to him or her and whether he or she has a plan to reach out to them. Ask the client if he or she needs assistance in finding these resources, and consider having a list of applicable resources in hand so that they are easy to access when needed.

EXAMPLES

- Diffuse anger by creating physical separation with space. Be cognizant of personal space and take care not to invade it.[8]
  - If the client is in the lobby, move the conversation into a private room.
  - Consider seating yourself in the examination room to reduce tension.
  - Invite the client to join you in being seated.
  - If the client does not join you, seat yourself anyway.
  - Lowering yourself may reduce the intensity of the conversation and lessen the anger.
- If the conversation continues to escalate, consider excusing yourself. This provides a natural break or pause, and gives you time to consider next steps.
- Use nonverbal cues to your advantage. Open your posture: avoid crossed arms. Engage in comfortable eye contact. Speak slowly and reduce your volume. Use a warm, inviting tone.
- Invite the client to share. Elicit his or her perspective. Find out what he or she is angry about and why.
- Speak less and pause more. Simply listen. An angry client wants to be heard.
- Use reflective listening to make sure that you heard the client correctly:

  "Am I correct to say that you would have wanted …"

  "What I heard you say is …"
- Take note of the words that the client uses to express his or her feelings and reflect those back to the client:

  "I can sense your frustration."

  "I hear that you're upset."
- Validate how the client is feeling:

  "It is normal to question if you did everything you could for your dog."

  "It is okay to be angry that your dog died."
- Apologize for how the client perceived the situation.

CAUTIONS

- Avoid defaulting to, "This isn't my fault," or "Don't blame me, I didn't do it!." Although these gut responses may be true, they only fuel the fire.
- Avoid "cold" terminology like "policy." Although it may be true that your office operates a certain way, the word "policy" sounds dismissive and mechanical.

5.22. Discussing Quality of Life and End of Life Issues

BASICS

OVERVIEW

• Empathetic and nonjudgmental communication during quality of life (QOL) and end of life (EOL) discussions is a cornerstone of client support.
• The EOL period embodies the critical final stage in a pet's life, and it is often just as important and meaningful as the sum of all care provided during that pet's lifetime.
• Despite its importance, the current veterinary curriculum is limited in preparing students to skillfully engage in QOL and EOL discussions; adding to this, is the fact that EOL discussions are arguably some of the most challenging and emotionally difficult conversations to have with a family.
• Empathetic communication is a skill that can be both learned and improved upon, and there are many programs available for healthcare professionals (see Recommended Reading).

TERMS DEFINED

Quality of Life: The total wellbeing of an individual animal that considers the physical, social, and emotional aspects of its life.

ISSUES AND OPTIONS

COMMUNICATION SKILLS

• Frequent, empathetic communication is the hallmark of effective client support during the EOL phase.
• Client grief responses can range from emotionally charged to stoic and "shut down." It is most helpful for the client to be able to express their emotions to an empathetic and nonjudgmental listener (see 5.10 – Empathy).
• Asking open-ended questions is one of the best techniques for initiating QOL and EOL conversations with a client (see 5.7 – Positing Client Questions Effectively: Open-Ended Inquiry).
• Reflective listening techniques include acknowledging you heard what the client has said, followed by summarizing their comments, and are helpful for facilitating difficult discussion topics (see 5.8 – Reflective Listening).
• It is important to remember that what you do not say is just as meaningful as what you do say. Allowing a person to sit in reflective silence and be present in the moment is an incredibly powerful form of communication and support.

COMMUNICATION CONSIDERATIONS: QUALITY OF LIFE

It is helpful to start conversations with "What are your goals for you and Sam?" Beginning in this manner helps guide conversation and frame plans. Most importantly, it makes the conversation client-centric right from the start and is a way to show that you care most about their needs and what they want.

When helping a family to assess their pet's QOL, there are three major areas of discussion to help guide client communication:[1]

• **The pet's disease or ailments:** It is important to discuss what the disease process means in terms of how it will make their pet feel and how it will progress over time, including the anticipated clinical signs that may be observed by the family.
• **The pet's personality:** It is important to discuss with clients how their pet deals with situations such as pain, symptoms specific to disease, willingness to receive treatments or medications, and what brings them the most joy on a daily basis.
• **The client's abilities, beliefs, and wishes:** It is important to discuss with clients how their pet's disease and treatment will impact their QOL, and to understand "how far" a client wishes to go with regards to therapies.

One of the most common questions asked is, "How will I know it's time?" When communicating with clients, it is recommended that you avoid canned responses such as "You will just know." While sometimes "knowing" is clear, for many families it is never as straightforward as this, and many clients express angst when their veterinarian tells them that they will know "when he's ready" and to come back for euthanasia "when it's time." These phrases can place a heavy burden on families when, more often than not, they have no idea when their pet is at the right point for euthanasia. When clients don't know, but feel that they should know, they become burdened with feelings of guilt and that they are not doing right by their pet. An alternative expression could instead be:

> *"When you begin to feel that Sam is not experiencing joy or quality of life, let's talk more about what that may mean to both of you."*

The emphasis is now placed on noticing changes and revisiting family goals, not the overwhelming or sole burden of making a final determination about euthanasia without support.

Assessment tools are available to help evaluate QOL. There is no perfect tool for all situations, and it is helpful to provide families with all resources, letting them choose the ones that best meet their personal needs.

COMMUNICATION CONSIDERATIONS: END OF LIFE

When discussing euthanasia, it is OK to be the first to broach the topic as many clients fear they will be judged if they are the ones to do so. Clients can fear that they will be perceived as not caring or that they are giving up on their pet. Gently approaching the topic opens up space for discussion and gives the client permission to express their QOL and EOL concerns.

The following guidelines will help the veterinary team to engage in supportive and thorough EOL conversations:
• Discuss all euthanasia and natural-death options with the pet owner. Do not exclude or minimize any single option.
• Pet owners may rely on the veterinarian's recommendation for the best approach to their pet's end of life ("What would you do if this were your pet?"), while others prefer to take the primary decision-making role. Understand and meet your individual client's needs.
• Describe EOL options to pet owners in language they can understand.
• Describe EOL options in a factual and nonjudgmental manner, discussing pros and cons of each option.
• Avoid a biased sharing of information that may influence a client's EOL choices in the direction of personal preferences.
• Support, do not judge, the pet owner's EOL decisions for their pet, accepting that their values and beliefs may be different from those of the healthcare team.

COMMUNICATION CONSIDERATIONS: EUTHANASIA APPOINTMENT

Communication during the scheduling of a euthanasia appointment should be done with empathy and concern, and when the client and patient arrive, a staff member should greet them and lead them directly to the euthanasia room.

Although it is important to adequately communicate what to anticipate with the dying process and postmortem changes, be sure to do so simply, and with as much or as little detail as your client wishes.

Consider the use of language and recognize how subtle word differences can have an impact; instead of saying, "When you are ready," say "When you are as ready as you can be."

Many families will want their pet's collar or leash. It is recommended that you have on hand a soft, decorative bag in which you can place such items so families are not left carrying out a leash in hand with no pet. This gesture nonverbally communicates caring and respect.

5.22. Discussing Quality of Life and End of Life Issues

A call from the veterinary staff the day following euthanasia is a way to exceed client expectations and raise the bar on EOL communications. Extra efforts in this area help retain clients following the EOL event.

Staff should not be afraid to communicate feelings of emotion – families want to know you care, and showing emotion is not unprofessional in any way. It is OK to hug or offer a gentle touch to your clients – small gestures can communicate far greater empathy than words ever can.

COMMUNICATION CONSIDERATIONS: AFTERCARE

Options for aftercare should be discussed in a simple and succinct way. Owners are sometimes concerned about how their pet's body will be cared for. The veterinarian should engage in a candid but gentle discussion and ask if the client has any questions or concerns.

COMMUNICATION CONSIDERATIONS: FINANCES

Discussing finances and collecting payment is one of the most difficult parts of an EOL appointment. Set up the team for success by sharing with the client the cost of care in advance, offering payments in advance when a service is anticipated in the near future, and gathering necessary information regarding the patient and the needs of the client ahead of time.

EXAMPLES

When discussing QOL/EOL, the veterinary team should always include the name of the pet in addition to expressing empathy: "I'm so sorry you and Sam are going through this; I understand what a difficult this time is." Open-ended questions invite the client to share information: "Share with me what your biggest concerns are with Sam's diagnosis."

Use softer words in place of more emotionally charged words. For example, instead of saying, "What would you like to do with Sam's body," say, "Have you thought about how you would like to care for Sam following his passing?" When discussing euthanasia, instead of saying, "I'm going to give an injection" or "He won't feel any pain," try, "I'll be giving him medication under the skin" and "This is a very peaceful process."

The following are useful communication phrases for common postmortem occurrences:

- **Agonal breathing:** "This is just Sam's body "letting go"; it is a very normal part of the dying process and his mind (or spirit) has already disconnected from his body; he is not aware, and this letting go process is not painful or distressful for Sam in any way."
- **Twitching:** "The death of the body happens in phases and this is one of the last. Be assured that death has already happened for Sam; this is a normal and expected last change to his physical body."
- **Stretching or arching:** "This happens frequently to pets who die on their own at home; this tells me Sam's body was very ready to pass. Please know Sam is not aware that this is happening to his body, and that this is not distressful or painful to him in any way."

Note how the pet's name is used in each communication.

CAUTIONS

Do not pass judgment when communicating with your clients. Lack of support from the veterinary team can leave a family feeling guilt about their decision for years to come.

5.23. DEALING WITH A GRIEVING CLIENT

BASICS

OVERVIEW

As veterinary professionals, we have devoted our lives to the care and protection of the human–animal bond. The relationship between a pet and the pet parent is often deep and substantial, and the death of a pet can be a very difficult time for the owner of that pet. The veterinary profession is looked to for help and guidance through this time, before, during, and after death, while the pet parent, our client, resumes their normal activities without their beloved animal.

- For some pet parents, we can be the only ones who honor the relationship they have with their pet. Perhaps their boss belittles their request for time off or misunderstands sub-par performance, acquaintances express the sentiment that "it's just a dog," or "you can get another cat," and sometimes even the person's own family does not comprehend the depth of this relationship.
- The pet-owning public expects the veterinary profession to be the expert and advisor in all matters pertaining to owning a pet, including the loss of that pet.
- The pet is often in our care when death occurs, whether it is due to illness, injury, or humane euthanasia. We are the ones providing the last care to that pet in life (see 5.22 – Discussing Quality of Life and End of Life Issues), so we are the first ones who should provide care to the human family members left behind.
- We have access to the portion of the population experiencing grief over pet loss.
- The death experience for a person and their beloved pet will create memories that will last a lifetime, that person's lifetime, and will affect their perception of the veterinary profession and our level of compassion for both animals and the people who own them.

TERMS DEFINED

Companioning: The act of helping someone through the process of grief, without having the education or designation of counselor or therapist.

Empathy: The ability to share another's emotions; can take place automatically or without express knowledge due to the presence of mirror neurons in the brain.

Five Stages of Grief: Created by Elisabeth Kubler-Ross, the five stages are known as denial, anger, bargaining, depression, and acceptance. They do not happen in sequence, and a person does not necessarily experience all of these stages.

Grief: The constellation of internal thoughts and feelings we have when someone we love dies.

Mourning: When you take the grief you have on the inside and express it outside of yourself; the outward expression of grief.

Sympathy: The act or ability to understand and relate to the feelings of another.

ISSUES AND OPTIONS

Kubler-Ross is credited with identifying the Five Stages of Grief: denial, anger, bargaining, depression, and acceptance. They are meant to describe the phases a person goes through leading up to their own impending death, and also the phases experienced by the survivors of the loved one. However, they do not always occur in this way: a person might never experience one or more of these phases, and they may experience feelings not encapsulated in the five stages. The stages may occur in no particular order or over any specific period of time, and we must remember that everyone's grief is individual to them; it is their own.

A person's grief can be affected by any or many of the following factors:

- **Nature of the relationship:** There are often unknown factors involved in the relationship between our clients and their pets. Oftentimes the pet once belonged to someone who is now deceased, or the pet remained by this client's side during difficulties in life such as illness, tragedy, divorce, etc.
- **Age of owner:** Older clients can have a more profound relationship with their pet because they may be isolated from other human contact. The pet may have been shared with someone who is now dead, so that the loss of the pet triggers feelings of past loss.
- **Mixed feelings:** There are times when pets are challenging, which can result in mixed feelings about the pet while he or she is alive. When the pet dies, this can complicate the client's grief because they may feel guilty for those moments of disharmony.
- **Circumstances of the death:** No matter what the circumstances, they are all difficult. If a pet has been suffering from a chronic or terminal illness, the client likely has already been experiencing anticipatory grief. Sudden death is shocking, and the client will struggle to make sense of the loss. Humane euthanasia for any reason is difficult, and often clients will feel guilt, blame, and/or shame as a result of making this last loving choice.
- **Personality of owner:** Just as clients have different personalities, they will mourn or grieve differently. Some clients may shut down and become withdrawn, whereas others will be expressive. This is when the stages of grief depend on the person, as one may slip into denial whereas another expresses anger, often misdirected at the veterinary professionals.
- **Support system:** Often the veterinary professional is the only one who understands the bond between the client and their pet; therefore the veterinary profession needs to be prepared to provide support and resources for these clients.
- **Other stressors:** The grief process will be affected by the presence of other life stressors. The loss could be the final straw, or could be pushed aside until later.

When we "companion" someone through their grief, our role includes:

- empathizing from our own experience of pet loss,
- separating our own emotions from the client's emotions,
- letting the pet owner experience their emotions,
- not pushing, diminishing, or putting aside this expression of mourning,
- supporting them as they move through their grief.

A compassionate practice includes calling the family after the loss, at intervals such as two days and two weeks. This demonstrates our compassion, and we can determine how well the family is coping and if we should refer to more of our resources such as referral to a mental health professional.

EXAMPLES

The veterinary profession needs to be the clearinghouse for all the various resources related to pet loss and grief. These resources include telephone hotlines, pet loss websites, books and literature on pet loss for the family including the children, various ideas for memorializing the life of that pet, and a referral to a mental health professional who can assist the family if needed.

It is helpful to gather and prepare these resources in a packet that is given to every client who experiences pet loss. We should provide this packet to our clients even if the loss of the pet did not occur in our practice. At the very least, we should reach out and ask them if they would appreciate having more resources.

5.23. DEALING WITH A GRIEVING CLIENT

CAUTIONS

We are not "counselors," as we do not have the education or experience appropriate to provide mental health assistance. However, the term "companioning" has been used to reflect our role when supporting a grieving client.

We cannot make a determination if a client does, or does not, need to seek a mental health professional. For this reason, it is important that we provide that referral to every one of our grieving clients, to allow them the opportunity to make that choice for themselves. Providing the information also helps to normalize the option of seeking professional help if/when necessary.

We must also be aware of the experience of loss as it relates to us as caregivers; it is our patient dying, not just the family's pet. Controlling our empathy in order to provide the medical care we are responsible for can be exhausting, and can lead to compassion fatigue. We must pay attention to this and address our own mental health as we assist these families through the loss. (see 2.8 – Compassion Fatigue and Burnout).

We must realize that our profession is unique in that we could need to be present for euthanasia of a pet we have known for years, and minutes later we must meet a new client with a puppy in the next exam room. Besides the effect on us personally, we must realize that although this is routine for us, the loss of a pet is not routine for the family who is now grieving. We need to be present for them, both emotionally and physically, by providing them time with us if they so desire.

5.24. DEALING WITH A CRISIS

BASICS

OVERVIEW

A crisis is an emerging or sudden situation – often unexpected – that can affect (negatively or positively depending on its actions) the reputation of a business or institution. Crisis situations typically require an urgency of response that can long plague the affected party if not handled effectively. How a veterinary practice manages itself, looks out for its stakeholders and communicates during what can be a challenging time, can result in praise, potentially strengthening its reputation, or – if mishandled – can result in reputational damage beyond repair.

Of course, in a crisis situation, many factors are outside of a practice's – or any business' control. However, that does not mean that the entity is not in a position to *manage* and influence the outcome.

In view of the growing number of unpredictable events we are faced with these days, no veterinary practice should be without a plan for managing crisis situations. Such a plan helps the practice anticipate types of situations that could arise, as well as put in place protocols and procedures for handling every aspect of a crisis, from securing the premises to communication with stakeholders.

Crises can be internal or external. Internal crisis situations originate through the actions of someone or something within the practice. External crises are caused by outside factors often out of the practice's control. If handled promptly, some crisis situations can turn into opportunities for a practice. Read more about internal versus external crises under "Issues and Options."

TERMS DEFINED

Audiences/Stakeholders: Individuals that have the potential to be impacted by a crisis situation and that represent the front line of accountability for a business.

Communication Channels: The vehicles by which the above audiences/stakeholders can be reached.

Crisis: A situation, often unexpected, that has the potential to cause physical or reputational damage or harm to a facility, its personnel, and its constituents.

Crisis Management: A proactive approach to anticipating crisis situations and taking responsibility for how the situation is handled.

Crisis Plan: A written document that anticipates possible crisis situations and details how such situations will be managed from operational and communication perspectives.

External Crisis: A crisis that originates due to outside factors, in most cases, outside the practice's control.

Internal Crisis: A crisis that originates as a result of the actions of a practice employee or facility malfunction.

News Media: Any number of news and information outlets that might have an interest in covering a practice's crisis situation. Interest depends on the volume of news on a given day, proximity of the practice to news outlets, and nature/scope of the incident. Today, with cell phone cameras, anyone can be a news reporter and stories can quickly reach thousands via social media and even more via pick-up by major news outlets.

ISSUES AND OPTIONS

All practices will benefit from putting in place a crisis plan that anticipates the types of situations the practice might face, as well as how it will handle the immediate response required (see 12.10 – Emergency Preparedness for Veterinary Professionals). Such a plan should address the who, what, when, and where of a crisis by detailing who at the practice plays what roles, how communication will be handled, and how people and pets will be kept safe. Such a plan should include the following action steps:

- Anticipate
- Review
- Create protocols
- Define roles
- Identify stakeholders
- Determine channels
- Prepare.

The crisis plan becomes a living document that should be reviewed and updated regularly, addressed periodically with staff and shared with new personnel. A document on a shelf is no good if no one knows where it is or is reading it for the first time under duress of a crisis.

ANTICIPATE

As mentioned earlier, the source of crisis situations can be internal or external. Of course, possible crisis situations can vary greatly based on the following factors:

- Type/nature of the practice
- Location
- Workforce
- Facility.

Table 5-24-1 outlines possible crisis situations that could occur at any veterinary practice. Again, based on the particulars of a given practice, some of these may be more likely to occur than others. Each practice may have more situations to add to this list. In some cases, a practice may be directly involved and at the center or focal point of the crisis. In other situations, the practice may be drawn in due to past actions or simply due to location.

On the "External" side, practices may notice several scenarios to which they might think, "What does this have to do with us?" Again, even if the practice is not directly involved, it could be impacted by such incidents as tainted pet food or a local disease outbreak. A practice can be applauded for emerging as a champion and leader – or be criticized for standing by and doing nothing.

REVIEW

Given the types of situations that could occur, practices should conduct an audit to determine how well the facility would function in an emergency situation. This is the time to assess the functionality and adequacy of the following:

- Emergency exits/escape routes
- Lock-down areas
- Entry points and building access
- Pet evacuation and safety
- Access to utilities/shut-offs
- Data security (outside the scope of this content).

Practices should also review any past security breaches or threats and might consider hiring a security company to identify facility strengths

Table 5-24-1. Types of possible crisis situations.

Internal	*External*
Medical error/malpractice	On-premises vehicle accident
Pet harm or wrongful death	Fire
Owner /veterinary/staff wrongdoing	Client or pet injury
Owner/veterinary/staff misbehavior	Client medical emergency
Data breach	Natural disasters
Employee/client escalation	Random violence
Workplace violence	Client-related violence
Veterinarian or staff medical emergency or death	Client complaint or unflattering post
Facility malfunction (gas leak, power outage)	Tainted pet food
Current/past employee actions	Disease epidemic

and weaknesses. Search online under "threat and vulnerability assessment."

CREATE PROTOCOLS

If your practice has not already done so, develop procedures and protocols for managing the types of crisis situations it has identified. Make sure any existing protocols are current and up to date. Such protocols should contain instructions directed to veterinarians and staff for taking control of crisis situations and include the following:

- Securing the facility
- Contacting emergency personnel
- Ensuring the safety of clients and pets
- Administering emergency first aid
- Managing possible on-site news media (see more on this under "Identify Audiences" below)
- Communicating with clients
- Acting as spokesperson.

DEFINE ROLES

The next part of the crisis plan is to define responsibilities and who does what. Roles should be defined for critical protocols discussed above. Each role should have a primary person as well as a back-up in their absence or incapacitation. Each name should also include contact information.

IDENTIFY STAKEHOLDERS

Managing a crisis situation is all about managing information flow to ensure that stakeholders are kept informed. Key in a crisis is reaching all stakeholders before information trickles out to them through other sources, which often results in rumors and misinformation. Stakeholders should receive information as simultaneously as possible.

Prepare a list of your practice's stakeholders and make sure that contact information for each group is up to date (see more in "Determine Channels" below). Stakeholders include the following:

- Employees
- Clients
- Vendors
- Local influencers (politicians, law enforcement)
- Other practices
- Special groups (shelters, rescues)
- News media (include major news outlets).

When a crisis gains media attention, a practice's first responsibility is to its employees, clients, and pets, making sure that everyone is safe. A practice does *not* have to give media access to its facility which is private property or allow an invasion of clients' privacy. It *is* advisable to provide media with accurate information once you know the facts. Never speculate. Include basic media statements as part of how you "Prepare," discussed further down in this content.

DETERMINE CHANNELS

Channels are simply the methods of communication that you will have available for reaching out to stakeholders. Examine the channels the practice currently has in place that will enable quick, simultaneous and proactive communication. Identify any gaps in the practice's ability to communicate. Social media such as Facebook and Twitter will reach some constituents; however, keep in mind that not everyone is on social media or checking your practice's website. Also consider what to do if Internet connections are disrupted or phone lines are out.

PREPARE

In the event of a crisis, the practice will be called upon to provide information quickly and under stress. Prepare by assembling basic information that can later be incorporated into statements, alerts, announcements, and news releases. Be sure to check spellings for accuracy. Your crisis plan should contain:

- Name(s) of owner(s)
- Address/location
- Description of practice
- When opened
- Track record/performance
- Generic media statement (that can be tailored to the situation).

EXAMPLES

NEGATIVE REVIEW

You might think of this as no big deal – all practices get them – but if a review features a video of deceased pets in trash bags out in the back alley behind your practice, you have a crisis on your hands. (True scenario.)

KITTEN DIES; OWNER THREATENS LAWSUIT

At one practice, a kitten experienced post-operative complications and died as a result of the owner not following verbal instructions from the veterinarian. With a lack of documented post-operative instructions, the practice had no proof that instructions were provided, plus the owner did not take the verbal comments seriously. Crisis planning is also a good time to think about crisis *prevention*.

A CRISIS BECOMES AN OPPORTUNITY

One practice has a "Hot Scoop" email that goes out to alert clients of pet food recalls and local health issues, such as infectious disease scares. Each alert includes enough detail for pet owners to act on the information and also to find out more through the appropriate links.

CAUTIONS

For whatever reason, many veterinary practices lack a crisis plan. Perhaps they believe "it will never happen to them." Today, with social media and everyone under the proverbial microscope, a practice's actions are under even greater scrutiny. Avoid leaving crisis management to chance and risking your practice's reputation.

Marketing Management

6.1. THE BIG PICTURE: MARKETING, ADVERTISING, PROMOTION, AND PUBLIC RELATIONS

BASICS

OVERVIEW

• The concept of advertising is easy to understand. You create a message, and then you come up with as much money as you can to get the message out. For the most part, you can say whatever you want and you have great leeway to talk about how great you are. Sometimes it works and sometimes it doesn't, based on your messages, the media, and your "offer."
• The American Marketing Association (AMA) defines marketing as: "the activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large."
• Marketing deals with how clients or customers make decisions, assess products and services, and ultimately choose what they will purchase. Marketing techniques also help organizations refine their techniques in dealing with clients. Some of these techniques include enhancing services, redesigning products, and implementing programs that try to increase client/customer satisfaction.
• Public relations is a little harder to grasp. The Public Relations Society of America (PRSA) defines the practice of public relations as "a strategic communication process that builds mutually beneficial relationships between organizations and their publics."

TERMS DEFINED

Advertising: Creating and placing paid media messages.
Community Relations: Continuing, planned, and active participation with and within a community to maintain and enhance its environment to the benefit of both an organization and the community.
Counseling: Providing advice to the management of an organization concerning policies, relationships, and communications; in effect, "what to do."
Employee Relations: Responding to concerns and informing and motivating employees.
Marketing: Matching products and/or services to consumer need.
Marketing Communications: Combination of activities designed to sell a product, service, or idea, including advertising, collateral (printed) materials, publicity, promotion, packaging, point-of-sale display, trade shows, and special events.
Media Relations: Relating with news media in seeking publicity or responding to their interest in an organization.
Public Affairs: Developing effective involvement in public policy, and helping an organization adapt to public expectations; also a term used by military services and some government agencies to describe their public relations activities.
Public Relations: Building mutually beneficial associations with publics.
Publicity: Disseminating planned messages through selected media without payment to further an organization's interest.
Publics: Any group with some common characteristic with which an organization needs to communicate, including the media, government bodies, financial institutions, pressure groups, and so on, as well as customers and suppliers.
Research: Determining attitudes and behaviors of publics and their causes in order to plan, implement, and measure activities to influence or change the attitudes and behavior.
Special Events and Public Participation: Stimulating an interest in a person, product, or organization by means of a focused "happening"; also, activities designed to enable an organization to listen to and interact with publics.

ISSUES AND OPTIONS

There are entire bodies of knowledge for each of these three disciplines (advertising, marketing, and public relations), and the clear-cut distinctions are disappearing as efforts become integrated.
• A basic rule of thumb is that if the end result is to match goods or services to a customer need (a marketing function), advertising and public relations become tools for the marketing function.
• But if the desired objective is to advance the entire organization (a public relations function), marketing and advertising become public relations tools.

Working as part of an overall effort enhances each function, but here is a quick overview of the differences:

ADVERTISING

Advertising is absolutely the best avenue to use if you need to control message delivery (often because you have a totally sales-oriented message) or if you need quick results. Basically, if you have enough money you can buy the time or space to say whatever you want about yourself and your clinic (and sometimes even about your competition). Although you will build awareness, the downside is everyone knows you paid for the advertising, and if you're too boastful you may do as much harm as good (see 6.19 – Paid Advertising).

Even at its most effective, advertising can only induce your target audience to try you once. Make sure you are ready to deliver when the pet owners come calling.

MARKETING

The five basic components of marketing are: product/service attributes; marketing communications (this is where advertising, sales promotion, and publicity can support the marketing effort); market research; customer service; and sales management.

Marketing looks toward the future to determine which products or services should be aggressively promoted, which should be maintained, and which should be abandoned. It also helps businesses decide whether or not to acquire or sell, and establishes priorities for new product development.

In this process, you should analyze market share, segmentation (see 6.9 – Client and Patient Segmentation), product line extensions, pricing (see 7.12 – Pricing Strategies), distribution, cost efficiency, and so on. You should also spend time investigating your market for size, growth, competition, captive customers, and the opportunity to segment.

PUBLIC RELATIONS

Public relations paves the way for the sale of services and products. Internal motivation is also a vital factor that affects the bottom line by building morale, enhancing productivity, and creating team spirit. Effective public relations also helps recruit qualified employees and retain them.

Public relations provides an early warning system by avoiding disruptions that may occur when a single surprise issue or unplanned-for change arises.

Public relations can also help protect a long-developed reputation when an organization is under attack. For instance, Johnson & Johnson did not suffer declining sales, morale, or stock values during the Tylenol-tampering debacle in the 1980s, largely because of their expert public relations handling of the problem – communicating the company's position.

As public relations began to be recognized and employed by more organizations, definitions began to include, from the Public Relations Society of America (PRSA), the need for research prior to initiating

6.1. THE BIG PICTURE: MARKETING, ADVERTISING, PROMOTION, AND PUBLIC RELATIONS

actions; careful planning and thorough evaluation or measurement of results; a continuing, systematic process instead of a one-time or single activity; multiple audiences or publics; its role as an essential function of management; public participation, mediation, conciliation, arbitration, and accommodation as important tools; and the need, in most instances, for long-term commitment. The PRSA formally adopted a definition of public relations that has become most accepted and widely used: "Public relations helps an organization and its public adapt mutually to each other." In this definition, the essential functions of research, planning, communications, dialogue, and evaluation are implied.

SOCIAL RESPONSIBILITY

The phrase "double bottom line" was coined to explain the relationship between an organization and its social responsibility. It is now well understood and accepted that social responsibility does have a traceable effect on economic success for every type of organization. The leading role in "social accountancy" is usually played by the public relations staff in large organizations.

EXAMPLES

Not understanding the differences between advertising, marketing, and public relations keeps many veterinarians from using the best communications tool for maximum results.

There is an old joke that highlights the differences between the three: "Imagine you see a person you would like to get to know. Advertising is when you go up to the person and confidently talk about how you are the greatest person on earth and perfectly equipped to make every dream come true. Marketing is when you strike up a conversation and, while you are talking, you explain how he or she needs a friend and you are the right person for the job. Public relations is when he or she comes up to you and says admiringly, 'I've heard how wonderful you are and I'd really like to get to know you."'

Even from the early days, public relations has had to confront the problem of ethical practices. In the heyday of press agentry, practitioners could get away with almost anything. Many followed the dictum of circus promoter P.T. Barnum, who proclaimed: "Let the public be fooled." At the same time, businesses operated secretly and often fraudulently, and newspapers engaged in completely fictional writing, also known as muckraking or yellow journalism.

Public relations is about developing and maintaining beneficial, two-way relationships with the people who can influence your success – it is not just about writing press releases. Members of the media are a big influence, but so are customers, animal healthcare team members, industry leaders, community leaders, and others.

Public relations is hard to define, which is why it is probably the least understood tool of the three. As with any other form of communication, public relations objectives that support your clinic's overall strategy should be determined before plans are developed. But do not make the mistake of tying public relations objectives to sales. Take a longer term approach and use the tools of public relations to establish credibility, increase awareness, and build competitive distinction.

Always remember that if you are attempting to obtain publicity, you are at the mercy of the media outlet. You cannot control what is said about you, which makes the message more credible.

The best scenario is when all three of these disciplines are understood and used to support each other in an overall branding effort. Your clinic brand should convey the essence, character, and purpose of your clinic and your products or services. The powerful branding process affects all forms of communication and is the strategically thought-out declaration of who you are, what you believe, and why pet owners should put their faith in your services.

All of these efforts require time and commitment, but they build the intangible yet very valuable assets that can influence customer and employee preference, and ultimately strengthen your clinic's bottom line.

6.2. GIVING CLIENTS WHAT THEY WANT MOST

BASICS

OVERVIEW

• It might seem that clients are looking for high-quality medicine, and this is certainly a common enough sentiment in practice mission statements, but clients rarely know how to assess this in a practice, so they make decisions based on the information that is available to them. Accordingly, to keep clients satisfied and coming back for all their pet healthcare needs, it is important to give them what they want most.
• The value of a client is much more than the sum of any individual invoice. Their true value comes in the developed relationships that might span years and the lives of several pets. A loyal client base is the most valuable asset that a veterinary practice possesses. Without it, the level of medicine practiced in the facility is almost irrelevant. Therefore, veterinary practices must endeavor to keep their clients satisfied, and that means giving them what they want most.

TERMS DEFINED

Bedside Manner: Perception of how well a physician relates to a client or patient.
Client: An individual or group who engages in a professional working relationship with a veterinarian or veterinary practice for the delivery of veterinary services.
Customer: Someone who pays for goods or services.

ISSUES AND OPTIONS

THE SIX C's OF CLIENT RELATIONSHIP MANAGEMENT

Clients often have difficulty expressing what they are looking for in a veterinary practice, but assessment of successful practices suggests that those features are known, even if clients cannot enumerate them when asked. Dr. Lowell Ackerman coined the Six C's of Client Relationship Management for veterinary practices:[1]

• Consistency
• Compassion
• Client service
• Convenience
• Competence
• Cost.

CONSISTENCY

• Clients can appreciate that medical issues are not black and white and that there is room for medical debate, but they do not want to get mixed messages regarding the healthcare of their pets. They want the facility to meet their expectations of a hospital, they want the veterinarian to "be a doctor," and they want the staff to act informed and professional. By some accounts, at least 95% of all cognition by consumers occurs below the level of conscious awareness.[2] Therefore, meeting this unconscious image of the professional veterinary practice is infinitely more important to the consumer than marketing plans, customer discounts, or even the surgical acumen of the attending veterinarians.
• It is also divisive if clients receive different messages from different members of the healthcare team. Practice protocols should be standardized so that this inconsistency is minimized, as it is confusing for owners and detracts from the trust they place in the practice and its recommendations (see 9.3 – Standards of Care and Care Pathways).

COMPASSION

• Most clients have embraced the human–animal bond (see 1.19 – Importance of the Human–Animal Bond) with their pets, and are visiting the veterinarian as a reflection of this bond. It is critical that the practice reflects its love of animals in everything that it does, from its logo to its discharge instructions. Although owners want to know that their veterinarian is proficient in his or her trade, they want even more to know that their pets are being cared for by people who clearly understand how important those pets are as family members. For clients, this is reflected in the "bedside manner" of the veterinarian, often an overlooked aspect of veterinary training.
• There are many things that can be done in a veterinary practice to show that animals are the reason the hospital is in existence. Grooming pets before they are discharged, providing giveaways or chew treats, and taking a little extra time with an animal when patience is required (see 4.14 – Developing a Fear Free Hospital), all speak volumes to clients about the value placed on animals. Encourage clients to stop by with their pets any time they are in the area just for the purpose of getting a

6.2. Giving Clients What They Want Most

special treat, and keep a ready supply of highly palatable treats for this purpose. This helps the staff members to readily recognize animals on sight (and they should greet the pet enthusiastically), bonds the pet and client to the practice, and serves the very useful purpose of habituating the pet to the practice and staff to lessen any fearfulness associated with the facility. Having a pet that is highly motivated to go to a veterinary hospital is a winning combination for both client and practice.

• Assessing emotional motivators for your client base is a great way to connect with them and is also a key lever for business growth.[3] Compare the emotional motivators for your best clients (e.g., appreciative that pet is not afraid to come to clinic) with other tiers, and develop messaging that would leverage this appeal to your other clients.

CUSTOMER SERVICE

• Clients want to be loyal to veterinary practices and are often more loyal to us than to other retail businesses. However, they are also consumers and are used to being treated as valued customers by companies with which they do business. It is important for veterinarians to realize this, because minor lapses in client service can lead to costly losses for veterinary practices. Sometimes a rude receptionist or the failure to deal with an issue in a timely manner can be enough for a client to seek services elsewhere. This is often a silent loss for practices, because clients may not volunteer the reasons for their departure.

• Much of marketing by companies today is relationship-based, in which there is significant effort exerted to determine what customers prefer; the trick is then to shift customers toward relationships that advance the organization strategic goals as well.[4]

• Understanding the realities of customer service is critical for veterinary practices, because clients are the lifeblood of such practices. It has been estimated that it costs five times more to get a new client than to keep an existing one, and 16 times more to get a new client to the same level of profitability as an existing one. The statistics do not stop there. Although a satisfied client will tell two to three others about their positive experience, a dissatisfied customer is likely to tell eight to ten others. Fortunately, if problems are handled quickly and fairly, about 80% of unhappy clients will remain loyal to the practice.

CONVENIENCE

• Today's pet owners are busy individuals, and they routinely pay a premium for convenience. It is important that we make it easy for them to do business with us. Location is important for a veterinary practice, and clients should have easy access to it. Some practices have even installed drive-by windows to make it that much easier for clients to pick up needed supplies and prescriptions. Location, however, is only one aspect of convenience.

• Time is a critical factor for many pet owners, quite a few of whom have jobs that make visiting a veterinary hospital during regular business hours somewhat challenging. The ability to accept drop-offs, schedule appointments for early mornings, evenings, and weekends, and even offering pet transportation to/from the practice all speak volumes that the practice is there to serve the needs of its clients. If clients have a time crunch after work when they need to pick up their pet at the practice, perhaps it is possible to discuss discharge instructions by telephone earlier in the day, process the payment in advance, and make pickup that much more convenient for all concerned. Offering telehealth options may also signal to clients that the practice recognizes client convenience (see 4.24 – Telehealth).

• Clients also value payment options, but this does not mean that the practice needs to extend credit. If a practice accepts cash, checks, and major debit and credit cards, that is sufficient for most clients. Offering prepaid services to clients (see 8.10 – Getting Paid for Services Rendered and 8.12 – Payment Plans) who need to budget for their veterinary care can work well for practices and clients.

• Today, more than at any time in the past, it is also possible to offer convenience by allowing clients to interact with the practice 24 hours a day via online services. There are programs available that allow clients to research their pets' conditions online, book appointments, request prescription refills, and even review an online medical record. Anything that makes it easier for clients to do business with you is worth evaluating.

COMPETENCE

• Veterinarians may assume that their clients have good reason for realizing they are competent, but in reality, it is very difficult for clients to appreciate the level of skill of any physician. They make judgments based on what they know and feel, and most of this, as previously discussed, is a subconscious decision.

• Clients have so little information on which to judge competence that they become excited whenever clues are available to them. Use opportunities to highlight the accomplishments of all professionals and paraprofessionals, such as practice promotional materials, the website,

6.2. Giving Clients What They Want Most

standards of care, and newsletters. Prominently display licenses, certificates, diplomas, and continuing education accomplishments, and make sure they are professionally framed.

• Clients typically want results, not sympathy, so competence is also reflected in giving clients what they want in terms of interactions with hospital personnel. While clients might appreciate an empathetic employee, and empathy is certainly a desirable trait (see 5.10 – Empathy), research suggests that clients may be frustrated by the amount of conflicting information they find on the Internet, and may be dissatisfied with their prior interactions, and might actually prefer to deal with a so-called "controller" – one who seeks not to solicit more information from the client about what they might like to do, and instead tells them what should be done to get to the fastest and easiest resolution.[5]

• Competence can also be demonstrated by understanding limitations. Telling a client that their pet has a problem that warrants them seeking the opinion of a specialist is not a sign of weakness, but rather a signal that you care deeply about the pet, that you are a team player, and that you value a successful outcome for the client and patient above all else (see 4.23 – The Extended Hospital Team: Making Referrals Work).

COST

• Nobody wants to overpay for services, no matter how professional the practice seems. Clients are paying for professional services, but may be interested in buying needed products, or commodities, elsewhere. This is not a lack of loyalty; it is a realization by the client that some products are commodities and without intrinsic value as to where they are purchased, whereas the medical services are value-driven purchases. Veterinary practices should endeavor to learn the same lesson.

• Selling goods, including diets, shampoos, pharmaceuticals, and parasite-control products from a veterinary practice should be a matter of convenience for owners, not a measure of practice loyalty. It is important to be an advocate for clients and for practices to understand what they can sell at a premium – professional services.

EXAMPLES

Mrs. Clark visited XYZ Veterinary Hospital for an office visit, and learned that her pet had a urinary tract infection that would require an antibiotic. The cost of the antibiotic seemed considerable to Mrs. Clark, and she asked if it might be possible to get a prescription for it because she had seen advertisements on television for an online pet pharmacy. She was hoping that she might be able to save some money on the medication. Dr. Barnes became somewhat indignant at the suggestion and proceeded to explain to her that pharmaceutical sales help subsidize surgeries and other services at the hospital, and those prices would have to rise if clients started buying their pharmaceuticals elsewhere. Mrs. Clark thanked him, said she would think about it, and left.

Mrs. Clark was uncomfortable with the discussion, and although she had been a loyal client at XYZ Veterinary Hospital for many years, she decided that she might be more comfortable elsewhere. She visited ABC Veterinary Hospital and was warmly greeted. Dr. Smith reached the same conclusion about the urinary tract infection, but thought it would be worthwhile to get a urine culture before starting on an antibiotic. She then scheduled a clinical re-evaluation to make sure that the antibiotic did clear the infection as anticipated. Mrs. Clark cautiously asked about a prescription, but this time got a much different response. Dr. Smith told her that they could supply the antibiotic from the hospital, but that they also had access to a veterinary online pharmacy if that would be more convenient. In fact, she volunteered to have Nancy, a client service representative, determine the online price so that Mrs. Clark could make an informed decision on what she would prefer. Mrs. Clark became a loyal client of ABC Veterinary Hospital.

6.2. GIVING CLIENTS WHAT THEY WANT MOST

CAUTIONS

The old saying that the customer is always right is not fundamentally correct. The customer is entitled to courteous, professional, and respectful service; however, it is also true that not all clients are good matches for a practice and not all clients are profitable for a practice. Cultivate the clients who fit the practice's mission, but retention of all clients is not a realistic goal.

MISCELLANEOUS

Veterinary services will constantly be challenged by both veterinary and nonveterinary competitors until practices concentrate on delivering value-added activities rather than just the retail sale of goods and services. Deliver value to clients, and they will deliver loyalty back to the practice.

6.3. BETTER MEETING THE NEEDS OF EXISTING CLIENTS (INTERNAL MARKETING)

BASICS

OVERVIEW

Internal marketing deals with promoting services to existing clients. Existing clients are already a well-defined population whose healthcare predilections are easily accessible. Compliance studies have shown that existing clients are rarely adhering to suggested standards of care (see 9.3 – Standards of Care and Care Pathways) for most veterinary hospitals, so marketing to existing clients is both medically necessary and cost effective.

TERMS DEFINED

Internal Marketing: Marketing efforts to employees as well as existing clients to support a positive brand experience.

Target Marketing: Selecting and developing offerings to meet the needs of a specific market segment.

ISSUES AND OPTIONS

THE NEED FOR INTERNAL MARKETING

• Organized veterinary medicine is failing the vast majority of clients who are already using veterinarians for their pets' healthcare needs. The failure is not one of medical incompetence, but of limited information sharing. Seeing veterinarians on a once-a-year or twice-a-year basis means that pet owners are getting information from other potentially less-informed sources the remainder of the time. This might be from staff in a pet supply outlet, from groomers, from workers in a boarding kennel, from friends and family, and often from the Internet. The solution involves different strategies than are currently being employed (see 1.1 – Models of Veterinary Practice), but for now, clients are getting most of their pet healthcare information from nonveterinarians, and this is cause for concern.

• Internal marketing is not about selling, it is about educating. Veterinarians need to inform clients about the proper ways of caring for their pets. The more complete the picture provided, the more likely there is to be compliance and good choices made by clients. Similarly, the more often clients hear the same message from different individuals, the more likely they are to act on it. For example, most people understand that they should see their dentists twice a year and, in between, should brush and floss regularly. Veterinarians over the years have created the expectation that pets should be vaccinated (on a basis that is currently not well defined), and that they should be seen once a year. For most animals, this is inadequate, and guarantees that unless an animal is sick or hurt, the veterinarian may not be at the center of all healthcare discussions.

• There is also somewhat of a misperception that we need to ramp up our messaging to clients, with the hope that more interaction will translate to improved client loyalty and more clinic visits. However, many consumers are distracted by the sheer volume of marketing messages that they receive on a daily basis, and there is little evidence that contact alone leads to engagement. Instead, it is likely better to concentrate on decision simplicity, in which we make it easy for the client to understand the information we provide, have confidence in the appropriateness of that information, and then act decisively and are most likely to follow through on the recommendations made.

DATABASE MANAGEMENT

• Effective internal marketing requires knowledge of the pets being served by the practice, contact information for owners, and some way to measure compliance. Whether the system is computerized or manual, if the information is not available in the records, then it is hard to use it productively for internal marketing efforts.

• For example, if a practice concedes that dental care is important for pets, then it is imperative that the clinician be able to track the progress of dental disease in all patients, and to track the compliance of making recommendations to clients about dental care. Every examination should include an evaluation of the teeth and gums, and notations about the stage of periodontal disease, gingivitis, and calculus accumulation (see 5.16 – Discussing Oral Health). However, this is not enough if nothing more is done with the information. The hospital needs to have a protocol in which there is agreement that when stage X is reached, a dental prophylaxis should be recommended, and when stage Y is reached, the dental procedure should be considered a medical priority. The client should receive a uniform message to this effect from the veterinarians, technicians, and receptionists, and also see that information on client handouts, the website, and elsewhere.

• Although veterinarians tend to believe that they regularly make such recommendations, it seems clear that from the client's perspective, the importance of such recommendations is often not perceived by pet owners and clear communication can improve compliance by as much as 40%.[2]

• The practice must be able to track this information and direct client educational materials to those owners who have been notified but have not yet acted. The information of what services are outstanding for any individual animals must be available as a central resource, not just buried in the medical records.

6.3. BETTER MEETING THE NEEDS OF EXISTING CLIENTS (INTERNAL MARKETING)

PET-SPECIFIC (PERSONALIZED) CARE

• As a profession, veterinarians have tended to make generalized rules for patient care, but in the age of the Internet, clients are expecting customized solutions and deserve such (see 4.10 – Personalized Pet Profiles). Is the medical care of a Labrador retriever really that similar to the needs of a shih tzu? Groomers certainly appreciate the differences, as do boarding facilities, but veterinarians for the most part still embrace a "one size fits all" healthcare philosophy. The profession is just coming to terms with the frequency of vaccine administration as a general ruling, but have yet to address similar concerns, such as should a Chihuahua receive the same vaccine dose as a Great Dane? Should a Doberman pinscher receive vaccinations at the same recommended intervals as a Shetland sheepdog? Are all pets considered senior at seven years of age?

• Pet-specific care requires more effort, but it is infinitely more responsive to the needs of clients and pets (see 4.8 – Pet-Specific Care). This is even more significant when it comes to disease screening. For example, in recognition of the relatively high incidence of von Willebrand disease (vWD) in Doberman pinschers, a practice may elect to recommend screening by DNA testing or by biochemical testing (von Willebrand factor) for all young Dobermans, especially those undergoing surgery. In many instances, this condition is only detected when bleeding is hard to control during and after the surgical procedure. However, simple testing in advance can inform clients if there is any risk of complications during the procedure, and special precautions can be taken if needed.

• Each breed has its own risk factors for diseases, and veterinarians would be well served to understand these differences when developing internal marketing efforts (see 4.9 – Lifelong Excellence in Healthcare).[1] Similarly, protocols should be established for monitoring patients on therapeutic or preventive regimens. Sometimes, delivering doses of heartworm prevention by injection, or on a monthly basis to owners is superior to selling them a year's supply if they are prone to missing doses. Animals on most medications should be monitored periodically for therapeutic benefits as well as for adverse effects. All animals require some form of periodic monitoring, even if they are otherwise healthy and just on preventive medicine regimens (see 9.3 – Standards of Care and Care Pathways).

REMINDER SYSTEMS

• Along with having systematic documentation of patient needs that are easily accessible, it is also important to have functional reminder systems (see 4.16 – Client Reminder Systems). At the end of every client visit, there should be a reminder generated for the next visit. Logically, pets should be seen at least twice a year, but even if the practice adheres to a once-yearly evaluation, a reminder should be generated in the system. For practices with robust web capabilities, this can be automatically generated as email or text (SMS) reminders. Give the client several options for reminders, and most clients who lead hectic lives will not consider this an intrusion. Some options include email, text (SMS) messaging, mail, and telephone calls. Because mailings are the most expensive and sometimes the most neglected forms of contact by recipients, having the other options available are convenient for both client and practice.

• If all reminders have been sent and the client has still not responded, the practice should send one final notification that it is assuming that the client is not interested in continued veterinary care at the practice, and that unless it hears otherwise, the patient's medical record will be removed from the active medical files (but maintained by the practice as required by law). If veterinary care is being provided elsewhere, then the practice offers to forward relevant medical information to that practice upon notification by the owner.

• Above all, the message should be that if the pet is not receiving care at the practice, it is the hope that the pet is receiving its needed care elsewhere. If clients do not respond to this message, there is no point in sending additional reminders.

• If the client does respond, the staff should schedule the needed appointment and then inquire as to the form of reminder notification preferred by the client.

TARGET MARKETING

• With a solid database of information on pets, target marketing is a very effective form of internal marketing (see 6.10 – Target Marketing and Targeted Client Outreach). Target marketing identifies pets or owners in the practice that have similar needs, and customizes an offering to meet those needs. A target market could be as general as all pet owners in a specific zip code or as specific as all Cavalier King Charles spaniels over five years of age that have not had cardiac evaluations.

6.3. Better Meeting the Needs of Existing Clients (Internal Marketing)

• The promotional piece can be written to specifically target the defined group, both because the need is similar and because this allows personalization of the message. Messages that are personalized and speak to a defined need are most likely to be regarded seriously and acted upon.

MARKETING TO STAFF

• It is important to realize that our staff are also consumers of our goods and services and are ambassadors of our hospital brand. Accordingly, everything possible should be done to ensure that they are educated on the value that is being delivered and experience excellence in customer service first hand (see 6.16 – Internal Team Marketing).
• Stronger links should be developed between the employee brand experience and that of the customer to ensure that the values of the hospital are clearly portrayed at every opportunity.

EXAMPLES

ABC Veterinary Hospital decided to review its internal marketing efforts. Even though the hospital maintains computerized medical records, it was soon evident that they could not access data important to their compliance needs, including dental stage information for all animals evaluated, recommendations for senior profiles, dietary recommendations made, and so forth. Accordingly, although they had always assumed that client compliance was high, published studies suggested this was perhaps not very likely, and they had no way to verify the statistics themselves.

The first step in the internal marketing process was to create computer codes/flags for all the recommendations they hoped to track. They would enter that information for all clients seen from that date, and staff would slowly enter information from past visits on an ongoing basis, with a timeline of three months to implementation. Surprising to the veterinarians was that the medical records, which they were very proud of, were incomplete with regard to much of the information sought. In a large percentage of cases, there were no periodontal stages even recorded in the record. Many others did not include weight, body condition scores, pain scores, recommendations verbally made for senior screening, and other such valuable information.

Apart from the value realized in improving their compliance, the doctors and staff took more care in their medical record-keeping, and practiced a higher level of medicine as a result.

CAUTIONS

• Internal marketing is about education and delivering value. In veterinary medicine, this can be accomplished at the same time as generating a reasonable professional profit. However, it is important to ensure that the reasons for the marketing have more to do with value creation than with revenue generation. If clients can understand the value in a process (pre-anesthetic screening, for example), then they appreciate the professionalism and care behind the recommendation. If they cannot understand the value in an offering (routine proctoscopic examinations of healthy pets, under anesthesia, at three years of age, for example), then it can have a negative impact on trust and compliance.

6.3. BETTER MEETING THE NEEDS OF EXISTING CLIENTS (INTERNAL MARKETING)

MISCELLANEOUS

Internal marketing should not involve selling clients services that lack intrinsic value. For most veterinary practices, internal marketing should focus on delivering those services, which the hospital team already believes are valuable but which are not currently being delivered in a reliable fashion. Consultants refer to this as "low-hanging fruit." Whereas veterinarians may be tempted to buy expensive equipment that can be marketed to clients, there are many routine services that are not being consistently delivered and that warrant increased attention by practices.

6.4. ATTRACTING NEW CLIENTS (EXTERNAL MARKETING)

BASICS

OVERVIEW

To build and grow a veterinary practice, there must be a continual pipeline of new clients. Retaining clients and getting current clients to utilize more services is of equal or greater importance. But it all begins with prospecting – identifying those pet owners who you would like to welcome into the practice as new clients.

They are one of the key essentials to developing a healthy, sustainable business.

TERMS DEFINED

Prospect: An identified potential client that can be targeted for business.

Segmentation: A marketing term referring to the aggregating of prospective buyers into groups (segments) that have common needs and will respond similarly to a marketing action. Market segmentation enables businesses to target different categories of consumers who perceive the full value of certain products and services differently from one another.

Target Audience: A specific group of people within a target market at which a product or the marketing message of a product/service is aimed.

ISSUES AND OPTIONS

Most healthy practices have a natural attrition rate due to many factors. Therefore, it is critical to have a process in place to reach out to potential new clients on an ongoing basis. There are many reasons why a client may not return to a practice, such as:

- Relocation
- Price shopping for lower costs
- Pet dies
- Referred elsewhere by a friend
- Sees an advertisement for something their pet needs at the right time available at another practice
- Does not feel they or their pet was treated well
- Thought the practice was expensive (e.g., did not see value for the price)
- Saw too many negative reviews online for the practice
- Viewed or interacted with an advertisement on social media.

An influx of new clients is needed just to replace the ones lost to normal attrition. For practices that are not at the top of their game and occasionally or frequently provide service that is short of excellent, attrition rates will most certainly be higher.

In order to sustain or grow a practice, a steady stream of new clients who have never visited the practice before must be identified, reached out to, and motivated to make that first call.

There are many reasons why a pet owner would look to select a new veterinarian:

- Recently moved to the area
- Referred by a friend
- Acquired a new pet
- Found the practice online
- Saw an advertisement that appealed to them
- Met representatives of the practice at a community event
- Saw many positive reviews online.

TARGET AND SEGMENT YOUR OUTREACH FOR BEST RESULTS

The easiest and least expensive way to attract new clients is to reach out to a defined target audience. What this means is to identify what type of pet owner you want as a client. What characteristics do they possess that make them a model client? What services do you offer that would appeal to this segment of the pet-owning population? Do you offer low-cost high-volume services, a full spectrum of care from preventive to wellness services, grooming, and boarding, or perhaps you are a high-end, lower volume practice with advanced technology. Understanding who your ideal client is will help you determine where to find them and therefore be able to market the services you offer that will most likely appeal to them.

By segmenting your prospective clients into categories and creating marketing initiatives directed specifically to speak to them, you increase your chances of reaching them exponentially (see 6.10 – Target Marketing and Targeted Client Outreach). It is all about relevance – what is important to one audience may be less important to another. Some pet owners want convenience, some want comprehensive services (grooming, boarding, wellness/preventive care, fully-stocked pharmacy, etc.), others want low cost, or a high-end designed facility, or simply being made to feel welcome and that you know them by name.

THE BEST SOURCE OF NEW CLIENTS

Word-of-mouth marketing will always be the very best resource to acquire new clients. With the prevalence of digital connectivity today, word-of-mouth also applies to the online version. For some, seeking online resources is the norm rather than the exception. It is more important than ever to know what people are saying about you, and to consider whether it is what you want them to say.

Create awareness among your staff that you are always looking for new clients. Help them understand that part of their role is to be a brand champion, in essence, an ambassador for the practice. Develop referral programs that reward staff members and clients for referring others to the practice. Make these programs visible. For instance, among staff, thank team members openly at staff meetings for bringing a new client to the practice. There may even be a small reward for each new client. Include information on your referral program on your website, reminders, newsletters, e-blasts, brochures, advertisements, materials in exam rooms, etc.

People are much more likely to refer a friend when prompted. Do not forget to provide an extra business card or magnet for each client when checking out (if it is been a happy visit) and tell them the practice welcomes referrals and offer information on your referral program if you have one. This is the perfect opportunity to plant the seed and your front office personnel are typically the best equipped to have these types of conversations. It also demonstrates you are confident enough in your services to ask clients to recommend you to another pet owner. Encourage online reviews, at check out, in email communication, on your website, etc.

WHY IS WORD-OF-MOUTH THE BEST SOURCE FOR NEW CLIENTS?

- New clients who arrive through word-of-mouth come with an element of trust already built in because they have been referred by someone they know and trust.
- They likely fit a similar demographic and/or have similarities to the client that referred them, keeping them in the "most desired" category of prospective clients, which increases the likelihood you can satisfy their needs.
- They cost less. You have not had to spend a dime to acquire that client other than delivering a great experience for the client who referred them – which you should be doing for every client, every day.

6.4. ATTRACTING NEW CLIENTS (EXTERNAL MARKETING)

EXAMPLES

• **Convenience:** If you are located in a middle-class area where most households have two working adults, you may find it helpful to stay open late one or more evenings a week and one or more weekend days to accommodate the schedules of local pet owners.
• **A local member of the community:** Likewise, if there is a public school within walking distance of the practice, then it might make sense to advertise in a school sports program, newsletter, or even sponsor a team. You reach a local audience with a service that offers convenience from a fellow community member. People like to support their community, especially if they feel an affinity for them or are acquainted with them in some way.
• **Low-cost high-volume:** When located in a facility that may be a bit outdated, or in a high-density or urban area that has a mixed demographic, it can be a good idea to work with a local shelter whereby you are a recommended resource for newly adopted pets, even offering a free first exam if allowed by law. The shelter or rescue organization provides your practice with the exposure it desires to families acquiring a new animal.
• **High-end services:** Reaching a highly educated, white collar clientele that is in either a relatively new neighborhood or an older, established, well-maintained area calls for a modern, spaciously designed facility with good signage and exceptional service. This audience will find the practice's advanced imaging technologies, special skills or interests of the medical team, and comforts offered to patients of interest through home owner association newsletter advertisements or columns, support of the local arts community, visibility and participation in local charitable circles and even partnership with other ancillary business for services you may not offer (e.g., pet resort, boarding, grooming). Online, use targeted Facebook ads with specific criteria to reach this demographic based on location, income, hobbies, etc.
• **All inclusive:** If you have the space to accommodate ancillary services beyond wellness care, and have the time, resources, and personnel to operate these additional revenue centers, it may make sense to capitalize on your current wellness care clients and expand their usage of your practice by taking advantage by offering boarding, grooming, behavior training, and the like. Busy people, especially families, will find great value and convenience in multiple services at the same location. And they will feel a great sense of confidence because they "know" the people that will be caring for their pets in these other situations.

CAUTIONS

• Not every pet owner is an optimal client for your practice. And your practice cannot offer all things to all pet owners. It is necessary to determine the type of pet owner that makes a good client at your practice and specifically what is important to them in a veterinary practice (see 6.9 – Client and Patient Segmentation). Then you can reach out to this particular segment of the potential audience of pet owners in a way that is relevant and meaningful to them.
• Do not launch marketing initiatives to attract new clients without determining how to measure the results. With limited financial resources and a desire to receive a good return on your investment, always note how new clients heard about you. Track these results on a regular basis and see what type of outreach efforts are producing what results. Increase or continue those that are working well and eliminate or modify those that are not generating the results desired. The key is to track the sources of new clients over time and watch the trends (see 6.23 – Measuring Marketing Performance).

6.5. DEFINING MARKETPLACE OPPORTUNITIES

BASICS

OVERVIEW

Planning marketing efforts when a practice fails to first identify opportunities that justify doing marketing in the first place just does not make sense. There is no reason to invest in marketing if a practice has not identified marketplace opportunities to drive marketing efforts.

Many practices implement what they consider to be marketing efforts for a variety of reasons that have nothing to do with marketing. Perhaps someone told them that they "need to do more marketing" or the practice wants to "get its name out there." Others incorrectly believe that marketing is simply posting to social media or sending out generic mass-produced newsletters. Without identifying the opportunity and setting goals around it, what practices are calling marketing could be a waste of time, effort, and money.

On the other hand, smart practices recognize that marketing starts with defining a space or gap in the marketplace that, for whatever reason, is not being filled. It might be because such a service does not exist yet, that pet owners are frustrated with the current level of service, or that a trend is creating a new need that did not previously exist. Whatever the reason, opportunities give marketing direction, purpose, and a rallying point around which to focus.

TERMS DEFINED

Define: Being able to pinpoint the scope, nature, and boundaries of what is being understood.

Market Segment: A piece or part of the overall market that shares similarities in its demographic traits, attitudes, or views that lead it to experience similar needs or desires.

Marketing: The process of understanding marketplace needs and creating/delivering products and services in a way that is preferred over that of the competition.

Marketing Goals: The ultimate measurable outcome – or series of outcomes – that a business desires to achieve based on marketing opportunities and the realities of the marketplace.

Marketplace: A collective term for the representation of numerous market segments that span a wide range of consumer demographic and lifestyle traits.

Marketplace Opportunity: An identified reason to pursue and reach out to a particular market segment as a result of unmet needs, dissatisfaction, inadequate delivery systems, or other weaknesses affecting the segment.

ISSUES AND OPTIONS

Defining marketplace opportunities starts with paying attention to issues affecting pets and the local pet owner market with the purpose of identifying changing pet owner needs. In understanding these needs, ask yourself:

- Are they being met now?
- Are they being met effectively?
- What could be done better?
- Are there holes or gaps in current service delivery?

Studying pet health trends, gaining client feedback and looking at regional attributes will open multiple doors to opportunities for marketing, market development and practice growth.

PET HEALTH TRENDS

There are numerous trends and developments affecting today's pets that represent opportunities for veterinary practices. Veterinary and consumer pet literature is filled with information on today's trends such as:

- More overweight pets
- Pets living longer
- More multiple pet homes
- Pets being humanized ("I only trust my dog")
- Pets on vacation
- Increase in dental disease
- Cat popularity among millennials
- Increase in infectious diseases including Lyme disease
- Premiumization in the pet product market
- Increase in chronic illnesses.

All of these represent opportunities for practices to develop services that fill needs in each of these areas.

There are numerous examples of veterinary hospitals stepping up to the plate with new services – or, in some cases, entirely new facilities – to service unmet needs. Examples include a doggie weight loss camp, pet hospice (see 1.24 – Hospice and Palliative Care), pet public health campaigns, mobile clinics (see 1.23 – House-Call and Mobile Practice), pet trauma centers (see 11.19 – Referral and Emergency Facilities), luxury pet daycare/boarding (see 11.20 – Pet Boarding and Luxury Accommodations) and more. All of these are based on the recognition that, in these cases, pet and pet owner needs and expectations were not being met, or there was room for improvement in the existing service delivery models.

CLIENT FEEDBACK

Listening to pet owners, which should be a regular part of any practice's marketing, always leads to identifying opportunities. Pet owners are typically pretty candid about sharing their frustrations and discussing services that they would like to receive but cannot currently get. Any company will tell you that their greatest source of new ideas is hearing from customers about their experiences with their products.

However, practices must actively reach out to pet owners to gain usable qualitative feedback. This goes way beyond asking, "How did we do?" or "Is everything ok?" It also goes way beyond sending out the occasional client satisfaction survey, which is typically nothing more than a report card of past behaviors. Instead, gain usable information by choosing from multiple avenues for seeking and gathering meaningful and valuable input from pet owners.

- Conduct focus groups with clients (see 6.21 – Client Focus Groups).
- Form advisory boards of especially opinionated and active clients.
- Conduct focus groups among the local pet owner that are not necessarily clients of your practice. (Ask your local pet supplies store if you can access their customers. This is a great way to determine how pet owners view your practice against the competition.)
- Hold discussion groups with local pet community thought leaders (shelter managers, rescue group heads, groomers, and others).

Also use client feedback to test marketing programs before you implement them. This will save time, money, and reduce the risk that marketing efforts are in misalignment with pet owner needs.

REGIONAL ATTRIBUTES

The geographic location of your practice – and the locale's features – can represent potential marketing opportunities. Is your practice in a tourist or recreation area? Is it surrounded by bodies of water? Are dogs used for hunting? Do local business employ working dogs, such as herding dogs on farms to dogs being used to calm inmates in the local prison? Does your area contain pet health hazards that are particular to the region? Is your practice in an urban versus suburban or rural area?

Know your area, the roles that pets play and the related health issues (see 4.8 – Pet-Specific Care). Any of these could represent potential unmet needs or underserved market segments.

EXAMPLES

- Recently, a good friend took her cat to the local veterinary hospital and was quickly informed by staff that, "We don't really like cats around here very much." Well someone does. Opportunity: There are many feline-only practices, many of which are thriving.
- Pet owners often put off getting their pets spayed/neutered due to the cost. Opportunity: Low-cost spay/neuter clinics are now in just about every major market across the United States.
- Pets are too fat. Opportunity: Some practices are adding pet fitness programs. Some facilities offer pet weigh-ins and weight-loss plans under the supervision of a veterinarian.
- Pets are living longer. Opportunity: Some veterinary hospitals are setting up geriatric pet care programs. A practice might offer senior cat discounts and specialized geriatric screenings and exams with the goal of early detection of chronic illness.
- Pet owners are having a more difficult time making good nutrition choices for their pets given the large number of foods, frequent food recalls, and inflated pet food claims. Opportunity: A hospital could align with a board-certified veterinary nutritionist for online consultations.

CAUTIONS

Before a practice pursues an opportunity, it should be substantiated and based on careful study of trends, pet owners, and the local market. Avoid pursuing opportunities that a few acquaintances simply think is good idea. Substantiate it first.

Spotting an opportunity is one thing – acting on it is another. Create programs and initiatives that offer substance and meaningful value to pet owners. For example, the feline market is growing, but simply saying, "Oh ya, we see cats," is not going to help any practice pursue this market opportunity.

6.6. MARKETING PLAN

BASICS

OVERVIEW

• Ideally, every practice should have a vision and mission statement before writing a marketing plan that will guide decisions made in marketing planning (see 14.9 – Mission and Vision Statements).
• Engage in strategic planning before drafting a marketing plan (see 14.5 – Strategic Planning and Implementation). Strategic planning involves developing a clear vision and mission for the practice and outlining objectives and strategies to achieve practice goals. This process serves as a foundation for the marketing plan.
• The process of writing the marketing plan helps define the focus and direction of the practice. It should reflect the image and reputation the practice wishes to have in the community.
• All practices, regardless of size, should have a written marketing plan that outlines programs and activities for a defined period of time, typically a year.
• The marketing plan should involve team input and be made available to the entire team. Without employee involvement and "buy-in," the plan will not be as successful because team members may be less than enthusiastic about implementing its programs and policies.
• Components of the marketing plan include situational analysis and market planning: objectives, target markets, marketing mix, and implementation and control of the plan. Budget allocations should be included if significant funding is necessary.

TERMS DEFINED

External Marketing: Written or verbal communication aimed at attracting new clients. Examples include exterior appearance of the hospital, advertising, mailings, community events, speaking engagements, hospital signage, website, digital marketing, social media, and converting phone calls to booked appointments.
Internal Marketing: In veterinary medicine, this refers to efforts to increase the utilization of services by existing clients. Internal marketing also refers to efforts by the practice to train and motivate staff to work together as a team to better meet client needs.
Market Segmentation: Dividing markets into specific groups based on specific criteria.
Marketing Mix: The 4 P's of marketing: Product (which veterinary services to offer), Price (decisions about fees), Promotion (written and verbal communication), and Place (the time and location of services).
Marketing Plan: Involves establishing marketing objectives, defining target markets, and deciding on the marketing mix.
Mystery Shoppers: Individuals known to management, but unknown to the team, who call or visit the practice and report back to management about their experience. Mystery shoppers can be used to assess the practice's client service efforts from the client's perspective.
Situational Analysis: Review of the current environment, including competitors as well as social, political, economic, and legal conditions. For established veterinary practices, the situational analysis includes looking carefully at the current state of affairs for the practice in terms of its ability to meet client needs.
Target Markets: Group of clients the practice wishes to attract.

ISSUES AND OPTIONS

• The concept of marketing for veterinary practices involves the desire to improve the financial health of the practice by meeting the needs of clients. The focus is on meeting client needs (see 6.3 – Better Meeting the Needs of Existing Clients).
• Excellent client service is important to meet or exceed client needs. Components of client service are integrally related to client satisfaction with a particular practice. Therefore, a marketing plan should focus on achieving high-quality client service (see 4.1 – The Basics of Client Service).
• The marketing plan should reflect the practice philosophy of medical care. For example, patient advocacy and pain management may be incorporated into programs.
• Marketing in veterinary practice involves marketing primarily services rather than products.
• For service industries, marketing involves a long-term relationship.
• Bear in mind that clients cannot easily visualize many services as they would a product. Therefore it is important that procedures and benefits are explained in detail.
• Client communication, both verbal and written, is a vital element in all aspects of the marketing plan.
• Specific marketing objectives should help meet overall practice goals related to pet healthcare, client satisfaction, and matching client needs with veterinary services offered.
• Team training is critical if the practice is to deliver effective client communication and excellent medical care (see 3.10 – Staff Training).
• Team members need to be kept informed about all marketing programs.
• Some components of the marketing plan may be seasonal, such as promoting heartworm and flea programs; other components, such as promoting senior diagnostic screening, will be encouraged every month.

SITUATIONAL ANALYSIS

• This analysis includes a review of the strengths and weaknesses of your practice and the competitive environment (see 6.7 – Basic Tools of Marketing). This information may be useful in several ways (see Examples).
• Evaluate consumer behavior. Understand what influences clients' decisions regarding veterinary services (see 4.6 – Client Perception and Learning).
• Review the level of client satisfaction regarding all aspects of the practice (see 4.19 – Measuring Client Satisfaction). Client surveys, which offer a means to gather this information, can be emailed to clients after they visit the practice or mailed to a random sample of clients. Surveys can also be done on the telephone by outside agencies.
• Solicit feedback from both team members and clients about client service and hospital operations. This feedback will help the leadership team understand the strengths and weaknesses of the practice.
• The practice should gather revenue data on utilization of services.
• Assess the size and growth opportunities for particular veterinary services.
• Decisions should be made on whether the practice has the resources and willingness to provide various services.
• Consider team training needs and whether the team is coordinated and efficient in the delivery of services.

MARKETING PLAN

• Consider what type of clients you want to attract and which services you most want to promote.
• Establish specific, measurable objectives (see 14.5 – Strategic Planning and Implementation). These may be related to improved client service, gaining new clients, increasing client education on certain topics, increased utilization of certain services, or target goals for utilization of new services.
• Objectives may be program-based, such as developing a senior care program or an obesity management program for the patients.
• Decide on target markets and promote services to these segments (see 6.10 – Target Marketing and Targeted Client Outreach).
• Develop methods of communication for offering services to the target market.

• Define the marketing mix of the 4 P's. For example, for Product, decide which services will be specifically marketed in the plan for the year; for Price, evaluate the appropriateness of fees for new services as well as existing services; for Promotion, decide on internal and external marketing for the services or programs offered; and for Place, decide if programs or services will be offered at specific times.

IMPLEMENTATION AND CONTROL

• Effective leadership is necessary for the successful implementation of a marketing plan (see 2.12 – Leadership).
• The plan must state how programs will be implemented and who will be responsible (see 2.14 – Implementation: Getting it Done).
• Responsibility for all tasks outlined in the plan should be delegated to specific individuals (see 2.6 – Accountability).
• Teams should be empowered to implement the marketing plan.
• Measures to track utilization of services should be outlined. Computer software should be able to facilitate tracking utilization.
• Progress of the plan must be followed with regular frequency, ideally every month.
• Consistency is extremely important. Lapses in client service, communication breakdowns, inconsistent training of staff, and sporadic recommendation of services will result in an ineffective marketing plan.

EXAMPLES

See marketing plan example in appendix (see 15.5 – Marketing Plan).

EXAMPLE 1: DEVELOPING AND UNDERSTANDING THE SITUATION ANALYSIS

Your veterinary practice has determined that 10 other practices are located close enough to yours to be considered competitors. One of these practices is a feline practice, but it does not seem to be highly regarded by the cat-owning community. Another practice, opened a year ago, has a lovely new building and offers grooming, extended hours, and a large boarding facility.

Mystery shoppers have reported variable levels of client service at many of these practices, including yours. Analysis of your client surveys reveals that clients did not make many comments about exceptional service, and their biggest desire is to be able to drop off their pets before 8.00 a.m.

Review of your service utilization data shows that there is low compliance with senior health screening recommendations and a growth opportunity for increasing feline visits.

In response to this situation analysis, the practice may decide the following:

• There is a significant growth opportunity with respect to attracting new clients who own cats. The practice has a nicely decorated, separate cat-waiting area in the reception room and a separate cat ward.
• There is an opportunity to differentiate the practice from other area practices by offering exemplary client service (see 6.15 – Practice Differentiation).
• The practice can better meet client needs by opening at 7.30 a.m.
• There is an opportunity to increase the utilization of senior diagnostic testing for both dogs and cats.
• The practice is not willing to offer extended hours at night in response to the other hospital's hours because it is not deemed profitable or desirable at this time.

EXAMPLE 2: DEVELOPING TARGET MARKETS AND THE MARKETING MIX

As a result of carefully reviewing the previous situation analysis, the practice may decide to segment the market based on the following criteria:

• Type of client – new versus existing
• Dog owners versus cat owners
• The pets' ages
• The number of office visits per year.

The practice will have the following target markets:

• All clients for client-service marketing efforts
• Cat owners within a 10-mile radius for marketing aimed at attracting new clients with cats
• Existing clients with dogs aged 7–10 for senior diagnostic testing
• Existing clients with cats aged 8–11 for senior diagnostic testing
• Clients who are not visiting the practice annually.

The marketing mix for offering feline senior health screening would include:

• **Product:** Define what a feline senior health screen includes, as well as any options. A basic senior health screen may include complete blood count (CBC), biochemical profile, urinalysis, and T4 (thyroxine).
• **Price:** Decide on fees, be sure they are entered in the computer, and advise the team.
• **Promotion:** Educate staff on the importance of senior programs, recommend senior health screening to all cats over eight years old coming in for routine visits, use brochures on senior healthcare to reinforce the message, send a newsletter on feline senior healthcare to clients.
• **Place:** As an ongoing program, allow clients to drop off their cats for blood draws and urinalysis.

CAUTIONS

• The marketing plan must be updated at least annually.
• Management should review whether the objectives of the marketing plan were met at year-end and use this information to make improvements or adjustments to future plans.
• The practice should utilize the marketing plan to differentiate its services. The client must see quality and value associated with your services.
• The practice should constantly strive to keep service quality high as part of their marketing plan.
• New employees should be educated about all aspects of the marketing plan.
• The healthcare team must believe in the marketing plan and maintain excitement and commitment for the plan to be successful.

6.7. BASIC TOOLS OF MARKETING

BASICS

OVERVIEW

Marketing is a science of sorts, and effective marketing campaigns rarely happen by accident. Even in small business settings such as veterinary practices, certain tools can be used to help drive positive outcomes in marketing.

TERMS DEFINED

Diversification: Promoting new products to new markets.
Market Development: Promoting existing products to new markets.
Market Penetration: The extent of sales of existing products and services to existing clients.
Market Segmentation: Process of dividing the total market for a product or service into smaller, more manageable subsets or groups of customers.
Marketing Mix: The unique blend of product, pricing, promotion, and place (distribution channel) designed to reach a specific group of consumers.
Product Development: Developing new products or services for sale to existing clients.
Target Marketing: Selecting and developing offerings to meet the needs of a specific market segment.

ISSUES AND OPTIONS

MARKETING MIX

The marketing mix, sometimes referred to as the 4 P's, refers to the constraints associated with any offering, whether a product or a service (Figure 6-7-1). It is not possible to control consumer habits, although they can be influenced, but there is the ability to control the 4 P's, namely:

- Product
- Price
- Promotion
- Place (Distribution).

This is important, because the successful delivery of any service depends upon meeting a perceived need. Not all products and services need to target the most affluent market. Companies like Walmart have become global powerhouses by catering to a different demographic than many of the other major retailers. Where businesses get themselves into trouble is when the 4 P's cannot be reconciled, such as trying to offer high-end services (the product) at heavily discounted rates (the price).

MARKET SEGMENTATION

Market segmentation is a method of subdividing the client base into more manageable subpopulations with common needs (see 6.9 – Client and Patient Segmentation). On a very basic level, one could segment the client population into dog owners and cat owners for the purposes of a marketing campaign. The more segmented the market, the more specific and personalized the marketing message can become (see 6.3 – Better Meeting the Needs of Existing Clients (Internal Marketing)). When trying to attract new clients, the potential marketplace can be segmented based on useful demographic information, such as zip codes in which the average household income exceeds $75,000, or psychographic information, such as client attributes and preferences.

TRADE AREA ASSESSMENT

Most veterinary practices draw clients from their immediate area, and this area is usually referred to as a trade area or a catchment area (see 1.4 – Veterinary Trade Areas). For most urban and suburban practices, drive time is actually a better predictor of trade area than is any given radius from the practice, because clients will typically have a comfort zone for how long they are prepared to travel to get to a veterinary practice. The longer the drive time, typically the more likely those potential clients will consider their alternatives.

Trade area (demographic) assessments are important marketing tools because they offer a graphic representation of the likely marketplace for a practice and suggest possibilities for potential marketing efforts (see 6.8 – Demographic Assessment). Trade area assessments are so powerful that it is now even possible to overlay important demographic information, such as household income, expenditures on pet services, and numbers of dogs and cats in an area.

SWOT ANALYSIS

The SWOT analysis is a common tool of marketers, and offers a quick glance at the Strengths, Weaknesses, Opportunities, and Threats for a practice (Figure 6-7-2). This information is typically used in strategy sessions early in the marketing process.[1] The strengths and opportunities highlight the strategic elements, while weaknesses and threats constitute the challenges facing the practice. It is easy to create a SWOT analysis on a blackboard or a sheet of paper and list the appropriate attributes under each heading. A very simple but powerful tool, the SWOT analysis helps focus attention on the major elements of a practice that can dramatically affect a marketing campaign.

Figure 6-7-1.
The marketing mix.

Figure 6-7-2.
SWOT analysis.

Figure 6-7-3.

SMART objectives.

GOAL SETTING

Marketing must be associated with clear goals, so metrics can be used to judge success (see 14.5 – Strategic Planning and Implementation). There are a variety of step-by-step approaches that can be followed, but many follow a GOST (Goals, Objectives, Strategies, Tactics) format. The first step is to have well-defined goals. Then, objectives need to be created, and in general we want them to be SMART objectives (Specific, Measurable, Achievable, Relevant, Time-bound). From there, strategies will be formulated to achieve these long-term goals, and tactics are the short-term actions needed to fulfill the strategies over time (Figure 6-7-3).

SEARCH MARKETING

Search marketing, also known as search engine marketing (SEM), is a subset of digital marketing strategy, consisting primarily of search engine optimization (SEO, see 10.14 – Search Engine Optimization) and paid search advertising (PSA) (see 10.15 – Paid Online Advertising). The goal is to get more visibility in search engines either by getting more free traffic (SEO) or paid traffic (PSA).

MARKETING PLAN

A marketing plan, like a business plan, provides details as to how the practice intends to market its services over a given period of time (see 6.6 – Marketing Plan). Like any business document, the marketing plan must be realistic to be effective, and must be accompanied by a reasonable budget to get the job done. The plan encompasses both internal and external marketing efforts, including a website, any advertising, and client communication. Veterinarians traditionally underutilize marketing and inadequately fund marketing efforts.

EXAMPLES

ABC Veterinary Hospital, as part of its preliminary marketing research, commissioned a demographic study of their trade area. It turned out that in one high-income area within a 10-minute drive time, the Hispanic population was 32% of the community population. Within that neighborhood, in which the average household income was $106,000, 34% of homes had at least one dog and 26% had at least one cat. A retrospective assessment of practice records suggested that only about 3% of the client base of ABC Veterinary Hospital was of likely Hispanic origin.

A SWOT analysis revealed that there were no Spanish-language client educational materials and no Spanish-speaking staff. However, two of the staff members were willing to learn Spanish at a local community college if supported by the practice, and the graphic designer being used for logo and advertising creation was a Mexican-American fluent in Spanish and willing to help design materials in Spanish. No other practices in the area seemed to be catering to the Spanish-speaking population. Some basic research also indicated that there were several sources for Spanish-language client educational materials.

In the marketing plan, one of the goals that was established was to provide more services to the Spanish-speaking residents in the area, with an objective being to increase the Hispanic portion of the client base from 3% to 6% over the next 12 months. It was also decided that 20% of the marketing budget would be reserved for developing these services and for promoting those services to the community. A number of strategies were created to increase competency in Spanish within the practice, develop resources in Spanish, and then market this initiative. From these strategies, a number of tactics were developed. A survey would be done of families in the target market to see if they would be responsive to such an effort. If the survey yielded positive results, the plan was to develop marketing materials and a bilingual website, and to send the two staff members (one technician and one receptionist) to Spanish classes. The new initiative was to be launched in three months. If the service was well received, preference would be given to bilingual applicants when they planned to hire an additional receptionist in six months. Specific metrics were developed to track the practice's progress.

CAUTIONS

• Marketing is a science, but not an exact science. It is not always possible to predict with certainty what the response to a promotional effort will be. However, if promotions are ethical and professional, the biggest risk typically is that optimistic projections were not realized. The larger the risk (e.g., building a veterinary hospital in a community that is already well served by practices), the more marketing research is needed to mitigate those risks.

MISCELLANEOUS

Because most veterinary practices are privately owned, there is a dearth of information available on market trends, other than those voluntarily reported in industry surveys. There is also a relatively large untapped market of pet owners who do not seek regular veterinary care. Inferences for the potential use of veterinary services are therefore typically distilled from available statistics, such as the number of households in a trade area, the proportion of pets in that area, the proportion of pet owners that seek veterinary care, and the full-time equivalent veterinary population available to service animals in that area.

ABBREVIATIONS

GOST: Goals, objectives, strategies and tactics
PSA: Paid search advertising
SEM: Search engine marketing
SEO: Search engine optimization
SMART: Specific, measurable, achievable/attainable, relevant, time-bound
SWOT: Strengths, weaknesses, opportunities, threats

6.8. DEMOGRAPHIC ASSESSMENT

BASICS

OVERVIEW

Whether preparing to start a practice from scratch, buy a practice, build a new building, open a satellite facility, or remodel an existing facility, demographic and market potential analyses can be powerful tools to help in the decision-making process. There are six steps to performing a market potential analysis:

1. Define the practice's market
2. Collect data on the area
3. Estimate the demand for your services
4. Estimate the current supply within the trade area
5. Calculate the market potential
6. Final assessment.

TERMS DEFINED

Demographic: Describing the various characteristics of a specific population.

ISSUES AND OPTIONS

STEP 1: DEFINE YOUR MARKET

This is the most important step, as it provides the focus for the remainder of your analysis. Your practice's trade area is the area in which 80% of your clients are located (see 1.4 – Veterinary Trade Areas). This is often best estimated using drive times and known physical boundaries.

STEP 2: COLLECT DATA ON THE TRADE AREA

This step involves collecting demographic, psychographic and socioeconomic data on the communities surrounding the practice. Much initial data can be obtained from free websites such as www.census.gov or by purchasing a demographic profile report (see the References and Recommended Reading sections for more data resources). In general, purchased data will be more specific to the potential trade area than free data, which are usually tied to zip codes or city boundaries. The main variables needed for the analysis are:

- number of households,
- average or median household income,
- aggregate income for the area (sum of all the household incomes).

It is best, though, to collect as much demographic data as possible including data on such areas as consumer expenditures, average household size, percentage of home ownership, and other descriptive statistics if available, especially when comparing multiple potential locations. When collecting the data, collect both present- or recent-year data and projected data, typically 3–5 years into the future. In addition to demographic data, it is important to collect as much information as possible on any other factor that might influence the community or the practice, such as the following:

- What is the economic forecast for the area and how is the community's economy expected to grow/change?
- Are there highway projects planned that will impact the practice?
- Where are new housing projects going to be constructed?
- Are there any cultural attributes to the communities that may impact the potential for pet ownership?
- Does the community have a plan for the future, or will they just let it happen?
- Is there a significant transient population such as in vacation towns and shore communities?

Local planning and zoning boards and chambers of commerce are an excellent source of information, and many of them now have websites. It is also good to search the web for economic outlook reports and anything else that you can find on the area. It is better to have too much information than not enough.

Table 6-8-1. Percent of households with pets.

Any pet	56%
Dogs	36.5%
Cats	30.4%
Birds	3.1%

STEP 3: ESTIMATE THE DEMAND FOR YOUR SERVICES

Develop an estimate for the number of pet-owning households in the trade area. Using pet ownership data, the conversion is straightforward: (no. of households) × percent of households with pets. To convert a population count to the number of households, divide the population by the average of 2.53 persons per household.

The data in Table 6-8-1 are from the 2012 *U.S. Pet Ownership & Demographic Sourcebook* published by the AVMA.[1] It contains national and state projections as well as information on other types of pets and additional pet ownership data.

The numbers are national, but state data are available. Specific trade areas may have a higher or lower percentage in the state average; adjustments can be made for what was learned about the community in Step 2.

The end result of this step is an estimate for the number of pet-owning households likely to be in need of veterinary services – that is, the demand. If a projection for the number of pets is needed, the calculation can be made based on species data in the *U.S. Pet Ownership & Demographics Sourcebook*.[1]

STEP 4. ESTIMATE THE CURRENT SUPPLY WITHIN THE TRADE AREA

The supply focuses on an estimate of the total number of veterinarians who are or who could be influencing the trade area. This is more than just a count of the practices in the trade area.

- Compile a list of all of the veterinary practices in the region, including practices outside the trade area. If a competitor's trade area (by your estimation) could overlap with yours, then include them on your list. The "search by distance" feature at www.superpages.com or www.whitepages.com is a quick way to start. For each practice, you will need an estimate for the number of full-time equivalent (FTE) veterinarians (for example, two full-time and one part-time veterinarians would be 2.5 FTE). Create a map that contains your location, your trade area boundary, and all of the other practices on your list.
- Estimate the amount of trade area overlap among the trade area of each practice on your list and your trade area. Be realistic, even liberal, when estimating overlap – it can be readjusted later if necessary.
- For each practice, multiply their number of FTE veterinarians by the percent of the overlap. It is good to create a table or spreadsheet (Table 6-8-2). Total the "Effective Influence" column as shown. Your practice should be included in the list.

Table 6-8-2. National pet ownership.

Practice name	*No. FTE*	*% Overlap*	*Effective influence*
My practice	1	100%	1.0
Clinic name 1	1.5	40%	0.6
Clinic name 2	1	80%	0.08
Totals	2.4		2.4

The total provides a reasonable estimate for the number of veterinarians providing similar services who would be available to the pet-owning households within the trade area. This is utilized in Step 5.

STEP 5. CALCULATE THE MARKET POTENTIAL

There is no 100% reliable means of determining a trade area's market potential. It is possible, though, to develop an understanding of what the market potential might be, based on comparing it to other benchmark observations. The calculations in this step are estimates and points of reference, at best.

There are three main calculations: share of the aggregate household incomes, potential clients per veterinarian, and potential revenue per veterinarian.

Share of the Aggregate Household Incomes

Share of the aggregate household income =
(aggregate household income)/(TA FTE)

Dividing the aggregate household income (from Step 2) by the trade area FTE (the TA FTE from Step 5) results in a number that is usually in millions of dollars per veterinarian. Observations of different veterinary markets indicate that most veterinarians operate in communities with between $90 and $250 million of aggregate income per veterinarian. As a conservative point of reference, $170 million per veterinarian is a reasonable middle. More than $170 million indicates a positive indicator that there may be potential in the market for additional veterinarians. Less than that indicates that the market could potentially be tight or saturated.

Potential Clients per Veterinarian

Potential clients per veterinarian = (no. of pet households)/(TA FTE)

This calculation provides an estimate of the potential clients per veterinarian, if they were divided equally among the total number of veterinarians that are influencing the trade area. As a point of reference, it is good to have a minimum of 1,000 to 1,500 pet-owning households per veterinarian. More than that indicates there may be potential for additional veterinarians, and less indicates that the market could be tight or saturated.

Potential Revenue per Veterinarian

This calculation uses the number of potential clients as a foundation to calculate the potential revenue per veterinarian:

Potential revenue per veterinarian = (no. of pet households)/(TA FTE)
×(% clients seen) × (average client sales)

- **Percent of clients seen:** Typically 65–70% of all clients come in to the practice in a given year, so the total number of clients per veterinarian is multiplied by the percent of clients seen, usually 68%.
- **Average client sales:** This is an estimate for what the average client spends annually on veterinary services. It can be based on personal experience or on data from similar practices. It typically ranges from $250 to $450, or more, depending upon the practice.

As a point of reference, in most communities it is difficult for a practice to be successful over the long term with revenues of less than $400,000 per veterinarian. Values higher than $400,000 per veterinarian are a positive indicator that the market is capable of supporting an additional veterinarian.

The three calculations above are not cast in stone; however, they do provide a little more perspective on a market's potential than just your gut instinct. Because these calculations are based on assumptions, it is good to examine the calculations with changes to the key variables. For example,

- What if pet ownership in the trade area is 49% instead of 58.3%?
- What if the trade area FTE is higher or lower than the initial step 4 calculation?
- What if the average client sales is $275 instead of $350?

STEP 6. FINAL ASSESSMENT

Pull all the data together and use them to identify the strengths and weaknesses of the intended plan for this trade area.

- Be realistic.
- Conservative estimates are better than "rosy pictures."
- It is often worth the time and money to have a colleague, mentor, and/or consultant review your analyses for additional opinions and perspectives.

6.9. CLIENT AND PATIENT SEGMENTATION

BASICS

OVERVIEW

Practices that try to be everything to everybody are on risky ground. Successful businesses profile customers and segment the market so they can tailor products and services to meet the needs and preferences of each segment. For veterinary practices, knowing who their clients and prospects are is essential to practice positioning and to planning and pricing the right mix of services. The result: a practice that is in sync with its clients and the marketplace and is postured to deliver meaningful value better than the competition.

On the other hand, practices that attempt to "cast a wide net" and appeal to everyone, offer little that's compelling to anyone. It is difficult to form a meaningful connection with a client or prospect with a "one size fits all" approach.

There are numerous advantages for practices that profile their client base and segment their market. They can:

- better understand client needs and wants,
- more easily define and deliver value,
- focus client retention and growth efforts on predetermined targets,
- determine what types of clients a practice currently attracts and cannot attract,
- identify targets for outreach and business development efforts,
- more easily define marketing goals and track/measure results,
- identify opportunities among particular pet owner segments and niches (see 6.10 – Target Marketing),
- save money by avoiding misguided marketing and marketing missteps.

TERMS DEFINED

Client or Market Niche: A subset of a client or market segment that possesses like characteristics. An example of a client or market niche is pet owners who go camping with their dogs.

Client Profiling: Understanding a practice's existing client (and patient) base by grouping together pet owners based on a variety of like traits and attributes. These resulting client "segments" are then assumed to have similar needs and wants based on these attributes.

Client Segmentation: Using client profile data to categorize existing clients (and patients) into groups with similar characteristics.
