Market Segment: A reachable part of a group or market that is identified as a result of market segmentation. A market segment can be identified from a variety of traits and characteristics that can include: geographic location; demographic characteristics which are objective, measurable traits, such as gender, income, age and education; psychographic characteristics, which have to do with a segment's lifestyle, values, and attitudes; and behaviors that pertain to the usage of a particular service or product.

Market Segmentation: The process of splitting or segmenting the pet owner market into identifiable parts or segments that share similar traits. Market segmentation makes it easier for any business to identify and reach out to its most likely and/or lucrative targets.

ISSUES AND OPTIONS

Profiling a practice's client base – and segmenting the local pet owner market – are essential to client retention, client attraction, and practice growth. Who a practice attracts, and seeks to attract, must be in alignment with the practice's business goals. The critical groundwork of client profiling and market segmentation determine how a practice:

- Positions and defines itself in the marketplace. If it does not know its targets, a practice will have a difficult time developing a market identity that will resonate with anyone.
- Plans and structures its service mix (services should ideally be "client-focused," meaning they should be defined taking into account the needs of particular pet owner segments). Otherwise, practices end up offering the same list of veterinary services that mean something to the practice but mean nothing to the pet owner.
- Delivers its services. Different pet owner segments seek out different standards of care (see 9.3 – Standards of Care and Care Pathways). If service delivery is out of alignment with a segment, they will go elsewhere.
- Prices its services. Without knowing who it is targeting, a practice has no clue how to set prices. Prices are a big factor in influencing how pet owners perceive the value of a practice's services and set their expectations.
- Defines and delivers value. What represents value varies from segment to segment. If pet owners do not feel they are receiving value they will go elsewhere.
- Communicates with clients and prospects. Pet owners interpret generic service reminders as sales messages from the practice. On the other hand, segmentation enables a practice to reach out with information that is meaningful and valuable: "Sign up for our new glaucoma screening program for early detection of this devastating eye disease that is common in your pet's breed."

PROFILING CLIENTS AND PATIENTS

What types of clients and patients is a practice seeing now? Practice management software makes it easy to enter customized variables, run reports, and obtain a variety of client data.

Practices should first determine what they want to know. This will differ for each practice and should be based on the practice's goals, observations, financial performance in various sectors, hunches, market opportunities, and other factors.

Most practices track some type of client frequency data. They may know how many dogs they see, number of cats, number of multi-pet households, number of single households and so on. Beyond this, it is valuable for practices to break these segments down further. For example, for dogs, how many are puppies, geriatric, purebred, mixed-breed, and performance pets is the practice seeing?

Practices can easily cross-tabulate data to further profile their client and patient base. Using a matrix like the one in Figure 6-9-1, a practice that wants to better understand the relationship clients have with their pets can compare differences based on species. This can lead to a better understanding of a pet's role in the family, which can translate to how important the pet is to the family, how much the family may be willing to spend on veterinary care, how interested they will be in various types of messaging about pet care, and so forth.

		Pet owner relationship with pet	
		Family member	Pets are pets
Species	Dog		
	Cat		

Figure 6-9-1.

Client and patient segmentation to discern the role of pets in the family, by species. Using the above "2 × 2" matrix as a guide, practices can cross-tabulate client data. This approach can be used with multiple sets of variables.

6.9. CLIENT AND PATIENT SEGMENTATION

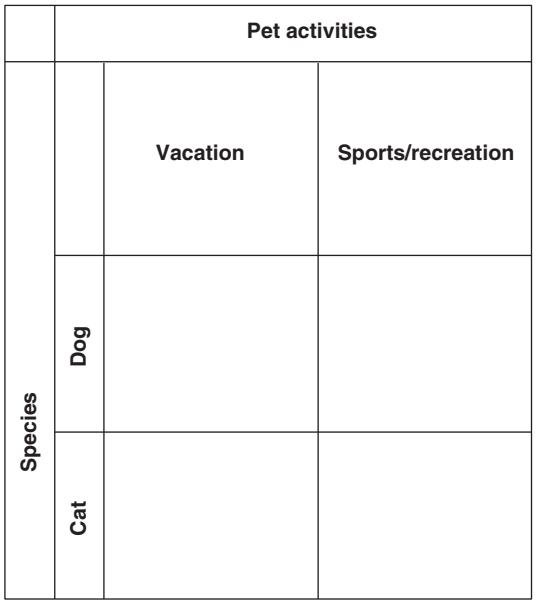

Figure 6-9-2.

Client and patient segmentation based on pet activities, by species.

Practices can further profile clients by further segmenting data. For example, pets viewed as family members can be further segmented by the variable, "pet activities" to identify what the pet does as part of the family (Figure 6-9-2). In this example, the practice is identifying pets that participate in family vacations and those that are involved in some form of sport or recreation. Understanding the role that pets play in client families enables practices to tailor services as well as messaging directed to these groups. In addition, based on the response a practice gets, it may want to reach out to these segments as part of its client attraction efforts.

Such variables can also be tracked to help the practice identify service growth areas, areas in decline, greatest revenue to the practice, and so on.

Profiling enables practices to tailor and distribute communications to particular segments of their client/patient base (e.g., cat owners, puppy owners, etc.). Practices that use patient profile data to track illness and health conditions can also use this information to report on trends and emerging health concerns. Being able to say, "Our data shows an X percent increase in feline heart disease," is a powerful message for a practice to send, especially to clients who are on the fence about wellness exams. It also helps the practice position itself as an authority, build credibility, and create news for local media.

MARKET SEGMENTATION

Segmenting the pet owner market is similar to profiling and segmenting a practice's client base. However, the practice is focusing its attention externally and looking for opportunity in the marketplace. Practices have to ask themselves which segments represent the greatest opportunity to attract new clients and grow their client base. However, it is never enough to say, "Well we don't have a lot of small dogs at the practice so let's try to get more small dogs." Instead, a practice must first get a good handle on where opportunity exists by taking the following steps:

- Become familiar with pet owner trends and related needs and preferences. Understanding trends helps practices recognize changes in everything from human–pet relationships to health concerns and issues affecting various species and breeds (Table 6-9-1). For example, the fact that pets are living longer has opened up tremendous opportunity for practices given that longevity (as in humans) leads to age-associated health concerns such as arthritis and kidney disease. The fact that there is a growing number of single households in the United States represents a segment in which pets take on the role of companion or child.
- Look for pet owner segments not being served, or being underserved, by the competition. A practice that understands how a particular group of pet owners views local veterinary services has an advantage over its competition in servicing this segment.
- Look for "gaps" in service delivery, such as services that are not being delivered or being poorly delivered. In some cases, there may be a lack of a particular type of veterinary service that pet owners seek. For example, a practice might determine that owners of pet rabbits have nowhere to go for dental care as no practice in the area has yet claimed the role of rabbit dental expert. The underlying issue is that rabbits are more frequently becoming house pets just like cats and dogs. As a result, they are getting better care and living longer. Older rabbits are prone to tooth spurs and abscesses that can be serious, requiring removal, and often surgery. The practice could carve out a lucrative niche by recognizing an unmet need and attract clients from throughout the region.

Table 6-9-1. A sample of pet owner trends.

Population	*Trends*
Pet owners	Living longer
	More mobile
	More single households
	Pets are "children"
	More stressed/less leisure time
Pets	Living longer
	Getting fatter
	More kidney/heart disease
	Considered as family members
	More performance pets
	Popularity of big dogs

METHODS OF SEGMENTATION

Understanding the marketplace paves the way for practices to identity and target market segments (see 6.10 – Target Marketing). Trends, along with local market intelligence, help practices determine whether or not to pursue a particular segment. There are numerous ways in which pet owners (and any market) can be segmented.

Geographic Location

Where pet owners originate from and how far they are willing to go are considerations that all practices take into account. For small animal practices, this is calculated as drive time for which the typical standard is 10–15 minutes to get to an urban or suburban practice (see 1.4 – Veterinary Trade Areas). However, if a practice is perceived to offer a meaningful difference or advantage that no one else offers, this drive time can be considerably longer. An example is the niche practice, specialty practice, or emergency clinic. For specialty practices, the typical acceptable drive time is 45 minutes; however, again, drive time becomes less important when clients perceive a difference. It is not unusual for certain specialty practices to draw clients from multiple states.

Geographic location also pertains to type of setting, such as urban, suburban, or rural. Where a pet owner resides plays a big role in pet and owner lifestyle and related veterinary needs.

Demographic Characteristics

Veterinary practices can segment both clients and patients by demographic traits. For humans, there are numerous demographic traits that marketers consider (see 6.8 – Demographic Assessment).

6.9. Client and Patient Segmentation

Veterinary practices might take into account traits such as gender, age range, type of household, and number of pets, all of which will have different needs as a result. In regard to pets, practices might target services/programs to such pet demographic traits as species, breed, size of pet, known predisposition to disease and health problem/condition.

Psychographic Characteristics

These traits, also known as lifestyle, include personal beliefs, values, and outlook, as well as likes and dislikes when it comes to activities and pastimes. These traits will also very likely influence a person's choice of pet and acceptable veterinary practice. Oftentimes values and likes/dislikes are related. For example, a person who is passionate about the environment will probably spend more time in nature/natural settings. A person who is passionate about the environment and spends time in nature and has a dog, probably has a large dog like a golden retriever or other hearty breed, and probably takes that dog hiking and camping. A person who is sedentary may read a lot and is more likely to have a lap dog.

Usage Traits

Usage traditionally has to do with customer buying and consumption frequency and patterns. For veterinary practices, usage pertains to frequency of visits and purchases of such things as pet food, but a broader definition of usage can extend to a segment's participation in the pet community. Active participants are more likely to share information through Facebook likes, social media sharing, blogging/re-blogging, and so on. Highly engaged pet owners comprise a desirable target because they are more likely to become advocates for the practice.

Influencers

There is one more type of segment that may not appear on traditional lists of ways to segment a market. Consider the influence that others can have on customers or, in this case, clients. Influencers, or thought leaders, include anyone in a position to have an impact on someone else's decisions and choices. For pet owners, there are many. Pet supplies retailers, pet groomers, pet boarding and daycare facilities, shelters, and rescue groups can all be considered trusted sources by people who have pets. Their opinions can be valuable when it comes to choosing other pet-related services. Segmenting and targeting influencers is a smart choice for any practice.

SEGMENTING THE PET OWNER MARKETPLACE

Using segmentation variables, a practice can identify a variety of pet owner segments (see Table 6-9-2). Of course, this is not a complete list. Again, these segments should match the local marketplace and where the practice spots opportunity. In this case, the practice has identified Segment 1 as dogs that are overweight; Segment 2 as senior empty nesters with cats viewed as children; Segment 3 as young Hispanic families with dogs; and Segment 4 as males with large breed active performance dogs.

By checking off and further defining characteristics among these variables, a practice can pinpoint market segments that have identifiable needs as a result of these characteristics. For example, looking at Segment 4, males with dogs involved in performance sports, needs in this segment will likely have to do with:

- getting the right nutrition,
- fitness and conditioning,
- recognizing signs of injury and/or arthritis,
- injury prevention.

Such information provides a focus for practices to develop:

- Services to reach out to the needs of the segment.
- A possible point of difference to distinguish a practice from others.
- Information that is much more meaningful and valuable because it focuses on the needs of the segment.
- Multiple ways to engage clients in related discussions; something to talk to them about.

MEASURING RESULTS

Once a market segment is targeted, just as with any marketing effort, tracking/measuring results is critical. Segmentation makes measurement much easier because a practice knows who is responding to its efforts. The practice that does not segment its market, and tries to reach everyone, will have little idea who its efforts are resonating with. Segmentation allows a practice to determine:

- how the segment responds to services and programs directed its way,
- what client feedback says about whether or not the segment feels its needs and expectations are being met,
- if the segment was accurately defined or if it should be narrowed or broadened,
- the impact that the segment is having on the practice's bottom line.

Additionally, practices that measure client satisfaction will also be able to compare client satisfaction among various segments. For example, a practice may be getting a good response from dog owners, but may not score as high among clients with cats.

EXAMPLES

N/A

Table 6-9-2. Pet owner segmentation.

Pet demographics	*Segment 1*	*Segment 2*	*Segment 3*	*Segment 4*
Species	Dogs	Cats	Dogs	Dogs
Breed				Large breed
Age				
Health condition	Obese			
Owner demographics				
Age		Seniors		
Gender				Male
Family		Empty nest	Young families	
Ethnicity			Hispanic	
Lifestyle				
Sports				Performance
Pet role in family		Child		Companion
Travel				

6.9. CLIENT AND PATIENT SEGMENTATION

CAUTIONS

Practices should not assume that just because they have the desire to reach out to a certain market segment that an opportunity is there. The practice has to first identify the need and then tailor its services or develop new services to meet the need – not the other way around. Or, a practice may notice a competitor pursuing a particular market segment and follow suit. What is successful for one practice may not work for another. That is why understanding pet owner trends, the local marketplace, and your competition are so important. Look for opportunity first, and then define the segment, as opposed to targeting the segment and hoping that the opportunity is there.

6.10. TARGET MARKETING AND TARGETED CLIENT OUTREACH

BASICS

OVERVIEW

Practices that assess the market, choose their targets, and focus their marketing efforts will have greater success than practices trying to be everything to everyone. Target marketing enables practices to do the following:

- "Get their arms around" clients and prospects that are the best match for their services.
- Focus marketing efforts to avoid wasting time and resources.
- Develop a positioning strategy that is meaningful and postures the practice to attract and retain the right clientele.
- Develop a service mix that is in alignment with the needs of a practice's targets.
- More easily track and measure results.

TERMS DEFINED

Commodity: Services and goods that are easily interchanged due to lack of perceived differences among targets. When services or goods become viewed as a commodity, consumers shop on price alone because they view everything else as equal.

Marketing: The process of developing and delivering services and/or products matched to the needs of consumers with the ability, desire, and means to acquire them. Marketing includes service/product development, pricing, distribution, and promotion.

Positioning Strategy: Defining a practice and creating a market identity that is in alignment with the needs and desires of the practice's targets. A practice's positioning is conveyed through every way in which it interacts with pet owners, including the practice's facility, visual devices and symbols, people, services, and service delivery. All these elements work together to create an understanding of what pet owners can expect when they walk in the door.

Service Mix: The selection of services a practice offers. This should be in alignment with, and reflective of, the needs of its targets. When services are structured around the needs of a target, it is easier for the target to understand the benefit or advantage they will gain from using the service.

Target Marketing: Identifying select target markets and directing marketing efforts to these targets. This is the opposite of mass marketing, in which all customers and prospects are treated the same.

ISSUES AND OPTIONS

Marketing professionals have known for years that mass market appeals only work for homogenous products or services with broad market appeal. These are typically low-cost and low-risk (less customer remorse if they are dissatisfied) products and services that are easily interchangeable and considered commodities. Still, even widely marketed goods and services are often promoted through targeted campaigns.

Once a practice has defined its targets (see 6.9 – Client and Patient Segmentation), it is ready to tailor its marketing efforts to reach out to these targets. Practices must start with a good grasp of each target's needs, wants, and preferences. These are related to what defines and distinguishes the target in the first place. For example, cat owners will have different needs from dog owners and so on. Note that what a target is looking for often changes over time, as the target group's needs evolve, new needs arise, or new choices become available in the marketplace.

Once the target's needs are understood, target marketing is done by creating ways to deliver value to the target using the following.

TARGETED SERVICES

Most practices offer the same list of veterinary services. The problem is that most clients have a difficult time relating to or understanding the need for surgery, chemotherapy, dental care, radiography, ultrasound, and so on. In fact, in most cases, clients hope that their pet will never need any of these!

Practices must look for ways to create and orient services to make them meaningful and relevant to a target, such as the following:

- Bundle existing services to create tailored packages appealing to different targeted segments. Although these "bundles" may contain the same services a practice offers now, they are repackaged to create meaning and obvious value for the segment. For example, the practice could offer:
  - Senior pet exams for older pets
  - Healthy living packages for overweight pets
  - Pre-travel exams for pets who vacation with their owners
  - Glaucoma screening for breeds at risk
  - Cat exams based on breed-specific health concerns
- Create or add new services that reach out to client targets, such as:
  - Pet-specific care (see 4.8 – Pet-Specific Care)
  - Sports medicine for active/performance pets
  - Hospice care for terminally ill pets (see Examples)
  - Arthritis early detection and care for aging pets
- Consider specialized education or study for a veterinarian or staff member who may be interested in reaching out to a particular client target. (Example: the practice discussed in the following example has a trained pet hospice nurse on staff and has affiliated with a local clinical psychologist for client grief counseling.)

TARGETED PROGRAMS

Engaging today's pet owners must occur on their terms. Given that pet owners can easily access information from multiple sources, pet owners are more likely to act based on what they have learned from other sources instead of what their veterinarian has told them to do. Developing targeted programs adds value and helps to build client relationships through information/education, participation in the practice (through events, workshops, etc.), access to other pet owners, and so on. Client programs should have meaning and relevancy to a particular client segment and are a great way to engage clients without being seen as pushing or selling services. Some examples of the programs a practice might create include the following:

- Programs based on the traits and needs of particular pets, such as:
  - pets with chronic conditions,
  - geriatric pets,
  - pets with breed-specific health problems,
  - pets with behavior issues.
- Programs based on client situations, such as:
  - multiple pet homes,
  - families with new puppies or kittens,
  - rescue group foster care homes,
  - homes with young children.
- Programs used as a platform for delivering value to clients and prospects through:
  - workshops, seminars, and events,
  - blogs, including guest blogs by clients,
  - support groups,
  - special education/instruction,
  - patient specials and special offers,
  - related social media posts.

TARGETED INFORMATION

Due to information overload, consumers have become adept at disregarding messages that they consider a waste of time and capturing those that mean something to them. Practices that target their marketing are more likely to get through the filters. Instead of sending

out "one size fits all" reminders, practices should engage clients with information that is relevant to their pets or households by:

- varying newsletter content to reach out to different pet owner targets,
- creating specialized bulletins or newsletters tailored to particular segments (e.g., cats, big dogs, purebreds, senior pets, performance pets, etc.),
- developing information pieces and/or website content tailored to different pet health concerns and issues,
- creating useful videos that reach out to specific pet owner issues and concerns,
- reaching out to different client segments via Facebook, Twitter, and other social media.

TRACK AND MEASURE

By engaging in target marketing, practices will also find it easier to track and measure results. Practices can gauge which targets are most responsive to various initiatives and which, for whatever reason, are not.

Target marketing also enables clients to capture meaningful client feedback. By targeting particular client groups for surveys, focus groups, interviews, and other client feedback measurement tools, practices will gain a better understanding of which groups' needs are being met and which are not. This is better than simply putting clients into one big group and lumping responses together.

EXAMPLES

One feline-only practice has reached out to families whose cat has a terminal illness or is near end of life. The practice's end-of-life and hospice care program targets clients whose cats are considered family members and who are looking for options to euthanasia but have concerns about their pets' comfort. The end-of-life care program, which offers palliative care and helps clients monitor their pet's quality of life, fits hand in hand with another of the practice's targets – patients with serious illnesses and chronic conditions.

CAUTIONS

- Practices must make sure that they are prepared to service a particular segment before reaching out to it. This means putting in place the right expertise and experience, procedures and protocols, internal communication, and client information. It is easy to lose client trust when a service area or program lacks clarity or credibility. Making whatever you do real before introducing it to clients is a must.
- To effectively perform target marketing, it is important to appropriately "flag" patient features in the practice management software so that pets with similar needs can be easily located for marketing campaigns. For example, although features such as species, breed, age, and gender are easily segmented within practice management software, others are not routinely designated for later recall. Some of these important segments might include periodontal score, body condition score, pain score, diagnosis, and therapy. Once this type of information is routinely entered and flagged within the software, it is possible to recall all patients with a specific feature to be sent targeted marketing materials.

6.11. Push versus Pull Marketing

BASICS

OVERVIEW

In the "old days," manufacturers typically "pushed" advertising messages out to consumers who were often naïve and had few other sources to which to turn for reliable information. Consumers' believed advertiser promises and purchased everything from new cars to pet food to cigarettes based on these unsubstantiated claims.

"Push" advertising techniques often contained little substance, relying instead on emotional and lifestyle appeals offering consumers what advertisers thought they needed – more fun, action, acceptance or love. At the same time, competitors were few and choices were more limited than they are today.

The computer and Internet changed everything. Now, with the world at their fingertips, consumers access service and product facts and information including everything from the background and performance of the provider to what other consumers are saying in the form of online reviews. Gone are consumer naivety and being stuck relying on only the self-serving claims of advertisers. Push marketing has lost its impact, being replaced by marketing efforts that "pull" in consumers due to their relevancy and compelling content.

TERMS DEFINED

Compelling: Motivating to the point that the target is likely to act or is compelled to do something.

Content: Broad category of substance conveyed through customer interactions. Content can be information or it can be the customer's experience. In all cases, to be effective, content should be compelling and deliver customer value.

Customer Insights: A window into how consumers think and the motivation behind their needs and wants in a given product or service category. Used to predict future customer behaviors.

Customer Value: How well a service provider or product manufacturer does at satisfying customers' needs at any point in a transaction. A customer can assign value, beginning with pre-purchase information through to post-purchase service and follow-up.

Engage: Obtain someone's interest or attention as a result of some form of interaction.

Market Segments: Portions or parts of a targetable market whose members share common characteristics and traits based on similar lifestyle and demographic characteristics.

Marketing: The process of identifying unmet needs and wants in the marketplace and of developing and offering goods and services that will satisfy those needs and wants.

Marketplace: The collective consuming environment made up of multiple market segments.

Pull Marketing: The opposite of "push" marketing in which marketers seek to engage and connect with consumers through relevant and compelling content with the goal of consumer engagement leading to sales.

Push Marketing: Promotional efforts that rely on aggressive advertising campaigns to disperse often one-sided information on products and services with the goal of consumer sales.

Relevant: Meaningful and applicable to a particular target; pertaining to the target in a way that members can relate to it.

ISSUES AND OPTIONS

Veterinary practices that are still "pushing" promotional information "out there" hoping that something will stick are wasting time and resources. Information that is "pushed" often takes on the form of self-serving messages that tout the self-perceived merits of a service or product by an institution or business, while oftentimes ignoring the needs of the customer. Customers are being told what to choose without being engaged or compelled due to the limited value of the exchange.

On the other hand, "pull" marketing serves to stimulate customer interest and achieve engagement due to the *value* that is being created at the start. At every point of contact, the customer is exposed to valuable information that – if correctly targeted – will lead to customer interest and desire to find out more.

Note the example below. With push marketing, the veterinary practice is telling pet owners what to do. While it also mentions why this is important, it comes across as self-serving and lacks the substance of pull marketing. "Of course they want me to bring my pet in for a wellness exam. They're a veterinary hospital." It is broad, not targeted and does little to make the pet owner want to find out more.

On the other hand, the pull marketing message accomplishes several things:

- It targets a particular need and, in this case, a particular type of pet.
- It adds value by raising awareness of the characteristics of a disease affecting millions of pets: arthritis is subtle, it is painful and it is treatable.
- It offers a next step or something that will help the client address the problem serving to engage and involve them.

Consider these two examples:

- **Push marketing:** "Your pet should have a wellness exam annually to aid in early detection and disease prevention."
- **Pull marketing: "**The signs of arthritis are often subtle even though your pet may be in tremendous pain. Watch our video or come to one of our arthritis clinics to learn how to spot the signs of this highly painful but treatable disease."

As one can see from these, pull marketing is not a "one size fits all" approach. Instead, it takes into account who a practice's clients are, and their problems, concerns and needs. This is the basis of any sound marketing program.

"Pulling" in clients means getting their attention in a way that is meaningful and relevant to them. It requires several steps.

STEP 1. GAIN CLIENT INSIGHTS

If a practice does not know what is meaningful and relevant to its clients it will be difficult for it to be meaningful and relevant. Pull marketing is based on a knowledge of client dynamics. Why did they leave the last practice? What do they expect from yours? What are their frustrations? What would they like to get for their pet that they cannot get now? How can a practice improve their experience?

It is impossible to develop meaningful, valuable content without first understanding the target. Qualitative insights – such as those gained through professionally conducted client interviews, discussion groups, and focus groups, provide a solid foundation for pull marketing tactics. Many practices fail to find out what clients think – and then wonder why their marketing efforts fail.

STEP 2. SEGMENT

Treating all clients and pets the same just does not work. To successfully "pull" clients in segmentation needs to be applied. Client motivations and needs differ greatly. It is not useful to ask "What do pet owners want?" That is *not* the question. What do owners of large dogs over the age of 10 want and need? What do the owners of Maine Coon cats need that other cat owners might not?

Consider the health issues and concerns faced by clients based on the type of pet they have (see 4.8 – Pet-Specific Care). Without segmentation, a practice that tries to reach everybody will end up connecting with no one.

Segment by any number of variables (see 6.9 – Client and Patient Segmentation). These might include age of pet, size of pet, proclivity to certain diseases, breed of pet, pet's lifestyle, owner's lifestyle, and

more. Choose groups that are sizeable enough to make outreach worthwhile.

STEP 3. DELIVER VALUABLE CONTENT

Without first understanding clients and second, recognizing that clients' needs vary greatly, determining what represents value is elusive, making it difficult to pull in clients.

Pull marketing is about delivering valuable content at every point of contact. The challenge is that what is oftentimes meaningful to a practice is probably not meaningful to clients.

Delivering valuable content means that a practice strives to provide something that delivers value to a pet owner. Such value could take the form of helping pet owners:

- spot signs of serious illness while it is still early,
- save money,
- become a better pet parent,
- recognize the signs of acute or chronic pain,
- prevent injury,
- stay out of the ER,
- manage chronic illness,
- care for a senior or terminally ill pet,
- reduce guilt,
- reduce helplessness.

Again, the above will vary based on the targeted client segment. Content can be delivered through a variety of channels including the following:

- Educational messages
- Printed materials
- Website content (however you need a form of outreach to generate website visits)
- Facebook/Twitter posts
- Newsletters/electronic communication
- Special events/programs.

EXAMPLES

- A program for spotting and treating arthritis pain in aging dogs.
- A special forum dedicated to senior pets.
- Classes/training for administering home care to chronically and terminally ill pets.
- Cancer clinics for spotting signs of cancer early in prone breeds such as large dogs.

CAUTIONS

Pull marketing is *not* about posting any type of content just to "get the practice's name out there." It is about careful consideration of the target, the target's needs, and what will compel them to be "pulled in" to a practice. With increasing competition, creating meaningful forms of outreach is more important than ever.

6.12. PRACTICE POSITIONING

BASICS

OVERVIEW

Positioning creates an expectation of what pet owners can expect; it is the promise of the standard of care that a practice will deliver.

Practices that know who they are targeting – and work to create a practice identity or to position their practices to attract those targets – are more likely to be successful in their marketing efforts. Practices that try to be everything to everybody will have a more difficult time reaching out to pet owners with a clear, understandable message and presence. Positioning enables practices to:

- build a distinguishable market identity and presence,
- stand out from the competition,
- attract and engage desired targets,
- send a clear and consistent internal and external message,
- stand for something.

TERMS DEFINED

Identity Elements: The various ways in which a practice conveys who it is. This includes everything from the facility in which a practice is housed, to the behaviors of its people, to its manner of service delivery, to its visual identity (logo, icons and symbols), to its messaging. Practices all convey some sort of identity – whether or not it is conscious or a reflection of how the practice wants to be seen.

Market Identity: The results of positioning; the way in which a practice is perceived or understood by pet owners and in the marketplace. All practices have a market identity. Often the identity that the marketplace has is not in alignment with the desired reality of the practice (see Perception Gap).

Perception Gap: Sometimes a practice wants to be understood or thought of in one way, but the marketplace has a different view. The result is a perception gap – the desired reality and the actual reality are not in alignment.

Practice Positioning: Defining how a practice wants to be understood in the marketplace; the space the practice seeks to occupy in the minds of pet owners. Positioning essentially determines how a practice will "look and talk" in the marketplace.

ISSUES AND OPTIONS

In business sectors where there is little or no competition, positioning is not as important since customers are drawn to a provider due to a scarcity of alternative goods or services. But when there is strong competition, positioning is essential not only to define what the business – in this case a practice – stands for, but also to enable the practice to attract the desired clientele that are a good match for its services (see 6.15 – Practice Differentiation).

PRELIMINARIES TO POSITIONING

Positioning should never be based simply on someone's idea of what the practice should be. Instead it must take into account market influences that determine whether or not the direction being considered for the practice is a good "fit" for the marketplace. Before starting the positioning process, practices must take the following into account:

- **Market conditions:** Pet owner trends, purchase behaviors and market data all impact the timeliness and relevancy of positioning efforts.
- **Gaps in the market:** As part of this process, practices should look carefully for market segments that are being underserved (see 6.9 – Client and Patient Segmentation). Is there a need for a practice that does not currently exist? Are there frustrations with existing veterinary services? Is there an unoccupied space in the market for a new type of practice to step in?
- **The practice's targets:** These are the market segments that the practice is targeting and would like to attract (see 6.10 – Target Marketing and Targeted Client Outreach).
- **Needs and preferences of the targets:** What has the practice learned about the targets? What are they looking for in veterinary services? What is important to them? How do they view their relationships with their pets?
- **The competition:** Practices must consider how their competitors are positioning themselves and to whom they are directing their services. Competition includes other small animal practices as well as nontraditional veterinary services providers such as low-cost clinics, retailers, and mobile units.
- **Realities of the practice:** Practices must ask themselves if they are equipped to deliver what they are promising as part of their positioning. Are the practice's expertise, staffing, service delivery and facilities consistent with the identity that the practice seeks to create? If they are not, the practice risks overpromising and underdelivering. The result: client disappointment and buyer remorse.

THE POSITIONING PROCESS

Positioning does not happen overnight. It is a process that requires careful thought and consideration. This process is outlined in Table 6-12-1 and elaborated on in the following sections.

- Practices must start by understanding the marketplace and spotting opportunities for the practice (see 1.4 – Veterinary Trade Areas). The main questions are: How can the practice deliver superior value in a way that is not being done now? Where are the gaps? This part of the process benefits greatly from conversations with pet owners and fully understanding local market dynamics. Many practices are surprised at what they can find out. At this point, professional marketing counsel is extremely beneficial and brings outside objectivity to this critical point in the process.
- Identify targets: Understand who the practice is reaching out to, what they are looking for and what they are not getting now (see 6.10 – Target Marketing and Targeted Client Outreach). Talk to them!
- Develop a written positioning strategy. This document or "brief" becomes the road map for how the practice "looks, talks and behaves." It should include:
  - Identification of targets: Who they are and what the practice has learned about them.
  - How the practice will define itself to appeal to these targets.
  - Where the practice fits into the competitive landscape; what distinguishes it and sets it apart.
  - Practice positioning goals and how the practice wants to be perceived and understood in the marketplace.

Table 6-12-1. The positioning process.

Step 1: Look for opportunities	Market outlook and trends
	Opportunities to deliver superior value
	"Gaps" in competitor service delivery
	Underserved market segments
Step 2:Identify targets	Needs/preferences
	How they define value
Step 3: Develop a positioning strategy	Positioning goals
	How to achieve goals (new/revised services, staffing, standards, service delivery)
Step 4: Apply and implement the strategy	"Audit" of current identity elements
	Alignment with positoning goals/strategy

◦ How the practice will achieve the above goals. This includes addition of any new or revised services, staffing, approaches and standards of care, service delivery, service pricing, and other considerations.

• Apply and implement the positioning strategy. Practices should conduct an "audit" of all the ways in which the practice presents and defines itself to clients and the marketplace. It is important to bring all of the practice's identity elements into alignment with the practice's positioning goals and strategy. As an example, if the practice wants to be perceived as "the go to place for serious illness and chronic care," it must make sure that it is "talking, looking and acting" like a practice that delivers this.

• Show and not just tell. Care must be given so that the practice is not simply telling clients and prospects who it is. Instead, it must demonstrate this. A common mistake many practices make is simply listing their attributes and hoping that clients will accept what they tell them. Simply stating that a practice offers "the highest quality care, provides compassionate care, or treat pets like our own" does not make so in the eyes of pet owners. Telling pet owners what you want them to believe has very little influence over today's skeptical consumers. They want to come to this conclusion themselves (see 6.11 – Push versus Pull Marketing).

AVOIDING A PERCEPTION GAP

Developing a positioning strategy enables a practice to create a guide for how it will present itself to clients and the marketplace. Everything a practice does and says should be consistent with how the practice is striving to be understood. There are two realities: the practice's and its clients'. When a practice says one thing and does another, it is sending mixed signals (see 4.6 – Client Perception and Learning). This undermines practice credibility and pet owner trust. For example, if a practice wants to be viewed as a leader in the diagnosis and treatment of serious and chronic conditions, it needs to make sure that its appearance, messaging, and actions portray it as the leader it says it is. Simply saying the practice is a leader does not make it so in the minds of clients. There must be distinguishable differences that pet owners can see and experience for them to come to this conclusion. If this is not apparent in pet owners' minds, their reality is different from that of the practice. And to them, the practice has not lived up to their expectations – or its promise.

ALIGNING ALL ELEMENTS OF THE "MARKETING MIX"

To avoid a perception gap, all elements of a practice's "marketing mix" must be in alignment. The "marketing mix" is the combination of elements that a practice – or any business – presents to the marketplace as part of its offering (see 6.7 – Basic Tools of Marketing). Basic elements in this mix, also known as the "four P's," include the following:

• **Product:** The product or service being offered. For practices, how it describes and packages its services influences marketplace perceptions. For example, by offering "surgery" pet owners might perceive that a practice promotes surgery which is self-serving. It is smarter to offer surgery as part of a client-focused service area such as pet "orthopedics and mobility enhancement."

• **Pricing:** Today's consumers expect to get what they pay for. Practices that reduce their prices of products and services as a client attraction tool are positioning themselves as low-cost and low-quality. When a practice tries to compete on price, it invites pet owners to look at only price. When price is the only advantage, you have a commodity that is easily replaced.

• **Place:** The place or method of product distribution or service delivery includes everything associated with providing access to services, from location and facility appearance to a practice's hours and whether or not it makes house calls.

• **Promotion:** How a business reaches out to its targets. The messages a practice sends to clients and the community impact perceptions. Client-focused messages – that provide valuable pet owner information – do more to build a favorable image then those that simply try to sell services.

POSITIONING AIDS REFERRALS

Having a clear identity in the marketplace also substantially aids a practice's ability to stimulate referrals. Practices always hope that clients will recommend them to friends and family, as well as to strangers through online reviews. When clients have clarity of what the practice to which they are referring stands for and what it delivers, they are going to be much more confident and comfortable making a referral. They are also going to be in a better position to accurately articulate why other pet owners should go there.

EXAMPLES

N/A

CAUTIONS

What works for one practice does not always work for another. Do not assume that because one practice you hear about has successfully carved a niche for itself or is attracting a particular type of clientele the same will work for another practice. Each practice is different and is faced with different variables, including location, local market composition, practice history, current market perceptions, staffing, and many other factors. Although there are basic guidelines to follow in the process, positioning is never one size fits all!

6.13. BRANDING

BASICS

OVERVIEW

• Branding is the process of creating a unique, recognizable identity that communicates value and fosters customer loyalty, trust, and referrals.
• Your branding helps create your brand. Veterinary practices can improve their business by building a strong brand that conveys a clear message and resonates with their preferred clients.
• Some types of branding are obvious, such as logo, slogans, and name, but your day-to-day practice and interactions with your market (clients, prospective clients, colleagues, and community) are also part of your marketing and branding.
• Your brand includes stories, images, and the feelings they evoke, which cause your customer to choose or recommend you over alternative products or providers (see also 6.14 – Emotional Branding).

TERMS DEFINED

Brand: The idea your market has about your business. A brand is more than a logo or business name – it is your clients' perception of your practice.
Branding: A consistent, distinctive marketing message and practice image. Branding includes logo, name, and promotional material, as well as your staff behavior, services, premises, communications, and interactions with your clientele.
Logo: A symbol or other small design that identifies your products, uniform, vehicles, and so forth. Logos often include the company name and meaningful icons or images.
Market: Your customers, prospective customers, and other consumers or providers of your products and service. Competition is central to the concept of market – clients can choose you, or other options, or not buy at all.
Marketing: The process of communicating the value of a product or service to customers. This includes advertising, signage, and brochures as well as your interactions with your clients and community.

ISSUES AND OPTIONS

WHY YOU NEED A STRONG BRAND

• A strong brand helps you attract and retain quality clients and staff, and teaches clients what to expect from your services.
• A brand communicates value above the normal price of the services you provide.
• Marketing and branding author Seth Godin defines a brand in terms of value:

> *A brand is the set of expectations, memories, stories and relationships that, taken together, account for a consumer's decision to choose one product or service over another. If the consumer doesn't pay a premium, make a selection or spread the word, then no brand value exists for that consumer.*[1]

• A branded product has more value to the customer than a generic product. Unbranded products and services often have to compete on price.
• A strong brand is sharable, making it easy for satisfied clients to refer their friends to you.

THE IMPORTANCE OF A CLINIC BRAND

• People like doing business with people they know, like, and trust. Veterinary practices generally need the clients to bond to the practice, rather than individuals, to ensure practice stability, smooth operations, and a good work-life balance for staff.
• Each staff member should be focused on delivering great service and value to clients and their pets (see 6.3 – Better Meeting the Needs of Existing Clients).
• To make the clinic brand more personable it can often be helpful to focus on a fun and friendly team persona within the clinic brand. For some practices, such as specialty or referral practices, a more serious tone may be appropriate.
• Sole practitioners should focus on both their personal brand and their clinic brand, to aid in succession planning and make it easier to employ new staff and to take time away from the clinic.

DEVELOP A WORLD CLASS BRAND

A decade ago your competitors probably included a local veterinary clinic or two, a pet store, and a groomer. The family veterinarian was seen as the primary pet health expert. Today, animal owners have hundreds of pet and animal experts competing for their attention, many with appealing branding and global online businesses (see 1.2 – Challenges to the Profession). Some are pet health or training professionals. Others are breeders or enthusiasts. They are often backed by a passionate community of loyal fans, boosting their authority and credibility. This means your clinic branding must be first class, even if you only serve clients within your immediate vicinity. If your clients cannot find you online or your website has not been updated in five years it undermines your credibility and professionalism.

YOUR BRAND STORY

People respond more powerfully to stories than to facts. They make decisions based on emotion and then rationalize to justify the decision. To create a strong brand you need to create an emotional connection with your clients and story is the best way to do this (see 6.14 – Emotional Branding). Weave into your brand the story of why you became a veterinarian, why you practice what and how you do, how you help your clients, and how they feel about you. Use real stories rather than general descriptions to create a stronger message. Customer testimonials are a great way to do this, and should be incorporated on your website and your clinic brochures.

YOUR BRAND SHOULD DISTINGUISH YOU FROM YOUR COMPETITORS

Many veterinarians use similar branding and marketing, which makes them less distinctive. Although it is great that you "treat all creatures great and small," if every other local clinic does this too it may hold no special value for your clients. Most people assume all veterinarians love animals and offer the same basic facilities and services.

Veterinarians are fortunate to have a strong positive perception and trust in the community, but you need to go beyond that to create a brand that is memorable and exceptional in some way. To find out where you excel, ask your staff and clients. If you still can't find something, ask your clients what they want, and work on becoming exceptional at that. This can be described as your "brand promise" – it is a guarantee of what you will deliver to your customers. It should enhance your credibility and be memorable, informative, and emotionally engaging. If you make a brand promise you need to keep it, or you will devalue your brand.

An example might be "Join our pet care family." To live up to this you would need to remember people and pets' names, return calls on time, and think of them on special occasions. If you could offer this sort of service, people might travel further and pay extra for this added value.

BRAND YOURSELF BEFORE YOU MARKET OR ADVERTISE

Marketing activities amplify your brand and your message, so it is critical that you develop your branding before you begin marketing or your efforts will be ad-hoc or even counterproductive.

YOUR BRANDING SHOULD APPEAL TO YOUR IDEAL CLIENT

Identify who is your ideal client and what they want in veterinary services, and develop your marketing and branding with that in mind. Make sure you focus on your clients' needs and interests, not your own. (Some veterinarians focus on their fancy equipment or technical details of their skills. Clients want to know you have modern facilities, but do not need to see a photo of your autoclave!)

LIVE UP TO YOUR BRANDING

Your marketing efforts need to match your clinic goals and your clients' experiences. If you promise one thing and deliver another, or fail to deliver at all, you are eroding your brand and client trust.

USE CONSISTENT BRANDING, IMAGES, AND LANGUAGE ACROSS YOUR ONLINE AND OFFLINE PRESENCE

Once you develop your brand, use it consistently in your marketing efforts. This is what building a brand is all about. Inconsistency results in a fragmented or confused brand.

The basics of branding include an attractive and memorable practice logo, colors, and related artwork, as well as your practice name and a practice slogan or brand promise.

Your branding should be incorporated across these marketing materials:

- Clinic signage, uniforms and equipment, vehicles, and street or event signs
- Advertising and directory entries
- Stationery
- An appealing brochure covering your services, location, and contact details
- Business cards, preferably for each staff member
- Handouts or other information resources
- Any additional branded promotional material (magnets, pens, leashes, etc.).

DIGITAL BRANDING

Digital branding is just as important as your signage and brochures. People now communicate, learn, do business, socialize, shop, and make decisions online. This requires a strong digital brand, incorporating the following, which is essential for every business:

- A high-quality, professionally designed and branded clinic website should be the hub of your online marketing efforts (see 10.13 – Websites and Search Engine Optimization). You should also have a clinic blog, testimonials, galleries, and articles.
- An email and print newsletter from your hospital with regular useful and interesting content.
- A presence on third-party sites such as social media networks, business directories, and pet websites, which should direct prospective clients to visit your own website or to call or visit you.
- Promotional or informational videos, slideshows, and other media.

In the age of social media the strength of your brand is more important than ever before (see 10.16 – Social Media). Building and maintaining a presence on social networks can be a powerful tool for promoting your brand, allowing clients to make referrals by sharing a link to your website or Facebook page. You also need to be active to protect your brand from negative messages online.

It is vital to remember that this space is about fun, networking, sharing, and learning. It is a great way to connect with new clients but not a place for pushy marketing.

GET THE WHOLE TEAM ON BOARD

Make sure your team is on the same page when it comes to branding the clinic, and that everything you do supports your brand and fulfills the expectations it raises.

Make sure you have policies in place that protect your brand, even when your staff are not in the clinic. Examples include policies governing staff uniforms, client privacy, and use of social media.

CONCLUSION

Your brand is not your logo or slogan – it is how your clients perceive your business after every interaction. Building a strong brand helps attract the clients you want and establishes you as a leader in your market. Branding your business can strengthen your business. Getting factors such as your practice vision, mission, and values aligned with your brand are essential.

6.14. EMOTIONAL BRANDING

BASICS

OVERVIEW

• People primarily make decisions emotionally at a subconscious level and then rationalize them logically afterwards. This is in part because there are now so many similar products on the market that differentiating between them rationally becomes an extensive and near impossible task.
• The purpose of emotional branding is to create a bond between the consumer and the brand by provoking a consumer's emotions. This emotional connection, not wholly dissimilar from the connection a person might feel with another person, must be formed between the brand and the client in order for a brand to be truly successful.
• A brand needs to portray a particular personality with specific values attached to it in order for people to create a relationship between themselves and the brand.
• Emotions arise through experience and consumption of a brand. This resulting emotion plays a dominant role in client loyalty and retention.
• Clients with emotional brand relationships are more likely to resist the temptation to use another brand simply because of price (or other "rational" reasons).
• It costs between 5 and 25 times less to retain a client than it does to attract a new one (see 4.21 – Client Retention). Therefore, successful emotional branding ultimately leads to increased profitability.
• A consistent brand message creates familiarity and sets a brand apart from its competitors.
• As the emotional connection with a brand and the associated loyalty increases, clients may become brand advocates, helping to convert new clients. Word-of-mouth recommendations are one of the key reasons a pet owner will choose a veterinary practice.
• Brand love can lead to brand loyalty, trust, positive word-of-mouth recommendations, and even resistance to negative information about the brand.
• Veterinary practices are lucky to already be working with some of the most emotion-inducing content around – pets. It is no coincidence that animal videos are so popular on YouTube!

TERMS DEFINED

Brand: A brand is made up of the name, symbol, design, messages and ethos that together form the identity of your practice, differentiating it from your competitors. A brand allows those familiar with it to distinguish it among competitors.
Branding: The practice of creating a consistent image of your brand.
Client Persona: A semi-fictional representation of your ideal client based on market research and real data about your existing clients.
Emotional Branding: The practice of building a brand that appeals directly to a consumer's emotional state, needs, and aspirations.
Sensory Marketing: Marketing that engages the consumers senses and as a result affects their perception, judgment, and behavior.

ISSUES AND OPTIONS

In order to create an emotional brand you first need to define your potential and current clients, then create emotional communications, and remember to appeal to all the senses.

DEFINE YOUR CLIENTS

• People define themselves through the brands they use and associate with. In order to appeal to your target clients you need to know who they are and what resonates with them (see 6.10 – Target Marketing and Targeted Client Outreach).
• Using current client data is a great place to start. Do you have more female than male clients? Which are the main areas that your clients live in? What sort of affluence does this suggest? What sort of pets do they have? As veterinary practices tend only to gather necessary client information (and rightly so) this makes finding many details very difficult.
• Utilize your front office team to create a typical client persona (it may be advisable to have more than one). Give this person a name, age, and pet or pets based on what you know about your existing clients and general information about the market. Think about what their hobbies and interests might be, how much disposable income they might have, whether they might have children and identify what their values might be. This will help you to connect with your client and what might appeal to them on an emotional level. Your brand needs to share the values of your ideal client persona.
• When you have got your persona or personas, make sure you use them. For example, if your main persona is a female mother of younger children with a dog, your communications should reflect this. For example, you might want to make sure your branding reflects family values and the importance of pets within the family (see 6.13 – Branding). Promotional posters of families or children with a dog, a blog post on keeping your dog safe around young children, and a competition via social media offering a free family (and pet) photoshoot are all ways in which you could portray these values. In addition, providing activities to keep children entertained in the practice waiting room will make the overall veterinary experience less stressful for a parent, thereby increasing the positive emotions associated by them toward the practice.
• Remember not to focus on one persona to the level of alienation of others. Where possible, different communications (with the same overall values and message) should be created to appeal to the variety of personas that visit your practice. However, where this is not possible, focusing on the persona that represents or appeals to the majority of your clients is advisable.

USE EMOTIONAL COMMUNICATIONS

• Reevaluate the practice's mindset when it comes to communications. Do not just think about communicating key messages but also the best way to phrase these messages which will resonate with the client. You are not just selling great pet care but also the feeling a client experiences knowing their pet is in great hands and that they are doing the best for them by coming to your practice. Use words such as "happy" and "healthy" and make sure accompanying pictures reflect this.
• Where possible personalize communications for your clients. Use their name and/or their pets name on the phone, when calling them into the waiting room, in recall communications, and anywhere else that you can.
• As well as necessary formal communications with clients, focus also on the informal. Social media and newsletters are great ways to build a more relaxed relationship with clients and to appeal to their interests and values.
• As goes without saying in the veterinary world, always put the pet first and make sure the client knows that this is what you are doing. If you offer a pet healthcare plan for example, make sure you focus on the benefits for the pet, not just the price point. Make the client feel that what they are investing in a better quality of life for their pet (see 4.8 – Pet-Specific Care).
• Utilize feel-good stories of pets recovering from illness or injury to create positive emotions.
• Everyone loves added value and this is not always easy to create or to communicate. Publicizing the charity work and the work your practice does in the local community to your clients (and beyond) helps them to feel that by supporting you they are also supporting a larger cause. Show them that you are the kind of brand they want to be associating with. Another way to do this is to run a campaign whereby you give a

small amount of money to a local charity that may resonate with clients (a children's charity for example).
• Make sure your practice is getting regular positive local press coverage.
• Remember that not all communications need to provoke positive emotions from clients. A sad or fear-inducing campaign can be just as successful, particularly when it comes to compliance (such as heartworm or leptospirosis campaigns). Use this approach sparingly and with caution.

APPEAL TO ALL THE SENSES

• Emotional branding should engage all the senses.
• Think about every single possible client touch point – from your website, to a phone call, to a first visit to the practice, to being in the consultation room. Review all these touch points with a critical eye. It might be worth asking someone to mystery shop the practice or invite someone impartial to visit the practice for the first time and provide constructive feedback. Ask them to focus on the look, the smell, what they hear (barking dogs or calming music?). Is the environment stress inducing? Are there separate cat and dog waiting areas to put cat owners at ease?

EXAMPLES

N/A

CAUTIONS

• Your communications should help clients come to the realization on their own that you are the right practice for them. The language and imagery used should compel them but not feel like you are telling them what to do.
• Do not get hung up on unique selling points (USPs) but instead focus on where your value lies. You may be promoting something that your competitors also have (such as family values) but what is important is that you are doing it better and promoting it more successfully.
• Emotional branding as a concept has been criticized for the moral and ethical implications of manipulating human emotions. Always be authentic and honest and look to play to emotions. Most consumers will see straight through manipulation and this will work to harm your brand, not build relationships.
• Always be consistent with your messages and ensure your team know your brand and its associated messages inside out.
• Have a policy in place for dealing with negatives (e.g., bad press or bad online reviews). These can work against the brand image you are trying to portray. However, if dealt with in the right way, this can reinforce a client's positive association with your practice.

6.15. PRACTICE DIFFERENTIATION

BASICS

OVERVIEW

• Practice differentiation is the process of distinguishing your hospital, products, and services from others, to make them more appealing to your target market.
• As competition in an area increases, differentiation becomes more important to ensure an adequate share of new clients, as well as creating brand loyalty.
• To be effective, differentiation must be valued by clients. A differentiation attempt that is not perceived is not effective.
• Without adequate differentiation, products and services often become perceived as commodities.
• When clients cannot perceive a difference between practices, they can be tempted to differentiate based on price (i.e., who offers the services needed at the lowest price?).
• Differentiation on its own does not make clients unaware when a price premium is presented. It just makes them less sensitive to competing offers because of the value they attribute to the differentiated offering.

TERMS DEFINED

Differentiation: The process of distinguishing your hospital, products, and services from others, to make them more attractive to your target market.
Omnichannel Consumer: Consumers looking for a consistent marketing message, both online and offline.
Target Market: A particular type of client that the practice wants to attract.

ISSUES AND OPTIONS

THE VETERINARY MARKETPLACE

• The veterinary marketplace tends to be fairly homogeneous, and this contributes to the commoditization of veterinary services – the perception that services offered at one hospital are likely comparable to those offered at all or most other hospitals.
• Most veterinary practices in a given community offer similar services, and dispense similar products, often for very similar fees and this can foster a belief among pet owners that there is not much difference between veterinary practices.
• When this is the case, and pet owners do not see much of a difference between veterinary practices, they might decide to choose a practice based on price. After all, if one practice is very much like another, why pay a premium at one location when you can likely get comparable service at a lower price point elsewhere?
• Consumers may not choose the very cheapest competitor, believing that the lowest price may be associated with some inferior aspect, even if they cannot discern this, but consumer psychology suggests that in the face of no clear differentiation, they will likely choose one of the mid-priced alternatives, avoiding the highest- and lowest-priced options, unless they are appropriately differentiated.
• There are relatively few examples of clear-cut differentiation in veterinary practice. Clients expect to pay more when they are referred to a specialist, or when they need to take their pet to an emergency clinic, but otherwise there is little to differentiate one primary care practice from another, and this complicates the process of trying to increase fees without clients (or staff) complaining (see Figure 6-15-1).
• In times past, veterinarians used to be the keepers of veterinary medical information, and so clients were compelled to come to veterinarians for information that they could not obtain elsewhere.

Figure 6-15-1.

Without appropriate differentiation, it can often be difficult for clients to discern why one hospital charges more than another for the same service or product. Image courtesy of pixabay.com, CCO Creative Commons.

This is no longer the case. There is an extensive assortment of noncurated pet health information online, most of it available for free, so veterinarians cannot rely on access to information to be their sole differentiator in the marketplace.

THE RETAIL WORLD

• In most sectors of the retail world, differentiation allows customers to perceive a clear relationship between value and price, and for consumers to select accordingly.
• Most consumers know that price exists along a spectrum, whether they are considering a restaurant for dining, buying a car, television, or timepiece, or deciding whether to wear haute couture or bargain-basement fashion. They can go cheap, expensive, or anywhere in between and likely find an option with which they will be satisfied.
• When we compare this to the veterinary marketplace, it is clear that this spectrum of price and quality is much compressed with veterinary options. If the qualifications of one graduate veterinarian in primary care practice is very much like the qualifications of most graduate veterinarians, and if they are all using similar quality equipment, medications, vaccinations, and approaches, it can be difficult for pet owners to discern why they should pay considerably more at one practice.
• It is this relative uniformity of veterinarians and veterinary practices that leads to commoditization of veterinary services, and a hesitancy to spend more when differentiation is not evident.
• After all, in the retail world, when clients perceive something to be clearly a commodity, they tend to naturally gravitate to getting the best deal they can, which might even involve making the purchase online rather than buying from a "bricks-and-mortar" establishment.
• It is important not to lose sight of the fact that pet owners actively differentiate pet services, even if they do not or cannot discern differentiation in veterinary services. Many actively select certain pet foods, accessories, over-the-counter products, and a variety of ancillary pet services (grooming, boarding, etc.) on the basis of perceived value and price.

PARETO'S PRINCIPLE

• Pareto's Principle is a crude rule of thumb that suggests that the majority of effects (about 80%) are actually due to a small number of events (about 20%). The principle is therefore sometimes referred to as the 80/20 rule.
• This principle suggests some wide-ranging considerations when it comes to veterinary practice, such as that 80% of a practice's revenue likely comes from about 20% of its clients, or that 80% of a hospital's retail revenue likely comes from about 20% of its products.
• If the Pareto Principle is true, then a small segment of your client base is actually responsible for a large share of your revenue stream.

This segment is often your core or "A" clients, and often the target market for differentiation.
• Core clients are those aligned with your mission, not necessarily those that spend the most money in a given year.
• It is important to realize that the Pareto Principle is simply a rule of thumb, and almost no hospitals will have exactly an 80/20 spilt between effects and events.

MAKING DIFFERENTIATION WORK

• Define your target market or your "core" customers and develop messaging that will resonate with them (see 6.10 – Target Marketing and Targeted Client Outreach). Most veterinary hospitals utilize a "one size fits all" approach, which will only appeal to generic pet owners, not your target audience.
• Create conversion pathways to transition willing typical clients to being "core" clients. In this way, develop ways to convert "D" clients to "C" clients, "C" clients to "B" clients, and "B" clients to "A" clients.
• Do not take customer loyalty for granted. Businesses need to prove and re-prove their value to clients with every interaction.
• Copycat competition is to be expected. Businesses must continually evolve and innovate to stay ahead of the competition.
• Differentiation needs to be specific enough that staff understand the distinctions and are able to communicate them effectively with clients.
• Clients today are omnichannel consumers, so it is important that they receive consistent messages across all your marketing efforts, including your website, in-hospital materials, conversations with staff, standards of care, etc.

EXAMPLES

Veterinary hospitals can differentiate themselves across a spectrum of attributes. Here are just a few:
• Expertise/specialization
• Hours of operation
• Financing options
• Pet-specific care
• Customer service
• Accessibility
• Reputation
• VIP/loyalty programs
• Niche services
• Value/quality/price
• Trendiness
• UI/UX.

CAUTIONS

• A hospital's differentiation strategy should change and evolve along with its clients and competitors.
• Businesses must be able to measure and illustrate the value delivered to clients. It is not enough that the hospital thinks the differences are to be valued. Clients are only prepared to pay a premium when they clearly value the differentiation offered.
• When differentiation is introduced to a practice, it is important to realize that it will not appeal to everyone. The goal is to cultivate clients whose interests align with the practice, not to convince all clients that they should immediately embrace the new offering.

6.16. INTERNAL TEAM MARKETING

BASICS

OVERVIEW

- It makes no sense to spend money on marketing the practice if the team is not ready to contribute to the plan.
- Internal marketing occurs all the time – intentionally or unintentionally.
- Internal marketing is about reputation management, not advertising.
- A marketing plan must include the mission and vision and values of the practice, and continuous, year-round education for the team.
- Team members support the brand established by the hospital.
- Brands are established when the client experiences the same consistent, positive experience every time they visit the practice.
- Clients rate a veterinary practice based on the experience they have, not on the level of veterinary medicine.
- Team members must understand that they are always marketing the practice in their communication styles, level of professionalism, and their actions.
- The appearance of the building itself markets the practice (intentionally or unintentionally).

TERMS DEFINED

Brand: The repeated, positive experiences created (by the veterinary practice team) for the client who returns for service and refers friends and family.

Internal Marketing: The act of marketing the practice to existing clients while they are visiting the hospital.

Practice App: Application used on smartphones that allows easy access to a business and improves the client experience.

ISSUES AND OPTIONS

COMMUNICATION STYLES

Communication is expressed using three methods:

- Verbal – contributes to 7% of the message and incorporates the words used to deliver the message.[1]
- Paraverbal – contributes to 38% of the message and incorporates the tone of voice and enunciation of words.[1]
- Nonverbal – contributes to 55% of the message and incorporates all nonverbal communications (i.e. facial expressions, body posture, actions, and behaviors).[1]

LEVEL OF PROFESSIONALISM

Communication styles contribute directly to the level of professionalism.

- **Choose words with care:** Do the words we use to educate clients create value? Or a subpar experience? Professional terms that clients can understand should be used. For example:
  - Utilizing the term "vaccinations" versus "shots" creates a higher perception of value for the client.
  - Use caution and prevent overloading clients by providing too much information in words they do not understand (see 5.5 – Translating Medicalese). This detracts from the message.
  - Clients usually remember just 30% of the information presented in the exam room.[2] Determine the three most important points the client must understand and provide written material for them to refer to once they get home.
- **Use an appropriate tone of voice** when communicating with either team members or clients. Is the tone condescending or authoritative in any manner?
  - Team member communications directly affect client communications; a condescending tone detracts from the message and reflects poorly on the practice.
- **Ensure team members appearance fits a professional image:**
  - Uniforms must be professional; stain free, wrinkle free, and fur free. Clients respect team members that appear professional.
  - Hair color/facial piercings. Obtrusive hair colors and facial piercings can decrease the respect/trust clients have for team members, affecting client compliance. If a client does not respect/trust the message being delivered by the team member, they will not accept recommendations.
  - Ensure appearance standards/requirements for team members are clearly stated in the employee manual. Define a uniform replacement policy, hair and facial appearance, and consequences for not following the stated policy.

ACTIONS

As stated in the nonverbal communication section (see 5.9 – Nonverbal Communication), the behaviors and actions of team members account for 55% of a message and can develop trust and respect from clients. While professional appearance is critical, so are the actions or behaviors exhibited by team members.

Actions speak louder than words. Positive team member actions include the following:

- Taking ownership for the client and patient experience. Clients watch team members – which contributes to the brand experience. Team members should take pride in delivering the best care possible to both clients and patients. Employees should walk tall with pride, smile continuously, and engage clients with passion and enthusiasm.
- Showing that they love their job. Does the practice give all team members a reason to be proud? Does the practice leverage staff appropriately?
- Engaging clients with education. Team members who go above and beyond to ensure client understanding gain higher client compliance and ensure the best patient care is provided. Engaged team members are excited, compassionate, and able to listen and identify client needs.

APPEARANCE OF THE BUILDING

The veterinary practice should be visually appealing both internally and externally. The practice signage should be bright and modern. The parking lot should be well lit and free of trash, debris, and pet waste. The interior should be clean, odor free, and comfortable.

Evaluate the cleanliness of the interior/exterior: Walk in the front door weekly and evaluate the clinic from a client's perspective. Sit in the reception area for five minutes and note what is seen, heard, and smelled. Repeat this step in the exam rooms.

TECHNOLOGY

Today's veterinary consumer is seeking easy access to information and convenient communication methods for their busy lifestyles. The consumer has changed, and the practice must update technology to meet the changing client needs. Technology drives internal marketing. Technology upgrades should include the following:

- **Electronic medical records (EMR):** Clients want to have access to their records immediately through pet portals (see 10.18 – Patient Portals). Although paper medical records still allow a pet portal to exist, the information provided for the client to see is far from ideal. EMR allows integration with pet portals, allowing the clients to see radiographs, laboratory results, reminders, and medical and medication history. Human healthcare information has become digitized and clients expect the same from veterinary healthcare providers.
- **Digital radiographs:** Clients want to be able to see their pet's radiographs – in pet portals, email, or through practice app integration. Analog radiographs can be scanned, but that is time consuming for staff.

• **Website:** About 39% of clients visit "Dr. Google" before ever calling the practice, while 19% visit Google while in the exam room.[3] Ensure the practice website has the resources clients are seeking, controlling the information (to a degree) the clients read. Websites should be easy to navigate and updated on a continual basis (see 10.13 – Websites). They must give the clients the ability to request appointments, refill medications and provide access to the pet portal.
• **Pet portals:** In addition to the above integration of EMR, pet portals allow clients to upload images of their pet, select how to receive reminders (postal/email/text), set up medication reminders, and message the staff if needed.
• **Practice app integration:** Clients do business on their smartphones (check emails, respond to text (SMS) messages, search the Internet). A practice app makes it easy for clients to do business with the hospital (see 10.17 – Mobile Applications). Practice apps allow clients to see their medical records, receive alerts when their pets are due for vaccines, request appointments, request medication refills, receive updates for hospitalized pets, or search a pet health library.
• **Reminders:** Practices must determine how each individual client wishes to receive their pet's service reminders – either by mail, email, text, app notification, or phone call. The practice must know what the client preference is and deliver accordingly (see 4.16 – Client Reminder Systems).
• **Online pharmacy:** Clients want the convenience of ordering medication at any time and having it delivered directly to their home. An online pharmacy should integrate with website, pet portals, and practice app.
• **Telehealth:** Telehealth is alive and well in human medicine, and clients expect veterinary practices to offer the same in the near future. Consider integrating patient consults through the use of FaceTime, Skype, or Google Hangouts. Refer to the current State Veterinary Practice Act for telehealth regulations.

If technology has not been integrated into the practice, client preferences may not be met, and the internal marketing of the practice will struggle (see 11.14 – Integrating Technology). Practices must provide "wow" experiences to clients in order for them to refer friends and family (increasing the Net Promoter Score) and return for future services.

EXAMPLES

Every team member delivers internal marketing, whether they realize it or not. Consider the following opportunities (and areas for potential improvement) for successful internal marketing:
• Team members wearing scrubs with practice name embroidered on them promotes a professional appearance and builds the practice brand.
• Social media posts that promote the practice and the team in a positive manner also build the brand.
• The cleanliness of the parking lot makes a first impression. Overgrown bushes, weeds, debris, potholes, pet waste, etc. should be removed.
• The smell of the lobby must be clean and welcoming.
• The building condition and maintenance must be managed.
• Outdoor signage should be modern and inviting.
• Clients must not overhear team member conversation/gossip.
• Clients should not hear frightened pets waking up from anesthesia. This creates a perception that pets are in pain.
• Clutter at the front desk creates a disorganized appearance.
• Team member food and beverages should never be allowed at the front desk.
• The appearance of postcard reminders should be in line with the practice brand, colors, and logo.

CAUTIONS

The practice is internally marketing at all times – whether it is intentional or not. Practice leaders must ensure every team member understands their role and the significant impact it can have on the client experience.

Internal marketing does not have to "cost" the practice a large amount of money. As with any marketing initiative, return on investment (ROI) should always be monitored. However, of the solutions discussed above, technology is the only category that may require a substantial monetary investment.

Measuring ROI on technology can be difficult; however, the overall revenue of the practice will grow, as will client satisfaction (when used appropriately).

6.17. PROFESSIONAL PROMOTION AND PUBLICITY

BASICS

OVERVIEW

• Many professionals do not like the topics of promotion or publicity. Traditionally, the professions did not need such marketing methods for a successful practice or for the delivery of services, but times have changed and one of today's main focuses is growing a profitable practice by attracting new clients and competing with the tide of ever-growing competition, management, and compliance issues.
• Aside from traditional marketing and advertising methods, promotion and publicity can be as effective and cost a great deal less. Proven publicity methods can be fun to execute and can be a source of new clients, new celebrity, and even media attention.
• Much of local community publicity also involves a simple attitude of involvement, volunteerism, and a sense of community. Practices that have taken the leap and have launched into community events have seen this pay off handsomely!
• The bottom line in the attitude adjustment needed to be a good publicity expert is to let yourself be overtly passionate and enthusiastic about what you do. It does not hurt to take a moment and remember that your veterinary hospital is an incredible community asset. Most members of your community would love to know more about what you do. And no one is better suited to tell them than you. Recapture that passion about your life's work, and let that drive the many ways you can promote your hospital.

TERMS DEFINED

Byline: The line in a publication that denotes the author.
Promotion: The act of encouraging a trial or persuading an action to contribute to the growth and advancement of a business.
Public Relations: The art of developing reciprocal understanding and good will between a business and the public.
Publicity: The act of delivering information of news value as a means of gaining public attention or support.
Tip Sheet: A document containing the latest information or "tips" for a particular topic.

ISSUES AND OPTIONS

PROFESSIONAL WAYS TO PROMOTE OR PUBLICIZE A VETERINARY PRACTICE

• The first step in professional publicity is designing an outstanding, professionally created logo, mark, and/or slogan. Far too many veterinarians have a friend or family member who draws something cute and it becomes the hospital logo. If you are going to think long term and understand the many ways a hospital logo is used, you should seek professional help in this area.
• There are graphic artists who specialize in logo design and production, and it is well worth the money to do this correctly once.
• As soon as possible, register the hospital name and variations of the name for use on your website. Web domains are filling up fast, and you may be surprised to find that your "unique" name is already taken by someone else. Go to an appropriate registry service (e.g., www.GoDaddy.com) and pay the small fee needed to secure your website name. This is extremely important because it will be used in all your publicity and promotion efforts.
• Websites are meant to be current and the information fresh (see 10.13 – Websites). Endeavor to make your site professional, attractive, and always changing with rich content.
• Promotional items are fun to give out, and you will be surprised at how many clients refer to these for your phone number and website address. Refrigerator magnets, coffee cups, caps, pens, and thousands of other gadgets can actually be little "24/7" promoters for the hospital and can be responsible for clients obtaining your phone number without resorting to print directories, search engines, or your website. Set a yearly budget for these items and buy them, give them away, and have fun. For good sources, use a search engine and type in "promotional items."
• Submit articles to the local papers and neighborhood weeklies or monthly papers. These publications are always looking for content, and regular submissions by you are often easily accepted. By becoming a regular contributor or even a columnist, you generate tremendous credibility among readers and this celebrity translates into calls to the practice. Local papers are usually very happy to have columns and articles written by local experts, and the promotional value to the practice is significant. Just be sure to always have a byline that contains the hospital name and website address.
• Many hospitals find that sponsoring community activities generates excellent goodwill that translates into community visibility, credibility, and new clients. Little league teams, church activities, and senior centers need your help, and sponsoring activities with these groups is an excellent source of professional publicity.
• Try holding an event and inviting the public and the media. Pet-a-thons, dog walks, dog baths, health screenings, service-dog awareness, first aid events – all are excellent weekend events that are fun, helpful for nonprofit organizations, and seem to consistently attract the news media. Be sure to be available for interviews and have your message points ready, which of course will include your hospital name and website address.
• Create free local community seminars. These events can be coordinated with local animal shelters, pet stores, and feed stores. You can bring in other experts such as equine practitioners. Develop a one-hour, half-day, or even a full-day seminar for pet owners to attend. Be sure to have "how-to" exhibits, give samples away, and do lots of demonstrations. You could tie in the event with an upcoming season or major event. Be sure to invite the media!
• With almost every promotional or media event, you will need to provide a media kit. This is the toolbox the media uses to generate a story for your event. Agencies will charge a lot for the development of such a kit, but practice staff can easily compile them. Simply buy glossy pocket folders at the office supply store and include inside: a news release about the event, a photo of you and your hospital, your brief biography, copies of testimonial letters and letters from prior media appearances, potential interview questions about the event, any published articles or columns you have available, your business card and brochures, and samples of promotional items.
• Write "how-to" articles and give them away. This is an easy and effective way to generate client education and general publicity. They can be sent to the local papers and given away at events and local shops. Get your staff involved; you may find a frustrated writer on the team. Always include all of your contact information in the bottom byline.
• Write a series of "tip sheets" and give them away. Tip sheets are easy, informative, to the point, single sheets you can write in minutes. They usually contain 5–12 facts telling readers how to do something. The media loves tip sheets, and they are perfect content for your website.
• Get your website underway and make the site functional, fun, and full of resources for pet owners. Even if your website is not an award-winning thing, it still gives you a presence on the web and in today's "keyword"-driven search it is an excellent way for someone to find you. Of course, if you can, you should have the nicest site you can afford. But even a basic site that is professional, with good pictures, a phone number, a map of where you are, and search engine optimization is essential (see 10.14 – Search Engine Optimization). Practically everyone now has web access, many on their smart devices, and this trend continues to grow.

• For the media, develop a media room, online media kits, a news release section, and even post all your past news stories. It's better that you work with a web expert instead of trying to do this yourself; you want it to look highly professional. After all, it features your image as much as that of your hospital.
• Volunteer your services. This fosters tremendous goodwill among community leaders and the word-of-mouth referrals are worth your time invested here. This is an outstanding way to meet people and develop relationships that will benefit your hospital in ways you cannot even imagine. City shelters, private humane societies, therapeutic riding centers all need your help. Your volunteer time does not even need to be animal oriented.
• Start a monthly newsletter (see 6.18 – Client Education Tools). This is quite a commitment in time, but you could get your staff involved to do much of the writing or you could make it a quarterly newsletter. Another key timesaving consideration is to publish this important PR tool online and send it via email. This saves tremendous staff time and money in postage. Be sure to use lots of pictures, keep it newsworthy, and include the media in your mailings. What was old is new again is a true adage when it comes to some forms of marketing. Although paper newsletters were out of style for many years, they are coming back (along with many other forms of marketing) as clients love to read your work and see your pictures. Both print form and electronic form are excellent ideas.
• There are a variety of publicity "tricks" that seem to work in generating media attention. For example,
  ◦ Start a "Hall of Fame" where you induct prominent members of the animal community. Add members each year, and always send out media releases.
  ◦ Make a "List." For some reason, these really seem to attract the media's attention. Generate the "Smartest Pet List," or "The Best, The Worst, and The Most Pet Friendly List," and so on. Remember, this is not news, it is simply entertainment, but it can get the media's attention because it is a good counterpoint for bad news.
  ◦ Create an "Index." The "Index of Pet Health" might be the result of observations from the practice. The "Pet Stress Index" could be an assessment of pets in artificial environments. Create the index, and then send out press releases with educational facts and, of course, your contact information.
  ◦ Create a quiz. Quizzes are fun because they invite participation with the audience, they fit short media times and formats for counterpoint news, and they are fun to have on your website. Examples include: What is your pet's personality? Can you think like a cat? Are you a dog or cat person? Are you the best pet parent? Are you vet-smart?
• Begin contacting the media on a regular basis. By now, your community activities should be established and your credibility and celebrity should be known. The media loves both of those things – a credible local celebrity expert! Follow the local news and see which reporters do your kind of stories, call them and pitch quickly, then offer to follow up with some good newsworthy facts. Adapt your story ideas to news of the day – that is always an attention getter for a news producer. Remember, in this effort you are building a relationship that will benefit you for many years.

EXAMPLES

N/A

CAUTIONS

Few people like to "blow their own horn," especially professionals and scientists. Consequently, to make publicity work one must really take a different view of this marketing tool. It helps to reinvigorate the attitude of being proud of what you do, and telling the world of your enthusiasm about veterinary medicine.

MISCELLANEOUS

• When you are your own PR department, it cannot have a very large reach and, without a network, you are limited by the "touch" principle. Therefore, build your own publicity network.
• Your family, friends, and staff should always carry cards and brochures so they can leave them with dentist, doctor, accountant, lawyer, website manager, pastor, insurance agent, and anyone else you do business with.
• These professionals understand and admire your skills of self-promotion. Offer to do the same for them. Referrals bring in class A clients.
• You will be surprised at the acceptance of many pet and non-pet-related businesses that are willing to do business card exchanges and referrals.
• Include members of the media. They will see you as a leader and will call on you when a story needs your expert input. It is hard to put a value on media attention!

6.18. CLIENT EDUCATION TOOLS

BASICS

OVERVIEW

• It is in the veterinary professional's interest to educate their clients. Clients who understand what they are being asked to do and why are more likely to be compliant, therefore resulting in a better outcome for the pet.
• The average client relies on advice and guidance from veterinary professionals for the information needed to make decisions about their pets. They will not read veterinary journals or keep up to date with the latest advances in pet healthcare. The responsibility for the education of the client therefore falls upon the practice team.
• According to "The rule of 7" a person needs to hear about a product or service seven times before they feel compelled to act. Exposing clients to information regularly and through different channels will therefore increase likeliness of action or compliance.
• Different people learn and remember things in different ways. Therefore, it is important to utilize a range of tools and channels for client education. In addition, people often need to hear or read over something many times in order to fully understand it. Allowing them to process the information in a variety of different forms allows for higher retention.
• We live in a digital world and in recent years the tool kit needed for client education has been adapted to reflect this. There is an increased need to provide information digitally so that it can be accessed anywhere and at any time by busy clients.
• Mapping out various pet lifecycles with your team will allow you to predict the information needed by clients at various stages of their pet's life (e.g., when a pet achieves a certain age, it would be relevant to send the client information about a senior pet health check).

TERMS DEFINED

Compliance: The number of clients who act upon recommendation and instruction from a veterinary professional given to them with the aim of improving their pet's welfare.
Email Automation System: Software which allows you to automate email sending. It is the most effective way to engage in email marketing, enabling you to send out emails at specific times, or when a customer takes a specific action.
Reach: The total number of different people or households exposed to a medium during a given period.

ISSUES AND OPTIONS

ADVANTAGES OF GOOD CLIENT EDUCATION MATERIALS

• Marketing and client education go hand in hand. A campaign surrounding the importance of dental health can have both the aim of educating the client and also the aim of generating more veterinary work for the practice via the use of strong calls to action (CTAs), such as "Make an appointment for your pet's dental health check today!" Put simply, client education is good for business and more importantly, it is good for the pets under your care.
• Educating the client not only increases their capacity for making the right decisions but also helps to build trust between the client and the practice, creating loyalty and bonding them to the practice.
• Educating clients about the practice in general (e.g., opening times and services offered) increases transparency and should therefore reduce complaints. If you offer additional services such as grooming and boarding make sure this is communicated to clients who may be taking their pets elsewhere for services that they could be getting from you. Clients cannot buy a service that they do not know is offered by you or even that exists.
• The client in the consult room may not be the only decision-maker for the pet. Providing accessible information in various forms and locations (such as online) allows other decision-makers to stay educated and informed.
• Keep information as specific and personalized as possible (see 4.8 – Pet-Specific Care). Clients are more likely to read or watch the materials if they know they will be relevant.
• Engaging educational materials allow you to contact the client outside of the twice a year that they typically visit the practice. This increased communication with the client has the advantage of strengthening the bond between client and practice and in turn increases their loyalty to the practice.
• Educational campaigns for clients can be linked with team member continuing education (CE)/continuous professional development (CPD).
• Having engaging and high-quality educational material on offer, in print and online, is an outward sign of a professional and high-quality practice.
• Well-produced and integrated materials have the purpose of providing consistent information to clients.
• Having educational materials on display and easily accessible increases the exposure of clients to ideas and concepts. Every repetition can be effective.
• Client education can help in the retention of a client. Retaining a client costs between 5 and 25 times less than it does to attract a new client.
• If clients take promotional materials away with them, this can help to promote the practice externally to their friends and family.
• Online and easily accessible relevant client materials may be found via search engines such as Google and have the potential to act as new client conversion tools.
• Effective client education tools can free up consult time as many queries can be dealt with by directing clients to a page on the practice website or by sending a relevant email with the information. This is not suggesting that consults should not be thorough but rather, where a client has a lot of questions this can be a way of ensuring the appointment does not run over and the practice continues to run efficiently. The same can be said for telephone enquiries.

EMAIL NEWSLETTERS

Regular informal newsletters are a great way to keep clients engaged by building up an informal and friendly relationship between the client and the practice. They should have the aim of educating and entertaining the client as well as promoting the practice and its services. Clients who feel connected to your practice are much more likely to be loyal and stay long term.
• There are a number of budget-friendly email automation systems that make the process of creating a digital newsletter simple. They contain pre-built templates that text, images, and web links can be easily added into. Smaller practices may even be able to use the service for free (dependent on the number of email addresses they are sending to per month).
• These email automation systems also allow you to analyze which links have been clicked the most, giving you an insight into popular content.
• Newsletters should be fun and friendly, featuring pictures of pets and people. You may want to encourage clients to send in photographs of their own pets to include in future editions.
• Creating a content calendar of upcoming events such as Valentine's Day, Dental Health Month, or Rabbit Awareness Week ensures the newsletter is topical and timely. This can also be very helpful when creating social media posts and other general content.
• Vary the length of the articles in the newsletter but as a rule stick with shorter and simpler items, adding a link to a fuller version hosted on your website. This ensures people get the relevant and most

important information, with the option of finding out more and also increases traffic to your website.
• Newsletters should be regular but not too often. Once a month is enough, however if you are a smaller practice or you struggle for content every month then quarterly is fine providing it is relevant and timely.
• If you collect email addresses via website enquiries then these should be added to your newsletter mailing list (you will have to explain that their email address is being used in this way and give them opt-out authority). An informal newsletter can be a great way of introducing a potential client to the practice. It may be that you keep these email addresses separate and create a slightly different variation of newsletter for these potential clients. For example, this may include an additional offer for new clients to redeem.
• A good newsletter should contain a mix of the following content: practice news and updates, competitions, feel-good stories, educational blogs and articles, current offers, links to social media, and information about team members.

OTHER EMAIL COMMUNICATIONS

Practices often hand out or send paper documents with various information. These are easily lost, particularly as they may be handed out well in advance of when they are needed (e.g., pre-op information). Email communications can be sent alongside or instead of paper versions.
• These can be sent directly after an appointment, before or after an operation to recap information that has been supplied by other means.
• For successful email communications an automation system must be in place to ensure timely streamlined delivery. A client whose pet has been in for an operation needs the post-operation information that day.
• Remember that the person who you are talking to in the consult room may not be the only decision-maker for the pet. Providing information via email allows the client to share with their partner or other relevant party.
• Examples of relevant content: welcome email, pre-op and post-op information, neutering information, dental health recommendations, etc.

SMS/TEXT MESSAGING

SMS communication is low cost, has one of the highest open rates, and is usually one of the quickest communications to be read.
• Be aware that SMS can feel intrusive if used too often, however it can be an efficient way to get communication out quickly to clients when needed.
• Relevant content could include important communications such as a short-notice change to opening hours, a change to an appointment, or general appointment reminders.

VISUAL AIDS

Visual aids, such posters and TV screens in the practice are great tools which can be used to reinforce key messages or promotions. They are less intrusive than other means but still count as a touch point for the client.
• Keep posters interesting and eye catching but also clean and simple. They should be image-led with text kept to a minimum. If lots of information is needed, refer them to your website, an accompanying leaflet, or a team member.
• There may be some key services you want to promote constantly, such as your monthly healthcare plan. This is fine but try to have at least one campaign that changes regularly, such as every three months. This keeps content fresh and means clients are more likely to notice it as it is new.

DEMONSTRATIONS

• When in the consult room with a patient, take the time to explain what you are doing to the pet and why. Talking through a physical examination gives the client further peace of mind, builds trust, and can help to demonstrate the value for money of a consult.
• One of the main reasons clients often are not compliant with administering parasite treatment or toothbrushing is because they do not know how, or do not have the confidence to do it themselves. Offering a free demonstration or one as part of a consult will therefore increase compliance in these areas, also resulting in more frequent purchase of the relevant products.
• Demonstrations can also be done with groups of clients in order to free up consultation time, for example at a practice open day or a puppy party.

LEAFLETS/HANDOUTS

Leaflets can be a valuable take-home aid for a client to learn more about a specific topic. Although this information should also be presented on your website, by giving a physical copy to a client you can have the peace of mind that you have provided them with the relevant information.
• Only hand out leaflets that are relevant to the specific client.
• Leaflets should ideally be professionally designed and printed.
• Although suppliers often produce their own leaflets on various topics, it is useful to have your own containing your key messages.
• Examples of topics to provide leaflets on: neutering, parasite control, vaccinations, puppy, kitten, rabbit, other relevant pets, or dental hygiene.

CLIENT WELCOME PACK

New clients are the most receptive and engaged, particularly if they are a new pet parent. Providing them with a pack of relevant information for their situation will help build a positive relationship and increase compliance.
• Make sure the pack is relevant so that they do not feel bombarded with unnecessary information.
• Items to include: relevant flyers, vaccination record card, offers and discount vouchers (including information on recommend a friend schemes if you have these).

USE OF VIDEO

Video is a powerful tool for distributing information. Viewers retain 95% of a message when they watch it in a video compared with 10% when reading it in text. In addition, 69% of all consumer Internet traffic is video, a number that is likely to continue to grow.
• Share any videos you make across social media to increase the reach of the information.
• Keep them short – videos that last up to two minutes long get the most engagement.
• About 85% of Facebook videos are watched without sound. It is recommended therefore that videos to be circulated primarily via Facebook should ideally contain subtitles.
• The average user spends 88% more time on a website with video. Including videos relevant to specific webpages will increase the effectiveness of your website. For example, on an advice page for dog dental healthcare include a video demonstration of how to brush a dog's teeth.
• Professional videos have a great impact and it is worth having a generic professional one made to use in various advertising campaigns.
• Encourage team members to also film content on their smartphones. It might be worth publishing some guidelines for the team to use to ensure the videos adhere to a similar format and quality.

SOCIAL MEDIA

Most adults are using Facebook, making it (after traditional mail), the most consolidated channel available to marketers for accessing most of the population in one place.
• Create a Facebook Business page. Facebook Business has a number of benefits for practice marketing, such as allowing you to pay to promote content and measuring the reach and success of content posted. If you have more than one Facebook page, for example for different practices, you can manage these centrally using Facebook Business.

6.18. Client Education Tools

- Paying to promote social media posts will increase the spread of information. Examples of where this might be helpful:
  - A change to opening hours (e.g., over Thanksgiving) – promote this via Facebook to those who have already "liked" your page.
  - Hosting a puppy party – you may want to pay for this post to be shown to dog owners in the local area to increase the number of attendees.
- Encourage a few team members to take ownership of social media.
- Have a mix of posts including:
  - General "cute" or funny content
  - Content that promotes your offers and general services
  - Content that directly encourages client engagement (such as competitions)
  - Feel-good stories
  - Information or fun facts about team members and their pets
  - Helpful tips
  - Behind the scenes at the practice (nothing gory!).
- Use social media to drive traffic to your website by including links to relevant pages. If you are promoting a current offer, link to information about that offer hosted on a website. If you are posting about a top tip, include a link to the full blog article.
- Always include pictures with posts.
- Review which posts get the most engagement (i.e., get the most "likes," reach, and shares) and make sure you are utilizing these types of post.
- Facebook is a must. Only explore other social media channels such as Instagram or Twitter if you are running Facebook comfortably and successfully and if you have team members who are confident and willing to take charge of new social media channels.

WEBSITE

In 2016, cell phone web usage overtook desktop usage for the first time and the number of people viewing websites on a cell phone continues to grow, therefore a cell phone-friendly website is a must. The more user friendly your website is, the more accessible the information is to your clients.

- Websites should be simple and easy to navigate. There is a widely accepted web design "three click rule" concerning the design of website navigation which suggests that it should only take a website user three clicks (maximum) to find the information they require.
- Blog posts should be hosted on the website. These should be informal, interesting, and generally lighthearted. They can also be more general than an advice page. Utilize your team to write blogs on different topics. Examples of blog content include: 10 top tips for a happy and healthy holiday season with your pet, 8 reasons to neuter your pet.
- Advice pages should be more specific and serious than blogs.
- As a general rule, all web pages should have a call to action. An offer page may have a link to phone the practice to book the offer or to a request for a callback form (for times the practice is closed). Pages may also link to other pages, for example a blog may link to a more specific advice page.
- All content from the website including blogs and advice pages can be linked to and from social media to encourage readership and increase traffic.

NURSE/VETERINARY TECHNICIAN CLINICS

Veterinary nurses/technicians are often underutilized within practices. Offering free or low-cost nurse services will encourage people to bring their pets in more often, increase education and compliance and allow clinical signs and issues to be spotted earlier, increasing the effectiveness of veterinarians.

- Examples of nurse clinics include dental checks, weight and diet advice, puppy parties, free worm and flea treatment applications, neutering advice and senior health checks.

TELEPHONE ON-HOLD MESSAGES

There are times when a client will be put on hold. Although you should endeavor to keep this time to a minimum, having interesting and informative on-hold messages with specific CTAs creates another touch point for clients to process key messages and information.

- Example: "Did you know that 7 out of 10 pets over the age of three suffer from dental problems? Book your pet in for a free dental health check with one of our nurses today."

EXAMPLES

N/A

CAUTIONS

- According to most current regulations, clients must have the option to opt out of all forms of communications. Using an automated email system such as MailChimp provides an easy solution. Always make sure clients are aware why they have received the email. Keeping it as appropriate as possible maximizes readership and minimizes the number of clients who will decide to opt out of future communications.
- Always use appropriate terminology for the client. Remember that they probably are not a medical professional. In order to generate compliance and a better outcome for the pet, the client needs to understand what is being recommended and why.
- Update mailing lists regularly to ensure inclusion of new clients and exclusion of those whose pets have been euthanized (where appropriate).
- There are certain days and times that have been proven to be more effective for particular types of audience. This is great advice to follow but ensure if your social media post or email contains a CTA that the practice is open and equipped at the time of the communication to respond to the enquiry.
- All team members should be trained in client education. Hearing the same, coherent information from a number of sources will reinforce the message and increase compliance. If a certain campaign is running, team members should be fully educated about the campaign in the weeks prior to its commencement.
- Clients should always feel informed and educated, never as though they are being sold something.

• Train front office staff to be vigilant in collecting email addresses and cell phone numbers. There is no point spending time and effort on fantastic email communications that only reach a small number of clients.

6.19. PAID ADVERTISING

BASICS

OVERVIEW

Many veterinary professionals are suspicious of advertising and promotion, especially when it comes to paying for such services. However, every business needs advertising, and some of that effort is going to be associated with cost. In fact, even advertising that might be considered "free" is typically associated with costs, and so veterinary practices need to have a plan for dealing with both paid and (presumed) unpaid advertising.

It is important to realize that all forms of promotion come with costs. Even word-of-mouth marketing needs to be cultivated and that cultivation often requires internal efforts. In fact, word-of-mouth marketing campaigns may actively influence or encourage customers to make recommendations (e.g., social media postings, business rating sites, client surveys, etc.) and such campaigns typically have very real costs associated with them.

Earned media refers to unpaid publicity associated with exposure based on expertise, such as appearing on a radio show, or writing articles for a local publication, or participating in a podcast. Although typically there are no fees associated with such activities, there are still opportunity costs associated with dedicating time to them rather than concentrating solely on the delivery of veterinary medicine. The lines are thus somewhat blurred between paid and unpaid advertising. If you pay to advertise your practice with a commercial on a pet radio show, it is considered paid advertising. However, if you take time away from practice to participate for free on a pet radio show, it would be considered unpaid advertising.

Today's pet owners are omnichannel consumers, so need to receive coordinated educational messaging through a variety of different media options (see 6.15 – Practice Differentiation).

The purpose of advertising is to inform and educate consumers about an organization's products and services, to enhance the image of the brand and offerings, and to help clients understand their pets' needs, and how those needs can best be met by the healthcare team. Advertising is not meant to sell services that are not needed, to imply that other hospitals provide inferior services, or to pressure people into making healthcare decisions that are not in the best interests of their pets. In this context, advertising is all about education and differentiation and should be embraced by all veterinary organizations as a practical necessity.

TERMS DEFINED

Differentiation: The process of distinguishing your hospital, products, and services from others, to make them more attractive to your target market.

Earned Media: Publicity gained through invitation to participate in media events, rather than paying for them.

Omnichannel Consumers: Consumers looking for a consistent marketing message, both online and offline.

Opportunity Cost: A benefit that could have been realized, but was not, because an alternative was selected instead.

Reach: How large an audience will be exposed to the advertisement.

Target Market: A particular type of client that the practice wants to attract.

Word-of-Mouth Marketing: Recommendation of an organization by a satisfied customer to a prospective customer.

ISSUES AND OPTIONS

- Advertising is a method of meeting the goals of the practice, which should be a direct reflection of the practice mission.
- It is a method of meeting the needs of clients by making sure they are aware of what they should be providing for their pets in the way of healthcare (see 6.3 – Better Meeting the Needs of Existing Clients).
- Advertising of any kind does come with costs, but this should be considered a cost of doing business in any field of endeavor. Most veterinary practices seek advertising opportunities with relatively limited reach; they tend to want the most impact in their specific trade area (see 1.4 – Veterinary Trade Areas).
- It is critical to control those costs by having a marketing plan, as well as a marketing budget, and then tracking the response to marketing efforts to determine the return on investment (ROI).

MARKETING PLAN

- A marketing plan, like a business plan, provides details as to how the practice intends to market its services over a given period of time (see 6.6 – Marketing Plan).
- Like any business document, the marketing plan must be realistic to be effective, and must be accompanied by a reasonable budget to get the job done. The plan encompasses both internal and external marketing efforts, including a website and search engine optimization (SEO), any advertising, and client communication. Veterinarians traditionally underutilize marketing and inadequately fund marketing efforts.
- The marketing plan might include information on the marketing mix, market segmentation, trade area assessment, goal setting, and evaluation for ROI (see 6.07 – Basic Tools of Marketing).

MARKETING BUDGET

- One of the most important aspects of paid advertising is to have a sensible marketing budget, and have a plan to evaluate how effectively that plan delivers practice value and ROI.
- Many veterinary practices have an inadequate budget for this purpose, and yet are often confronted with multiple pitches for how to spend advertising dollars. A well-thought-out marketing plan and budget help rein in the tendency to spend advertising dollars impulsively and without purpose.
- In most veterinary practices, the marketing budget should be 3–6% of revenues in the first few years of planning. This may be reduced to 1–3% during maintenance phases, but most practices should try to remain in growth mode for as long as possible, and an adequate marketing budget is needed to sustain this.
- Allocating funds to budget categories involves forethought as to practice strategy; otherwise paid advertising efforts tend to be unbalanced. This may result because of bias toward or against past marketing efforts, because of existing relationships with promotion vendors, or because there are individuals in the practice committed to specific tactics.

ALLOCATION OF FUNDS

- Funds from the marketing budget can be allocated on the basis of internal versus external marketing, or on the basis of strategic intent.
- When funding based on strategy, major categories might include branding, traffic generation, conversion rate optimization, and evaluating ROI.

• Branding is typically the first consideration for new marketing efforts, since it is important to clearly position the organization according to its mission, and to differentiate its services from the competition (see 6.15 – Practice Differentiation). Such investments might include logo development, client materials, staff training, website development/SEO, etc. The proportion of funding to be dedicated to branding will depend on what has already been accomplished to date and how well differentiated the practice is from others in its community. Branding may not sound like an exciting use of marketing funds, but if clients do not know, appreciate, and trust your organization, it will be difficult for other marketing efforts to generate results that meet or exceed expectations (see 6.13 – Branding).
• Traffic generation is important for all veterinary practices. New clients will be needed not only to grow a practice, but also to make up for clients lost incidentally from other passive and active processes. If clients are actively leaving because of perceived problems with the practice (e.g., poor customer service, poor communication, pricing not consistent with value delivered, etc.), this needs to be addressed in branding efforts before trying to boost traffic. The organization may have a target number for new client acquisition, and this is important, but in many cases the most benefit is often realized from increasing traffic from existing clients who many not be aware or not fully utilizing the services needed (see 4.8 – Pet-Specific Care).
• In many instances, it is possible to improve a brand, and to increase client traffic, but the process is incomplete unless those clients see the value in the offerings and are prepared to pay for them. This often requires some work on what is known as conversion rate optimization. This conversion rate may relate to customer segmentation (see 6.9 – Client and Patient Segmentation), such as converting "B" clients to "A" clients and "C" clients to "B" clients, etc., or converting noncompliant clients to compliant clients for things such as parasite control, vaccination, genetic testing, inflammation management, and many others.
• Once an organization has improved its brand, generated additional client traffic, and optimized conversion rates, it is important to measure the impact of the various efforts employed to determine which have been most effective in helping the organization meet its goals, as well as generating a reasonable ROI.

EXAMPLES

ABC Veterinary Hospital has decided to be more rigorous in its marketing efforts. In the past they have focused on a modest telephone directory advertisement, and developing content for their website, but have been uncertain of the ROI from these efforts.

Following the advice of their consultant, they have decided to focus on branding, traffic improvement, and conversion rate optimization. They devoted 25% of their marketing budget to branding and decided to differentiate themselves as an organization dedicated to keeping pets healthy rather than focusing on just treating illness. They thought there might be much more opportunity in taking a proactive stance in prevention and early disease detection (see 4.8 – Pet-Specific Care). They developed collateral materials for clients around this philosophy, surveyed clients on their attitudes to health and disease, and invested in staff training to ensure that all employees could engage in meaningful discussions with clients around this objective.

They devoted 25% of their budget to improved traffic generation. After an internal strategy exercise, it was determined that the bulk of that investment would be aimed at existing clients that were underutilizing services, as well as clients that were using services but were not fully compliant with recommendations. External marketing efforts were used with the goal of attracting new clients, but especially clients that were likely to be responsive to a message of keeping pets healthy. They also put in place a program to actively recommend pet health insurance, and to substantially increase the percentage of pets in the practice with insurance, as this is often associated with increased visits and utilization of services.

In order for their overall strategy to be successful, the hospital decided that it would need to dedicate 40% of its marketing budget to conversion rate optimization, and the final 10% to measuring ROI. Client surveys indicated that many of the clients associated the hospital with a place to bring their pet when it was sick, but did not fully appreciate the value the hospital could provide in keeping their pet healthy, and in detecting problems early, when there tends to be the most options available for management. A separate effort was dedicated to improving compliance in parasite control, inflammation management, vaccination, hereditary disease screening, and other areas in which the hospital seemed to be underperforming.

6.20. PERSONALIZED MARKETING

BASICS

OVERVIEW

• Retaining a client costs between 5 and 25 times less than it does to attract a new client.
• Personalized marketing is dependent on many different types of technology for data collection, data classification, data analysis, data transfer, and data scalability.
• Technology enables veterinary practices to harness the client and pet data they collect through the process of delivering healthcare such as species, breed, age, existing or predisposed medical conditions and use this to communicate with them on a one to one basis.
• Relevant, personalized, timely and hypertargeted communications receive the highest response rates. By leveraging the data within the practice management systems (PMS), website, LiveChat and in practice, veterinary practices can empower owners to take the best care for their pet.

TERMS DEFINED

Beacons: Hardware transmitters that enable smartphones, tablets and other devices to perform actions (such as receive push notifications, open web pages and social media activities) when in close proximity. Beacons use bluetooth low energy (BLE) also known as near field communication (NFC) and are reliant on the client having turned on the functionality.
Cookies: A cookie is a small amount of data generated by a website and saved by your web browser. Its purpose is to remember information or preferences about the user.
Customer Relationship Management (CRM) Platforms: Systems used by veterinary practices to manage and analyze client interactions and data throughout the pet lifecycle to improve relationships with clients, deliver personalized healthcare, assist in client retention and drive sales growth. CRM systems are designed to compile information on clients across different channels (points of contact between the client and the veterinary practice) which could include the practice management system (PMS), practice website, LiveChat, direct mail, marketing materials and social media. They can also give client-facing team members detailed information on pets' personal information, medical history, buying preferences, and concerns. The most popular enterprise CRM applications are Salesforce.com, Microsoft Dynamics CRM, NetSuite, and Oracle Eloqua.
Lifetime Value (LTV): A metric that represents the total net profit a veterinary practice makes from any given pet. In veterinary practice it is essential to understand that owners will have more than one pet during their own lifetime and as such should be treated at every touch point based on their LTV ($0,000's) rather than the profitability of a single transaction ($00).
Pay-per-Click (PPC): A model of Internet marketing in which advertisers pay a fee each time one of their ads is clicked. Essentially, it is a way of buying visits to your site, rather than attempting to "earn" those visits organically.

ISSUES AND OPTIONS

• The greater the level of personalization the higher the probability that the client will respond to and act on the communication. Consider the difference personalization makes to a routine annual vaccination reminder;

"Hello, your animal is due for an annual vaccine booster soon. Please call the practice to make an appointment."

"Hello Justin, Poppy's annual vaccine booster is due 02/01/20. Please call us at xxx-xxx-xxxx to make an appointment."

• This can be further improved through the use of relevant imagery. Where possible (although this is currently not a service widely supported by most PMSs), a high-resolution photo should be taken of the pet and this should be incorporated into all communications from the veterinary practice in relation to that pet. If a photo of the pet is not possible then attempts should be made to mirror the breed, or at least the species, of the pet on all correspondence.
• Mapping out the lifecycle of a pet (by species) and then overlaying it onto the pet population will enable a practice to develop communications based on frequently occurring requirements and then communicate relevant healthcare information. Advice on choosing the right pet health insurance (+eight weeks of age) neutering advice (five months) dental care (+three years), senior pet clinics (+seven years), end-of-life counseling, etc.
• Grouping medical conditions and recommending treatments by breed can further help personalize communications and educate pet owners to help identify problems at an early stage, such as brachycephalic pets being prone to stress and breathing irregularities.

EXAMPLES

BEACONS

• Beacons can be placed in strategic locations around the veterinary practice. When a client with a BLE- or NFC-enabled mobile device comes into proximity with the beacon a desired action can be triggered on their cell phone.
• Beacons can be configured by distance from the beacon, duration spent within proximity of the beacon, desired action, and the number of times a device comes into proximity with a beacon, allowing almost endless possibilities.
• Veterinary practices can use beacons to prompt Facebook check-ins on approaching the front door of the practice, offering a discount coupon by way of an apology to clients in the waiting room for more than 20 minutes, introducing special offers when in proximity of the merchandise stand, or enabling mobile payments through point-of-sale systems at the reception desk.
• This technology is improving rapidly and while there are significant gains to be made by being an early adopter it has to be taken into account that numbers of mobile devices with BLE and NFC enabled are relatively low due to the additional drain on the device's battery.

CLIENT REMINDER SYSTEMS

• Ultimately these are the most important and cost-effective tool to drive client traffic into a veterinary practice by leveraging data stored within the practice management system.
• Systems include effective recall and reminders for appointments, annual vaccinations, parasite control, and age- and patient-specific conditions (see 4.16 – Client Reminder Systems).

PAID ADVERTISING AND REMARKETING

• PPC advertising, predominantly via Google AdWords or Facebook, enables targeting and personalization based on geographic location, interests, and lifestyle (including being interested in, or ownership of, a cat or a dog). This information can then be harnessed by veterinary practices to show relevant messages tailored by species and the lifestage of the pet.
• Remarketing campaigns can be triggered when a visitor reaches a specific page, such as the practice's pet healthcare plan, but does not make a purchase. These are the ads which seem to follow you around the Internet offering additional chances to purchase.

• Lookalike campaigns generate audiences who share the characteristics of clients that have previously visited your website and can be used to increase the reach of your veterinary practice.

WEBSITES

• To personalize a user's experience on a practice website, cookies are used to remember a user's preferences to deliver hypertargeted content. For example, a website visitor who has previously read an article on "The most suitable dog for a family with children" should be shown content about puppy socialization, the importance of regular vaccinations, and good-quality pet health insurance.
• Geo-targeting can be used to detect a visitor's real-world location and automatically serve up details of their closest veterinary practice along with directions, opening hours and a prominent call to action (CTA).
• Enabling social login via Facebook or Google will allow further personalization (e.g., showing the user which of their friends have previously checked in to or reviewed the veterinary practice).
• Pet owner portals fully integrated with data stored in the practice management system will facilitate a broad range of personalization on the practice website, including, but not limited to, access to pets' medical records, recommended healthcare advice, and cross-sell and up-sell products (see 10.18 – Patient Portals).

CAUTIONS

• Communications between the client and the veterinary practice should avoid being overtly sales-oriented. Their main aim is to empower the pet owner to take the best possible care of their pet. This approach will also ensure that all communications from the practice are compliant with local data protection legislation and maintain the bond of trust between the client and their veterinary professional.
• While collecting email addresses and cell phone numbers in practice, ensure clients have separate opportunities to opt out of marketing communications and recall communications across each key channel: phone, mail, email, and SMS (text). The reason to separate these out is to ensure the practice can still communicate with a client by alternative means even if the client would prefer to opt out of one specific medium.
• In the wider world, many people are concerned that companies are using too much personal information to create the personalized marketing used today by businesses.
• One of the perceived problems with personalized marketing is that data is being generated by algorithms, and the algorithms associate preferences with the user's browsing history or personal profiles. This has led to some high-profile controversies where software has published inappropriate content on behalf of well-known brands.

MISCELLANEOUS

6.21. Client Focus Groups

BASICS

OVERVIEW

Focus groups can form an important part of developing a client-oriented veterinary practice using client feedback and insight to assess and control every aspect of practice life. Focus groups are basically:

- ways of listening to clients and learning from them;
- one way of facilitating active participation of clients in the development of a veterinary practice; and
- one way for practice owners to demonstrate commitment to a participative process of delivering veterinary care.

The purpose of using focus groups is to discuss the findings gathered through the continual cycle of measuring client satisfaction (see 4.19 – Measuring Client Satisfaction) with a sample of pet owners and to elicit suggestions for improvement.

Pet owners can draw on their own experiences of caring for their pet or choosing a veterinary practice to:

- uncover the underlying factors that resulted in them choosing (or not choosing) a particular veterinary practice;
- enrich interpretation of the data collected while measuring client satisfaction;
- identify local issues;
- prioritize the specific areas in which there is a need for action;
- explore practical and workable improvements.

The role of the practice manager/market research agency will be to combine the focus group information with existing data. The main issues and solutions that arose can then be summarized and prioritized.

In deciding what actions to include in the practice's action plan the following aspects need to be considered:

- What action is the practice already taking? And is it enough?
- What more does the practice need to do?

TERMS DEFINED

Facilitator: The person with the task of leading the focus group.

ISSUES AND OPTIONS

STEP-BY-STEP GUIDE: PREPARATION

Developing a Question Set

The data gathered while continually measuring client satisfaction will have highlighted a number of areas warranting further exploration. Therefore, it is advised to base the question set on these areas. The post-visit client survey or online reviews may have indicated poor client experiences or a failure of the practice to meet expectations. The question set may then contain questions to unravel causes of poor client experience asking focus group participants to comment on priorities and expectations. After exploring the issues, it is important to remember to elicit some practical and workable improvements from participants.

A pre-prepared schedule of questions can:

- help ensure each group is given adequate opportunity to discuss all the key issues in a similar fashion;
- be helpful if the facilitator has been drafted in from outside and is unfamiliar with your practice or the veterinary industry as a whole;
- help the facilitator to stay on track and on time.

Types of Questions

Remember that you are not merely seeking oral responses to a questionnaire. It is important to encourage open exchanges and discussion in a conversational manner. The set of questions should include the following:

- **Introductory questions:** These are designed to get participants discussing the challenge of caring for their pet in general before homing in on particular issues.
- **Linking questions:** These enable the facilitator to move from the broad general discussion, following the introductory question, to the more specific areas of interest.
- **Key questions:** These address the key issues which the facilitator wants to cover in the focus group session.

6.21. CLIENT FOCUS GROUPS

Number of Questions

A rule of thumb is that you will have time for no more than four or five key questions in a focus group lasting 1.5–2 hours.

Developing a Method to Record the Data

Before the focus groups begin it is worthwhile to consider how the discussions are to be recorded and how they will be analyzed. One way is to produce a template for the facilitators to complete at the end of the session.

Planning and Timetable

It is important at the start of the process to plan the focus group sessions into the practice's marketing plan.

Selecting the Group

The number of focus groups and pet owners involved in this stage will depend on the size of the practice, the available resources (both time and budget) and individual constraints.

The number and make-up of focus groups that you select will be determined by such things as:

- the issues that need to be addressed (e.g., low new client registrations, poor client feedback, insufficient take-up of practice healthcare plans or other relevant management information);
- groups of pet owners who are likely to have to deal with similar types of issues;
- considerations of practicability and feasibility.

Experience has shown that veterinary practices choose different approaches to select participants for focus groups. Some practices use current engagement with the practice: bonded client/lapsed client/prospect to invite the different groups to attend the focus groups. Others have chosen to run focus groups for specific species or groups where "hot spots" have been identified (e.g., new pet parents, owners of senior pets).

Choosing Participants

The basic purpose in using focus groups is to hear clients' discussions of issues of relevance to them. Thus, it is important to set up groups where participants are likely to share common interests, encounter similar kinds of frustrations when caring for their pets, and feel comfortable in expressing their views in front of the other group members.

Number of Participants

The typical size of a focus group is 6–10 participants. This range gives scope for a large enough range of different viewpoints and opinions, while enabling all participants to make contributions without having to compete for "air time."

Invitation to Participants and Briefing Note

You should send written (or email) invitations to participants well in advance of the focus groups. Such invitations should include a briefing note that:

- explains the purpose of the focus groups;
- describes what taking part in the focus groups will involve for the individual pet owner;
- explains how issues of confidentiality will be dealt with;
- makes clear that participation is voluntary and offers alternative options for expressing their views where appropriate;
- describes how results will be analyzed and reported;
- emphasizes that individual responses will not be attributable;
- describes what will be done with outputs, suggestions for action, etc.;
- offers a contact point for further information; and
- is signed by the practice owner to demonstrate commitment.

The Facilitator

The facilitator has the task of leading the focus group. This involves:

- setting the scene, explaining the purpose of the focus group;
- introducing participants to the topics for discussion;
- keeping the group on time and focused on the topics;
- encouraging participation from all the group members;
- summarizing discussions from time to time to check appropriate understanding of participants' comments;
- ensuring that all the key issues are addressed.

It is useful to have a note taker or video camera recording all discussions, so the facilitator is freed up to give all their attention to the group.

Selecting a Facilitator

Although there is no need to require an external facilitator to run focus groups, it is a highly skilled role which benefits from extensive training and experience. It may be very difficult, for example, for a member of the practice to fulfill a facilitator role.

6.21. Client Focus Groups

Although they do not need to be specialist facilitators, facilitators do need to have certain skills or will need to receive some training. The most critical skills of the facilitator are those described as "active listening skills." Many market research agencies are available to support your practice through this process.

How Long Should the Focus Group Last?

The focus group is likely to take between 1.5 and 2 hours.

Location

If possible, use a location for the focus group where:

- participants will be free from interruptions and distractions;
- participants will be able to see each other and hear each other easily (U-shaped seating arrangements or arrangements where everyone is round one table tend to work best);
- the facilities are comfortable and make it pleasant for participants to sit and talk to each other for up to 2 hours.

EXAMPLES

STEP-BY-STEP GUIDE: RUNNING THE FOCUS GROUP

Materials

The types of materials you will need to run a focus group session include the following:

- Notepads and pens or pencils
- Flipchart and markers
- Cards (or badges, stickers, etc.) for writing participants' names on
- Watch or clock
- Focus group questions guide.

Preparation/Set-up

The facilitator should arrive at the location before the participants and ensure that:

- domestic arrangements and any refreshments are in place,
- the room and seating arrangements enable participants to see and hear one another,
- the venue is comfortable and conducive to discussion.

Welcome and Introductory Briefing

After welcoming the participants to the group session, the facilitator should:

- introduce themselves and any assistants to the group and explain their roles and such things as domestics, timescales, etc.;
- ask people to introduce themselves, when not already known to one another or to the facilitator;
- explain once more the purpose of the focus groups and reiterate the points covered in the briefing note, particularly:
  - the fact that the main focus will be on issues that affect the delivery of pet healthcare and interactions with the veterinary practice,
  - the fact that individual responses will be anonymized before being reported back (it may be helpful to say how you will ensure this);
- explain how they will operate, that is:
  - beginning with open discussion,
  - focusing in on certain questions, and ideally
  - finishing with suggestions for action/improvement;
- ask for any questions or issues that need to be clarified.

CAUTIONS

STEP-BY-STEP GUIDE: TAKING ACTION AFTER THE FOCUS GROUP

Interpret and Report Results

- **Summaries:** Write up a summary of your notes as soon as possible after each meeting – a quick turnaround time on the transcription helps avoid memory lapses.
- **Analyze the summaries:** It is useful to start by reading all the focus group summaries in one sitting. Look for trends (comments that seem to appear repeatedly in the data) and surprises (unexpected comments that are worth noting). Keep in mind that context and tone are just as important as the reiteration of particular words.
- **Write the report:** The final report can take many different shapes, but it may include information about the background and purpose of the focus group, details of the sessions, results, and conclusions.

Translate Results into Action

The greatest danger is the failure to apply the results to the purpose for which they were originally commissioned.

- Schedule a meeting to review the summaries and discuss their implications.
- Highlight the main themes, issues, problems, or questions that arose in the focus groups.
- Put the focus group information in context. Compare, contrast, and combine the focus group information with information gathered when measuring client satisfaction or the financial performance of the practice.
- If there is a lot of information, prioritize it. Then decide what actions need to be taken with regard to the priority items and by when.
- Decide what issues can be tackled via internal change and which issues require external input through the use of specialists or consultants.

6.22. Outbound Telephone Calls

BASICS

OVERVIEW

• Outbound telephone calls are, for most practices, an underutilized marketing tool.
• They are initiated by the practice and made to existing clients for three primary purposes: to increase purchases of veterinary products and services, to improve client service, and to salvage lost accounts.
• When properly handled, clients appreciate outbound telephone calls and feel that they are helpful.

TERMS DEFINED

Outbound Telephone Calls: Phone calls to clients that are initiated by the practice. Their purpose is to increase the purchases of veterinary services, improve client service, and salvage lost accounts.

ISSUES AND OPTIONS

• Before the 2003 American Animal Hospital Association (AAHA) Compliance Study, *The Path to High-Quality Care*, veterinarians and staff felt that clients would be offended if they called them at home. The AAHA study showed that clients actually want the practice to call them, especially if they have not responded to a written reminder.
• Outbound telephone calls should be made only to existing clients, and only for needed and wanted services.
• Staff members require training to make outbound telephone calls. If the calls are not handled in a client-friendly manner, the practice risks alienating rather than pleasing clients.
• Outbound telephone calls are not a substitute for written or email reminders, but should be used in conjunction with a traditional reminder system.

CLIENTS WANT US TO CALL

• Many veterinarians and staff members believe that clients do not want to be called, but the 2003 AAHA Compliance Study surveyed 1,000 veterinary clients and found that busy clients appreciate phone help to take care of their pets.
• Eighty-two percent of clients said they want the practice to call, especially to discuss feeding changes and home care. The person calling from the practice did not have to be the veterinarian. Clients were happy to talk to knowledgeable staff members for noncritical issues.
• Seventy-eight percent of clients said they want a reminder telephone call if they fail to respond to a mailed reminder card.
• Thirty-eight percent of pet owners said they would have come in for an appointment if they had received a telephone call.
• Staff members will require training to make effective outbound calls. Most are not used to doing this, and they do not know what to say to clients. Word choices are especially important to communicate a positive rather than negative message (see Examples).

THREE KINDS OF OUTBOUND CALLS

Calls to Increase Purchase of Veterinary Services

• If a team member notices that a client agreed to a procedure, such as a pet dental prophylaxis, or that the patient requires follow-up care, laboratory work, weigh-ins, or anything else but did not schedule it, a staff member should call the client at home to make the appointment. For instance, if a dog was put on seizure medication, but no laboratory appointment was scheduled to check the phenobarbital levels, a staff member should call to set up the laboratory appointment.
• If a client does not respond to a mailed reminder postcard or emailed reminder, a staff member should call the client to offer them a second chance to make the appointment (see Examples).
• Staff members should call the client the night before their pet's appointment to confirm the dates and times, even if it is not for a procedure that requires the client to withhold food and water. Clients appreciate this gentle reminder, and it helps to reduce "no shows" the following day (see Examples).

Calls to Improve Client Service

• When a pet goes home after routine surgery or a dental prophylaxis, a staff member or veterinarian should call to see how the pet is doing at home. This is a caring gesture, which is much appreciated by clients, and it will help catch any problems early so they can be addressed.
• When wellness laboratory test results come back after the client has left, a quick phone call to give the client the good news is an unexpected "value added" to the client. Your call gives them peace of mind and builds trust by letting clients know that their pets' results were reviewed and that everything is normal.
• Written instructions should be provided to clients if at-home care is required for their pets. In addition, clients should be called to see how they are doing and to see if they have any questions. This improves compliance for complicated home care such as changing dressings, giving pain medication and injections, and for simple home care. Calls should be made to see if clients are having trouble giving pills, changing their pets' diet, brushing their teeth, and starting flea or heartworm prevention programs.

Calls to Salvage Lost Accounts

• Clients fail to return for many reasons. Sometimes their pet has died, or a divorced spouse has taken the pet with them when they leave. Sometimes clients move. Sometimes they are unhappy with the way they were treated. Usually, however, time just got away from them and they forgot to make the appointment.
• All inactive accounts should be called and the clients invited to make the appointment for their pets. This helps clients take better care of their pets, and it is a good way to fill your appointment book during slow times in the year.
• Clients do not perceive these types of calls as "telemarketing," but instead welcome them because they help them do what they wanted to do anyway.

EXAMPLES

EXAMPLE 1. SAMPLE CALL TO A CLIENT WHO HAS NOT RESPONDED TO A REMINDER CARD OR WHO HAS BECOME INACTIVE

Hello, this is [staff member's name] from the [animal hospital's name]. We were concerned because we hadn't heard from you and we wanted to make sure that you received [pet's name] reminder for his/her appointment.

Usually the client will respond that they had been meaning to call and make the appointment. In that case, make the appointment and thank the client. Tell them you look forward to seeing them and [pet's name] on [the date agreed].

If the call is picked up by an answering machine, leave a message similar to what you would have said had the client picked up the phone. In addition, make sure to leave the hospital's telephone number. Repeat the telephone number twice so that clients have a chance to write it down. End by saying that you look forward to hearing from them soon. Whether you speak with the client or just leave a message, always note the call in the patient's record.

If a client's phone is disconnected, try directory assistance or the Internet to see if they have a new number or area code. If you learn that the pet has died or does not live with them any more, respond with empathy. Close the conversation by thanking the client. Update

your records, delete future reminder notices for the pet, and retire the record from your active files.

If a client has decided not to return because they were unhappy with your service, sincerely apologize to them and assure them you will do your best to take better care of them in the future. Ask if they would be willing to give you a second chance. Offer to make the appointment for their pet. If the client says yes, make the appointment. If the client says no, offer to send the pet's health record to their new practice. In either event, document the client's issue and bring it up at a staff meeting to brainstorm ways to avoid similar problems in the future.

EXAMPLE 2. SAMPLE CALL TO A CLIENT WHO LEFT AND THE STAFF DID NOT SCHEDULE A NEEDED APPOINTMENT FOR THE PET

Hello, this is [staff member's name] from the [animal hospital's name]. Dr. [name of the veterinarian whom the client saw] asked me to call you. Dr. [name] wanted to get [pet's name] in for a dental cleaning this month, if possible. I'm calling because we have an opening on [date] and I'd like to set that up for you. Will that date work?

If the client agrees, set up the appointment and assure the client that you or someone from the hospital will call to go over everything with her the night before. If the client declines or says that she has changed her mind, ask if you can send a reminder card in a couple months in case she would like to schedule it later. Thank her and follow through by setting up the reminder card as promised. In addition, note the call and the outcome in the patient's record.

EXAMPLE 3. SAMPLE CALL TO A CLIENT TO REMIND HER OF AN APPOINTMENT

Hello, this is [staff member's name] from the [animal hospital's name]. I'm calling to confirm [pet's name] appointment tomorrow morning at 9 o'clock.

If the client is not home, leave the same message on the answering machine. In both cases, end the call by saying, "I look forward to seeing you then."

If the client cannot make the appointment, let her know that you understand and offer to reschedule it for a more convenient date. Schedule the appointment as promised and set up a tickler to remind you to call the client the night before the new appointment. Note the call in the patient's record.

EXAMPLE 4. SAMPLE CALL TO A CLIENT TO REMIND HER IT IS TIME TO PICK UP A PRESCRIPTION RENEWAL OR DIET FOR HER PET

Hello, this is [staff member's name] from the [animal hospital's name]. I'm putting in our order for [pet food] and wondered how [pet's name] was doing. Would you like me to order another bag for him/her? I could put it aside for you and you could pick it up any time after [delivery day].

or

Hello, this is [staff member's name] from the [animal hospital's name]. I called to see how [pet's name] was doing on his prescription and to see if you wanted me to get his renewal medication ready. This way you can pick it up whenever it is convenient for you.

Usually, clients are grateful and appreciate your help. If, however, they have discontinued the diet or the medication, you will have a chance to talk to them about it and find a way to help the pet.

Always note the call and the outcome in the patient's record and follow through on your promise to have the diet or prescription ready.

EXAMPLE 5. SAMPLE CALL TO A CLIENT TO SEE HOW THE PET IS DOING AT HOME

Hello, this is [staff member's name] from the [animal hospital's name]. I'm calling to see how [pet's name] is doing, now that he/she is home. How is he/she feeling? Do you have questions about anything?

If everything is going well, say, "Great! Call if anything comes up; otherwise we will see you again on [date of next appointment] or recheck." If the client has noticed problems or has questions, respond appropriately. If you need to, get the veterinarian involved. In all cases, note the call and the client's response in the patient's record.

6.23. MEASURING MARKETING PERFORMANCE

BASICS

OVERVIEW

• Are your marketing dollars producing a sufficient return on your investment? Many veterinarians cannot answer that simple question. You must track each expenditure to find out if your marketing investment is paying for itself.
• Conversations with veterinarians (and many other small business owners) reveal uncertainty regarding whether marketing dollars are truly being invested wisely.
• Marketing opportunities include both traditional and social media. Some Americans still reach for the Yellow Pages when they want to find a service or product in their immediate area. But now professional service providers, such as veterinarians, know they need to also be found on the Internet and social media (see 10.13 – Websites and 10.16 – Social Media). The Internet has become the ultimate product catalog, information encyclopedia, sales brochure, and travel guide. Still the old standby "word of mouth" remains powerful as we seek recommendations from people we trust – and it can be measured as part of your marketing efforts.
• In order to calculate the performance of your marketing tactics, you need to have a way to track incoming leads, as well as an idea of your client lifetime value.

TERMS DEFINED

Autoresponder: Automatic response (set up through email system) that provides a prewritten message to anyone who sends an email message to a particular email address or uses an online feedback form. For example, you might use an autoresponder to automatically email your clinic services to anyone who sends a message to services@myvetclinic.com. By combining an autoresponder with a form on your website, you can capture information from your visitors to build a mailing list or sales leads.
Marketing: One of the three essential business disciplines that study the demographics and psychographics of target consumers, as well as the development of positioning strategy and messages. Marketing strategy affects everything that touches customers, prospects, employees, investors, vendors, and essential business processes. Marketing communications, or "marcom" is an all-encompassing term, as it covers marketing practices and tactics including advertising, branding, graphic design, promotion, publicity and more (source: www.ama.org).
Public Relations: Builds mutually beneficial associations with publics. These publics can be external (clients, nearby pet owners who are not currently clients and local pet-related influencers). Publics can also be internal (staff). Public relations also includes media relations, the practice of building relationships with members of the media to provide newsworthy information and influence editorial coverage.
Target Audience: The people most likely to buy your product or service, or most interested in the information you provide. The more you know about them, and have designed your animal healthcare services with them in mind, the easier it will be to sell to them.

ISSUES AND OPTIONS

• Veterinary practice management consultants and several national studies indicate that the average veterinary practice does not devote sufficient energy to measuring marketing performance.
• The first place to start analyzing marketing efforts are those related to current clients, who are always the most important drivers of a service-oriented business such as veterinary medicine (see 6.3 – Better Meeting the Needs of Existing Clients).
• Target your current customers first because you will reap double benefits from your efforts. You will encourage current clients to remain with your practice while increasing the level of care they provide their pets, as well as your clinic's overall compliance effectiveness. By providing this great service, you will also encourage current clients to refer their friends and colleagues to your practice.
• Focused, measured marketing efforts are critical to the financial success of your practice.

EXAMPLES

Here is a helpful checklist for marketing veterinary practices:
• Do you actively encourage referrals from existing clients?
• Do you actively collect testimonials (both online and "in real life")?
• Do you write thank-you notes to clients who have referred another client to you?
• Do you reward clients who refer multiple clients to you?
• Do you send welcome notes or letters to all new clients? What else do you do to onboard new clients?
• Do you make follow-up calls within 24 hours to all clients whose pets have been treated at the practice for a serious illness or have undergone surgery?
• Does the practice offer in-house seminars to its clients on medical or husbandry issues of interest to them?
• Are employees and owners of the practice actively involved in local organizations?
• What can you do to showcase your star staffers?
• Do employees and owners of the practice write articles for local publications on pet care and developments in veterinary medicine?
• Do employees and owners of the practice speak at local functions, schools, and so on, regarding pet care and developments in veterinary medicine?
• Do you have a newsletter? If so, how often is it sent?
• How is your website performing? Is it properly set up for search engine optimization (SEO)?
• Are you tracking the performance of specific landing pages?
• Do you have an active social media presence?
• Could you have a staffer run a fun social media contest (cute holiday pet photos, etc.)?
• Do you share photos and videos on your social media channels?
• Do you monitor your online reviews? (These become even more important as they are tied to map search results.)
• Do you encourage happy clients to post reviews?
• Do you actively monitor your online analytics?
• Could you offer reminders or other helpful information via text message?
• Do you have access to a graphic designer to help make sure you have professional looking printed materials to communicate pet care needs?
• Do you market your practice offerings during your on-hold message?

Keeping these questions in mind, the first step in any successful marketing campaign is to identify your audience. The better you can identify the people who will be most willing to buy what you have to sell, the more successful you will be at measuring your efforts.

One measurement strategy is to run the same ad in consecutive issues of a publication, in the same location on each page, or in different publications. Put a different autoresponder address in each ad. Make sure the responses are forwarded to separate email boxes, so you can track the responses and see which ad pulls the best (you usually get several email addresses with your service). If they are all about the same and you can afford to run them all again, run them again. But if one ad pulls poorly, drop it.

Your White Pages ad should be targeted to your existing clients, because they know your clinic's name. To keep these Yellow versus

6.23. MEASURING MARKETING PERFORMANCE

White Pages calls separate, consider an additional line for your Yellow Pages ad. Be sure you track all calls, even if you merely note the caller's name and phone number. Have a staff member enter this into your database (this is often a good fill-in project for the receptionist during slow times).

The extra cost of an additional phone line is minimal compared to the value of knowing which form of advertising is giving you the greatest return on your money.

A strategy for measuring media relations efforts is to develop a "tip sheet" before your media appearance; for example, "11 Tips for the Best Senior Pet Care." Talk about a couple of the tips during your interview, and then offer the tip sheet as a freebie if people contact tips@myvetclinic.com. If you set up an autoresponder to deliver the tip sheet, there is no incremental staff time required. By setting up several different mailboxes (e.g., services@myvetclinic.com; info@myvetclinic.com; admin@myvetclinic.com) you can easily track the results of your efforts.

Several methods are available to track your website statistics. Your domain hosting service can likely provide a free tracking mechanism; however, upgraded services can provide enhanced reporting at a reasonable cost (see 9.14 – Measuring Performance of Digital Media Campaigns).

Many marketing methods are low- or no-cost; for example, participating in local community groups. However, you must still calculate time (either yours or your staff members) into the measurement equation.

One way to measure overall satisfaction with your practice is based on the Net Promoter Score (NPS) concept (www.netpromoter.com/know). The NPS is based on the assumption that one simple question, "How likely is it that you would recommend [provider] to a friend of colleague?" can measure customer perception and performance.

According to the NPS website, respondents are grouped as follows:

- Promoters (score 9–10) are loyal enthusiasts who will keep buying and refer others, fueling growth
- Passives (score 7–8) are satisfied but unenthusiastic customers who are vulnerable to competitive offerings
- Detractors (score 0–6) are unhappy customers who can damage your brand and impede growth through negative word-of-mouth.

Subtracting the percentage of Detractors from the percentage of Promoters yields the NPS.

As a final tracking mechanism, asking new clients "How did you hear about us?" can be tricky, because it sometimes takes more than one touch point to motivate someone to select a service provider. However, it is a good start and allows you to thank current customers who are likely a great source of referrals.

Remember, in marketing there is rarely a "silver bullet." Success is more about tenacity. If your efforts are not producing the results you want, kick the tires and keep testing. Do not just run some ads or plan a few events and then move on. Instead, stay with your plan and keep measuring results. As an alternative to doing it yourself, consider a marketing firm to handle your efforts in a systematic manner, but always keep measurement at the forefront to maximize your investment.

6.24. DEALING WITH THE MEDIA

BASICS

OVERVIEW

• Even in the age of instant Internet communications of all types, local television and radio continues to be the media with the most reach. This is not true with all radio and television, but the key word here is "local." Local media is America's primary and most credible source for news and information. Interestingly enough, local radio has been increasing in listenership for several years.
• The good news in this fact is this – local television and radio producers are delighted to have a local veterinary expert on the air. A veterinarian from the media's community lends credibility to any appearance and they know this appeals to their audience, not only by featuring local experts but by the instant reliability such a guest offers.
• However, our profession and the media are sadly not making a connection.
• Media producers are very busy and will rarely take the time to seek out local experts even though they desperately want them in their news and other programs. And, of course, veterinarians are also very busy but are uncertain how to take the first step in contacting a television or radio station.
• Yet when the news media and the veterinary profession do come together, compelling and powerful stories are communicated and individual practices and the entire profession benefit.
• The first skill needed is being proactive. Take the time to call them, offer your services and you may be surprised at how accepting they are of having you on as an expert guest.
• The next skill needed is the ability to deliver a well-thought-out story so when you do appear in your local media, the net result of your appearance is a clear and succinct storyline that any audience can understand.
• And do not forget, if the media calls you, especially when breaking animal health news is happening, you should know just enough to react properly and give them what they need. This often leads not only to a good story, but to future appearances, and that is valuable. One of the best ways to have the media come to you, is by letting them know of breaking animal health news, especially that which involves human medicine, and you can become a valuable source for them in this important area of their coverage.

TERMS DEFINED

Bridging: The use of a statement that transitions the listener from something negative to a key positive point. This is a valuable skill or technique when you want to get away from a negative reporter question to your crafted and positive message points. Examples of bridging statements are: "The good news is …," "An important point is …," or "What I can tell you is …."

ISSUES AND OPTIONS

BEING PROACTIVE WITH THE MEDIA

• When approaching the media you must appreciate the specific needs of the media outlet you have targeted. Remember, their need or goal is *not* to deliver your message or to give you exposure. The key is to use their outlet to deliver your message framed in a way that appears to meet their needs.
• Television and radio news people are skeptical, probing, negative, not interested in too many details, and always in a hurry.
• Therefore, when you call one of these people be ready to get to the point quickly. It helps to set up the problem, tie it to local events or trends, solve the problem with the "news" you are offering (it helps if it is highly visual), and then tell the producer where you are going to send their viewers for more information. This is the action step that all good news stories must have.
• That is the flow of a good news story, and that is how it should be pitched to a news producer (i.e., Problem; Solution; Where to go for more Information!).
• For news people, operative words that really get their attention are: now, just released, latest, and new. It is, after all, news. The most hated word in the newsroom is "yesterday." News is *new*.
• "How-to" demonstrative-type segments are good, but they must be highly visual and fun. This makes up in entertainment value what you may lack in news value. Just watch most of the morning shows today and you will see these "demo" segments. They are very light on substance, typically very fast paced (frustrating for you – the information expert), but the goal is to inform, raise awareness, and send the viewer to a place where they can get more information.
• News should be topical, local, and timely. It should also directly affect viewers. This is the reason local viewers are listening to radio or watching TV news. And don't forget; for television, your information must be visual. Think of any way to make almost any subject visual.
• You should always try to keep your story ideas localized. Keep an eye on new veterinary trends, research, or activities that will (or are) currently affecting your community. Local radio, television, and newspapers are only interested in stories that affect their own listeners, viewers, and readers. Your idea may be a national story, but you should try to localize it to really appeal to local producers. "All News Is Local."
• What is being offered to the producer? Do you have a case example for the story? Would a pet owner help with your story? Can the video crew or photographer show the owner at home with their pet? Can you schedule surgery or a treatment at a time convenient to the newsroom? Be easy to produce, and be available on short notice.
• Know the media you are pitching. Morning drive radio is frenzied, and you should be ready for "anything goes" on these shows. Morning and noon news programs are more normal avenues for factual pet-related information. The evening news rarely does light news and how-to segments. Public service shows, general interest, and specialty cable shows are very good avenues for your information.
• Once you know the type of media you will be doing, tailor your information for that type of delivery. Programs can vary from upbeat and very fast to informative with lots of detail.
• Remember, media news is hot, but veterinary medical news is not, unless you make it so. Your goal in pitching a story to a producer is to get them to say something like, "Really? I didn't know that!" Then you have them hooked to hear more.
• Become a good TV viewer or radio listener so you can learn to match your story idea to their format. Also match your energy level to theirs. This is hard, but very important. Too dull and you will not be asked back.
  ◦ A news story done as consumer service is good.
  ◦ A news story tied to a human medical issue is great.
  ◦ A news story tied to news of the day is the best.
• Email is an excellent way to pitch a producer because it actually saves them time – they can respond quickly.
  ◦ Email pitches can quickly link the producer to supportive websites. Producers can wait until they have time to give your idea some thought.
  ◦ Producers can usually tell very quickly if your story is going to be something worth their time by simply reading a few lines.
• When pitching a story idea to a producer either in person, by phone, or by email, remember to answer the key questions every journalist learns in school: Who will be affected by this story? What is the story about? When is this story happening? Where could this story happen? Why is this story happening? How will this story affect my viewers?
• If they do not like your story idea, don't take it personally. They know best what their viewers want to see. You can either try a second

angle on your story, like a real news zinger bullet point that would get their attention, or you should always have a secondary story ready just in case, such as "Okay, did you hear there is a new treatment for AIDS in cats?" or "Did you know Lyme disease is not found in all 50 states?" "Really? I didn't know that! Tell me more." This is how news people think – so think like them and give them what they want.
• Be very brief, but always be seen as a good source of newsworthy, interesting, leading-edge news in veterinary medicine. Even if you do not get your first story on the news, you are establishing yourself as a good source of newsworthy information in an interesting area, and they will take your calls in the future.

HOW TO REACT WHEN THE MEDIA CALLS YOU

• The first thing you must do when the media calls you (assuming you want to do the interview) is to meet their needs.
• Media reporters or producers typically need a quick story done on short notice that has good news, entertainment, and visual value.
• Give them these, and you will be on their "go to" list for the next story.
• But remember, you also have needs. No one wants to spend a half of a valuable day at the hospital at a radio or TV station helping them do their job! You should communicate your points. There are two categories of things you want to communicate: one is your information for the segment and the other is some awareness for your hospital and your profession.
• If you do not accomplish these goals, you are only helping the media people and wasting your time.
• Every opportunity of media exposure is an opportunity for you to tell your community about the wonderful things you do. Of course, you should be subtle and professional, but that should be one of the goals of communications. Working in the name of your practice, perhaps your website address, can typically be given without sounding too self-promoting, and yet it will generate calls, website traffic, and perhaps new clients.
• If you are uncomfortable with this (it has to be practiced and done at the correct level of subtlety), then always end by sending the viewers or listeners to their veterinarians. The simple fact that you are the veterinarian the media is interviewing will cause some viewers to seek you out because of your "celebrity" status.
• That said, when you get a call from the media you should first ask yourself a few critical questions:
  ◦ Why have they called you?
  ◦ How did this story come to their attention?
  ◦ Who else are they interviewing?
  ◦ What is the news of the day?
  ◦ What type of show is this?
  ◦ What impact will this have on your practice and your profession?
  ◦ Can you have some time to prepare?
  ◦ Do you know the reporter from seeing their work?
  ◦ Will they come to you, or do you have to go to the station?
  ◦ What is their contact information?
  ◦ Is this one story, or part of a series?
• The next step is to determine what the reporter wants:
  ◦ Will this interview be a "soft" or "hard" news interview?
  ◦ Will this interview be controversial or on general care?
  ◦ Do they want short or extensive answers?
  ◦ Is this print or electronic media?
  ◦ What is their angle on the story?

NOW TAKE SOME TIME TO PREPARE

• The best way to prepare is to anticipate the questions you will receive and write short answers.
• Practice about 10 questions, knowing you will only get three to four in the interview and, if it is a taped interview, they will only use one or two.
• Begin to practice your answers. Keep them short and stick with the facts. If you do not do this critical step, you will ramble and perhaps be left on the "cutting room floor."
• Next step is to write down any question you feel you do not want to be asked. These are "hot seat" questions. Almost anyone doing an interview is afraid of these difficult questions, but if you practice them in advance, it will take much of the fear out of doing interviews. Practice your answers, and then practice "bridging" back to something positive! Always bridge back to your positive points.
• Practice your questions out of order and be prepared to support what you say with some statistics or a recent study.

EXAMPLES

N/A

CAUTIONS

• You do not have to agree to an interview.
• You do not have to agree to their terms.
• Reporters are neither your enemy nor your friend.
• Reporters are driven by deadlines, are in a hurry, are not interested in too much detail, like negative or sensational things, and are skeptical and probing.
• Stay with the subject at hand. Do not ramble. It is a natural thing to do because it is what we do in conversation. In an interview setting rambling is time consuming, boring to the audience and will cause you to say things you do not mean to say. However, this is not the case if you have taken the time to practice your answers and then deliver them as if they were not rehearsed.
• The call you receive from the media might be a "pre-interview." If you want to do the interview, your goal here is to "sell the story" a little, and prove you are a good interview subject.

I would recommend you be cautious about using the phrase "pet parent." Legal experts tell to me this phrase has legal consequences that can be more far reaching than we think. While it has become popular and "cute" to use this term, staying with "pet owners" is the safest way to communicate this in a media setting.

Financial Management

7.1. TIME VALUE OF MONEY

BASICS

OVERVIEW

The premise of the time value of money is that a dollar held today has more value than a dollar received at some point in the future.

- The buying power of a dollar typically declines with time.
- With immediate cash on hand, investments can be made with a presumed rate of return, used to fund other projects that will bring an acceptable rate of return, or spent elsewhere.
- For many management projects, expenditures for equipment and goods are not necessarily rewarded immediately with revenues to cover them.
- When there is a lag between money expended and money collected, the time value of money must be appreciated to determine if the project delivers an acceptable rate of return.
- Opportunities can be compared on the basis of either present value or future value, net present value, or internal rate of return.

TERMS DEFINED

Future Value: The monetary value of some defined investment at some point in the future, given a specified rate of return.
Internal Rate of Return: The calculated rate of return, given the cost and future value of an investment.
Net Present Value: The net return on a project, given all costs and revenues, in terms of current monetary value.
Present Value: The current monetary value of some defined investment return, given a specified rate of return.
Rate of Return: The amount an investment appreciates or depreciates over time, often expressed as a decimal (e.g., 0.06) or a percentage (6%).
Rule of 72: A simple method for estimating the time it would take for an investment to double in value, given a fixed compounding annual rate of interest.

ISSUES AND OPTIONS

PRESENT VALUE AND FUTURE VALUE

- Present value is the monetary value of an opportunity today.
- Future value is the presumed value of an investment at a specified time in the future at a specified rate of return.
- Future value is just the present value compounded at the stated rate of return; present value is just the future value discounted at the stated rate of return.
- Present value is assured based on current knowledge; future value is presumed on the basis of a predicted rate of return over time.
- Given any rate of return (r), present value (PV) or future value (FV) can be calculated for any time period, if the other value is known.

NET PRESENT VALUE

In many cases we consider projects, but we have alternative potential uses for our funds. We can evaluate these options by calculating the net present value (NPV):

Net present value (NPV) = PV of all revenues − PV of all costs

We will accept the project as long as the NPV is positive (i.e., greater than zero). For example, you have $10,000 to invest. You can invest the money today in a risk-free two-year project that will provide you with $5,400 at the end of the first year and then another $5,400 at the end of the second year. At first glance, it seems that this project will "net" you about 8% (return of $800 on your $10,000 investment). If you do not accept this project, you can put your money in an investment that promises you a guaranteed 6% return on your money. Do you accept the project, or put your money in the cash investment? Find out by calculating the NPV:

NPV = PV of year 1 revenues + PV of year 2 revenues − PV of costs

Using the rate of return from the cash investment as the standard against which we will compare:

$$NPV = \$5{,}400/1.06 + \$5{,}400/1.06^2 - \$10{,}000 = -100$$

Since the NPV was not greater than zero, the project should be rejected.

INTERNAL RATE OF RETURN

In the NPV example, we determined that the project was not as good an investment as our 6% cash investment return, but we never did exactly determine what the return actually was. The actual internal rate of return (IRR) is the rate of return for an investment that will provide a zero NPV. So, if x is the unknown rate of return, then:

$$0 = \$5{,}400/x + \$5{,}400/x^2 - \$10{,}000$$

If you try to figure this out algebraically, it will keep you busy for a very long time. However, using the IRR feature on a spreadsheet program makes the process simple. In Microsoft Excel, the IRR for this project can be easily calculated as 5.3%. Just click on the paste function button (fx), select IRR from the function list, and enter your values (or highlight the appropriate series in the spreadsheet). Just make sure that your revenues are positive numbers and your costs are negative, and let the spreadsheet do the rest.

CALCULATIONS

$$FV = PV \times (1 + r)^t$$

where
PV = present value
FV = future value
r = rate of return
t = time.

These values can be determined on any device that will incorporate exponents into an equation. This is available on most handheld calculators and spreadsheet programs. Online calculators (www.calculator.com) can also be used.

RULE OF 72

The Rule of 72 is a simple method for estimating the doubling time of an investment. The number 72 (sometimes 70 and 69 are also suggested) is divided by the interest percentage per period to obtain a rough estimate of the number of periods (typically years) that would be required for the investment to double. Spreadsheet programs can easily do the calculation, but without a simple "rule," the mathematics are a bit daunting.

$$T = \frac{(\ln n)}{\ln(1 + r)}$$

where
T = number of periods (typically years) required
n = increase desired (e.g., $n = 2$ = doubling)
r = interest rate per period.

EXAMPLES

EXAMPLE 1: COMPOUNDING

A veterinarian invests $1,000 in an investment that pays 6% annually. What will the investment be worth after five years?

Future value (FV) = $PV \times (1 + r)^t$

In this case, PV = $1,000, $r = 0.06$ (i.e., 6%), and $t = 5$. Therefore,

$FV = \$1{,}000 \times (1.06)^5$, or $1,338.26

Tip

If you are using Microsoft Excel, which is the most common spreadsheet program in use today, you can easily calculate present and future value with the knowledge of a few symbols. The symbol "^" is used to denote an exponent, and "*" is used as a multiplier sign. To start an equation, the equal sign (=) needs to precede the other values to designate that this is a formula. Accordingly, the above formula would need to be entered into an Excel field as: = 1000*(1.06 ^ 5), then hit enter, and the result will appear in place of the formula.

EXAMPLE 2: DISCOUNTING

A veterinary owner is considering selling her hospital. A valuation determined the fair market value of the practice as $500,000, and buyer and seller accepted this figure. However, the buyer proposed that instead of paying $500,000 today, he would take possession immediately and pay $600,000 for the practice at the end of the third year of his ownership. The owner thought that if she had the money today, she would be able to invest it for a return of at least 10%. By using the following formula and ignoring other considerations (including tax issues, buyer risk, etc.), is the owner better off considering the proposal or continuing to look for another buyer?

$PV = FV/(1 + r)^t$

In this case,

$PV = \$600{,}000/(1.1)^3$

where $r = 0.10$, $t = 5$, FV = $600,000. So PV = $450,788.90, which is substantially less than the agreed upon price.

If the owner could find a buyer at $500,000 and then invested that money for three years at 10%, the future value of the investment would be: $FV = \$500{,}000 \times 1.10^3$ or $665,500. Therefore, the owner is better off continuing to look for another buyer or renegotiating with the first veterinarian.

EXAMPLE 3: THE RULE OF 72

You have an opportunity to invest money in a business venture that you are confident will pay you back compounding interest of 10% a year. How many years (T) will it take you to double your money?

$T = 72/10 = 7.2$ years

Therefore, if you invested your money at the stated interest rate, you would double your money in just over 7 years.

EXAMPLE 4: THE DECEPTIVE POWER OF COMPOUNDING

In 1626, Peter Minuit bought the island of Manhattan for $24. What is the present value of that investment? We cannot know for sure, but if Peter had managed to invest that money in an investment that delivered a 6% rate of return, 394 years later (2020) it would be worth over $224 billion ($224,244,683,837.58). Even more deceptive, if Peter had found an investment that paid just 1% more (7%), his investment in 2020 would be worth over 9 trillion dollars ($9,066,082,143,624.65)! That illustrates well the deceptive power of compounding and the time value of money.

CAUTIONS

In many instances it is not possible to know precisely the rate of return, unless we have a fixed-term investment (e.g., bond or certificate of deposit). The rate of return is often approximated by the opportunity cost, which is the next-best option forsaken to participate in the project considered. For example, if you had $100,000 to invest, is a veterinary hospital a good vehicle for that investment? If a passive investment in a stock market index fund will average 10% annual return over time, then a veterinary hospital (which is a riskier investment) must return significantly more than that over time to be considered a worthwhile investment.

MISCELLANEOUS

ABBREVIATIONS

IRR: Internal rate of return
FV: Future value
NPV: Net present value
PV: Present value
***r*:** Rate of return
***t*:** Time

7.2. Financial Statements

BASICS

OVERVIEW

Whether a practice records deposits and checks internally using software such as QuickBooks or sends the information to an accountant to record, it will end up with financial statements summarizing that data. These statements are supposed to provide useful, historical financial information about a practice, information that enables you, the reader, to manage the practice and to monitor results. But do they? There are two problems with that theory:

- The statements produced are generally in a format designed by accountants and presented using terminology and groupings that are meaningful to accountants, but not necessarily to veterinarians.
- Veterinarians have typically not been trained on what financial statements represent, and how they should be reviewed and interpreted.

There really is some very useful information on those statements, and in all likelihood the presentation of data can be changed slightly (and easily) to make them even more useful. Understanding financial statements makes you able to monitor trends and ask relevant questions, armed only with some basic information about how financial statements work.

TERMS DEFINED

Assets: Things of value, such as cash, equipment, inventory, or buildings.

Balance Sheet: A report on financial conditions which lists a practice's assets, liabilities, and owner(s)' equity at a specific point in time.

Basic Accounting Equation: Assets = Liabilities + Equity. The balance sheet reflects this underlying principle, but if yours does not, the data you see is not reliable. Computerized accounting programs make this equation true, but data exported into Excel and then regrouped or edited may result in formula errors and incomplete data that can make your statements "out of balance."

Cash Flow Statement: Report reflecting the sources of cash (such as profit, increased debt, and collections on client accounts) and the uses of cash (such as reducing debt or buying more drug and supply inventory) during a period of time. The current format groups these items by operating, investing, and financing activities.

Equity: The owner(s)' claim on the practice's assets; that is, the portion of the practice's assets that belongs to the owner, not the creditors.

Liabilities: The practice's debts; that is, money owed to creditors.

Net Book Value: Another name for equity; that is, the difference between the practice's assets and its liabilities. Net book value is not the practice's current value, since all assets are recorded at original cost, not current value, and goodwill is often not shown at all, unless it has been purchased.

Profit and Loss Statement: Also known as the income statement, this is a report on financial performance which covers a period of time and reports income and expenses during that period.

ISSUES AND OPTIONS

BASIC ACCOUNTING METHODS

Most accounting practices use one of the following methods as the basis of their accounting system. For income tax purposes, the choice of method is made at the time the first income tax return is filed, and it generally cannot be changed without permission from the Internal Revenue Service (IRS), although some changes do not require permission. The tax return itself shows the method of accounting that has been elected, which is one reason why practice appraisers ask to see tax returns as part of their analysis.

Some practices, however, have chosen a different method for tax purposes than for their internal financial statements. This is perfectly acceptable to the IRS, as long as an annual conversion is made to the method elected for tax purposes. Tax preparers make the conversion as part of the return preparation process.

The three most common methods of accounting for veterinary practices are the following:

- **Cash method:** Income is recorded when the cash is received, not when the services are performed. (A client's payment by credit card is considered the same as payment in cash, even though the client has not yet paid the bill to the credit card company.) Expenses are recorded when the practice makes the payment, not when the expense is incurred. (Similarly, if the practice pays an expense by credit card, the payment is considered made when the credit card is charged, not when the credit card bill is paid.)
- **Accrual method:** Income is recorded when the services are performed, not when the client ultimately pays for those services. Expenses are recorded when incurred, even if the practice still owes the vendor. Generally, when the accrual method is elected, the cost of drugs and supplies on hand is recorded as an asset ("inventory") until the items are sold or dispensed and transferred to the profit and loss statement.
- **Hybrid or modified accrual method:** This is a combination of the two methods, and therefore requires that the practice be consistent from year to year as to how income and expenses are recorded.

The preferred method depends on the practice, but accrual accounting is generally a better representation of actual results and is therefore more informative for internal accounting. Keep in mind that cash basis financial statements which do not tell you what your clients owe you, or what you owe your vendors, are giving you a very incomplete picture of your finances. That is because services that have been performed but for which clients have not yet paid will not be included in income on the profit and loss statement, nor will the amount of money they still owe be shown as an asset on the balance sheet. Similarly, expenses which the practice has incurred will not be included on the profit and loss statement if they are still owed to the vendor. A practice that is very short on cash may look more profitable on statements prepared on the cash basis simply because the practice has not yet been able to pay its vendors and has not recorded any of the unpaid expenses.

Historically, many tax preparers have recommended the cash method for income tax purposes on the theory that the practice's clients would owe the practice more than the practice would owe its vendors at any point in time. Under that fact pattern, the cash method would indeed result in lower profit and lower income tax for the year. However, those facts are frequently not the case for veterinary practices, since most practices require payment from clients at the time the services are rendered (and all of them should). Therefore, the amount due from clients is fairly small; but because a practice's vendors send invoices dated in the prior month and allow a grace period for paying for drugs and supplies, most practices owe their creditors more than their clients owe them at any point in time. You should discuss this issue with your tax advisor to determine what is best for you and your practice.

The IRS has become increasingly concerned about practices that stock up on drugs, supplies, and diets at year-end and then deduct the full cost of those purchases even though the items are still on the shelf. Proper tax accounting suggests that the cost of items that are sold to clients (such as diets and retail items) cannot be deducted on either a cash or accrual method unless the item has actually been sold. Fortunately, there seems to be more flexibility as to the expensing of drugs and supplies that are used as part of providing veterinary services, not sold to clients. By tradition, those items apparently can be expensed when purchased, even if not used by year-end.

Of course, there is much controversy about defining which items are supplies used in providing veterinary services and which are items that are ultimately sold to clients. Intuitively, a better matching of income and expense, however, would be to deduct the cost of drugs and supplies used in providing services against the income generated by those services, not in some earlier period when they were purchased. Again, ask your tax advisor for more information on this topic.

Most importantly, you need to understand the accounting method used on the statements you are reviewing, because you may be getting incomplete information if the financial statements are prepared on a cash basis.

FINANCIAL STATEMENT ANALYSIS

If you are a practice owner, you are being given, or have access to, financial statements about your practice. If you are not a practice owner now, you may not have had the opportunity to look at a practice's financial statements. But that does not mean you will not need or want to do so in the future. Veterinarians looking to buy a practice or buy into a practice are generally given financial data. Prospective buyers then attempt to interpret that information to determine whether ownership in the practice represents a good investment. Finally, if you are the practice team member responsible for keeping the practice's books, some basic financial statement analysis will help you understand the work you are doing and spot your own accounting mistakes quickly. Similarly, you can point out trends and relevant figures to the practice's leadership.

THE PROFIT AND LOSS STATEMENT (ALSO KNOWN AS AN INCOME STATEMENT OR P&L)

If you only look at one financial statement, it is likely to be this one, even though you should see the balance sheet as well (see below) The P&L is the statement that shows the income the practice earned (or collected) and the expenses it incurred (or paid) during the month, with the difference between total income and total expenses representing net profit for the month. Whether your statement shows income earned and expenses incurred (versus income received and expenses paid) depends on the method of accounting selected for your financial statements, as explained above.

How do you know which method of accounting is being used on your financial statements? All the newer versions of QuickBooks print the method of accounting on the face of the statements, which makes it much easier to identify the method used. But for statements prepared by other software packages, the fastest way to find out how the profit and loss statement was prepared is to look at the balance sheet, not the P&L. Accrual method statements will have an asset account called "Accounts Receivable" and a liability account called "Accounts Payable," while cash method balance sheets generally do not list these accounts. Accounts receivable represents the fees your practice has earned but not yet been paid for, while accounts payable is the total of the expenses you have incurred but not yet paid.

The method of accounting is of practical interest because one of the figures that should be monitored from month to month is accounts receivable. Far too many practices have no idea about the total amount their clients owe them and rarely, if ever, review a receivables report from their practice management software. Tracking old receivables in the software which likely will never be collected makes no sense. If your credit policy allows clients to check out without paying (generally not a good idea), be sure you follow up on those outstanding receivables regularly to turn them into cash. On an ongoing basis, you should track whether your clients owe you more or less money at the end of the month than they did at the beginning, but if your statements are prepared on the cash method, you cannot see this figure anywhere on your statements. To find it, you would have to look at production reports and income summaries from your practice management software.

Similarly, if your statements are prepared using the cash method of accounting, you do not know from looking at the statements what bills were not yet paid by the end of the month. That means that a portion of the profit on your P&L statement may already be "spent" (or at least committed), but you will not know how much unless you locate the stack of unpaid bills and add them up.

If you are looking at financial statements for a practice you are thinking to buy, be sure you receive both the balance sheet and the P&L statement so you know which method of accounting is being used, as well as a listing of uncollected accounts receivable and unpaid bills for that practice.

Notice that the P&L statement always covers a period of time. The heading at the top will identify the beginning and ending date (or month or year) for which the statement has been prepared.

You can make a P&L statement more meaningful by comparing the results with the numbers from a comparable period a year earlier. For example, comparing May 20XX with the income and expenses for the prior May will provide some interesting information. Most software packages can add this information easily and with only a few keystrokes. Similarly, common sizing all expenses (stating the percent of gross income that each figure represents) makes the statements more meaningful. Most of us can compare percentages more easily than actual figures. Again, most software programs have this capability. If the statements you receive do not have percentages or comparative data, ask if that data is available.

If you are preparing your financial statements internally, ask the person producing the statements to show you all the reports and options that are available. Remember that the point of accumulating all this data is not just to input it – the point is to get that same data back out of the system in a format which is useful to you, the reader of the statements.

THE BALANCE SHEET

As suggested earlier, the balance sheet complements the P&L statement by providing additional information about the method of accounting. But that is only a secondary purpose. Its primary purpose is to provide a snapshot view of the assets, liabilities, and owner(s)' equity at a specific moment in time. This is different from the P&L statement, which covers a period of time.

The balance sheet represents the basic accounting equation upon which all accounting systems are based (that is,
Assets = Liabilities + Owner(s)' equity).

Assets

Assets represent all the things of value that a practice owns. That includes cash, accounts receivable (if on the accrual basis), inventory, buildings, land, equipment, prepaid expenses, and goodwill. Those assets are owned either by the creditors (whose claims are called liabilities) or by the owners, if the asset is free and clear. Viewed this way, the balance sheet tells you whether the owners or the creditors have a larger stake in the practice's assets.

However, the assets and the equity section can be misleading, since for most practices the single largest asset is the practice's goodwill, and in most cases that asset never shows on the balance sheet. Only those practices that have purchased goodwill from someone else reflect it on their balance sheet. Therefore, practices in which the owners grew their own goodwill will not list goodwill as an asset. Also, keep in mind that all the figures represent cost, not current value.

Liabilities

Sometimes the liability section can also be misleading. For example, many practices lease equipment under terms that call for a stream of fixed payments with a one-time buyout (often $1) at the end of the lease. Most practices simply deduct the lease payments as an expense as they are paid (or accrued). In those cases, the unpaid portion of the lease never shows as a liability. Only by asking about leased equipment

7.2. Financial Statements

can the reader determine if there are outstanding obligations to equipment lease companies.

Owner(s)' Equity

Owner(s)' equity can have different names on the balance sheet, depending on the form of organization. For corporations, it is a combination of capital stock, paid-in capital, and retained earnings. For partnerships, it is called partners' capital, and for limited liability companies it is called members' capital. The equity that a sole proprietor (or the sole owner of a limited liability company) has in his or her unincorporated practice is generally called owner's equity.

CASH FLOW STATEMENT

The third type of financial statement seems rarely to be provided to veterinarians, though those who do receive it generally find it useful. The statement reconciles net income for the period to the net change in cash. In many ways, it combines key figures from the P&L statement and the balance sheet to tell the reader where the cash came from (operations, selling assets, and borrowing) and where the cash went (operations, buying assets, and repaying debt). This statement is available through most accounting packages, including QuickBooks. It is simply a different choice off the report menu, so if you have not seen one, ask to have it prepared for you.

WHAT PRACTICES SHOULD MONITOR

Small practices historically monitored their operations simply by watching the bank balance. If there was money left over after the bills were paid, then things must have been going well. If the money ran out before the bills got paid, something had to change or some payments had to be delayed (usually the owner's compensation). The problem with this approach was that it provided no information about what to do differently to make the money outlast the expenses. It also did not allow an owner to plan for expenses that were not due for several months, such as deferred payments on purchases of drugs and supplies. That could, and sometimes still does, lead to unpleasant surprises and cash crunches when the bill comes due.

Larger practices generally have monthly financial statements, but often receive them weeks or even months later if an outside accountant is producing the reports.

Production reports frequently get more attention, since doctors' compensation is often based on production, and since the profession has emphasized the importance of measuring specific data such as total revenue, average transaction charges, and the number of new and active clients, etc.

Here is a short list of items you should review monthly. Furthermore, you should have this information about the prior month in your hands no later than the 15th of the current month; otherwise, the information may be too stale to allow you to make any meaningful decisions based on that data. In addition to reviewing a monthly P&L, a balance sheet as of the end of the month, and a cash flow statement (if you find it useful), you should monitor the following:

- Gross production from services
- Gross production from drug/pharmacy sales
- Gross production from boarding and grooming, if you offer these
- Production by doctor, including owner(s)
- Average transaction charge overall
- Average transaction charge by doctor
- Client visits
- New clients
- Drug and supply costs as a percent of income for the month
- Salary expense by job classification as a percent of income for the month
- Ancillary costs as a percent of income for the month
- Rent expense as a percent of income for the month
- Net profit after all expenses but before owner(s)' compensation
- Net profit after all expenses (and after owner(s)' compensation)
- Outstanding client accounts receivable at the end of the month,including their age (current, 30 days, 60 days, etc.)
- Cash on hand at the end of the month.

This information is meaningful in any one month, but becomes even more useful when compared to prior months. Comparing these figures side by side over a 12-month period will help you identify trends quickly. If you are an owner, and even if you see no other reports for the month, have your hospital administrator or practice manager give you this information for the current month, as well as the prior 11 months, summarized in a spreadsheet.

BENCHMARKING A PRACTICE AGAINST INDUSTRY AVERAGES

Financial analysts frequently compute ratios to test a company's profitability, stability, inventory management, etc. While a book on finance can teach you how to make these calculations, the results are not very useful for most veterinary practices. The results depend largely on the method of accounting, and several ratios cannot be computed by the typical veterinary practice for that reason alone.

However, comparing a practice's results against national averages can be useful, though there is a risk of reaching questionable conclusions. Whenever you use benchmarks, ask yourself four questions:

- Am I looking at an average or a benchmark? In other words, am I trying only to be average or do I want to be better than average and reach a loftier goal set by successful practices' data?
- What do I know about the data that makes up this average? How extensive is the underlying database? How much variation is there in the data? In other words, $1,000,000 and $200,000 average to $600,000. But so do $545,000, $620,000, and $635,000. Only by also knowing the standard deviation would you know whether the data points are close to the average or vary widely.
- What is the definition of the number you are comparing? In other words, do you include the same items in your number as the people who generated the benchmark? One of the most notorious differences relates to "net income." Is that figure (1) net income before subtracting veterinarian compensation, (2) before subtracting owners' compensation but after deducting associate pay, or (3) after deducting both owners' and associate compensation? All three variations exist in the veterinary professional literature. The moral: be sure you're comparing apples with apples, not oranges.
- If your number is different from the benchmark (which it almost always will be), how concerned should you be about the difference? There is a risk that practices that spend too much time benchmarking will lower themselves to the average rather than setting goals that make sense and are attainable for their unique practice.

With those caveats, there are a few good sources for benchmarking. One is the *Veterinary Economics* annual benchmark study available through DVM 360 (http://www.dvm360.com/).[1] The American Animal Hospital Association (AAHA) also has a publication entitled *Financial and Productivity Pulsepoints*.[2] Included are statistics on staff, income, productivity, and expenses, with definitions provided for each category. WTA publishes the Well-Managed Practice study, which provides a good complement to the other statistics (https://www.wmpb.vet/). Be sure to understand their definition of terms to make good comparisons.

Finally, if your practice provides equine or food animal-related services, it can be difficult to find suitable benchmarks (see 1.26 – Equine Practice Management; 1.27 – Food Animal Practice Management; 1.28 – Mixed Animal Practice Management). Data for specialty and emergency practices is also hard to find, but there is increased emphasis on collecting and publishing reliable data for these practices as well (see 1.25 – Specialty and Emergency Centers).

7.3. Measures of Liquidity, Solvency, and Profitability

BASICS

OVERVIEW

• Practice managers use measurements derived from a practice's financial information to plan practice profitability and uses of capital.
• The development and use of mathematical relationships between various monetary measures appearing on the practice financial reports is called financial ratio analysis.
• Financial ratio analysis compares various asset, liability, and equity accounts to compute ratios that give clues about a practice's liquidity and financial structure. Liquidity and solvency ratios predict financial flexibility. Financial flexibility is the ability to quickly respond to unexpected cash demands and new opportunities to enhance earnings and assets.
• Financial flexibility correlates with financial liquidity, the time needed by a practice to:
  ◦ convert noncash assets to cash,
  ◦ pay maturing liabilities.
• Financial flexibility relies on profit. Profitability measurements are based on the relationship of revenues and expenses; specifically, what level of expense (a measure of asset utilization and depletion) will be incurred to generate revenues? As such, profitability measures generally evolve from the analysis of revenue and expense measurements over specific periods of time.
• Financial measurements are often used to help outside parties weigh the relative financial stability of a veterinary practice and its ability to reinvest capital, to meet timely payment of obligations, and to pay dividends to owners/investors.

TERMS DEFINED

Accounts Receivable Turnover (Revenue:Asset Measurement): The relationship between sales made through credit and accounts receivable, computed by dividing sales on account by average net accounts receivable. The higher the accounts receivable (A/R) turnover number, the quicker collections occur (and higher the probability of successful collection).
Acid Test Ratio (Asset:Liability Measurement): Sum of cash, receivables, and marketable securities divided by current liabilities. The acid test provides a quick measure of the practice's ability to pay its near-term liabilities out of liquid assets. Passing the acid test requires that the sum of highly liquid assets be at least equal to current liabilities, if not greater.
Aging Accounts Payable (Liability Computation): Accounts payable reported in layers, subtotaled by the duration of time the payable has been due to the vendor.
Aging Accounts Receivable (Asset Computation): Accounts receivable reported in layers, subtotaled by the duration of time the receivable has been outstanding and owing from the client. (Less than 30 days, 30–60 days, 60–90 days, > 90 days.)
Cost of Professional Services (COPS): Direct costs of patient care and product retailing, including drug and pharmacy costs, professional and hospital supplies costs, laboratory supplies and reference laboratory fees, radiology and imaging supply costs, surgery and anesthesia supply costs, dietary product costs, mortuary costs.
Current Asset: Cash or another asset that may reasonably be expected to be realized in cash, sold, or consumed within a year or less, through normal practice operations.
Current Liability: Amounts owed to outside parties that are due and must be paid within the next 12 months.
Current Ratio (Asset:Liability Measurement): Current assets divided by current liabilities. In general, moneylenders look for a ratio of 2:1 or better as a sign of financial flexibility and health. The current ratio is one of the most commonly used financial ratios to evaluate a business's balance sheet.
Days in Accounts Receivable (Asset Measurement): Divide 365 days by the Accounts Receivable Turnover Ratio for the entire year's sales. In general, a measure of less than 40 days in A/R is considered a good measure of likely collection, and would equate to an annual A/R Turnover of approximately 9. The shorter the average days in A/R, the more likely collection of outstanding accounts. Conversely, the better payment and collection policies, the shorter the average days in A/R.
Gross Income: Income resulting from all veterinary operations before any cost/expense deductions and excluding interest income, service charge income, rebates, sales tax collected, or any other income resulting from other than veterinary professional services, animal care ancillary services such boarding and grooming, and pharmacy/product retail income.
Gross Profit (Profitability Measure): A monetary amount, computed by subtracting total cost of professional services from gross income.
Gross Profit Percentage (Profitability Measure): The ratio percentage resulting from gross profit divided by gross income.
Horizontal Analysis: Comparison of a specific account in one financial reporting period to the account balance or amount in another financial reporting period. Also, the comparison of one percentage or ratio in a financial period with that in another period.
Inventory Turnover (Expense:Asset Measurement): The relationship between expense of total items sold and inventory value, computed by dividing the cost of drugs and dispensed items by the average inventory value. The higher the number, the more often inventory turns over, resulting in less outdating, less damage, and less inventory on hand at any one time. Typical veterinary practice inventory turns are 5–8 times per year, but some practices attain very high turnover of 10–12 times per year.
Leveraging: Borrowing money (incurring debt/liabilities) to obtain capital needed to pay for the costs of revenue generation. In theory, the revenue thus generated is adequate to pay for newly incurred expenses, to pay interest on the debt, to retire (over time) the principal portion of borrowed funds, and to generate adequate additional profits for further capital investment in needed assets consumed to allow future revenue growth.
Net Profit (Profitability Measure): A monetary amount equal to gross income from operations, less cost of professional services, less general and administrative expenses (before interest income or expense, before income tax expense, before any other sources of income or expense other than from veterinary services and retailing).
Quick Asset: An asset that can be converted to cash (liquidated) rapidly: cash, accounts receivable, short-term notes receivable, certificates of deposit, and other short-term investments in marketable securities. Specifically excludes inventory.

7.3. MEASURES OF LIQUIDITY, SOLVENCY, AND PROFITABILITY

Vertical Analysis: Comparison of a specific account in a financial reporting period to the total within that period. For example, the ratio of cash compared to all assets as of a specific date, or the percentage ratio of support staff wages to total practice revenues during a specified period of time.

ISSUES AND OPTIONS

- In order to generate meaningful financial ratios and measurements, financial records must be maintained in a logical and consistent fashion to yield information that is reliable and useful. Consistently gathered and compiled data leads to a story based in the financial information of a business, such as a veterinary practice, beginning with the first day of practice.
- Comparison of carefully compiled financial data leads to meaningful measures of profitability, solvency, and liquidity.
- Practice solvency and liquidity measurements primarily use data from the financial report most commonly known as the balance sheet (see 7.2 – Financial Statements). The balance sheet is organized in a logical fashion that allows calculation of financial ratios. The balance sheet lists the most liquid assets first (cash, cash equivalents, accounts receivable, prepaid expenses, inventory). Fixed assets (property, plant, and equipment) are presented next, first listing tangible property that will be used up most rapidly and followed by equipment and property with longer life expectancies (computer equipment, medical equipment, office equipment). Building, land improvements, and land are the final fixed assets listed. Intangible assets (computer software licenses, patents, goodwill) are listed after fixed assets.
- The balance sheet lists liabilities after assets, in order of most currency for payments due. Current liabilities (coming due within the next 12 months) include accounts payable, payroll taxes, retirement funds payable, short-term debt, current portion of long-term debt and of capital leases. Long-term debt is listed next: that portion of debt due in greater than 12 months.
- Measures of solvency and liquidity compare:
  - assets to liabilities,
  - current assets to current liabilities,
  - invested capital to profit,
  - owner's equity to liabilities.
- Profitability measures derive from the profit and loss report (similar to the income statement or the statement of revenues and expenses). These different terms have specific meanings and definitions within the accounting profession. For the purposes of the veterinary practitioner or practice manager, we will simply refer to the profit and loss statement as the starting point for profitability measures in this chapter.
- Profit and loss statement measures and ratios compare:
  - operating expenses to gross income,
  - relative periodic increases and decreases in revenue contribution.
- Steps in ratio analysis:
  - convert cash basis financial statement to accrual basis
  - include A/R, inventory value, all equipment, and tangible property
  - capitalize purchase leases by
    - including the asset (equipment) value
    - recording the remaining liability (the present value of future lease payment obligations).
- Transaction classification analysis:
  - Prepaid expenses recorded?
  - A/R collectible?
  - Inventory correct?
  - Short-term debt or long-term debt?
  - Other current liabilities recorded?

EXAMPLES

LIQUIDITY MEASURES

Working Capital (Also "Net Working Capital")

- Total current assets $50,000
- Total current liabilities $20,000
- Difference = working capital $30,000

Current Ratio, Working Capital Ratio (Measure of Liquidity)

- Current assets $50,000
- Current liabilities $20,000
- Current ratio computes to 2.5
- Or, expressed as 250%
- Or, as 2.5 to 1
- $2.50 of current assets for each $1 of current liabilities

Acid Test

More severe test of immediate liquidity – ability to react to sudden demands on current assets, especially cash.

- Quick assets = cash, A/R, short-term notes receivable, and short-term investment in marketable securities (excludes inventory)
- Quick assets $25,000
- Current liabilities $20,000
- Acid test computes to 1.25
- Or, expressed as 125%
- Or, as 1.25 to 1
- $1.25 of quick assets for each $1 of current liabilities

SOLVENCY INDICATOR RATIOS

Working Capital to Total Assets

Measures liquid assets relative to total capitalization and distribution of resources employed as to liquidity:

- Net working capital $30,000
- Total assets $300,000
- Working capital to total assets computes to 10%

Receivable Turnover

Measures credit and collection efficiency of trade accounts and notes:

- Net credit sales (1 year) $500,000
- Average trade receivables $50,000
- Average trade receivables = average receivable balance over 1 year (in this example)
- Receivable turnover = 10
- Days in A/R = 365 days/10 = 36.5 day

7.3. Measures of Liquidity, Solvency, and Profitability

Inventory Turnover Ratio

Measures effectiveness and efficiency of inventory purchases and use:

- Drug and profession supply purchases (1 year) $150,000
- Average inventory on hand $20,000
- Average inventory on hand = average inventory value over 1 year (in this example)
- Inventory value = physical count at cost
- Inventory turnover = 7.5 times per year

Days Supply in Inventory

Indicates general condition of over- or under-stocking:

- 365 days
- Inventory turnover 7.5
- 365 days/7.5 = 48 days
- Number of days' supply in the average inventory

Working Capital Turnover

Indicates effectiveness with which average working capital was used to generate sales:

- Net sales $1,000,000
- Average working capital $50,000
- Working capital turnover = 20

Basic Sources of Funds Used

Owner's equity and/or creditors' equity:

- reflects certain financial strengths and weaknesses of the business
- reflects long-term solvency and potential for obtaining investment resources.

Debt to Equity Ratio

Measures balance of resources provided by owners versus those of creditors:

- Total liabilities $200,000
- Owner's equity $300,000
- Debt to equity ratio computes to 0.67
- Or, as 0.67 to 1
- Or, $0.67 of debt for each $1 of owner's equity

Owner's Equity to Total Assets

Measures proportion of assets provided by owners and reflects the practice's financial strength and cushion for creditors:

- Owner's equity $300,000
- Total assets $500,000
- Owner's equity to total assets ratio computes to 0.6
- Or, as 0.6 to 1
- Or, $0.60 of owner's equity for each $1 of assets

PROFITABILITY MEASURES

Revenue Growth

Percent increase over prior defined period:

- Current year revenues – last year revenues $1,000,000–$900,000
- Last year revenues $ 900,000
- Revenue growth is 11%

Gross Profit

- Gross income (revenues) $1,000,000
- Less cost of professional services $210,000
- Gross profit $790,000

Table 7-3-1. Example of vertical analysis and veterinary industry ratios (expenses as percentage of gross revenues).

Gross income	$1,000,000	100.00%
Drugs and professional supplies	$150,000	15.00%
Laboratory fees	$30,000	3.00%
Dietary product expense	$25,000	2.50%
Mortuary expense	$5,000	0.50%
Total cost of professional services	$210,000	21.00%
Veterinary wages – owner	$130,000	13.00%
Veterinary wages – associates	$160,000	16.00%
Wages – other employees	$205,000	20.50%
Payroll taxes	$41,000	4.10%
Employee benefit programs	$32,000	3.20%
Advertising and promotion	$9,000	0.90%
Licenses and permits	$3,800	0.38%
Office and computer supplies	$18,000	1.80%
Postage expense	$3,700	0.37%
Accounting, legal, and professional services	$12,500	1.25%
Miscellaneous taxes	$1,100	0.11%
Rent expense	$70,000	7.00%
Real estate taxes	$6,000	0.60%
Property and casualty insurance	$6,200	0.62%
Utilities	$10,400	1.04%
Telephone	$6,600	0.66%
Maintenance	$10,000	1.00%
Janitorial supplies and service	$3,600	0.36%
Repairs	$2,700	0.27%
Depreciation and amortization	$12,300	1.23%
Interest expense	$7,800	0.78%
Income taxes	$12,000	1.20%
Profit after income taxes	$26,300	2.63%

Gross Profit Percentage

- Gross profit $790,000
- Gross income $1,000,000
- Gross profit percentage is 79.0%

Small animal practice gross profit percentages typically range from 76% to 82%, but can go higher or lower. Lower gross profit percentages (less than 78%) are typical with higher levels of product vending and/or inadequate fee structure (revenue generation).

Table 7-3-1 shows typical veterinary practice expenses as percentage of gross income (vertical analysis). It is intended as an example only. The number of veterinarians, mix of services, patient species types, product vending philosophy, fee structure, and many other factors affect the unique ratio relationships identified in a particular practice.

Horizontal analysis compares financial information (dollar values or ratios) for two or more financial periods. Example comparisons include:

- current fiscal quarter with year-to-date
- current fiscal quarter with last fiscal quarter
- current fiscal half with same six months of prior year
- Most recent 12 months of revenues and expenses with immediately preceding 12 months of activity (12 months ending April 30, 20XX with the 12 months ending April 30, 20XY).

Table 7-3-2 shows an example of expense ratio horizontal analysis.

7.3. MEASURES OF LIQUIDITY, SOLVENCY, AND PROFITABILITY

Table 7-3-2. Example of expense ratio horizontal analysis.

	Year ended 12/31/20XY	*Year ended 12/31/20XX*	*Increase/ (Decrease)*
Gross income	100.00%	100.00%	
Drugs and professional supplies	15.00%	16.00%	(1.00)
Laboratory fees	3.00%	2.75%	0.25
Dietary product expense	2.50%	3.25%	(0.75)
Mortuary expense	0.50%	0.50%	0.00
Total cost of professional services	21.00%	22.50%	(1.50)
Veterinary wages – owner	13.00%	11.00%	2.00
Veterinary wages – associates	16.00%	14.50%	1.50
Wages – other employees	20.50%	21.25%	(0.75)
Payroll taxes	4.10%	3.90%	0.20
Employee benefit programs	3.20%	2.80%	0.40
Advertising and promotion	0.90%	1.20%	(0.30)
Licenses and permits	0.38%	0.40%	(0.02)
Office and computer supplies	1.80%	2.00%	(0.20)
Postage expense	0.37%	0.35%	0.02
Accounting, legal, and professional services	1.25%	1.15%	0.10
Miscellaneous taxes	0.11%	0.06%	0.05
Rent expense	7.00%	7.40%	(0.40)
Real estate taxes	0.60%	0.65%	(0.05)
Property and casualty insurance	0.62%	0.57%	0.05
Utilities	1.04%	1.11%	(0.07)
Telephone	0.66%	0.80%	(0.14)
Maintenance	1.00%	1.20%	(0.20)
Janitorial supplies and service	0.36%	0.30%	0.06
Repairs	0.27%	0.50%	(0.23)
Depreciation and amortization	1.23%	1.80%	(0.57)
Interest expense	0.78%	0.95%	(0.17)
Income taxes	1.20%	0.70%	0.50
Profit after income taxes	2.63%	2.91%	(0.28)

Earnings before interest, tax, depreciation, and amortization (EBITDA) is a profitability measure used by financial analysts of large publicly traded entities, with audited and generally accepted accounting principles (GAAP)-based financial statements. EBITDA is usually computed as profit (after all expenses) plus interest expense, plus income taxes, plus depreciation expense, plus amortization expense (see Table 7-3-3).

The EBITDA computation works well for publicly traded entities, but not for closely held businesses such as veterinary practices. In small businesses, tax entity structure, tax mitigation, and compensation strategies take precedence over financial statement presentation that allows the EBITDA ratio to be meaningful.

Table 7-3-3. Example of EBITDA computation.

Profit after income taxes	$26,300	2.63%
Income taxes	$12,000	1.20%
Interest expense	$7,800	0.78%
Depreciation and amortization	$12,300	1.23%
EBITDA	$58,400	5.84%

Practice valuation models use profit analysis and earnings adjustments that provide the best determination of net profit and allow one practice to compare itself to the industry or another practice on an "apples to apples" basis. Such profit margin computations adjust for the following items (list is not all inclusive):

- Excessive or below market compensation (usually owners and related parties, such as spouses working in the practice).
- Excessive or below market perquisites, such as unnecessary vehicle expense; high travel, entertainment, and continuing education expense; and non-essential business expenses.
- Unusual, nonrecurring expenses or income (such as insurance proceeds).
- Errors in expensing long-lived property that should be capitalized and depreciated over the property's true life expectancy.
- Lease payments on equipment intended to be eventually owned.
- Fair value of practice real estate utilization (rent expense) when real estate is owned by a related party, such as the owner of the veterinary practice itself.
- Interest expense.
- Depreciation and amortization expense.
- Revenue and expenses not related to veterinary practice operations.
- Fluctuations in expense due to timing differences in payment (e.g., 13 utility payments in one year, and 11 payments in the next).
- Errors in inventory capitalization (or lack thereof).

Engage your accountant or a practice management/financial consultant to help you evaluate true practice profitability. A commonly used measure of practice profit is based on earnings before rent, veterinary compensation cost, interest, depreciation, and miscellaneous non-operational revenues and expenses (see Table 7-3-4).

Table 7-3-4. Example of profit computation for earnings before veterinary compensation and rent expense.

Profit after income taxes	$26,300	2.63%
Income taxes	$12,000	1.20%
Interest expense	$7,800	0.78%
Depreciation and amortization	$12,300	1.23%
Veterinary wages – owner	$130,000	13.00%
Veterinary wages – associate	$160,000	16.00%
Employer payroll taxes for veterinarian wages	$20,000	2.00%
Employee benefits – veterinarians' portion	$20,000	2.00%
rent expense	$70,000	7.00%
Earnings before DVM compensation and rent	$45,840	45.84%

7.3. Measures of Liquidity, Solvency, and Profitability

The ratio of earnings before veterinary compensation and rent to gross income usually ranges between 40% and 50% in small animal practices, and 35% and 45% in equine and large animal practices. The amounts of product vending (professional supply expense) and support staff wage and salary structure have the greatest impact on earnings in this computation of profitability.

CAUTIONS

- Ideally, record-keeping methods are similar among businesses globally, nationally, and within a specific industry, such as private veterinary practice.
- In the United States, publicly traded businesses report financial information in accord with guidelines promulgated by the American Institute of Certified Public Accountants (AICPA) through what are known as generally accepted accounting principles (GAAP). Most veterinary practices do not follow these complex rules because of the associated accounting expense. Privately owned veterinary practices must develop systems that allow consistent collection of financial data.
- "Off-balance sheet" accounting will skew and corrupt ratios. Before using ratio analysis for balance sheet accounts, financial information must be converted to accrual basis so that all assets and liabilities are reported.
- Bankers and loan officers often apply rules of thumb to financial reports, which are based in ratio analysis. If you present financial statements and/or tax returns that omit significant practice assets, your practice may present a misleadingly weak financial picture. Make sure the banker is aware of all your veterinary practice owns. Perhaps ask the banker to tour the practice to observe activity, assets, and available collateral.
- Some practice balance sheets omit significantly valuable assets, such as fair value of inventory and supplies, collectible accounts receivable, and equipment.
- In veterinary practices, the actual value of long-lived medical equipment may be far greater than the balance sheet implies. Also, many items of equipment or valuable tangible property may not be correctly reported on the balance sheet.
- Liabilities may not be recorded on the balance sheet, either. For example, the present value of required future lease payments may not be recorded.
- Contingent liabilities are those liabilities dependent on a future event. A lawsuit against the practice could be a contingent liability depending on the findings of the court or jury. The amount of the liability might not be measurable to a future date. Contingent liabilities, known or unknown, could affect the interpretation of financial ratios of liquidity and solvency.
- The saying goes "garbage in, garbage out." If practice bookkeeping systems poorly compile transactional data, all ratios and measures become suspect. Attention to detail ensures financial information you (and others) can rely upon.
- Published benchmarks can be misleading. Financial measures of profitability, liquidity, and practice capital health should derive from understanding the unique trends and consistency of your own practice's data. Many surveys and data pools represent accumulation of voluntarily submitted information that has not been audited or evaluated for accuracy. Be careful of basing your management decisions solely on published financial information applied comparatively to your practice.
- Veterinary practice profit margins range widely from practice to practice (see 7.11 – Understanding Practice Profitability). True profit is difficult to ascertain based on simple examination of a tax return or financial statement. Apparent profitability can be affected by the type

of tax entity, the number of owners, the types of patients treated, the type of practice (general, specialty, emergency, not-for-profit), among other factors. Regular profit margin analysis through the assistance of the practice's accountant or a veterinary consultant experienced in finance is advisable.

MISCELLANEOUS

- Use the standardized veterinary industry chart of accounts (https://www.aaha.org/professional/resources/chart_of_accounts.aspx) to set up a practice accounting system that allows your practice data collection to be as similar as it can be to other practices.
- Engage your accountant's services to develop financial reports, ratios, and measures that help you actively manage your practice with meaningful information.

7.4. GETTING THE MOST OUT OF YOUR ACCOUNTING PROFESSIONAL

BASICS

OVERVIEW

The integration of an accounting professional into a practice owner's stable of consulting professionals (practice management consultant, accountant, attorney, financial planner, risk management consultant, etc.) is a great addition to filling the desired spokes on the "valued professionals" wheel of good fortune (see 1.17 – Practice Management Support Professionals). What most veterinary practice owners do not realize, though, is that not all accounting professionals are alike.

TERMS DEFINED

Accountant: Term typically applied to Certified Public Accountants (CPAs), bookkeepers, tax preparers, enrolled agents, auditors, and general corporate-level accountants. Each is particularly suited for certain tasks at hand consistent with each of their discrete windows of experience. However, the best and most comprehensive financial analysis can be obtained by a professional with a vast array of financial, accounting, and tax experience, and the CPA provides this. By working in various industries, not just the veterinary profession, to obtain their certification, a CPA can translate cutting-edge and sophisticated techniques from a host of industries to the practice at hand.

Certified Public Accountant (CPA): College-trained accounting professional who has attained certification in the state that he or she practices in by passing a comprehensive two- to three-day exam, maintaining continuous professional education, obtaining relevant years of experience, and subscribing to a heightened level of ethics in a challenging business context.

Chartered Accountant (CA): Canadian/UK certification for accountants, similar to the CPA designation in the United States.

ISSUES AND OPTIONS

The most general examples of work products that an accountant can provide are financial statements, income tax returns, income tax planning, and management consulting.

FINANCIAL STATEMENTS

Financial statements are written historical records of financial standing, earnings, and cash flow for a given period (see 7.2 – Financial Statements). Lenders, boards of directors, and veterinary practice owners may require certain types of financial statements from a CPA firm on behalf of a client in order to gain some level of assurance (by an independent third party such as a CPA) that the financial records are indeed what the practice asserts.

"Audited" financial statements provide the highest, but not absolute, level of assurance. Audits are a comprehensive undertaking, entail a lengthy process, and are generally expensive. They rely on statistical sampling methods to capture relevant data and, therefore, do not examine all financial data. The audit report is a one- or two-page letter signed by the CPA (or on behalf of the CPA firm as a whole) attached to a set of financial statements. When the audit is completed, the CPA's standard audit report states that an audit was performed in accordance with generally accepted auditing standards, and expresses an opinion that the financial statements present fairly the entity's financial position and results of operations. This is known as expressing "positive assurance." In addition, the auditors are required as a part of their procedures to report incidences of fraud, should those matters come to their attention, but they are not specifically engaged to search for it unless that is part of another separate and specified engagement.

"Reviewed" financial statements provide a greater level of assurance than compiled financial statements, although not much more. A review consists principally of inquiries of company personnel and analytical procedures applied to financial data. It is substantially less in scope than an audit in accordance with generally accepted auditing standards, the object of which is to express an opinion regarding the financial statements taken as a whole. In order to generate the reviewed financial statements, the CPA must gain an understanding of the internal accounting controls and obtain representations from management that certain fundamental aspects of control are adhered to as presented.

Upon completion, a review report is issued stating that a review has been performed in accordance with AICPA professional standards, noting that a review is substantially less in scope than an audit, and that the CPA did not become aware of any material modifications that should be made in order for the practice's financial statements to be in conformity with generally accepted accounting principles (GAAP), or another comprehensive basis of accounting, such as the "income tax basis" method of accounting. A review may be adequate for entities that must report their financial positions to third parties, such as creditors or regulatory agencies. Reviewed financial statements may also be useful to practice owners who are not actively involved in managing their practices.

"Compiled" financial statements provide the most basic level of assurance. The CPA must comply with certain basic requirements of professional standards, such as having knowledge of the client's industry and applicable accounting principles, a clear understanding with the veterinarian of the services to be provided, and whether there are any obvious departures from generally accepted accounting principles (or, in some cases, another comprehensive basis of accounting as described above).

It may be necessary for the CPA to perform other accounting services, such as correcting general ledger reporting or assisting with adjusting entries for your practice's accounting records before financial statements may be prepared. Upon completion, a report is issued that states a compilation was performed in accordance with American Institute of Certified Public Accountants (AICPA) professional standards and that no assurance is expressed that the statements are in conformity with GAAP.

INCOME TAX RETURNS

The preparation of annual federal and applicable state income tax filings fulfill a basic need – regulatory compliance – for all practice owners. However, the goal of obtaining all relevant information in a manner that secures the filing of these returns by the due date (March 15 for S corporation and partnership tax returns and April 15 for individual, trust, and calender-year C-corporation tax returns) also compresses a year's worth of activity into a relatively short window for the CPA to examine, adjust, and produce tax returns. Thus, to get the most efficiency (and effectiveness) out of a CPA at this time of year, it is best to have obtained income tax planning services prior to the end of the calendar year and to have all accounting records, either QuickBooks or other accounting software package information, to the CPA firm by the third or last week in January. This is entirely possible to accomplish, as bank statements necessary for reconciling practice bank accounts are available either online or by the second week of January. Then your practice's tax work will not accumulate with that of all the other clients of the firm with the same filing goal. In speaking with every CPA, the same tenet holds true – the early client gets better service.

INCOME TAX PLANNING

To many veterinary practice owners, income tax planning typically involves "planning to use the same CPA next tax season." But the best approach to managing tax consequences of income and expense levels, equipment purchases, and cash flow concerns is to begin a regular and consistent approach to tax planning. The typical tax planning engagement should entail your CPA using either a safe harbor approach (based on the previous year's adjusted gross income and tax

7.4. GETTING THE MOST OUT OF YOUR ACCOUNTING PROFESSIONAL

liability) or a projected income for the current year. Then you would provide your CPA quarterly, semiannual, and/or November/December financial statements that you can utilize to plan a few scenarios, using projected income for the remainder of the year as well as large equipment purchases, employee bonuses, and so on. Then there will be no surprises in March or April when tax obligations are due.

MANAGEMENT CONSULTING

Many CPA firms are now heavily involved in niche industry management consulting as a way of differentiating themselves from the competition. The CPA that specializes in automotive dealer inventory valuation issues or litigation support for trial lawyers may not necessarily be the right source for your veterinary practice's future growth, unless the staff of the CPA firm gains the requisite knowledge necessary to advise the veterinary practice owner on issues pertinent to the veterinary industry.

EXAMPLES

Because your entire venture revolves around money (making it, saving it, protecting it, using it, investing it), accountants play a critical role in helping you run a successful veterinary practice. Thus, your CPA should be one of your most trusted professional advisors. You should hire an accountant even before contemplating the organization of a veterinary practice, as the CPA can utilize the team approach with your legal counsel, risk management professional, and/or veterinary practice management consultant to gain the most efficient route of formation, organization, and development of your veterinary practice.

The Massachusetts Society of CPAs sponsored research with Bentley College designed to discover how small businesses choose an accounting professional (21% of the survey participants showed gross annual revenues under $1,000,000). The survey also found that 12.87% of participants stated that they do not use a CPA, while 93% of those who do said that it is beneficial and worth the extra money to use a CPA over a noncredentialed accountant.

CAUTIONS

Just as with all the professional advisors on your team, your ultimate goal should be to hire a firm that adds intrinsic value to your company's service delivery, and ultimately bottom line profitability. Therefore, finding a good match in a CPA firm generally has very little to do with price for professional services.

As with evaluating a veterinarian, physician, architect, or attorney for the provision of professional services, you should examine the following relevant factors to see if there is a true value your accounting professional can provide to you:

- **Talented people:** Make sure the professional staff members have enough experience, and the right kind of experience, as well as veterinary industry contacts you can leverage.
- **Industry expertise:** Make sure the firm has sufficient depth of expertise in areas affecting the veterinary industry.
- **Continuing improvement (CPE):** Make sure the firm's staff members are current on continuing professional education requirements.
- **Involvement:** See how active the CPA firm is with professional organizations, not only in the accounting world like the American Institute of Certified Public Accountants (AICPA) and/or state CPA societies, but with the American Animal Hospital Association (AAHA), VetPartners, and the American Veterinary Medical Association (AVMA).
- **Publication:** Research how many and what type of articles in trade publications, books, and seminars the CPA firm's staff members have written, published, lectured, and presented.
- **Regulatory boards:** Check with state boards of accountancy or other regulatory bodies to ensure the firm is in good standing in the CPA and financial communities.

7.5. ANALYZING CLIENT TRANSACTIONS

BASICS

OVERVIEW

• There is an abundance of client transaction information available to practice owners and managers from their practice information management systems (PIMS) and medical records.
• Analysis of client information from the PIMS will reveal trends in numbers of active clients, new clients, lost clients, number of pets per client, number of visits per client, and other areas. These types of metrics are often called key performance indicators (KPIs) (see 7.8 – Key Performance Indicators).
• Analysis of hospital medical records helps determine how compliant clients are with doctor recommendations, whether all services are being charged for, and if there is inconsistency in care among doctors in treating similar medical conditions.
• All of this information is extremely helpful in improving both the medical/surgical care offered by the practice and the practice's profitability.

TERMS DEFINED

Full-Time-Equivalent (FTE) Doctor: A doctor who works 40 hours a week for a full year. Normal vacation, sick time, holidays, or other paid time off are treated as work hours in this calculation but an extended leave is not.
Key Performance Indicators (KPIs): Key metrics (financial and operational) used to measure performance of an organization.
Practice Information Management System (PIMS): The software system used by the practice for client invoicing, medical records, inventory, metric analysis, tracking of accounts receivable and other revenue-related activities.

ISSUES AND OPTIONS

ANALYZING CLIENT KEY PERFORMANCE INDICATORS

KPIs are used very effectively to:
• measure performance of the practice,
• explain changes seen in the financial statements.
They also help to answer the question, "How am I doing?" by:
• providing detail as to why hospital changes are occurring (this detail is necessary to understand which areas of the hospital need improvement),
• allowing comparison of a hospital's data internally (e.g., from quarter to quarter or year to year),
• allowing comparison of a hospital's data to published benchmarks.

The most common client-related KPIs include the total number of active clients, number of clients per doctor, number of new clients, number of lost clients, number of transactions per client, and revenue per client. Client retention ratios and the average retention of a client in years can also be calculated from this information.

COMMON CLIENT KPIS AND COMPARATIVE BENCHMARKS

Some of the most helpful sources for comparative benchmarks include: the American Animal Hospital Association's *Financial and Productivity Pulsepoints*,[1] the Well-Managed Practice Benchmarks Study (WMPBS),[2] and the Veterinary Hospital Managers Association monthly Insiders' Insights report (www.vhma.org).

Active Clients per FTE Doctor

Most studies consider an active client to be one who has visited the practice in the last 12 months. It is important that this same definition be used if comparison is to be made to these numbers. The number of active clients per doctor is influenced by several factors, including efficiency of the doctors in seeing patients, productivity of the doctor/staff teams as a whole, type of practice (wellness services versus internal medicine focus), local demographics, the economy, and practice marketing.

Annual New Clients per FTE Doctor

The number of new clients a practice "needs" depends on the practice, whether it is a growing or mature practice, the demographics of the area, and other factors. The number of new clients per doctor is influenced by several factors including type of practice (wellness services versus internal medicine focus), local demographics, client service, the economy, and practice marketing.

Lost Clients Per Year

Published benchmarks are not usually seen for this KPI; however, it is a very valuable figure to know, particularly when compared to the number of new clients. The number of lost clients is calculated as follows:

$$\text{Lost clients} = \text{active clients last year} + \text{new clients this year} - \text{active clients this year}$$

For example, if your practice had 4,000 active clients in 2011, 5,000 active clients in 2012, and 1,200 new clients in 2012, then:

$$\text{Lost clients} = 4,000 + 1,200 - 5,000 = 200$$

The definition of active clients must, of course, be the same for each year used in the calculation for the results to be valid. Clients are generally lost because they no longer own the pet, they moved, they had a poor service experience at the practice, or they can get (or perceive they can get) better value for their money at another practice.

Transactions Per Client Per Year

The number of transactions per client per year is influenced by several factors, including the range of services offered by the practice, the level of client education done by the practice, local demographics, client service, and the local economy.

DEVELOP YOUR OWN SET OF HOSPITAL KPIS

The practice's management team should review its client KPIs each month. Additional related metrics can be added depending on the management areas the practice is currently focusing on.

Most KPI information is available from the hospital's PIMS. The software company's help desk can assist a practice to determine how to access information they are having trouble finding.

The reports generated by the management software are often not in the best format for trend analysis, but simple spreadsheets can be set up in Excel or a similar program to facilitate this review.

ANALYZING CLIENT MEDICAL RECORDS

As mentioned in the overview, analysis of hospital medical records helps determine how compliant clients are with the practice's recommendations, whether all services are being charged for, and if there is inconsistency in care among doctors in treating similar medical conditions.

Some information can be obtained manually from records, some from the practice management system, and more from available data mining software.

CLIENT COMPLIANCE WITH VETERINARY PRACTICE RECOMMENDATIONS

The AAHA 2002 Compliance Study demonstrated that client compliance with practice recommendations in the areas of heartworm testing and preventive, dental prophylaxis, therapeutic diets, senior screenings, core vaccines, and pre-anesthetic testing was much less than veterinarians thought (see 4.11 – Compliance and Adherence). It was

Table 7-5-1. Example of a medical record audit for missed charges.

Doctor	*Date*	*Patient*	*Invoice amount*	*Items not charged*	*Value of items not charged for*
Dr. A	5/15/13	"Sam" Smith	325.00	No missed charges	0
Dr. A	5/16–18/13	"Thomas" Jones	632.25	Hospital stay, pet vomiting	
				No exam fee charged 5/16	$45
				Hospitalization not charged 5/16	$30
				Fecal not charged 5/17	$25
				No meds noted on 5/17; were they given? If so, not charged	?

also clear that the quality of pet care suffered due to this lack of compliance. Although many practices have seen improved client compliance, it still remains a significant issue.

The practice's management software or reasonably priced data mining services provide information that can be used to determine client compliance in almost any area.

Once the practice has determined areas in which client compliance is not as high as it should be, goals can be set for the future and plans laid to achieve these goals. Recommendations from the AAHA study include establishing protocols for common services provided to clients, reviewing all client records before appointments to determine compliance status, providing written follow-up instructions, improving reminders, and making follow-up calls.

HOW MANY PROCEDURES NEVER MAKE IT TO THE INVOICE?

Analyzing client medical records for services not billed can be a real revelation. In the typical practice, a remarkable number of procedures are not invoiced. There is no point in developing an excellent fee structure if the item is not billed.

The first step in correcting this is to identify the scope of the problem by comparing invoices to medical records for missed charges:

1. Select a recent week.
2. Select 40–50 medical records per doctor where services were performed during that period. Also pull all the invoices that correspond to these medical records. The invoices should cover all types of services provided: outpatient, surgery, dentistry, etc.
3. Set up a chart similar to the one in Table 7-5-1.
4. Look for patterns during the times the missed charges occur. Do they only occur with one doctor? With one technician? At one time of day?
5. Review the practice's system for getting charges into the computer. Is a travel sheet used? Is everyone consistent in how they mark the travel sheet? Does the staff have time to input the charges? Do staff members look for charges the doctor may have missed?

CONSISTENCY IN CARE

Although there will always be some differences among doctors in the same practice in how they treat particular cases, it is important that most services offered (particularly preventive care services) be consistently performed among doctors (see 9.3 – Standards of Care and Care Pathways). It is very confusing to both clients and staff if one doctor uses one vaccine protocol and another uses another. Or if one doctor treats an ear infection by examining the debris under a microscope, flushing the ears, and then determining an appropriate medication, and another doctor simply sends the client home with a tube of ointment.

These differences are very difficult to explain to clients. It appears as if one doctor did more than was needed simply for financial gain, or else the other doctor was negligent in his or her workup. It is similarly confusing to staff. They cannot work efficiently because there are no consistent expectations nor can they communicate effectively to clients.

Written guidelines for every common medical service the hospital performs are critical to ensure consistency of care. The doctors in the practice should discuss each common type of case and come to an agreement as to how they should be treated. Doctors, of course, always have the option to modify the protocol if appropriate for a certain case or if clients refuse treatment.

EXAMPLES

N/A

CAUTIONS

Although comparison with industry standards is very useful for identifying areas that a practice is successful in versus those that may need further investigation, it is important to remember that every practice is unique and industry standards are not always the "right" answer for every practice.

7.6. BENCHMARKING

BASICS

OVERVIEW

One of the oldest business axioms still rings true today: "You must be able to measure it in order to manage it." Benchmarking should be an ongoing process for all practices that wish to improve their processes and outcomes. Otherwise, a practice may remain static or decline.

There are three primary types of reference data for benchmarking: historical information, rules of thumb, and industry norms. Each of these types has specific strengths and weaknesses. Consequently, a prudent person should consider more than one type of reference data before drawing conclusions and planning a course of action.

TERMS DEFINED

Benchmarking: Process by which a practice compares itself to others (especially those known for outstanding performance) in an attempt to improve performance. Today all types of businesses perform some degree of benchmarking as part of their normal management protocols. There are typically five distinctive components to a benchmarking program: (1) identifying the area requiring benchmarking, (2) collecting the data, (3) analyzing the data, (4) recommending and implementing changes, and (5) evaluating the results.

Business Life Cycle: The four major phases that describe a business from the time it is formed until the time it is closed: startup, growth, plateau, and decline.

Continuous Quality Improvement (CQI): An ongoing process of seeking small improvements in processes that have an overall effect of improving efficiency and productivity while reducing waste within an organization.

Flowchart: Graphic representation of the stages in a process or of the steps required to solve a problem. A flowchart is commonly used to outline the sequence of functions in a complex process. For example, some practices have created a step-by-step graphic representation of a healthy pet wellness exam in order to identify all of the potential roadblocks to customer service and/or practice efficiency.

Historical Benchmarks: Data from your own practice that represents various time periods. The most common historical data is collected at the end of each operating year, although other periods of time may be used depending on the specific focus of the research.

Industry Norms: Values derived from the analysis of a large number of practices. Most of the national groups that represent organized veterinary medicine publish some variety of industry norms. The most common examples would be the American Animal Hospital Association (AAHA) and the American Veterinary Medical Association (AVMA).

Rules of Thumb: Standards of performance used by specific industries in analyzing all types of businesses. For example, banks have rules of thumb for analyzing the financial statements of all professional service businesses whether they are veterinary practices or not.

ISSUES AND OPTIONS

THE PROCESS

• **Identifying the area:** This is an important decision because each management discipline has its own distinctive set of benchmarking tools. Examples of common areas that practice benchmark include customer service, human resources management, productivity, and profitability.

• **Collecting the data:** Once you have chosen the area you wish to analyze, you must begin collecting a library of reference data (i.e., historical information, rules of thumb, and industry norms) that you will compare against similar data derived from your practice.

• **Analyzing the data:** This is an important part of the process and often the most challenging. Data analysis is best handled by someone with experience that can identify deviations from the data and potential root causes for the deviation. This is commonly facilitated using a flowchart analysis to identify potential problems. In order to address each potential problem discovered on the flowchart, the use of additional benchmarks and further comparative analysis is almost always required.

• **Action plan:** Once the root cause of poor performance has been identified, the practice leadership should develop an action plan to correct the problem(s).

• **Evaluation:** Benchmarking is a continuous and ongoing process in a well-run veterinary practice (or business of any type). After a predetermined amount of time, the benchmarking process should be repeated to determine if the action plan, as implemented, accomplishes the desired changes within the practice. The cycle repeats itself again and again.

PERFORMING A BENCHMARK ANALYSIS

• The first step in the benchmarking process is to identify clearly the process or issue you wish to analyze.

• The second step is to gather as much specific data as possible. Mixing the types of data collected (such as historical and industry norms) is always a prudent course of action.

• In addition to the specific data, it is important to take into account related data, as it may also influence your analysis. Some of this information is obvious, such as the type of your practice, the size of your practice, and whether you are in an urban, suburban, or rural location. Other information may be less obvious to the beginner, such as where your practice is on the business life cycle. A startup practice has different characteristics than a growing, plateau, or declining practice.

• A flowchart that represents the process under evaluation helps speed up the interpretation of data by quickly identifying additional, related benchmarks that may also need to be evaluated.

• Once you have completed your analysis, you have two possible outcomes: a favorable result or an unfavorable result. If the results are favorable, share the good news with the practice team. If the results are unfavorable, you will need to develop an action plan that you believe will correct the root cause of the problem and prospectively place the practice into a favorable zone.

• All action plans should be time limited. A deadline often works as a motivator as well as a schedule by which to initiate a new benchmarking analysis to determine if your action plan has accomplished its purpose.

• The cycle then repeats itself on an ongoing basis as part of the backbone of a continuous quality improvement cycle.

EXAMPLES

In this example, we will explore how benchmarking procedures can be applied to answering one of the most frequent questions in veterinary medicine. Is our practice productive? Obviously, this is an expansive inquiry, but it is useful in illustrating some basic concepts.

One approach may be to look at historical data and industry data for practices of similar size and scope. If unable to locate a sufficient number of similarly situated practices, you may instead choose to focus on the productivity of individual doctor(s) in your practice. For example, if you feel that the productivity of each individual doctor is low, you may wish to compare the productivity of each of your full-time doctors against those of a similarly situated competitor. In

other words, document the number of hours each doctor works per week. Do the same for other practices and compare the data on a per-doctor basis. Keep in mind that the definition of a "full-time" doctor can be quite varied depending on the source (see 7.9 – Making Valid Comparisons Between Practices and Services).

If your doctor works a similar number of hours, you may wish to look at how well your doctor is leveraged. What does the available data say about the number of support staff per doctor?

If you are happy with the level of staff support your doctor has, you may wish to look in a different direction. Practice revenue comes from the number of transactions times the value of the average transaction. You may wish to evaluate each of these components on an individual doctor basis. How does the number of transactions completed by your doctors each year compare to industry norms? If it is low, you may need to develop an action plan that gets more client transactions through the door, such as increasing the appointment fill rate and/or reminder return rate. If your number is comparable to an industry norm, the amount of your average transaction may be low. If the number of transactions is high, then their average transaction is probably significantly lower and further benchmarks should be analyzed to evaluate why.

If the average transaction value is low, it could be the result of low fees, missed charges, poor treatment recommendation compliance rates, or any combination of previously mentioned factors. Thus, additional benchmarks and audits would need to be conducted to get to the root cause of the problem.

This example illustrates how important it is to flowchart an entire process (in this example, how a doctor creates revenue) and continually analyze benchmarks that represent a standard or norm that evaluates or measures the influence of a specific component on the flowchart.

CAUTIONS

- Always test your conclusions on others within the practice to make sure they seem plausible and that there are not other indicators you should be exploring to identify a more accurate conclusion. This technique is often much more efficient and effective than wasting time and resources implementing an action plan that does not address the root cause of the process or outcome you wish to improve.
- Never draw a conclusion from a single benchmark or indicator, because most outcomes are affected by multiple influences. Some managers create dashboards that consolidate all of the necessary benchmarks related to a specific discipline. They may have a human resource, financial, practice productivity, inventory, and client satisfaction dashboard. This well-organized data collection supports early detection of problems within the practice.
- Beware of putting too much faith in industry norms. Many times, the data in these studies come from practices that are managed by individuals with the same (and often fewer) skills and experiences than you have. Meeting an industry norm only indicates that you are "average." If you desire to be above average, you will need to produce results that exceed the norm.
- If you are using industry norms, try to find a subset that relates more closely to your specific situation such as practice type, size, location, scope of services, and position in the business life cycle. This is often referred to as "comparing apples to apples," whereas data that come from dissimilar practices is referred to as "comparing apples to oranges."
- Industry norms can be problematic if the industry is having hard times. For example, many Internet-based businesses produced consistent norms in 2000, only to declare bankruptcy in 2001.
- Historical data eliminate a lot of the variations that are present in industry norms. Business location, size, scope of services, and philosophy are generally pretty standard from year to year because it is the same practice. If you did make a significant change to your practice operations from one year to the next, you are at least familiar with all of the aspects relative to that change, so you can properly account for them in your analysis.

MISCELLANEOUS

Utilize technology as much as possible in gathering, storing, and comparing data. Computer spreadsheets are ideal for this purpose, and many veterinary practice management software products have built-in benchmarking tools.

7.7. DATA YOU SHOULD BE REVIEWING REGULARLY

BASICS

OVERVIEW

It is not possible to manage a practice effectively without reviewing key data on a regular basis to identify what the practice is doing well and where the challenges lie. As the old adage says, "You can't manage what you can't measure."

- Although there is an endless list of items in a veterinary practice that could be measured, most of these are not meaningful and practice owners and managers do not have the time or inclination to review things that do not matter. Therefore, it is essential that a reasonable number of meaningful metrics be identified for regular review.
- Much of the data analyzed will be of a financial nature; other operational information will help explain changes in the financial data or be useful in planning and monitoring future progress.
- The financial data and related metrics give an overall picture of how well the practice is doing. Regular review of this data will help the practice understand its progress financially and operationally.
- After determining what data need to be reviewed regularly, a system should be set up to ensure the data are collected properly each month. The practice's accountant, bookkeeper, practice manager, and any other pertinent people should be involved in the process to be sure everyone understands the system, including the source of all the information used and what the data are really saying.
- The financial and other data that should be regularly reviewed can be grouped into three categories – data that come from the balance sheet, data that come from the income statement, and other operational key performance indicators.

TERMS DEFINED

Balance Sheet: A commonly prepared financial statement that shows a business's financial position at a specific point in time; this statement lists a practice's assets, liabilities, and owners' equity.

Income Statement: Another commonly prepared financial statement that shows a business's performance over a period of time; this statement lists income and expenses during the covered period (also known as a profit and loss statement, or P&L).

Key Performance Indicators: Key metrics (financial and operational) used to measure performance of an organization.

Practice Information Management System (PIMS): The software system used by the practice for client invoicing, medical records, inventory, metric analysis, tracking of accounts receivable, and other revenue-related activities.

Statement of Cash Flow: The third of the commonly prepared financial statements listing the sources of cash in a business (such as revenue from services, proceeds from debt incurred, and collections on client accounts) and uses of cash (such as debt payments or purchases of drug and supply inventory) during a period of time.

ISSUES AND OPTIONS

FINANCIAL DATA — THE BALANCE SHEET

- Most practices do not have an employee with the financial knowledge necessary to prepare an accurate balance sheet, and therefore they rely on their accountant to prepare this statement. Some practices receive financial statements from their accountant monthly; others get them on a quarterly or annual basis (see 7.2 – Financial Statements). Some practices may be able to generate some of the balance sheet data from their accounting system even if they do not prepare a full balance sheet.
- Balance sheets are generally more confusing to most small business owners than income statements and are less useful in running the practice on a day-to-day basis. However, very important information is included in the balance sheet concerning the assets and liabilities of the practice, and this should be reviewed at least annually (preferably quarterly) with the practice accountant. Practice owners and managers should understand the items included on the balance sheet, and why these amounts have changed from period to period as well as the practical implications of these items.
- Significant items on the balance sheet (such as levels of cash, accounts receivable, inventory, accounts payable, and other loans) should be reviewed and compared to prior periods. Large or unusual changes should be investigated to determine if there is a problem that needs to be resolved or an opportunity to be further capitalized on.

FINANCIAL DATA — THE INCOME STATEMENT

- The income statement is intuitively easier to understand than the balance sheet. This statement shows the revenues, expenses, and net income of a practice for a given period of time, usually a month or a year. The income statement should be reviewed by the practice manager and owners on a monthly basis. The bottom line (usually called "net income") on financial statements that are not prepared using generally accepted accounting principles generally is not a measure of the true profitability of the business; this must be calculated separately.
- This statement may be prepared on a cash or an accrual basis. Most practices prepare income statements in-house on a cash basis, and the accountant prepares the income statement on either a cash or an accrual basis at the end of the year.
- Accrual basis financial statements are more accurate than cash basis ones in matching revenue and expenses to the activity that caused these items to be incurred; however, regular monthly review of cash basis financial statements is still very useful in managing the practice.
- The AAHA/VMG Chart of Accounts[1] is a list of the most useful and most commonly used accounts for recording financial transactions. Using this chart of accounts will ensure that a practice gets meaningful information from its income statement and that the accounts will be reasonably comparable to outside benchmarks.
- The financial statements are most useful if they can be reviewed on a comparative basis. Instead of looking at only one month, look at the current month in comparison to prior months to locate changes and trends in significant items.
- Some accounting packages are limited in the comparative reports they can generate. For example, it may be possible to print a report that compares this month's activity to last month's, but not to each of the past six months. Therefore, it is often useful to put this data into a spreadsheet program each month to get the best results from the analysis.
- Each income and expense item should be shown as a dollar amount and as a percentage of gross revenue. Some expenses (such as drugs and medical supply costs) fluctuate with gross revenue, and changes in these need to be analyzed in conjunction with the changes in revenue. For example, if the practice revenue is growing, it would be expected that drug costs would also grow. However, looking just at the dollar amount of the drug costs may not reveal that the costs have grown at a much faster rate than revenue, indicating a potential inventory-control problem. Reviewing the expense as a percentage of gross revenue, as well as a dollar amount, will improve the analysis.
- When first reviewing the income statement, it is important to understand what each account means and what kinds of transactions go into that account. For example, what kinds of things are recorded in "Drugs and Medical Supplies"? In some practices, everything related to medical care, including dietary products, goes into this account; in others, there are several accounts such as "Dietary Product Costs," "Laboratory Costs," and "Pharmacy Costs."

7.7. DATA YOU SHOULD BE REVIEWING REGULARLY

• There is often a single line item for practice revenue on an income statement, whereas expenses are broken out into multiple categories. Because increasing revenue will generally have more impact in increasing profits than reducing expenses (assuming expenses are within reasonable limits), it is important to review income by category in order to best understand the changes. This information is easily obtainable from the practice's PIMS and will be discussed further in the Key Performance Indicators section.

KEY PERFORMANCE INDICATORS (KPIS)

• KPIs in a veterinary practice are financial and operational metrics that are used to measure performance within a practice, expand upon the information seen in the financial statements, explain changes seen from one period to another, and compare a practice to other practices. They should be reviewed on a monthly basis.
• Many KPIs offer more detail about the revenue generated by the practice; for example, is an increase in revenue due to an increase in the number of clients seen or an increase in the average amount each client spends at the practice? Other KPIs are used to measure client activity, the collectability of accounts receivable, and doctor performance.
• KPI information is readily available from the PIMS but usually needs to be input into a spreadsheet program to be most useful. This data input should not take more than an hour or so each month.
• Each month's totals should be compared to the prior month and the same month in the prior year in order to understand the trends within the practice. For example, is revenue increasing at a steady pace each month? If there is a decline, is this something normally seen at this time of year? Remember that the number of days the practice is open for business may vary each month and will impact this analysis.
• Common KPIs that should be reviewed monthly include:
  ◦ Total practice revenue
  ◦ Total practice transactions
  ◦ Average transaction charge (ATC) for the practice
  ◦ New clients
  ◦ Lost clients
  ◦ Revenue, transactions, and ATC per individual doctor
  ◦ Revenue by category (immunization, laboratory, etc.)
  ◦ Accounts receivable by aging category.
• Other KPIs can be very useful to individual practices depending on where their attention is focused. For example, a practice that wants to increase the number of dentals done will track this statistic each month, both for the practice as a whole and by doctor.
• A chart such as Table 7-7-1 will help a practice easily review the information discussed as well as show how these figures stack up on a per-full-time-equivalent doctor basis. Because practices are of different sizes, calculating this information on a per-doctor basis will let a practice compare their operations to others. Comparative data are readily available in several veterinary publications. One chart would be prepared for each KPI (see Table 7-7-1).
• As with balance sheet and income statement information, large or unusual changes should be investigated to determine if there is a problem that needs to be resolved or an opportunity to be further capitalized on.

EXAMPLES

N/A

Table 7-7-1. Key performance indicator template.

Total revenue	*2018*	*2019*	*$ change*	*% change*
January	$ 91,526	$ 93,211	$1,685	1.84%
February	$ 84,297	$ 82,915	($1,382)	−1,64%
March	$ 109,944	$ 115,238	$5,294	4.82%
April	$ 109,128	$ 116,734	$7,606	6.97%
May	$ 119,410	$ 120,233	$ 823	0.69%
June	$ 129,031	$ 134,000	$4,969	3.85%
July	$ 113,915	$ 118,579	$4,664	4.09%
August	$ 114,413	$ 115,989	$1,576	1.38%
September	$ 94,371	$ 97,065	$2,694	2.85%
October	$ 99,724	$ 98,234	($1,490)	−1.49%
November	$ 95,567	$ 95,123	($ 444)	−0.46%
December	$ 86,968	$ 88,354	$1,386	1.59%
Total	$1,248,294	$1,275,675		
# of FTE doctors	3	3		
Revenue per doctor	$ 416,098	$ 425,225		

CAUTIONS

• All practices are different, and comparison to outside data must be done carefully. Differences between your practice and the outside benchmarks can indicate an area that should be investigated, but they do not necessarily mean there is a problem in your practice.
• Tracking changes is not enough. Significant changes must be investigated in order to understand why they occurred and if corrective action is necessary.

7.8. KEY PERFORMANCE INDICATORS

BASICS

OVERVIEW

Key performance indicators (KPIs) are quantifiable measurements used by businesses of every size to evaluate progress toward attaining their objectives. Veterinary hospital owners and managers can use KPIs along with other metrics to gauge the effectiveness of changes implemented to improve anything from overall profitability to compliance to client satisfaction.

There are literally thousands of KPIs that could be implemented by a veterinary practice and measuring them all would be a full-time job. The challenge is to limit KPIs to those things that are truly "key." It takes time to compile information from KPIs and to research any changes. Limiting the number of KPIs in place will not only save time but will help owners and managers focus on the most important aspects of the business.

TERMS DEFINED

Full-Time Equivalent (FTE): The equivalent of a full-time employee or one working 40 hours per week. For example, a practice with two veterinary nurses working 35 hours per week plus one working 50 hours per week would equal three FTE nurses calculated as $(35 + 35 + 50)/40 = 3$ FTE.

Gross Revenue: The total dollar amount taken in by a business before expenses are subtracted.

Key Performance Indicator (KPI): A quantifiable measurement used to evaluate the performance of a department or organization compared to its goals.

ISSUES AND OPTIONS

KPIs are intrinsically linked to a company's strategic goals (see 14.5 – Strategic Planning and Implementation). Even though there are thousands of KPIs to choose from, selecting the right KPIs for your practice is relatively simple. The most important KPIs to monitor are aligned with your strategic objectives and the hospital's core values. Therefore, goal setting is the first step in identifying the best KPIs. For example, if the hospital has a goal to increase revenue by 10% this year, the KPIs should reflect progress toward that goal. Examples of related KPIs include revenue per doctor, revenue per staff member, sales of annual health maintenance plans, forward booking of appointments and boosting compliance. A common mistake is to measure everything in the hopes that something will be important. A better strategy is to limit KPIs to no more than 15–20. Monitoring too many numbers leads to confusion and dilution of effort. Do not select a specific KPI simply because it was a hot topic at the latest conference or in a recent management article. If it does not relate directly to your hospital's goals, it is not a KPI for your business.

Often there is synergy among goals, and a single KPI may track progress toward multiple hospital goals. A common goal for veterinary hospitals is increasing the rate of compliance because higher levels of compliance should result in healthier pets (see 4.11 – Compliance and Adherence). Of course, increased compliance rates also result in increased income for the practice, thus providing a win–win for the business.

USING BENCHMARKS WITH KPIS

It is important to understand the meaning of the word "benchmark." Merriam-Webster defines benchmarks in several ways (www.merriam-webster.com), first as "a standard of excellence or a standard by which others can be measured." An alternative definition is "a point of reference from which measurements are made." When applying the term to the veterinary industry's published benchmarks, it simply means "the average from a set of data." This is an important distinction. When evaluating industry benchmarks, understand that these are not recommendations for where your numbers should be, but averages of the practices included in the survey (see 7.6 – Benchmarking).

The two best-known sources of benchmarks for companion animal practices are the American Animal Hospital Association (AAHA) and the Well-Managed Practice® Benchmarks (WMPB) Study.[1,2] KPIs can be used in conjunction with benchmarks to improve performance. Use benchmarks as reference points and use KPIs to evaluate progress toward goals. For example, if the goal is to increase practice profitability, one KPI to monitor is the change in profitability. Some of the benchmarks that relate to profitability are doctor and staff wages as a percent of gross income, production by doctor, and the percent of total income provided by professional services compared to the percent derived from product sales (see 7.7 – Data You Should be Reviewing Regularly).

Remember that the benchmarks are only as good as the data on which they are based. Regarding AAHA's *Financial and Productivity Pulsepoints*, those data were subjected to rigorous statistical testing to ensure the results were accurate. WMPB goes to great lengths to ensure the numbers in their study are reported consistently. Not all benchmarks are so thoroughly vetted.

Regardless of which benchmark or survey you use for comparison, that benchmark represents an average of the practices surveyed. That average may or may not represent your practice. For example, AAHA's benchmark for prescription food revenue as a percent of total revenue is 3.4–3.6%[1] and the WMPB for food revenue is 3.9%.[2] For practices that sell considerably more food than average, is it appropriate to intentionally sell less food simply to fit within these ranges? Only if the hospital owner makes a conscious decision to do so to free up space or other resources for a different purpose. No benchmark or KPI should replace strategic planning.

There is no such thing as an "average" hospital. Some of your hospital's numbers will be similar to national averages and others may be very different. It is important to understand what each KPI measures and whether the national benchmarks apply to your hospital. Gain a thorough understanding of how the study defines each measure and consider whether your practice is similar enough to use the data as published. Define the benchmark using the same criteria the publication uses. For example, if "employee benefits" on the hospital's profit and loss statement includes only health insurance and retirement contributions, that number cannot be directly compared to the AAHA average because AAHA includes life and disability insurance, uniforms, dues and continuing education in "employee benefits." If you find yourself wondering why the benefits you offer do not compare favorably, verify that you are making an "apples to apples" comparison. At the same time, do not excuse poor performance by insisting the data are not comparable.

Be cautious when applying a benchmark, and understand that the best performance is not always above or below the benchmark. Consider a benchmark related to staff salary and wages. The industry

benchmarks for this expense as a percent of gross fees are 19.1–20.4%[1] (AAHA) and 22.5%[2] (WMPB). If the hospital's total salaries and wages are higher than 22.5%, it could mean that:
- wages are high compared to the market,
- the schedule is too heavy or includes too many hours of overtime,
- there are too many staff members on the payroll,
- gross fees are too low for the number of staff members.

In contrast, if wages are below 19.1%, it may mean that:
- the practice uses staff very effectively,
- doctors are doing procedures that technicians should do,
- client service levels may be suffering,
- the owner is working too many hours doing things a staff person could do.

You can see that operating below a particular benchmark is not always a positive indicator. This underscores the importance of understanding the factors that influence salaries and wages. If total staff compensation is lower now than it was at the same point last year, did you reduce staff size or cut hours? Have you hired new positions at lower rates than you were paying before? Are the same number of payroll runs included? Perhaps a mistake was made when recording payroll one month. There are many reasons why the numbers may be higher or lower. The most important question to ask when reviewing your practice's performance is, "does this make sense?" Make sure you understand the underlying cause before you take remedial action.

Because every practice is different and none conforms exactly to the industry benchmarks, there are times when it is best to use internal benchmarks and compare your practice to its own performance over time. Unless you have made changes to internal accounting procedures, such a comparison will provide you with accurate, "apples to apples" comparisons.

EXAMPLES

PRODUCTIVITY KPIs

Productivity measures the hospital's income compared to the number of doctors and staff in the practice. Productivity KPIs can support goals such as increasing revenue, bringing a new doctor up to full capacity, determining whether to enlarge the facility or identifying the number of staff hours to include in the schedule. Examples of KPIs include:

- **Revenue per FTE veterinarian:** This is calculated by dividing the hospital's gross revenue by the number of FTE veterinarians, including relief doctors. In addition to regular fee increases, revenue per FTE doctor can be increased by offering all appropriate services, following up on recommendations, increasing compliance levels, capturing all charges, minimizing discounts, ensuring clients understand the recommendations made and why they are appropriate for the pet, and following up on cancelled appointments and "no shows." This is a good example of a KPI that requires concerted effort from multiple team members.
- **Revenue per FTE staff member:** This is calculated by dividing the hospital's gross revenue by the number of FTE nonveterinarian employees. This KPI may be part of goals to increase revenue, improve efficiencies, reduce overtime hours, and increase profitability, a KPI in its own right. The methods to use to increase revenue per staff member are consistent with those for increasing revenue per FTE doctor. However, this KPI comes with a caveat. Understand that the ideal revenue per employee is neither too high nor too low. Often, practices with low revenue per FTE employee will defend their position by saying that their practice focuses on client service more than the average practice, and more employees are needed to provide that higher level of service. Consider, however, that businesses that provide excellent customer service can charge more than a practice that provides lower levels of client service. At the opposite end of the spectrum, if revenue per FTE staff member is much higher than the benchmark, it may indicate that there are not enough staff hours or not enough people on the schedule to handle the caseload. This situation may lead to stress and potential burnout, as well as lower levels of client satisfaction.
- **Revenue per open hour:** This is calculated by dividing gross revenue by the number of hours open. This KPI measures how well the facility is utilized as well as its ability to meet the demand for services. This KPI relates to goals for increasing revenue as well as strategic goals for expanding hours of operation.
- **Revenue per square foot:** This is calculated by dividing gross revenue by the square footage of the facility. This KPI provides information regarding how efficiently the facility is used as well as whether it is time to consider an expansion or a move to a larger facility. Revenue per square foot will be very different for a practice that does a large amount of boarding than for a practice that does little to no boarding.

INCOME-TO-EXPENSE RATIO KPIS

- **Laboratory income compared to laboratory expense:** The ratio of laboratory income to the corresponding expense can be used to determine if pricing is appropriate, whether missed charges are being identified, and whether income is keeping pace with inflation. To make this measurement even more useful, track the ratio of in-house lab income to in-house lab expense separately from ratio of reference lab income to reference lab expense. Although many practices have integrated laboratory equipment, meaning every test ordered appears on a client invoice, a percentage of tests are not charged, frequently because a doctor or staff member chooses to discount the test in part or in full. Tracking these ratios over time will help to identify areas where the practice may be losing money.
- **Prescription food income-to-expense ratio:** With the competition for food sales, most veterinary practices have a very low margin on food, meaning the markup is small. As decisions are made to reduce the number of brands and varieties stocked, this income-to-expense ratio should stay the same or increase. This KPI relates to cash flow, profitability, as well as client satisfaction.

FINANCIAL

- **Quick ratio:** "Quick" assets can be converted to cash within 90 days and the quick ratio measures how easily the business can meet short-term liabilities. This ratio, defined as quick assets divided by current liabilities, is often used as a KPI related to the practice's financial stability and growth.
- **Costs of professional services (COPS):** These are the costs associated with providing veterinary medicine to your patients. This is a huge category of expenses that includes pharmacy, laboratory, imaging, anesthesia, surgical supplies, and diet and over-the-counter products. COPS represents a huge investment of money, and closely managing this area can improve profitability, cash flow, and return to owners.
- **Inventory turnover:** This ratio calculates how quickly the practice sells the inventory on its shelves or how often it "turns" or replaces

7.8. KEY PERFORMANCE INDICATORS

inventory on hand. Tracking inventory turnover as a KPI would relate to goals for reducing COPS or increasing cash flow. Although having a higher number of turnovers indicates that the practice is keeping a minimum amount of product in stock, if the number of turns is too high it could indicate that an excessive amount of staff time is required to place frequent orders, or that inventory levels are inadequate for the level of business the practice generates.

- **Profitability:** Of all the financial KPIs, profitability is the most important for overall practice success as well as sustaining the value of the business to a buyer. Profitability represents the money remaining after all normal business expenses are paid, including fair market rent and owners' compensation equal to what a non-owner would be paid. Profitability KPIs support goals related to cash flow, financial stability, return to owners, practice value, and owner exit planning.

There are many other KPIs related to the financial aspects of running a business. However, relying strictly on financial KPIs takes attention away from a large portion of practice activity. KPIs from several different areas should be tracked to give a broad view of the practice. Other critical areas where KPIs are often implemented relate to compliance levels, client engagement, marketing, and human resources. Examples of relevant KPIs for veterinary practices include the following:

- Compliance
  - Number of fecal tests per number of wellness exams
  - Number of senior panels per number of senior wellness exams
  - Number of pre-anesthetic laboratory tests per number of surgeries/dentistries
  - Percent of dogs on heartworm preventive
- Client engagement levels
  - Client satisfaction scores
  - Client retention rates
  - Frequency of visits
- Marketing
  - Lifetime value of a client
  - Social media traffic, "likes" and "followers"
  - Brand awareness
- Human resources
  - Time to fill positions
  - Engagement level
  - Ethnic and age diversity
  - Absenteeism
  - Employee satisfaction.

UTILIZING KPIs IN A VETERINARY HOSPITAL

Just as it is important to review financial statements regularly, KPIs should be monitored and discussed throughout the year. Based on their relationship to the hospital's goals, some KPIs should be reviewed weekly or monthly, while those that do not change dramatically from one month to the next may be reviewed quarterly or annually. Profitability, a critical KPI for every hospital, fluctuates throughout the year due to the seasonality of most veterinary practices. Reviewing profitability more than once a year, and acting on those results, could lead to incorrect strategic assumptions.

Like most practice goals, KPIs require staff participation to be successful. KPIs should be clearly defined and easily communicated. Discuss KPIs at staff meetings and explain how each KPI will help the practice track progress toward its goals. Help each person see a direct line between his or her role in the practice and achieving each goal. When employees understand the goals and why they are meaningful, as well as the impact each person has on those goals, the likelihood of achieving those goals is greatly increased (see 2.1 – Workplace Management). Employees want to know that they play a vital role in practice success.

Just as practice goals change over time, KPIs must change along with them. Some KPIs will be relevant for many years, while others will reflect shorter term priorities. Even so, it is best to continue to monitor indicators that are no longer "key" to your goals, to ensure that the practice continues to meet the new standard. For example, if the practice achieved its goal of 80% compliance with fecal exams, instead of dropping that factor completely, review it on a less frequent basis, such as quarterly or semi-annually. Given the many competing priorities in a veterinary hospital, it is easy for compliance levels to drop off when compliance is no longer a key objective. Continual monitoring will help the practice maintain high levels of compliance even after other priorities are in place.

KPIs are important tools to help you monitor the success of the actions you take to achieve your goals. But KPIs have two serious limitations. First, KPIs report what changed, not why the change occurred. It is up to hospital owners and managers to interpret the numbers and identify what changed and why. Regular review allows you to monitor changes and switch course, if necessary, but you must invest the time to understand what caused the change to occur.

The second limitation of KPIs is that they do not measure every factor critical to business success. This is because some key indicators are difficult to measure, let alone quantify. Practice culture, for example, is difficult to measure but is critical to achieving business goals, such as providing high levels of patient care, staff retention and maintaining a positive work environment. Ignoring practice culture while focusing on financial goals may result in a pervasive attitude of being "in it for the money." According to the authors of "Understanding the Importance of Organizational Culture in Veterinary Practices," the more the practice grows, the more difficult it can be to establish and maintain a positive culture.[3]

At their best, KPIs help managers and staff members focus on those factors that influence performance. At their worst, KPIs take too much time to track and take attention and effort away from other important activities. Tracking every possible data point distracts what is truly important and may create confusion among staff and doctors. Nothing is important if everything is important.

CAUTIONS

- Do not collect data simply to collect data. Measuring KPIs takes time, and there are many other demands on practice owners' and managers' time. Measuring 50 KPIs instead of 10 does not result in 5 times the level of improvement. In fact, the time spent tracking so many figures may leave little time to fully investigate the source of changes. There is an article on LinkedIn called "The 75 KPI Every Manager Needs to Know." If veterinary managers could sit in an office all day and do nothing but monitor numbers, it is conceivable that 75 KPIs could be monitored. Given the constant demands on a manager's time, most of which are more time-sensitive than tracking KPIs, a much smaller number of KPIs should be selected.
- Explore why the numbers are changing – or not changing – before taking remedial action.

7.9. MAKING VALID COMPARISONS BETWEEN PRACTICES AND SERVICES

BASICS

OVERVIEW

There is a high degree of variability between veterinary practices, even though many of these practices offer similar products and services. Whereas the old standard for comparison between practices was often gross revenue, this does not adequately reflect differences in staffing and services rendered and is a poor barometer of practice efficiency.

TERMS DEFINED

Chart of Accounts: Systematic listing of all account names and numbers used by an organization.

Full-Time Equivalence (FTE): Method of comparing staff based on a 40-hour workweek. A staff member who works 40 hours in a week is considered a full-time equivalent employee.

Veterinary Time Equivalent (VTE): Method of assigning labor expenses on the basis of veterinary staffing expense. This allows a practice to calculate approximate labor expenses for procedures using veterinary expense as a standard.

ISSUES AND OPTIONS

STANDARDIZED REPORTING

• If veterinary practices are to be reasonably compared to one another, then the first hurdle is to arrange for all practices to use the same categories and criteria by which they report.

• A chart of accounts uses a standardized naming and numbering system by which transactions can be grouped. In ideal circumstances, with all veterinarians in similar types of practice using the same system, this would allow for the categorization of income, expense, asset, and liability information according to a single industry standard. This standard does not exist, although the American Animal Hospital Association (AAHA) does publish a recommended chart of accounts for companion animal practices (https://www.aaha.org/professional/resources/chart_of_accounts.aspx).

• Most accounting and practice management software comes with an existing chart of accounts that can be modified. If the practice hopes to compare itself with industry benchmarks, then it will be important to modify the chart of accounts from the outset.

BENCHMARKING

• Covered in more detail elsewhere in this book (see 7.6 – Benchmarking), benchmarking is becoming more and more popular in veterinary medicine, as more practices start to embrace more standardized methods of reporting. There now are several excellent resources for benchmarking income and expense elements, veterinary fees, and compensation and benefits, which can be found in the Recommended Reading section.

PROFIT CENTERS

• Although it is certainly possible to lump all revenues together, as well as all expenses, there are benefits to breaking down hospital services into profit centers – self-contained elements of the practice that have their own revenues and expenses (see 9.5 – Profit Centers).

• Profit center assessment is critical in veterinary practice, because veterinarians often use one portion of a practice to subsidize another. For example, the cost of delivering radiography is not necessarily borne only by those clients needing radiography services. Those costs are often spread across other hospital operations, such as office visits and pharmacy, concealing whether radiography is actually generating a profit or costing the practice money.

• Some common profit centers in veterinary practice are pharmacy, outpatient visits, laboratory, surgery, dentistry, hospitalization, vaccination, and others. Depending upon how informative the assessment is to be, the profit centers might be broken down into their component elements, such as pharmacy being attributed to prescription items dispensed or administered, nonprescription items sold (including parasite-control products), and diet sales (prescription and nonprescription).

• Tracking revenues and expenses related to profit centers is relatively simple in a computerized practice, because once the centers have been established in the software's chart of accounts and assigned appropriate codes, the process is automatic.

STAFFING ELEMENTS

• It is generally accepted that practices are most profitable if veterinarians do what they are best trained to do (practice veterinary medicine), and paraprofessional staff handle most other medically oriented tasks in the practice. In the very oldest models of the profession, the veterinarian may have literally been a "one-person" taskforce, doing all of the associated labor and often the billing as well. That was very limiting, because the veterinarian could not deal with more than one patient at a time, and thus could only be compensated by one client at a time for services rendered.

• In most small animal practices, there are four or five nonveterinary staff members to every full-time equivalent (FTE) veterinarian. This allows staffing to perform duties for which the veterinarian is not directly required, such as the duties performed by receptionists, technicians/nurses, assistants, kennel attendants, and managers. There are still some practices where this ratio is close to 1:1, whereas with others the ratio might be 15:1 or even more. Both of these kinds of practices can be profitable. Veterinarians who like to do all of their own patient work save money on practice staff, which often consumes 25% of practice revenue. Veterinarians who delegate more responsibility often generate higher gross revenues, but have increased staffing expenses.

• Whenever comparing practices, it is important to understand these differences so that valid comparisons can be made. One basic way of doing this is to compare services between practices, correcting for the number of FTE veterinarians. For the purposes of standardization, an FTE veterinarian is expected to work a 40-hour workweek, even if the typical veterinarian works much more than that.

• Comparing practices based on full-time veterinary equivalency is useful, but it does not provide a lot of information on staff efficiency. One way to compare staffing among practices is to assess the number of staff hours needed to generate a single invoice. This can be accomplished by measuring the total nonveterinary staff hours in a given period and dividing that by the number of transactions in the same period. In most veterinary practices, a good goal is to keep this ratio (total staff hours/total transactions) at two or less. Some very efficient practices can function at a ratio of 1.75 to 1.85 to 1. Another method of comparing staff productivity is to measure income per nonveterinarian employee, by dividing a practice's total income by the number of FTE nonveterinarian employees and comparing that with industry benchmarks (such as the AAHA's *Financial and Productivity Pulsepoints*[1]).

• Another way to assess the impact of staff on income and expenses is to use veterinary time equivalents (VTE) for all medical aspects of the practice that involve veterinarians, technicians/nurses, or assistants. This is a useful method of spreading overhead and labor expenses across all the professional and paraprofessional time available in a practice, and within specific profit centers. This is important, because (for example), veterinary practices are expensive operations to manage, and most of the expenses are not things that can be directly allocated to clients (e.g., staff wages, utilities, telephone expense, etc.). VTEs are a way of correcting for this.

7.9. Making Valid Comparisons Between Practices and Services

• For example, within the medical arena of a veterinary practice, the only medical duties that get billed to clients do so because of the efforts of veterinarians, technicians/nurses, and assistants (not receptionists or office managers who can support those efforts, but not directly deliver them). Therefore, if we can determine the hours these medical staff members work, and their rate of pay compared to that of a veterinarian, we should be able to spread the cost of overhead on a per-minute basis across all of these professionals and paraprofessionals on a compensation-adjusted basis. Another option is to spread the charges over all transactions to get an overhead rate per transaction, but this does not fairly allocate expenses based on how much staff time is required.

CALCULATIONS

ABC Veterinary Hospital wants to calculate an overhead rate per minute for the hospital and a labor rate per minute for its employed (associate) veterinarians, technicians/nurses, and assistants. For comparison purposes, the practice pays its technicians roughly one-third of a veterinary salary and its assistants receive (on average) one-quarter of a veterinary salary. The average veterinary rate of pay is considered one VTE. The total overhead expenses for a period is $12,000, not including veterinary or paraprofessional salaries or supplies. During the period, there were 200 hours of veterinary time available (200 VTE hours), 450 hours of technician time (150 VTE hours), and 200 hours of assistant time (50 VTE hours), comprising a total of 400 total VTE hours of medical availability. The practice's management consultant has determined that only 50% of practice time is billable to clients, so it must spread the overhead over half of the time availability, or 200 VTE hours.

$$\begin{aligned}\text{Overhead rate} &= \text{Overhead/VTE availability}\\ &= \$12,000/200 = \$60/\text{hour or } \$1/\text{minute}\end{aligned}$$

Therefore, for procedures performed at this clinic by veterinary or paraprofessional staff, an overhead rate of $1 per minute should apply. (Applications of this principle are covered in more detail in 7.12 – Pricing Strategies.)

The management consultant has determined that for associates to receive their current compensation (based on production), they must be billed out at $4.20 per minute. How much should the practice calculate the labor portion of the cost of placing a catheter in a dog, if it takes one technician and one assistant six minutes, on average, to perform the task? Not counting overhead, materials, or profit, the labor cost should be approximately the following:

$$\begin{aligned}\text{Labor cost} &= \tfrac{1}{3}\ \text{VTE} * \$4.20/\text{min} * 6\ \text{minutes}\\ &\quad + \tfrac{1}{4}\ \text{VTE} * \$4.20/\text{min} * 6\ \text{minutes}\\ &= \$8.40 + \$6.30 = \$14.70.\end{aligned}$$

Therefore, the labor portion of the charge should be $14.70 for the six-minute task. (Applications of this principle are covered in more detail in Section 7.12 – Pricing Strategies.)

EXAMPLES

Practice A has medical service income of $825,000 with two veterinarians on staff, whereas Practice B has medical service income of $960,000 with four veterinarians. Which practice is more productive? One way to compare the revenues is based on the veterinary hours worked. In Practice A, Dr. Smith works 60 hours a week and Dr. Jones works 50 hours a week. Therefore, Practice A has doctors working 110 hours a week, which converts to 2.75 FTE veterinarians (i.e., 110/40). In Practice B, the veterinarians each work 30-hour workweeks, averaging 120 hours a week in total, or 3 FTE veterinary positions (i.e., 120/40). Therefore, Practice A generates $300,000 per FTE veterinarian ($825,000/2.75), while Practice B generates $320,000 per FTE veterinarian ($960,000/3).

CAUTIONS

• These are only some of the techniques used to help make valid comparisons between practices. A variety of other models can also be used, including calculating various measures of profit (such as earnings before interest, taxes, depreciation, and amortization, EBITDA), which can help compare veterinary practices across other industries.
• It is important to realize that whenever generalizations are made about what constitutes business success, by studying existing companies (such as with benchmarking studies), the results are likely to be plagued by selection bias – that is, relying on samples that are not representative. Surprisingly, one of the best ways of overcoming such bias is to examine both thriving and floundering companies and trying to identify the qualities that separate the successes from the failures.

MISCELLANEOUS

To effectively determine how a veterinary practice is doing relative to others in the profession, there needs to be certain measurements that can be used as benchmarks (see 7.6 – Benchmarking). Newer tools, especially on-site resources and surveys performed by various veterinary organizations, are producing results that make this an achievable reality.

7.10. COMPENSATING OWNERS IN MULTI-OWNER PRACTICES

BASICS

OVERVIEW

When starting a business with one or more partners, the owners may share everything equally, from responsibility to salary. As the business grows and changes occur in the owners' lives, compensation structures must adapt to meet these evolving needs.

TERMS DEFINED

ProSal: The practice of compensating veterinarians with a base salary and performance bonuses for personal production exceeding a specific threshold. The term is a conflation of "production" and "salary" and provides the security of a salary with the opportunity to earn more.

ISSUES AND OPTIONS

From a theoretical perspective, compensation for veterinary practice owners consists of two pieces: compensation for the work they do in the practice and a share of the practice's profits, usually allocated per ownership percentage. Whether they are veterinarians or managers, hospital owners must understand that their total compensation reflects their personal efforts and overall hospital profitability.

The first piece of ownership compensation is based on the work each owner does in the practice. For veterinarian owners, this piece includes a clinical portion as well as a management portion. For manager owners, only the management portion applies.

COMPENSATION FOR CLINICAL PRODUCTION

Veterinarian owners should be compensated for clinical production in the same manner and rate as the associate doctors in the practice. This compensation may be based on straight production, ProSal, or a salary. A salary should reflect what each owner would make if paid on production. Salary-based pay can lead to resentments in multi-owner practices if there is a mismatch between the salary and the work schedule. With multiple veterinarian owners, some form of production-based pay is ideal because it minimizes disagreements over mismatched schedules and compensation.

COMPENSATION FOR BUSINESS MANAGEMENT

Owner managers should be paid for the responsibilities they have, and the expertise required to address those responsibilities properly. As a rule, total compensation for practice management should not exceed 5% of the hospital's total gross fees. A range of 1–5% of gross fees for management compensation is common, with smaller practices paying a lower percent of gross. Large practices require more management infrastructure for shift managers, facility managers, IT managers, etc. A higher percentage of gross is needed to pay for this additional management expertise, The more money spent on non-owner management, the less compensation is available for owners to take.

PROFIT DISTRIBUTION

Practice owners receive a portion of the business's annual profit in the form of dividend, distributions, or draws. The ability to withdraw profit is one of the greatest rewards of business ownership. The caveat is this: the business must be profitable before this payment can occur. Some owner compensation formulae dictate a percentage of gross fees to allocate to owner distributions. What these formulae ignore is actual practice profitability. The business must first be profitable or there is nothing to allocate to the owners.

It is important to leave sufficient money in the practice to cover normal expenses and have cash available to take advantage of opportunities that may arise throughout the year. Sometimes owners take such large distributions that there is little left to invest in new equipment, doctor and staff education, or facility improvements.

FAIR COMPENSATION

In multi-owner practices, it is important that each owner's compensation is "fair." Understand that "fair" compensation does not mean "equal" compensation. If two veterinarian owners invest the same amount of money to start a practice, work the same number of shifts, produce the same amount of income, and divide management responsibilities between them, having identical compensation and benefits may be fair. Unfortunately, the facts are rarely this clear.

An owner may need to work a reduced schedule temporarily or permanently. Another may wish to take an extensive vacation. Because there is no way to predict what the future holds, use a flexible owner compensation formula and make it part of the owners' agreement. Decide in advance under what circumstances changes will be made to the formula, so it is not necessary to make a critical decision during a crisis.

EXAMPLES

The hospital is owned by two veterinarians. Each works four days per week and is paid 20% of veterinary production. Owner A spends one out of four days on management instead of seeing patients, while Owner B spends all four days seeing patients and does the schedule from home on the weekend. Together, they decided that total owner management compensation will equal 2% of gross fees, and that each will have an equal portion of management responsibility. The tacit agreement is that each spends approximately 12 hours per week on management responsibilities.

Example 1	*Owner A*	*Owner B*
Gross fees = $1,500,000		
Clinical production	$400,000	$480,000
Clinical compensation @ 20%	$ 80,000	$ 96,000
Management compensation @ 2% of fees = $30,000	$ 15,000	$ 15,000
Total	$ 95,000	$111,000

Comparing compensation, each is paid appropriately for their clinical production. Owner B will make more veterinary compensation because she sees more cases. Management compensation is equal, based on their agreement.

The following year, Owner A wants to increase time spent on management duties such that half of her time in the practice is spent on management and her time as a veterinarian is reduced to two days per week. What is the impact on owner compensation?

Example 2	*Owner A*	*Owner B*
Gross fees = $1,500,000		
Clinical production	$320,000	$480,000
Clinical compensation @ 20%	$ 64,000	$ 96,000
Management compensation @ 2% of fees = $30,000	$ 15,000	$ 15,000
Total	$ 79,000	$111,000

In this situation, Owner A's production is lower which results in lower clinical compensation. The $80,000 reduction in personal production, which resulted from working one fewer day as a

7.10. Compensating Owners in Multi-Owner Practices

veterinarian, must be generated by another doctor in the practice to maintain the same level of gross fees. Because all doctors are paid the same rate of production, total veterinary compensation remains the same, but compensation to Owner A is lower.

Now consider management compensation. In this example, the allocation of management compensation remains the same; but should it? Would it be "fair" to reallocate the pool such that Owner A receives 2/3 of the pool ($20,000) and Owner B receives 1/3 ($10,000)? Should Owner B accept less management compensation simply because Owner A wants to do more management? Would Owner A relieve Owner B of some or all management responsibility?

This simple situation underscores the need for a clearly defined owner compensation strategy. Seemingly minor changes in responsibilities, combined with the sensitive nature of compensation discussions, can create tension between practice owners. The more hypothetical situations can be discussed and decisions regarding compensation made in the early conversations and incorporated into a compensation formula, the fewer difficult conversations may occur in the future.

What considerations should be part of the owner compensation formula? Certainly, the hospital's gross fees and profit level should be captured. There should also be an allowance for principal payments on loans, acquisition of new equipment, leasehold improvements, and a decision on the minimum cash balance to maintain in business bank accounts.

Differences in the costs of benefits should also be part of the equation. If one owner is much younger than the others, health insurance costs will be different. Life insurance premiums will be higher for the older owners, too. Include premiums paid by the practice on behalf of the owners' families, plus other benefits provided for family members such as cell phones, car insurance, or gym memberships.

Sometimes, the owners' spouses work long hours in the practice without compensation. Other times, family members may be on the payroll but rarely set foot in the practice. This arrangement may allow nonworking spouses to contribute to a retirement plan, or may help fund college savings plans for children. When family members are on the hospital payroll, the owners' total compensation formula should include any "excessive" pay to family members above what an unrelated person would earn for a similar position. For example, if kennel attendants are paid $10/hour but an owner's son is paid $25/hour for the same work, the $15/hour difference should be reflected in the calculation of total owner compensation.

Strong business partner relationships make owning a business more manageable, lessening the burdens on and increasing the strength of the management team. Flexible, well-documented compensation agreements allow all parties to understand the impact changes in their personal situations will have on their compensation.

CAUTIONS

- Business owners should work closely with their tax advisors when making decisions related to compensation and profit withdrawals to understand the income tax consequences to the business and to each owner personally.
- Work with an attorney to draft formal agreements among owners that include compensation structures. Include a flexible formula that can accommodate changes in owners' circumstances.

7.11. UNDERSTANDING PRACTICE PROFITABILITY

BASICS

OVERVIEW

Understanding the profitability of a practice is one of the most important concepts necessary to manage a veterinary hospital well. The operating profit is the one single number that indicates how well the practice is doing financially. In addition to the obvious impact on current cash flow, profitability also is a critical determinant of practice value.

Most practice owners do not know what their operating profit is and many practices are not particularly profitable. Calculating the true operating profit of a practice is not a simple task. Large or publicly held businesses are required to use generally accepted accounting principles (GAAP) and the financial reports these businesses get consequently include a measure of operating profit. Small businesses are not required to use GAAP accounting, and the financial reports these practices generally receive do not include a reliable calculation of the operating profit of the business. Taxable income per the tax return is calculated based on tax law and this figure is not the same as operating profit. The first time many owners realize their true profitability is when their appraiser talks to them about it prior to selling the practice.

Fortunately, there are many things a practice team can do to improve the profitability of the practice, once they understand what is causing the problem.

TERMS DEFINED

Net Operating Profit: The dollar amount left over after all normal and necessary operating expenses calculated at fair market value rates are subtracted from the revenue of the practice.

No-LoSM Practice: A term coined by the Veterinary Valuation Council of VetPartners describing a practice with no profit–low profit or no value–low value.

Profit Margin: The dollar amount of profits divided by the gross revenue of the practice and expressed as a percentage.

VetPartners: A US-based professional association for those involved in veterinary practice management (www.vetpartners.org).

W-2: Internal Revenue Service (IRS) form that reports income paid and taxes withheld by an employer for a particular employee during a calendar year.

ISSUES AND OPTIONS

As previously noted, the net operating profit of a practice is the single most important financial metric that must be calculated in order to understand the financial success of a practice. In addition to the obvious impact on current cash flow, profitability also is a critical determinant of practice value. In the United States, practice owners have historically assumed (and with good reason) that when they decided to sell their practices there would be buyers ready to purchase them and willing to pay a good price. In other words, they have assumed there was value in these businesses that could be transferred to someone else. Of course, there have always been a few practices for which this assumption did not hold true. A buyer could not be found or what buyers wanted to pay was not remotely what the seller thought the practice was worth. Fortunately, there were not too many of those practices.

In the last 10–15 years, however, the number of practices with no or little profitability (and no or little value) has been increasing – to the point where the Veterinary Valuation Council of VetPartners (a US-based professional association for those involved in veterinary practice management) coined the term "No-LoSM practice" (no profit–low profit or no value–low value) to describe these practices. More and more practices, when appraised, did not have the profit or value that would normally have been expected and thus fall into this No-LoSM category. In almost all cases, the owners of these practices were totally unaware of the problem.

Some of these practices had traits in common with the practices that have historically had little or no value. They were small practices that had not kept up with changing client demands regarding service, quality of medicine, advanced technology, and improved facilities.

The other practices with no or little value, however, were a surprising group. On the surface, these practices would appear to be doing very well. They were located in very attractive facilities, offered a high quality of medicine and surgical care, had all the latest equipment, a large support staff, offered comparatively high compensation and benefits to their employees and, in the owners' eyes, cash flow was strong.

7.11. UNDERSTANDING PRACTICE PROFITABILITY

Table 7-11-1. Calculating operating profit.

Taxable Income	
+	Depreciation (Note A)
+	Amortization (Note B)
+	Equipment lease payments (Note C)
–	Average amount spend on equipment per year (Note D)
+	Interest on debt (Note E)
+	W-2 compensation paid to practice owners and related payroll taxes (Note F)
–	Fair market value owner compensation for medical and surgical work (Note F) including related payroll taxes
–	Fair market value owner compensation for management work including related payroll taxes (Note G)
+	Rent paid (Note H)
–	Fair market value rent for the land/building that the practice is housed in if the practice owner also owns the facility (Note H)
+	Personal expenses paid by the practice on behalf of the owner (Note I)
–	Estimated value of free services provided to the practice by family members or others (Note J)
+	Compensation paid to family members or others who do not provide an equivalent amount of work for the practice (Note K)
+	One-time, nonrecurring expenses such as clean-up costs related to a massive flood (Note L)
–	Nonrecurring income (Note M)
–	Interest income (Note N)
=	Operating profit

However, practice value is largely based on profits and the very factors that make these practices look attractive on the surface are those that can reduce profitability (see 14.13 – Determining a Practice's Worth).

As noted, calculating the true operating profit of a practice is not a simple task for a small business. Large or publicly held businesses are required to use GAAP and the financial reports these businesses get consequently include a measure of operating profit. Small businesses are not required to use GAAP accounting and the financial reports these practices generally receive do not include a reliable calculation of the operating profit of the business. Taxable income per the tax return is calculated based on tax law, and this figure is not the same as operating profit. This does not mean those reports are improperly prepared; it simply means the reports required by the IRS or US accounting standards for small businesses were not designed to determine profitability. No one report will give a practice all of the financial information it needs to make intelligent operating decisions; unfortunately, the report that seems to be prepared least often is the one that calculates true practice profitability. Because practice owners and managers are not used to getting this kind of information, they generally do not know what the true profitability of their practice is. The first time many owners realize their true profitability is when their appraiser talks to them about it prior to selling the practice.

Because the reports received by a practice do not include true practice profitability, the practice owner or manager needs to either perform this calculation themselves or consult with a veterinary financial advisor about doing it. The taxable income per the tax return is usually the starting point for this calculation. Although the specific adjustments needed to convert taxable income to operating profit will vary in individual practices, the basic concept is the same for all.

The operating profit is the difference between the operating revenues and expenses of a practice. Operating revenue and expenses include only items normally and necessarily seen in the day-to-day operations of a veterinary practice. Revenue items would include fees for professional services and income derived from the sale of drugs, pet food, or other pet products carried by the practice. Expenses would include facility rent, compensation for doctors and staff, and drugs and medical supplies expense. Non-operating items should not be included. Examples include rental income collected by the practice for an apartment located adjacent to the practice facility or personal expenses paid by the practice on behalf of the owner.

All operating revenue and expense items should be stated at fair market value (FMV) rates. Ideally, the reports used for this calculation are prepared on an accrual basis. If they are not, adjustments may be needed for inventory, prepaid expenses, or other items for which there is a significant variation between cash and accrual accounting. An accountant or financial consultant can help determine if this needs to be done.

For ease of comparison with other practices, the operating profit is generally stated as a percentage called the profit margin – this is calculated as operating profit divided by gross revenue.

The basic formula for calculating operating profit is shown in Table 7-11-1. Various adjustments are made to taxable income to arrive at this figure.

The operating profit is divided by the gross revenue of the practice to get the percentage profit margin. In some practices, there may be other adjustments necessary to convert taxable income to operating profit. Remember that the goal is to include all operating practice revenue and expenses in the calculation at fair market value rates. If non-operating revenue or expenses are included in the tax return,

7.11. Understanding Practice Profitability

remove them. If operating revenue or expenses are *not* included in the tax return, then they should be included in the calculation. If any operating revenue or expense item is included but not at fair market value rates, then adjust the figure to fair market value.

The following is a discussion of the adjustments included in Table 7-11-1:

- Note A: Depreciation is a way of allocating one-time expenditures to the various periods in which the practice will benefit from the expenditure. For example, the purchase of an ultrasound machine will benefit a practice for more than one year; therefore, the entire expense should not be recorded in the financial records of the practice in the year of purchase. Instead it should be spread out over the years that the practice will own the equipment. The IRS generally does not use depreciation methods that truly reflect the "use" of the expenditure by the practice over the life of the equipment. Instead they are using the tax law to promote various policy decisions and the depreciation period used in the tax return does not reflect the actual useful life of the equipment. The depreciation amount must be removed from the operating profit calculation and replaced with a better estimate (see Note D).
- Note B: Most items amortized in a practice's tax return (goodwill, startup expenses) are one-time expenditures that should not be included in the operating profit calculation.
- Note C: Equipment lease payments included as expenses in the tax return should be removed in the profitability calculation. A better estimate of the average amount spent on equipment each year will be substituted instead.
- Note D: Depreciation related to equipment purchase is removed from the operating profit calculation because the amounts used in the tax return are not correct for these purposes. Similarly, lease payments are also not included in the profit calculation. However, equipment purchase is an ongoing, important expenditure in a practice and must be included in the operating profit calculation. This is normally done by deducting the estimated average amount spent on equipment per year.
- Note E: The interest portion of any loan payments is not included in the operating profit calculation. This is considered a financing cost, not an operating cost.
- Note F: Owner compensation is one of the most significant adjustments and almost always has to be calculated differently in determining operating profit than would be done for the tax return. Owners often arbitrarily determine an amount they will be paid through their payroll system; this amount often has no correlation to the actual medical, surgical, and management work the owner does in the practice, and therefore, the tax return looks as if the practice is more or less profitable than it really is. Owner compensation for medical and surgical services provided to the practice can be reasonably calculated as a percentage of the personal revenue generated by the practice owner. Twenty percent of owner production is commonly used in a small animal practice. The salary could also be estimated as the amount that would be paid a non-owner veterinarian for similar work. Related payroll taxes should also be adjusted.
- Note G: Owners generally provide management and leadership services to the practice and an estimate of the value of these services must be determined. If the practice owner is the only person providing these services to the practice, a reasonable estimate for owner management compensation would be 3–4% of total practice gross revenues. If the practice has a practice or office manager who is paid to perform some of these services, the owner compensation would be at a lesser rate – perhaps 1.5% of total gross practice revenues. Related payroll taxes should also be adjusted.
- Note H: If the practice owner or a related party does not own the practice facility, no adjustment is necessary to facility rent expense because it is assumed the rate charged for rent is a fair market value. An adjustment may be necessary if the practice owner also owns the practice facility and the rent paid from the practice to the owner is not a fair market value rate. Owners will sometimes charge a rent rate different from fair market value for tax or other reasons. A rent adjustment is also necessary if the facility is owned by the same legal entity that owns the practice and no rent is paid. There is an economic cost to using a facility that must be included in the operating profit calculation.
- Note I: Many small businesses pay for the personal expenses of owners in order to gain a tax deduction. These payments make the practice look less profitable than it really is. These expenses are not necessary to the operation of the practice and should not be included in the operating profit calculation. Examples of these expenses include: excess meals and entertainment expense, excess auto costs, swimming pool payments, personal furniture, trips to Tahiti, airplanes, and so on.
- Note J: Family members or others may provide free business services such as bookkeeping or management services to the practice at no charge. If the practice had to hire someone to do this work, there would be a cost involved and this should be included as an expense in the operating profit calculation.

7.11. UNDERSTANDING PRACTICE PROFITABILITY

• Note K: Family members or others are sometimes paid a salary and benefits from the practice even though they provide no or limited services to the practice. These expenses make the practice look less profitable than it really is and should be removed from the operating profit calculation.
• Note L: Occasionally, a practice will have some kind of very unusual one-time expense that is not representative of normal ongoing operating expenses. These expenses make the practice look less profitable than it really is and should be removed from the operating profit calculation. An example of this kind of expense is the clean-up and repair expenses related to a natural disaster.
• Note M: Occasionally, a practice will have some kind of unusual one-time receipt of income that is not representative of normal ongoing operating income. This will make the practice look more profitable than it really is and should be removed from the profit calculation.
• Note N: Interest income is not considered to be operating income and should be removed from the profit calculation.

In the United States, a profit margin of greater than 18% for a companion animal general (non-referral) practice is considered to be superior, 16–18% is excellent, 13–15.99% good, 8–12.99% is considered fair, and less than 8% a poor level of profitability. The majority of noncorporate-owned practices are thought to fall in the bottom two categories.

Even with this calculation outline, it can be difficult for a practice manager or owner to calculate their own profitability because there are often individual practice variables that impact the calculation. One resource is a practice management consultant with strong knowledge and experience both in finance and in veterinary medicine. Visit the VetPartners website for a list of member consultants (www.VetPartners.org). It is important to remember that operating profit can be measured in both absolute dollars and as a percentage of gross revenues (the profit margin). Both are important numbers and must be understood by the practice owner. The profit margin is useful in that it can be compared between one practice and another. Comparing absolute dollars does not make sense because practices differ in their size and character. Profit margin percentages also help predict whether a practice will sell at a higher or lower price. The absolute dollar profit figure, however, drives cash flow and dollar value of a practice.

If the profits in a practice are not as high as desired, what can be done about it? A lack of profitability either comes from revenues that are too low, expenses that are too high, or a combination of the two. Increasing revenue while holding expenses constant (i.e., increasing productivity and efficiency) will usually have the most profound impact on practice profitability. However, it is critical that expenses be kept within normal limits. Key expenses to focus on include drugs and medical supplies and doctor/staff compensation and benefits. It is also very important to review the expected profitability of major investments such as the purchase of new equipment or a move to a new facility. Too many discounts and missed charges can also lead to declining profitability.

Understanding not only the profitability of the practice but the kinds of factors that lead to this state is critical. Until the practice has an idea of the root causes of the problem, it is difficult to determine what the correct solution is. There are a large number of continuing education courses and publications available to help with practice improvement. Another solution is to work with a financial advisor or practice consultant to gain a greater understanding of the issues impacting profitability as well as possible solutions.

EXAMPLES

N/A

CAUTIONS

Calculating profitability can be very helpful to practice owners and managers who want to understand this information. However, it is important to realize that many practices will have unique aspects in how data are recorded in their accounting system, which will require other adjustments in addition to those discussed here to get the correct profitability calculation. Working with a financial professional can help ensure the calculation is done correctly.

7.12. PRICING STRATEGIES

BASICS

OVERVIEW

There are many different methods by which veterinary services can be priced. Veterinarians frequently price services on the basis of benchmarking to other sellers of similar goods and services (sometimes referred to as community pricing). This is convenient, but is fraught with a number of hazards:[1,2]

- Other practices may be undercharging for the service, so you could be losing money by matching prices.
- Other practices may be overcharging for the service, so there may be opportunities that would result in a competitive advantage.
- In many cases, practices "bundle" their prices (examination, anesthesia, surgery, medications), so it may be difficult to discern the true cost of providing services.

Markup pricing is commonly used in veterinary practices and involves taking the acquisition cost of the product and multiplying it by a markup percentage (or a markup factor) to arrive at a retail price for customers.

Margin (cost-plus) pricing is a basic pricing method in which all of the costs of providing a product or service are calculated, including direct and indirect costs of overhead, labor, and materials, and then a profit margin is added once all costs have been recovered to arrive at the retail price.

TERMS DEFINED

Acquisition Cost: The wholesale price at which a good or service can be acquired for re-sale.
Community Pricing: Establishing a price for a good or service based on the prices charged by others.
Direct Labor Hours: Costs associated with providing staffing for a service.
Margin Pricing: Also known as cost-plus pricing, this involves taking all the direct and indirect costs in providing a good or service and adding a set amount or percentage that corresponds to a gross profit margin to arrive at a retail price.
Markup Pricing: Pricing based on taking the acquisition cost and increasing it by percentage or factor to arrive at a retail price.
Materials: Costs associated with providing products used for a service, including both direct and indirect costs.
Overhead: Costs of operating a business, even if no clients avail themselves of any services.
Profit Margin: The (gross) profit margin is the difference between the total cost to the practice of delivering a product or service, and the final price to the client. It is typically expressed as a percentage.

ISSUES AND OPTIONS

MARKUP

Although markup is currently the most common pricing model used in veterinary practice, it has several disadvantages:

- Applying a fixed markup percentage to the acquisition cost has uneven effects depending on the acquisition cost. So, inexpensive medications that are "marked up" remain inexpensive and provide very little profit potential for the practice, whereas the same markup applied to more expensive goods and services tends to inflate the retail price to the customer, without providing commensurate value.
- Veterinarians may use markups for commodities (products) that are significantly higher than those used by retailers for the same or similar items, potentially making veterinary prices seem artificially higher than competitors.
- Markups tend to amplify the costs of products or services that tend to be more expensive or used to treat larger animals while minimizing the costs of less-expensive goods or services or those used to treat smaller animals, unrelated at all to value delivery.
- Markups applied to acquisition costs tend to work best on moderately priced goods and services in which there is minimal variability in price, or when different markups are used in a tiered fashion, based on acquisition price.
- Paying employed veterinarians (associates) a commission (production) on such items to be marked up forces the final retail price to be even higher to the consumer without providing additional value than was gained from the office visit.
- Using markup enables the easy determination of a retail price, but additional calculations would be necessary to determine indirect costs and profit margin (Figure 7-12-1).

MARGIN

Margin (cost-plus) pricing is used to price a good or service based on full cost recovery plus a gross profit "margin" that could be a percentage or a fixed amount (Figure 7-12-2).

- Margin pricing accounts for all the direct and indirect costs associated with providing a good or service and then adds a gross profit margin.
- It does not penalize an animal that needs a more expensive product or service and does not artificially discount less expensive goods or services or those intended to treat smaller animals.
- Margin pricing intends to achieve full cost recovery for delivering a good or service, and then add a fair gross profit margin based on the value delivered.

OVERHEAD

- Overhead for a veterinary practice includes all basic expenses associated with offering services (such as rent, utilities, and insurance),

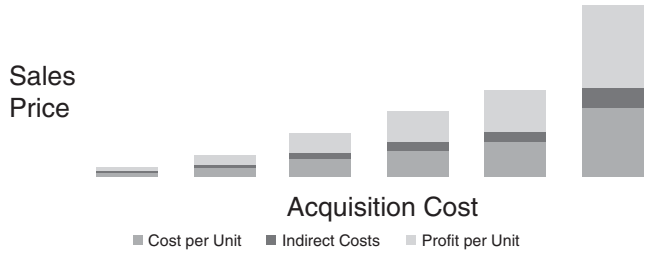

Figure 7-12-1.

When the acquisition cost is "marked up," the gross profit varies with the acquisition cost, rather than value delivery. Accordingly, inexpensive goods deliver very meager profits, whereas more expensive products deliver considerably more gross profit than would be anticipated based on the value being provided.

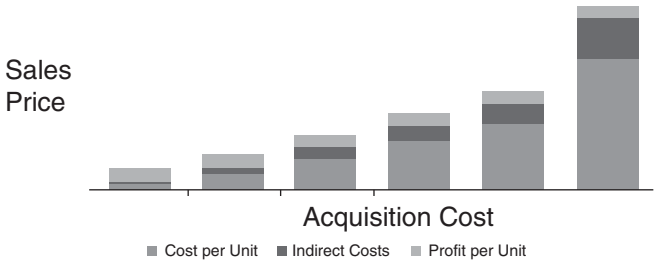

Figure 7-12-2.

When margin pricing is used (in this case, a fixed margin amount), there is full recovery of direct and indirect costs and the desired gross profit margin can be added to determine the retail price to the client.

or total expenses minus the cost of professional and paraprofessional staff and the costs associated with materials that typically would be used up in the process of offering services (suture material, for example). Overhead can be calculated for the entire practice, or there can be individual overheads for each profit center in a hospital.

- The purpose of acknowledging overhead is that it can be an invisible expense for both doctors and staff. When performing procedures within the hospital, it is important to remember that along with products and direct services provided, charges must also include an amount suitable for covering such fixed expenses as rent, utilities, telephone service, insurance, and many others.
- Once overhead is calculated, there needs to be a fair and equitable way to spread that cost over all the services performed. Some overhead items can be directly allocated to specific profit centers, such as the radiographic machine lease to the imaging profit center, but other charges, such as property maintenance, telephone service, and utilities, need to be assigned based on some other "driver," such as square footage of the facility, personnel levels, and so on.
- For equipment used during a procedure, it is also worthwhile to build replacement cost into the final fee. Thus, if a piece of equipment has a likely lifespan of 1,000 applications, then the eventual replacement can be paid for by assessing one one-thousandth of that replacement cost every time the piece of equipment is used (and accounting for time value of money if relevant; see, 7.1 – Time Value of Money) and passing that expense along to the beneficiaries of that equipment use.
- Once overhead has been apportioned, there needs to be some unit measure by which it can be passed along to clients. One of the most direct ways of doing this is using veterinary time equivalents (VTE) (see Section 7.9 – Making Valid Comparisons Between Veterinary Practices and Services). This spreads the overhead over the time availability of those individuals capable of initiating billable services; namely, veterinarians, technicians/nurses, and assistants. In fact, it allows a practice to calculate how the overhead should be assigned to clients on a per-minute basis, depending on the level of staffing required and the length of the procedure.
- In practices that do not bill clients for time spent by technicians and assistants, nonveterinary staff expenses can be included in overhead.

LABOR

- A large part of offering veterinary services is the staffing component for the hospital. Although most veterinary staff are continuously busy throughout the day, it is still almost impossible that every minute is directly billable to one client or another. There are many "nonbillable" gaps in the day, including communicating with clients on the telephone, cleaning, the time between appointments or procedures, and the time needed to complete medical records. It is not unusual that only about 50% of a veterinarian's time (and about 75% of a technician's time) in any given day is directly billable to specific clients.
- VTEs can also be used to apportion labor charges for any given procedure, based on staffing levels and length of procedure. In general, if a per-minute billing rate can be determined for veterinarians in the practice, the cost of paraprofessional staff can be expressed as fractions of this amount. For example, most technicians are compensated at about one-third of that of an employed veterinarian, and veterinary assistants are typically compensated at about one-quarter of that of an employed veterinarian.
- Once again, if the practice does not bill clients on the basis of nonveterinary paraprofessional staff efforts, then those staff expenses can remain in overhead and only veterinary time can be counted in labor calculations.

MATERIALS

- Materials used in the process of offering a service must be included in the pricing, together with the "invisible" indirect costs of the products. The indirect costs are often significant, and likely average 20–45% of the direct costs in most practices. Indirect costs include ordering costs (employee's time spent buying the product, receiving and unpacking the orders, and putting the product on the shelves) and holding costs (the value tied up in inventory, personal property taxes paid on the inventory, wastage, insurance costs, theft, etc.). In some practices, product theft (often known as "shrinkage") can be significant enough that indirect costs surpass 50% of direct costs.
- When considering materials costs in a margin (cost-plus) equation, it is important to add up all the materials used in the process and then add a reasonable percentage for indirect costs. If the numbers have not been determined for an individual practice, a standard of 30–35% would not be unreasonable.
- When considering direct and indirect materials charges, do not forget common expenses such as medical waste disposal. Every time any form of tissue, or a syringe, needle or gauze is used and discarded as medical waste, an appropriate charge should appear on the client's invoice.

PROFIT

- There are many definitions for profit, but in margin pricing, the gross profit is the actual dollar value (often expressed as a percent) that is added to the equation as the desired return on investment once all the costs of offering the service have been recovered. It is important to note that the gross profit margin must be based on the final retail consumer price ("off the top") or the amount remaining will not cover the underlying costs. The same holds true for production-based compensation. If it is not calculated correctly, the profit margin will not yield the desired return.
- For example, a consultant determines that the total cost of offering a service (including direct and indirect costs of overhead, labor, and materials) is $100. The practice wishes to make a 25% profit on the service, and initially prices the service at $125 (i.e., marking it up by 25%). The consultant informs them that this does not deliver a 25% profit and shows why. Twenty-five percent of the total bill of $125 would actually be $31.25, significantly more than the $25 remaining after the costs have been paid. If the client was charged $125 and $100 went to cover costs, the $25.00 remaining provides only a 20% profit (i.e., $25/$125 = 20%; 20% of $125 is $25). The proper way to calculate a profit margin is demonstrated in the Calculations section.

CALCULATIONS

A markup is calculated by taking the acquisition cost and multiplying it by a markup percentage or factor. If the acquisition cost is $100 and a 25% markup is desired, then the retail price would be:

$$\underset{\text{Markup percentage}}{\$100 + (25\% \text{ of } \$100)} \text{ OR } \underset{\text{Markup factor}}{\$100 * 1.25} = \$125$$

So, a markup can either be achieved by adding a markup percentage to the acquisition cost, or by multiplying the acquisition cost by a markup factor (Table 7-12-1). Table 7-12-2 shows the relationship between markup percentages and markup factors. So, for example, a markup of 100% is the same as doubling the acquisition cost; a markup of 150% is the same as multiplying the acquisition cost by 2.5.

Table 7-12-1. The relationship between markup percentages and markup factors.

Markup %	*Markup factor*
25%	1.25
30%	1.3
40%	1.4
50%	1.5
100%	2
150%	2.5
200%	3

7.12. Pricing Strategies

Table 7-12-2. When total costs are used, rather than acquisition cost, markup and margin are algebraically related.

Markup %	*Markup*
25%	20%
30%	23%
40%	29%
50%	33%
100%	50%
150%	60%
200%	67%

For margin pricing, to claim a fixed percentage profit of the retail client charge (C), the equation needs to be set up as follows:

$$C = T + (P)(C)$$

where C is the final charge to the client, T is total costs associated with overhead, labor, and materials, P is the percent "off the top" that needs to be available after costs are covered. This could be the profit margin alone, or could include any commission that will be paid to associates.

In this example, if the practice wants a 25% profit margin, the equation is:

$$C = \$100 + 0.25C$$
$$C - 0.25C = \$100$$
$$0.75C = \$100$$
$$C = \$100/0.75 = \$133.33$$

Now, 25% of the final bill is $33.33, leaving $100 to cover costs. If total cost is known, rather than just the acquisition cost, then margin and markup are just different sides of the same coin. For any desired margin percentage, the markup percentage can be calculated as the desired margin divided by 100 minus the desired margin (and expressed as a percentage), or determined through a profit margin calculator (such as https://www.calculatorsoup.com/calculators/financial/profit-margin-calculator.php).

If the desired margin percentage is 60%, then the markup is 60/(100 – 60) or 150%. So, when a practice uses a 2.5 × markup (150%) on acquisition costs, they are achieving a gross profit margin of 60% (not counting production commissions that they may be paying their associates, the indirect costs of maintaining their inventory, and any shipping charges or taxes). Notice how steeply the markup climbs compared with the margin, and you can appreciate the pricing impact that markups have on client costs (Table 7-12-2).

EXAMPLES

EXAMPLE 1: GROSS PROFIT MARGIN ON A SERVICE

ABC Veterinary Hospital, which sets prices on the basis of both professional and paraprofessional labor, would like to price catheter placement – a procedure that does not involve a doctor, but does involve one technician and one assistant, and takes an average of six minutes. The labor rate based on VTE for the six minutes has already been calculated (see 7.9 – Making Valid Comparisons Between Practices and Services) to be $14.70. The overhead rate for the practice has been determined to be $1.00 per minute. The direct cost of supplies is $6.00, and an estimate of the indirect expense is 45%; therefore, the total materials cost is $8.70 [$6 + (0.45)($6)]. If the practice hopes to make $25% profit on the procedure, what should it charge? In this case, the equation is:

$$T = \text{Overhead} + \text{Labor} + \text{Materials} = \$1 * (6 \text{ minutes}) + \$14.70 + \$8.70 = \$29.40$$

To make a 25% profit,

$$C = T + P(C)$$
$$C = \$29.40 + 0.25(C)$$
$$C = \$39.20$$

EXAMPLE 2. FIXED GROSS PROFIT MARGIN ON A MEDICATION

ABC Veterinary Hospital preferentially uses injectables when medically prudent to do so, both as convenience for pet owners and to ensure compliance. They are having trouble pricing some of these medications for pet owners when using standard markups and are wondering if margins might make the medication more cost-effective for pet owners. For one of the medications, they have determined that the direct cost is $2.25 per kilogram to treat and they estimate that the indirect costs are approximately 33–35% of the direct costs, or roughly $0.75 per kilogram, and the total drug cost is therefore about $3 per kilogram treated. In a 4.5 kg cat, that represents about $13.50 in total drug costs [($2.25 + 0.75) * 4.5 kg] and they typically use 150% markup on the acquisition cost of $2.25/kg (2.5 times the acquisition cost) to price the product at $25.32 ($2.25 per kg * 4.5 kg * 2.5 markup factor) for most cats (not counting the injection charge). This amount was acceptable to most cat owners, but they questioned how much profit they were actually making on the basis of this markup. On the other hand, they did get objections when they attempted the same approach with large dogs. Recently they wanted to treat a 45 kg Labrador retriever with the medication but the pet owner balked at the suggested price of $253 (acquisition cost of $2.25 per kg * 45 kg * markup factor of 2.5) plus an injection fee.

The hospital administrator evaluated the situation, considered the effort involved, the value to the customer, and the gross profit margin and had several suggestions. It was first suggested that because it takes the same effort to inject the large dog as it does the small cat, perhaps they should price the product with full cost recovery and a sensible fixed gross profit margin of $25 per animal treated. In this instance, the 45 kg dog would be treated with total medication costs of $3 per kg * 45 kg, plus the $25 fixed margin, or $160 (not counting the injection fee). They found that this was much more attractive to owners of large dogs. Using the same rationale, they determined that they should change the price for 4.5 kg cats to $38.50 plus the injection fee, so they were making the same gross profit margin on dogs and cats, covering all their direct and indirect expenses, and adding the injection charge to cover technical services (Table 7-12-3).

Markup is calculated by multiplying the patient weight by the acquisition cost per kilogram and then multiplying by the appropriate markup factor. Notice that after full cost recovery for the medication, there is a huge disparity between the gross profit margin for the dog versus the cat, despite the fact that the value delivery (the convenience and compliance of the injection) was essentially the same. This value was captured in the margin approach in which there was full cost recovery (acquisition cost plus indirect cost) and then a fixed profit margin of $25 was added, making the proposition more attractive to dog owners while cat treatments became more profitable to the hospital.

One of the veterinarians in the practice wondered if they were losing money because the price for very large dogs had dropped when they converted to the margin method, but because nobody in the practice

Table 7-12-3. Prices determined by markup and margin, not including the injection charge.

Patient	*Method*	*Acquisition cost ($2.25 per kg)*	*Indirect cost ($0.75 per kg)*	*Client price*	*Gross profit margin*
Cat (4.5 kg)	Markup	$10.13	3.37	$25.32	$11.82
	Margin	$10.13	3.37	$38.50	$25
Dog (45 kg)	Markup	$101.25	33.75	$253.13	$118.13
	Margin	$101.25	33.75	$160	$25

was managing to sell the service to large dog owners at the standard markup, the point was moot. In the new margin model, the practice was injecting both dogs and cats, covering all their costs, and making a fixed gross profit margin with each injection, plus the injection charge. The change resulted in more hospital profit and happier clients.

CAUTIONS

• Using margin (cost-plus) pricing is only as accurate as the estimates used for indirect costs. However, it is far better than benchmarking alone, and approaches pricing from the perspective of covering costs and then charging a standard gross profit margin based on value delivered.

• When employed veterinarians (associates) are paid a commission on their production, this greatly affects the final price to the client in the same way that adding a markup of *x*% delivers a profit margin of less than *x*%. In the example provided previously in which costs were $100 and the practice wanted to make 25% profit, the price to the client was 33.33% above costs to deliver that 25% profit margin. If an associate veterinarian was entitled to make a commission of 22% on the final price, but was not involved in the procedure itself (and so was not counted in direct labor), then the required pricing formula would be:

$$C = \$100 + (0.25 + 0.22)\,(C)$$
$$C = \$181.81$$

Note that to deliver a profit margin of 25% and pay an associate commission of 22%, the actual cost of the service needed to be marked up almost 82%.

MISCELLANEOUS

• The true costs of providing veterinary goods and services is often shocking given that most veterinary practices undercharge for their professional services. This is a chronic problem and translates not only to the relatively low profit margins for many veterinary hospitals, but also to what the practices can then afford to pay paraprofessional staff, receptionists, and practice managers.

• Clients may not know what the price of veterinary products or services should be, but they often have some knowledge of signpost items, things they have purchased in the past that might be considered an approximation. Clients might use the prices of signpost items to form an overall impression of prices quoted, thereby giving at least an impression to guide the purchase of items when they have less actual price knowledge.[3] In some instances, the disconnect between what clients know about the prices of signpost items (such as their own medicated shampoos, or flea-control products they see at a pet store) can lead them to believe that veterinary products are overpriced, so attention must be given to value-based prices, especially those considered shoppable.

• Pricing in the retail marketplace tends to be more dynamic that just establishing a single price for services. In many cases, offering tiered solutions (good, better, best) allows clients to select the level of service they prefer, and often results in higher revenue generation for veterinary practices.[4]

• Today's consumers are not passive price-takers, so it is important to price goods and services in a manner that is considered fair, and a way that focuses on relationships over transactions.[5] If at all possible, prices should be set in ways that encourage customer behavior that benefits both the practice and the pet owner. Businesses that are transparent about how they make their money tend to foster engagement and build trust with clients, which in turn lead to better client satisfaction and retention.

• With continued use, value-based approaches to pricing will help veterinarians charge appropriately, or stop performing services for which they cannot be adequately compensated to cover costs and make a fair return on investment.

7.13. BREAKEVEN ANALYSIS

BASICS

OVERVIEW

Breakeven analysis shows how revenues related to a new project relate to costs – the breakeven point being the dollar value at which revenues will cover all costs (before there is any thought of profit).

Breakeven analysis is particularly useful when opening a new hospital, expanding an existing practice, or buying major equipment.

TERMS DEFINED

Breakeven Point: The level of sales that will just cover all costs, both fixed and variable. It can be expressed in dollars or units sold (or, in a veterinary practice, the number of patients seen).

Fixed Costs: Costs that do not fluctuate with revenue. For example, the rent paid to lease the building in which the veterinary practice is located is a fixed cost. Even if no clients come in the door and no revenue is generated by the practice, the business still has to pay rent.

Semivariable Costs: Costs that do not fluctuate directly with revenue, but still do not stay fixed in the sense that rent does. Staff salaries are an example. Often these costs increase in a step-wise fashion. Staff salaries may be fixed over a certain range of revenue but increase once the high end of that range is reached.

Variable Costs: Costs that fluctuate directly with revenue. For example, variable costs in a veterinary practice would include anesthesia, drugs, and supplies. If no patients are seen, none of these items is used and there is no procedure-associated cost (other than the original cost of the existing supplies).

ISSUES AND OPTIONS

WHAT IT IS ALL ABOUT

- Breakeven analysis is particularly helpful in analyzing the consequences of starting or expanding a business or when acquiring significant pieces of new equipment.
- In thinking about fixed costs, it is important to note that very few are fixed forever over the life of the business. A two-exam-room veterinary hospital may spend $5,000/month in rent payments for the facility. This amount will be the same whether the practice generates $300,000 or $600,000 in revenue per year.
  - Rent can thus be a fixed cost over a very wide range of revenue (in this case from $0 to perhaps $900,000).
  - There will come a point, however, at which the hospital facility is simply too small to accommodate any more clients or any more revenue growth. In order to continue growing the business, facility expansion will have to occur, and this cost will increase.
  - It is important to recognize that if there were no fixed costs, there would be no breakeven point. A practice would have no costs if it had no revenue.
  - These costs are still considered fixed because they do not change over a long time period.
- At the breakeven point:

Revenue = Fixed costs plus Variable costs

or

Revenue = Total costs

- The formula for calculating the quantity of items sold (or in a veterinary practice, the number of patient visits) at which the business breaks even is as follows:

$$\text{Number of patient visits} = \frac{\text{Fixed costs}}{\text{(Average transaction charge less average variable costs per transaction)}}$$

EXAMPLES

- Dr. Felsted wants to open a cat clinic. She has found a leasehold space that suits her needs and has prepared a budget for the first year of operation. She estimates that staff costs will run about $80,000 during the first year, administrative costs about $85,000, and rent $48,000. She estimates that drugs, supplies, laboratory, and other direct patient care costs will run about 20% of fees. In her previous practice, Dr. Felsted had an average transaction charge (ATC) of about $180 and feels she will be able to match that in her new practice. Therefore, her variable costs are expected to be about $36 per transaction (20% of $180).
- Dr. Felsted does not have another source of income and feels she will need to take a salary of $60,000 the first year and will have debt payments of $63,079 to finance the $400,000 she has borrowed to start the practice. Therefore, her fixed costs are $336,079 for the year.
- The number of patient transactions necessary to break even is calculated as follows and shown in Figure 7-13-1:

$$\text{Patient transactions} = \frac{\text{Fixed costs (i.e., } \$80{,}000 + \$85{,}000 + \$48{,}000 + \$60{,}000 + \$63{,}079)}{\text{ATC } (\$180) \text{ less average variable } \frac{\text{costs}}{\text{transaction}} (\$180 \times 20\%)}$$

$$= \frac{\$336{,}079}{(\$180 - \$36)}$$

$$= 2{,}334$$

- Dr. Felsted must see 2,334 patients (where the line for revenues intersects the line for total costs) during the first year to break even. Assuming she will be open six days a week during the year, will not take a vacation the first year, and will be closed for six holidays, this averages about 7.6 patients a day. Dr. Felsted has a loyal following in the area and expects to draw many new clients from a newly built housing division. Thus, she feels it is reasonable to expect she will be

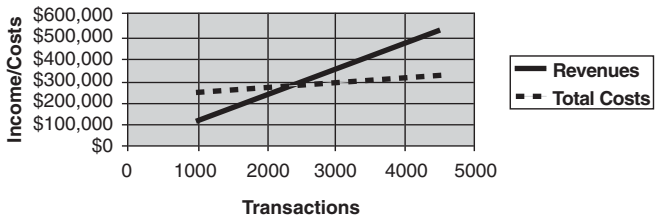

Figure 7-13-1.

Breakeven chart, showing the number of transactions needed for the business to break even.

able to see, on average, at least this number of patients per day. In addition to the revenue from patient care, she anticipates some ancillary boarding, grooming, and prescription refill revenue.

• Breakeven analysis can also be used effectively for new equipment decisions. For example, let us assume the Felsted Cat Clinic has now been in existence for five years and has been doing very well. Dr. Felsted decides to buy a new digital x-ray machine and wants to know how many radiographs she will have to take in order to pay off this machine. The machine costs $70,000, and the average fee charged to clients per series is $135.00. Costs to the practice for each radiographic series are $30 and include veterinarian compensation related to provision of the service, staff time, supplies, and maintenance.

$$\text{Number of radiographs} = \frac{\text{Fixed costs (i.e., \$70,000)}}{\text{Fee for radiographs (i.e., \$135) less cost per series (\$30)}}$$

$$= 667$$

• Dr. Felsted must take 667 radiographic series in order to pay for this machine and start making a profit. Because she takes about six series a week (312 per year), she feels this machine can be paid for in a reasonable amount of time – just over two years. It is important to note that this is a fairly simple example that excludes the time value of money.

CAUTIONS

• Although breakeven analysis is very useful in understanding the relationships among transaction volume, prices, and costs, it does have some weaknesses. As with all analyses, reasonable estimates are essential. The linear assumptions made may not hold true in all cases; for example, as the volume of transactions increases, variable costs may increase or decrease on a per-unit basis. The clientele or mix of services may change, and the ATC generated by the practice may change over time.

MISCELLANEOUS

ABBREVIATIONS

ATC: Average transaction charge

7.14. Activity-Based Costing and Cost Allocation

BASICS

OVERVIEW

- Activity-based costing (ABC) is a form of cost management.
- Cost management deals with the reduction and control of costs.
- ABC is a costing method that has been used effectively in the human healthcare field for many years.
- ABC identifies the true cost of producing a product or service (cost object).
- ABC identifies the activities or processes associated with the sale of a product or service, and estimates the costs of those activities.
- ABC is considered a more accurate method of costing compared with traditional costing methods.
- ABC focuses on indirect costs and makes them direct costs. It traces more costs to a particular product or service than traditional cost accounting, and it identifies the drivers of costs.
- ABC supports management in making strategic decisions on a day-to-day basis and for the long term.

TERMS DEFINED

Cost Driver: Quantifiable measure used to assign costs to activities; reflects the consumption of costs by activities; for example, labor, supplies, equipment, and associated depreciation.

Cost Object: Any activity for which a separate measurement of costs is desired; for example, services, service lines, products, product lines, processes, and responsibility centers (surgery, pharmacy).

ISSUES AND OPTIONS

Traditional cost accounting methodologies determine cost by adding the direct cost of a product or service to a proportionate amount of overhead. The overhead is usually allocated based on a volume indicator such as the number of units produced or number of labor hours. This methodology assumes a direct and proportional relationship between volume and cost, which is not always the case.

In a veterinary hospital, different services and products consume very different amounts of resources. Some products and services require significantly more resources to produce than others: for example, selling a retail product versus spaying a dog. Resources consumed include labor, medical supplies, and equipment. Consumption of these resources results in substantially different costs, depending on the cost object.

ABC focuses on indirect costs. The goal of ABC is to convert as many indirect costs as possible into direct costs by tracing more costs to a particular product or service. A significant component of cost in a service setting is labor. ABC takes into account what are typically considered indirect costs of labor and makes them direct costs. These include employee benefits, employee-paid taxes, uniforms, and unproductive employee time. Tracing these labor costs to a particular service results in a more accurate representation of the true cost of delivering this service. There are still indirect costs associated with ABC.

BENEFITS

- ABC assists management with strategic decision-making.
- It identifies the true cost of a product or service.
- It provides an accurate representation of the profitability of a product or service.
- ABC assists management with pricing decisions, outsourcing decisions, allocation of resources (staffing), and continuous quality improvement.
- By implementing ABC, management becomes more aware of the activities that drive costs, allowing management to put into action strategies to reduce costs.
- Nonvalue-added activities are more apparent. They can be reduced or eliminated from the process.

EXAMPLES

EXAMPLE 1: APPLYING ABC TO A PROFIT CENTER

Transforming Indirect Doctor Labor Costs to Direct Costs

- ABC is critical in practices where there are different profit centers and costs need to be fairly shared.
- Assume there are three profit centers: pharmacy, surgery, and medicine. Doctors spend 30% of their time in surgery.
- The cost object is the profit center.
- The cost driver is the amount of time doctors spent in surgery expressed as a percentage of total labor time.
- The percentage of total labor time is multiplied by the total cost of doctor labor to arrive at an estimate of the cost of labor for the surgery profit center. Total cost of doctor labor includes indirect costs such as uniforms and unproductive time.

Transforming Indirect Photocopy Costs into Direct Costs

- Assume a practice makes a total of 1,500 photocopies per year.
- The cost object is the photocopy machine.

7.14. Activity-Based Costing and Cost Allocation

Table 7-14-1. Applying ABC to outpatient radiographic procedure.

General activity	*Cost drivers (labor, supplies, equipment)*	*Application rate*	*Cost/activity*
Front office admission	Receptionist labor time	$ .27/minute[a]	10 minutes × $ .27 = $2.70
Radiographic procedure	Technician labor time	$ .33/minute	12 minutes × $ .33 = $3.96
	Assistant labor time	$ .17/minute	10 minutes × $ .17 = $1.70
	No. of x-ray films	$2.50/x-ray[b]	4 x-rays × $2.50 = $10.00
	X-ray machine	$1.56/x-ray[c]	4 x-rays × $1.56 = $6.24
	Unproductive labor time	$ .27/minute	5 × .27 = $1.35
	Receptionist technician	$ .33/minute	8 × .33 = $2.64
Doctor interpretation	Doctor labor	$ .75/minute	5 × $ .75 = $3.75
	Unproductive labor time doctor	$ .75/minute	5 × $. 75 = $3.75
Client communication	Doctor labor	$ .75/minute	5 × $ .75 = $3.75
	Technician labor	$ .33/minute	5 × $ .33 = $1.65
	Unproductive labor time doctor	$ .75/minute	3 × $ .75 = $2.25
	Technician	$ .33/minute	5 × $ .33 = $1.65
Discharge	Reception labor time	$ .27/minute	5 × $ .27 = $1.35
	Unproductive labor time reception	$ .27/minute	2 × $ .27 = $ .54
		Subtotal direct costs	$47.28

[a] Includes direct labor costs plus what are traditionally considered indirect expenses (benefits, taxes, an uniforms).
[b] Includes direct cost of x-ray film plus what are traditionally considered indirect expenses (processing fluids and maintenance of fluids calculated on a per x-ray basis).
[c] Includes what are traditionally considered indirect expenses (annual depreciation of x-ray equipment divided by the number of x-rays per year).

- The cost driver is the number of photocopies expressed as a percentage of total photocopies.
- The medicine profit center makes 750 copies (50%).
- The percentage of total photocopies is multiplied by the total cost of the photocopy machine, including indirect costs (depreciation), to arrive at a cost of photocopier use for the medicine profit center.
- If some of the profit centers in the hospital have very disparate photocopy needs, it may be more fair to split the cost of the unit between the different profit centers, and then calculate a per-copy cost that takes into consideration the costs of paper, toner, and maintenance that can be directly allocated to each profit center based on its use.

EXAMPLE 2: APPLYING ABC TO A SERVICE OFFERING

An example of how ABC can be applied to an outpatient radiographic procedure follows, and is illustrated in Table 7-14-1.

Step 1. Develop a Flowchart of Activities (Figure 7-14-1) and Draw Up a Detailed List of Activities (Column 1)

The list helps to identify areas where resources are consumed and costs accumulated.

- Front office admission
  - Receptionist schedules appointment, greets client, retrieves records, weighs patient, provides estimate, has appropriate releases signed, updates computer.
  - Receptionist transfers client and patient to technician.
- Radiographic procedure
  - Technician communicates with client regarding procedure; transfers patient to imaging area.
  - If needed, animal anesthetized for the procedure.
  - Radiographic set-up.
  - X-ray exposure.
  - Animal recovered from anesthesia (if anesthetized).
  - Technician transfers patient back to client.
  - Staff assists with x-ray exposure and development.
- Doctor interpretation
  - Doctor reviews radiographs, interprets findings.
- Client communication
  - Doctor communicates radiographic findings to client.
  - Any needed medications or treatments prepared for client.

Front Office Admission → Radiographic Procedure → Doctor Interpretation → Client Communication → Discharge

Figure 7-14-1.

Flowchart of activities involved in outpatient radiographic procedure.

7.14. Activity-Based Costing and Cost Allocation

- ◦ Technician determines charges for patient.
- ◦ Technician transports client and patient to discharge area.

• Discharge
- ◦ Receptionist inputs data into computer, receives payment.
- ◦ Receptionist discharges client with appropriate client communication.
- ◦ Client scheduled for appropriate follow-up visit

Step 2. Identify Cost Drivers (Column 2)

• Identify where and how resources are consumed by examining the details of the activities.
• In this example, we will focus on the labor, supplies, and equipment resources that are consumed.

Step 3. Develop Rates for Applying Costs to the Cost Drivers (Column 3)

• Annual labor costs divided by 1,950 hours divided by 60 minutes = labor costs/minute of activity.
• Labor costs include direct plus traditionally indirect expenses (annual salary, benefits, employer-paid taxes, training, uniforms).
• Unproductive labor time should also be factored into the costing exercise.
• Examples of unproductive labor time include doctor waiting time associated with radiograph development, technician waiting time for a doctor to view films, personal communication with other staff members, and so on.
• Supply costs include the direct cost of film plus the cost of processing fluids per radiograph.
• Equipment costs include annual depreciation divided by the annual use of the equipment.
• Note how ABC changes the indirect costs of labor (uniforms), supplies (processing fluids), and equipment (depreciation) into direct costs.

Step 4. Calculate the Cost Associated with the General Activity (Column 4)

• Multiply the application rate determined by the estimated consumption of the cost driver; for example, the technician's rate of $ .33/minute multiplied by 10 minutes.
• The total direct costs associated with the radiographic procedure are $47.28.

Step 5. Calculate Remaining Overhead

• Determine remaining overhead attributed to radiographic area based on the square footage of the radiographic area. Divide the total remaining annual overhead cost by the number of radiographic procedures per year, and add to the subtotal of direct costs.

Note: The estimates and data used to perform ABC should be based on interviews with staff, observation, and analysis of available historical data.

7.14. Activity-Based Costing and Cost Allocation

CAUTIONS

• Human healthcare facilities have the advantage of accounting software packages to assist with implementation of an ABC system.
• Implementing ABC throughout an entire veterinary clinic can be an onerous and expensive task; however, the simplified approach taken in these examples can provide management with the tools to make more accurate strategic decisions.

MISCELLANEOUS

ABC methodologies can be applied to many areas within a veterinary practice including the following:
• Services and service lines – grooming, boarding, wellness visits, dentistry, and so forth.
• Responsibility centers (departments) – pharmacy, surgery.
• Products and product lines – food supplements, pet foods, toys, and so forth.

Dr. Lowell Ackerman provides an excellent example of ABC applied to profit centers in his book *Business Basics for Veterinarians*.

7.15. INTERNAL ACCOUNTING CONTROLS

BASICS

OVERVIEW

Insider fraud and embezzlement comprise the greatest source of internal crime in any business, whether small, medium-sized, or large in scale. Internal accounting controls are a documented series of procedures designed to promote and protect secure general and financial management practices. By instituting sound, proven, internal accounting control procedures, veterinary practice owners, managers, and shareholders will significantly increase the likelihood that:

- financial information as presented is reliable enough without external third-party verification so that veterinary practice owners can make important strategic decisions with confidence;
- tangible and intangible practice assets and records of the organization are not stolen, misused, or accidentally destroyed;
- the veterinary practice's accounting and operational policies are followed;
- regulations promulgated by the taxing and governmental boards and authorities are met.

A study by the international accounting firm of KPMG, US, LLP identified three key factors that determine whether a person will commit fraud. These determinant factors are as follows:

- **Situational pressures:** Employees may be attempting to deal with overwhelming factors such as compounding debt and financial pressures, their own or family medical problems, alcoholism, drug abuse, or even psychological problems, and they may feel that they are unable to share these problems with employee assistance personnel (EAP), if available, family, friends, or coworkers.
- **Opportunity:** The opportunity for an employee to commit fraud generally increases as their job roles and responsibilities increase and/or poor internal controls are inherent in the job place.
- **Personal integrity:** This is probably the single most important factor in determining whether a person will commit fraud. Employees who are intent on doing so may often be successful in perpetrating fraud in a well-managed organization. However, given high personal integrity, an employee driven by strong moral values will probably not commit fraud even when faced by situational pressures or an opportunity to commit fraud.

Other key findings of the KPMG forensic practice study were the following:

- Fraud committed at the company level is typically embezzlement facilitated by a feeling of trust. Employees under age 25 who committed fraud produced a median loss of $12,000, whereas employees older than 60 years of age had a median loss of $346,000. Older employees enjoy both greater trust with employer longevity and greater access to company assets.
- Twice as many companies as five years ago took legal action (either civil or criminal) against embezzling employees, and almost the same percentage notified a regulatory or law enforcement agency after finding fraud.
- Companies show a dramatic rise in internal controls as the chief method for detecting fraud.
- Collusion between employees and outside third parties (a vendor organization offering kickbacks if a company employee buys its product, for instance) is a growing problem.
- Some 60% of companies in the study reported being victimized by employee fraud.

TERMS DEFINED

Defalcation: Misappropriation of money or funds by someone entrusted with their care or management.

Embezzlement: The fraudulent appropriation of funds or property entrusted to your care, but actually owned by someone else.

ISSUES AND OPTIONS

By far the most common method of embezzlement in a veterinary practice is the misappropriation of the practice's cash and checks by the practice manager. The practice manager generally knows the makeup of the deposits and knows the vendors, what they supply, and what they charge. He or she also has a reasonable understanding of your pet owner base. In most cases, you value the fact that your practice manager understands your practice so well, but this information can also be used against you. The following represent potential embezzlement scenarios.

Two broad types of internal accounting controls are listed below:

- "Prevent controls" are procedures designed to prevent an error or fraud at a single transaction level.
- "Detect controls" are policies and procedures designed to monitor the attainment of relevant processes (disbursement, recording, custody), including identifying errors or fraud applied to groups of transactions. Without prevent controls, a high error rate can render detect controls ineffective in finding and correcting intentional or unintentional errors in a timely fashion. In a practice with a high patient volume, a lack of prevent controls significantly increases the risk of errors and increases the need for sensitive detect controls.

To be effective, internal accounting control systems must include strong prevent controls in addition to detect controls.

DESIGNING AN INTERNAL ACCOUNTING CONTROL SYSTEM

The first step in developing an effective internal accounting control system to both prevent and detect potential problems is to identify areas where abuses or errors are likely to occur:

- **Cash receipts:** Ensure that all cash intended for the organization is received, promptly deposited, properly recorded, reconciled, and maintained under adequate safeguards.
- **Cash disbursements:** Ensure that cash is disbursed only upon proper authorization of management, for valid business purposes, and is properly recorded.
- **Petty cash:** Ensure that petty cash is disbursed only for proper purposes, adequately safeguarded, and properly recorded.
- **Payroll:** Ensure that payroll disbursements are made and recorded only upon proper authorization to bona fide employees, and that related payroll tax deposits are complied with.
- **Fixed assets:** Ensure that fixed assets are acquired and disposed of only upon proper authorization, are adequately safeguarded, and properly recorded.

An accounting policies and procedures manual should be developed that describes each administrative task and employee(s) responsible for that task. The manual should document how functions such as paying vendors, making bank deposits, reconciling bank accounts, and replenishing petty cash are handled. Writing the initial document as well as periodic revisions and testing of the practice's accounting policies and procedures manual are good opportunities to ascertain whether proper internal accounting controls are in place and working as intended. The manual also serves as an introductory guide to new financial staff and as a reference to current staff. The practice manager should be responsible for overseeing day-to-day implementation of practice policies and procedures, but the practice owner should have ultimate responsibility for the success of an internal accounting control system.

The best method of reducing employee opportunity to commit fraud is to properly separate all financial tasks in the practice, thereby minimizing inherent task conflicts. The same person who opens the mail should not also post cash receipts and make bank deposits. This segregation of duties is highly improbable in a practice with only one

employee responsible for all financial tasks, but with adequate supervision and complementary controls, some of the risk factors can be factored out.

One of the best practices to show owner involvement in internal controls to staff is to require the bank to send the practice's monthly bank statement directly to one of the practice owner(s) instead of to the bookkeeper (or mandate that the practice owner download the statement directly and review it for any unusual or suspicious entries). Payees and endorsements on checks should be examined with special attention paid to checks made payable to "cash," an employee, or bookkeeper. After the practice owner reviews the statement, it is forwarded to the bookkeeper for reconciliation.

For some schemes to work there needs to be collusion between two or more individuals. With the proper internal controls in place, cash safeguards will minimize fraud risk if:

- mail is opened by the receptionist upon receipt, and the receptionist prepares a deposit slip;
- a copy of the deposit slip and a photocopy of every check is forwarded to the practice bookkeeper for an accounts receivable system update;
- the practice manager takes the daily deposit to the bank and returns with a validated deposit slip;
- the practice manager gives the deposit slip to the bookkeeper.

EXAMPLES

There are many checklists and programs that will combat fraud, embezzlement, and defalcation in your veterinary practice. Your CPA or accounting professional should be able to assist you in obtaining them for you. However, a sense of ethics is not instilled in each employee in the same manner and fashion. It is imperative the existing environment shows that practice owners and managers maintain high expectations from practice employees. The following list of general steps will help prevent fraud within your veterinary practice:

- Develop a written code of ethics for all employees, including the veterinarians.
- Communicate to employees a zero tolerance for theft and fraud, and the policy that, if discovered, employees will be prosecuted without exception.
- Conduct a thorough background and reference check on all employees hired, including a criminal background check and credit check on those handling cash and accounting transactions.
- Bond employees so that in the event you are defrauded, insurance can reduce potential losses.
- Compensate employees fairly, reward personnel where appropriate, and try to help employees in financial trouble.
- Develop a training program for partners and staff on fraud awareness and detection.
- Enforce mandatory vacations for all employees involved in the positions of financial responsibility for the firm.
- Insist that key personnel be cross-trained in other positions and that they rotate jobs for a two-week period each year.
- Reduce exposure to accounts receivable manipulation by requiring your employees to deposit all the day's receipts intact.
- Ensure that practice owners and/or managers review and authorize all fee adjustments.
- Make sure the practice owner or manager reviews a vendor invoice or other supporting documents before signing a check for payment.
- Compare today's patient appointment list to the practice day sheet. Verify that every patient seen was charged.
- Conduct surprise mini-audits on a random annual basis, possibly with the help of your own accountant, or contact a member of the Association of Certified Fraud Examiners (www.acfe.com).

CAUTIONS

Practice owners and practice managers should be wary of employees in significant levels of responsibility that show many of the following characteristics in their daily job performance:

- Displays resentment toward the veterinarian's income and associated lifestyle
- Creates unexplained and unusual financial statement trends
- Operates outside accepted practice procedures
- Resists change in present accounting controls and systems
- Produces sloppy records that have many corrections and are difficult to follow
- Desires inordinate amounts of job responsibility, but rejects offers of assistance from colleagues
- Personally appears to create severe financial pressures with frequent pay advance requests
- Changes personal spending patterns
- Employs new vendors for no apparent reason
- Does not strictly control petty cash
- Refuses to take vacations due them
- Determines to control the mail receipt or downloading of the practice bank statement
- Is a "workaholic" – arrives before and leaves after other employees and practice owner(s)
- Is associated with frequent pet owner complaints.

7.16. RETURN ON INVESTMENT FROM PRACTICE OWNERSHIP

BASICS

OVERVIEW

• Return on investment (ROI) is a measure of a company's ability to use its assets to generate additional value for the owners of the company. There are many versions of this formula; one of the more common ones is discussed here.
• ROI is a valuable measurement, but as with many measurements of company performance, it should be used in conjunction with other information when evaluating a company.
• In addition to being useful for evaluating a company's internal performance, it is also valuable when considering purchase of a business. However, in veterinary medicine, ROI often is not an easy figure to obtain and is rarely used on a regular basis to evaluate a practice for sale.

TERMS DEFINED

Return on Investment (ROI): Income that an investment generates compared to the cost of the investment. ROI is a measure of how effectively a firm uses its assets to generate profit.

ISSUES AND OPTIONS

ACCOUNTING METHODS AND ROI

• Veterinary practices, as with other small businesses, are not required to use generally accepted accounting principles (GAAP) in the preparation of their financial statements.
• They are allowed to use other accounting methodologies, and most practices generally use a tax-based methodology for financial statement reporting.
• Many small veterinary practices do not include all assets and liabilities on their balance sheets, either because they do not use the accrual method of accounting or because only minimal accrual adjustments are made.
• Accounts receivable and inventory may or may not be recorded in the financial statements or may not be recorded at appropriate amounts. Not only does this impact the calculation of the profits, but it impacts the calculation of the operating assets, both of which are necessary figures in calculating ROI.
• Some practices that do include inventory on their balance sheets do not base the figure on an accurate count of actual inventory at year-end. They simply estimate the figure and do not change it from year to year.

If the balance sheet is not prepared accurately with all assets and liabilities included at the correct amounts, then the ROI calculation will not be accurate.

ENTITY STRUCTURE AND ROI

• Tax regulations dictate different ways of accounting for certain transactions, depending on what kind of entity a business is: corporation, partnership, or sole proprietorship. Even if the businesses had exactly the same revenue and expenses, the line called taxable income will not be the same for different entity types. Therefore, the ROI calculations would not be the same, simply due to tax reporting issues, not genuine financial differences.
• For example, the taxable income for a sole proprietorship will not include a deduction for compensation for medical and surgical work of the owner doctor, whereas taxable income for a corporation will.

Taxable income should not be used as an estimate of net income in the ROI calculation.

CALCULATIONS

• ROI is calculated by dividing net income by the average operating assets of the company and expressing the result as a percentage. A company with an ROI of 18% is using its assets more efficiently to generate profits than is one with an ROI of 14%.
• In order to calculate the true profits for a practice as opposed to what appears on the tax return as taxable income, a number of adjustments need to be made to the tax return figures. Net income should represent the amount left over after all normal and necessary expenses of the practice are paid at fair market rates.
• Some common areas that need to be reviewed and adjusted in order to properly calculate net income include the following:
  ◦ Compensation for owner medical/surgical work
  ◦ Compensation for owner management work
  ◦ Rent
  ◦ Equipment lease
  ◦ Perks
  ◦ Depreciation
  ◦ Free services provided to the practice.
• The calculation of profitability is covered in its own chapter in this book (see 7.11 – Understanding Practice Profitability) although a summary of the key components of the calculation are presented here. It may also be helpful to work with your financial advisor to determine the appropriate adjustments to make for your practice.
• In a sole proprietorship or partnership, owners do not receive a salary. In a corporation they do, but it may not represent the amount that would have to be paid to a non-owner veterinarian to do the work the owner does.
  ◦ Owner compensation should first be adjusted to represent a fair compensation for the medical/surgical work the owner does in the practice. Twenty percent of personal production is a good average for a companion animal practice.
  ◦ Owners generally provide management and leadership services to the practice as well, and an estimate of the value of these services must be determined. Management and leadership expense in total generally averages 3–4% of gross revenues in a companion animal practice. If the owner were the only one providing these services to the practice, a reasonable estimate for owner management compensation would be 3% of total practice gross revenues. If the practice has a practice or office manager who is paid to perform some of these services, the owner compensation would be at a lesser rate – perhaps 1.5% of total gross practice revenues.
• If the practice owner also owns the real estate outside of the practice entity, the amount of rent paid to the real estate entity should be reviewed and possibly adjusted. This figure should represent the fair market value rent that would be paid to a third-party landlord in an arms-length transaction. If the practice entity itself owns the real estate and no rent is paid, the profits need to be adjusted to reflect the real economic cost of using the real estate. If this adjustment is not made, practice profits will be overstated. The practice may be making a mortgage payment for the real estate, but this amount will almost never be the same as the fair market value rent and an adjustment is necessary.
• Many small business owners use the business entity to pay for perks or expenses that are largely personal in nature and not necessary to the operation of the practice (see 7.17 – Perks of Practice Ownership). Generally, the reason for paying for them in this way is to gain a tax advantage. Examples include: personal meals and entertainment, personal auto costs, swimming pool payments, personal furniture, trips to Tahiti, and so on. The effect of these payments is to understate the true net income of the practice; this effect must be reversed in order to calculate an accurate ROI.

7.16. RETURN ON INVESTMENT FROM PRACTICE OWNERSHIP

• Depreciation as calculated for tax purposes does not reflect the actual economic usage of equipment purchased by the practice; it also should be adjusted before calculating the ROI. Very few practices keep two sets of depreciation records, one for taxes and one for book purposes. If book depreciation figures are not readily available, an estimate can be made of the average amount spent on equipment each year, and this figure used in place of depreciation.
• Another area to be reviewed is any free services provided to the practice. Family members may provide bookkeeping or other services to the practice at no charge; if the practice had to hire someone to do this work, there would be a cost involved and this should be included as an expense. A related adjustment would be salaries and benefits paid to family members or others above the true fair market value of the services provided.
• After making appropriate adjustments to the income statement, it is necessary to review the balance sheet. Most practices do a good job of recording cash and fixed assets on the asset side of the balance sheet, but may not include accounts receivable or inventory. Without these items, the operating assets of the practice will not be accurate, nor will the ROI. None of these items is difficult to calculate – the practice's practice management system has a report containing the value of accounts receivable, and inventory can be determined through a physical count.
• Once the balance sheet has been adjusted, ROI can be calculated as follows:

ROI = Net operating income/(Average operating assets × 100)

EXAMPLES

N/A

CAUTIONS

• The percentage obtained from an ROI calculation is only as good as the information used to perform the calculation.
• It is not difficult in one's own practice to make the adjustments necessary to calculate ROI properly, but it can be difficult to get this information from other practices one is interested in purchasing.

MISCELLANEOUS

• As discussed, ROI is a valuable tool for analyzing a practice, but it is not a definitive measure of the value of a practice. It should be used in conjunction with other information when evaluating a company's performance.
• Because practices do not generally prepare their financial statements on a GAAP basis, it is necessary to make the adjustments previously discussed to get an estimate of ROI. This may be only an estimate; however, even an estimate such as this can be useful in analyzing the efficiency and profitability of the practice, particularly when compared on a year-to-year basis.

ABBREVIATIONS

GAAP: Generally accepted accounting principles
ROI: Return on investment

7.17. PERQUISITES (PERKS) OF PRACTICE OWNERSHIP

BASICS

OVERVIEW

One of the main benefits of owning your own practice is that it is "your name" on the door. This means that you are able to practice the kind and style of medicine that you want to practice. Other than the constraints that are put upon you by your clients and the government, you are the boss.

One of the other benefits of being the boss is that, because you own the practice, you can establish the kind of benefits the practice is going to offer. Some of these benefits will be to your advantage as well as to the advantage of the other employees of the practice; some of these benefits will be to your advantage only. In all cases, however, what benefits you choose to offer need to be legal and, to use a tax phrase, "ordinary and necessary business expenses." It is never a good idea, for a number of reasons, to run personal expenses through your practice. No matter how well you think you are hiding these expenses from your employees, you are presenting the example that there is a "limited liability to steal" in the practice. What is good for you is applicable to them also.

Presenting financial statements to a potential third-party lender or buyer that are clouded with questionable deductions can also put you in a very difficult position.

TERMS DEFINED

Perquisite (Perk): An incidental or "fringe" benefit.

ISSUES AND OPTIONS

Some of the fringe benefits associated with practice ownership are detailed below.

TAX-FAVORED HEALTHCARE

Under the Affordable Care Act (ACA) and the new Tax cut and Jobs Act in the United States, health insurance for small business is undergoing radical changes. It is critical that you work in this area with a knowledgeable health insurance professional consultant to determine the best route that you can take. As a small business owner, you are still allowed to deduct the full cost of health insurance premiums for yourself and your family, as long as they are paid from your business and you draw a salary from that entity. However, when it comes to coverage for your employees it is critical that you get good advice from a qualified professional. In 2019 the mandated individual coverage requirement of the ACA was removed. All this means is that when we think we have it figured out now, things are going to change. Make friends with a good knowledge consultant.

HEALTH REIMBURSEMENT PLANS

Health reimbursement plans (HRPs) are written plans that provide for the tax-free reimbursement to employees for out-of-pocket medical costs covered by the plans. It is important in these types of plans that the covered costs are clearly defined and that a dollar limit is placed on the amount of costs covered. Because benefits under these types of plans are considered self-insured plans, there can be no discrimination in how the plans are implemented. Talk with a qualified benefits advisor before you offer one of these plans. However, HRPs and flexible spending accounts (FSAs), a type of HRP, can fit the need for providing healthcare coverage for certain specialized situations. HRPs have also undergone some changes. There are now specific HRPs for small businesses. The exact coverage and provisions of these plans will likely change over time, so talk with a knowledgeable professional who is familiar with HRPs for small businesses.

DEPENDENT CARE ASSISTANCE PROGRAMS

A dependent care assistance program (DCAP) is a tax-favored arrangement by which the practice makes payments to third parties for care of employees' dependents (including in the case of employees caring for elderly parents). DCAP includes practice-paid payments or reimbursements for dependent care services necessary for the employee's gainful employment. Because a qualified DCAP cannot discriminate in favor of key employees, no more than 25% of the assistance benefits paid during a year can be provided for the practice owner. There are key regulations that need to be accounted for in implementing a DCAP; however, with so many employees and practice owners facing the problem of providing daycare for their children, this is a benefit that should definitely be explored.

EDUCATION ASSISTANCE PROGRAMS FOR EMPLOYEES

One useful tool to attract good employees, and possibly potential associates, is to offer a qualified education assistance program. The first $5,250 of qualified educational assistance (tuition or books, for example) provided during a calendar year is exempt compensation for federal income tax, Social Security, and Medicare tax. If the requirements for the plan are not met, all payments are taxable employee compensation. Although there are strict limits on how much of these benefits can be used for expenses incurred by owners' children, this can be a substantial benefit for employees who want to complete schooling to receive their technician certification or to go on to veterinary school. Employers can put conditions on providing these benefits, including requiring the employee to remain employed by the practice for some period of time. It is important to consult with a knowledgeable advisor before setting up one of these programs.

EMPLOYMENT OF FAMILY MEMBERS IN THE PRACTICE

One way to legally move income from parents to dependents is to employ them in your practice. It is important that the children actually work in the practice and that they are paid a reasonable wage for the services they perform. If the practice were incorporated, the wages paid to the children would be subject to the same payroll reporting requirements as wages paid to any other employee. However, because the income is earned income, IRA contributions can be made subject to the income limitations, and given the income tax brackets of most children, this is a way to move money from the higher tax bracket of the parents to the lower children's bracket. Because the money is earned income, "kiddie tax" rules do not apply to this income. Be sure to consult with your tax professional for any other issues that might affect your particular case.

PRACTICE-OWNED OR LEASED VEHICLES

An employee/owner of a practice must generally include in income the fair market value of his or her personal use of a practice-provided vehicle. If, however, substantial business use of a vehicle is necessary to carry out the work of the practice, then having the practice own the vehicle and the owner reporting its personal use can be a substantial benefit. The key in this area is to document on an ongoing basis the business use of the vehicle. There are very definite rules dealing with deducting the costs of a vehicle; for example, commuting to the office every day is not considered business use. Be sure to contact a qualified tax professional to be certain that you understand the rules and the consequences to the practice if you do not comply and if you get caught. In the absence of having the practice own the vehicle, if you own your car yourself, it is a perfectly legal practice expense to be reimbursed at the IRS rate for the business use of your personal vehicle.

CONTINUING EDUCATION

Costs to attend seminars or conferences related to the technical or business aspects of your practice are clearly an ordinary and necessary business expense (see 3.6 – Continuing Education Expenses). The

transportation costs to and from these seminars can be another issue. There is no requirement that you attend only conferences in your general practice locale, nor is there a requirement that you stay in a one-star motel and take public transportation to the conference. If the trip is related primarily to the betterment of your practice, all costs are deductible subject to the 50% limitation on meals. If you take your family with you on the trip, the costs directly related to family members are considered personal expenses. If you extend your stay for purely personal reasons, make side trips, or engage in other nonbusiness activities, only the costs associated with the business portion of the trip would be treated as business-related expenses. The costs incurred in getting you to and from the destination, however, are considered business expenses.

RETIREMENT PLANS

There are numerous qualified and nonqualified retirement plans available to veterinary practice owners. There is a special section that covers the benefits and special rules attributable to the various plans. This is an area where you would want to seek advice from a qualified retirement plan specialist.

EXAMPLES

N/A

CAUTIONS

The Jobs Cut and Tax Act has changed much of what we do with regards to deducting fringe benefits. Moving expenses can no longer be paid tax free for our employees. Reimbursing employees for job-related expenses without adequate documentation will result in taxable income to them.

MISCELLANEOUS

ABBREVIATIONS

DCAP: Dependent care assistance program
FSA: Flexible spending account
HRP: Health reimbursement plan
IRA: Individual retirement account
IRS: Internal Revenue Service
LTC: Long-term care

7.18. Forgotten Costs of Doing Business in a Veterinary Hospital

BASICS

OVERVIEW

When veterinarians or practice managers talk about the costs related to running a practice, they are usually thinking of the common expenses: drugs and medical supplies, laboratory costs, facility rent, payroll expense, utilities, and advertising. However, there are a number of additional costs not always considered in budgets that can wreak havoc with a practice's cash flow if they are not recognized and planned for in advance. This can be particularly devastating when purchasing a practice or starting one up. If all costs have not been included in the budget, the practice may not generate the level of profits necessary to pay back the loan and allow the owner to make a reasonable salary and return on investment.

In addition to the costs people forget to consider, there are also some expenses hidden in others. For example, most support staff training is done internally. The biggest cost related to this is payroll – the compensation paid to the person doing the training as well as the person being trained – and is lumped in with other payroll costs on the financial statements (see 3.5 – Employee-Related Costs). It is important to remember when analyzing payroll costs that paying someone for 40 hours of work a week does not mean they are available for 40 hours of receptionist or technician work. Some of that time may need to be spent in training or doing management work, and appropriate staff scheduling must take this into consideration.

TERMS DEFINED

Overtime: Hours worked in excess of the maximum regular number of hours fixed by statute, union contract, or custom.
Pro Forma: Projection of income and expenses, based on a set of assumptions.

ISSUES AND OPTIONS

CREDIT CARD MERCHANT FEES

• In most practices, veterinary services are seldom paid in cash. Checks, too, have declined as a method of payment. Instead, clients are using primarily debit and credit cards.
• The costs related to the processing of these cards add up, and are usually between 1.5% and 2.5% of a practice's total gross revenues.
• Costs vary between processing companies, so it makes sense to price-shop this service annually. Make sure you understand what all the costs are when comparing services. Run some comparative calculations using the average monthly number of transactions and dollar amount of credit and debit card transactions in your practice to see what the effect of varying percentage rates and per item rates are. Areas to discuss with the processing company include the following:
  ◦ Percentage charge per dollar of transaction (may vary depending on card)
  ◦ Per transaction fee
  ◦ Application fees
  ◦ Statement fees
  ◦ Miscellaneous other fees
  ◦ How soon the funds are deposited to your bank account, because the faster the money is in your account, the faster it can be earning interest or spent.

BAD DEBT

• Another cost of doing business that is not always considered is bad debt. If your practice accepts checks or allows clients to have an account at the practice, you will have some clients who will not pay their bills.
• With an effective credit and collections system, it is possible to limit the practice's losses, but it is impossible to eliminate them altogether.

FINANCE CHARGES FOR BUYING A PRACTICE AND PURCHASING EQUIPMENT

• Few individuals are able to buy a practice with cash; the purchase of large and expensive pieces of equipment frequently requires financing as well. Unfortunately, banks and other lending institutions do not provide this service for free and the interest charged must be considered in a practice's budget or pro forma financial statements.
• Leasing equipment also has a finance charge component; additionally, sales tax is often charged on the interest portion of the lease as well as on the principal portion.

CONTINUING EDUCATION

• Continuing education costs for doctors are usually clearly reflected in the financial statements. The practice generally pays for all or some portion of conference registration and related travel costs, and these expenses are recorded in the appropriate income statement categories (see 3.6 – Continuing Education Benefits).
• However, the compensation paid for the days used to attend the conference is not shown separately; it is just a part of the doctor's total compensation. Although the investment in continuing education is critical to the long-term success of the practice, in the short run a portion of the doctor's pay is for time he or she is not available in the practice to see clients.
• The situation is somewhat different for support staff members because the biggest percentage of staff training costs in most practices is payroll cost. Many of the people hired in veterinary practices have no previous experience in the veterinary field, and those who do will still need considerable training to learn how things are done in their new situation. Although there may be some costs related to books, videos, and so on, the compensation for training time, both that of the trainer and of the person being trained, is much higher in most practices. Thus, the total dollar effect of support staff training may not be readily visible, but it is considerable and, in the aggregate, may be more than that of the doctors.

STAFF TURNOVER

Turnover is usually seen as an inconvenience. It takes a considerable amount of time to find a new person, get them on board, complete all the paperwork, integrate them into the practice, and train them in the specifics of their jobs (see 3.20 – Staff Turnover and Retention). Certain staff members may have to temporarily add the duties of the departed employee to their own already busy schedule during the hiring and training process.

However, turnover is considerably more than an inconvenience when one starts putting a dollar value to all those hours spent in staff replacement that do not produce client revenue.
• **Interviewing and hiring costs:** The most obvious, but not usually the biggest cost, is that of advertising for a new employee. However, when done right, interviewing takes time (see 3.7 – Effective Staff Recruitment). For example, a practice may be looking for a new technician and has 10 applicants for the job, with several promising candidates. The practice manager or hiring doctor will spend time sifting through the applications and doing phone and initial in-person interviews of these candidates. A second working interview with one or two candidates will take additional hours, and more hours will be spent on the final evaluation of the candidates, paperwork, and notification of the applicants. A practice easily spends 25 or more hours in this process.
• **Training costs:** These costs represent distinct losses in productivity by everyone who is involved in training a new staff member, because time spent on training decreases the time spent with clients or on other revenue-producing activities. This is not to say that training is not important – it is tremendously important. The point to remember is that it costs real money in the form of the trainer's and trainee's wages.

7.18. Forgotten Costs of Doing Business in a Veterinary Hospital

And other team members may have to work overtime to get the work done until the new person is trained.

• **Intangible costs:** It is harder to put a dollar value on these costs, but they are there nonetheless. There can be a negative effect on client loyalty if a departing staff member was highly valued by at least some part of the client base. Further, when a position goes unfilled for a period of time, clients may become restless over the resulting poor service. And there is often a loss in productivity when a person knows he or she is leaving, but has not actually left. They usually do not work as hard and may reduce the productivity of others because they are more interested in chatting with or complaining to their colleagues.

In general, the cost of losing an employee is estimated by most experts in the field at one-third to two times the annual salary of the employee. Most of this is not in direct costs such as advertising, but in labor costs, lost productivity, and lost revenue.

STAFF MANAGEMENT

Managing people properly takes time. This time is not available for seeing clients or otherwise producing revenue. However, the practice will function much better with appropriate time spent on these tasks (see 2.1 – Workplace Management). Training and the interview/hiring process have already been mentioned. Other critical functions include:

- Scheduling
- Recording of work hours; tracking vacation, sick, and holiday pay
- Payroll check preparation
- Annual performance appraisals
- Day-to-day supervision and management
- Maintaining employee files
- Evaluating different benefit plans such as health insurance, retirement, etc.
- Mediating conflict
- Termination.

OVERTIME

- There will always be occasions when overtime is essential, but it is costly. A practice gets the usual amount of productivity for one and one-half to two times the normal cost.
- For this reason, many hourly employees in the workforce want overtime, and unfortunately there will always be some who will pace their work with that goal in mind.
- Overtime must be managed with a balance obtained between cost and having an appropriate number of staff available for both medical and client service tasks.

FREE OR DISCOUNTED VETERINARY SERVICES

- Free or discounted services are given to clients and to employees for different reasons.
- Free or discounted veterinary services are an important benefit to most employees in a practice. Veterinary staff members do not have high compensation levels and often have more than a few pets, so discounted care is one of the reasons they work at a practice. Although this is a critical benefit that should be maintained for employees, it is important to control excessive use of it (for example, by the person with 20 pets) and to recognize the labor and supply costs related to the care as well as any revenue foregone because a doctor was not available to see paying clients.
- Marketing discounts can be effective in growing a practice but random client discounts given for little reason should be held to a minimum, and it should be clear to the practice what they are accomplishing with the discount. Even a small amount of discounts can dramatically eat into practice profits. This kind of loss prevention is best addressed by having very complete fee schedules that are updated twice a year, reviewed periodically with the staff, and well understood by all. In addition, a random selection of invoices should be pulled each month and checked for completeness against the medical service records.

7.19. CAPITALIZATION AND DEPRECIATION

BASICS

OVERVIEW

Depreciation is the term used for allocating the cost to acquire capital assets (digital x-ray machines, computers, etc.) to expense over the useful life of the acquired asset in a "systematic and rational" manner.

Theoretically, depreciation accounts for the loss in "value" of a capital asset over time. However, value has different meanings to different practices.

It is almost impossible to equate net book value to market value. No depreciation method arrives at the net book value of an asset equaling the fair market value of the asset at any point during its useful life. Thus, even given a wide variety of alternative depreciation methods, eliminating taxable gain or loss on the sale, or the disposal of a capital asset, is almost impossible.

The sheer complexity of depreciation issues should lead veterinary practice owners to outsource tax preparation to a qualified tax professional.

TERMS DEFINED

Fair Market Value: The price a willing buyer would pay a willing seller for the asset.

Intrinsic Value: The deemed asset worth derived by the practice owner, including how the equipment generates value for the practice.

Net Book Value: The historical asset cost less accumulated depreciation since the purchase date.

ISSUES AND OPTIONS

TIMING

Depreciation expense is recognized in the first tax year in which you place the asset in service. "In service" means that the practice must place the asset in productive use before the tax year's end. If you are electing Section 179 depreciation (discussed in the next section), timing is not an applicable issue as the cost of the asset may be expensed entirely in one year, subject to qualifying standards. If property is not eligible for the Section 179 election (practice real estate), the date on which you place the property in service and the total amount of property placed in service during the year are the two factors that determine how much of a full year's deduction you will get for the first year.

DEPRECIATION METHODS

- The costs of capital items having a useful life exceeding one year are depreciated over specified periods. For materiality purposes, practices should set a minimum dollar limit on those assets to consider for depreciation, such as $2,500 (for those hospitals without an Applicable Financial Statement under the new IRS DeMinimis Safe Harbor Tangible Property regulations passed in 2016). Those individual assets falling below that threshold would be expensed immediately (for example, a fax machine costing $289 or an office chair costing $199).
- Many states previously had depreciation methods different from federal income tax laws, requiring practices to keep multiple sets of depreciation records. Most states have now adopted federal depreciation standards, although some have not accepted newer depreciation regulations passed in 2003 regarding bonus depreciation eligibility.
- Straight-line depreciation is the most commonly understood and easiest depreciation method to implement. It establishes specific years of depreciation.
- Whatever rules or tables are in effect at the time you first place assets into service must be followed as long as you own the property.

SECTION 179 DEPRECIATION

Normally, you cannot take a current business deduction for the entire cost of a capital asset in the year you purchase it, because the asset's usefulness to your practice will extend beyond the year in which it was purchased. A special tax provision allows small businesses an option to claiming a deduction for the entire cost of such qualifying practice assets in the first year of service. In 2017, the maximum Section 179 expense election is $500,000, subject to a phase-out once aggregate property placed in service exceeds $2,030,000. Under the 2018 Tax Cuts and Jobs Act (TCJA), there is unlimited Section 179 expensing of up to $1,000,000 and an increased phase-out limitation of $2.5 million of aggregate property placed in service during the tax year.

- You must elect to use Section 179 on your tax return for that year on Form 4562, Depreciation and Amortization, or on an amended tax return filed before the applicable return due date, including extensions.
- Property purchased must be tangible personal property actively used in the practice, for which a depreciation deduction would normally be allowed.
- Property must be newly purchased, rather than property you previously owned but recently converted to business use. Acquisitions by gift, inheritance, or from related persons (spouse, children, parent, or other ancestor or descendent, or a business with common ownership) do not qualify for the election.
- Eligible Section 179 property includes property that is not a building or a structural component of a building, but can be a single-purpose livestock or horticultural structure. Congress extended Section 179 eligibility to air conditioning and heating units for years beginning after December 31, 2015. Off-the-shelf computer software is eligible for Section 179 tax treatment.
- The property must be used more than 50% for business. Practices may expense only the portion of the property's basis that corresponds to its business use percentage.

MACRS DEPRECIATION

The Internal Revenue Service (IRS) established property classes to group similar assets and to select the proper depreciation method and useful life for each asset. For most practice property placed in service after 1986, the IRS requires depreciation using the Modified Accelerated Cost Recovery System (MACRS). Normal MACRS uses a 200% declining balance method for three-, five-, seven-, and ten-year property, and a straight-line method for 27.5- or 39-year real estate. Taxpayers can elect to use straight-line depreciation for any other property (Table 7-19-1).

Normal MACRS depreciation tables provide the largest current tax deductions in the earliest ownership years. Although MACRS is the most common and favorable method, taxpayers may use slower depreciation methods such as a 150% declining balance method, which must be used for all farm property and for all nonfarm property in the 15- and 20-year property classes.

COST SEGREGATION

A cost segregation study is a comprehensive engineering-based analysis of the total cost or value of building and site improvements that allows building owners to reallocate Code Section 1250 (real property depreciated over 39 years) to Code Section 1245 (personal property depreciated over 5, 7, or 15 years), resulting in increased depreciation deductions. Generally, the more specialized and unique an asset is, such as a veterinary practice facility, the greater the tax benefits derived. A change in the practice's method of accounting needs to be disclosed to the IRS by the taxpayer filing Form 3115 (Change of Accounting Method). IRS Revenue Procedure 2004–11 also allows property owners to retroactively catch up on missed depreciation on assets owned as far back as 1987, with a one-time catch-up provision under an IRC Section 481(a) adjustment, precluding the use of amended tax returns.

Table 7-19-1. Property tax depreciation method using Modified Accelerated Cost Recovery System (MACRS).

Property class life	*Capital asset acquired*
3-year	Tractors; racehorses over 2 years and horses over 12 years when placed in service; and off-the-shelf computer software
5-year	Autos, trucks, computers, telephone systems, office machines (printers, copiers, etc.); R&D property; and breeding/dairy cattle
7-year	Office furniture/fixtures and any property not belonging to another class
10-year	Single-purpose agricultural or horticultural structures; and fruit/nut-bearing trees and vines
15-year	Depreciable land improvements such as shrubs, fencing, and parking lots
20-year	Farm buildings (barns, etc.) not listed as agricultural or horticultural buildings
27.5-year	Residential rental property (i.e., rental apartments attached to practice structure)
39-year	Nonresidential real estate, including practice buildings and home offices

VEHICLE DEPRECIATION LIMITS

Although the expensing limit for general business property is $500,000 in 2017, the limit for cars is much lower: $3,160 is the maximum amount of depreciation of any type that can be written off if a passenger vehicle is first placed in service in 2017. Additional bonus depreciation may be taken in the first year of service.

The maximum amounts that may be deducted under the MACRS and under Section 179 for the first year are known as the "luxury car limitations," even though they apply to cars valued at more than $19,000 in 2017. Depreciation must be proportionately reduced if your business use of the vehicle was less than 100%.

OTHER DEPRECIATION ISSUES

- Depreciation is reported on IRS Form 4562 for the first year your practice claims depreciation on acquired property; for any year you claim Section 179 depreciation (including prior year carryover amounts); and for every year you claim depreciation on a car, other vehicle, or special types of property.
- When constructing practice facilities, obtaining a "cost segregation" report, or highly detailed breakout of all construction costs incurred may enable practice owners to accelerate depreciation to 15- and 20-year property expenditures versus classifying the majority to nonresidential building costs (39.5 years).

EXAMPLES

- A van, truck, or sports-utility vehicle used in your practice whose gross vehicle weight (GVW) exceeds 6,000 pounds is not subject to the annual depreciation dollar caps.
- If you qualify for Section 179, the practice receives a significant reduction in the out-of-pocket cost for needed practice equipment. For 2017, a sole proprietor in the 33% marginal tax bracket reduces the net cost of buying a $100,000 piece of lab equipment to $67,000 (not including the reduction in associated self-employment tax).
- It may be more tax-efficient to purchase property by December 31 if you can receive an incrementally higher tax benefit from deducting the property's cost on your current tax return versus the following year tax return.

CAUTIONS

- If employees use your practice vehicle, you count any mileage driven for documented business purposes as "business use." Personal use, such as commuting to work, is treated as taxable compensation to employees.
- If you do not use the asset 100% for business, each year you must multiply the asset's total tax basis by the business percentage for that year.
- Because land is a "nonwasting" asset, its value may not be depreciated. The value of land must be segregated from the overall purchase price of property so that it is not commingled and unintentionally depreciated.
- Practices should keep records showing that your business usage was at least 51% of total usage of the property. For vehicles, a mileage record or "log" detailing starting and ending mileage, destination, and business purpose (if personal use, that should also be noted) will be deemed adequate if it displays enough to prove the work relationship, if necessary in an audit situation. Apps such as MileIQ help document business mileage generated during the year.
- If property is disposed of within the year you placed it in service, you cannot claim a depreciation deduction.

7.20. Accounting Closing Processes

BASICS

OVERVIEW

The accounting closing process is a series of activities designed to take raw accounting data, notably fee income in the form of cash receipts and disbursements in the form of checks written, and transform that data into meaningful and accurate financial records. The closing process typically takes place at the end of each month, with a more substantial closing process occurring at the end of the calendar or fiscal year of the practice.

Manual and computerized accounting systems use the same underlying financial accounting concepts and principles to serve the same information gathering, processing, and reporting functions. Almost all successful veterinary practices use computers to streamline financial mechanisms to generate financial statements, management reports, and income tax returns for practice owners and decision-makers. What most practice owners do not realize is that the entire manual closing process has not been eliminated with the onset of computerized accounting programs such as Xero, QuickBooks, and others. The process has just been concealed from view and mathematical errors from transposition of digits or misposting have either been reduced or eliminated. Most manual records are now available as a part of the program's normal reporting features.

The accounting process is composed of two separate phases to ultimately produce financial records:

- The recording phase includes analyzing, recording, and classifying business transactions during the fiscal period.
- The reporting phase updates and summarizes financial data collected during the recording phase to result in the preparation of financial statements and reports.

TERMS DEFINED

Accrual Accounting: Recognizes revenues are earned and expenses are incurred, which disregards when the actual cash transaction occurs.
Cash Basis Accounting: Recognizes revenues and expenses as cash received or disbursed, regardless of the earnings process or the matching concept.
Generally Accepted Accounting Principles (GAAP): Requires the use of accrual accounting; broadly describes the body of principles that governs the accounting for financial transactions underlying the preparation of a set of financial statements. GAAP derives from such sources as the Financial Accounting Standards Board (FASB) and the American Institute of Certified Public Accountants (AICPA).
Ledger Books: Actual physical books where cash is recorded chronologically when received or disbursed, and where the value of services is recorded when rendered on credit. These subsidiary ledgers are then summarized (or "closed") daily, monthly, and annually in a general ledger, the precursor of today's computer-generated financial records.

ISSUES AND OPTIONS

- Decreasing the amount of time involved in the accounting closing cycle provides numerous benefits for a hospital, including faster decision-making and an increased confidence level in practice managers. Reducing the number of days it takes to close the books involves identifying the activities and process steps that drive longer closes and determining how to eliminate them.
- Manual work can be eliminated by automating manual reconciliations and reporting functions (now almost commonplace with artificial intelligence based rules in accounting programs).
- If practice owners can receive the numbers in a more timely fashion, they can identify trends faster and adjust to market conditions before the competition.
- The amount of time needed to complete the close may indicate how well managed the financial processes are, and how well designed the information technology systems are. If the decisions practice owners make are correct, the potential valuation of the veterinary practice may increase significantly.

EXAMPLES

Well-designed accounting systems have a predetermined time frame for completing both the monthly and annual accounting closing processes, and they are aware of stumbling blocks that may interfere with those processes. Responsible parties are also included, and may consist of other practice members besides the practice manager and/or the bookkeeper. A sample time schedule for the closing process is shown in Table 7-20-1.

CAUTIONS

- Computers usually require a general centralization of all accounting activities, and thus increase the efficiency and cost-effectiveness of the accounting system.
- Although a computerized accounting system can serve effectively in recording activities, it cannot replace the accountant, who must still determine what principles are applicable in arriving at financial statements that present fairly the company's financial position and results of operations.
- A practice using a computerized perpetual inventory system maintains the inventory and cost-of-goods-sold accounts through retail transactions in the computer, and thus no adjustment is necessary every time retail product is sold. It is highly recommended, though, that a periodic physical inventory, or cycle counts of high dollar inventory items, be taken to verify computer records and that the computer inventory balances be adjusted to the physical counts made.
- The use of standalone spreadsheets (such as Excel) and manual re-entry of data create potential fraud risks.
- Any practice that re-enters data during the closing process must find a way to automatically pass data from one system to the next (such as data downloads from your practice management software directly to Xero or QuickBooks).
- Manual journal entries should be a small part of the closing process. A high volume could signal errors in your accounting system or personnel problems.

7.21. TAX PLANNING

BASICS

OVERVIEW

Tax planning is a process of examining various presentation options in order to report business and personal transactions so that taxes are minimized, deferred, or even eliminated. Veterinary practice owners will often have the option of reporting a taxable event by more than one method. Landmark legal decisions have agreed that taxpayers may choose the practice of tax avoidance, a decision that plans to report transactions resulting in the lowest, but entirely legal, tax liability. One of the greatest of US federal judges, the esteemed Learned Hand, spoke on behalf of the US taxpayer as follows:

> *The legal right of the taxpayer to decrease the amount that would otherwise be his taxes, or altogether avoid them, by means that the law permits, cannot be doubted. (Gregory vs. Helvering, 293 U.S. 454, 1935.)*

> *Anyone may so arrange his affairs that his taxes shall be as low as possible; he is not bound to choose that pattern that will best pay the Treasury; there is not even a patriotic duty to increase one's taxes. (Gregory vs. Helvering, 69 Fed. 2nd 809 (2nd Circ. 1934).)*

As Judge Hand states, tax avoidance is legal tax planning, whereas tax evasion by a fraudulent event is illegal. In the unlikely event of an Internal Revenue Service (IRS) examination, IRS examiners typically review tax returns and imbedded transactions for the following items:

- Intentional underreporting of a practice's cash receipts
- Inflating practice tax deductions to reduce taxable income
- Accounting irregularities
- Unreasonable or inconsistent compensation
- Inadequate records to substantiate income and/or deductions
- Improper allocation of income to a child in a lower tax reporting bracket than the practice owner.

Retaining a competent accountant or other tax professional that possesses a working knowledge of how our tax system works is more often than not cost beneficial. Taxpayers must be cognizant that outsourcing tax planning and preparation to a third party does not alleviate their filing and reporting requirements, as the taxpayer bears ultimate responsibility for fulfilling federal, state, and/or local tax obligations.

The results gained by tax planning, especially with many variables entering the picture, far outweigh not engaging in the tax planning process. By not having an estimate of cash flow needs and deadlines for those tax payments, veterinary practices may be left with surprises at critical junctures of the practice financial picture.

TERMS DEFINED

Accrual Basis: Accounting recognizes revenues as earned and expenses as incurred, which disregards when the actual cash transaction occurs.
Adjusted Gross Income (AGI): The total of an individual's income (wages, salaries, interest, dividends, etc.) on a tax return after all allowable deductions have been subtracted.
Cash Basis: Accounting recognizes revenues and expenses as cash received or disbursed, regardless of the earnings process or the matching concept.
Tax Bracket: Marginal federal tax rate assessed on your taxable income. It is the tax rate applied to each additional dollar of income. You need to know your current tax bracket in order to make informed decisions.
Tax Credits: Incentive programs authorized by the IRS that provide incentives in the form of dollar for dollar tax reductions based on expenses incurred to encourage business owners to comply with the law in achieving certain commendable goals on behalf of society. Examples include providing accessibility to the disabled, hiring disadvantaged youth, establishing a presence in lower socioeconomic neighborhoods, and so on.

ISSUES AND OPTIONS

In general, veterinary practice owners should try to minimize tax liabilities in the present year, even if this increases tax liabilities in a future year. The most basic goal of tax planning is to develop both a short- and long-term tax reporting strategy to effectively and efficiently reduce taxable income and minimize marginal tax rates.

REDUCE TAXABLE INCOME

To create an effective tax plan, veterinary practice owners should estimate both personal and business income for at least three years. This is necessary because many tax planning strategies save tax dollars at one income level, but will create a larger tax bill at other income levels. The primary way to reduce the part of your income that is subject to tax is to take advantage of all available legal tax deductions. Practice owners must be generally aware of potential deductions and applicable rules related to meals and entertainment, automobile, and travel expenses. In many cases, practice owners may deduct expenses that, given other circumstances, may be classified as nondeductible personal expenses.

MINIMIZE MARGINAL TAX RATES

There are certain actions you can take that can lower your marginal tax rate:

- You may be able to shift investment income from the veterinary practice owner to a child who is taxed in a much lower income tax bracket by gifting investment assets to children. These gifts are subject to both amount and tax-attribute limitations.
- Sole proprietor practice owners can hire their children at a greater advantage than corporate practice owners. Sole proprietors with children as employees under age 18 are exempt from Federal Insurance Contributions Act (FICA), Medicare, and unemployment taxes. The children must, however, perform services commensurate with their age and abilities, and comply with state and local laws (age, work permits, hours, etc.).
- Children may be gifted interests in your practice, so that taxes attributed to business income are spread among a larger group. Family limited partnerships and limited liability companies may be the proper entities to perform this more complicated tax-skirting maneuver.
- An investment or other income transaction can be structured to receive capital gains treatment. Long-term capital gains earned by individual taxpayers are generally subject to lower tax rates than other earned income.
- Choose the proper organizational entity for your practice (such as sole proprietorship, partnership, or corporation). sole proprietorships, limited liability companies, or subchapter S corporations usually offer better tax benefits than a straight partnership or C-corporation in most, though not all, cases.

CONTROL THE TIMING OF TAX PAYMENTS

Estimated tax payments are due on April 15, June 15, September 15, and January 15 of the next year. Taxpayers are charged interest if they underpay one or more installments. Any payments outstanding after April 15 of the following year are subject to a late payment penalty in addition to late payment interest.

To avoid underpayment assessments, taxpayers must satisfy one of four "safe harbor" guidelines, as follows:

- For taxpayers with adjusted gross income of $150,000 or less, no underpayment assessments will apply if tax payments equal to last year's tax liability number (shown on last year's Form 1040) is paid.
- For taxpayers with adjusted gross income exceeding $150,000, no underpayment assessments will apply if payments equal to 110% of last year's tax liability are paid.
- Regardless of last year's income level, no underpayment assessments will apply if payments of at least 90% of the current year tax liability

are made. In this safe harbor exception, proper tax planning is critical to assessing current year income tax liability.

• The annualized installment method is used by taxpayers who often have irregular fluctuations in income and expense (sometimes due to seasonal practices, the sale of portfolio assets, etc.) that are not conducive to filing regular or even estimated tax payments. Under the annualized installment method, estimated payment liabilities are calculated to correspond to taxable cash flow. Tax planning is necessary in assessing current year income tax liability using the annualized installment method prior to the filing of tax returns. Many practice owners instead wait until filing season to use the annualized installment method as an "after-the-fact" method of tax planning to reduce underpayment assessments.

Practice owners and their tax planning professional may use any of the safe harbor methods for estimated tax planning. Taxpayers are liable for underpayment assessments if their tax planning results are later proven incorrect, which may result in additional tax due different from that planned. Most taxpayers may receive automatic extensions of the time to file their individual income tax return until October 15, but the extension of time is only an extension of time to file the "paper" or electronic copy of the tax return, not an extension to pay any resulting residual tax liability.

POSTPONE INCOME AND ACCELERATE DEDUCTIONS

Practice owners who employ the cash method of accounting may minimize current year tax liabilities by postponing the receipt of income into the next tax year and accelerating deductions into the current tax year. This is done by:

- delaying year-end billings until the following tax year,
- delaying C-corporation dividends until after the end of the tax year,
- delaying the sale of capital-gain-producing property or investments until next tax year,
- accelerating business expense payments into the current tax year,
- accelerating the purchase of depreciable personal property or real estate into the current tax year,
- electing to expense under IRC Section 179 the cost of eligible capital equipment rather than depreciating the equipment using normal methods.

It is usually more difficult to effect tax planning for accrual-based practices, as steps to eliminate the earning of income or the incurring of expenses must be enacted to enable effective tax deferral.

ACCELERATE INCOME AND POSTPONE DEDUCTIONS

In the event that you expect your marginal tax rate to be lower next year than in the current tax year, you may accelerate income by billing and collecting receipts by the end of the tax year and postponing expenditures until the following tax year.

IMPLEMENT TAX-DEFERRED RETIREMENT PLANS

Another strategy to reduce current year taxable income would involve setting up and funding qualified retirement plans such as a Simplified Employee Pension (SEP), Individual Retirement Account (IRA), 401k (a type of employer pension plan), or SIMPLE (Savings Incentive Match Plan for Employees, a type of tax-deferring employer-provided retirement plan) for practice owners and eligible employees. The practice receives a tax deduction for the amount contributed. As the practice owner controls the direction of retirement planning for a typical veterinary practice organization, the practice owner should ensure that the plan matches both practice human resource goals and the owner's own retirement objectives.

CLAIM ALLOWABLE INCOME TAX CREDITS

There is a wide variety of tax credits awarded to qualifying practice owners. One of the most underutilized tax credits is the Disabled Access Credit. Under the Americans with Disabilities Act of 1990 (ADA), businesses that are open to the public, such as veterinary practices, must make reasonable accommodations to disabled persons who intend to or do use practice services. Practices must remove physical barriers to the disabled. Renovations or new construction must include provisions for accessibility by the disabled, in accordance with technical specifications.

The following restrictions apply to utilizing the Disabled Access Credit:

- Eligible access expenditures include expenses for removal of physical barriers during renovations, equipment, services, or devices to make services available to deaf, blind, or other disabled practice clients, and various similar expenses.
- The law allows businesses to claim a credit for 50% of eligible access expenditures that exceed $250 but do not exceed $10,250, thus limiting the credit to a maximum of $5,000 in any tax year.
- The Disabled Access Credit is available only to "qualified small businesses," businesses having gross receipts of $1 million or less, or having no more than 30 full-time employees.
- The Disabled Access Credit is part of the general business credit and, as such, the total of all general business credits cannot reduce the practice owner's current year tax liability below the larger of (1) your tentative minimum tax or (2) 25% of the part of your regular tax liability that exceeds $25,000.

ALTERNATIVE MINIMUM TAX

Congress created the alternative minimum tax (AMT) to prevent higher income taxpayers from substantially reducing or eliminating their tax liabilities through incentives afforded by the tax code. AMT affects even middle-income taxpayers because the AMT exemption amounts have traditionally not kept up with inflation. As a result, many taxpayers are required to compute their income tax liability under the regular method and the AMT method. Taxpayers are subject to the AMT if their AMT liability exceeds their regular tax liability for the year due to AMT adjustments for:

- state and local income taxes and real estate taxes,
- miscellaneous itemized deductions,
- the excess of accelerated depreciation over straight-line depreciation,
- gain or loss differences on the sale of property for AMT and regular tax calculations,
- certain income from incentive stock options,
- changes in income from installment sales,
- certain passive activity loss deductions,
- deductions relating to oil and gas investments, or drilling or mining operations,
- interest income on certain municipal private activity bonds.

Careful tax planning needs to be enacted in the event that a veterinary practice owner is subject to the AMT. There are tax law changes being contemplated for elimination of the AMT, but not enacted as of this edition.

REASONABLE COMPENSATION

Subchapter S corporations must pay reasonable compensation (subject to employment taxes) to shareholder veterinarian employee(s) in return for the services that the veterinarian provides to the corporation, before nonwage distributions may be made to that shareholder employee.

7.21. Tax Planning

Pass-through income from an S corporation is not subject to self-employment tax, while partnership pass-through income is generally subject to self-employment tax. If a shareholder veterinarian employee of an S corporation provides veterinary professional services to that S corporation, then reasonable compensation generally is required to be paid in return before any nonwage distributions (classified as a return of capital) are made to that shareholder employee. Court cases support the authority of the IRS to reclassify other forms of payments made to the shareholder employee as a wage expense. In addition, several court cases have reinforced and clarified the IRS position as to the employee status of S corporation shareholders who perform services for the S corporation. "Reasonable Compensation" paid for professional services provided are then based upon all relevant facts and circumstances.

In the landmark Tax Court case applicable to the veterinary profession, "Veterinary Surgical Consultants, P.C. vs. Commissioner," a veterinarian as president and sole shareholder of an S corporation generated all corporate professional fees. The president received no salary for services rendered, but provided substantial services to the corporation, and thus was determined to be an employee. Therefore, the amounts distributed to him were actually wages subject to employment taxes. The Tax Court stated:

> *The characterization of the payment to [the president] as a distribution of petitioner's net income is but a subterfuge for reality; the payment constituted remuneration for services performed by [the president] on behalf of petitioner. An employer cannot avoid federal employment taxes by characterizing compensation paid to its sole director and shareholder as distributions of the corporation's net income, rather than wages. Regardless of how an employer chooses to characterize payments made to its employees, the true analysis is whether the payments represent remuneration for services rendered.*

EXAMPLES

EXAMPLE 1: REASONABLE COMPENSATION

Steven Newfoundland, DVM, a 100% shareholder of Springfield (Ohio) Veterinary Hospital, Inc., a subchapter S corporation, typically does not include himself in the payroll on a weekly basis similar to other employees of the hospital. He was advised by a golfing partner to not pay himself through payroll, but to instead take distributions from the corporation to avoid paying Social Security and Medicare tax. Accordingly, he does not receive a Form W-2 at the end of the calendar year. The annual pass-through income of the hospital for the year, reported on Dr. Newfoundland's Form 1040 Schedule E Part II, is $200,000.

The IRS, in the event of an audit or other comprehensive examination, is highly unlikely to concur with this "tax planning," or rather, tax evasion strategy. If $150,000 is deemed reasonable compensation for a veterinarian in a corporation of similar size in the geographic location in which Dr. Newfoundland's practice is located, then he will be required to report $150,000 as wages on his personal income tax return and only $50,000 will be treated as pass-through income.

The result may not be what was originally intended.

Re-characterizing veterinary practice owner compensation may necessitate:

- amended Form 1120S and state income tax filings,
- corrected Forms 941, W-2, and W-3, to be issued with late payment penalties and interest on the 12.4% FICA tax not originally paid up to the FICA limit and Medicare's 2.9% tax up to the total wage amount,
- amended filings for personal income tax returns with late payment penalties and interest assessed,
- amended federal and state unemployment tax filings with late payment penalties and interest assessed,
- potential worker's compensation premiums may be due, or the policy may be cancelled for undue risk.

EXAMPLE 2: UNDERPAYMENT PENALTIES

During tax planning, your accountant has calculated your projected tax liability at $24,000 for the current tax year. Only $14,000 is projected to be withheld from annual compensation by the end of the year. This results in an underpayment of $10,000. The following assumptions are correct:

- As long as the prior tax liability (the amount owed before payments were applied against it) was $14,000 or less, there is no need to make additional estimated payments. This assumes that the prior year adjusted gross income (AGI) was $150,000 or less.
- If last year's tax liability was $18,000, the practice owner will need to pay in an additional $4,000 in the form of four (4) equal federal estimated tax payments of $1,000 to qualify under the 90% safe harbor rule.

These rules only consider federal tax implications, but it is assumed that, during the tax planning process, state taxing authority regulations will also be recognized, if applicable.

CAUTIONS

- Practice owners may tend to make important business decisions based mainly on tax consequences. Consider all the strategic, financial, and tax consequences of a transaction or business practice before making important practice decisions. Decisions with only a good tax result may not always satisfy overall practice objectives. The adage "Don't let the tax tail wag the dog!" may be a prudent motto, even to the accountant.
- For calendar year individual taxpayers (including those filing as sole proprietors and single-member limited liability companies (LLC)), the filing and payment of tax due date for these returns is April 15 of the following year. For Limited liability partnerships (LLP), multi-member LLCs, and regular partnerships, the filing date for these returns is March 15 of the following year.
- For S corporations with a calendar tax year, the due date for Form 1120S, applicable state and local income tax returns, is March 15 of the following year unless an extension is filed.
- Retail tax preparation software such as Intuit's TurboTax or Kiplinger's Tax Cut handles basic input and eliminates math errors. However, the taxpayer must ensure that the amounts are properly reported. Ultimate responsibility for a missed payment, filing deadline, an improper deduction, or incomplete records to substantiate deductions falls on the taxpayer.

• For any deductible item, you should retain documents proving the expense itself (a receipt, bill, or invoice) and proving that you paid it (a cancelled check, credit card slip, or bank statement itemizing your checks).
• The IRS does not require you to keep any specific forms of records so long as your records clearly show your income and expenses for the period. If you use a computerized system, you must be able to obtain printouts of your records that are easily read.
• If you want to deduct vehicle expenses used for business, charitable work, or medical appointments, you must keep mileage records of your driving for any of these tax-deductible purposes. The IRS asks you on your tax return to answer that you have written evidence of your vehicle expenses. The mileage app MileIQ is a convenient tool for recording business mileage.
• In an audit, the IRS will combine an examination of a closely held corporation with an examination of the tax returns of a corporation's owners to discover whether personal expenses have been improperly characterized and deducted by the corporation. Items that may appear suspect are personal vacation trips deducted as business expenses, personal living items characterized as a corporate expense (such as household repairs performed by practice vendors), related-party-interest payments, sales to related parties (especially sales resulting in a loss), and excessive compensation paid to practice owners and relatives.

7.22. EMPLOYEE STOCK OWNERSHIP PLAN (ESOP)

BASICS

OVERVIEW

• An employee stock ownership plan (ESOP) allows employees to own stock in the private company in which they work, and it can be used as a way to transition a business from the current owner(s) to its employees.
• In general, employees are provided with stock as part of their compensation for work performed, and the stock is held in an ESOP trust until the employee retires or leaves the company, when they are bought back by the company for redistribution, or voided.
• ESOPs can be used for succession planning, when owners want to gradually pass along ownership of the company to its employees.
• In the United States, ESOPs are a qualified defined-contribution benefit regulated by the Employee Retirement Income Security Act (ERISA), a federal law that sets minimum standards for investment plans in private industry.
• ESOPs can be associated with tax benefits for both employers and employees, and are the only retirement plans allowed by law to borrow money.

TERMS DEFINED

Employee Stock Ownership Plan (ESOP): A program that allows an organization's employees to have an ownership interest in the organization.

ISSUES AND OPTIONS

WHY AN ESOP?

• ESOPs may be used as a financial strategy, to align the interests of employees with company shareholders, and participants receive certain tax benefits.
• Most ESOPs are used to provide a market for the shares of a departing owner of a profitable, closely held company. In other cases, it might be used as a supplemental employee benefit or as a means to borrow money in a tax-advantaged manner.
• Since ESOP shares are part of employees' remuneration for work provided to the practice, they help ensure that employees remain focused on practice performance so that their shares appreciate in value over time.
• Most employees participate in the process at little or no upfront costs, so there is little to deter them from participation.
• Shares in the trust are allocated to individual employee accounts, either on the basis of relative pay or some other equitable formula.
• The shares may be held in a trust until the employee retires or leaves at which time the shares revert to the organization for redistribution or are voided.
• When employees leave the company, they receive their stock, which the company must buy back from them at its fair market value (unless there is some other public market for the sale of such shares).
• ESOPs provide packages that act as additional benefits for employees and help maintain a cohesive corporate culture. A practice can issue new or treasury shares to an ESOP, deducting their value (to that allowed) from taxable income. A practice can also contribute cash, buying shares from existing owners.
• ESOPs can also be used in conjunction with employee savings plans. Rather than matching employee savings with cash, the company can match them with stock from an ESOP, perhaps even at a higher matching level.
• Since employees become partial practice owners through the use of an ESOP, they tend to work hard in good times and bad because of their commitment to and investment in the business. Benefits tend to be highest when an ESOP is combined with a high degree of worker involvement in work-level decisions (such as employee teams).
• ESOPs can be a great way to incentivize employees through participation of company ownership with little or no out-of-pocket cost to those employees.
• Most ESOPs limit the amount of company stock that can be held by individual employees, and senior employees may be allowed the benefit of getting more shares compared to new employees. As employees accumulate seniority with the company, they acquire an increasing right to the shares in their account (vesting). Vesting can occur all at once (cliff vesting) or more gradually.
• ESOPs must not discriminate in their operations in favor of highly compensated employees, officers, or owners.
• An ESOP is just one mechanism for allowing employee ownership and creating a market for private company stock. Other forms that are not covered here include stock options, direct purchase plans, restricted stock, phantom stock, and stock appreciation rights. In some non-US countries, employee stock option plans may even be referred to as ESOPs but they are not the same as ESOPs in the United States.
• Every year the company needs to have a valuation to determine a current stock price.

HOW ESOPs WORK

• The company establishes an ESOP according to regulatory guidelines.
• A trust fund is typically established for the benefit of participating employees.
• The company contributes either cash to buy company stock, contributes shares directly to the plan, or borrows money to buy shares (leveraged ESOP).
• When the ESOP borrows cash to buy company shares, or buy shares from existing owners, the company then makes tax-deductible contributions to the ESOP to repay the loan, so that both principal and interest are deductible.
• Contributions to the plan are tax deductible in the United States under current regulations.
• Employees pay no tax on the contributions until they actually receive the stock benefits when they retire or leave the company. Such benefits can typically be rolled over into a qualified Individual Retirement Account.
• Owners of private companies that sell to an ESOP may be able to defer taxation, but such possibilities require consultations with a tax professional familiar with ESOPs.
• The stock price is determined by an independent valuator or appraiser that is hired by the ESOP trustee.

ESOPs FOR SUCCESSION PLANNING

• ESOPs can be used to let founders cash out, and for employees to cash in.
• Without an ESOP, the principal succession plan is to sell the practice, which might result in a change in practice culture.
• With an ESOP, the practice owner can gradually transfer the ownership to the practice itself, with the practice making tax-deductible contributions to a trust set up to facilitate the employee stock ownership plan. The trust then buys stock from the existing owners, allowing the existing owners to cash out gradually.
• An ESOP is a good tool for selling a minority interest in a practice. By selling a minority interest, cash can be available for other investments, allowing diversification.
• ESOPs can also provide a source of retirement income for practice owners, without having to sell the practice.
• ESOPs can help ensure that long-term employees have a stake in the business they help build, and that they have the ability to eventually retire with some financial security.

7.22. EMPLOYEE STOCK OWNERSHIP PLAN (ESOP)

• Rather than a sale of the practice to others who may not preserve the company culture, ESOPs provide an exit strategy in which the employees become the owners and they can continue to build the business for the benefit of the practice, the people who work in it, and the clients that are serviced by the business.

EXAMPLES

ABC Animal Hospital has a long and proud history, and its owners are nearing retirement. None of their employed veterinarians has the ability to purchase the practice, but the owners are hesitant to sell to corporate entities, who already have made offers on the practice well above its fair market value. The hospital has a large, well-trained, and dedicated staff, and it is the sincere wish of the owners that they preserve the practice culture they have worked so hard to create, and they would also like to reward their staff for their commitment to making this the hospital it is today, and hopefully will be well into the future.

The hospital's management consulting team suggests an ESOP as one way of preserving practice culture, rewarding staff, allowing succession planning for the retiring owners, and providing tax benefits as well.

Despite the considerable cost of establishing the ESOP, the owners were happy that in the process of creating a market for their shares, they also had an opportunity for rewarding their employees and giving them a stake in keeping the performance and culture of the practice in line with expectations.

CAUTIONS

• The law does not allow every business category to utilize ESOPs. Check with your accounting professional.
• Make sure that the benefits of the ESOP outweigh the downside, including the costs of implementing and maintaining the plan. In many cases it takes a team of ESOP specialists, accountants, valuation experts, and attorneys to determine whether a stock ownership plan is feasible for one's particular circumstances.
• Transferring cash from your business to the trust will reduce cash reserves for the practice, so there is a financial cost to setting up and maintaining an ESOP.
• However, when profits go into an ESOP, which then uses the money to purchase stock from the owner(s), the transaction becomes a capital gain, and may have tax implications.
• Private companies must repurchase shares of departing employees and this can be a major expense, especially with significant employee turnover.
• When new shares are issued, the stock of existing owners is diluted, and the dilution of owner shares must be weighed against the tax and other benefits provided by the ESOP.
• Setting up an ESOP is often associated with substantial upfront costs.
• For employees, ESOPs can concentrate their investments in a company with limited marketability of its stock, thereby reducing diversification.
• ESOPs are strictly regulated by the federal government, which sometimes changes the rules on such things.

7.23. BUYING A PRACTICE

BASICS

OVERVIEW

There are many factors that should be considered when deciding to become a practice owner and when deciding to purchase a particular practice. To prepare, you should have a good understanding of practice ownership and management, practice value, and the purchase process. Buying a practice is not something that you have to or should do alone. There are many qualified consultants that can assist in the analysis, the decision-making, and the sorting of the various factors involved in the process.

TERMS DEFINED

Due Diligence: The process by which persons conduct inquiries for the purposes of timely, sufficient, and accurate disclosure of all material statements/information or documents that may influence the outcome of the transaction.

ISSUES AND OPTIONS

TYPICAL STEPS IN BUYING A PRACTICE

• The first step is to give serious consideration and reflection as to whether practice ownership is the right path for you. For many veterinarians, the thought of being your own boss is quite appealing. This can be especially true depending on your current employment arrangement. Thoughts of making the rules and key decisions, practicing medicine your way, leading the charge, increasing your earning capability and so on, can be very attractive. The grass can look mighty green on the other side of the associate–owner fence. But is it really? What does it mean to be a practice owner? Are you owner material? If so, time spent improving your communication and people management skills is time well invested in yourself.

• Begin watching the different practices that come on the market for sale. Watch for both for sale by owner opportunities and the practice listed with the veterinary brokers. Many brokers maintain buyer lists. Being on the list often provides advance notice for new listings and if your target area is popular, having the advance notice can give you a head start.

• Watch all practices, not just the ones in your target geographical location. Tracking the market will help you refine your search by learning how practices are presented and by comparing different purchase opportunities. The price is much less important than finding a right practice – the one that is a match to your personal standards of care, practice philosophy and professional goals.

• Once you find a possible match, contact the broker/owner. If the practice is listed with a veterinary practice broker, you will be able obtain the practice information from them. If not, you will need to request the information from the owner. The initial information typically involves introductory information to see if this practice might be a match for what you are seeking. You may need to sign a confidentiality agreement first. Then you should receive recent financial and productivity data, general equipment and staffing information, photos, etc.

• **Important comment no. 1:** If the practice is "For Sale By Owner," the owner should have the practice valued. It is the owner's responsibility to set the price, ideally by engaging a veterinary practice appraiser. The reason for this is that the owner cannot commit to a sale until he or she knows what the practice value is – and the owner needs to hear the value from the appraiser that he or she engaged. The owner will not trust the conclusion from the buyer's appraiser. As the buyer, you have the responsibility to test the price that the owner gives you.

• **Important comment no. 2:** Remember to respect the confidentiality – the staff, clients, and community are usually not aware of the pending change in ownership and it is important to protect this until closing. This goes in two directions – you do not want your employer to know about your pending departure until you are much further along in the process.

• If the practice is a match for what you are seeking, the next step is to schedule a practice visit. Typically this will be after practice hours, depending on the confidentiality needs of the seller. Before the visit, keep a written list of the questions that you want to ask about the practice, standards of care, team utilization, opportunities, etc. While you are at the practice, imagine yourself as owning and working in it. Is it right for you? Does it come close to matching your personal goals of ownership? Take good notes on your observations and impressions and write down your unanswered questions and thoughts. Take pictures of the practice and the community. Take time to tour the neighborhood and to learn more about the community.

• **Post-visit A:** If the practice is a match, start working on securing the financing. There are many veterinary-specific lenders (i.e., not your local bank) that will provide financing for the practice purchase and the real estate. Completing their applications involves providing them with your personal financial information and the practice financial data. If they approve the combination of you + the practice, they will provide you with a financing proposal. Securing proposals from a few lenders can provide you with different options. Typically, a financing proposal is not accepted until your offer has been accepted by the seller.

• **Post-visit B:** In addition to starting the financing step, if the practice is a match then it is time to engage an attorney to prepare the formal offer known as a "letter of intent" (LOI). The LOI establishes agreement on the general terms for the transaction including the price (practice and real estate if available), the target timelines, whether seller

7.23. BUYING A PRACTICE

financing is needed, and the contingencies (real estate appraisal, building inspection, etc.). It should also provide you with exclusivity once the LOI is accepted by both sides. The first offer might not be accepted as-is. Often it may take a little negotiation before you reach agreement with the seller. At this point, it is important that you are committed to the purchase and that this is the correct decision.

TIME FRAME

There is no simple answer for how long it will take to find and purchase a practice. Some wait years to find the right practice. The broader your geographic search area, the more likely you are to find a practice. After finding a possible match, it could take a week to a couple of months to get to the point of securing the financing and presenting the owner with an offer/LOI. Once an offer is accepted, there are two initial steps:

- First, the financing proposal is accepted. This will start the lender working toward closing. The lender will have a to-do list for you and your attorney.
- Then your attorney will prepare the purchase documents and work with the seller's attorney to refine all of the purchase details.

The closing is typically within 2–4 months. It can be longer if issues come up. Ultimately the closing can happen when the lender is ready and when the attorneys have the purchase contracts complete and all details settled. As the transaction moves closer to closing consideration can be given to notifying the staff, post-closing announcements to the clients and community, and preparing for the transition itself.

DUE DILIGENCE

To decide whether or not to purchase a practice requires consideration of a seemingly endless number of factors, all of which can impact the success of the decision. The process of collecting all the data necessary to make the decision is referred to as performing due diligence. This is usually not done alone – there are veterinary consultants who can help make the process easier. Some of the variables to consider include the following:

- Factors related to the practice
  - Years in existence
  - The level and quality of fees and the fee structure
  - Quality and stability of the existing client base
  - Number of new clients
  - Employee training and retention
  - Practice revenue and earnings history
  - Availability of emergency/specialty services
  - Transferability of the business and personal goodwill
  - Adequacy and quality of the equipment
  - Enforceable noncompetition agreements
  - Demographics of the practice trade area
  - Quality and stability of the practice management
  - Impact of the competition
  - Compatibility with your style of medicine and client interaction.
- Financial factors:
  - Review of the owner or broker's information package
  - The practice's financial and productivity data and track record
  - Financing options to make the deal work
  - Affordability/feasibility analysis (discussed below).
- Factors related to the facility/community
  - Zoning requirements, permissions, and restrictions
  - Sign and practice visibility
  - Amount and quality of parking for staff and clients
  - Condition and attractiveness of the facility
  - Functionality and layout of the facility
  - Presence of deferred maintenance items
  - Building and environmental inspections
  - If real estate is not for sale, terms and conditions of the lease
  - Community infrastructure changes and growth
  - Demographic analysis
  - If you have a family, the community school system.

This list is not comprehensive. It does, however, provide a foundation for assessing a purchase opportunity or comparing multiple opportunities. The goal of the due diligence process is to help the buyer acquire the knowledge necessary to make an informed decision as to whether or not this is the practice to purchase, and then to make sure that the practice is all that it should be.

PRACTICE VALUE

As noted above, the practice owner needs to have the practice valued (see 14.13 – Determining a Practice's Worth). A veterinary practice appraiser should value the practice. Ideally, this would be completed prior to the owner(s) offering to have you buy (or buy into) the practice. Without a known value for the practice, the owner(s) could change their timeline if the practice value is lower than expected/desired.

- Once a practice value is determined by the owner, your due diligence should include testing the value to make sure it is a fair market value – the purchase feasibility analysis.

PURCHASE FEASIBILITY ANALYSIS

For most buy-in opportunities, the seller provides the purchase price and terms, usually based on the practice valuation. Although a buyer can have a second appraisal done, it is possible to save time and money by first focusing on whether or not the purchase price is a feasible price. In other words, focus on answering the question: If I purchase this practice under the asking terms, will I have adequate cash flow to service the debt, pay taxes, and still be able to support my lifestyle?

A purchase feasibility analysis is the means by which that question can be answered.

- If there is positive cash flow after paying the debt and the taxes, then the purchase price is at least theoretically reasonable and you can move forward with your goal of considering purchase of the practice.

7.23. Buying a Practice

• If there is not positive cash flow, then either the price is not reasonable or your personal budget requires a practice that is capable of providing a greater cash flow.
• If there is not positive cash flow and you believe that the price is not reasonable, then the negotiations on the price can be based on the facts instead of another appraiser's opinion of value.

Step One: Adjust the Financial Statements

The financial statements and tax returns that the buyer receives are designed to minimize taxes and, as such, rarely reflect the true profit derived from owning the business. Therefore, the first step in the analysis is to examine the practice's financial operation to determine a reasonable estimation of the practice's profitability.
• The true profitability of a practice is determined after accounting for all normal operating expenses, including the facility rent and the owners' veterinary compensation. It is the resulting share of the profits that will allow a buyer to pay the debt service and taxes and have the funds on which to live.
• In order to obtain an estimation of the practice's true profitability, it is necessary to adjust the financial statements. Usually, adjusting the financial statement involves identifying non-operating and nonrecurring expenses that the owner put through the practice.
• Adjusting the income statement is not a simple, formulaic process. It requires a solid understanding not only of this practice and how it operates, but also a broader understanding for comparison purposes of how practices operate in that region and nationally. Because of this, it is usually recommended to work with a veterinary consultant on the analysis.
• When the analysis is complete, the result is a financial history of the practice, its financial operation, and its profitability. This forms the foundation of the second step, which is to look forward and project what will happen if the purchase occurs.
• The adjusted income statement for the practice also provides a foundation for the financial transparency needed for a long-term, successful multi-owner structure.

Step Two: Forecast Future Cash Flow

This step seeks to assess what would happen if the buyer purchased a portion of practice under current operations. This step requires several variables including:
• the seller's asking terms for the practice,
• the financing details for the loans: loan amounts, length of loan, interest rate, etc.,
• the historic profitability from Step One.

These variables are then used to project the cash flow to the new owner. It begins by growing the practice forward a year and calculating the cash flow that the new owner will receive, which includes the profit from operating the practice, the new owner's veterinary and/or management compensation, and any other income streams associated with the ownership purchase such as rent. The total is the gross amount the buyer will have as a result of purchasing the practice. Unfortunately, the buyer does not get to keep all of it. There is still the debt to service and taxes to pay.

Step Three: Debt and Taxes

The next stage involves calculating the costs associated with servicing the debt (the principal and interest) and then the taxes associated with the cash flow, which is usually an estimate for state and federal taxes, but can also take into account estimates for depreciation, amortization, and interest deductions where appropriate.

Step Four: Decision

The conclusion of the purchase feasibility analysis is an estimate of the cash flow that would be available for a buyer to live on after purchasing the practice (and real estate if involved), paying the debt, and associated taxes. Whether the resulting amount is enough for you and your household will depend on your personal financial needs. (Remember that because this is an after-tax number, it is not directly comparable to a salary/W2 which is pre-tax.) If the determined cash flow amount is reasonable, then the purchase price is an affordable price for you as the buyer. This should be true regardless of the percentage purchased. If the resulting amount is not reasonable, then it is necessary to make sure that the practice data are correct. If the data are correct, then the purchase price may be too high or too low, or the terms of the deal may need to be adjusted. Either way, this analysis provides the information to take the best next steps.

USING CONSULTANTS TO HELP WITH THE PROCESS

A buyer does not have to be and should not be alone in this process. There are numerous veterinary consultants who can help with the due diligence process, perform the feasibility analysis, and make sure that the entire process goes smoothly. In the typical transaction, the following advisors below can be quite helpful. Before you hire a consultant or advisor, interview them. Ask for references and take the time to call the references and ask about their experience with that consultant. You are paying for the consultant's experience and opinions, so you will want to find a good match and one on which you can rely.

Attorney with Veterinary Transaction Experience

It is important that buyers obtain legal counsel to represent their interests in the purchase transaction. There will need to be several documents created for the transaction to occur, such as the practice sale contract, the real estate sale contract, a restrictive covenant or noncompete covenant, and possibly employment contracts with the associate veterinarians or key staff. There will also be numerous documents that you will have to sign.

Accountant

In many sales transactions, the choice of the new business entity (sole proprietor, partner, limited liability company, corporation, professional

corporation, etc.) must be made as well as other important decisions such as the asset allocation of the purchase price. Such decisions are far-reaching and can significantly impact your future tax burden. An experienced tax accountant can provide informed assistance to making these important decisions, and can also help after the purchase is concluded with taxes and future planning.

Veterinary Business Appraiser/Broker Consultants

Although sellers are enlisting the services of an appraiser to establish a value for their practice, buyers are often left with limited or no counsel.

Lenders will definitely provide a second perspective on the affordability of the purchase, but do not usually consult beyond that point.

Veterinary Appraiser/Broker

The appraiser can help with the purchase affordability analysis and by providing support in the data analysis and the negotiations. His or her experience can also help with other issues such as coordinating the contract contingencies, planning the transition, and finding management consultants after the sale to help the buyer grow their practice.

7.24. BUYING INTO A PRACTICE AS A PARTNER

BASICS

OVERVIEW

There are many factors that should be considered when deciding to buy into the practice in which you are currently working. To prepare, you should have a good understanding of practice ownership, owner management responsibilities, and practice value. You should also have a solid communication foundation with the current owner(s). Buying into a practice is not something that you have to or should do alone. There are many qualified consultants that can assist in the analysis, the decision-making, and the sorting of the various factors involved in the process.

TERMS DEFINED

Due Diligence: The process by which persons conduct inquiries for the purposes of timely, sufficient, and accurate disclosure of all material statements/information or documents that may influence the outcome of the transaction.

ISSUES AND OPTIONS

TYPICAL STEPS IN BUYING A PRACTICE

• The first step is to have the practice and the entity that owns the practice valued (see 14.13 – Determining a Practice's Worth). A veterinary practice appraiser should value the practice. Ideally, this would be completed prior to the owner(s) offering to have you buy into the practice. Without a known value for the practice, the owner(s) could change their timeline if the practice value is lower than expected/desired.

• Once a practice value is determined by the owner, your due diligence should include testing the value to make sure it is a fair market value. See the section on Purchase Feasibility Analysis.

• In the conversations leading up to the decision to buy into the practice, you should be discussing how the practice will be operated with an additional owner. Topics to be discussed include: owner veterinary compensation, compensation for owner management efforts, tracking and equalizing owner perks (e.g., non-operating expenses paid by the practice on behalf of an owner), the timeline for additional buy-in purchases, the timeline for the purchase of the real estate (if owned by the practice owner(s)), and so on. The financial operation of the practice and the owner compensation (in all forms) should become transparent to make sure it is fair.

• Explore and discuss the financing options (see 11.4 – Financing Basics). Although the veterinary lenders may provide the financing, the terms may not be in agreement with the current owner(s) goals. This may result in seller financing or other purchase structures. Exploring the options early helps to keep the process on track.

• Engage a veterinary attorney to review and/or prepare the entity operating agreement (aka buy/sell agreement, shareholders' agreement; see 13.9 – Buy/Sell Agreements). This document outlines how your entity will operate between the owners. It also provides structure for handling unforeseen events. Although no one wants to enter a partnership expecting the dissolution, it is good to have an experienced veterinary attorney provide insights and structure to help for those "worst case" scenarios.

• Once the practice is valued and the operating agreement for your entity is being reviewed/constructed, the documents needed for the purchase can be started. All parties should also review the tax implications of the transaction with their respective accountants.

• When the documents are ready, closing can be scheduled. Prior to the closing, the equity value of the entity should be updated. See the comments on asset value of the practice versus the equity value of the entity that owns the practice.

TIME FRAME

• The timeline for a buy-in hinges on the practice value, the buyer due diligence, and the operating agreement. There may also be additional negotiations needed on the details such as owner employment contracts, the facility lease, financial transparency, and so on.

• For tax and financial tracking purposes, buy-in closings are frequently timed to the end of a quarter, especially June 30 and December 31.

ASSET VERSUS EQUITY VALUE

When your goal is to buy into a practice, it is important to recognize that you are not buying a portion of the practice, rather you are buying into the entity (see 14.11 – Business Entity Structures) that owns the practice (S corporation, LLC, partnership). The typical practice appraisal concludes with the fair market value (FMV) of the practice. This is the value of the practice as if it were being sold on the market. This is referred to as the practice asset value and it is a debt-free determination. It is not the value of the entity that owns the practice.

The entity that owns the practice may have other assets (an emergency fund, investments, accounts payable) and other debt/liabilities (equipment leases, line of credit, accounts payable) that are typically not included in the practice asset value. The entity value is referred to as the equity value as it takes into account all of the entity assets (including the practice) and all of the entity liabilities.

The equity value is calculated on the entity balance sheet. Typically the first balance sheet is done as of the valuation date and uses the practice asset value. Then as you approach the closing on the buy-in, the balance sheet can be updated to a more current date and the associated account balances.

PURCHASE FEASIBILITY ANALYSIS

For most buy-in opportunities, the seller provides the purchase price and terms, usually based on the practice valuation. Although a buyer can have a second appraisal done, it is possible to save time and money by first focusing on whether or not the purchase price is a feasible price. In other words, focus on answering the question: If I purchase X% of this practice under the asking terms, will I have adequate cash flow to service the debt, pay taxes, and still be able to support my lifestyle?

A purchase feasibility analysis is the means by which that question can be answered.

• If there is positive cash flow after paying the debt and the taxes, then the purchase price is at least theoretically reasonable and you can move forward with your goal of considering purchase of the practice.

• If there is not positive cash flow, then either the price is not reasonable or your personal budget requires a practice that is capable of providing a greater cash flow.

• If there is not positive cash flow and you believe that the price is not reasonable, then the analysis provides the evidence to support your negotiation with the owner to adjust the purchase price.

Essentially, the goal of a feasibility analysis is to forecast the discretionary cash flow that will be available to the buyer:

• after purchasing the practice,
• after accounting for the costs associated with operating the practice,
• after payment of all taxes and all debt requirements.

The remaining discretionary dollars represent the funds available to lead a reasonable lifestyle (i.e., raise a family, buy a home, and so forth).

Step One: Adjust the Financial Statements

• The financial statements and tax returns that the buyer will receive are designed to minimize taxes and, as such, rarely reflect the true profit derived from owning the business (see 7.2 – Financial Statements). Therefore, the first step in the analysis is to examine the practice's financial operation to determine a reasonable estimation of the practice's profitability.

• The true profitability of a practice is determined after accounting for all normal operating expenses, including the facility rent and the

owners' veterinary compensation. It is the resulting share of the profits that will allow a buyer to pay the debt service and taxes and have the funds on which to live.

- In order to obtain an estimation of the practice's true profitability, it is necessary to adjust the financial statements (see 7.11 – Understanding Practice Profitability). Usually, adjusting the financial statement involves identifying non-operating and nonrecurring expenses that the owner put through the practice.
- Adjusting the income statement is not a simple, formulaic process. It requires a solid understanding not only of this practice and how it operates, but also a broader understanding for comparison purposes of how practices operate in that region and nationally. Because of this, it is usually necessary to work with a veterinary consultant to have the analysis completed.
- When the analysis is complete, the result is a financial history of the practice, its financial operation, and its profitability. This forms the foundation of the second step, which is to look forward and project what will happen if the purchase occurs.
- The adjusted income statement for the practice also provides a foundation for the financial transparency needed for a long-term, successful multi-owner structure.

Step Two: Projecting Future Cash Flow

This step seeks to assess what would happen if the buyer purchased a portion of practice under current operations. This is done in several stages:

1. There are several variables that need to be defined, including the seller's asking terms for the practice:
   - Loan information (length of loan, interest rate, loan amount) for the practice loan
   - The practice's historic level of adjusted profitability from Step One
   - Estimates for the practice's future growth and profitability, based on the Step One analysis
   - Estimates for the federal and state taxes going forward.
2. These variables are then used to project the cash flow to the new owner. It begins by growing the practice forward a year and calculating the cash flow that the new owner will receive. This includes:
   - The profits from operating the practice
   - Compensation for the owner's efforts as a practice veterinarian
   - Any other income stream associated with the ownership purchase.

   The total is the gross amount the buyer will have as a result of purchasing the practice. Unfortunately, the buyer does not get to keep all of it. There is still the debt to service and taxes to pay.
3. The next stage involves calculating the costs associated with servicing the debt, principal, and interest, and with paying the taxes. (The tax estimation is typically a general estimate for state and federal taxes, but usually does take into account estimates for depreciation and interest deductions if appropriate.)

The conclusion of the purchase feasibility analysis is an estimate of the cash flow that would be available for a buyer to live on. Whether this amount is enough for you will depend on your personal financial needs. Because this is an after-tax number, it often helps to have the number "grossed-up" to a before-tax value, which is then similar to a salary.

If the determined cash flow amount is reasonable, then the purchase price is an affordable price for you as the buyer. This should be true regardless of the percentage purchased. If the resulting amount is not reasonable, then it is necessary to make sure that the practice data are correct. If the data are correct, then the purchase price may be too high or too low, or the terms of the deal may need to be adjusted. Either way, this analysis provides the information to take the best next steps.

USING CONSULTANTS TO HELP WITH THE PROCESS

A buyer does not have to be and should not be alone in this process. There are numerous veterinary consultants who can help with the due diligence process, perform the feasibility analysis, and make sure that the entire process goes smoothly. See 1.17 – Practice Management Support Professionals for more information on the types of consultants that are available to assist you.

7.25. PRACTICE SALES: PLANNING, STRUCTURE, AND METHODS TO MINIMIZE TAXES

BASICS

OVERVIEW

- Veterinary practice sales usually occur in one of two formats – asset sales or stock sales.
- Taxation of seller and deductibility for buyer varies depending upon what is sold.
- Typical assets sold include furniture, fixtures, retail fixtures, equipment, goodwill, inventory, noncompete agreements, patient records, and accounts receivables. Goodwill may be company or personal or some combination of both.
- Typical stock sales include stock or membership interests in a specific entity.
- Federal tax rates for different items being sold vary from ordinary income tax rates to depreciation recapture rates to capital gains rates.
- State tax rates are also applicable and will vary by state. Some states may charge transfer taxes and some municipalities may charge tax.
- Government entities may change tax rates, which can affect taxation of existing or future transactions.
- The sale of a practice generates higher taxable income the year of the sale which usually triggers additional alternative minimum tax and the loss of some or all deductions and exemptions. This additional tax and phase-out of deductions or exemptions are applicable at higher income thresholds (which vary based upon financial parameters and marital status).
- Appropriate tax planning of a sale can result in significant tax savings or tax deferral.
- Section 1031 exchanges and 721 contributions are IRS-approved tax deferral tools used to partially or completely roll over a seller's tax basis into a new asset or entity.
- Installment sales are a method of deferring current tax on a sale until later tax years when principal is paid.
- Seller financing, intermediary installment sales, deferred sales trusts (DST) and structured sales are all types of installment sales to defer tax.
- Comparisons (using comparable rates of return and appropriate state and federal tax rates) between paying versus deferring taxes can provide insight into the benefits of tax deferral.

TERMS DEFINED

Alternative Minimum Tax: Special tax system calculated on tax returns of itemized filers. Typically applicable to taxpayers with significant deductions or preferences, passive losses, or capital gains.
Asset Sale: Sale whereby some part of the sale price is allocated to items which can be expensed, depreciated, or amortized by a buyer.
Capital Gains: The increase in value of a property above your investment cost basis.
Deferred Sales Trusts (DST): An installment sale to an independent trust followed by a sale to an ultimate purchaser.
Depreciation: Monetary amount of estimated annual normal wear and tear on assets or property improvements deducted annually from tax basis of property. Not applicable to land.
Installment Sale: A sale whereby any part of the purchase price is received in a tax year subsequent to the year of the sale.
Intermediary Installment Sale: An installment sale through an intermediate LLC entity (usually with family members) followed by a sale to the ultimate purchaser.
IRS Section 1031: "No gain or loss shall be recognized on the exchange of property held for productive use in a trade or business or for investment if such property is exchanged solely for property of like kind which is to be held for productive use in a trade or business or for investment." This technique is used primarily in real estate sales to roll over the seller's cost basis from a relinquished property into a replacement property with no current tax due if rules are followed for complete tax deferral.
Rate of Return: The amount an investment appreciates or depreciates over time.
Relinquished Property: The property being sold.
Replacement Property: The property being purchased.
S-Corporation: A corporation that has between 1 and 100 shareholders and that passes through net income or losses to its shareholders.
Stock Sale: A sale where a seller sells an interest in some type of entity, typically an S- or C-corporation, or limited liability company (LLC).
Structured Sales: An installment sale whereby an installment obligation is assigned to an insurance company for an annuity payment.
Tax Basis: Total purchase price of property plus additional improvements minus all accumulated depreciation.

ISSUES AND OPTIONS

TYPES OF PRACTICE SALES

Practice sales and practice real estate sales are typically either asset sales or entity (stock or LLC interests) sales. Asset sales make up the majority of practice and real estate sales. Buyers generally prefer asset sales as they can get a deduction over time for assets purchased, and lenders generally prefer asset sales as they have some hard assets for security (equipment and inventory, possibly real estate). The biggest practice asset sold is goodwill, usually at around 80–95% of the sale price allocation. The remaining cost is usually divided among furniture, fixtures, equipment, inventory, noncompete agreements, patient records, and accounts receivables. Most practice business loans are based on the cash flow of the operating enterprise, and lenders will securitize the fixed assets, but they are usually not a comparable amount to their total practice loan.

Sales where the entire practice or building is sold are rarely entity sales, as in entity sales the buyer assumes the tax basis for all assets in the entity (thus assuring significantly less future depreciation and other tax deductions) and assumes all the past liabilities of the entity (both known and unknown). Even though the liabilities may be indemnified against in a purchase agreement, the lack of significant ability to write off the majority of the purchase price via future deductions is a huge stumbling block to entity sales. Most entity sales are transfers of partial entity interest or stock to a partner or associate as part of a phased purchase buy-in or exit strategy in large group practices, or sales of C-corporation stock where an asset sale would entail significant detrimental tax cost to a seller. Because of these negative attributes, many times entity sale prices are discounted. Taxation of entity sales is at capital gains rates, and tax deferral methods described further are applicable.

7.25. Practice Sales: Planning, Structure, and Methods to Minimize Taxes

Many of the sales occurring today are partial sales to associates. These have historically been transactions where the owner carried an installment obligation from the buyer, and because of this there has been some reluctance on the part of owners to part with cash flow streams they already have to finance a purchase by someone else. In the current lending environment and using some of the tax deferral techniques described further, an owner may sell a portion of practice assets or entity to an associate and incur no current taxes on most or all of the transaction (depending upon structure and allocation of what is being sold). The buyer obtains a loan for 100% of the cost of the assets or entity interest, and the buyer (and possibly the practice) guarantees the purchase debt (but not the selling owner). Lenders today may in some circumstances loan to the purchaser with the only security being the entity interests being purchased. This scenario has facilitated many more transactions due to the perception of it being an arm's length cash transaction and the owner not having to be the lender for the associate/partner.

TAXATION OF PRACTICE SALES

Taxes due on the sale of a practice (Table 7-25-1) include the following:

- **Depreciation recapture income tax:** In an asset sale where the assets being sold utilized shorter term depreciation or expensing (typically equipment), then depreciation recapture income generated by the sale of these assets is taxable at ordinary income rates (state and federal) the year of a sale (regardless of the tax deferral method).
- **Depreciation recapture tax:** Real estate depreciation is currently recaptured at a 25% federal tax rate (plus applicable state rate) on the sale of most real estate where the sale price of the asset is above the current adjusted tax cost basis. In partial tax deferral situations (i.e., mixed cash sales with 1031 exchange or installment sales), this tax is paid completely before any capital gain taxes are assessed.
- **Capital gains tax:** Taxes on gains are computed from the net sales price of an asset minus the original cost, plus improvements. Current federal tax rate on most capital gains is 15% (plus applicable state tax rate), but for individuals with incomes above $400,000 single and $450,000 married this rate will be 20%. This is typically applicable to gain in practice goodwill or real estate value, and the higher rates will apply to most practice sales because of the concentration of income and capital gains the year of the sale.
- **Alternative minimum tax (AMT):** Long-term capital gains count 25% toward the phase-out of the AMT exemption. The net effect could be the exposure of additional income to the AMT if there are significant capital gains (which typically occurs at the time of a sale), and an effective capital gains rate of greater than 20%. An AMT analysis should always be performed with any proposed sale transaction at higher price levels where this applies.
- **Ordinary income tax** in most sales is applicable to any employment, consulting, or noncompete agreements, as well as inventory allocations. Future income as a result of employment agreements has the potential to expose much of seller's future social security income to taxation.
- **Net investment income (NII) tax at 3.8% on investment income:** Income from assets used in a trade or business is excluded from the NII tax, so it is not applicable to practice sale income. If a seller has other investment income, the sale of a practice without some type of tax deferral could easily push a seller (who previously did not qualify) into the income bracket whereby the NII tax is applicable on any other investment income, making it an effective tax on the practice sale. In addition, some sellers retain the practice real estate as rental property, and a future sale of that rental property plus the rental income would be subject to the 3.8% NII (as it was not property used in a trade or business if the doctor is retired).
- **Loss of deductions/exemptions:** At adjusted gross incomes above $250,000 single and $300,000 married a phase-out of both personal exemptions and itemized deductions will occur. The net result is an exposing of more income to taxation, and this is more likely to occur in the year of a sale.
- **State income tax:** State rates vary from 0 to 13.3%, with many states enacting temporary surtax increases to help fund budget and pension deficits (Table 7-25-2). In some localities, there may also be local tax on the sale and some states impose transfer taxes.

TAX DEFERRAL TECHNIQUES

Tax deferral on an asset sale is accomplished by many varied techniques. The traditional method that has been in existence for many years is an installment sale. The IRS has issued significant guidance on installment sale compliance. An installment sale is an asset sale with a gain whereby some of the payment is received in a year subsequent to the year of the sale. Installment sales allow sellers to defer current taxation for both real property and intangibles (typically goodwill).

Table 7-25-1. 2018 taxation on the sale of practice assets.

Asset type	*Seller tax*	*Buyer deduction*
Real estate	Real estate Depreciation Recapture + capital gains	39-year depreciation
Furniture, fixtures, and equipment	Ordinary income	Depreciate 5–7 years
Inventory	Ordinary income	Immediate expense
Goodwill	Capital gains	Amortizable 15 years
Patient records	Capital gains	Amortizable 15 years
Any entity interest	Capital gains	None

Table 7-25-2. 2013 tax rates in the United States.

Type of tax	*Federal rate*	*State rate*
Ordinary income	25–39.6%	0–13.3%
Capital gains	15–20%	0–13.3%
Depreciation recapture	25%	0–13.3%
Alternative minimum tax	0–4%	0
Net investment income tax	3.8%	0

7.25. Practice Sales: Planning, Structure, and Methods to Minimize Taxes

Installment sale income typically consists of three parts: interest income on the obligation, return of capital (adjusted cost basis in the property), and gain on the sale (both depreciation recapture and capital gain). Installment sales are often a necessary evil in practice sales, as buyer's equity plus outside lender financing available may not equal the entire purchase price. In today's markets, 100% practice financing is rarely seen, thus installment obligations may be required to complete the transaction. Installment obligations also carry credit risk to the seller, and mitigation of that risk by other installment sale techniques that might enhance the credit risk of the buyer may be considered.

IRS Section 1031 exchanges are typically used for real estate tax deferral by selling an investment property and exchanging into another investment property. These are primarily used when practice real estate is exchanged for another investment property. We rarely see this on practice business sales because most times the primary asset being sold is goodwill, and goodwill is specifically excluded from being exchanged. Characteristics of a 1031 exchange include the following:

- Properties must be exchanged for like-kind properties. This is determined by IRS asset class, and for real property exchanges this class is very broad. It may include any deeded real property for investment or productive use. It may not generally include LLC interests, stock/bonds, or property that is personal use, inventory, or stock in trade.
- Properties must be identified properly, with written identification within 45 days of the sale. There are three methods of identification allowed based upon IRS regulations (the three-property rule, the 200% rule, or the 95% rule). Failure to properly and timely identify exchange replacement properties can invalidate an exchange.
- Exchangers also have 180 days to close on their identified replacement property, or properties, to comply with IRS provisions.
- The IRS has issued many rulings clarifying reverse exchanges, construction exchanges, vacation home exchanges, related party exchanges, exchanges into a personal residence, and refinancing surrounding an exchange. Several are areas of significant IRS interest due to frequent abuse, and additional regulations and reporting have been implemented in the last few years.
- For complete tax deferral, exchangers must replace all equity and all debt from the relinquished property into the new property.

Intermediary LLC installment sales and deferred sales trusts are installment sales to an independent entity. They rely upon compliance with installment sale law for tax deferral, and are structured in a manner to suit the asset seller's income needs. In these, assets are sold to the independent entity in exchange for an installment note, and the LLC/trust then sells the assets to the end buyer in return for the payment for the assets. Use of this technique significantly enhances the credit-worthiness of an installment sale versus having a note with the end-user, and defers the taxes on gain until principal payments are received on the note based upon the terms of the note. It essentially trades business risk for investment risk (which can be controlled). The assets are kept segregated in an independent entity account and the seller has the sole security interest on the assets. Assets are typically invested in market-based investments (stocks, bonds, notes, separately managed accounts) and are held in custody at national firms (e.g., Schwab, Fidelity, TD Ameritrade, etc.). The interest rate on the installment obligation is related to the investment objectives and risk tolerance of the seller, as investments meeting those criteria can affect the rate of return on assets. Terms of the note can vary depending upon the needs of the seller, with both the duration and the amount of principal paid on the note based upon the income needs of the seller and the amount of tax deferral desired.

A 721 exchange may be utilized (with restrictions) for contribution of assets or entity interests to a partnership or LLC entity in exchange for entity interests. There is no tax cost to this contribution, unless monetary consideration is also given at the time of the contribution. Restrictions on distribution of the property received by the entity or monetary exit by the seller may be in place for several years. Section 721 exchanges are utilized by both real estate firms and businesses to acquire assets they wish to own without paying cash for the assets. The contribution benefits the contributor by gaining assets in a more diversified entity without any out-of-pocket cost or tax cost. The primary use is practice mergers or buyouts where the seller wants stock or partnership interests instead of cash, or a buyer wants to acquire additional assets without having to purchase for cash. The form in veterinary transactions currently is contribution of some or all of a practice's assets to a veterinary private equity parent company as an investment. Veterinary private equity investments have had significant appeal to veterinary practice sellers as tax-deferred investments with significant growth potential. It is also increasingly being utilized in joint venture situations where a practice owner sells a partial interest in a hospital to a veterinary company and retains a portion with future exit rights and pricing determined. Both of these are effectively combining exit and tax planning with investment planning, which is more a more common in the veterinary market today. These 721 contributions may also be used in planning for future exit strategies for older veterinarians, as a merger with another local hospital may lock in a future buyout by the merged group of the contributing owner. Other effective mergers may occur when one practice simply purchases the assets, patient records, and cash flow of another and absorbs them into the purchasing practice, but any cash consideration paid at that time would be taxable unless additional tax deferral methods described here are employed. This contribution/merger approach is becoming increasingly common as an exit strategy for practice owners. Section 721 contributions are also commonly used in real estate transactions, whereby the real estate owner contributes the property to a real estate entity (LLC, REI) in return for membership interests or shares in a diversified entity.

7.25. PRACTICE SALES: PLANNING, STRUCTURE, AND METHODS TO MINIMIZE TAXES

CAUTIONS

Tax deferral techniques may not recognize current gain in an asset sale, potentially allowing those assets to receive a step-up in basis at the time of death and the sale taxes never to be paid. Other techniques postpone the date which the taxes are due and allow the seller to generate substantially more income than would be generated after a taxable sale on the higher pre-tax proceeds which are invested and paying interest on an installment note. Looking at the portion that is tax-deferred, under the current tax rate environment (15–20% capital gains tax rate) the difference in the amount of assets and potential return generated from these assets is usually 20–40% depending upon the state tax rate and applicability of alternative minimum tax. Under the 20% capital gain tax rate, in a taxable transaction the minimum differential of income generated by utilizing tax deferral methods is 25% (assuming no state tax) and could exceed 50% in states with high tax rates. This is extremely material to many sellers as they (in many circumstances) are relying on cash flow and growth from the assets generated by the sale of the veterinary practice to fund retirement income.

7.26. PLANNING FOR THE SALE OF A PRACTICE

BASICS

OVERVIEW

Selling a practice requires planning and preparation. It is probably the largest financial transaction made during a practice owner's lifetime and involves much more than just setting a price. Advance planning, providing for the continuity of practice operations, and preparing the facility for sale are a few of the essentials necessary to help maximize the transaction. If you are planning your future, you should be asking yourself:

- Why are you selling?
- Is it really time to sell or are you just reacting to other issues?
- What are you going to do after the sale?

Selling a practice can be a significant change for the practice owner and the owner's family. Proper advance thought and preparation will help keep the process smooth and on track see 14.21 – Succession Planning).

Note: It is often helpful to view the perspective of a buyer during this process, and it is important to understand that it is a practice's profitability and not its revenue that drives the practice's value.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

TIME FRAME

- It is not possible to predict how long it will take to sell a veterinary practice. If you do not have a buyer identified already, the primary factor will be where the practice is located. If it is where buyers want to be, then 1–6 months may be typical. If it located in a less-desirable region, then it may take a year or more to find the buyer that wants to be there. Additional factors include the type of practice (small/large animal, species specific, holistic/alternative medicine, etc.), the quality of the practice, the size of the practice, and how realistically the practice is priced.
- Once an offer is accepted, the timing will typically be 2–4 months but this depends upon how the contract details proceed, the third-party involvement (real estate appraisal, survey, inspections, etc.), and how the financing comes together for the practice and the real estate.

WHAT ARE BUYERS SEEKING?

Buyers today typically have been practicing for 4–10 years. They are both male and female, and for most of them, balancing practice ownership with personal quality of life issues is important. They are usually willing to wait for the right practice. In general, the practices that sell the quickest are the following:

- Small animal
- Located in or near major metropolitan areas
- Having access to emergency facilities
- Grossing more than $450,000.

PRACTICE DATA YOU CAN EXPECT TO PROVIDE TO A BUYER

The following list contains the documentation that the practice broker, appraiser, buyer, lender, and/or buyer's consultant will be requesting at some point during the sale process. The more you have collected the better:

- Copies of the practice's tax returns and financial statements for the last three years
- A recent year-to-date profit and loss statement (income statement) and data from the same period for the previous year
- Data on the practice's productivity: revenue by category, revenue by doctor, number of active clients, amount of the accounts receivable
- An employee census, a copy of the employee manual, and job descriptions
- A copy of the practice's fee schedule
- A legal description of the property if it is for sale
- A copy of the lease if the property is not for sale
- A listing of the major practice equipment that will transfer in the sale. In general, make, model, and serial numbers will be needed for anything that has a value over $1,000
- A list of what will not transfer in the sale, such as personal items in the practice, artwork, your first microscope, etc.

FOR SALE BY OWNER OR HIRE A VETERINARY PRACTICE BROKER?

- Similar to selling a home, a practice can be sold by the owner or it can be sold using a veterinary practice broker. Both routes can be successful.
- Most practice brokers work on a commission that is paid at the time of closing the sale.
- In general, veterinary practice brokers often help manage the process to keep it moving forward so that the owner can focus on continuing to run the practice. They also can usually market the practice to a broader audience than can an owner. As specialists in veterinary transactions, their experience and knowledge can save time and energy – it can also help avoid pitfalls and problems that could derail the transaction. They can also help create a smoother transaction by assisting in the financing, the lender's closing contingencies, by helping everyone involved to the closing table and by guiding the transition to the new owner.
- It is best to interview potential brokers to discuss their philosophy, the sales process, and the services they provide to determine whether or not it would be a good match to help you reach your goals.

PLANNING YOUR EXIT

Three Years Before Putting the Practice on the Market

- Make quality time to write down goals, develop a timeline, and consider life after practice (see 14.21 – Succession Planning).
- Have a baseline practice valuation performed by a competent veterinary practice appraiser.
- Use the practice value to review the tax and financial implications of your exit with your advisors.
- Identify areas where improvements can be made that will improve practice's financial health and its value.
- Manage the practice for revenue and earnings growth.
- Consider hiring a practice consultant to help ensure at least two years of profitable growth prior to sale.
- If possible, identify potential practice buyers.
- Take an active role in the practice; begin delegating management responsibilities to key staff.
- Concentrate on enjoying practice and avoiding burnout.
- If you do not have an emergency center nearby, consider setting up emergency rotations with colleagues in the area (most buyers do not want to take after-hours calls).
- Make sure there are no unsettled environmental concerns (buried gas tanks, x-ray chemicals, etc.) or other real estate issues that will impede the sale of the real estate.
- Resolve any real estate zoning compliance issues that might impact transfer.
- Have a building inspection done and take care of any deferred maintenance issues.
- If the practice is not computerized with practice management software, perhaps it should be.

7.26. PLANNING FOR THE SALE OF A PRACTICE

One Year Before Putting Your Practice on the Market

• Clean the facility thoroughly, repair cosmetic damages, paint, landscape, and so forth.
• Upgrade the practice to current standards (imaging, computer management system, etc.).
• Secure current employment agreements that include non-competes with your associates. This can be a significant issue for the buyer and the lender.
• Ensure that any facility lease has a life of at least five years, is renewable, and is transferable or that the landlord will sign a new lease with the buyer.
• Check equipment leases for prepayment penalties (usually, all leases are paid off at closing).
• Revisit your financial needs and the tax implications of the sale. This involves meeting with a tax accountant and possibly a financial planner.
• If a commercial real estate appraisal has not been done recently, consider ordering one.
• Begin preparing the practice records for a buyer's review: the financials, contracts, employee records, and so on. See the aforementioned list of documents a buyer may request.
• Compile inventory and equipment lists of what will transfer in the sale, and a list of what will not transfer to the new owner.

A COMMENT ON THE BUYER'S FIRST IMPRESSION

Although the location is the major variable, the first impression does matter. Without a doubt the physical appearance of the facility, the friendliness of the welcome, and the first few minutes talking with the owner will have a huge impact on how easy or difficult the potential buyer thinks that the practice will be to buy. Devoting some time, effort, and a few dollars to "put the practice's best foot forward" will go a long way to expedite the sale and for the right price. There is only one first impression. Much has been written on the subject, and intuitively most people recognize its truth. Arguably, a first impression can set the tone for future interaction or influence someone's opinion and choices. Sellers should ask themselves questions like these:
• What will the buyer see when he or she drives into the parking lot?
• How well placed is the signage?
• Is the exterior in good shape and freshly painted?
• How is the landscaping?
• Once inside, will the potential buyer smell any strong odors?
• Will they find the hospital tidy and well kept, or are yellowing and tattered posters taped to the walls?
• What about the back areas of the hospital? Does it look like someone has picked things up off the floor just long enough to mop?
• Is everything organized and current, or are there piles and stacks of archaic supplies and unused equipment?

When a buyer visits the practice, it is better for them to focus on the practice's philosophy, growth rate, profitability, and future potential than on the cleanliness or lack of organization. Major remodeling is unnecessary, but organizing, cleaning, and light touch-up painting will go a long way.

GETTING THE PRACTICE TO THE MARKET

• If utilizing a veterinary practice broker, their first step will be to establish the purchase price for the practice, typically the fair market value (FMV). If you are not working with a broker, have the practice valued (see 14.13 – Determining a Practice's Worth). Although there are many business appraisers, it is important to make sure that the appraiser understands the market for veterinary practices and how they transact. Appraisals are opinions of value, so you want to find the most reliable opinion as it can save time and frustration later in the sales process.
• Prepare the facility to show to potential buyers (clean, paint, prepare the grounds, etc.).
• Prepare a detailed information packet on the practice that can be presented to interested buyers. It should include the following items plus any others that will contribute to the buyer's understanding of the practice and the community:
  ◦ Practice and real estate purchase prices
  ◦ The history of the practice
  ◦ Reason for selling and seller's plan post-closing
  ◦ Description of the facility, including major renovations, the value of the real estate, and a floor plan
  ◦ Description of services offered by the practice
  ◦ Samples of the practice's promotional materials such as brochures, website, and directory advertisements
  ◦ A list with comments on the other veterinary practices in the area
  ◦ Descriptions of opportunities and clinic potential that a new owner could pursue
  ◦ Pictures of the practice, inside and out
  ◦ Information on the community surrounding the practice, such as demographics, the school system, recreational opportunities, or special activities.
• Prepare the additional data (previously mentioned) that an interested buyer will request, usually after visiting the practice.
• If for sale by owner, prepare a marketing plan for sale of the practice. If working with a broker, review their plan with them.
• If selling the practice by yourself, consider contacting national, regional, and state professional journals and magazines to place classified ads.
• Send out direct mail to potential buyers.
• Prepare to work with the potential buyer's advisors (attorney, accountant, lender) as they will be requesting additional information and clarifications as they work through their review of the practice and the contracts.

MYTHS THAT IMPACT TRANSACTIONS

The following statements are often believed, but are not supported, by what veterinary practice brokers, appraiser, and consultants observe in the market:
• A practice is worth 70–80% of gross revenues. Not true. Each practice is different, and there is no single rule that covers all practices. There are many variables that influence practice value, the most significant of which is its profitability. Based on actual transactions, practices can sell from 25–120% of gross revenues.
• If I take cash out of the practice (unreported) it can still count as profit. Unreported income cannot be recognized when determining the practice value. Essentially, unreported income is taking the value out in tax savings. Make sure all income is reported at least one full tax year (two years are preferred) prior to valuing and selling the practice.
• I run other expenses through the practice and just add it back as profit. Although many non-operating expenses can be recognized, the lenders' tolerance for such add-backs is minimal, especially when trying to approve the loan. As a part of your exit plan, the cleaner the books are the smoother the transaction.
• As long as the profit is high, any practice in any location will sell easily, or "location, location, location" does not apply to veterinary practices. Not true. Location is very important with respect to how quickly a practice will sell. An underperforming practice in a great location (suburban/urban, popular city) will sell quicker than a profitable and growing practice in an undesirable location (rural, unpopular towns).
• A buyer should pay more because there is great potential here. In general, potential has attractant value but it may not have monetary value. A buyer's decision to purchase will take into account the potential, but ultimately they will pay for what they are getting. In other words, what is already in existence, not what "could be." If there is great potential, attain it and then sell if you want to include it in the purchase price.

7.26. Planning for the Sale of a Practice

A COMMENT ON PRACTICE VALUE

The purchase price for a veterinary practice is important, and there are a few perspectives you should be aware of as you prepare to sell your practice:

- As the owner of a practice, you receive income from several different sources:
  - Compensation for your efforts as a practicing veterinarian
  - Compensation for your management efforts (sometimes this is included with your veterinary compensation)
  - If you own the practice real estate, then you should receive a fair market rent from the practice
  - A return from owning the practice; that is, the profits from the business after all operating expenses have been paid.
- The return from owning the practice is the factor that has the greatest impact on practice value – the greater the profitability, the greater the practice value. Therefore, the higher the practice value, the more profit the owner should receive from owning the business, and the more a buyer will be willing to pay for the business.
- When a practice is properly appraised by a veterinary practice appraiser who is familiar with the market for veterinary practices, the fair market value purchase price will provide enough cash flow after the sale for the new owner to live on after servicing the debt and paying taxes.

Because of these factors, for most educated buyers the practice price is not the primary driver in their decision to purchase your practice. They will focus on whether they like the practice and whether it has what they need to help them attain their personal and professional goals.

A COMMENT ON CORPORATE BUYERS

In addition to the fair market value buyers, the recent years has seen a marked increase in the corporate buyer, or the consolidators – entities that are buying multiple practices nationally or within a target region. The purchase price paid by the consolidators can be fair market value or it can be considerably higher depending on that buyer's competencies, strategies, and goals.

There are often many details beyond the price that needs to be negotiated. The first offer may not be the best offer. Pay attention to all of the details and work with professional advisors to help with the process.

CHECKLIST FOR CLOSING A PRACTICE SALE

Once a sale price is agreed upon between the buyer and seller, there are many steps necessary to move the transaction to closing.

1. Come to an agreement on the purchase price. A good fair market value appraisal will save time in the negotiations.
2. Work with the attorneys and accountants to negotiate and agree on the purchase contracts (see 13.9 – Buy/Sell Agreements). The contracts will typically address the following:
   - The purchase price and the allocation amounts for tax purposes
   - The financing terms, especially if there is an owner-financed note
   - Closing contingencies – a checklist, for both the buyer and the seller, of what will need to be done prior to the closing
   - When/if the earnest or deposit money will be collected and how it will be handled
   - Disposition of employees, especially the associate veterinarians
   - The noncompete agreement between the buyer and the seller; usually larger than an agreement between a practice owner and an associate veterinarian (see 13.11 – Noncompetition)
   - The target closing date
   - Which party is responsible for which closing cost and what items need to be prorated
   - Identification of the equipment that will transfer in the sale, and the items that will not transfer with the sale
   - Deed for the real estate and the legal description
   - The transition period and seller employment after the sale, if any
   - Indemnifications for the buyer and the seller
   - Disposition of accounts payable and accounts receivable
   - The buyer's credit check, if the owner is providing additional financing.
3. Assist the buyer in obtaining financing. The lender(s) may need additional information in order to provide formal approval on the loan(s).
4. Receive confirmation of the buyer's formal loan approval.
5. Satisfy all contingencies of contract.
6. When real estate is involved, the real estate appraisal, a building inspection, and possibly a formal survey will need to be completed.
7. Identify where the closing will be held – typically a local title company or in the office of one of the attorneys.
8. If needed, work with the title company for the lien releases and the title searches.
9. Confirm that the buyer has all needed insurances (life, disability, business overhead, workers' compensation, etc.).
10. Discuss with the buyer how to handle notifying the staff and the clients about the sale.
11. Review settlement statement from the title company or attorneys.
12. Set up closing appointment with title company or attorneys.
13. Confirm closing date and time with lender.
14. Confirm money transfer from lender to escrow account.
15. Notify all vendors and utility companies to close or transfer accounts as of closing date. The buyer will open new accounts after the closing.
16. If needed, confirm inventory with buyer the day before closing.
17. Attend closing and sign many documents; receive the proceeds of the sale.
18. Begin the transition process, which may include a letter to clients, a practice open house, and an article in the local newspaper.

SHOULD YOU SELL THE PRACTICE REAL ESTATE?

- Although the real estate does not have to be sold with the practice, in most situations the buyer will want to purchase it because:
  - the practice will pay a fair market rent to whomever owns the real estate and the rent amount is usually enough to cover the mortgage,
  - there are many commercial lenders who make it possible, usually with small down payments, to finance the entire deal.
- Why not keep the real estate?
  - Although the real estate represents a good investment, veterinary practices are special-use buildings. Should the practice buyer move the practice and not renew the lease, it can be difficult to find a new tenant.
  - For investment purposes it is usually possible to find alternate investments that will provide a better return.

It is important to note that selling the practice real estate can trigger significant tax repercussions. If the proceeds from the sale are not needed and if the seller would like to defer a tax on the gains from the sale, 1031 tax-deferred exchange may be a good option (see 7.25 – Practice Sales: Planning, Structure, and Methods to Minimize Taxes). It is important that the seller discuss this with his or her accountant and a 1031 exchange specialist.

The process is similar to the capital gains deferment that occurs when selling a residence and purchasing another one, except that with commercial real estate, a qualified intermediary must be used. Also, if the seller wishes to do an exchange and fully defer all capital gains taxes, the process must begin well in advance of the closing on the practice real estate. There are requirements that must be met:

- The investor must reinvest all proceeds from the sale of the practice real estate. If all of the proceeds are not being reinvested, the balance may be taxable based on the capital gains.
- The investor must use a "qualified intermediary" (also known as a facilitator or accommodator) to hold the funds from the first sale until purchase of the new property is closed. The qualified intermediary is the person or entity who acts as the middle person in the exchange,

providing the paperwork, oversight, escrow services, and expertise necessary to ensure that the transaction legally qualifies as an exchange under Section 1031 of the Internal Revenue Code. Even though a 1031 exchange is a complicated process, an exchange using a good qualified intermediary can become a simple transaction and look surprisingly like a standard sale.

- The new investment must be a "like-kind" property. This means that any real property held for investment or real property used in a trade or business can be exchanged for any other real property held for investment or real property used in a trade or business. It cannot be undeveloped land that you would then develop.

HIRING CONSULTANTS TO HELP WITH THE PROCESS

There are numerous veterinary consultants and advisors that can help with your due diligence and to make sure the process goes smoothly (see 1.17 – Practice Management Support Professionals). Their experience and advice can be invaluable for getting the transaction to the closing table. The money you spend on consultants and advisors is an investment in your future.

Legal Consultant

- Sellers should have solid legal counsel and representation during the sale process. The days of a handshake transaction are long gone.
- If you already have an attorney who can handle the purchase contracts, it can be worth considering an additional veterinary legal consultant to provide assistance to your regular attorney. These individuals are well versed in issues related to the veterinary industry and veterinary practice transactions.
- An attorney will be a sizeable expense. However, it is important to have good representation; these are not the corners to cut during such a significant transaction.

Financial Consultants

- An accountant's advice is crucial when selling a practice as there will be significant tax issues involved in the sale of the practice and the real estate. Working with your accountant may help you to minimize the resulting tax burden.
- Another significant area to consider is your long-term financial perspective, especially if you are expecting to retire. A certified financial planner can help you explore your investment options for the proceeds of the sale.

Veterinary Business Appraiser/Broker Consultants

- A practice should be valued correctly, using sound methodology and reality checks by someone who has a solid understanding of the market for veterinary practices.
- An incorrect value will give someone the short end of the stick. If it is the buyer and the sale transacts, it could result in them defaulting on the purchase and damage to the practice; if the seller is providing financing, the practice could come back to the seller in poor condition.
- A properly determined value will be able to withstand the buyer's consultants' critical analysis as well as the analysis done by the finance company for the buyer's loans. It will also contribute to a smoother transaction, as there are fewer reasons to try to negotiate on the price.
- A veterinary practice broker provides service beyond the practice valuation to include marketing the practice, finding the buyer, facilitating the transaction, and making sure that everything comes together to a successful conclusion.

To Find the Right Consultants

- Ask your colleagues what their experience has been and who they recommend.
- Ask a practice broker and/or other veterinary consultants for their referrals.
- Contact a member of the consultants' association VetPartners (www.VetPartners.org). They can help you find potential consultants to meet your needs.
- Interview potential consultants or advisors before hiring one. You are paying for their experience and opinions, so you will want to find a good match.

7.27. Selling to a Corporate Entity

BASICS

OVERVIEW

Many practice owners love to practice medicine but reach burnout on the daily management issues that arise in every practice. Even with great practice managers, owners still feel stressed with the responsibilities for the final decisions of practice ownership and with concerns for the changing veterinary marketplace. These changes include the increase in corporate practice ownership that may seem like a threat to some hospital owners.

There are also some associate (employee) veterinarians who are theoretically ready to purchase a practice, but believe they are not qualified financially to consider purchase of a multi-doctor operation. This financial issue can also be a concern for the seller (employer).

The elephant in the room for most sellers, when they have a qualified associate that wants to buy is whether or not they can they afford to sell for a fair market value price (commonly much lower) to an associate or do they financially (for retirement or other reasons) prefer to accept a much higher investment practice value (price) from a corporate buyer, if their practice meets corporate criteria.

The corporate investment buyer may be willing to pay a price for a small animal veterinary practice that is at least 25% higher than a fair market price.

To give guidance to these seller and buyer issues we need to compare the common expectations and needs of an associate or private buyer versus a corporate buyer.

TERMS DEFINED

Corporate Buyers (or Consolidators): Small or large groups of investors that seek to purchase and hold or resell after they have consolidated the purchased small animal practices into equity group demanded size of revenue streams (usually 10–100 practices).

Normalizing Adjustments: Changes made to financial statements to make them comport to typical or "normal" circumstances. This usually involves adjusting items such as compensation, discretionary expenses, perks, one-time gains or losses, expenses or revenues related to non-operating assets, and converting certain assets and liabilities to fair market value. The goal is to convert the individualized financial statements of a potential seller to those that would be considered reasonable and realistic for a proposed buyer. For example, a seller can set their compensation at whatever they like while they own the practice, but normalizing adjustments may convert this to fair market value so that a more realistic expectation of expenses can be achieved.

Private Buyers: Individual associates at a practice or third-party private buyers. These individual buyers may be either veterinarians or nonveterinarians desiring to purchase to own an investment, where they may or may not work.

Real Estate Investment Trust (REIT): An investment company that owns and manages a portfolio of real estate properties and mortgages. Most REITs trade like stocks on financial markets, and REITs are sometimes referred to as "real estate stock."

ISSUES AND OPTIONS

The common important factors that both buyers and sellers consider in a practice purchase include the following, even though they may have a different perspective.

THE BIG THREE PRIORITY FACTORS

- **Location:** This factor is a major issue for practices finding associates and/or a private practice buyer, but not so much for a corporate buyer. They just want access to their regional management team and the presence of a demographic that will support the minimum size and growth they require.
- **Number of doctors and/or gross revenue:** Private buyers want colleagues to work with and collaborate with on medical cases, but usually do not have a minimum requirement for the number of associates. This is a big requirement for corporate buyers. They need an economy of size and efficiency to include usually three doctors and a gross revenue of greater than $1 million. Some corporate buyers have even raised their size minimum revenue to $2 million per year. Private buyers, if aware of the efficiencies and economies for a profitable practice, will usually want a practice with at least $500,000 or more annual revenue.
- **Sale price:** Fair market value (FMV) for private buyer; investment value for corporate buyer. This issue is where sellers have big choices to make and associate buyers commonly have the heartbreak of not being able to reach the financing needed to purchase, if they have to match the purchase price of an investment value that a corporate buyer will offer.

Practice sale price as calculated by veterinary practice valuators is based on historic performance and profit and loss statement analysis, verified by tax returns to conclude with an adjusted net cash flow, also known as an adjusted earnings before interest, taxes, depreciation and amortization (adjusted EBITDA). This financial result is then capitalized at a market rate generally resulting in a multiple of 4–5.2 for a fair market value, after consideration of specific subjective factors and the cost of capital.

The tough choices for sellers and associates is that corporate buyers, commonly not needing any debt financing to make the purchase, while having less risk because of their size, may make an offer of an investment value based on their needed rate of return that could bring their offer at a multiple much larger than the FMV rate, increasing price by 25% or more.

The only way a seller can help an associate buyer reach the sale price they prefer (if corporate buyers raise price to an investment value) is to help with financing secondary to a bank loan and to allow the pay-off period to be much greater than a common bank term of 10–15 years. Even then, banks may decline to lend, if the practice total debt, exceeds FMV.

ADDITIONAL FACTORS THAT MAY BE IMPORTANT TO BUYERS

Profitability or excess cash earnings of the practice on a normalized cash basis accounting or an adjusted EBITDA basis is not only the value that helps create sale price as discussed above, but it is also the cash flow that provides for the buyer's financing payment plan or the corporate buyers needed return on investment. In a FMV sale to a private buyer, generally the buyers are not as concerned about whether the normalized cash profitability is in the 5%, 10%, or 15% range, as long as the practice will provide a reasonable wage to buyer and sufficient cash for payments. But the corporate buyer will commonly not take the time to look at a practice with less than a 12–15% or greater adjusted cash flow or adjusted EBITDA.

Seller financing is a common requirement for an associate or private buyer depending on the price and financial condition of buyer. Corporate buyers of course do not need any seller financing in most cases. Some sellers prefer to carry some of the financing to maintain a source of income and to reduce sale taxes by using the installment sale IRS rules.

Partial sale initially works for some sellers and private buyers, where a seller still wants to remain in control or is willing to become an equal or minority owner over a period of years. Very few corporate buyers are willing to do any partial practice purchase, but if they are willing, typically require a majority ownership status and a controlling interest purchase.

7.27. SELLING TO A CORPORATE ENTITY

• Is seller required or able to work after sale closing? Most sellers are willing and able to work for at least 1–3 years after the sale closing if there are no health issues. Depending on the size of the practice most private buyers want seller to help transfer the goodwill of the practice for six months to 2 or 3 years, if affordable to buyer. Corporate buyers usually demand at least 1–3 years of seller commitment to work after sale closing.
• Is real estate part of the sale? Private buyers commonly prefer to purchase a practice and the real estate. Lenders like to lend (when economically feasible) on both a practice and the real estate. Corporate buyers usually prefer not to purchase any real estate. If the seller prefers to sell the real estate, some corporate buyers will have an independent party (or REIT) purchase the real estate and lease it to them.

OTHER FACTORS THAT ARE IMPORTANT TO SELLERS OR BUYERS

Choosing a successor owner for their clients is a desire of a few sellers. Of course, if they can sell to the associates they have achieved their goal. If they sell to a corporate buyer, they may choose the buyer, commonly with the help of a practice sales broker, to bring more than one soliciting corporation buyer to the offer point. But with a corporate buyer the seller's associates may continue at least in the short run, but maybe not in the long run to maintain constant relations with the seller's clients.

How long will it take to close after the buyer is found? Normally, private party buyers take much longer to close than for a sale to a corporate buyer. Corporate buyers have cash for purchase. Private buyers need financing that takes much longer, and the sale will be contingent on obtaining financing. Private buyers may take 2–6 months to close a purchase. Corporate buyers may close in as little as 45–90 days.

What is the sale process and documentation? In this area, most buyers will prefer to use a nonbinding letter of intent (LOI) to find agreement on the basic terms such as price and pay-off plans. The LOI, after some due diligence, is followed by a purchase and sale agreement also known as an asset purchase agreement (APA) that becomes binding after some contingencies are met and usually an earnest money deposit is paid to seller by buyer. Corporate buyers, do not commonly make any earnest money deposit because they are investment value buyers, paying a higher purchase price so they can get sellers to wait without payment of any earnest money.

EXAMPLES

It is typically a tough decision for the seller to make the choice to sell for a much higher price to a corporate consolidator and get cash, or to sell to an associate for a price near a consolidator price with the seller being involved in the sale financing. This reality comes home when one considers a practice with a gross revenue of $1.5 million, with a net adjusted cash flow or an adjusted EBITDA of 15%, which normally would sell on the private market for around $1.125 million or would sell to a corporate (consolidator) buyer for $1.35 million or $1.8 million. Which choice does the seller make? A private buyer cannot get corporate price financing from a third-party lender.

CAUTIONS

Selling or buying a veterinary practice is a very big financial and emotional commitment for either side. It should not be taken lightly, nor done without the help and consultation from experts on both sides. Sellers usually experience a greater financial value in sale price by using a practice broker, even if a corporate buyer or an associate has already made an offer to purchase.

Buyers likewise should use a buyer's representative, whether a consultant with experience in this field or at least one who has plenty of veterinary practice valuation experience and preferably is a certified valuation analyst (CVA) or a similarly qualified certification, to prevent overpaying for a practice that may have a pay-off period of one to two decades or more.

MISCELLANEOUS

ABBREVIATIONS

APA: Asset purchase agreement
CVA: Certified valuation analyst
EBITDA: Earnings before interest, taxes, depreciation, and amortization
FMV: Fair market value
IRS: Internal Revenue Service
JD: Juris doctorate or licensed attorney
LOI: Letter of intent
REIT: Real estate investment trust

Section 8

Cash Management

8.1. REVENUE STREAMS IN VETERINARY PRACTICE

BASICS

OVERVIEW

• The revenue section of a typical income statement for a veterinary practice is usually composed of just a few lines – for example, fees for professional services, refunds, and discounts – with the net of these amounts equaling total revenue for the practice.
• For more useful analysis, a detailed breakdown of revenue categories is needed so that individual revenue items (e.g., dentistry revenue) can be identified and evaluated.
• The amount in each revenue category should be expressed as a percentage of total revenue so that comparisons can easily be made between prior periods within the hospital, and also with industry benchmarks.
• From a financial viewpoint, it is generally acknowledged that diagnostic and other medical services have a higher profit margin than nonmedical income areas.
• Areas in which the profit margins are generally lower in veterinary practices include boarding and grooming services, product sales, and vaccinations. These are still valuable services to offer, however, as they are important to the quality of care, level of client service, and building of the relationship with the client.
• Other key performance indicators (KPIs), such as the number of transactions per period, the average transaction charge (ATC), and revenue per doctor, are also valuable tools for analyzing total revenue. These metrics help the user understand whether revenue is increasing due to an increase in transactions, fees, client acceptance of procedures, or other variables, and the level of doctor productivity.
• The fees charged for products and services also influence revenue, and an understanding of how fees are set and the value offered by the practice for these fees is also critical to practice success.
• There are several regularly published studies of business and financial metrics related to veterinary practices, including the American Animal Hospital Association's (AAHA's) *Financial and Productivity Pulsepoints*, the Veterinary Hospital Managers Association Insiders' Insights, and the *Well-Managed Practice Benchmark Study*. Most of the available data are for companion animal general practices.

TERMS DEFINED

ATC: Total revenue over a period of time divided by the total number of transactions during that same period; this represents the average amount spent by clients each time they visit the practice.
KPIs: Key metrics (financial and operational) used to measure performance of an organization.
Practice Information Management System (PIMS): The software system used by the practice for client invoicing, medical records, inventory, metric analysis, tracking of accounts receivable, and other revenue-related activities.

ISSUES AND OPTIONS

REVENUE CATEGORY ANALYSIS

• Although a detailed breakdown of revenue by service and product category is not usually contained in a practice's income statement, it should be readily available from the practice's PIMS (practice information management system).
• Commonly tracked categories of revenue include exam fees and office calls, vaccination revenue, outpatient procedures, laboratory income, hospitalization income, radiology revenue, dietary product revenue, pharmacy income, surgery income, dentistry income, boarding revenue, grooming revenue, and ancillary product revenue.
• Each category contains multiple individual services or products sold by the practice (see 9.5 – Profit Centers). For example, the surgery category would include the service codes for all of the different types of surgeries done by the practice. The items contained in each category should be reviewed regularly to ensure they are still services or products offered for sale by the practice, are not duplicated by another code, and are in the correct category. Each product or service should be put in the correct category and not just included in a catchall "other" or "miscellaneous" category.
• All categories should be reviewed regularly; however, the following require particular attention:
  ◦ Vaccinations
  ◦ Diagnostics: laboratory, radiology, other
  ◦ Dentistry
  ◦ Product sales
  ◦ Boarding and grooming.
• Many traditional veterinary practices do not generate as much revenue from vaccination services as they used to; the most recent studies indicate vaccination revenue in a companion animal general practice ranges from 7 to 8% of total gross revenue, depending upon the study and the year referenced. Low-cost vaccinations are now widely available, and clients often choose to have their pets vaccinated at one of the low-cost sources while continuing to visit their regular practice when the pet is sick or needs more comprehensive care. When choosing how to price vaccination services, practice owners/managers need to look at their cost of providing the service as well as the value perceived by the client for this service, the importance of these appointments in attracting and retaining clients, and how to communicate the additional value associated with higher prices if the practice charges more than low-cost alternative sources.
• Diagnostic services generally have a higher profit margin than some other income areas and may be indicative of the practice of a higher quality of medicine. The diagnostic services (laboratory, imaging, and other) in a typical companion animal general practice range from about 18 to 20% of total gross revenue, depending upon the study and the year referenced. Owners and managers in practices with diagnostic revenue that is lower than this may want to review their medical protocols, doctor and staff training programs, reminder systems, and staff and doctor communication skills to identify areas that may need improvement and ensure the appropriate recommendations are being made to pet owners.
• Dentistry revenue in the typical practice ranges from about 2.5 to 5.0%, depending upon the study and year referenced. This figure is for dentistry procedures only and does not include related services, such as anesthesia, antibiotics, and pain medications. There are some practices that focus intensely on dental care and have figures that are much higher than this. In most practices, however, this is a huge potential growth area because so many pets continue to need dental care (see 5.16 – Discussing Oral Health).
• Revenue from product sales (prescription drugs, including heartworm preventive, flea and tick products, food, and over-the-counter (OTC) products) has typically ranged from 28 to 34% of total revenue in a companion animal general practice. There has been some decline in product sales from veterinary practices because pet medications and products are now available from many

8.1. REVENUE STREAMS IN VETERINARY PRACTICE

other sources. Profit margins on readily available products have also dropped. Practice owners/managers need to closely monitor product sale metrics and focus on pricing, convenience, and communication of value in order to maintain or increase this revenue stream.
- Boarding and grooming often do not have high profit margins by themselves, but often lead to an increase in medical revenue as well as by drawing clients to the practice for "one-stop shopping."

REVENUE RATIO ANALYSIS

- Revenue ratios are calculated by dividing a particular revenue or expense amount by total gross revenue, with the result expressed as a percentage. These ratios are then compared internally from year to year, and/or with industry standards.
- Internal trend comparisons can be very useful and should include a comparison from one period to the next, as well as a comparison from one period to the same period in the prior year. Remember that it may be necessary to take into account the different number of days the practice was open in each period.
  - An example of a trend comparison would be to review total revenues for each month of a year to see if they are increasing or decreasing, and by how much.
  - Comparing data from one period to the same period in the prior year adds additional information and eliminates some of the flawed results that can be seen in businesses with a cyclical nature if only a trend comparison is used. For example, if revenue has been increasing each month but suddenly falls off in September, it may appear that something has gone wrong.
  - However, comparison with prior years may show that this always happens in September, and that even though September's revenue is less than August's revenue both are still above the same months last year.
  - Or, when comparing revenue from the first to the second to the third quarter of the current year, it may appear that a practice is doing well because the revenue is steadily increasing. But if the revenue is compared with the same quarters in the prior year, it may be noted that, although the revenue is increasing from quarter to quarter, the total for each quarter is still less than that in the previous year.

OTHER REVENUE KPIS

- Total practice revenue:
  - Revenue = Number of transactions × ATC
  - Total practice revenue divided by the number of full-time-equivalent doctors of veterinary medicine helps evaluate the productivity of the practice as a whole.
- Total doctor revenue:
  - Doctor revenue = Number of doctor transactions × Doctor ATC
  - Includes revenue for all medical and surgical services
  - Does not include revenue for ancillary services (boarding, grooming, OTC product sales)
  - Usually 85–90% of total practice revenue
  - Total doctor revenue divided by the number of full-time-equivalent veterinarians helps evaluate medical productivity of the practice.
- To review individual doctor production and efficiency, use the actual revenue generated by each veterinarian from computerized production reports.
- Conditions that cause changes in revenue KPIs are:
  - Fee increases
  - Change in transactions (number of clients or number of visits per client)
  - Change in recommendations made to and accepted by clients
  - Change in support staff (number, competency)
  - Equipment additions
  - Changes in the demographics of pet owners visiting the practice
  - Range and mix of services
  - Changes in economy
  - Discounts and missed charges
  - Efficiency.

KEY ISSUES IN FEE MANAGEMENT

- The level of fees charged is an essential part of revenue generation.
- Fees can be grouped into (1) price-shopped items (products or services), (2) products, and (3) services.
- It is first important to identify which products or services are price shopped and the price range for these services in the hospital community. With this information, the hospital can decide where to position its fees after taking into account the comparative value offered.
- When considering pricing for products, it is also important to consider clients' nonveterinary alternative sources for purchasing, including the Internet and local stores. Clients are much more knowledgeable than they used to be about the availability and cost of products from different sources.

SETTING FEES

- Setting fees is an art, not a science. There are no magic formulas.
- Most practices start with a fee schedule obtained from another practice and adapt it to their practice and changing circumstances. Ideally, a fee schedule would be constructed using a more logical method, but this is rarely seen.
- Fees have increased significantly in most practices since the early 2000s; this rate of growth is likely not sustainable in many practices.
- Ideally, there will be logic in the fee schedule – fees for particular services will be based on the cost of providing the service with equal consideration given to market forces and the value of the service to the pet owner (see 7.12 – Pricing Strategies). Services with similar value or cost should, all other things being equal, have similar prices. If a cost method is to be relied upon, the costs in the practice must be reasonably controlled. Passing inefficiencies on to clients will not work well in the long run.
- Fee levels will be impacted by the type of practice – high-end, service-oriented practices versus lower priced, high-volume practices.
- Determining how much extra can be charged to a client for the "value" the practice provides is difficult. Some of the things that impact value are:
  - Location and hours of operation
  - Convenience
  - Facility appearance
  - Practice history (years in operation, reputation in the community)
  - Competition
  - Responsiveness and reliability
  - Equipment/technology available in practice
  - Staff training, people skills, attitude
  - Relationships with clients
  - Client service.
- Factors to consider when increasing fees:
  - Impact on client visits or acceptance of services
  - Cost increases
  - Changes in client perceptions of value
  - Technology investment
  - Known areas of concern in fee schedule. Example: laboratory or product costs that are too low.

8.1. Revenue Streams in Veterinary Practice

- Some fee-increase guidelines:
  - Track consumer price index annually.
  - Identify price-shopped products and services and periodically check what they are selling for at other locations.
  - Consider a regular fee increase based on cost increases; this would generally apply to most fees except those that are most price sensitive.
  - Other, more significant fee increases will be dependent on the additional value the client perceives in the service. Price increases without value increases are not sustainable in the long run.
  - Assign someone in the clinic the specific responsibility for pulling together a general fee analysis with increase recommendations and an implementation plan.
  - Increase the fees at the same time each year.
  - Review not just the cost of individual services, but also the overall cost of a typical case or visit. Small increases to individual services may add up when the care elected by the pet owner is comprised of many services or products.
  - Move toward a more logical fee schedule. This may take time to achieve but will result in a more supportable fee schedule. Things to consider include:
    - Cost of providing services. This may be difficult to calculate for all services without special software, but even an understanding of the costs related to some of the most common services will be helpful.
    - Perception of value. Does it make sense to charge more for cage space with no daily doctor exam or less for the cage space but with an added daily doctor exam? Which brings the most value to the client?
    - Similar procedures should be priced at similar amounts unless there is a value component that will differentiate them. For example, group your surgery fees by time (short, medium, long) and by difficulty (easy, moderate, difficult). This grid will have nine boxes with time down one side and difficulty across the top (Figure 8-1-1). All surgeries that fall in a particular category, such as medium length of time to perform and moderate difficulty, should have similar fees, barring a market or client value perception reason why they should be different.
    - Track the frequency with which procedures are performed and the impact that fee increases have on that frequency.
- How to ruin a perfectly good fee:
  - The "right fee" is worthless if it gets discounted for random reasons. Well-designed and well-monitored marketing discounts may be acceptable.
  - The "right fee" is worthless if clients do not see the value and accept the recommended services. All doctors and staff should be trained in effective communication skills, and the practice must offer exceptional client service; both of these support the fee schedule.
  - The "right fee" is worthless if it does not get charged; set up systems to make sure all fees are captured and invoices are audited to verify fee capture.
  - The "right fee" is worthless if clients do not have or cannot get the money. Consider offering additional payment options and educating clients about pet insurance.
  - The "right fee" is worthless if you do not ultimately get the cash from in-house payment programs.
- A good collection policy is essential. Information to be included:
  - Who will be allowed to grant credit
  - Types of services that can be charged
  - Dollar limits

	Easy	Moderate	Difficult
Short			
Medium			
Long			

Figure 8-1-1.

Services delivering similar value to clients, and with similar costs to the clinic, should be priced similarly to clients.

  - How the policy is communicated to clients
  - Prequalification process
  - Treatment of first-time clients
  - Training of employees
  - Deposits – emergency, elective work
  - Legal requirements
  - Billing cycles/progress billings
  - Statement frequency
  - When is a bill past due
  - Collections procedure
  - Acceptance of partial payments
  - Interest
  - Who has authority to determine payment schedule or write off account
  - Who will field disputes
  - Who will determine when service should be suspended.
- To effectively enforce the policy:
  - Make sure staff members understand the policy and know that adhering to it is one of the duties of their job
  - Do not override properly made staff decisions
  - Do not make policy exceptions yourself
  - Suspend service when needed.
- Client communications about fees and payment policies:
  - Ensure that clients understand the value and necessity of the service recommended
  - Always provide cost information, including a written estimate for surgery, hospitalization, extensive diagnosis, and so on
  - Provide clients with specific information about the credit policy in advance of their usage.
- Monitor past-due accounts monthly and start the collection process early; do not just focus on old accounts. Look at dollar amounts as well as percentages in each category.

EXAMPLES

N/A

CAUTIONS

- Revenue is not effective as the sole monitor of the practice's financial health because it is not a sensitive or exclusive indicator – everything impacts it. Furthermore, it is not a measure of profitability; expenses must also be controlled.

• Though comparison with industry standards is very useful for identifying areas that a practice is successful in versus those that may need further investigation, it is important to remember that every practice is unique and industry standards are not always the "right" answer for every practice.

8.2. REVENUE BUDGETS AND FORECASTS

BASICS

OVERVIEW

• Budgets are a critical management tool for practices of all types and sizes.
• Budgeting is very misunderstood, and therefore has a bad reputation within veterinary medicine. If done properly, budgeting is an excellent tool for practice managers.
• A budget is typically the end result of a strategic planning exercise, not a number-crunching exercise. If you prepare your budget correctly, the planning comes first, and the numbers follow.
• If prepared properly, a budget should affect all business disciplines (e.g., marketing, customer service, finance, and human resources management).

There are numerous resources available to first-time and novice budget creators. Many veterinary-specific and general business conferences host budgeting workshops. Courses and instructional videos are also available on the World Wide Web at low or no cost. Networking with a fellow manager with budgeting experience is also a wise approach to creating and administering a first budget.

TERMS DEFINED

Actual Value: Actual value is obtained from real performance. Actual values are either current for the time period being studied, or they may be historical from an earlier time period.
Bottom Line: Typically, a synonym for profit, referring to the bottom line in financial statements that indicates net profit or loss.
Favorable: Historically, people described budget variances as "under budget" or "over budget." These characterizations created confusion because sometimes being under budget was a good thing and sometimes it was a bad thing. In lieu of these characterizations, the term *favorable* should be used. A favorable result is always a desirable result.
Operating Budget: The most common budget format encompasses a 12-month period of operations. Operating budgets typically include those items found on a profit-and-loss statement, but not usually items found on a balance sheet or cash-flow statement.
Projected Value: Projected value is your best guess for anticipated future performance. For example, if last year the practice generated $1,000 and next year it expects to generate $1,100, the practice's projected value is $1,100.
Unfavorable: An unfavorable result is always an undesirable result. For example, if the practice projected $1,000 in revenue and only produced $900, the result is a $100 unfavorable variance.
Variance: Variance is the difference between the projected value and the actual value for each line item in the budget. For example, if the practice's projected value for the current year was $1,100 and the actual value generated is $1,150, the variance is $50.

ISSUES AND OPTIONS

HOW TO PREPARE A BUDGET

• In preparing a budget, it is advantageous to utilize technology as much as possible. Spreadsheet software such as Microsoft Excel is the most common tool in preparing budgets. Many accounting software programs, such as QuickBooks, have built-in budgeting features as well. Use pencil and paper only as a last resort.
• Prior to beginning the budgeting process, it is important for strategic planning purposes to gather as much relevant data as possible. Two or three years of historical data provide an excellent baseline to help the practice make realistic and informed projections. A current SWOT analysis can also provide useful information for creating budget assumptions and projections (see 6.7 – Basic Tools of Marketing).
• Typically, when several people are involved in a business planning process, it takes longer to complete. However, the end result is usually better and easier to implement. Veterinarians, practice managers, technicians, and receptionists each provide their own unique insight to the planning process. Consequently, staff participation and staff buy-in is one of the most critical elements of a successful budgeting process.
• As the team works together, they should set realistic projections based on specific goals.
• It is crucial to document each of the specific goals that factor into the projections. Collectively, these goals should become the basis for an action plan with an associated timeline.
• Once the planning and goal-setting process is complete, calculate the financial outcome.
• The compiled data should be entered into a budgeting template. Accounting and spreadsheet software typically include budget templates, and templates may also be available from veterinary associations or management groups.
• Once all the data are entered, you may determine if the bottom-line projection meets the practice's needs and goals. If it does, it is time to celebrate. If it does not, then you should continually revise the projections until the desired bottom line is achieved.
• At the conclusion of each time period (e.g., month or quarter), enter the actual results into the budget template, compare the actual values with the projected values, calculate the variances, and determine if the results are favorable.
• If the results are favorable, it is time to celebrate. If they are unfavorable, you should develop a strategy to obtain the desired outcomes during the next time period (e.g., month or quarter).

EXAMPLES

To illustrate this procedure, we will review some of the steps involved in developing laboratory revenue projections:
• Collective brainstorming with key team members is a strategic component of budget preparation. Once you have identified all possible strategies to increase laboratory income, the mathematical component is simple.
• If the practice is an established entity, the team should first review actual results from earlier operational periods. In so doing, the team can establish a historical baseline from which to work. For example, in forecasting next year's projections, it would be helpful for the team to review actual data from the current year and then use that data as its baseline.
• The simplest way to increase prospective laboratory income is to increase laboratory fees. Typically, a well-established practice may need to raise its fees only by inflation. However, there may be market forces that compel an alternate course of action, such as not raising fees (usually not recommended) or increasing fees by a factor greater than inflation.
• If the practice is experiencing real growth in new client numbers, this growth should have a trickle-down effect in all departments. Therefore, it is often safe to assume that if the practice is going to grow 10% in size this coming year, then laboratory revenue should increase by 10% as well.
• Another method of increasing laboratory income is to capture potential lost charges. The chapter on patient and procedure logs (see 9.2 – Patient and Procedure Logs) outlines the steps involved in this process).
• Many practitioners believe that if you focus on the quality of patient care then the money will follow. Increasing compliance with

established standards of care will not only improve patient care but will also increase the practice's profitability.

• The value of improved compliance with treatment recommendation can be calculated for a variety of routine preventative healthcare laboratory tests. For example, the practice could develop a standard that requires staff to offer pre-anesthetic blood work prior to all surgical procedures. As always, the team should establish a baseline compliance percentage from historical data and then set a realistic goal to increase the client compliance rate in accordance with the practice's newly established pre-anesthetic protocol.

• A common standard of care requires that all pets have a fecal examination in conjunction with their annual wellness exam (see 9.3 – Standards of Care and Care Pathways). The practice could also encourage chemical profiles and complete blood counts for senior pets (i.e., pets over the age of six, seven, or eight years, or whatever age your practice has specified in its life stages wellness program) as part of the practice's geriatric wellness program.

• Purchasing in-house laboratory equipment often results in an increase in the amount of laboratory work performed. After all, in-house laboratory testing affords greater convenience and quicker turnaround time. Practitioners with in-house laboratory equipment are more likely to perform serial laboratory tests.

• Many pets have long-term medication needs due to chronic illness or other disease processes. Although these medications do often improve the animal's quality of life, they may also have harmful side effects as a result of long-term usage. Prudent practitioners should perform regular laboratory testing to monitor the patient's ongoing condition (see 9.3 – Standards of Care and Care Pathways). Some common examples include performing liver panels on pets undergoing long-term analgesic therapy for conditions such as arthritis. Pets on thyroid medication may have regular thyroid profiles to monitor the status of their condition. Identifying the appropriate testing, determining a baseline, and setting goals for increased compliance will ensure an increase in laboratory revenue.

• Once the strategic decisions have been made, the mathematical calculations are simple. The number of active pets eligible for each test, multiplied by a reasonable increase in compliance, multiplied by the fee for the subject test equals the amount that that specific test will prospectively increase laboratory revenues. For example, if your practice has 1,000 active adult canine patients and you recommend annual heartworm testing for all dogs, the first step would be to determine your current compliance rate. If your practice performed 600 heartworm tests last year, your baseline compliance rate for this recommendation is 60%. If the team increases its compliance projection to 75% (after first determining that this is a reasonable goal for the upcoming year), a 15% increase results. This increase represents 150 additional tests (1,000 active dogs × 0.15 increase in heartworm compliance = 150 additional tests). If the practice's fee for the heartworm test is $30 and the 15% increase in compliance is achieved, then the practice should generate an additional $4,500 in laboratory revenue.

• Once the practice team has calculated the amount of each projected increase, these figures should then be combined to establish a total value.

• For example, if the practice produces $10,000 in laboratory income in the current year and anticipates a 3% increase next year for inflation, the end value would equal an additional $300 in revenue based on the prior year's performance. This number, combined with the projected results from projected real growth, capturing lost charges, senior pet testing, fecal exams, pre-anesthetic blood work, and follow-up tests for pets on chronic medications equals the total projected increase in laboratory income. If, for example, these numbers combine to $1,800, they would represent an increase of 18% over the prior year's actual productivity. Thus, our projection for the upcoming year would be $11,800.

CAUTIONS

• Do not base practice decisions on a small sample sizes of data, such as one month's data. Most budget veterans analyze budget results quarterly. A larger sample size minimizes the impact of certain variables (staff vacations, inclement weather, etc.), which could dramatically impact a single month's data.

• As mentioned previously, documentation is a critical part of the budgeting process. Remember, budget analysis could be taking place six months or longer after budget creation, it will be impossible to recall all factors involved in the budget without a detailed action plan. If the team fails to record every assumption included in generating the numbers, it will be difficult to determine which goals the staff has met and which goals the staff has failed to meet. Absent proper documentation, it will be impossible to remedy an unfavorable variance. For example, if you cannot remember what was going to generate $1,800 in extra laboratory revenue and you only generate $1,000 in extra laboratory revenue, you will not be able to determine which goals were met. An action plan might indicate that $500 was from increased fees, $1,000 from improved compliance rates, and $300 from improved charge capture and auditing. If each item is assigned to a member of the practice team and has a corresponding timeline, it will be much easier to determine how the practice fell short of its goal.

Events happen that even the most experienced practice leaders cannot foresee. Therefore, it is wise to review budget projections once or twice a year and reset them as needed given current practice performance.

MISCELLANEOUS

• Established goals will not be realized unless the practice is actively engaged in achieving them. The best way to accomplish these goals is to assign them to specific individuals within the practice and require that they be completed within a particular timeframe. For example, if one technician is assigned the responsibility of increasing pre-anesthetic blood work compliance, there are numerous standards he or she might implement in order to achieve this goal:

  ◦ He or she could create a new surgical admission form.

  ◦ He or she could establish a protocol whereby the practice mails forms to clients prior to their pet's scheduled surgery.

  ◦ Rather than just having clients leave their pets with the receptionist, he or she could implement a new standard of care that affords clients an opportunity to have a one-on-one discussion in an exam room with a technician regarding blood-work recommendations.

• The chapter on performance planning (see 10.17 – Mobile Applications) outlines this process in greater detail.

8.3. INCREASING THE TOP LINE IN PRACTICE

BASICS

OVERVIEW

• Increasing the top line (revenue) can be accomplished by practicing high-quality medicine, promoting the services currently offered to new and existing clients, working with other stakeholders in the veterinary and pet industry to promote veterinary care, and offering new services. Revenue generation will occur as a result of an educated staff and educated clients.

Before making an investment in any new service:

• Obtain staff buy-in and secure a commitment from staff to utilize the investment.

• Develop marketing plans and protocols for implementing the new service.

• Train staff on the benefits, the use, and the sale of the service.

Merchandising contributes to practice revenue. The delivery of veterinary services generates a need for products, and it is logical for veterinarians to attempt to meet at least some of the product needs.

TERMS DEFINED

Revenue: Sales income from services and products. Referred to as turnover in some countries.

Top Line: Typically a synonym for revenue, income (or turnover in some countries), referring to the top line in financial statements that indicates income received by the business.

ISSUES AND OPTIONS

PRACTICE HIGH-QUALITY MEDICINE

Offer clients the best in preventive medicine, diagnostics, and therapeutics.

DIAGNOSE FIRST

Revenues can be greatly enhanced if your practice makes a commitment to first diagnose problems before treating them or making recommendations (see 9.3 – Standards of Care and Care Pathways). This is the basis of practicing high-quality medicine.

Examples. A lump is not "just a lipoma" until it has been accurately diagnosed. Treatment for an infected ear does not commence until the underlying cause of the infected ear is determined. When a dog is presented with a dull and scaly coat, diagnostics are performed before any therapeutic recommendations are made. *Discuss the diagnostic pitfalls of your practice with your staff and implement strategies and standardized diagnostic protocols* to improve the quality of medicine you practice.

MEET ETHICAL STANDARDS

Practicing high-quality medicine ensures veterinarians meet ethical and moral standards, with the added bonus of generating revenue for the practice.

Example: Parasite control. The guidelines of the Companion Animal Parasite Council (CAPC) are designed to establish "optimal control of internal and external parasites that threaten the health of pets and people." A very important role of every veterinarian is to prevent and treat potentially zoonotic diseases. Veterinarians who do not follow the guidelines of the CAPC are putting themselves at increased risk of liability. The guidelines are available at www.capcvet.com. Practicing the level of medicine outlined in the guidelines will have the added benefit of increasing clinic revenue.

Many organizations have published standards of care for both dogs and cats (see 9.3 – Standards of Care and Care Pathways). These guidelines are excellent resources. Review these documents and determine what areas in your practice need more attention. Some organizations also provide implementation tools to accompany their standards of care.

In addition, the Catalyst Council provides some excellent resources for increasing revenue generated by feline patients (www.catalystcouncil.org).

UNDERUTILIZED EQUIPMENT

• One of the many reasons x-ray machines, ultrasound units, and endoscopes remain idle in practices is because veterinarians do not feel comfortable and competent utilizing the equipment and interpreting data from them.

• Increase your revenues from these investments by providing adequate training for all staff members, especially veterinarians. If adequate training for such equipment is not an option, avoid purchasing the equipment in the first place.

• Consider outsourcing the interpretation of radiographs and ultrasounds to board-certified specialists. Some veterinary practices have outsourced all of their ultrasound and radiograph interpretations. Under these circumstances, veterinarians become confident in recommending the service to clients, resulting in increased utilization of the service. In addition, board-certified interpretations frequently generate additional diagnostic work for the referring veterinarian, resulting in more revenues.

• Identify underutilized equipment in your practice and develop and implement strategies for increased utilization.

Example: Tonometry. Review your clinic's use of tonometry. Intraocular pressure (IOP) readings can be performed under the following circumstances:

• On all veterinary patients to establish a baseline value specific to the animal.

• Annually on all 42 purebred breeds (and mixes) of dogs, as well as cats predisposed to glaucoma, or for which DNA screening has indicated glaucoma risk; more frequently in animals from bloodlines that have a history of glaucoma.

• All head trauma or eye trauma, red eyes, etc.

• All senior wellness exams.

• Develop a marketing plan that includes all the circumstances in which IOP measures will be offered and recommended to your clients. Ensure your staff are trained and committed to using the tool to its fullest potential. Measure the success of your plan.

EXTEND YOUR SPHERE OF INFLUENCE

Most urban and suburban practices primarily draw clients from a five- to ten-minute drive time from the practice (see 1.4 – Veterinary Trade Areas). Differentiation of your practice can extend those boundaries, increase market share, and thereby increase revenue. Examples: alternative therapies, orthopedic specialization, high-end boarding facilities.

CHARGE APPROPRIATELY

Many veterinary practices set fees based on what other practices in the area are charging rather than on a cost-plus or value-added basis. Charging appropriately for services being rendered is an important aspect of cost recovery in veterinary hospitals and is absolutely essential in the revenue optimization process (see 7.12 – Pricing Strategies).

PET HEALTH INSURANCE

Pet health insurance can have a positive effect on practice revenue (see 8.11 – Pet Health Insurance).

In *A Veterinarian's Guide to Pet Health Insurance*,[1] the authors described how clients with pet insurance spent twice the amount of money on their pets during the pets' lifetime than owners without pet insurance. In addition, owners with insured pets visited their veterinarians more frequently.

Insured animals are presented for a problem earlier in a disease process than uninsured animals and are more likely to receive more expensive treatments associated with higher quality care.

8.3. INCREASING THE TOP LINE IN PRACTICE

Veterinarians can increase their revenues dramatically by increasing the number of insured patients in their practice. In doing so, veterinarians improve the quality of life of their patients, creating a win-win-win scenario for veterinarians, clients, and pets.

MERCHANDISING

In general, veterinarians are relying less on product sales and more on service sales; however, product sales contribute to practice revenue and profitability. The amount they contribute depends upon various factors, including:

- Display space and location
- Appropriate markups
- Marketing and sales training of support staff
- Use of point-of-purchase sales material, signs, and so on.

Although the markup on product sales is generally less than the markup on veterinary services, veterinarians must consider the cost associated with the sale of a product versus the cost associated with the sale of a service. For example, a point-of-purchase display may be the only communication necessary for a client to make a product purchase. On the other hand, the labor costs of delivering a service to a client are generally much higher (see 7.14 – Activity-Based Costing and Cost Management).

Numerous studies prove that merchandising tools have a direct influence on the purchasing behavior of your clients. Actively manage product sales by assigning responsibility to a staff member. Product sales fit nicely into a pharmacy profit center where monthly reports of sales and profit margins help determine the most profitable product lines. This is especially important if space is limited in a practice.

Accept and request assistance from your product vendors in marketing and sales, staff training, and staff education, and carry products that you and your staff believe enhance the wellness of your patients.

EXAMPLES

Increase revenue with a minimum investment in laboratory tests and staff training by practicing quality medicine and working with industry.

EXAMPLE 1: LABORATORY TESTING

Tests are available to evaluate the presence of microalbuminuria. Research demonstrates that persistent microalbuminuria requires further investigation into the underlying health status of an animal.

The following steps are recommended to increase revenue from this and similar services:

Step 1. Establish circumstances under which the test will be recommended to clients.
- Test all breeds at risk for hereditary renal disease at an early age.
- Follow up testing to monitor all positive results (~25% will be positive).

Step 2. Develop a protocol for recommending the test to clients.
- Identify client educational material that staff will use to support their recommendations.

Step 3. Introduce protocols at staff meetings, and review the benefits associated with the test and its implementation.
- Discuss policies for how to proceed when such tests detect underlying problems that are not yet clinically apparent or problematic.
- Review the tools available to assist with client education, and review the protocol for recommending the test.
- Role-play the marketing of the service, using the various client education tools, and train staff to answer questions.

Step 4. Implement the program and measure its success. Review results with staff at your next staff meeting.

CAUTIONS

The top line increases with the practice of excellent medicine. Providing unnecessary testing or services may increase top line in the short term, but it will dramatically lessen revenues in the future as clients seek better value elsewhere.

Revenues are a reflection of the provision of goods and services that are in the best interests of your clients and patients. Meeting client needs in a professional and value-added manner is the best way to assure continued top line improvements.

MISCELLANEOUS

Compliance and pricing are important topics that impact a practice's revenue and are addressed elsewhere in this book. There are many additional ways that practices can increase their revenues, including merging with other practices or acquiring other practices, for example. It is impossible to touch on all the possibilities for increasing revenue in this chapter.

8.4. EXPENSES IN VETERINARY PRACTICE

BASICS

OVERVIEW

• Good financial management of any business is critical to its success. This is particularly true of a small business, such as a veterinary practice, which often does not have the resources to sustain itself during poor economic times or during periods of change in the profession.
• Small business owners often focus most of their financial analysis effort on expenses (rather than revenues) because they are easier to understand and perhaps control. For example, if insurance costs have been rising, it is simple to call four agents and get a new quote for workers' compensation insurance.
• Increasing revenue has historically been thought to be the most effective way of increasing profitability; however, this is harder to do now than it used to be. Expense control can be a very useful way of maintaining or increasing profitability.
• The biggest expenses in most practices are those included in the Cost of Professional Services section of the income statement (drugs and medical supplies, laboratory costs, surgery costs, etc.), as well as support staff, associate veterinarian, and facility rental costs.
• Cost of Professional Services can also be called Cost of Goods Sold, Cost of Goods and Services, or Cost of Medical Services—these are all variations on the same thing.
• Expense ratios are calculated by dividing the dollar amount of the expense by the total gross revenue, with the result being expressed as a percentage. This percentage can then be compared with prior results or industry benchmarks.

TERMS DEFINED

Chart of Accounts: Systematic listing of all categories used to group payments in a practice's accounting system.
Cost of Professional Services: Group of direct costs associated with producing a product or service; in veterinary medicine, these costs generally include drugs and medical supply expense, laboratory expense, dietary product expense, and other similar items. Employee labor costs are not included here.

ISSUES AND OPTIONS

CHART OF ACCOUNTS

• A good way to begin analyzing expenses is to review the Chart of Accounts, which is the basis for the practice's financial statements. A Chart of Accounts is simply a list of all the categories to which income and expense are assigned during the accounting process.
• Accounts are classified according to whether they represent assets, liabilities, income, expenses, and so on. The American Animal Hospital Association (AAHA)/Veterinary Management Group (VMG) Chart of Accounts (available from www.aaha.org) is a list of useful and commonly used accounts for recording financial transactions. Table 8-4-1 shows some of the more common expense accounts seen in a veterinary practice.
  ◦ Note that expenses *directly related to the services and products provided to the client* are classified as "Cost of Professional Services." These expense categories are similar to the revenue categories (immunization expense, pharmacy expense, surgery expense, drugs and medical supplies expense). These expenses fluctuate with the amount of revenue generated; for example, if no patients are seen there is no outside lab expense.

Table 8-4-1. Sample list of accounts.

Cost of Professional Services
Pharmacy Costs
Laboratory Costs
Drugs and Medical Supplies Costs
Ancillary Products and Services Costs
Veterinary Specialist Costs
Animal Disposal Expense
Medical Waste Disposal Expense
Dietary Product Costs
Compensation and Benefits
Owner Veterinarian Compensation
Associate Veterinarian Compensation
Relief Veterinarian Contractor Payments
Support Staff Compensation
Employer Payroll Taxes
Worker's Compensation Insurance
Group Health Insurance
Employer Retirement Plan Contributions
Laundry and Uniforms
Continuing Education Expense
Veterinary Licenses
Veterinary Dues
Facility and Equipment Expense
Facility Rent
Repairs and Maintenance
Utilities
Telephone Services
Cable and Internet Services
Depreciation Expense
Property and Casualty Insurance
Real Estate Tax
Equipment Rent
Practice Vehicle Expense
Personal Property Tax
Equipment Expense
Administrative Expense
Office Supplies
Postage
Printing
Advertising and Promotion Expense
Accounting Fees
Legal Services
Business Gifts and Flowers
Meals and Entertainment
Employee Staff Meetings and Events
Business Licenses and Permits
Charitable Contributions
Fee Income Collection Expense
Bank Charges and Service Fees
Credit Card Merchant Service Fees
Bad Debt
Returned Checks
Collection Fees
Other Expense
Amortization Expense
State Sales and Use Tax
Miscellaneous
Interest Expense
Federal Income Tax Provision
State Income/Franchise Tax Provision
Other Income
Interest/Dividend Income
Miscellaneous Income
Gain or Loss on Disposal of Assets

8.4. EXPENSES IN VETERINARY PRACTICE

- Most of the hospital's other expenses (compensation, facilities, administration) are indirect costs. Indirect costs generally do not fluctuate with revenue. Even if the hospital sees no patients in a given day, it must still pay for rent and utilities.
- A final group of accounts is called either "Other Income" or "Other Expense" and includes such items as interest expense, penalties, tax provisions, and gain/loss on sale of assets. These are grouped separately because they are not operating expenses such as those previously discussed.

• Some practices would not use all of the accounts and others would use more; the AAHA/VMG Chart of Accounts can be used to select those that best represent the hospital's activities. Too many or too few accounts can result in financial statements that are not useful from a management perspective.

HOSPITAL EXPENSE RATIOS

• Expense ratios derived from information in the hospital's income statement can be very useful in analyzing and controlling expenses.
• Ratios are more useful than reviewing actual numbers because:
- Trends over months or years can be more easily analyzed
- Businesses of different sizes can be more easily compared
- Relationships between various pieces of information are often more clearly apparent.

• A simple expense ratio is Expense/Total Gross Revenue.
This percentage can then be compared with industry benchmarks or prior year experience in the same hospital. This kind of ratio analysis is particularly important with expenses that are driven by the level of revenue.
• Efforts to control expenses are best focused on larger items:
- Direct costs (cost of professional services)
- Support staff expense
- Associate veterinarian expense
- Facility rental costs.

• As with most kinds of financial analysis, expense ratios have limitations.
- First of all, the results they give are only as good as the information used to calculate them. If the financial statements are erroneous, old, or not prepared on a useful basis, the ratios derived from this information will also be problematic.
- When analyzing information for the same business, but at different points in time, it is important to understand the changes that have been going on within the business in order to correctly determine the importance of the change in the information being analyzed.
- When analyzing ratios between different companies, it is important to remember that differences in accounting methods or operations may create differences in ratio results.
- The results of ratio analysis are not always a measure of good or bad management, but indicate areas that should be more fully investigated.

ANALYSIS OF EXPENSES

• The first step in monitoring expenses is to ensure that the person paying the bills understands the categories to which expenses should be assigned, and consistently puts expenses in the appropriate categories.
• Some expenses could appropriately be put into several different categories. With these, it generally is not as important which category the expense is assigned to as it is that the expense be put in the same category each time. The expense categories selected, however, should be consistent with those used in published benchmark studies for good quality comparison.
• Expenses should be compared both with outside sources and with the practice's prior history. Comparative benchmarks for other practices can be found in publications by AAHA[1] and Tumblin et al.[2]
• Expenses should be compared on both a dollar basis and a percentage basis.
• Expenses should be reviewed monthly.
• All accounting programs can provide a detailed list of everything put into an expense category during a particular period. This detail should be reviewed for all categories that appear to be either high or low for a particular period.
• Once the reason for a change in an expense category has been determined, a decision can be made as to whether this change is appropriate or not.

EXAMPLES

N/A

CAUTIONS

• Although comparison with industry standards is very useful for identifying areas that a practice is successful in versus those that may need further investigation, it is important to remember that every practice is unique, and industry standards are not always the "right" answer for every practice.
• Identifying problem areas is not enough – a practice must investigate and develop a solution.

8.5. MANAGING GENERAL AND ADMINISTRATIVE EXPENSES

BASICS

OVERVIEW

- Veterinary practice operating expenses are divided into two broad categories: Cost of professional services (direct costs of patient care and product retailing, like drugs and professional supplies and laboratory fees) and general and administrative (G&A) expenses.
- G&A expenses represent an accumulation of all executive, organizational, and clerical expenses associated with the orchestrating management and operation of the practice rather than with the specific delivery of patient care, ancillary services such as pet boarding and grooming, or product/pharmacy sales.
- Practice managers evaluate G&A expenses within its defined time frames against prior periods and in comparison with the corresponding period budget to look for variances.
- Practice management should understand its practice's typical G&A expenses, with only secondary reliance on veterinary industry benchmarks.
- When variances are identified, action should be taken to identify why the practice is over or under budget.
- The first investigatory step of a variance is to evaluate the underlying transactional detail for the time period in question. Bookkeeping coding errors, such as expensing a capital asset, could result in what appears (erroneously) to be a significant cost variance.
- The second investigatory step of a variance is to determine whether timing differences in payment have occurred (cash basis of accounting issue).
- The third investigatory step involves looking for practice operational problems or enhancements that account for the variance.
- If many G&A expenses are high as a percentage of operating revenues, evaluate whether revenues (and profits) are too low. Causes may include inadequate fee structure, excessive discounting and barter arrangements, too many low-cost employee sales, and embezzlement.
- Concentrate management time on G&A expenses that have the biggest impact on practice profitability. For most practices, costs of labor represent the most substantial use of resources and cash. As such, the best return on manager time is often detailed compensation planning, labor scheduling, and monitoring factors related to paid employee time.
- Larger G&A costs, such as labor, should be categorized into more manageable subcategories so that variance causes can more quickly be isolated.
- Supplement analysis of G&A ratios with source documents to isolate issues requiring intervention (e.g., payroll records to identify excessive overtime hours and cost).

TERMS DEFINED

Accrual Basis Accounting: Accounting method that recognizes income when it is earned and expenses when they are incurred, regardless of when cash is received or disbursed. The accrual method, in its purest form, provides a very close matching of assets consumed (G&A costs expended) with revenue generated for the period of time under consideration.

Capital Asset: A cost that has utility over more than one accounting period; for example, a computer printer.

Chart of Accounts: An organized listing of all the income, expense, asset, liability, and equity categories used to record a practice entity's transactions that are monetarily measured.

Common Cost: A cost incurred to support a variety of practice activities and objectives, but cannot be traced to them individually. For example, the salary cost of a veterinarian or technician is a common cost to all of the clients seen and patients treated, but in most cases cannot be purely attributed and allocated to specific patients.

Cost: An exchange price at an acquisition date to obtain a present or future benefit.

Direct Expense (Cost): An expense (cost) that becomes an integral part of a specific patient's care or client sale, that can be physically and conveniently traced to it.

Expense: A measured outflow of services and/or goods, matched to the revenue generated for that outflow.

Fixed Expense (Cost): An expense (cost) that remains relatively constant in dollar amount within a relative range of practice activity; for example, real estate tax expense.

G&A Expenses: All executive, organizational, and clerical expenses associated with the general management and operation of a practice, rather than with delivery of patient care, ancillary services such as pet boarding and grooming, or product/pharmacy sales.

Modified Income Tax Basis – Cash: A method of accounting for income and expenses in accord with US tax laws, which, *in general*, results in the reporting of revenues as payment is received from clients and of expenses as the practice makes payment to outside parties.

Operational Revenues: Increases in owner's equity resulting from veterinary professional activities and sales entered into for the purpose of earning income.

Variable Expense (Cost): An expense (cost) that increases or decreases as a dollar amount in direct relation with the volume of practice activity; for example, office supply expense.

8.5. MANAGING GENERAL AND ADMINISTRATIVE EXPENSES

ISSUES AND OPTIONS

• Practice costs and expenses are accumulated, categorized, reported, and used for a wide variety of purposes. These purposes include tax reporting, external financial reporting (such as to banks), budget planning, and management decision-making.
• In part, the labor costs of accumulating and reporting cause most practice administrators to establish financial data systems that result in reports used primarily for tax regulatory purposes. Oftentimes, practice administrators decide to sort and report only the bare minimum of data necessary to fulfill the objective of tax law compliance. Such systems make practice expense interpretation more challenging.
• The profession of veterinary medicine is predominantly a service industry. In accord with current US tax laws, the majority of veterinary practices report on a modified cash basis. This method of accounting often does not accurately match revenues earned with expenses attributed to that revenue stream's generation.
• Accrual-based accounting best serves practice management interpretation. Many practice administrators will opt for accrual-based managerial accounting (regardless of tax reporting methods) to eliminate timing differences to the extent possible, considering the bookkeeper's experience level and bookkeeping software sophistication.
• Managerial financial reports should list each G&A expense as a dollar amount, and also as a percentage of operational revenues.
• The practice bookkeeper should consistently categorize practice expenses in accordance with the practice's chart of accounts. Inconsistent categorization of practice expenditures results in unreliable financial information, including that of G&A expenses.
• G&A expenses typically include payroll-related and office- and facility-related expenses. The other significant operating expense category is the Cost of Professional Services expense.
• Financial reports should give adequate disclosure and detail of practice expenses, so that management can easily spot changes and trends in order to take corrective actions when necessary for maintaining profitability and cash flow.
• Engage the practice's accountant to help implement the veterinary profession's standard chart of accounts,[1] coding methodology, and financial report structure to assist management in getting the most flexibility from the practice's accounting system.
• Labor (payroll) expenses may or may not be included in G&A, depending upon the complexity of the veterinary practice. For most veterinary practices, labor cost and payroll represent common costs and are probably best included in G&A (see 8.7 – Payroll Management). Larger practices (of, say, greater than $3 million of annual revenue activity) may segregate direct and indirect (G&A) labor costs as personnel perform increasingly specialized functions.
• G&A expenses may be fixed or variable. For example, accounting service expense and facility-related expenses are usually fairly fixed within a certain range of practice activity, whereas other G&A expenses are mostly variable. Computer supplies, office and postage expense, and labor-related expenses are primarily variable.

EXAMPLES

EXAMPLE 1: INVESTIGATING VARIANCE AND IMPROVING G&A EXPENSE INTERPRETATION

Data

Selected financial information for the 12 months ended 12/31/20xx and 20xy.

Insurance Expense = 4.5% of operating revenues (20xx) and 5.7% of operating revenues (20xy).

Interpretation

Variance 26.7% increase; calculation is (5.7% – 4.5%)/4.5%.

Assessment

What premiums were included in the expense category called "Insurance"?

Were the various premiums correctly recorded as an expense in the operating period of coverage? That is, is health insurance premium

8.5. Managing General and Administrative Expenses

expense correctly matched to the January through December periods of 20xx and 20xy?

If the premiums are correctly matched with revenues, what can be done to control costs?

Plan

Revise Chart of Accounts and train bookkeeper to segregate various insurance premiums by type of coverage:

- Facility and Property Related
  - Business Overhead Policy
  - General Liability Coverage (Liability Umbrella)
  - Vehicle Insurance.
- Personnel Related
  - Professional Liability
  - Health, Dental, Prescription
  - Workers Compensation
  - Personal Disability
  - Employment Practices Liability
  - Term Life Insurance.

Evaluate each type of coverage to determine if it matches with risk management assessment. Schedule meetings with an insurance agent to review options for employee health insurance coverage. Schedule meetings with an accountant to evaluate new tax law changes regarding allowed employee benefit plans, cost–benefit analysis, and administrative requirements.

EXAMPLE 2: G&A EXPENSE DETAIL WITH SUBACCOUNTS

Data

For the year ended 12/31/20xx, tax returns present salaries and wages of $520,000 and revenues of $1 million. Practice management has not engaged an accountant to prepare financial statements. Internally generated QuickBooks reports do not provide any additional detail.

Assessment

Total gross wage percentage is more than half of revenue production.

Practice management should reconfigure bookkeeping software to provide a breakdown by job function.

Plan

Segregate salary and wage expense into at least three categories, and present as total dollar amount as well as a percentage of gross operating revenues:

- Owner Veterinarian Salary and Wages, if any (depends upon tax entity structure)
- Associate (Nonowner) Veterinarian Salary and Wages
- All Other Salary and Wages.

Alternative Plan

Segregate salary and wage expense into subcategories as previously described, but into more detail for All Other Salary and Wages:

- Wages: Receptionists
- Wages: Technicians (licensed)
- Wages: Assistants (unlicensed)
- Wages: Kennel, Ward Attendants
- Wages: Maintenance and Janitorial Staff
- Wages: Secretarial/Clerical/Bookkeeper
- Wages: Office/Practice Manager.

8.5. MANAGING GENERAL AND ADMINISTRATIVE EXPENSES

CAUTIONS

- The reader of any financial information must be fully aware of the limitations of the data, especially in small closely or privately held businesses such as veterinary practices. In these cases, financial data are almost never audited. Audited financial data are usually limited to publicly owned corporations, as the expense is cost prohibitive for smaller entities.
- Due diligence requires a reader of financial documents to gain complete information about the origins of the financial information, who prepared it, and who the intended users of that financial information are.
- Many practice accounting systems poorly match expenses (expired costs) to the revenues generated; as such, managerial assessment of G&A expenses over short periods of time (12 months or less) is often impaired.
- Analytic review of the most recent 36–48 months of a practice's financial data may be more reliable, as timing difference in cost payment may even out, thus lending clearer interpretation of ongoing general and administrative expenses and trends therein.
- For making management and other financial decisions, expense analysis (and comparison with budgets) is only as good as the data collected.
- The type of practice (companion animal exclusive, emergency services, mixed animal, ambulatory, etc.) makes a significant difference in the ratio relationships of certain G&A expenses compared with operational revenues.

8.6. IMPROVING THE BOTTOM LINE (PROFIT) IN PRACTICE

BASICS

OVERVIEW

There is no one universal definition for "bottom line," but it is a reflection of financial statements in which the bottom line is what is left of revenues when expenses have been subtracted. As such, it is a measure of profit: the difference between money coming in and money going out.

- Improving the bottom line is a function of improving the components that make up the bottom line (profits).
- The bottom line is improved by maintaining or expanding revenues and by controlling expenses.
- If you focus on improving each of the components that make up profit, the result will be greater profits.
- If you focus on strictly trying to improve profits, then most of the time your efforts will be frustrating.
- Too many owners focus efforts in the wrong areas to improve profits.

TERMS DEFINED

Bottom Line: Profits after taxes. In calculations, Bottom line = Revenues – Cost of Goods Sold – Operating Expenses – Professional Salaries – Taxes.

Cost of Goods Sold: Variable expenses associated with revenue.

Operating Expenses: Also known as "fixed expenses." These expenses are less likely to go up and down directly related to sales. Examples are rent, staff wages, employee benefits, telephone, advertising, and insurance.

Professional Salaries: Compensation paid to owner, associate, and relief veterinarians. In the case of owner compensation, it includes any monies received out of the practice due to ownership, whether they are from veterinary salary, owner bonuses, return on investment, management fees, or division of profits.

Revenues: All sales of the practice for goods and services. Also referred to as Income, and in some countries as "Turnover."

Variable Expenses: Variable expenses vary with the amount of business being conducted. For example, laboratory fees are a reflection of business being done, going up or down with testing.

Taxes: All involuntary fees paid to federal, state, and local governments on the profits of the practice.

ISSUES AND OPTIONS

MAXIMIZING THE BOTTOM LINE

- For this discussion, we must focus on Table 8-6-1, which outlines each strategy of improving profits. We will then see the effectiveness and efficiency of changing management strategies in each area. Each column changes one item in the profit equation to change this practice to make $45,000 after-tax profit.
- The "Current Situation" column is an average veterinary practice. Notice the 1% profit.
- The "Goal" is to make a 10% profit, which is not optimal but is typical for many hospitals.
- The "Sales Increase" column uses the "more people in the door" or "working harder" approach. If we can just get more people in the door and do more for them, our profit problems will be solved. This is the most common method used to increase profits. To achieve this goal:
  - Common external marketing strategies are large directory advertisements, newsletters, school lectures, newspaper articles, coupons (see 8.17 – Discounting), outdoor signs, and so on.
  - Hospitals actually have very little control of sales. One can try to influence buying patterns but cannot control them.
  - To achieve a 10% profit solely by using this strategy would require a 17% increase in sales due to more visits or services. This outcome is very unlikely considering most markets are currently saturated with veterinary hospitals and veterinarians.
  - Increasing sales this way is only 75% efficient in helping profits, because 25% of increasing services goes to pay for products used to create those services (Cost of Goods Sold.)
  - Ease of implementation is 2 (0 = Hard, 10 = Easy).
- The "Price Increase" column involves seeing the same people and doing the same work. "Working smarter" means:
  - Normally there is severe reluctance by owners to implement.
  - You have 100% control of your price structure.

Table 8-6-1. Summary of six methods of improving profits.

Month	*Current situation*	*Sales increase*	*Price*	*COGS*[a]	*Expense*	*Salary*	*Tax*
Sales	$450,000	$527,333	$508,000	$450,000	$450,000	$450,000	$450,000
	100%	100%	100%	100%	100%	100%	100%
– Cost of sales	$112,500	$131,833	$112,500	$54,500	$112,500	$112,500	$112,500
($450,000 × 0.25)	25%	25%	22%	12%	25%	25%	25%
= Gross Margin/	$337,500	$395,500	$395,500	$395,500	$337,500	$337,500	$337,500
Gross profit	75%	75%	78%	88%	75%	75%	75%
– Overhead expense	$247,500	$247,500	$247,500	$247,500	$189,500	$247,500	$247,500
(55% of sales)	55%	47%	49%	55%	42%	55%	55%
– Owner's salary	$85,500	$85,500	$85,500	$85,500	$85,500	$27,500	$85,500
(19% of sales)	19%	16%	17%	19%	19%	6%	19%
= **Profit before tax**	**$4,500**	**$62,500**	**$62,500**	**$62,500**	**$62,500**	**$62,500**	**$4,500**
	1%	12%	12%	14%	14%	14%	1%
– Tax	$1,260	$17,500	$17,500	$17,500	$17,500	$17,500	($40,500)
(Assume 28% tax rate)	0%	3%	3%	4%	4%	4%	–9%
= **Profit after tax**	**$3,240**	**$45,000**	**$45,000**	**$45,000**	**$45,000**	**$45,000**	**$45,000**
(Goal 10% sales)	1%	9%	9%	10%	10%	10%	10%
Change in dollars		$77,333	$58,000	($58,000)	($58,000)	($58,000)	($40,500)
Change in percent		17%	13%	–52%	–23%	–68%	–331%
Ease of implementation[b]		2	10	1	4	10	0
Priority		3	1	4	2	5	6

[a]Cost of Goods Sold.
[b]Scale: 0 = Hard, 10 = Easy.

- To achieve a 10% profit solely using this strategy would require a 13% price increase. This strategy assumes you see the same number of clients and do the same number of procedures. A working "smarter" not "harder" outcome is very likely.
- Increasing sales this way is 100% efficient because Cost of Goods Sold remains the same because there are no additional services offered.
- Ease of implementation is 10 (0 = Hard, 10 = Easy).
- Only the owner's "perception of market" inhibits implementation of this strategy.

• "Cost of Goods Sold" (COGS) strategy is summed up as "Let's make a deal with vendors." This strategy requires lowering the cost of goods by buying in larger quantities to receive discounts. Typical deals from sales representatives fall into this category. Invoice dating (get product now, pay later) is also included in this strategy.

- Drug companies and distributors use common management strategy often to entice selling goods to veterinarians.
- You do have some control over purchases to take advantage of this strategy.
- To achieve a 10% profit solely using this strategy would require a 52% discount on *all purchases* of Cost of Goods Sold. Outcome is very unlikely.
- Increasing profits this way is 100% efficient, as every dollar saved can go to the bottom line.
- Ease of implementation is 1 (0 = Hard, 10 = Easy).

• "Operating Expenses" strategy is summed up as "keep employee wages to a minimum." Because staff wages usually are the largest expense in operating expenses and normally represent 40–60% of those costs, owners try to keep these costs low. Poor facilities and equipment are symptomatic of this strategy.

- Common management strategies are "pay the least you can get by with" for employees – minimal employee benefits and understaffing.
- Typical symptoms of this strategy are unmotivated employees and high turnover.
- You do have much control over operating expenses.
- To achieve a 10% profit would require a 23% reduction in *all* operating expenses (including staff wages, benefits, rent, insurance, etc.).
- Increasing profits this way is 100% efficient, as every dollar saved can go to the bottom line.
- Ease of implementation is 4 (0 = Hard, 10 = Easy).

• "Owner Salary" is the default way a financially poorly performing practice "makes ends meet." The owner is the last person to get paid; if there is no money left, the owner suffers.

- Typical symptoms of this strategy are underpaid and unmotivated veterinary owners with insufficient capital to expand and improve veterinary services.
- You have much control over this strategy, and it usually is implemented whether the owner wishes it or not. Outcome is *very likely*.
- Ease of implementation is 10 (0 = Hard, 10 = Easy).

• "Taxes" involves using tax strategies to lower taxable income:

- Common management strategies are buying large pieces of equipment and depreciating them all in the current year, paying future bills now to increase expenses in current year, and other tax strategies offered by accountants (see 7.21 – Tax Planning).
- The problem with most of these strategies is that you only get a one-time benefit. For example, if you write off the whole purchase this year, you will not have any deductions over the rest of the equipment's useful life. If you prepay future expenses in the current year, then the next year your income will be higher because those expenses have already been "booked." Therefore, owners must repeat this strategy annually to stay even or lose the initial benefit they received.
- To achieve a 10% profit would require a $40,500 tax *rebate*. This outcome is extremely unlikely, yet owners spend inordinate amounts of time trying to implement this strategy.
- Increasing profits this way is 100% efficient, and you do have some control over it.
- Ease of implementation is 0 (0 = Hard, 10 = Easy).
- If you are not making enough money after taxes, the problem is that the practice is not making enough money *before* taxes. The problem is not the taxes.

EXAMPLES

N/A

CAUTIONS

N/A

MISCELLANEOUS

When examining each strategy for increasing the bottom line, the order to implement your strategies due to efficiency and ease of implementation is:

- raising prices;
- reducing operating expenses;
- increasing sales volume;
- decreasing cost of goods sold;
- reducing owner salary;
- reducing tax.

An optimal approach is to use several of these strategies together to achieve the profit goal.

8.7. PAYROLL MANAGEMENT

BASICS

OVERVIEW

• Properly managing your practice's payroll is an important function that requires advanced planning in order to function smoothly. Yes, most staff members love their work, and some probably would work for free, but the reality is that they depend on you to ensure that they are paid the correct amount in a timely manner.
• Much has been written over the years describing the poor state of pay within our profession. Many veterinarians with eight or more years of college earn less than many professionals with only a four-year degree. Likewise, veterinary technicians/nurses often earn less than dental hygienists with a similar two-year degree. Managing payroll and staff compensation in general are going to become more important in the future.
• The first decision that needs to be made regarding payroll is to choose whether you are going to process your payroll yourself or utilize a third-party payroll service.
• Many veterinary practices still process payroll in-house. In many cases, this is a poor business decision. The primary reason is the opportunity cost of the time that it takes to process a typical staff payroll. Most practice owners and practice managers have lengthy "to do" lists. These lists often contain items that will produce a much higher return to the practice than calculating payroll and generating payroll checks. Performing a marketing activity, an auditing activity, or evaluating your customer service program will almost always benefit the practice more, given the amount of time expended.
• The actual processing of payroll is really quite simple compared with many of the tasks that need to be performed in a veterinary practice on an ongoing basis. Unfortunately, the confidentiality involved in payroll prevents it from being delegated too far down the ladder. In almost any practice, it comes down to the owner, manager, or bookkeeper, depending upon the size and sophistication of the practice.

TERMS DEFINED

Biweekly Payroll: In this case, the pay period covers two weeks, which represents 26 pay periods per year.
Payday: The day that the staff is supposed to receive paychecks. When determining the payday, it is important to allow for a sufficient amount of time between the end of the pay period and payday to allow for check preparation. A common scenario is for a pay period to end on Sunday night at midnight and payday to be on Thursday. This allows all day Monday, Tuesday, and Wednesday for processing.
Pay Period: Length of time covered by each payroll session. Pay periods typically include the amount of time covered as well as the specific starting and stopping points. The most common lengths of a pay period are weekly, biweekly, and semimonthly.
Payroll Processing: This term encompasses all of the steps it takes to be able to pay staff. Processing begins with obtaining the time records for each hourly worker and entering them into your system; it ends with getting the checks signed and distributing them to your staff. How many steps are involved and how time consuming it is depends on each unique situation.
Remote Rate: A different hourly wage for working remotely compared with working in the hospital. Some practices pay the same rate, others pay less (believing that remote work is an employee convenience), and others pay more to offset the employee's office expense.
Semimonthly Payroll: In this scenario, paychecks are issued twice a month, typically on the first and the fifteenth of each month.
Shift Differential: A premium that is added to regular pay in a 24-hour environment for working less-desirable shifts, such as weekends or overnights. Shift differentials are usually a specific dollar amount per hour or a percentage of regular hourly wage on top of the employee's regular hourly wage.
Time Tracking: Recording the amount of time employees have worked for each pay period.
Weekly Payroll: The most common length of pay period in veterinary medicine. Typically, paychecks are issued 52 times a year, or 13 times each quarter.

ISSUES AND OPTIONS

PAY PERIODS

A pay period may start on any day that you choose as long as there are no potential gaps between pay periods. A common starting and stopping point would be from Monday morning through Sunday night. However, a savvy practice may elect a Saturday through Friday pay period to help them manage potential overtime, which is often generated during busy weekend shifts. Thus, if an employee works a lot of weekend hours you may be able to reduce their schedule during slower weekday times to keep total hours at 40 or less.

The most common length of pay period in veterinary medicine is weekly. Typically, paychecks are issued 52 times a year, or 13 times each quarter

With biweekly payroll, the pay period covers two weeks, which represents 26 pay periods per year. This system is common to many businesses because it cuts the number of times you need to process payroll in half, which decreases the administrative burden on the business and allows the practice to "use" its money longer (because it holds onto it longer before giving it to the staff). However, there are two significant concerns associated with biweekly payroll. First, it requires all of the staff to have enough personal budgeting skills to survive for two weeks between paychecks; and second, 26 pay periods do not divide up evenly into four quarters. Thus, two quarters will have six pay periods and two quarters will have seven pay periods. This means that the average month has two pay periods except for two months each year that have three. Because payroll is typically the single largest expense for most practices, a three-pay-period month is usually far less profitable than a month with only two pay periods. As these "three-pay-period" months rotate each year, they make historical comparisons of financial reports quite difficult. These months always need to be footnoted that they had an extra pay period, and they often distract people from performing a complete and unbiased analysis.

With semimonthly payroll, paychecks are issued twice a month, typically on the first and the fifteenth of each month. It simplifies financial reporting and analysis for the practice because it produces 24 pay periods each year, which equals a nice symmetrical six per quarter. Unfortunately, it reduces the number of paychecks an employee receives each year by two, which makes it all the more challenging for them to manage their personal cash flow compared with biweekly or semimonthly pay periods.

In almost every veterinary practice, the majority of staff members must record the amount of time they worked for each pay period. This task can be accomplished in a variety of ways, each with its own advantages and disadvantages. Computer automation simplifies this task immensely. Most third-party payroll companies and practice management software programs offer time tracking options. This integration can save labor and reduce costly errors. This is most important when different pay rates are involved, such as shift differentials, holiday rates, remote rates, overtime, etc.

PROCESSING OPTIONS

Manual payroll is the most labor-intensive and cumbersome way to prepare your payroll. It involves totaling the amount of time worked; calculating gross wages; computing and deducting all appropriate taxes, deferrals, and deductions; and then writing the check. Employers

are almost always liable for payroll errors, and the manual system affords the greatest number of opportunities for errors or omissions.

Automated in-house processing is a vast improvement over manual processing by utilizing payroll-specific software programs such as QuickPay (a member of the QuickBooks suite of accounting software products) to create paychecks. In addition to saving time, automated in-house payroll processing offers numerous benefits. These include the reliability of computerized calculations, the ability to establish regular and recurring deductions, such as health insurance premiums and pension plan deferrals, thus reducing or eliminating the opportunity for errors. In addition, automated in-house processing creates and maintains legible payroll records automatically. Laws vary, but most states require businesses to retain payroll records for three to seven years (ask a local professional for the applicable laws in your area).

Third-party payroll services are the last major option for payroll processing. These services offer convenience, expertise, and savings. Processing payrolls is often their only line of work, so these companies are usually up to date with the most current regulations and tax tables, helping to protect you from careless errors or omissions. They have economies of scale that often allow them to charge you less than it would cost you to do the same work in-house.

EXAMPLES

N/A

CAUTIONS

• Hourly workers are paid for the amount of time they work during each pay period, and they are not exempt from federal overtime laws. In many states, employees that are exempt from overtime rules are still required to track the amount of time they are at work. Tracking everyone's time helps the practice to evaluate staff productivity and efficiency, but it also helps protect the practice from legal problems that may arise. One example is when a doctor (who is usually an exempt employee) leaves a practice in the middle of the year. It is difficult to determine the exact number of hours he or she has worked year-to-date. If, for example, your pension plan requires 1,000 hours of work per year to become vested in the plan, the burden rests on the employer to prove the doctor did not work the required number of hours.

• Third-party payroll services can solve a problem if they perform well, or they become a management and legal headache if they perform poorly. Check the references provided, but go a step further and ask your clients who own businesses whom they recommend. In many cases, the fees are the same between competitors, so the decision comes down to their reputation for accuracy and customer service. Some managers prefer the security of working with a large firm, whereas others like the individualized attention offered by smaller local firms. It's your money – the decision is yours.

• A compelling reason to consider outsourcing payroll to a third party is the increasing number of payroll deductions that need to be processed. Statutory deductions include items such as federal and state tax withholdings. Other deductions may include health insurance, dental insurance, retirement contributions, wage garnishments, and even payroll deductions to apply to their balance due at the practice. Each of these deductions has its own unique set of regulations that must be followed. Collectively, they represent a huge burden for a practice manager or bookkeeper to memorize, but they may be fully automated in the payroll software of a payroll management company.

• Always ask for a complete fee schedule when selecting a payroll company. Many have huge hidden fees for issuing extra checks, such as a required paycheck after employee separation. Contracts can be cumbersome and include exorbitant fees for hardware, specific services, or early contract cancellations. Others may charge huge fees to access your archived records if you change vendors. Make sure individual features are itemized and explained in writing.

• If your payroll vendor provides your timekeeping solution, make sure it is scalable to meet your needs. For example, many large practices have multiple services or departments within their timekeeping system. If an employee is shared, it may be cumbersome for them to transfer between entities if there is only a single physical time clock in the practice. A web-based timekeeping solution provides greater access and, therefore, helps ensure compliance and accuracy.

• Create detailed payroll policies, have them reviewed by your attorney, and make them available to your team. Examples include eligibility for paid time off and how it is calculated, requested, and paid. The definition of holiday pay and eligibility to receive holiday pay is another important payroll policy. For example, some practices do not include Christmas Eve as a holiday, whereas others do. If it is a holiday, is it the entire day, does holiday pay start at noon, or at 6:00 p.m.? These distinctions are significant and should be clearly defined before staff members are scheduled. Eligibility for shift differentials is an important consideration for 24-hour hospitals.

• Each state has many laws and regulations that govern the management of staff payroll. Always check with your attorney prior to making changes in the way you process payroll. For example, some states allow employers to retain final wages to settle an outstanding account balance at termination, but others do not. Some states require that unused accrued vacation time be paid out to the employee at separation, whereas others do not. Some states require minimum reporting pay for showing up to work, whereas other states may require you to pay overtime based on hours worked per day instead of hours worked per week. Most states make these laws and regulations available to both employers and employees on the World Wide Web.

MISCELLANEOUS

When you look at payroll management, review your timekeeping procedures as well. Many states require that time records be kept for up to seven years. The burden of proof is always on the employer when payroll disputes become legal actions. Written timekeeping procedures and unalterable records, such as those provided by computers or biometric time clocks (those that rely on a thumbprint or retina scan instead of "punching in"), are the most reliable.

8.8. ORDERING INVENTORY ECONOMICALLY

BASICS

OVERVIEW

Maintaining inventory is often very costly for veterinary practices, as tying up cash means that money may not be available for other purposes.

- The cost of inventory is more than just its purchase price; it includes a variety of indirect costs that must be factored into the selling price.
- Indirect costs associated with buying and holding inventory include time spent shopping for the best price and placing the order (ordering costs), the cost of tying up money in the form of inventory and maintaining documentation, insurance, and physical space (holding costs), as well as theft (often referred to as "shrinkage").
- Shortage costs result from the inconvenience to clients of not carrying the inventory that they need, so that they then go elsewhere.
- Indirect costs can account for 25–40% of the cost of the products themselves.
- Some purchasers perceive that purchasing is just a routine function necessary to keep inventory on the shelf. However, it involves buying the *right products* in the *right quantity* at the *right price* at the *right time* from the *right vendor* while keeping the *right turns*.

TERMS DEFINED

Economic Order Quantity (EOQ): The most economical quantity of a product to order, factoring in both holding and ordering costs.
Holding (Carrying) Costs: All costs associated with maintaining inventory on the premises.
Just-in-Time (JIT) Inventory: Receiving product as it is needed, rather than storing product as inventory.
Ordering Costs: Costs associated with employee time used for shopping, ordering, receiving, and documenting purchased products.
Reorder Point: Inventory level at which additional product is ordered.
Safety Stock: Inventory remaining past the reorder point.
Shortage Costs: The costs of not maintaining sufficient inventory so that the sale is lost when consumers go elsewhere.
Shrinkage: The loss of product from inventory not resulting from sale; this includes product lost to employee theft, shoplifting, administrative and paperwork errors, and vendor errors/issues.

ISSUES AND OPTIONS

MINIMIZING INVENTORY COSTS

- Place orders after the distributor's billing cutoff date so that the purchase appears on the next statement period, giving you more time to sell items before payment is required.
- Ultimate profitability of retail items depends upon the difference between revenues generated and total costs (both direct and indirect) and whether the space occupied by inventory could be used for more productive purposes (opportunity cost).
- Inventory is not an investment that appreciates in value the longer it is held. Profitability depends on the difference between revenues and costs and the ability to regularly "turn over" the inventory through product sales.
- Inventory "turns" should average 8–12 times each year, such that product is not sitting on the shelf for more than 30–45 days. This average is made up of all products. Keep in mind that your hospital's "A" products will move more and have more turns than your "B" and "C" products. That is why it is also important to monitor turns on specific products.
- Buying more than three months' worth of inventory at a time is rarely profitable, unless there are substantial savings and little risk that the products will pass their expiration date. Savings must be even higher to consider purchasing enough stock to last for six months or longer.
- Delayed billing (also known as forward buying) can be cost effective if the distributor provides a no-interest incentive to buying product, as long as that product will not expire before being used and the money would not be used more profitably elsewhere.
- Quantity discounts are typically offered as an incentive for purchasing large quantities of single products or grouping of specific products offered by a manufacturer. A purchaser can take advantage of these discounts if the products are salable and the quantity discount can decrease the ordering (acquisition) cost of the drug. These discounts should also balance the savings with the costs of storing and having excess inventory. Knowing that the average holding cost is 8–20%, a purchaser may want to take that into consideration with what the discount savings should be.
- Inventory items should be priced on the basis of the fair market value of the product considering its direct and indirect costs and a sufficient profit margin. Additional returns gained from delayed billing, bulk buying, and other strategies should accrue to the practice as a reward for efficiency.
- Ensure that short-dated stock is sold first before it goes out of date.
- Stay ahead of the cost curve. Price increases for products purchased should be reflected as soon as the new product pricing information is entered into the computer.
- In some cases, especially when holding costs are high, product turnover is low, and risk of shrinkage is high, it is preferable to have customers' needs met by a pharmacy or other supplier. In many cases, using such a strategic partner can be just as profitable as carrying inventory (when total costs and commissions have been considered). It might even be more convenient for clients and help promote compliance.
- Most practice management software packages have inventory modules, but few are successfully implemented and utilized by veterinary practices. It is important to track both the inventory that is sold on a retail basis (e.g., pharmaceuticals) and the supplies that are used internally and never dispensed (e.g., suture material).
- Routinely have an ABC analysis done to identify your "A" products, which are your top 20% of your products that generate 80% of your usage and sales (see 9.11 – Effective Inventory Management). Practices that do not identify these "A" products often make multiple orders in a week. Keep a template or list of these "A" items and make a point to spot-check them all to be sure you have enough until your next order.
- Use web services by vendors who allow automated order levels to minimize employee time spent on ordering.
- Industry representatives, both distributors and manufacturers, can provide valuable information about available products, trend data, and new or soon-to-be released products. Be sure to have scheduled appointments with your representatives rather than have them just "stop by." Having appointments ensures that you have the time for information exchange.

CALCULATIONS

- Probably the simplest way of determining reorder points and/or reorder quantities is by reviewing past usage and calculating in desired inventory turns.
- If your desired turn for products is 12 turns (which can be a monthly supply and a good balance of not needing to order too frequently and using the product before the bill is due), review the past data for one year and divide that by 12. This can be used for a reorder point and/or reorder quantity.
- To have a lower reorder point or lower reorder quantity for products you can divide the past data by a higher turnover, such as 18–26 (which would be a two- to three-week supply).
- *JIT* is becoming a popular order habit. Though it keeps holding costs low, ordering costs tend to be higher (e.g., employees spend more time processing product orders, not to mention the chances of stockouts

8.8. ORDERING INVENTORY ECONOMICALLY

and backorders). Ordering in bulk keeps ordering costs down, but holding costs are higher. JIT ordering should be reserved for essential "B" products (those not needed immediately) and "C" products. Also, you need to take *lead time* into consideration with JIT ordering. A minimum of one week should be considered for lead time even if you can get a product within 24 hours. To calculate lead time, take your past data for one year and divide it by 260 to get an average daily demand. Dividing usage by 260 days instead of 360 days will be more accurate, considering a hospital can typically only receive shipments five days a week. Once you have your daily average use, you can multiply that by 7 to get your reorder point based on one-week lead time.

This calculation is based on one year of past data, but it can be adjusted to as much or as little a practice would like to use for data history.

• A more advanced model that describes the level of inventory and reorder quantity at which the combined costs of purchasing and carrying the inventory costs is called the *economic order quantity* (EOQ). Though the EOQ can be calculated as the most economical quantity of any item to purchase, given demand, ordering costs, and holding costs, it can be difficult to derive and calculate.

$$\text{EOQ} = \sqrt{\frac{2DO}{H}}$$

where D = annual demand, O = order placement costs (per order), and H = annual holding costs (per unit).

• This can be computed on any calculator that can handle square roots, in a spreadsheet, or with an online calculator, such as www.calculator.com.

• Annual demand D can be calculated as an extrapolation of previous years' sales or as a prediction based on other suppositions (promotional program, expansion, etc.).

• Order placement costs O often account for 15–20% of the retail cost of a product.

• Holding costs H may account for 8–20% of the retail cost of a product.

EXAMPLES

• Last year, the practice sold 1,067 packages of heartworm prevention, and that number is expected again in the current year. Each package has a wholesale cost from the distributor of $25. The hospital administrator suggests that holding costs are 20% of the package cost ($5.00) and that order placement costs average 15% on a per-unit basis ($3.75).

$$\begin{aligned}\text{EOQ} &= \text{Square root of } (2)\,(1{,}067)(\$3.75)/\$5.00\\ &= \sqrt{1{,}600}\\ &= 40\end{aligned}$$

• Heartworm prevention should be ordered 40 packages at a time to minimize inventory costs.

• You can also simply determine the order quantity by dividing 1,067 by the "turns" that you have set for a goal. If, for example, your "turn" goal is 26 (two weeks' supply), you will simply divide 1,067 by 26. This will give you an order quantity of 41 packages.

TIP

If you are using Microsoft Excel, which is the most common spreadsheet program in use today, you can easily calculate EOQ with the knowledge of a few symbols. The symbol "SQRT" is used to initiate a square root, and "∗" is used as a multiplier sign. To start an equation, the equal sign (=) needs to precede the other values to designate that this is a formula. Accordingly, the formula would need to be entered into an Excel field as

= SQRT(2 ∗ 1,067 ∗ 3.75/5)

Hit the Enter key and the answer will appear in place of the formula.

CAUTIONS

• EOQ determines the most cost-effective quantity of products to purchase, based on costs only.

• If vendors offer interest-free extended repayment schedules (delayed billing), then the time value of money must also be considered (see 7.1 – Time Value of Money).

• Actual costs, both direct and indirect, are often difficult to determine with precision, especially on a per-order and per-unit basis.

• EOQ is not a measure of profitability.

MISCELLANEOUS

• Inventory reorder points can be flagged on a computer system or manually with a card system. Having a system capable of tracking this information is one of the best methods of preventing shrinkage in a practice.

• Assess reorder points on a regular basis to ensure that the instructions and product levels are still pertinent.

• Veterinary practices do not need to stock all products to be profitable, nor to meet client needs. Stock only those products that have sufficient "turns" or those required for appropriate medical care (e.g., emergency drugs). Even routinely used products, such as heartworm preventatives, can often be more cost-effectively supplied to clients by a partner dispensing pharmacy, and they often have effective systems to help ensure compliance (e.g., reminder systems or JIT deliveries).

ABBREVIATIONS

***D*:** Annual demand
EOQ: Economic order quantity
***H*:** Annual holding costs (per unit)
JIT: Just-in-time

8.9. Accounts Receivable Issues

BASICS

OVERVIEW

Receiving payment in a timely fashion for work performed is a mark of a well-managed business. Clients have been trained by many other businesses that payment is expected at the time of a purchase. Most companies expect payment at time of service, as should veterinary practices.

TERMS DEFINED

Accounts Receivable: Money owed to a practice for services rendered or products sold that is not paid at the time of service or when the product is dispensed.

Deferred Payment Plan: Written document stating the amount owed, dates, and amounts of expected payment installments, consequences of failing to make payments on time, and a signature line for the clients to sign that they are in agreement with the terms outlined.

Finance Charges: Amount of money charged for payments that extend beyond an agreed-upon time limit. The amount charged is governed by usury laws in the state within which you practice. The amount of finance fee charged must be clearly reflected on the invoices rendered.

ISSUES AND OPTIONS

• A new client information sheet, which includes a caveat that payment is expected at the time of service, should be given to every new client. Practice brochures, the sign at the checkout area, and other printed materials all reinforce the position that timely payment is expected. This allows the client-relations specialists that field questions about payment to have a policy that is standardized and accepted throughout the practice.

• Staff, including veterinarians, should be educated that the accounts receivable balance represents real money. If fees are not collected at the time care is provided, then there may be a shortfall in money that is needed for other purposes, such as raises, the purchase of equipment to provide even better care to the pets, and payment of other costs associated with running a business.

• Maintaining accounts receivable is not only expensive in terms of money not being received by the practice, but there are additional expenses associated with generating and mailing statements, waiting for collection, and then reconciling the accounts. For every dollar that resides as accounts receivable, there is also the potential that the money will never be received, or that the client will be sent to collection, and the amount recovered (if any) will not even cover the costs of the services provided. Money not collected at time of service may potentially translate to money never being collected at all.

• Role-playing training sessions with the staff are a good way to help them deal with the many times they have to discuss money issues with clients. It is important that staff have the verbal tools to handle situations where they may be asked to explain and justify the cost of veterinary services.

• If you pay your associates on production and they are having trouble having money discussions with their clients, you may want to revise your compensation policy to remind associates that they are paid for production collected, not just produced.

• Not all clients can afford the very best care for their pets. A veterinarian's job is to offer the best in care options; however, it must be recognized that not all clients can afford that level of care, so offering other care options that are acceptable and that fit within the client's budget can help to minimize collection problems.

• Most practices take credit cards, and this is a logical mechanism whereby clients can charge their veterinary fees and then decide at a later date how they might elect to ultimately pay for them. The fee charged by credit card companies for processing the payment is much less than the cost of a practice offering credit to its clients and subsequently trying to collect payment.

• Third-party payers are another great way to offer payment options for clients who, for whatever reason, do not use cash, checks, or credit cards for their payment (see 8.13 – Third-Party Payments). Additionally, expensive healthcare needs for their pets can seem much more of an option to clients if they break up the payment into three, six, nine, twelve, or more installments. With third-party payers, a credit check is generally run on the person; someone other than an employee of the veterinary practice does this. If a client is rejected by such a service for being a bad credit risk, the veterinary practice should take this news as an advisement that extending hospital credit to such a client is a risky enterprise for the practice. The more ways you can help clients pay you, without you becoming the bank, the better. Pay attention to what is happening in the lender market place.

• Pet health insurance is an additional option and allows risk-averse clients to be prepared for medical intervention as the need arises (see 8.11 – Pet Health Insurance). Most of the insurance companies have field representatives who can train the entire staff, including veterinarians, to talk confidently about the benefits of having insurance to help with the healthcare needs pets might need.

• Endeavor to minimize disputes arising at the time the invoice is rendered. For expensive, complicated treatments, written estimates are appropriate and necessary. Standard estimates can be created for common disorders or treatment plans. Many practice management software programs have estimate templates available. Clients should be regularly updated as charges are incurred and as the treatment course changes. Clients should also stay current on their payments to the practice as situations change or as milestones in the in-hospital treatment process are reached.

• The aged accounts receivable schedule should be regularly reviewed. An aged accounts receivable listing shows amounts owed as current, 30–60 days, 60–90 days, and over 90 days. Collecting receivables that are greater than 90 days old is very difficult. Staff and associates should know who owes the practice money so that further service, if done at all, is on a current payment basis or at least arrangements are made to work off the "old money" before significant new money is added to the outstanding balance.

• What is an acceptable balance of accounts receivable for a companion animal practice? Ideally, zero. In reality, however, if the amount owed to the practice at any given time hovers around 1% of gross fees, you can consider yourself to be "on top" of your receivables.

• To the extent that your receivables are greater than 1%, you will find yourself in the banking business rather than the animal care business. Some practices try to justify letting clients get by not paying at the time the care is provided by charging interest on the unpaid balance. In practicality, we find that in most instances the veterinarians are so happy to ultimately collect the money owed them, assuming they do collect it, that finance charges are frequently waived.

• Not collecting at the time of service obviously hurts your cash flow from the standpoint of not having the cash. Compounding this problem, however, occurs when you are forced to either borrow funds to pay your own bills or, worse yet, you cannot pay your own bills – thereby hurting your credit rating and incurring your own finance charges that need to be paid because your creditors are not as nice as you in extending credit.

8.9. ACCOUNTS RECEIVABLE ISSUES

• In all situations, the time, money, and effort spent in collecting on your accounts receivables represent real costs to the practice that could better be spent on other areas.
• If accounts receivables have gotten out of hand, a compensation plan can be developed to motivate staff to help correct the situation. If the staff works hard at collecting old money that is owed to the practice, they deserve to share in the monies collected. However, it must be remembered that this is one more cost to the practice of having offered credit in the first place, and any profit that might have been present in the original fee is more than likely completely erased. In many cases, the transaction is often a net loss for the practice when viewed in real terms of the cost of that money.
• A good collection policy can be both fair and compassionate. Deferred payment plans may be appropriate for good clients with a good payment history, but they should not be used in all instances where someone cannot pay a bill. They should be reserved for those good clients who incur an unexpectedly large bill, but who have demonstrated from past history that they take good care of their animals and take care of you by paying their bills in a timely manner.
• Holding a client's check is generally not recommended. This puts one more level of responsibility on the practice to ensure that the checks are held in safekeeping and deposited only at the appropriate time. There is no guarantee the funds will be in the account when the checks are deposited, and if a slipup occurs and the checks are deposited too early then the practice will suffer the client's displeasure even though you are doing them a favor by holding the check in the first place. This is frequently a no-win situation.
• Small claims courts are sometimes looked upon as a way of collecting on old receivables. Assuming you have the time to go to court and plead your case successfully, this gives you lien rights against the client's assets. It is time consuming, has to be followed up on, and gives you no money in your checkbook at the time you win your case. It is best to avoid this route in the first place by having a good credit policy in your practice that you strongly adhere to.

8.10. GETTING PAID FOR SERVICES RENDERED[1]

BASICS

OVERVIEW

• Veterinary practices, and the staff who work in them, depend on the revenues generated from services to provide salaries, money for practice reinvestment, and as a return on investment. Operating a veterinary hospital is an expensive undertaking, and continued operation, compensating staff, and paying vendors in a timely fashion requires a consistent revenue stream. Accordingly, getting paid for services rendered is every bit as important as the level of customer service and the quality of medical care provided.

• Veterinary costs are a relative bargain for the pet-owning public when compared with similar costs in the human healthcare arena. However, most veterinary practices would counter that clients resist attempts to increase fees, and that it is a continual challenge to attempt to practice high-quality medicine without subsidizing the costs for clients in terms of keeping prices artificially low. This is only true, though, if veterinary medicine is a commodity in the minds of clients, and those services are interchangeable at any number of clinics. This also happens because clients often benchmark services against procedures that are already highly subsidized. For example, a client might have difficulty understanding why a laparotomy is being quoted at $1,200 when a complete ovariohysterectomy was performed for less than $400. This is the fault of veterinary pricing policies, not the whim of the pet-owning public.

• Similarly, something that veterinarians might consider a commodity transaction – the purchase of a dog or cat – is viewed quite differently by many pet owners. Although veterinarians might scoff at the "quality" of animals found in a pet store, clients willingly spend hundreds and sometimes thousands of dollars acquiring a pet, and often on impulse. These new owners typically buy the pet as a full cash transaction, with little tendency to price shop to see if they can get a better deal elsewhere.

• Veterinary services are only a commodity if veterinarians allow them to be commodities. Getting paid for services rendered involves delivering value and expecting to be paid for that value.

TERMS DEFINED

Commodity: Product that is interchangeable with another product of the same type. The price is a function of supply and demand.
Prophy: Colloquial term for a dental prophylaxis procedure.

ISSUES AND OPTIONS

ALLOWING CLIENTS TO MAKE INFORMED CHOICES

• A major problem associated with any sales transaction is prejudicially making assumptions about what the client can afford and what services they would elect if given appropriate information. The fact is that when clients pay for a consultation they are entitled to that consultation, which should include the appropriate options and the costs involved. Armed with all the appropriate information, the client is then prepared to make an informed decision.

• There are certainly clients that will select a path that is less expensive than the optimal route, but it is critical that the client makes that decision and not the veterinarian. Similarly, if the client would have selected the optimal route but the veterinarian did not recommend it because a personal judgment call was made that the client could not afford the service, then a terrible injustice was done to the client and to the pet.

• Discussions that occur between pet owners and veterinarians should be relationship based, in which the pet owner recognizes the medical expertise of the veterinary staff, and the veterinary staff acknowledges that only pet owners truly know what is best for their particular circumstances at any point in time. Therefore, arriving at an informed decision requires mutual respect and a partnership of sorts, in which both parties work toward a common goal (see 5.6 – Shared Decision Making). As such, it is critically important for veterinary staff to discern client expectations from the client perspective, so that those expectations can be met and even exceeded.

PAYMENT AT TIME OF SERVICE

• For many years, veterinarians offered care with easy payment terms, and so there are still a lot of clients that expect financing options (although they do not expect such options from other businesses). The easiest way to correct the situation is to make the terms of service obvious from the start and to feel comfortable speaking with clients about financial matters. This is often a point of concern, because many veterinarians do not feel comfortable talking about money with clients and therefore are prone to making bad decisions in this regard. Two of the most common mistakes include offering credit (often without charge) or discounting the service that was likely already offered at a bargain price. If the services were priced fairly (see 7.12 – Pricing Strategies), then only the hospital loses in this scenario.

• Veterinary practices should endeavor to increase transparency in setting expectations for visits, so clients can logically anticipate what their veterinary bill is likely to be for routine visits so they can plan accordingly. When clients cannot reasonably predict what veterinary charges are likely to be, it makes it difficult to be able to plan ahead for paying for them.

• Clients can and do spend money on things they value, and they pay for these things at time of service in most instances. Veterinary care is no different. If the practice accepts cash, checks, and debit and credit cards, then clients have more than enough options. For those clients who are temporarily cash strapped for unanticipated expenses, there are a variety of third-party payment options that can be exercised (see 8.13 – Third-Party Financing). Practices should be wary of extending credit to individuals denied credit by a third-party payer. In many instances, veterinarians have a habit of extending credit without even looking at a credit report. If a third-party payer has seen a credit report and found the client not to be creditworthy, veterinarians should take note and not extend the credit themselves.

• There are instances when needy clients do require veterinary services that they cannot afford. There are a variety of options in this regard, from referring the case to nonprofit hospitals that might be able to provide limited discounted services (see 1.22 – Not-for-Profit Veterinary Hospitals), to establishing a nonprofit foundation that can help fund needy pet owners (see 2.29 – Not-for-Profit Foundations). However, even with a nonprofit foundation, it is important that the veterinarian be far removed from the decision-making process of who gets discounted services. Veterinarians need to concentrate on giving clients the best information possible for them to make informed decisions, not to decide how to finance each pet's healthcare.

DELIVERING VALUE

• In most circumstances, consumers make purchase decisions on the basis of value, not price. The value may be perceived rather than actual, but clients nonetheless select on the basis of value. Thus, it is critical that veterinary hospitals deliver value and not try to sell goods and services as commodities. Commodities are only bought and sold on the basis of supply and demand. People willingly pay for goods and services that they value. For commodities, it is fine to shop around for the best price, because there is little difference in service. The value added by a veterinary practice is the entire reason for the veterinary visit, and the premise on which veterinary services are offered – the continued health of animals. Learn more about value in 9.6 – Value-Added Analysis.

• Not all clients want the same things. Some clients are prepared to pay for additional features, and some for less, so most retailers benefit from

[1] Some of the information in this section was abstracted with permission from Ackerman, L.J. *Management Basics for Veterinarians*. ASJA Press, New York, NY, 2003.

tiered solutions (good, better, best). Veterinarians would be well served to consider similar strategies.

CREATE A HEALTHCARE TEAM

Most consumers are unwilling to pay for services that they do not understand. Therefore, one of the most valuable tools to making owners aware of optimal medical care and its costs is to incorporate those pet owners into their pet's healthcare team. If they understand the process and are part of the solution, they will also bear responsibility for those costs.

MILESTONES FOR PAYMENT

Nobody likes surprises, so clients should be kept abreast of any possible changes in a patient's status, especially if they will affect the amount on the final bill, and clients should be able to anticipate payment points that correspond to milestones in the treatment-to-discharge pathway. This can be facilitated by:

- Creating estimates for all patients that will be admitted for any procedure. Standard estimates can actually be created for commonly performed procedures but should have realistic ranges so that the final bill should not be more than 10% above the estimated price.
- Establishing payment in full at time of discharge for all outpatient and day procedures. Clients should be aware of this prior to dropping off their animals. Establishing in advance how the bill will be paid can save time at discharge and also will confirm with the owner that payment will be expected at that time.
- Establishing payment points for animals that will be hospitalized for longer than one day. It is important to create a reasonable estimate, and to request payments that correspond to points between admission and discharge. For example, for an expensive hospitalization, one might ask for one-third of the estimated final bill in advance, another third after a given number of days (when a better estimate of prognosis might be possible), and the final third upon discharge. During daily communication with the owner, a more up-to-date accounting can be provided and the owner asked for additional funds (if warranted) in concert with the agreed-upon proposal. It is also important for clients to sign appropriate waivers that there might be unforeseen complications that may affect the anticipated outcome and the estimates of cost. Taking the time to get properly informed consent in advance is extremely helpful if things do go wrong, and if costs escalate for unanticipated reasons.

ACCOMMODATE CLIENTS' FINANCIAL NEEDS

In some instances, clients may authorize the work that needs to be done but simply cannot afford to have everything done and paid for at one time. There are several ways to manage this situation:

- Plan to have the same amount of work done, but space out the procedures (if medically feasible) to allow the client to budget and be better able to afford it. For example, if a pet needs a dental "prophy" and practice protocols require the animal to have a pre-anesthetic blood panel, consider collecting the blood sample first and then schedule the dental procedure for a future date that would better meet the budgeting needs of the client.
- If a significant portion of the bill is for pharmaceuticals, consider performing the medical procedures and authorizing a prescription for the medications that can be filled elsewhere (including an affiliated online veterinary pharmacy). In some cases, this may lessen your invoice to the client significantly and allow them to proceed with the medical care recommended (see 9.15 – Pharmacy Management as a Profit Center).
- Establish prepayment plans that spread the charges out over time rather than requiring a lump sum at time of service. For nonemergency situations, especially wellness programs, this is an excellent way to allow clients to budget and for practices to collect fully on the services provided (see 8.12 – Payment (Wellness) Plans).

ENCOURAGE HEALTHCARE RISK MANAGEMENT

Most people would not consider allowing their family members not to be covered by health insurance. Although nobody anticipates the need for expensive healthcare intervention, they appreciate that it is a possibility, so they manage this risk accordingly. This topic is covered in greater detail in 8.11 – Pet Health Insurance, but if more pet owners had appropriate insurance, veterinarians would have fewer complaints about getting paid for services rendered. As long as clients believe that pet healthcare will continue to be inexpensive and readily affordable, there is no real need for insurance. It is worthwhile for veterinarians to discuss the reasonable costs of pet healthcare over an animal's lifetime, including possible visits to specialists and emergency clinics. Clients would then choose to mitigate those risks, and likely many more would choose to properly insure their pets.

EXAMPLES

Donna Smith has complained to Dr. Jones that she spends about $250 yearly on her dog, Spike, but that there must be a less expensive way to care for him. Many times she buys a year's worth of supplies, such as heartworm prevention, and sometimes she even forgets to give the medication and then needs another blood test. Dr. Jones asked if it would be helpful if they provided two clinical examinations a year, a heartworm test and a fecal evaluation, and be charged $25 monthly instead. Donna agreed that it would. To help with the heartworm prevention issue, Dr. Jones even administered an injectable preventive so that Donna would not need to remember when to administer the medication at home.

CAUTIONS

- If clients do not see the value in services provided, they will be resistant to paying for those services.
- Similarly, if clients do not see the inherent value in their pet, they will be unable to see the value in veterinary services recommended.
- The best driver of client's valuing their pets is the human–animal bond, so this bond should be promoted and validated by practices at every opportunity (see 1.19 – Importance of the Human–Animal Bond).

MISCELLANEOUS

Clients love their pets, but they are also consumers. Accordingly, they want to understand the healthcare needs of their pets and seek value in the services they request.

8.11. Pet Health Insurance

BASICS

OVERVIEW

• Pet health insurance is an important method by which pet owners can manage the financial risks of pet healthcare. This will only become more pronounced as veterinarians' charges reflect the true value of services provided. It will also become more important as clients require services from specialists and emergency clinics, centers that tend to be significantly more costly than primary-care practices.
• Properly utilized, pet health insurance provides pet owners with peace of mind that they have planned ahead for the eventualities that we often do not want to think about but that nonetheless are an unavoidable part of pet ownership.

TERMS DEFINED

Benefit Schedule: Summary of covered services, benefit limitations, and applicable co-payments provided in an insurance policy.
Co-Pay: Specified payment amount of covered services that is the insurance policyholder's responsibility.
Deductible: Amount an individual must pay for health services before the individual's insurance company starts to pay.
Discount Plans: Not insurance. Instead, this is a service by which pet owners pay a fee to receive discounted services from participating veterinarians.
Exclusion: A condition that is not covered under an insurance policy.
Indemnity Insurance: System of health insurance in which the insurance carrier reimburses the insured individual for medical expenses after care has been provided.
Insurance Coverage: Insurance coverage, or cover, is the amount of risk or liability that is protected in an insurance contract.
Managed Care: Healthcare system under which healthcare professionals are organized into a group or "network" to manage the cost, quality, and access to healthcare.
Third-Party Payment: Monetary reimbursement for medical services from someone other than the client/patient.

ISSUES AND OPTIONS

THE NEED

• Veterinary healthcare is a multibillion-dollar enterprise, and it is natural that pet owners will want to find ways to manage those costs as effectively as possible.
• In human medicine, it is widely appreciated that it is necessary to manage the risks associated with high healthcare bills by having insurance, either as indemnity insurance, managed care, or socialized medicine.
• It might seem counterintuitive, but people do not buy insurance to save money – they purchase insurance for the peace of mind that comes with knowing that, if the unexpected happens, they will have the resources available to do what needs to be done.
• Pet health insurance has been available in the United States since 1982, but many pet owners are still unaware of the service and, in some instances, only hear about it after a problem occurs, which then becomes a preexisting condition and potentially invalidates future coverage for that problem.

THE PRODUCTS

• It is important to realize that indemnity insurance is not the same as human healthcare insurance, managed care, or discount plans. The major pet health insurance companies in the United States are indemnity insurers (property and casualty insurance), in which clients pay for veterinary services and then submit claims to the insurance company for reimbursement. With indemnity insurance, pet owners can visit the veterinarian or the specialty and emergency clinics of their choice, and the veterinarian and veterinary hospital are only required to provide the service, not process any paperwork (other than signing a claims form and providing clients with the information they need to submit with the claim). In some cases, the claims can be initiated by the veterinary practices themselves.
• Discount plans are not insurance at all. They are buying groups that sell discounted services to pet owners and then rely on a network of veterinarians to provide discounts in exchange for being promoted within the network. It is currently unclear if there is any real benefit for participating veterinarians, because the discount may exceed the profit margin on services offered. The premise is that discounted services attract new clients (the premise of all discounts), but that does not necessarily translate to profit for participating veterinary practices.
• Managed care plans have not been promoted in the veterinary marketplace. Given their lack of popularity with doctors and patients on the human side, they will likely not be warmly welcomed in veterinary medicine.
• Veterinarians do not need to promote specific insurance companies, but it is certainly worthwhile for them to notify clients that pet health insurance exists as a viable option and help them research the products available in their area so they can have intelligent discussions with clients about risk management (see Table 8-11-1). Owner compliance tends to be higher when veterinarians can provide information about the pros and cons of specific policies, reflecting features that would be of most concern to pet owners. In addition, pet owners are 50% more likely to enroll in pet health insurance if their veterinarian actively recommends it.[1]
• Clients (and veterinarians) should be aware of the terms of insurance policies, such as whether heritable conditions are covered, whether the insurance is offered on a benefit schedule or based on a veterinary invoice, whether the care of chronic conditions is covered, whether there is an annual limit, whether the pet is covered for its entire life, and whether there are exclusions in the policy.
• All insurance policies define what is covered in the policy, and also what is excluded from coverage. The most common exclusion is for preexisting conditions, problems that have been identified in the pet prior to the insurance policy taking effect. For example, if a pet has arthritis prior to being covered by insurance, it should be anticipated that the ongoing care of arthritis will be excluded from policy coverage. This is one of the reasons why it is so important that pets have insurance coverage early in life, when nothing is considered preexisting and the pet appears completely healthy.

8.11. PET HEALTH INSURANCE

Table 8-11-1. Resource for comparison of insurance plan features.

	Insurance plan comparison			
Coverage	*Sample*	*Plan A*	*Plan B*	*Plan C*
Accidents & illness	✓			
Emergency & specialty visits	✓			
Genetic and "predisposed" conditions	✓			
Ongoing care for chronic conditions	✓			
Clinical visits & diagnostic tests (not including wellness care)	✓			
Telehealth (virtual care)	✓			
Prescription medications	✓			
Surgeries & hospitalization	✓			
Rehabilitative, acupuncture, & chiropractic care				
Vaccinations, parasite control, and routine wellness exams	Optional add-on			
Annual limit	Unlimited			
Exclusions				
Deductible				
Co-pay				
Price				

• Some pet health insurance policies extend the concept of exclusion to conditions known or believed to have a heritable component. So, if a certain breed is known to be "predisposed" to certain ailments, coverage of those conditions may be excluded in some policies. The best way to safeguard against this is to recommend policies that clearly state that genetic problems are covered by the policy (as long as they are not preexisting). It should be expected that such policies are likely to be slightly more expensive, but they are often well worth it, since it can be disappointing to pet owners to have insurance only to learn that conditions that pose considerable risk might not be covered. Similarly, some policies can appear cheaper if they do not offer chronic care coverage. So, for example, a pet that develops diabetes mellitus during the policy term will be covered, but when the term renews the medical condition could be considered "preexisting" and excluded from further coverage. Everyone wants to save money on insurance, but such short-term savings are rarely worth it. If at all possible, recommend a policy that will provide ongoing care for chronic conditions, as well as coverage for hereditary conditions.
• Deductibles are set amounts that are "deducted" from the insurance reimbursement. Some policies have deductibles that apply per incident, whereas others might have an annual deductible whereby once that amount is reached further deductibles will not apply for the remainder of the term. Deductibles are meant to keep premiums affordable, by ensuring that pet owners have some stake in the process.
• Co-pays reflect the relative proportion of the covered amount to be paid for by the insurance company and the pet owner. For example, though there are a variety of possible co-pays, depending on what pet owners would like the premium to be, a typical co-pay may be that the insurance company will reimburse 90% of the covered amount, after the deductible, while the pet owner will be responsible for 10%. If owners are prepared for higher co-pays, they will likely see slightly lower premiums, but they will be paying for a higher percentage of their pet's care.
• Some insurance policies provide renewable lifelong care, albeit possibly with per-year or per-incident limits. However, some other policies with nonlifetime provisions may cover a condition during the course of a policy year but upon renewal in the subsequent year the condition might be excluded as "preexisting" and no longer covered. It is important to appreciate this distinction, because lifelong care is one of the most important reasons to consider pet health insurance in the first place (see 4.9 – Lifelong Excellence in Healthcare).
• Originally, pet health insurance was intended more for catastrophic coverage, and later for lifelong care, but some policies today also provide regular-care options, such as vaccination. In other instances, this type of wellness coverage can be an "add-on" to more traditional policies.
• It is worthwhile for veterinarians to understand treatment terms and any diagnostic codes for the insurance policies that they recommend. This makes it easier for the insurance company to match what was done at the veterinary hospital with conditions for which there is coverage, which in turn facilitates the process of the client being reimbursed. Policy information is provided on the websites of most insurance companies, or it can be requested by telephone or e-mail. Only some indemnity insurance companies use benefit schedules; some set annual limits, regardless of illness or condition.

INTEGRATING INSURANCE INTO PRACTICE STANDARDS

• Pet health insurance is an important component of allowing clients to manage their pet healthcare costs. It also allows clients to have veterinary care provided at the time it is needed without worrying about financing those costs by other means.
• Pet health insurance also tends to be highly effective at increasing compliance with veterinary recommendations, increasing purchases of veterinary medical services, and increasing pet health expenditures by pet owners.[2]

8.11. Pet Health Insurance

• Pet health insurance is also a valuable "perk" for veterinary hospital employees. It allows them to get veterinary care, including visits to specialists and emergency centers, without having to request discounts or informal consultations. This is one of the best ways to ensure that staff are ambassadors for excellent pet healthcare. Otherwise, many employees of veterinary practices may not be able to afford the care they are supposed to recommend to clients. Pet health insurance is a much-requested benefit from a variety of companies. In many cases, the employees pay for the plans themselves but receive a group discount by buying the insurance through their employers.
• Discussions of pet health insurance should take place as early as possible (typically when pets are about eight weeks of age), before any conditions occur that might be considered preexisting. Waiting until an incident has already occurred can be costly for clients. Similarly, the discussion should take place before the client encounters a situation that might involve a hefty healthcare bill. Most owners are unaware that they might eventually need levels of care that could cost hundreds or even thousands of dollars.
• Clients could save money specifically for the purpose of paying these bills when they arise, but most do not. Though it might be possible to replicate coverage by making contributions to a pet-specific savings account each month, it is important to realize that almost nobody takes this kind of disciplined approach to saving for a pet's healthcare needs. In addition, it would take years to save enough funds to cover potential veterinary expenses, especially given that it is not possible to predict when those funds will actually be needed. Sooner or later, most pets are going to develop medical problems that require ongoing medical care and monitoring (e.g., arthritis), need a referral to a specialist, or have a mishap that requires a visit to an emergency clinic. For most people, having a pet health insurance policy is the best way to deal with those likelihoods. Pet health insurance plays the role of taking the cost of pet healthcare out of available discretionary funds and turns it into a budgeted, affordable expense. Without such insurance, it can be very expensive to provide the type of care that most pet owners would prefer.
• The true value of pet health insurance, as it currently exists, is that it is truly a third-party payment. Clients visit their veterinary hospitals, veterinarians provide services, clients pay their bills and then submit them to the insurance company, and the insurance company reimburses the pet owner. This allows veterinarians to practice high-quality medicine and help clients afford high-quality healthcare, without veterinarians being directly involved in the financing of that care.
• As part of the arms-length relationship between insurance companies and veterinarians, it is important for the hospital to be a client advocate and to avoid direct intervention in the insurance process unless it is just to clarify the diagnosis made or the treatment provided.
• Part of the advantage of third-party payment is the independence that this affords veterinarians. As an advocate for the client and patient, the veterinarian should encourage clients to plan for unanticipated pet health expenses. The practice can facilitate this process by having clients compare available policies and select the one that best meets their needs. If the client later has a dispute with the insurance company over a claim, the veterinarian should remain impartial and not be viewed as an agent of the insurance company, which clearly they are not.
• It is helpful to both the client and the practice if hospital teams have basic knowledge of what different recommended insurance policies offer, so they can help clients select a plan appropriate for them (see Table 8-11-1). Insurance policies can be confusing to understand, but assisting clients in making valid comparisons enables them to select a suitable product for their specific circumstances, as well as basing decisions on value rather than just price. Sometimes, offering tiered solutions (good–better–best) can get clients past the initial decision of whether or not to get pet health insurance and instead to focus on which policy best meets their needs. Clients need to understand the tradeoffs in going for a policy that might be cheaper but not really meet their needs. In the end, clients need to be satisfied with the coverage they receive for the amount of money they are prepared to pay.

EXAMPLES

Schnitzel, a four-year-old miniature schnauzer, had been continuously insured since puppyhood without any insurance claims. In fact, Schnitzel's owners had considered discontinuing the insurance because it had not been used but continued it on the advice of their veterinarian. A few months later, Schnitzel was admitted to ABC Veterinary Hospital with acute abdominal pain that was later confirmed to be pancreatitis. Schnitzel was hospitalized for three days, maintained on intravenous therapy, and then finally released. The hospital bill was considerable, more than the total insurance premiums paid to date. Schnitzel's owner, Mrs. Smith, put the charge on her credit card and promptly submitted the bill to her pet insurance company. Within a few weeks, she received her reimbursement, in which the vast majority of the bill was covered, after the deductible and co-pay.

8.11. PET HEALTH INSURANCE

CAUTIONS

- Because indemnity insurance is true third-party coverage, it is important that veterinarians and veterinary hospitals not make any representations regarding the insurance company, such as assuring clients that the care being provided will be covered. If there are any questions about coverage, the clients should contact the insurance company directly.
- It is critical that veterinarians maintain their ethical standing with third-party payer companies and with clients. Clients sometimes ask veterinarians to provide fraudulent documentation that would allow them to recoup expenses from insurance companies. Veterinarians should never comply with such requests, only offering to make available legitimate records that are a truthful rendering of the situation.

MISCELLANEOUS

- True indemnity insurance is a highly regulated industry, and each state has its own licensing procedure. Many insurance look-alikes abound in the pet marketplace, but they are not bound by the same regulations as the insurance companies. These can be confusing for pet owners and veterinarians alike, but most are discount plans without the same regulatory safeguards in place.
- Insurance can be a confusing topic for owners, and it is worth making suggestions as to the types of companies available (not all insurance plans are necessarily available in all states) that offer indemnity insurance. One of the ways of keeping premiums comparatively low is that pet health insurance is not typically sold by agents, and there has been relatively little direct marketing to the public previously.
- Other forms of pet insurance do exist, but they are not related to healthcare coverage and so are not discussed further here. For example, liability insurance is available to cover damage done to property and people by pets, there are insurance products that would cover the theft of a pet, and even forms of life insurance that would pay out when an animal dies.

8.12. PAYMENT (WELLNESS) PLANS

BASICS

OVERVIEW

Payment plans, sometimes referred to as wellness plans or concierge plans, are tools used to make veterinary visits more affordable by spreading charges on a regular recurring basis rather than larger client invoices at time of service.

TERMS DEFINED

Driver: An aspect of a business that leads to change in other aspects of a business, usually in a positive fashion.

Insurance: A form of risk management in which reimbursement for specified veterinary expenses is guaranteed in exchange for premium payments.

Payment Plan: A bundled medical plan in which specified veterinary services are provided and paid for in installments or prepaid, rather than at time of service. Sometimes referred to as wellness plans or concierge plans.

ISSUES AND OPTIONS

PREMISE

• Research has indicated that pet owners want predictability of veterinary care expenditures and would appreciate opportunities to pay for those services over time rather than all at once.[1]

• Many clients that use payment plans appreciate the ability to budget for anticipated veterinary care and spread the annual costs over periodic (often monthly) payments.

• Veterinary practices often entertain payment plans to encourage clients to commit to a recommended array of services, improving compliance and smoothing out cash flow more evenly over the course of a year rather than changing with seasonal trends.

• Payment plans can include any services to which the practice and the client are in agreement. They are entirely customizable.

• Typically, payment plans cover services over a 12-month period, but that, too, is customizable.

• The most common payment plans are for "wellness" visits, and might include the number of visits during the plan period (from one to unlimited), vaccinations, parasite testing, certain diagnostics (e.g., heartworm testing), identification (e.g., microchipping, DNA screening), and other services.

• Payment plans are not limited to preventative care. They can also be used in care pathways (see 9.3 – Standards of Care and Care Pathways), for which expenses can be readily predicted, and even for accounts receivable, to provide an option for clients who carry a balance but hope to continue to utilize veterinary services.

• The number of clinic visits provided in a payment plan can be quite variable, even unlimited. Virtual care (telehealth) may also be incorporated into these plans (see 4.24 – Telehealth). The rationale for providing more clinic visits than is customary is to remove any barrier to the client coming in for attention, with the realization that it is the clinic visit that is the "driver" for additional medical expenditures.

• Research has demonstrated that the extent to which customers use the products they have already paid for helps determine whether they will repeat the purchase the next year.[2] Consumers feel compelled to use products and services that they have paid for, to avoid feeling that they have wasted their money. This approach benefits both pet owners, who want their pets to be cared for, and veterinary clinics that want to provide that care. This consumption also affects switching costs, since it would be difficult for clients to "unbundle" their services if they were considering changing clinics.

• Veterinary proponents of payment plans assert that clients seek veterinary attention more often and earlier when they have a payment plan, and that this makes clients less price conscious, removing one important barrier to more comprehensive and regular veterinary care. When this happens, client traffic in the clinic typically increases, more incidental problems are caught and treated, and pet owners have more opportunities for purchasing their medications, diets, and supplies at the hospital, typically as ancillary spend to the payment plan.

IMPLEMENTATION

• Currently, perhaps 20% or so of small animal veterinary practices offer some form of payment plans to their clients.[3]

• The working concept for most plans involves a commitment of the pet owner to make installment payments toward an agreed-upon bundle of services to be provided by the veterinary hospital. Other clients might be prepared to pay for the entire plan period up front in order to be assured a bundle of services at a fixed price.

• The veterinary practice must decide on the number of plans that will be offered, which might be determined by life stage (see 4.9 – Lifelong Excellence in Healthcare), plan status (e.g., silver, gold, platinum), species, care pathway, and any number of other determinants.

• For each plan, the practice needs to determine the total price for the bundle over the plan period (typically, one year).

• Once the fair retail price has been determined, the practice has the option of whether to offer a discount to that amount, as an incentive for owners to commit to the full array of services. In many premium plans, the service list typically includes more than most clients would otherwise request during the plan period, so discounts are offset somewhat by a higher starting fee. For example, the Companion Animal Parasite Council (CAPC; www.capcvet.org) recommends fecal evaluation two to four times during the first year of life, and then once to twice yearly in adults. Whereas many clients might have fecals evaluated perhaps once a year, the premium plans can actually cover the full recommendation of CAPC, bundled into a manageable payment plan.

• Practices also have the option to charge an up-front administrative fee to enact the plan, either as a fixed amount or as a percentage of the plan total. This "enrollment fee" reflects the pet owner's commitment to the process, perhaps even implying a sense of membership or community, and provides the hospital with some initial revenue to defray the costs associated with services provided before full payment is received.

• The payment plan itself is not just a way for clients to defer their veterinary expenses. It is meant to be a contract that guarantees revenues for the hospital as well as providing affordable payment options for pet owners.

• Once a practice has elected to initiate payment plans, it needs to create a marketing plan, train staff, set performance targets, and carefully measure return on investment.

ADMINISTRATION

• In addition to creating and pricing plans, the hospital must decide how they intend to collect recurring payments and how they are going to reconcile payments with services provided in the practice management software (PMS). For example, if a payment plan includes two office visits, vaccinations, and fecal and heartworm testing, the practice needs to be aware that when the client presents for a third office visit during the course of the plan period that this is outside of the plan and must be billed separately.

• Practices can decide to administer the plans themselves, with payment collected on a recurring basis, but they must maintain security standards (e.g., Payment Card Industry (PCI)) as required by law to protect the financial integrity of their clients.

• Practices can also make arrangements with their credit card merchant accounts for processing recurring payments, and with banks to debit clients' accounts for the appropriate amounts during the plan period. There are also commercial alternatives that will handle payment

processing for a fee. Depending upon the company selected, payment plans can be created for payments made with credit cards or automatic bank drafts (automated clearing house). Some of these companies even provide instant credit analysis as part of their service.
• A final approach is to consider utilizing a full-service company that processes payments, tracks plan utilization, provides sample plans, and may even integrate with some PMS.

EXAMPLES

Mrs. Franklin brought in her Maine coon cat, Franny, to ABC Veterinary Hospital, and while she was waiting for her appointment she read a brochure for the hospital's *Concierge Plans*, a form of annual payment plan. They even had some breed-specific plans, and the receptionist explained that for Franny they could construct an initial plan that would include up to four office visits per year, fecal evaluation, year-long parasite control, all vaccinations, microchipping, baseline laboratory values (blood and urine), viral profile, heartworm testing, and a genetic screening panel that included hypertrophic cardiomyopathy, polycystic kidney disease, and spinal muscular atrophy. The receptionist provided an estimate of the retail value of those services and offered two options for payment: a 10% discount on the total for prepayment of the entire amount or a monthly payment plan could be created and implemented for either credit-card or bank-draft processing, for a separate up-front enrollment fee. In subsequent years, different plans would be created based on Franny's particular needs.

CAUTIONS

• All veterinary hospitals in the United States, of any size, that process, store, or transmit credit card information must be PCI compliant for keeping clients' payment card data secure. This is particularly relevant for payment plans if the practice intends to store client payment card data for entry on a recurring basis.
• It is imperative that clients do not confuse these plans with pet health insurance (see 8.11 – Pet Health Insurance). Clients need to realize that payment plans cover only the specified procedures that constitute the plan itself. They do not cover unanticipated medical issues that are not specifically detailed in the plan. They also do not include visits to other veterinary practices, including emergency facilities and specialists. Payment plans should be associated with contracts that clearly depict the responsibilities, benefits, and limitations of such programs.
• Most payment plans do not guarantee that there will not be any payment defaults, so practices need to also have a process in place to deal with situations in which some services have been rendered but payments have been interrupted or discontinued. Some corporate services will assist with nonsufficient funds transactions, expired credit cards, and other such issues.
• There also need to be processes in place when clients move, a pet dies, or in some other circumstance, when payments will end before the plan period and it is necessary to reconcile payments made with services already provided.
• Employee (associate) veterinarians that are paid on production (commission) must be confident that the practice has a system in place to assure their fair compensation when clients come in for services not associated with invoices. The most common approach is to credit them on the basis of the discounted price at time of service; but as long as there is mutual agreement, many different compensation models could work.
• Some practices significantly discount the total payment plan amount as an enticement for clients to commit to the full complement of recommended services. They might also discount ancillary services as part of the loyalty program. Because veterinary profit margins might be lower than the discounts offered, it is important to track these programs to ensure that they are, in fact, profitable for the practice.
• It is not unusual that clients fail to fully utilize all services in a payment plan. Although in some ways this might seem attractive, as money is collected without providing services, it is important to remember that one of the reasons for offering payment plans is to actually deliver a high level of veterinary care. So, clients should be encouraged and reminded to fully utilize the services provided in their plans. Discounts are typically not necessary if the plan itself provides adequate value.
• Practices must consider strategies for ongoing renewal of plans, so they are not perceived as limited to puppy/kitten visits.
• Payment plans are not suitable for all clients. In many communities, there are still pet-owning families that have neither credit cards nor bank accounts, making then unsuitable participants in payment plans.
• Payment plans are not a guarantee of profitability for a practice. If the practice has problems with customer service, communications skills, staff alignment, or administrative oversight, then payment plans can contribute more problems than they will solve.

8.13. Third-Party Financing

BASICS

OVERVIEW

• Pet owners have a lot of options when it comes to paying veterinary invoices; most pay with credit cards, checks, or cash.
• There are also many clients who cannot afford to pay for their veterinary services this way, and so other mechanisms have become available to help clients in this regard.
• While similar to other forms of credit, veterinary-specific third-party financing allows clients to pay for services with a variety of other options.

TERMS DEFINED

Accounts Receivable: Monies due to a company for goods sold or services rendered for which payment has not yet been received.
Economic Euthanasia: A situation in which euthanasia is selected principally on the basis of a pet owner's unwillingness or inability to pay for needed veterinary care.

ISSUES AND OPTIONS

RISK MANAGEMENT

• It is important to help clients appreciate the potential healthcare costs for a pet over its entire lifespan (see 4.9 – Lifelong Excellence in Healthcare).
• When that is done properly, pet owners can then assess their potential risk management options for being able to pay for those veterinary services.
• The most common risk management strategies are pet health insurance (see 8.11 – Pet Health Insurance), and payment plans [see 8.12 – Payment (Wellness) Plans].
• Pet health insurance is a great mechanism for helping to pay for unanticipated expenses, such as the treatment of diseases, emergencies, and even referrals to specialists. Some pet health insurance policies will also cover more routine "wellness" care, either as part of the policy or on an add-on basis. The pet health insurance itself is pet specific, and whereas coverage is based on the particular policy selected, it can be used at virtually any veterinary facility, not just with the primary-care hospital at which the pet is being seen for routine care.
• Payment plans, on the other hand, are typically arranged by a specific veterinary facility for a specific pet, and for a specific array of services. The coverage is typically for anticipated care, allowing pet owners to spread the costs of this anticipated care over periodic payments (usually monthly). Most payment plans established by veterinary hospitals are only applicable for services performed at that specific hospital (or affiliated hospitals).
• For clients who do not necessarily have the financial wherewithal to pay for their veterinary care all at once with cash, check, or a credit card, and whose veterinary bills might not be covered by pet health insurance or payment plans, other options have become available.

OPTIONS AVAILABLE

• Many pet owners do not plan ahead for healthcare issues, and also may find that they do not have access to sufficient funds to provide the care they would like for their pets.
• When pet owners are confronted with veterinary expenses they cannot afford, they may turn to the veterinary hospital for solutions. In most cases, it is not an ideal situation for veterinarians to accept delayed payments, and in many clinics the number of clients that would avail themselves of such services would create accounts receivable issues (see 8.16 – Credit and Collections).
• Pet health insurance requires that pet owners have policies in place before care is needed, or such coverage is likely to be dismissed for "preexisting" conditions. Payment plans are simply a tool for pet owners to spread anticipated expenses over an established time interval. This leaves at least some clients with a need for a program that is flexible enough to be used with either anticipated or unanticipated pet care expenses and to be able to spread those costs predictably over an interval of time.
• Veterinarians are not in the financing business and probably should not be extending credit to clients, but there are several financial institutions that are ready to provide such veterinary-specific funding to our most creditworthy clients.
• Unfortunately, without such options, veterinarians would likely find themselves in even more predicaments where they have to make life-or-death decisions, not because there are no medical options, but because clients cannot afford to pay for them, at least not up front or all at once. Sometimes, this results in the death of the pet as a financial alternative. This is sometimes referred to as "economic euthanasia" and serves the interest of neither the veterinary hospital nor the client.

THIRD-PARTY FINANCING

• The goal of third-party financing is laudable: helping pet owners to be able to afford the care their pets need and allowing veterinarians to focus on the delivery of excellent healthcare with minimal involvement in financing.
• There are a variety of third-party financing options, but most involve credit cards, loans, or payment plans.

VETERINARY-SPECIFIC CREDIT CARDS

• Private-label credit cards are available through several different financial institutions (such as CareCredit, Wells Fargo, and Citibank in the United States) and pet owners may be aware of them because they are also used for financing different human healthcare needs (such as dentistry, chiropractic, and vision care).
• Veterinary-specific credit cards can be used at different locations, but only for veterinary expenses, and only at providers that are part of the company's network. These credit cards typically provide a revolving line of credit that can be used to pay for veterinary services within the company's network of enrolled providers.
• Veterinary hospitals accepting such credit cards typically pay an administrative fee to be part of the network, as well as merchant fees on the credit card purchases.
• Each company has its own financing options, but most provide no-interest (for the pet owner) loans if the debt is paid in full within the establish payback period, and fixed monthly payments at established interest rates for longer periods.
• In most instances, credit approval is quick for creditworthy clients and can be accomplished online or by telephone in real time. Once the application has been approved, the cardholder can use the card for purchases at veterinary clinics up to the approved limit.
• The approval rate for such cards may be higher than for typical credit cards, but creditworthiness of the client is the major determinant.
• When a client has been approved and uses such a card, the veterinary hospital typically receives its payment within a few days, less the administrative fees. With most of these programs, the financial relationship is between the financing company and the cardholder, so veterinarians get paid even if the client defaults.

• The benefit to veterinary hospitals is that it allows creditworthy clients who might not have the ability to pay for all needed services at once to pay for them over time through an independent financing option.

LOANS AND PAYMENT PLANS

• Other options for third-party financing include loans and payment plans.
• There are now several companies established to provide loans and payment plans for pet owners, including Medical Financing (https://medicalfinancing.com), First Look (www.firstlookapproval.com), LendingPoint (https://lendingpointmerchantsolutions.com), PetLoans (https://petloans.com), Prosper (www.prosper.com), Scratch (https://scratchpay.com), Varidi (https://varidi.com), and Veterinary CreditPlans (www.extendcredit.com/veterinary). There is often considerable flux within the industry, with companies entering and exiting the marketplace, and names changing with corporate mergers and acquisitions.
• Payment terms vary significantly depending on the creditworthiness of the pet owner. Some require automatic withdrawal for client's bank accounts, and most of the processing and administrative fees are paid by the borrower. Sometimes, hospitals are required to pay a fee with each transaction, but in most instances there are no start-up or subscription fees. Payment to the practice typically occurs as soon as the service is rendered.

OTHER VETERINARY ASSISTANCE PROGRAMS

• There is now a plethora of financing options available to clients that are only bounded by a pet owner's imagination.
• There are a variety of crowdfunding platforms where pet owners can appeal to others for for-profit funding, the largest of which to date is GoFundMe (www.gofundme.com). However, there are many others, including PlumFund (https://plumfund.com), Waggle (https://waggle.org), and YouCaring (www.youcaring.com). Expect this marketplace to continue evolving, and it is necessary to verify the integrity of such lending platforms.
• Assistance for pet owners is also available through a variety of programs, including the Pet Fund (www.thepetfund.com), the Humane Society of the United States (http://humansociety.org), the American Society for the Prevention of Cruelty to Animals (www.aspca.org), and Feline Veterinary Emergency Assistance (http://fveap.org). Programs are also available that function solely on a local level (e.g., https://face4pets.org), so it is worthwhile doing an extensive search to uncover resources that may be applicable.
• There are also a variety of charitable organizations that provide financial assistance on a breed-specific basis. Examples include LabMed (www.labmed.org) for Labrador retrievers and WestieMed (http://westiemed.org) for West Highland White terriers.
• In some instances, it might even be possible for veterinary hospitals to create a not-for-profit foundation to benefit clients who are unable to afford needed care (see also 2.29 – Not-for-Profit Foundations).

EXAMPLES

N/A

CAUTIONS

• Though there are many financing options available for pet owners, it is unlikely that solutions exist for every potential situation.
• There is a difference between clients that do not have the means to afford needed care for their pets and those that have the means but choose not to prioritize the needs of their pet over other expenditures. However, both cases can prove difficult for veterinary hospitals, since there is still a pet in need of care.
• If a veterinary financing company deems your client not to be creditworthy, then believe them and fight the temptation to be the lender of last resort.
• The best way to address the situation proactively is to address financing needs early with clients, even at puppy and kitten visits, and encourage the owner to plan ahead, if at all possible.
• Open-book management can be enlightening for the hospital team to help with the realization that individual veterinary hospitals are not in the position of being able to routinely finance veterinary care for clients (see 2.1 – Workplace Management).
• There is no doubt that having discussions about finances is not easy, especially when it involves the life of someone's beloved pet (see 5.13 – Discussing Finances).
• Realize the stress that comes from having to provide alternatives to an established standard of care (see 2.10 – Compromise Fatigue).
• Avoid the temptation to extend credit to clients unless you are prepared to research how such a process can be done legally, while protecting the financial security of clients. If considering doing so, develop a credit application and have it reviewed by an attorney, and learn what recourse you might have if the client defaults on the debt.

8.14. DIGITAL WALLETS

BASICS

OVERVIEW

• The term "digital wallet" is broadly defined as a digital system through which a person's identity, available payment methods, and other information are stored and transferred. Nearly always, a digital wallet is used in some type of transaction.
• An understanding of digital wallets is beneficial to veterinary practices because consumer adoption of the technology is increasing over time. More and more clients will come to expect that practices agree to accept digital payments.
• There are a few alternate names for digital wallets. A common one is "E-wallet." Since there is no standard definition for digital wallets they sometimes are erroneously viewed as being synonymous with mobile payment systems or other technologies. When discussing and considering digital wallets, it is important to be clear about the specific technologies and features to avoid confusion.
• The conveniences offered to consumers by digital wallets transcend online payments and now include in-person transactions. There are also myriad benefits to merchants.
• Technology solutions that enable merchants to accept digital wallet transactions are generally simple and integrate well with popular accounting and other merchant systems, making them viable and attractive for veterinary practices of all sizes to adopt.

TERMS DEFINED

Bluetooth®: A low-power wireless technology that allows devices to communicate.
Encryption: Changing data so it is not readable by unauthorized parties who might intercept it.
Internet of Things (IOT): Physical devices containing hardware, software, and sensors that are connected to a network, enabling these objects to connect and exchange data.
Merchant: A business who accepts payments from consumers.
Near-field Communication (NFC): A wireless technology that allows devices to communicate by touching or "tapping" them, or by holding them in close proximity to each other.

ISSUES AND OPTIONS

• Digital wallets, once typically used primarily for financial transactions, are now also used for many other types of transactions, such as loyalty programs, rewards systems, tickets and boarding passes, or identification/age verification.
• To understand a digital wallet, one can simply draw a comparison with all the cards and information commonly found in a physical wallet. This can include payment (credit/debit) cards, banking (automatic teller machine) cards, personal insurance information, personal identity (e.g., driver's licenses, state identification cards), library cards, and more. In addition, a digital wallet may also contain shipping/billing addresses and other contact information to make transfer of this data quick and error free.
• Although often perceived as a mobile payment system, digital wallets are often used in nonmobile environments, such as a personal computer. There are also standalone mobile devices (i.e., separate from an app on a phone or tablet) that can be used for digital wallets. The way the data is stored and the way it is accessed/transmitted are two separate components of a digital wallet. As such, the same information stored in a person's digital wallet could prospectively be accessible via a mobile device and/or via a nonmobile device.
• Adoption of mobile wallets suffered initially from a "chicken and egg" problem. In order for consumers to adopt it, a critical mass of merchants needed to accept it. In order for merchants to invest in the technology and systems to make it work, they needed enough consumers to want it. Adoption was slower in the United States than in other countries, but has been growing steadily over time and is expected to continue to rise globally. Some have speculated that digital wallets could overtake credit cards as the dominant method of payment worldwide.
• Digital wallet payments are commonly transacted using a traditional consumer-to-merchant method via a payment processor or payment gateway. Other systems have been pioneered thanks to digital wallets. One example is direct carrier billing, where mobile carriers (such as Verizon Wireless, Comcast, etc.) collect payments on behalf of an app company or other merchant. Another example is closed-loop payments where a mobile app for a coffee shop, grocery or retail store, restaurant, or other merchant collects money and maintains a balance that can be used by the consumer. Digital wallets can be used in peer-to-peer transactions as well, allowing individuals to transfer money or other digital value to another individual.
• Consumers enjoy a number of conveniences by using digital wallets, including:
  ◦ Managing funds availability and categorizing/annotating disbursements is simple and handy.
  ◦ Associating payments or transactions to loyalty or reward programs is common and easy.
  ◦ Mobile systems typically have an NFC or Bluetooth mechanism for wireless and touchless transactions – one only needs to hold the device near enough to a receiver for the data to transfer.
  ◦ Many devices that support digital wallets can be found in IOT devices. Examples include wearables, watches, pet collars and carriers, and more.
  ◦ Digital wallets support autorenewals for products and services, as well as payments and transactions for remote physical services (e.g., parking meters).
  ◦ Digital wallets can be shared by multiple users. For example, some digital wallets are shared by family members or by multiple staff in a group or company. A complete accounting of who accessed funds or data in the digital wallet can be made available, including what data/funds were used, when, and by whom.
  ◦ For online transactions, digital wallets may have the ability to automatically fill out form data. This is not only convenient, but it also reduces data entry errors. Form data is generally password protected so that it cannot be accessed by an intruder.
• Merchants also enjoy significant benefits from digital wallets:
  ◦ Transaction fees for merchant systems used by digital wallets are typically lower than for credit cards or other payment systems.
  ◦ Merchants can often access real-time data about their consumers, as well as historical data.
  ◦ Some digital wallet providers also offer merchants consumer profiling and other analytic services, which the merchant can use for marketing, decision-making, and other business endeavors.
  ◦ If the digital wallet system is used to automatically fill in online form data as described earlier, the likelihood of fraud is reduced, which mitigates risk to the merchant. In veterinary practices, this would be beneficial for the practice's online pharmacy, appointment setting, etc.
• Because they are digital, the data stored in digital wallets is readily extensible. Some efforts are made to allow people to store additional information about themselves that is not commonly found in a physical wallet. Examples might include medical records, prescription lists, insurance details (other than medical insurance – e.g., property/auto insurance, pet health insurance), lists of property

(including pets and pet details), shopping lists, contact lists, passwords, and the like. It is reasonable to expect that a good deal of pet-specific information will be made available using digital wallets.

EXAMPLES

Ms. Mathers prefers not to keep credit cards, health insurance cards, loyalty cards, or other physical cards in her purse because they may get stolen and they sometimes wear out. She has a digital wallet app on her mobile phone that allows her to make credit card payments to participating merchants by either tapping her phone on a compatible NFC device or allowing the merchant to scan a code on her phone screen. The communications between her phone and the merchant's equipment are encrypted, which eliminates the possibility of a hacker accessing her information. By participating in digital wallet transactions, the merchant is protected by its bank in the event Ms. Mathers is, in some way, fraudulently using her digital wallet.

Mr. Roberts desires to have his pet's prescriptions delivered to his home automatically every month via the practice's online pharmacy. He visits the online pharmacy using his home computer and opts to use his digital wallet to do the transaction. The digital wallet passes his name, shipping address, and billing address to the online pharmacy, which confirms the information after he enters his password. He then selects the prescriptions he wants to have auto-refilled and specifies he wants them paid using a specific credit card in his digital wallet. The online pharmacy is now able to fill the prescription each month and charge the appropriate credit card.

CAUTIONS

- Fragmentation is one major consideration for merchants and consumers alike. Disparate and proprietary systems from different digital wallet providers often are not compatible with each other. Some providers will bundle multiple digital wallet technologies into a single solution, but this often does not include all available options.
- Whereas hackers will have a more difficult time accessing data in a digital wallet due to the technologies involved, it is not completely impossible. It is likely that major providers of digital wallet technology will be regularly targeted by more sophisticated hackers.
- Merchants must be wary of fraudulent consumers. Although the general public is frequently cautioned against it, people are often willing to share passwords with people they trust, which can result in unauthorized use of digital wallet assets.
- Adoption is a consideration. The percentage of consumers who have digital wallets continues to grow, but critical mass across the board, as well as for a given market like the pet health vertical, may still take time. There is also evidence that consumers who have digital wallets may not using them as often as expected.
- Consumer privacy is a factor. Although digital wallet systems are designed to protect consumer information, consumers themselves are acutely aware of privacy issues and will often reject the use of systems like digital wallets out of concern for their privacy.
- Merchants must consider consumer privacy when adopting digital wallet technology. Data made available to the merchant must be protected. Local, state, federal, and international laws are constantly evolving to protect consumer privacy, and merchants are legally obligated to adhere to the changes as they happen.

8.15. CRYPTOCURRENCIES

BASICS

OVERVIEW

• Cryptocurrencies are just lines of computer code that hold monetary value. Those lines of code are created by electricity and high-performance computers.
• Cryptocurrency is also known as digital currency. Either way, it is a form of digital public money that is created by painstaking mathematical computations and policed by millions of computer users called "miners." Physically, there is nothing to hold.
• "Crypto" comes from the word cryptography, the security process used to protect transactions that send the lines of code out for purchases. Cryptography also controls the creation of new "coins," the term used to describe specific amounts of code.
• Governments have no control over the creation of cryptocurrencies, which is what initially made them so popular. Most cryptocurrencies begin with a market cap in mind, which means that their production will decrease over time, thus, ideally, making any particular coin more valuable in the future.

TERMS DEFINED

Blockchain: A digital ledger in which transactions for cryptocurrencies are recorded publicly and chronologically.
Hedging: A risk management strategy used in limiting or offsetting probability of loss from fluctuations in the prices of cryptocurrencies. Hedging employs various techniques, but it basically involves instantly exchanging cryptocurrencies into the preferred currency used.
Mining: Cryptocurrencies are made through a very interesting self-limiting system called cryptocurrency mining, and the people who mine these coins are called miners. This involves commanding a computer, or a network of computers, to work around the clock to solve "proof-of-work" problems.

ISSUES AND OPTIONS

WHAT ARE BITCOINS?

• Bitcoin was the first cryptocurrency invented. No one knows exactly who created it – cryptocurrencies are designed for maximum anonymity – but bitcoins first appeared in 2009 from a developer supposedly named Satoshi Nakamoto. He has since disappeared and left behind a bitcoin fortune.
• Because bitcoin was the first cryptocurrency to exist, all digital currencies created since then are called altcoins, or alternative coins. Litecoin, peercoin, feathercoin, ethereum, and hundreds of other coins are all altcoins to distinguish them from bitcoin.
• One of the advantages of bitcoin is that it can be stored offline on a person's local hardware. That process is called cold storage, and it protects the currency from being taken by others. When the currency is stored on the internet somewhere (hot storage), there is high risk of it being stolen.
• On the flip side, if a person loses access to the hardware that contains the Bitcoins, the currency is simply gone forever. It is estimated that as much as $30 billion in bitcoins has been lost or misplaced by miners and investors. Nonetheless, Bitcoins remain incredibly popular as the most famous cryptocurrency to date.

HOW BITCOINS WORK

• Bitcoins are completely virtual coins designed to be "self-contained" for their value, with no need for banks to move and store the money. Once you own bitcoins, they behave like physical gold coins: they possess value and trade just as if they were nuggets of gold in your pocket. You can use your bitcoins to purchase goods and services online, or you can tuck them away and hope that their value increases over the years.
• Bitcoins are traded from one personal "wallet" to another. A wallet is a small personal database that you store on your computer drive (i.e., cold storage), on your smartphone, on your tablet, or somewhere in the cloud (hot storage).

BITCOIN VALUES AND REGULATIONS

• A single bitcoin varies in value daily; you can check places like Coindesk (www.coindesk.com/) to see the current value. There are more than two billion dollars' worth of bitcoins in existence. Bitcoins will stop being created when the total number reaches 21 billion coins, which will be sometime around the year 2040. As of 2017, more than half of those bitcoins had been created.
• Bitcoins are stewarded by "miners," the massive network of people who contribute their personal computers to the bitcoin network. Miners act as a swarm of ledger keepers and auditors for bitcoin transactions. Miners are paid for their accounting work by earning new bitcoins for each week they contribute to the network.

HOW BITCOINS ARE TRACKED

• A bitcoin holds a very simple data ledger file called a blockchain (see 10.9 – Blockchain). Each blockchain is unique to each individual user and his or her personal bitcoin wallet.
• All bitcoin transactions are logged and made available in a public ledger, helping ensure their authenticity and preventing fraud. This process helps to prevent transactions from being duplicated and people from copying bitcoins.
• Note that whereas every bitcoin records the digital address of every wallet it touches, the bitcoin system does *not* record the names of the individuals who own wallets. In practical terms, this means that every bitcoin transaction is digitally confirmed but is completely anonymous at the same time.
• So, although people cannot easily see your personal identity, they can see the history of your bitcoin wallet. This is a good thing, as a public history adds transparency and security, and helps deter people from using bitcoins for dubious or illegal purposes.

BITCOIN PRODUCTION FACTS

• Bitcoins can be "minted" by anyone in the general public who has a strong computer. Bitcoins are made through a very interesting self-limiting system called cryptocurrency mining, and the people who mine these coins are called miners. It is self-limiting because only 21 million total bitcoins will ever be allowed to exist, with approximately 11 million of those bitcoins already mined and in current circulation.
• Bitcoin mining involves commanding your home computer to work around the clock to solve "proof-of-work" problems (computationally intensive math problems). Each bitcoin math problem has a set of possible 64-digit solutions. Your desktop computer, if it works nonstop, might be able to solve one bitcoin problem in two to three days, likely longer.
• For a single personal computer mining bitcoins, you may earn perhaps USD 0.50 to USD 0.75 per day, minus your electricity costs.
• For a very large-scale miner who runs 36 powerful computers simultaneously, that person can earn up to USD 500 per day, after costs.
• Indeed, if you are a small-scale miner with a single consumer-grade computer, you will likely spend more in electricity than you will earn mining bitcoins. Bitcoin mining is only really profitable if you run multiple computers and join a group of miners to combine your hardware power. This very prohibitive hardware requirement is one of the biggest security measures that deters people from trying to manipulate the bitcoin system.

HOW TO ACCEPT BITCOIN, FOR VETERINARY SERVICES

- Accepting payment in bitcoin is no different than accepting payment in other forms, such as cash, check, gift cards, or foreign currency. Clients can pay using hardware terminals, touchscreen apps, or simple wallet addresses through QR codes from third-party providers (e.g., https://stripe.com).
- The fees associated with bitcoin are lower than credit card fees, which saves money for both the clinic and their clients.

EXAMPLES

FOUR REASONS WHY BITCOINS ARE SUCH A BIG DEAL

There is a lot of controversy around bitcoins. The top reasons are as follows.

1. **Bitcoins are not created by any central bank, nor regulated by any government.** Accordingly, there are no banks logging your money movement, and government tax agencies and police cannot track your money. This is bound to change eventually, as unregulated money is a real threat to government control, taxation, and policing.
2. **Bitcoins completely bypass banks.** Bitcoins are transferred via a peer-to-peer network between individuals, with no middleman bank to take a slice. Bitcoin wallets cannot be seized or frozen or audited by banks and law enforcement. Bitcoin wallets cannot have spending and withdrawal limits imposed on them. For all intents and purposes, nobody but the owner of the bitcoin wallet decides how their wealth will be managed.
3. **Bitcoins are changing how we store and spend our personal wealth.** Since the advent of printed (and eventually virtual) money, the world has handed over the power of currency to a central mint and various banks. These banks print our virtual money, store our virtual money, move our virtual money, and charge us for their middleman services.

If banks need more currency, they simply print more or conjure more digits in their electronic ledgers. This system is easily abused and gamed by banks because paper money is essentially paper checks with a promise to have value, with no actual physical gold behind the scenes to back those promises.

Bitcoins are designed to put the control of personal wealth back into the hands of the individual. Instead of paper or virtual bank balances that promise to have value, bitcoins are actual packages of complex data that have value in themselves.

4. **Bitcoin transactions are irreversible.** Conventional payment methods, like a credit card charge, bank draft, personal checks, or wire transfer, do have the benefit of being insured and reversible by the banks involved. In the case of bitcoins, every time bitcoins change hands and change wallets the result is final. Simultaneously, there is no insurance protection of your bitcoin wallet: if you lose your wallet's hard drive data or even your wallet password, your wallet's contents are gone forever.

CAUTIONS

Bitcoin exchange rates can be volatile, and veterinary practices should take care to offset risk. Hedging for each transaction can nearly entirely eliminate exchange rate risk that the business is exposed to when accepting bitcoins for payment.

WHY BITCOINS ARE SO CONTROVERSIAL

- Various reasons have converged to make bitcoin currency a real media sensation.
- From 2011 to 2013, criminal traders made bitcoins famous by buying them in batches of millions of dollars, so they could move money outside of the eyes of law enforcement. Subsequently, the value of bitcoins skyrocketed.
- Scams, too, are very real in the cryptocurrency world. Naive and savvy investors alike can lose hundreds or thousands of dollars to scams.
- Ultimately, though, bitcoins and altcoins are highly controversial because they take the power of making money away from central federal banks and give it to the general public.
- Bitcoin accounts cannot be frozen or examined by tax agencies, and middleman banks are completely unnecessary for bitcoins to move. Law enforcement and bankers see bitcoins as "gold nuggets in the wild, wild west," beyond the control of traditional police and financial institutions.

8.16. CREDIT AND COLLECTIONS

BASICS

OVERVIEW

• Veterinary hospitals should minimize extending credit and avoid the need for collections in order to maintain sufficient cash flow for the practice.
• Clients should be advised of all payment options offered by the practice.
• Treatment plans showing associated fees for services should be given to all clients.
• Use of the words "wellness or treatment plan" should be used when communicating with clients, rather than the word "estimate," so the focus is on the value of care rather than on money.
• Practices should have well-established, standard payment policies. Team members must be informed and knowledgeable regarding these policies.
• Team members should be trained to answer questions regarding payment. Educate the team on the cost of running a business so they understand why the practice cannot subsidize medical care for some clients.

TERMS DEFINED

Check Authorization Companies: Companies providing approval for checks. Approved checks returned for "insufficient funds" will be paid.
Held Checks: Checks dated the day they are written, with a verbal agreement that you will hold them for deposit until an agreed-upon date. This may be better than no money collected, but there is no guarantee the check will clear when deposited.
Payment Plan Management Services: Companies that set up in-house payment plans for veterinary practices. These companies typically assess credit, set up automatic bank withdrawals from the pet owner's account, and follow up if payments are not made.
Postdated Checks: Checks written on the current day but dated for a future date. It is risky to accept these, and it may be illegal in some areas. Prosecutors likely will not prosecute a postdated check.
Third-Party Payment: Organizations offering interest-free payment plans to clients.

ISSUES AND OPTIONS

HOW TO HANDLE CLIENTS WHO CANNOT AFFORD MEDICAL CARE

• Always make appropriate medical recommendations for the pet regardless of the client's financial situation. Never assume a client does not desire or have the ability to pay for services.
• Once clients indicate they have cost constraints, advise them of all available payment options. This may include an in-house payment plan [see 8.12 – Payment (Wellness) Plans], held checks, credit cards, assistance from their friends or family, or third-party payment plans (see 8.13 – Third-Party Financing).
• Offer alternative levels of medical care within the client's budget whenever possible.
• Be sensitive to the potential embarrassment clients may have associated with their inability to pay, especially if children are present.
• Be willing to administer pain medication and perform humane euthanasia without payment, if necessary.
• When appropriate, refer clients to low-cost alternative service providers (see 1.22 – Not-for-Profit Veterinary Hospitals).
• Maintain a nonjudgmental attitude toward clients with limited funds.

TO WHOM SHOULD A PRACTICE EXTEND CREDIT?

• The simple answer is no one. To maintain the financial health of the practice, veterinary services should be paid for at the time of service.
• When deciding whether to extend credit, assess the risk of the investment. Consider the following questions: Is the client truthful? Does the client have a full-time job? Have you seen this client before? Has the client paid in the past but currently faces a temporary financial hardship? What is the amount of the bill, and what percentage of the bill can they pay?
• Established practices may elect to extend credit in certain instances, such as with long-standing clients who have a favorable payment history.
• Specialty hospitals should not extend credit to clients, because there is not typically an ongoing healthcare relationship. These practices should offer several payment options, including third-party payment plans (see 8.13 – Third-Party Financing).
• Emergency hospitals should not extend credit and should maintain strict payment policies. Ethically, emergency hospitals must provide pain medication, acute life-saving procedures, or humane euthanasia even if there is the possibility of nonpayment. This is true for all hospitals, but it may be a situation faced more often in an emergency setting.

BEFORE EXTENDING CREDIT

• Be sure to get driver's license information for clients who pay by check.
• Verify that all contact information on file is updated. It is impossible to collect on an account without a current address and telephone numbers for both work and home.
• Have clients sign a promissory note or truth-in-lending statement. This does not guarantee payment, but may avoid miscommunication, and could be used in legal proceedings to prove the client's commitment to pay.
• Payment agreements with clients should include written documentation of any finance charges according to hospital policy and when the charges will apply.
• Document social security numbers for clients who are not paying their bills in full and who have asked for an extension of credit. Be sure to review procedures and protocols to make sure that confidential and sensitive information such as credit card information and social security numbers are protected, and employees are trained in this area.

HOW TO COLLECT ON DELINQUENT ACCOUNTS

• First, try to collect on accounts internally. Most practices try to collect on delinquent accounts for 90 days before seeking outside assistance.
• Consider *why* the account is delinquent. If a client is 90 days past due but is making payments, it may be advisable to continue working with them rather than seeking outside help.
• Send monthly statements at 30, 60, and 90 days to clients with outstanding balances.
• Call clients to ascertain their willingness to pay and allow for discussion of the account. Clients may be more inclined to pay once they know you will seek external means to collect on the account.
• If an account is delinquent because a client stopped payment on a check, there is no reason to send monthly statements because the client has no intention of remitting payment. It is helpful to find out the reason for the decision to stop payment in case there are lapses in client service or communication breakdowns for management to address.
• Once internal efforts to successfully collect on an account have been exhausted, consider options for outside assistance, such as a collection agency or seeking resolution in the court system.
• Bad checks can be sent to the prosecuting attorney's office. It may take an extended period of time, but typically you will receive payment if you have correct information, the check was not postdated or held, and the client has some financial resources.

PROS AND CONS OF NOT EXTENDING CREDIT AND PROCEEDING ON DELINQUENT ACCOUNTS

- Answer the following questions: Are you willing to risk offending the client by refusing to extend credit? Are you willing to risk alienating the client by turning their past-due account over to a collection agency?
- Consider the value of the client. The financial worth of the client to the practice is evaluated based on their prior payment history, the likelihood of receiving payment this time, and the probability that they will continue to be a good client in the future.
- Consider whether there are any negative public relations associated with your decision. Remember that unhappy clients talk to many people. It may not be worth risking negative publicity in certain circumstances. If there is a dispute about the validity of the bill or the services provided, it may be better to forgive the debt.
- Extending credit to clients, especially those with large bills, is inherently a poor business decision. Occasionally, a hospital will decide this decision is worth the risk, but making a practice of extending credit for large bills will inflate accounts receivable beyond a reasonable amount.
- Remember that a successful practice must be financially solvent. High accounts receivable results in less income for other areas of the practice (see 8.9 – Account Receivables Issues).
- Losing clients who are difficult or cannot pay is not a significant loss for the practice.

EXAMPLES

EXAMPLE 1: SITUATION OF WHEN TO EXTEND CREDIT

The Jenkins family presents a three-year-old male cat named Shadow that has a urethral obstruction. The cat is still alert. The clients have recently moved to the area and have previous medical records for Shadow. You give Mr. and Mrs. Jenkins a treatment plan for appropriate medical treatment. Due to costs associated with moving and starting new jobs, the family has very limited funds. They would like to keep costs down by eliminating lab work. Mr. Jenkins starts work next week and Mrs. Jenkins will start her teaching job in two months. They state that they can only pay 50% of the bill "up front." They are clearly attached to Shadow and want to know if you would be willing to work out a payment plan for them to pay the balance within four to six weeks.

You decide to treat Shadow and set up a payment plan based on the following criteria:

- Shadow has a life-threatening illness that requires immediate attention and has an excellent chance of recovery.
- Although the Jenkins family has limited funds, this appears to be a temporary situation.
- Previous medical records indicate they have provided Shadow excellent care in the past.
- The potential value of this client outweighs the risk, and the cash collected up front covers the basic costs associated with the procedures.
- The owners consent to a fair processing fee associated with filing the credit application with the practice and have also provided a credit card for which the balance of the fees will be paid in three installments over a period of six weeks.

EXAMPLE 2: SITUATION OF WHEN NOT TO EXTEND CREDIT

Ms. Smith, who has never been in before, presents a five-year-old female cat, named Snowflake, with several chronic medical conditions. When you walk into the exam room, Ms. Smith acts irritated and complains about how long she had to wait (15 minutes). The current complaint is diarrhea, but Snowflake also has a history of chronic unilateral ocular discharge and an intermittent cough. Ms. Smith cannot be sure if the diarrhea is from Snowflake because she has five cats. She admits that she saw one of your colleagues at a nearby practice recently and received some eye medication. After a thorough exam, your medical recommendations include complete blood count, profile, feline leukemia virus/feline immunodeficiency virus tests, and chest x-rays. Ms. Smith asks if she can pay $20 today and then make payments.

You explain to Ms. Smith in a kind and professional manner that you cannot extend credit. You based your decision on the following:

- Ms. Smith appears to be a difficult client who jumps from one practice to the next.
- Ms. Smith indicates that she does not seek regular medical care for her five cats.
- Ms. Smith does not give any particular reason why she cannot pay.
- Snowflake is bright and alert with no need for emergency medical attention.
- You decide that the risk associated with extending credit to Ms. Smith is high.

CAUTIONS

- Recognize the administrative cost associated with billing and collection efforts. Costs can add up quickly if the hospital is sending out a significant number of monthly bills and pursuing collection on multiple accounts.
- Beware of doctors or staff members who consistently allow clients to charge.
- Discussing payment with clients is an emotional topic (see 5.13 – Discussing Finances). Be sensitive to the emotions of anger, fear, and sadness that clients may be experiencing.
- Provide training to team members on handling clients who are emotional or who cannot pay.
- Discuss payment options with clients who are angry or upset in the exam room or business office to avoid confrontations in the reception room.

8.17. DISCOUNTING

BASICS

OVERVIEW

- The use of marketing tools to attract and keep clients will become more prevalent and aggressive in the industry.
- Discounting is most often used as a form of marketing to either:
  - entice new clients to begin using the practice for veterinary products and services, or
  - entice your current clients to use more services.
- Common forms of discounting are:
  - Coupons. These can be distributed in newspapers, direct mail pieces from the practice or bundled by distributors, or with other group mailings. Coupons can also be incorporated on the back of business cards and included in hospital brochures.
  - Bundled services. Typically, bundled services are new puppy or new kitten packages that incorporate all the examinations, vaccinations, and laboratory tests for the first six months or first year of services. In order to improve compliance by clients, veterinarians bundle these services and discount them if they are prepaid [see 8.12 – Payment (Wellness) Plans].
  - Reduced fees on service. The most common forms are senior citizen, kennel, pet stores, breeder discounts, or service specials, such as a 10% discount on dentals during the month of February.
  - Free services or products. Examples include free exam fee, free vaccines for life, free nail trims, free day of boarding with each week of boarding, free upgrade in boarding, free sample bag of dog or cat food, and so on.
  - Matching prices. With the advent of online pharmacies, many practitioners offer price matching to prevent clients from purchasing products through other distribution channels.

TERMS DEFINED

Discount: Reduction in price for services and/or products. This can be a partial or total reduction of fees.

ISSUES AND OPTIONS

- Though discounts are intended to stimulate sales, and consequently profits, rarely does discounting help profits. In fact, discounts can hurt profits rather than help them. Some discounts, such as senior citizen discounts, actually are reducing fees to the historically wealthiest sector of clients (83% of wealth in the United States is owned by people 50 years of age and older, according to an Internal Revenue Service statistic). This is a strategy that must be further thought out. If a veterinary owner is trying to subsidize fees to the most needy, then, statistically, that would be newlyweds with young children, not senior citizens.
- Breeders and kennels historically are some of your poorest clients. Their decisions are typically based strictly on costs; therefore, by giving discount incentives to a cost-conscious client who is not likely to become a long-term "A" client makes questionable financial sense.

EXAMPLES

ANALYSIS

The following analysis (Table 8-17-1) analyzes the effects of discounting to profits and the additional income discounting must generate to prevent a reduction of profits for the fictional practice.

Table 8-17-1. Effects of discounting analysis.

Percentage increase/(decrease)	−10.0%	−5.0%	0.0%
Total sales	$802,353	$846,928	$891,503
− Variable expenses	195,239	195,239	195,239
= Gross margin	607,114	651,689	696,264
%	75.7%	76.9%	78.1%
− Fixed expense	632,076	632,076	632,076
Profit/(loss)	($24,962)	$19,613	$64,188
Percentage	−3.1%	2.3%	7.2%
Change sales %	−10.0%	−5.0%	0.0%
Change gross margin %	−12.8%	−6.4%	0.0%
Change profit %	−138.9%	−69.4%	0.0%
+/− Business	$117,820	$57,929	$0
= Old profit	14.7%	6.8%	0.0%
+/− # Invoices	1,664	775	0
= Old profit	14.7%	6.8%	0.0%

- In this average fictional practice, annual revenues are $891,503.
  - The average variable costs (i.e., cost of sales and cost of goods sold) are 21.9%. Types of variable expenses are drug purchases, x-ray costs, laboratory fees, pet food, and so on.
  - The average fixed expenses (i.e., administrative expenses and overhead expenses) in this example are 70.9%. Types of fixed expenses are advertising, depreciation, employee benefits, insurance, interest, staff and owner wages, and so on.
  - The profit in this example is $64,188, or 7.2% of revenues.
- The column headed 0.0% is the current situation of this fictional practice.
- The column headed −5.0% shows the effects of a universal 5% discount.
- The column headed −10.0% shows the effects of a universal 10% discount.

Figure 8-17-1 illustrates how small price changes through discounting can dramatically result in negative effects on profits.

FINDINGS

- Effects on profits.
  - A 5% universal discount lowers profits 69.4%, taking profits from $64,188 to $19,613. This is a loss of $44,575 in profit while doing the same amount of work.
  - A 10% universal discount lowers profits 138.9%, taking profits from $64,188 to a *loss* of −$24,962. This is a loss of $89,150 in profit while doing the same amount of work.

Figure 8-17-2 shows the amount of increased sales necessary to offset a decline in discounted revenues.

- Effects on revenue.
  - With a 5% discount, this practice would need to generate $57,929, or 6.8% *more* business, just to get back to making the same profit it did before discounting. Notice the amount of increase in revenue is *more than* the amount of discounts given (6.8% versus 5.0%, respectively). In this example of 11,333 annual transactions, discounting would have to generate 775 more services to pay for itself.
  - With a 10% discount, this practice would need to generate $117,820, or 14.7% *more* business, just to get back to making the same profit it did before discounting. Notice the amount of increase in revenue is *more than* the amount of discounts given. In fact, the gap is greater (14.7% versus 10.0%, respectively). In this example of 11,333 annual transactions, discounting would have to generate 1,664 more services to pay for itself. This outcome is highly unlikely. If added services do not manifest themselves, the practice would end up making *less profit* while doing *more work*.

8.17. DISCOUNTING

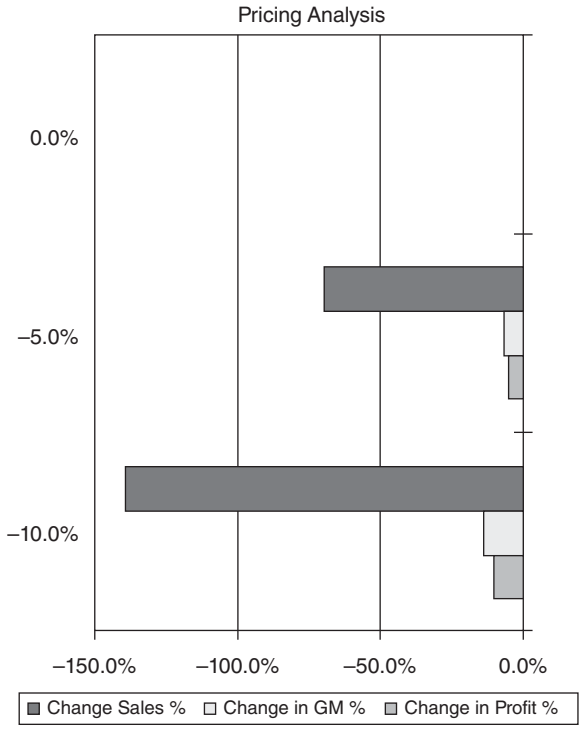

Figure 8-17-1.

Small changes in price through discounting have dramatic negative effects on profits (GM: gross margin).

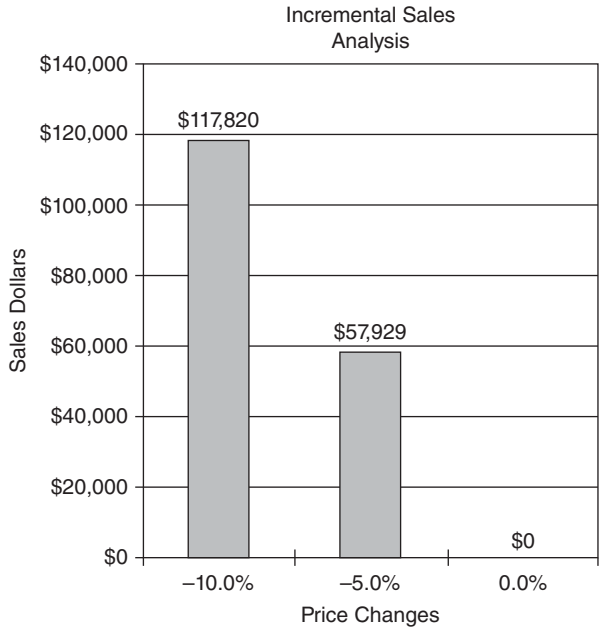

Figure 8-17-2.

Amount of increased sales needed to offset decline in revenues due to discounting.

CAUTIONS

N/A

MISCELLANEOUS

• Discounting has a leveraging effect. Small discounts can have huge negative effects on profits. (Conversely, small increases in fees have huge positive effects on profits.)
• Discounting rarely generates more profit for a practice, because the damage discounting does to profits is usually not made up by the necessary increased incremental revenue to support lower prices. When this happens, the practice (and thus the practice owner) ends up making less profit. Therefore, tracking your discounts and incremental increased sales due to discounts is important in evaluating the success of this marketing strategy.
• This is an example of working "harder, not smarter."
• Discounts targeted to senior citizens can be subsidizing your wealthiest clients who have the best ability to pay your full fees. Breeders, pet stores, and kennels discounts may be attracting different types of clients who are not necessarily financially rewarding for the veterinary owner and the veterinary practice.
• Discounting (if a practice does it at all) should be part of a well thought out marketing plan for the practice and not the single source of marketing.

8.18. PRACTICE REINVESTMENT

BASICS

OVERVIEW

- There is a true economic expense that must be recognized in replacing worn or outdated equipment and maintaining new technologies.
- Most veterinary practices do not differentiate between replacement of used equipment and the purchase of newer, more current technology.
- Practice reinvestment is more of a replacement or capital investment analysis decision.
  - These investments must earn a reasonable rate of return so the practice can meet its financial obligations to its creditors as well as earn a dividend for its shareholders.
- The decision is whether to replace an existing productive asset with a new one.
- Replacement analysis is the same whether it is for a piece of equipment or for an expansion or remodeling project.
- You will need to identify the net cash flow (NCF) of the practice, the incremental cash flow of the project, cash payback, the average rate of return, and calculate the net present value (NPV) of the project.
- There is a difference between net profit and NCF in making a reinvestment decision.
- The decision to make is whether the new technology and useful life of the new equipment is that much greater or better than the old equipment.
- Is the opportunity cost of the money used in an alternative fashion better than the proposed expenditure?

TERMS DEFINED

Amortization: Systematic allocation of the cost of an intangible asset (e.g., goodwill) over time.
Cash Payback (CP): The amount of time necessary between the capital expenditure and the complete recovery in cash (net after expenses) of the amount invested.
Depreciation: Systematic allocation of the cost of a tangible asset (e.g., radiographic unit) over time.
Income Statement (or Profit and Loss Statement): Financial report presenting income and expenses (with depreciation/amortization) made for a specific period of time.
Incremental Cash Flow (ICF): The change in the practice's NCF attributable to the capital investment.
Initial Investment Outlay: The ICF that occurs at the start of the project's life. These initial cash outflows typically include the purchase price, shipping, and installation charges.
Internal Rate of Return (IRR): The proposed capital investment using the present value concepts to compute the rate of return from the NCFs expected from the investment.
Managerial Accounting: Includes both historical and estimated data that management can use to conduct daily operations, planning future acquisitions, and developing business strategies.
Modified Accelerated Cost Recovery System (MACRS): Depreciation system that applies to all recovery property (not land or intangibles) placed in service after 1986. This typically reflects a five-year depreciation on autos, light trucks, computers, and specialized equipment, and seven years on office equipment (except computers).
Net Cash Flow (NCF): Revenues less expenses plus noncash expenditures (depreciation and amortization expenses).
Net Present Value (NPV): The value of an investment calculated by comparing the initial cash outlay with the present value of the future NCFs by using a management-determined interest rate of return.
Net Profit: Revenues less expenses (including depreciation and amortization).
Opportunity Cost: Amount of income foregone from an alternative to a proposed use of cash or its equivalent.
Rate of Return: The interest required by management on monies invested in a capital expenditure.
Section 179: An election to expense up to a certain dollar value of qualifying property in the year of acquisition. Check with your accountant for the most current allowances. Qualifying property generally is tangible personal property acquired by purchase for use in the active conduct of a trade or business. A 50% first-year special depreciation allowance was instituted with the 2003 Tax Act. If you acquire depreciable property with a recovery period of 20 years or less, you may be able to claim an additional 50% first-year depreciation allowance.

ISSUES AND OPTIONS

TOOLS

- Income statements include depreciation as an expense item even though it is not a cash expenditure for the reporting year.
- Depreciation expense is the minimum a practice should set aside for asset replacement or purchase, or approximately 1% of the gross revenue for the year.
  - Place these monies in a savings or money market account to incur some interest payments until they are needed for asset (equipment) purchases.

8.18. PRACTICE REINVESTMENT

- With the current use of Section 179, depreciation expense may become less on income statements.
  - For help in setting aside monies for capital asset reinvestment, consider having your tax professional establish a depreciation expense value as if the equipment was in a MACRS schedule. This will allow you to plan on setting this amount aside each year or the 1% of gross revenue as mentioned earlier.
- Replacement analysis and/or capital budgeting require managerial determination.
  - Some assets require limit analysis due to the nature of the piece of equipment (such as operating instruments or anesthesia machine) because the practice is already reliant on the equipment on a daily basis.
  - Other more expensive or unusual pieces of equipment require a more thorough analysis (such as a digital radiographic unit, laser therapy unit, etc.).
  - Determine whether this equipment will improve patient care, allow the practice to be more efficient, or increase revenue for the practice.
- Management must establish a protocol for the handling of equipment purchases.
  - If cash cannot be paid for the item, will it be leased or financed via a practice loan?
  - How much debt is allowed or desired by the practice?
  - How will the new service be priced?
  - Are all of the doctors in the practice going to recommend or use the new service?
  - Who will train the healthcare team on the equipment's use and maintenance?
  - What is the benefit to the client, and how does the practice educate the client to its benefits?
  - How will the practice promote or market the service?
- Management needs to research equipment with the needs of the practice.
- Time your purchases with national or regional meetings to compare products, and to seek the best prices and financing.
- CP is one of the two techniques used to evaluate a capital investment.
  - Considers the purchase price divided by the proposed NCF.
  - This method does not factor in the present value of future cash flows.
  - The shorter the payback period, the sooner a profit can be made and the sooner money becomes available for reinvestment.

EXAMPLES

EXAMPLE 1

If XYC Veterinary Hospital purchases a $30,000 ultrasound unit and expects to have an annual NCF of $8,000 from it, the payback period is 3.75 years.

$$\text{Payback Period} = \frac{\text{Purchase Price}}{\text{NCF}} = \frac{\$30{,}000}{\$8{,}000} = 3.75 \text{ years}$$

- The average rate of return (ARR) is a second method that does not utilize present values of money.
  - It measures the average expected income from an investment over its useful life.
  - The average investment is the midpoint of the depreciable cost of the asset. It is found by dividing the cost of the asset by 2.
  - The higher the ARR the more desirable the asset.
  - Management needs to set a minimum rate to compare with the ARR of the asset. This needs to be part of the protocol or policy the management team has developed.

EXAMPLE 2

If we use the previous example of the $30,000 ultrasound unit that has a five-year useful life with $10,000 as an average annual income, the ARR is 66.67%:

$$\text{Average Investment} = \frac{\text{Cost of Asset}}{2} = \frac{\$30{,}000}{2} = \$15{,}000$$

$$\text{ARR} = \frac{\text{Estimated Average Annual Income}}{\text{Average Investment}} \times 100 = \frac{\$10{,}000}{\$15{,}000} \times 100 = 66.67\%$$

8.18. PRACTICE REINVESTMENT

Table 8-18-1. Example of replacement analysis of $30,000 ultrasound machine versus other possible investment.

Year value of	*Present value of $1 at 8%*	*NCF*	*Present NCF*
0	1	–$30,000	–$30,000
1	0.926	$1,500	+$1,389
2	0.857	$8,500	+$7,285
3	0.794	$8,500	+$6,749
4	0.735	$10,500	+$7,718
5	0.681	$11,000	+$7,491
NPV			$632

- The NPV method analyzes the capital investment by comparing initial cash outflows with the present value of the NCF by discounting the value to the present by using an interest rate return determined by management (see also 7.1 – Time Value of Money).
- The interest rate can be thought of as the interest rate you could earn by investing the money in a different opportunity.
  - As an example, if you could invest the same monies in a mutual fund that historically earns 8% or in the ultrasound machine, which would you choose?
  - The 8% becomes the rate with which to compare the two projects.
- A positive NPV is a profitable project. Longer payback periods or higher interest rates can create a larger variation in the comparisons of projects.
- Performing NPV calculations is difficult, yet can give you a better opportunity to decide where to spend your monies.
  - Have your accountant help you perform a series of NPV calculations to become familiar with the concept.

EXAMPLE 3

Assume that you are considering purchasing the $30,000 ultrasound unit or investing the monies into another project that can earn 8%. Is the ultrasound a positive or negative NPV? (See Table 8-18-1.)

- The NPV is a positive $632. At this interest rate, the project is not profitable for the practice.
- The payback period is a little less than five years, which is more than the 3.75 years calculated earlier.
- The NPV calculation demonstrates to the management team that either a faster learning curve is needed to make the machine more profitable sooner, or a less expensive machine should be considered, or how can the practice better market the new technology.
- NPVs allow the practice to explore a wide variety of "what-ifs" for any project.
- The IRR is another tool to help analyze the feasibility of the capital asset.
- The IRR calculation is difficult to perform manually, and the help of an accountant or financial advisor should be considered. However, this equation can be easily determined with the use of spreadsheet programs (e.g., Excel).
- The IRR gives the management team a chance to see what interest rate would allow this project to break even and become profitable.
- The IRR for the ultrasound is 8.66%, which is better than the 8% required.
- The IRR gives management an opportunity to shop for the best financing alternative.

CAUTIONS

N/A

MISCELLANEOUS

- Set aside the depreciation line item or 1% of gross receipts each year for replacement and/or new capital acquisitions.

- Develop a management protocol and/or strategy for how to determine which new pieces of equipment should be purchased:
  - Using CP, NPV, IRR, and ARR:
  - Develop a list of questions to answer for the feasibility analysis.
  - Determine the desired rate of return and what percentage of debt the practice will accept.
  - Research your purchases.
  - Time your purchases to correspond to meetings (national and regional) for show specials.
- Utilize your advisors as resources to help develop the tools necessary to analyze the feasibility of the equipment.

ABBREVIATIONS

ARR: Average rate of return
CP: Cash payback
ICF: Incremental cash flow
IRR: Internal rate of return
MACRS: Modified accelerated cost recovery system
NCF: Net cash flow
NPV: Net present value

8.19. Borrowing Money

BASICS

OVERVIEW

• Effective use of money for obtaining additional wealth usually involves borrowing.
• Borrowed money allows acquisition of assets that will in turn generate money that allows both the timely payback of the original principal amount of borrowings, plus the fee charged by the lender for the use of the borrowed money, plus additional money in excess of these two cash requirements.
• A borrower can maximize the use of borrowed money by carefully planning how the money will be used to generate future earnings, by selecting an appropriate length of time for the loan's payback, and by maintaining an excellent credit rating.

TERMS DEFINED

Amortization: A periodic expense attributed to the decline in usefulness of an intangible asset over its estimated useful life.
Amortization Schedule: Uses the terms of a loan to provide due dates of payments, and the payment amount detailed by the principal and interest expense portions.
Balloon Payment: Large lump-sum payment scheduled at the end of a series of considerably smaller periodic payments.[1]
Capital: Rights (equity) of the owners in a business enterprise.
Capital Expenditures Budget: Budget planning for future acquisition of facilities and equipment.
Capital Investment Analysis: Management process for evaluating, planning, and controlling long-term investments in property, facility, and equipment.
Capital Lease: Lease that includes contract provisions that result in treating the leased asset as a purchased asset in the accounts.
Cash Payback Period: Estimated period of time that will elapse between the date of a capital expenditure and the complete recovery of the amount invested.
Collateral: Assets of value pledged to the lender, giving the lender a preferred interest in the assets in the event the borrower defaults on the loan.
Cosignatory: Individual who is not the borrower but who has equal and immediate liability to pay the loan in accord with its terms in the event the primary borrower does not. Generally required of a borrower who has inadequate financial strength to qualify for a loan. The lender evaluates the cosigner's credit rating, financial statements, and income in combination with those of the primary borrower to document a stronger debt-to-income ratio that enables loan qualification. Somewhat more risky than functioning as a guarantor.
Guarantor: Similar to a cosigner, an individual who guarantees an obligation and has a legal duty to fulfill it.[1] Common in commercial loans where the primary borrower is the business entity and shareholder or owner personally backs the loan. Unlike the case of a cosigner, the lender must first exhaust all means of collection against the primary borrower before the guarantor's income and assets are attached.
Interest: The cost of borrowing money assessed by the lender over time and usually expressed as a percentage of the principal amount of borrowings. The percentage is expressed as a rate over a time period, which can change (variable rate) or stay the same over the term of the loan (fixed rate).
Leveraged: Used creditor funds to purchase assets, based on the prediction that the rates of return on purchased assets will exceed the costs of borrowing.
Loan Terms: Exact requirements of how a loan will be made to and repaid by the borrower.
Long-Term Portion of Loan: Principal portion of a loan that is due to be repaid in greater than 12 months.
Mortgage: Type of loan made on real property (real estate) in which the collateral for the loan is the real property.
Points: A fee paid to the lender at the initiation of a loan, negotiated in exchange for a lower interest rate and that effectively equates to prepaid interest. One point equates to 1% of the borrowed principal amount.
Principal: Borrowed amount of money, excluding any interest on the outstanding amount. Over time, with regular payments, the principal balance of a loan gradually decreases. With a fixed payment amount per period, the earliest payments primarily satisfy the interest accruing on the note. Loan payments made later in the term increasingly reduce the principal portions of the note.
Security Interest: The legal rights a lender takes in collateral to protect against loss in the event of borrower default on loan repayment. A security interest is perfected when the lender formally records the interest with a governmental agency, such as a county recorder's office.
Short-Term (or Current) Portion of Loan: Amount of a loan's principal balance that is due within the next 12-month span of time.
Variable-Rate Loan: Borrowed funds in which the principal is subject to periodic adjustments in the lending rate (adjustable interest rate) usually based on an index, such as a bank's prime lending rate.

8.19. BORROWING MONEY

ISSUES AND OPTIONS

• Before borrowing, establish a well thought out business plan (see 14.10 – Business Plans). A practice business plan includes targets for price, volume, and revenue generation that will pay expenses, including any loan paybacks.
• Cash flow projections of revenues, expenses, and profit help borrowers and lenders have a clearer understanding of how loans will help build the practice's revenue streams and can be timely repaid.
• Plan cash flow needs carefully so that loans can be timed well in advance. Last-minute loan applications for when money is desperately needed lead to the worst possible and most expensive loan terms.
• Use borrowing to acquire assets known to allow services that have high value and/or frequent demand by clients. Be careful of purchasing assets that will not be adequately charged because of higher acquisition price, low usage, and/or intense expertise requirements.
• When planning the purchase of high-tech equipment, give adequate consideration to ancillary costs of service contracts, training time, and education that allows efficient and knowledgeable use of the acquired equipment, and negotiate loan amounts accordingly.
• A rule of thumb is to select the length of time for loan payback to match the intended purpose of the borrowing. Equipment loans should be approximately five to seven years, the expected useful life of the equipment. As such, the equipment should be effectively used to generate veterinary services that are adequately priced. Practice purchase loans are generally 10 years in length, whereas real estate and construction loans are usually 15–25 years in length.
• Credit lines are a good source of cash in the event of emergency and should be used as such, rather than for routine expenses that should be cash-flowed from current veterinary activities. Borrowings through a line of credit are usually due in full and payable at the end of 12 months.
• Negotiation of best loan terms with a bank usually depends on your creditworthiness – the better your personal and practice financial position, the easier it is to borrow money, and vice versa.
• An easy way to understand credit rating is to remember the five Cs: Character (integrity), Capacity (sufficient cash flow to service the obligation), Collateral (assets to secure the debt), Capital (net worth), and Conditions (of the borrower and overall economy).[1]
• The fee charged by a lender is usually expressed as an annual percentage of the principal borrowed, and this rate is dependent on the creditworthiness of the borrower, the time value of money (see 7.1 – Time Value of Money), and the inflation rate.
• Ideally, a borrower minimizes the amount of future cash required to pay interest to the lender by always being in a good financial position to negotiate good rates, by timely repayment of any borrowings, and by eliminating money waste. Money waste occurs through late payment penalty fees, higher than market interest rates, and by leasing rather than purchasing.
• Because purchase leases of medical equipment are generally easy to obtain, many practices use them as a common source of financing (see 8.20 – Buying versus Leasing). However, an imputed interest rate is usually built into the payment schedule and can be substantially higher than the rate that would be negotiated with a bank. Additionally, money is wasted on sales tax calculated on the entire amount of each lease payment, including the imputed interest component.
• Many times, practice loans are repaid more quickly than required, because cash is available and borrowers wish to reduce the amount of future money outflow that would otherwise be spent on interest. When loan repayments are accelerated, the borrower should be careful of three potential pitfalls: the loan terms require extra payment amounts be applied first to future interest, the loan terms include a penalty for prepayment, and the possible additional taxes that might be incurred.
• When loans are repaid quickly, a significant portion of cash is expended on principal repayment. Because principal is a non-tax-deductible cash use of current practice revenues, the practice may have a mismatch of cash available at year end compared with taxable income (no cash, but high taxable income, and sometimes called "phantom income"). Borrowers must plan taxable income when loan repayments are accelerated or, in the later years of a loan schedule, when most of the cash outlay is applied to principal repayment.
• Consider consolidating debt when numerous loans exist with various terms and when interest rates are lower than the current loans. An accountant or lender can help determine the amount of money that would be saved after refinancing, including the costs of refinancing.

EXAMPLES

PURCHASE OF ULTRASOUND MACHINE

Purchase price of ultrasound machine	$50,000
Terms	Down payment: 10% of purchase price
Interest rate	8.5% annual percentage rate, fixed
Payment schedule	Equal monthly payments of principle and interest
Payments	Amortized over five years (see Table 8-19-1)
Term of loan	Two years, with balloon payment due at end of loan

8.19. BORROWING MONEY

Table 8-19-1. Amortization schedule.

Contracted purchase price	$50,000.00
Less: Down payment	(10,000.00)
Resulting balance/Loan payable	$40,000.00
Annual incremental investment rate	8.50%
Length in years of amortization	5.00
Number of periodic payments/year	12.00
Computed periodic payment	820.66

Monthly payment	*Interest portion*	*Principal portion*	*Remaining principal balance*	*Month*
			40,000.00	
820.66	283.33	537.33	39,462.67	1
820.66	279.53	541.13	38,921.54	2
820.66	275.69	544.97	38,376.57	3
820.66	271.83	548.83	37,827.74	4
820.66	267.95	552.71	37,275.03	5
820.66	264.03	556.63	36,718.40	6
820.66	260.09	560.57	36,157.83	7
820.66	256.12	564.54	35,593.28	8
820.66	252.12	568.54	35,024.74	9
820.66	248.09	572.57	34,452.17	10
820.66	244.04	576.63	33,875.55	11
820.66	239.95	580.71	33,294.84	12
	3,142.77			
	Total Interest Paid in Year 1			
820.66	235.84	584.82	32,710.01	13
820.66	231.70	588.97	32,121.05	14
820.66	227.52	593.14	31,527.91	15
820.66	223.32	597.34	30,930.57	16
820.66	219.09	601.57	30,329.00	17
820.66	214.83	605.83	29,723.17	18
820.66	210.54	610.12	29,113.05	19
820.66	206.22	614.44	28,498.61	20
820.66	201.87	618.80	27,879.81	21
820.66	197.48	623.18	27,256.63	22
820.66	193.07	627.59	26,629.04	23
820.66	188.62	632.04	25,997.00	24
9,847.94	2,550.10			
Total annual payments	Total interest paid in year 2			

Short-term portion of loan at inception	6,705.16
Long-term portion of loan at inception	33,294.84
Total principal balance at inception	40,000.00
Short-term portion of loan at end of first year	7,297.84
Long-term portion of loan at end of first year	25,997.00
Total principal balance at end of first year	33,294.84
Balloon payment due at end of 2 years	25,997.00
Total payments on note	45,692.87
Total interest paid on note	5,692.87
Total principle paid on note	40,000.00
Total payments, including down payment	55,692.87

CAUTIONS

- Avoid late charges by establishing controls that assure timely debt repayment.
- Borrowing through credit card use is especially expensive and should be avoided through all effort and planning.
- Always talk with your accountant before signing loan documents. The fine print of a loan can stipulate additional costs that an accountant will be able to identify. For tax planning purposes, for maximizing deductions, and for proper reporting, your accountant will advise about the best borrower of the funds, which must be stipulated in the final loan documents. For example, it may be better for an individual to borrow funds rather than the veterinary practice, and vice versa.
- Be cautious of rapid pay down of debt in a business format. When the source of cash comes from current revenues (excess cash from operations suggests profit), be careful to reserve cash for taxes on the resulting profit. A good rule of thumb is to reserve $1 for taxes for each dollar of accelerated principal payment.
- When accelerating repayment and multiple loans are outstanding, make the extra payments toward the loan with the highest interest rate.
- When refinancing or consolidating debt, do not mix debts that originate from borrowings used for business and personal needs. As of 2017, except for home mortgages and equity loans (and subject to tax law changes which may eliminate deductibility), personal interest is not tax deductible, whereas interest related to business-use loans is deductible. Tax rules include interest-tracing requirements that will greatly increase accounting costs for determining which part of an

interest payment is deductible, versus nondeductible when personal and business debts are combined.
- Keep good records of all loans, whether as a borrower or a lender. Retain payment invoices, cancelled checks, and any other documentation relating to outstanding loans so that maximum tax deductions can be obtained.
- When loans are completely repaid, review credit agency reports to confirm the indebtedness has been cleared. Also, read the detail of insurance policies and determine if lender names should be removed as "named insured parties."
- Loans documentation is especially crucial when borrowings occur between practice owners and their practices. Promissory notes, loan terms, and amortization schedules should always be formalized to ensure maximum tax benefit of related party loans. Casual, undocumented loans can result in extremely adverse tax outcomes.

8.20. Buying versus Leasing

BASICS

OVERVIEW

All businesses need capital (money) to operate. The capital needs for the practice will vary depending on the stage of the practice (i.e., start up, mature, or winding down). Purchases that require a significant amount of capital warrant consideration as to how the purchase is best funded. The two options for acquiring such assets are buying and leasing, and there are pros and cons to be considered with each.

Even with leasing, there are two different ways to lease property: capital leases and operating leases. There is no right or wrong way to get the equipment needed, but there are good reasons to consider one method over the other, depending upon the item.

TERMS DEFINED

Capital Lease: Frequently over a long period of time and generally covers the economically useful life of the property in question, which is typically longer than the period of time an operating lease covers. A capital lease agreement may provide for a bargain purchase option at the end of the lease period, which would allow the lessee to purchase the property at a very low price.

Lessee: Person or company who uses the property that is the subject of the lease.

Lessor: Person or company who owns the property that is the subject of the lease or rental agreement.

Money Factor: Term used in leasing that is similar to, but not the same as, interest on a loan. It determines how much you will pay in finance charges over the life of the lease. The lower the number, the lower the total final payment. To convert the money factor amount into an equivalent interest rate, simply multiply the money factor number by 2,400.

Net Capitalization Cost: The amount that is actually being financed by a lease – the retail price minus any discounts and customer down payments.

Operating Lease: A true lease is generally for a short term, and ownership of the asset (the object being leased) remains with the lessor at the end of the lease.

ISSUES AND OPTIONS

• The benefit of purchasing property is that you own it. There are certain tax benefits to owning property that are not available to lessees. You also share in any appreciation that might occur with the property you own. This is especially true with real estate.

• Purchasing property, either real estate or tangible personal property, generally involves a down payment, frequently in the 10–20% range.

• A leasing arrangement eliminates the large down payment requirement, thereby lessening the immediate cash demands on the lessee.

• Leasing is generally more easily obtained than credit approval for purchase. The lessor retains title to the property, so any default on the part of the lessee would allow the lessor much easier access to the property in question.

• When dealing with property that has a high obsolescence rate, leasing limits the lessee's risk. As the lessee, you know precisely how long you are going to be paying for the property; and with a true operating lease, your cash outflow is generally much lower than with either purchasing the equipment outright or entering into a capital lease.

• Operating lease payments are generally 100% deductible on your income tax returns. With Section 179 depreciation allowances, this may not be as great a benefit as it once was, but for tax planning purposes the difference needs to be taken into account. The various alternatives should be discussed with your tax professional because, depending upon your individual circumstances, immediate expensing (Section 179 possibility) versus extending over the life of the loan may have advantages or disadvantages to be considered. A capital lease arrangement more closely mimics installment purchases of equipment.

• The lease agreement can be tailored to give you greater flexibility, especially related to any servicing or maintenance the property may require.

• Operating leases are never reflected on your balance sheet as a liability of the lessee. This may be of major concern to you if your debt-to-equity ratio is so large that it may be of concern to a third-party lender.

• Leasing is often more costly over the time period that you use the equipment than an outright purchase. This is generally the case because the lessor bears more of the burden and risk in a leasing arrangement and needs to be compensated for that.

• Lease agreements may be so restrictive that your use of the property could be curtailed. Also, there might be front-end or back-end charges, guarantees of condition of the property, or other fees that you need to be aware of before signing. Be sure you understand all of the terms of the agreement. If you do not, ask questions until you do or seek the help of someone who understands the agreement and listen to what they are telling you about how it impacts your decision.

• To help you make the decision to purchase or lease property, a discounted cash flow analysis should be done to compare the after-tax benefits of either arrangement. That usually requires the services of an accountant or financial consultant.

• Leasing vehicles used in your practice versus buying them is a major decision-making process. Leasing vehicles may provide the owner with a more favorable tax advantage for personal use of the vehicle than outright ownership of the car or truck. Owing to the specifics of various leasing arrangements and the personal tax situation of individuals, this is an area for which it is strongly recommended that you seek advice from a knowledgeable tax professional.

• If leasing a vehicle, care must be taken in trading in a vehicle as part of the agreement. In drafting the lease payment to fit specific cash requirements, you may receive much less of a benefit for the equity in the vehicle you are surrendering than selling the vehicle outright or trading on a new vehicle. Make sure you are fully aware of your total cost of the lease.

• The subject of owning the real estate on which the practice is situated also requires careful consideration. It is not necessary to own the real estate to be a success. If the location is right, the price is right, and outright ownership of the property has long-term benefits, then purchase can be a good business decision. If money is a concern and you want property management to be someone else's responsibility, the timeline for practice ownership is uncertain, or the main desire is veterinary practice rather than real estate holdings, securing a favorable lease on the location can be a good business decision.

• Because most veterinary practices are long-term commitments, the lease arrangement for the office is extremely important. Make sure the lease length, options to renew, common area maintenance charges, and responsibility for repairs to the physical structure are clearly spelled out and are something that work favorably for you. If your location is in a strip mall or similar structure, you may also want to consider limitations or restrictions on the landlord's ability to lease space to competing professionals.

• Knowing how your lease payment is being calculated is extremely important for you to evaluate whether leasing or purchasing is the right decision for you. Once you know how the payment is calculated, be sure you recalculate the lease payment to be sure you are getting the benefit of all the options you were offered. A lease payment is made up of three components: the depreciation fee, the finance fee, and the sales tax due on the payment. The depreciation fee is the price for the

equipment you negotiated with the dealer, plus any add-on fees and rolled-in loan payoffs, minus the value of the equipment at the end of the lease term. In lease terminology, the final negotiated price of the leased equipment plus associated added on costs, minus any reductions in the costs, is referred to as the net capitalized cost (often referred to as net cap cost). The value of the equipment at the end of the lease term is referred to as the residual value of the equipment. The finance fee is the money you are paying the leasing company for the use of their money to allow you to use the equipment. The finance fee is calculated by adding together the net cap cost and the residual value and multiplying the result by the money factor. Then, of course, you have to add any applicable sales tax to the final number.

EXAMPLES

CALCULATING A LEASE PAYMENT

Price for a new ultrasound machine	$28,000
Term	24 months
Trade-in value of old machine	$5,000
Money factor (provided by the vendor)	0.00375
Value of machine at the end of the 24 months	$14,000
Equipment fee	($28,000 − $5000 − $14,000)/24 = $375
Finance fee	($9,000 + $14,000) × 0.00375 = $86.25
Lease payment	$375 + $86.25 = $461.25 + applicable sales tax
Equivalent internal interest rate	0.00375 × 2,400 = 9%

8.21. CONTROLLING CASH FLOW: BUDGETING

BASICS

OVERVIEW

Particularly in the veterinary industry, cash flow is a driving force in determining how successful a practice is. Proper cash flow management is one of the most critical management tasks to make your practice successful. Movement of cash into and out of your practice occurs by several mechanisms:

- Cash "inflows" are the receipt of funds into your cash flow from the provision of veterinary services, the sale of retail products, and the provision of ancillary services to pets and their owners. The extension of credit to pet owners allows them to charge the sale of retail goods or services to their account. An inflow occurs as you collect on the customer's account. Proceeds from shareholder loans to the practice, lines of credit advances, or other bank financing are also considered cash inflow (though not from operations).
- Cash "outflows" are the disbursement of funds out of your veterinary practice to pay for practice expenses. Purchasing capital assets, payment toward bank and shareholder loan balances, and paying recurring practice bills are cash outflows.

Cash outflows and inflows generally occur independently of one another. This timing difference can create a cash flow gap. Managing your cash flow allows you to narrow or completely close your cash flow gap, and an analysis of individual cash flow components can point out signs that may result in a cash flow gap. The key to cash flow management is in identifying sources of and correcting cash flow gaps.

A practice cash flow budget is a good way to predict your practice's cash flow. It is a projection of your practice's cash inflows and outflows over a certain period, which may be weekly, monthly, quarterly, or annually. Most businesses in other industries typically prepare monthly cash flow budgets that roll into an annual, or overall, cash flow budget.

The primary purpose of using a cash flow budget is to:

- predict your practice's ability to generate a positive cash flow strictly from operations;
- gauge your practice's ability to create enough internal resources necessary for expansion;
- rate your practice's ability to provide a salary, management fee, and return of capital investment to the practice owner(s);
- predict cash flow gaps requiring potential utilization of external resources; and
- discover unfavorable trends and/or financial/operational policies requiring correction.

TERMS DEFINED

Accounts Payable: Amounts owed to your suppliers that are payable in the future. Without payables and trade credit, you would have to pay for all goods and services at the time you purchase them.

Accounts Payable Aging Schedule: List of all amounts you owe to your suppliers over certain blocks of time (30, 60, 90 days, and more).

Accounts Receivable: Sales that have not yet been collected. The bulk of patient service fees should be collected before the pet owner exits the practice door, as late-paying or slow-paying pet owners may extend cash shortages.

Accounts Receivable Aging Schedule: List of customers who owe the practice for services and shows balances owed over certain blocks of time (30, 60, 90 days, and more).

Accrual Basis Accounting: System in which income is recorded when the service is rendered, regardless of when you are paid, and expenses recorded when goods or services are received, regardless of when they are paid. The accrual method presents a more accurate financial determination of net worth than the cash method.

Balance Sheet: Summary of the practice's financial standing on a selected date, which lists assets, liabilities, and retained earnings or net worth. Balance sheets summarize the arrival at the practice's net worth, which is what would be available to the practice owner(s) after all assets were collected and all liabilities paid. One caveat: not all balance sheet assets are valued at market value.

Cash Basis Accounting: System that recognizes income only when cash is collected from a sale, and recognizes expenses when cash is actually paid for goods and services received, effectively resembling actual cash flow.

Credit Policy: Written guidelines to assist in deciding to extend credit to a customer. Formulating a standard credit policy helps to avoid extending credit to pet owners who are unable to pay their accounts. A good credit policy should help you retain good relationships without jeopardizing cash flow. The credit policy for most small practices is informal and relies on a practice owner's instinct.

Credit Terms: Time limits set for your customers' promises to pay for the merchandise or services purchased from your practice. Credit terms affect the timing of your cash collections.

Inventory: Extra merchandise or supplies your practice keeps on hand to meet the demands of pet owners and treatment requirements. Excess inventory depletes cash flow by tying up money budgeted for other cash outflows.

Profit and Loss Statement: Summary of practice income, expenses, and resulting profit or loss.

Trade Credit: Trade credit allows you to defer payment to vendors until a negotiated future date. A vendor payment discount may be available if you pay your bills quickly, within a certain period.

ISSUES AND OPTIONS

Most veterinary practices have many informal, primarily undocumented, accounting systems in place. A great place to start the documentation procedure is the cash flow process. By recording these discrete processes – who is responsible for accomplishing specific tasks, and when those tasks are performed – in flowchart form, the practice owner(s) will be able to perform a systematic cash budgeting process. In addition, in the process, they may find efficiencies and future improvement opportunities to be gained by the flowcharting effort.

Preparing a cash flow budget involves four primary steps:

- Preparing a sales forecast is the first step to generating inflows that will drive the other factors in your cash flow budget. By using your practice management software, you should be able to derive the factors that define this step, such as revenue-generating procedures, number of occurrences of each, and average fee(s) charged. Also, add projected retail sales for the period. Analyze those areas to see how reasonable they are to interpolate to the next time period (a monthly analysis may have seasonal irregularities), and if an applicable fee increase is warranted per service provided. Remember that these are fees generated (accrual basis) and not cash collected (cash basis).
- Projecting anticipated cash inflows involves incorporating the cash inflows derived from the sales forecast previously calculated. If your practice only accepts cash sales, projected cash receipts equals projected sales forecast revenues. Projecting cash receipts is more involved if your practice extends credit to its customers and handles more than a nominal accounts receivable balance. If you manage significant accounts receivable, you must take into account how rapid is the collection of an average accounts receivables balance. By quantifying this timing effect, you can see the impact on cash inflows. By analyzing current data, the practice can achieve a good starting point for planning future cash flows.

8.21. CONTROLLING CASH FLOW: BUDGETING

• Projecting your anticipated cash outflows involves projecting your expenses and other cash outflows over a certain period. The categories of outflows are as follows:
  ◦ "Cost of retail goods sold" highlights the purchase of retail inventory items sold to pets and pet owners. In a veterinary practice, which is a service-related rather than a manufacturing enterprise, only a nominal cash outflow will be for inventory items versus other expenses. The best way to complete your practice cash flow budget integrating costs of goods sold is to base the related cash outflows from the sales forecast. In order to achieve a certain level of retail item sales, your practice will have to purchase and maintain a corresponding inventory base (including display, sample, and stored goods). Using revenue information from your practice management software and cost of retail goods sold from prior years, accounting software should allow you to determine a percentage relationship of your practice's cost of retail goods sold to practice retail revenue.
  ◦ Operating expenses include the expenses you incur while operating your practice (see 8.4 – Expenses in Veterinary Practice). Examples of operating expenses include payroll and payroll tax expense, utilities, rent and other occupancy costs, insurance, and repairs and maintenance. Rent is the same cost for the typical lease period of one year or more. Other operating expenses, such as payroll and payroll taxes, fluctuate with revenue production. The best way to predict operating expense outflows is to base them on your sales forecast. Using revenue totals from your practice management software and operating expense data from prior years' accounting software should allow you to determine a percentage relationship of your practice's operating expenses to total revenues.
  ◦ Major purchases. You must predict the cash outflows for major purchases, such as veterinary equipment, vehicles, computers, or other office equipment. Major purchases are usually irregular in nature and are the result of a practice expansion, addition of services, or replacement and upgrade expenditures. The cash flow budget is an excellent tool to help you determine when or when not to make major purchases as requisite cash flow indicates.
  ◦ Debt payments consist of cash outflows to pay regularly scheduled and unscheduled loan payments. They are probably the easiest outflows to predict when preparing your cash flow budget. Debt payments, such as a lease and/or mortgage payments, are generally made at the same time for the same amount each month or period.
• The final step in preparing a cash flow budget is consolidating projected cash inflows and outflows to arrive at the practice cash flow (positive or negative).

In its basic form, your present cash balance, plus projected cash inflows, less projected cash outflows, equals your projected cash balance for that period. The ending cash balance for the first period becomes the second period's beginning cash balance. This process continues until the last period of the cash flow budget is completed.

A positive cash flow figure indicates your practice has a cash surplus at the month (or period) end. A negative cash flow figure indicates that your practice has run into a cash flow gap (a period where cash outflows exceed cash inflows) when added to your practice's beginning cash balance. In order to meet a projected temporary gap in cash flow, practice owners may consider any of the following strategies:
• Decreasing anticipated cash outflows by reducing inventory purchases and nonessential operating expenses.
• Consider using a third-party payment service (see 8.13 – Third-Party Financing) for all future noncash transactions besides check or credit card payments. If pet owners use this type of payment, the practice does not finance the pet owners' "accounts payable" (your receivable).
• Consider using a third-party service such as an "online pharmacy" for retail goods, such as pharmaceuticals, that does not tie up the unrealized gross margin of retail sales from order time until eventual sale to pet owners.
• Obtain short-term shareholder loans or arrange for a line of credit from your bank. Shareholder loans should be evidenced by a signed promissory note.
• Assess the possibility of maximizing accounts receivables collections through either employee telephone contact, flagging pet owners for reminders in the practice management software, or by other standard means.
• Major capital equipment purchase may be delayed until cash gaps are eliminated. Alternatively, instead of purchasing capital equipment for replacement or integration of new practice services, practices should pay the minimum deposit required for purchase and finance the balance by either leasing or third-party bank financing.
• Liquidate short-term money markets instruments held in the practice entity for short-term cash flow needs.
• Negotiate payment terms with your suppliers and vendors, or even delay payments to vendors. This strategy is commonly employed in the manufacturing sector. It is often advisable to explain the situation to them carefully and to let them know when they will be paid and the amount of each payment.
• Minimize the amounts you pay for operational costs of your practice by negotiating with potential new hires regarding salary and benefits, searching for lower cost providers of technology services, utilities and telephone systems, and finding innovative ways to outsource – perhaps payroll, bookkeeping, human resources, and other noncore provisions. These methods are typically longer lasting mechanisms to reduce standard operating costs rather than methods of delaying outflows due to capitalizing on cash flow timing differences.
• Increase service and retail revenues your practice generates by increasing fees by adjusting transaction charges based on the American Animal Hospital Association Fee Reference, which is one tool out of many widely available. The reference provides a guide to practice owners, who probably set desired fees on a periodic basis consistent with other types of practices (rural, suburban, and urban) similar to theirs.

Some indication of ratios and calculations may enable you to help analyze problems in cash flow (see 7.8 – Key Performance Indicators). Every practice is different and composed of different paying and payer relationships and cash flow metrics. The following ratios and statistics, when generated from internal financial data, can assist you in discovering both positive and (hopefully not) negative trends in practice cash flow and related accounts:
• The average collection period calculates the length of time it takes to convert average revenues into cash. It defines the relationship between accounts receivable and cash inflows. Longer average collection periods require a higher balance in accounts receivable, and less cash for practice cash outflows. The average collection period is calculated by dividing your present accounts receivable balance by your average daily sales:

$$\text{Average Collection Period} = \frac{\text{Current Accounts Receivable Balance}}{\text{Annual Sales}/360}$$

• The accounts receivable to sales ratio looks at accounts receivable relative to monthly sales. Using monthly revenue data, the accounts receivable to sales ratio looks at relatively current changes in accounts receivable. The calculating formula is

$$\text{Accounts Receivable to Sales Ratio} = \frac{\text{Accounts Receivable}}{\text{Monthly Sales}}$$

• An increase in your practice's accounts receivable to sales ratio from one month to the next indicates that your practice's relative level of accounts receivable is growing faster than that of practice revenues.
• Analyzing your accounts receivable aging schedule may help you identify potential cash flow problems. The accounts receivable aging

8.21. CONTROLLING CASH FLOW: BUDGETING

schedule is a useful tool for analyzing the makeup of your accounts receivable balance. The accounts receivable aging schedule is reviewed to identify the pet owners that are extending the time it takes to pay their outstanding bill for services and/or retail sales. If the bulk of the overdue amount in receivables is attributable to one or a few pet owners, a concerted effort can be made to collect on this pet owner's delinquent account. Overdue amounts attributable to a number of pet owners may signal a pervasive problem. Your practice needs to revisit its methodology of accepting payment over time from both new and existing pet owners.

• An accounts payable aging schedule may help you determine your cash outflows for certain expenses and will provide a good estimate of the cash outflows necessary to pay your operating expenses besides payroll and related liabilities. The average payable period is a good indicator of success in managing cash outflows. Using your payable period to slow down outflows, within acceptable vendor standards as prescribed by negotiation, can significantly improve your cash flow.

EXAMPLES

As previously noted, an important practice financial metric is the average collection period. It determines the effect of different accounts receivable collection periods on your practice's cash flow. For example, assume that your practice's average sales amount per day is $1,000 and that your average collection period is 14 days. Now assume that you were able to reduce your average collection period from 14 days to seven days. The resulting reduction in the average collection period of seven days reduces the accounts receivable balance from $14,000 to $7,000, generating an additional $7,000 in practice cash flow.

The accounting term "profit" views income and expense over a certain point of elapsed time. Profit is a very intangible concept. Cash flow is the actual flow of cash-equivalent funds in and out of a practice checkbook and is a very tangible concept. Every practice owner realizes that cash in a checking account is ready and available for use. If your practice uses the accrual accounting method (whether for internal reporting, financial statement purposes, or just for preparation of your annual income tax return), converting your accrual profit to your cash flow profit requires "accrual-to-cash" adjustments. Accrual-to-cash adjustments are necessary because certain accrual accounting transactions are taken into account to determine your accrual net profit, even though these expenses do not currently require a cash transaction (inflow or outflow) to have occurred. The formula for "accrual-to-cash" conversion for a simulated annual period is as follows:

Net profit or loss (accrual basis)	$65,000
+ Depreciation and amortization expense	$11,000
− Increases (or + decreases) in accounts receivable	($7,000)
− Increases (or + decreases) in inventories	($4,000)
+ Increases (or − decreases) in accounts payable	$10,000
− Decreases (or + increases) in notes payable (bank loans)	$25,000
= Net positive or (negative) cash flow	$100,000

The cash flow from operations does not include the receipt of additional bank financing, and is actually $75,000. The financing brings the total net positive cash flow to $100,000 for the period defined.

CAUTIONS

• Assumptions necessary to complete the cash flow budget are key to its preparation. As in any budgeting process, it may be determined that assumptions previously held as "certain" were actually incorrect, resulting in erroneous estimations.

• A budget is still a projected quantification of future events and, therefore, is subject to uncertainty even when compared with past results.

• If cash flow budgeting assumptions are made and specific performance to achieve those goals is not undertaken, the cash flow budgeting process may reasonably be doomed to failure.

• Using the "float period" between when your check is written and when it is cashed is a common but even riskier practice to handle periods of temporary cash shortage due to new, faster, check-clearing mechanisms enacted in 2004 by the Federal Reserve system.

• Because of the uncertainty involved in the cash flow budget process, trying to budget too far into the future (more than three to five years) may prove to be futile.

• Longer credit terms extended to pet owners mean your practice will have to wait longer for the cash inflows from the collection of accounts receivable, which may limit required payments to vendors, employees, and creditors.

• The use of monthly versus quarterly and annual metrics related to average collection days and accounts receivable to sales ratio tend to produce more current and actionable results as trends may emerge more from recent weeks' memory than from past-year history.

• Keep a close eye on your cash flow so you can forecast potential cash flow problems and take steps to remedy them. One of the easiest ways to monitor your business's cash flow is to compare the total unpaid purchases with the total sales due at the end of each month. If the total unpaid purchases are greater than the total sales due, you will need to spend more cash than you receive in the next month, indicating a potential cash flow problem.

• The main danger when putting together a cash flow budget is being overoptimistic about your projected sales. Expenses are typically realistic in budget models; variability from actual results is often seen when projecting revenues.

• The key to improving your practice cash flow with regard to cash outflow is to delay all outflows of cash as long as you possibly can. However, you still need to meet all your outflow obligations on time. Managing your cash outflow requires that you follow a basic rule in business: pay your practice's outstanding bills on or by the due date, but never pay your bills before the due date.

8.22. The Electronic Funds Transfer Payment Process

BASICS

OVERVIEW

There are a wide variety of payment mechanisms available to the veterinary practice owner for invoices both that the practice incurs as a normal course of operation and those that are generated by the veterinarian personally. These methods are as follows:

- cash payments
- checks or money orders
- credit and debit cards
- automatic payment by electronic funds transfer (EFT)
- automatic payment by credit/debit card.

Many veterinary practice owners still prefer to pay bills with checks, but electronic methods are becoming more popular. In examining the payment method histories of all consumers (veterinary practices included), electronic payments such as credit card and debit card transactions have recently surpassed cash and checks as the preferred method of payment for in-store purchases. According to the American Bankers Association 2012 Study of Consumer Payment Preferences, 72% of all recurring bill payments were made by writing a check during 2001, falling to 36.5% by 2012. This decline in check-writing volume is due in part to the increased adoption of automatic and online bill payment. Today, 81.2% of all consumers use some form of automatic payment. According to the *2016 U.S. Consumer Payment Study*,[1] when presented a choice for payment, 40% of consumers select credit cards, 35% select debit cards, and 11% choose cash. Debit is the preferred choice for everyday (supermarket, gasoline, etc.) transactions, and credit for higher dollar transactions and items of a discretionary nature. Credit is the preferred payment method among consumers aged 25–44 years and those 65 years and older. Mobile payment methods, as well as identity security, are also high on a list of consumer concerns (see 8.14 – Digital Wallets). And although the adoption of online bill payment is lower than automatic payments, it represents one of the fastest growing payment methods.

The goal of every veterinary practice should be to outsource the tasks that it does not perform efficiently or proficiently in-house. US accounting firms, software companies, and manufacturers are constantly seeking ways to offload cumbersome tasks. The veterinary practice and practice owner, by initiating automatic payments for recurring expenses such as utilities, telephone, vendor bills for supplies and products, and so on, reduce the manual transcription of checks to a bare minimum. As noted throughout this section, there are a variety of payment mechanisms to accomplish the payment process, and even the receipt of funds, with a minimum of effort after initial set-up.

TERMS DEFINED

Automated Clearing House (ACH): The national automated payment clearing system in the United States.

Check 21 Act: The Check 21 Act, signed into law during 2003 and effective October 28, 2004, was created by Congress and supported by the Federal Reserve Bank to further automate the American check-processing system. Checks impacted by Check 21 include consumer checks, business checks, cashier checks, teller checks, Treasury checks, and travelers' checks. By using electronic transmissions and a substitute check, the process can be reduced to hours. Banks are required to accept a substitute check from other banks in place of traditional checks while continuing to accept traditional checks as the system evolves. A substitute check effectively documents the electronic processing of a check. Check 21 does not apply to direct deposits, automatic teller machines (ATMs), or point-of-sale (POS) transactions, or to noncash items such as passbooks or certificates of deposit. It essentially mandates that veterinary practices employ stricter cash management procedures to eliminate any possibility of payment without sufficient cash to cover that payment, as payments could clear a payee's bank that very same day.

Electronic Funds Transfer (EFT): The process of moving transaction funds from one bank to another via the ACH of the Federal Reserve Network. An EFT processes preauthorized debits or credits from one bank account to another without using a check. This electronic, computer-based transaction process is governed by the Federal Reserve Banking System.

ISSUES AND OPTIONS

The national payment mechanism moves money between merchant and consumer accounts, utilizing a variety of EFT systems:

- ATMs.
  - Consumers can do their banking without the assistance of a teller to get cash or to make deposits, pay bills, or transfer funds from one account to another electronically. ATMs are used with a debit or EFT card and a personal identification number.
- POS transactions.
  - Some EFT cards can be used when shopping to allow the transfer of funds from the consumer's account to the merchant's. To pay for a purchase, the consumer presents an EFT card instead of a check or cash. Money is taken out of the consumer's account and put into the merchant's account electronically.
- Preauthorized transfers.
  - When the account holder authorizes a bank or a third party to do so, preauthorized transfers automatically deposit or withdraw funds from an individual's bank account. Consumers can authorize direct electronic deposit of wages, dividend payments, or other recurring deposits to their accounts. They may also authorize banking institutions to make regular, recurring payments of both vendor and personal bills (insurance, mortgage, and utility or product costs) as required.

First Data Corporation has become one of the nation's largest ATM processors by managing one of four major ATM companies in the United States. Their company research suggests:

- Online bill payment users pay an average of 6.5 bills a month online.
- Those households pay an average of 12 bills a month, online and offline.
- Seventy percent of online bill payers initiate online payments via billing websites.

Credit and/or debit card purchasing is an efficient way to simplify a practice's procurement and collection processes as well as financial reporting functions. Any practice, regardless of size, can use EFTs to conduct a variety of financial transactions. For veterinary practice accounts payable, EFT benefits include:

- Scheduled prompt payment of your practice and personal bills each month.
- Eliminating the need to receive, process, and pay recurring monthly bills via US mail, if electronic bills are not enabled. This can save on related labor, postage, and printing costs. Less paperwork means lower operating expenses. A study commissioned by Visa indicates that companies with purchasing card programs were able to reduce purchasing process costs by an average of 70%.
- Reducing late payment fees on mortgages, car payments, and other credit-affecting obligations.
- Credit card reporting solutions allow you to review your transaction details.
- Practices using credit cards can easily monitor and control expenses and set spending limits with vendors. In addition, owners can maintain control of employee spending without having to manually approve each transaction.

8.22. THE ELECTRONIC FUNDS TRANSFER PAYMENT PROCESS

• The monthly bank or credit card statement is proof of payment to another person, your record for tax purposes, and allows the reconciling of EFT transactions with your accounting records.

For those practices utilizing EFTs as an accounts receivable collections method, benefits include:

• Having fees automatically deducted from your pet owner's checking account reduces incidence of bounced checks and potential misappropriation or fraud surrounding checks.
• By using automated payments if using a level-fee billing service, your practice will provide pet owners the convenience and security of having their bill paid to you automatically by transferring payment from their checking account, savings account, debit card, or credit card.

EXAMPLES

ACCOUNTS PAYABLE

Practice owners or authorized managers must sign a form that authorizes vendors to deduct their payment for services on a certain date. The practice must provide a checking deposit slip or voided practice check to verify all account information. According to the billing cycle, the amount of your vendor bill is then automatically debited from the practice checking account and deposited into their account.

In the case of payroll, those practices already utilizing an outside payroll service, such as ADP, Paychex, or Gusto, to process employee payroll and remit funds to the taxing authorities already understand the concept of electronic payments. Your practice bank account is debited and your corresponding employee's bank account, as well as federal and state taxing agencies bank accounts, are credited each pay period.

The same system of electronic interchange applies to vendor and other payments made by the practice. In human medicine practices, we have designed payment systems so that large practices only write five actual checks per month for those parties that are either self-employed information technology consultants or relief practitioners. All other payment mechanisms are electronically presented.

CONCIERGE MEDICINE

As in the emerging trend of concierge medicine on the human side, veterinarians in those geographic or economic areas that allow it may consider the EFT payment process as an entrée into the business of retainer-based concierge medicine.

Because those practices strictly limit the number of patients they see, they are able to provide much more personal attention and a variety of extra services to vastly improve both a pet's and an owner's healthcare experience. In addition, a retainer is paid on a monthly, quarterly, or annual basis via EFT payment, greatly increasing regular cash flow and allowing budgeting to take place on a zero-based factor, with the retainer client collections possibly covering fixed expenses for the practice (occupancy costs at a minimum). Concierge practices, under that EFT retainer-based method, offer extended visits, flexible appointment scheduling, e-mail access, minimal waiting times, prompt prescription refills, and a focus on general wellness. At present, the concierge practice model seems more suited to primary care. Specialty care that is infrequent, consultative, or procedural really does not lend itself to a concierge practice model.

According to the American College of Physicians/Internal Medicine, one concierge physician calculated fees charged to his practice of 800 patients (down from 3,000 patients in his old practice model) $75 a month for individuals aged 35 years and up, $45 a month for those aged 21–35 years, and $15 for ages 18–21 years. For those fees, patients receive services such as routine exams, x-rays, and flexible sigmoidoscopy. The practice determines discounts on an individual basis for patients who want to subscribe but who are financially unable to. Like virtually all other retainer practices, this gives patients a variety of payment schedules (monthly, quarterly, annually) and types (including automatic debit and credit withdrawals).

Concierge gains are not purely financial. Another concierge provider said that moving to a retainer practice has given him time to recertify in internal medicine, geriatrics, and critical care. The time spent away from billing and collections has certainly enhanced the practice.

CAUTIONS

• There are some reasons why consumers may continue to favor checks or cash. They might value the anonymity of checks or cash payments or find it easier to budget their expenditures with cash, such as restricting their cash withdrawals to a set dollar amount per pay period, for example.
• The way to report errors is somewhat different with EFT services than it is with credit cards. As with credit cards, financial institutions must investigate and correct promptly any EFT errors reported. If there has been an error in an electronic fund transfer relating to your account, financial institutions must be contacted immediately.
• The debit card possesses potentially serious security concerns for consumers. Unauthorized use of a debit card could lead to greater liability than with a credit card. The consumer's loss is limited to $50 only if the loss is reported within two business days. If the card loss is not reported within two days, maximum liability increases to $500. In addition, if notification is not given to a financial institution within 60 days after receiving a statement showing unauthorized withdrawals, the consumer may be liable for all unauthorized use after the 60th day of loss.

8.23. VALUE-ADDED TAX AND GOODS AND SERVICES TAX

BASICS

OVERVIEW

- Value-added tax (VAT) is a general consumption tax. The amount of the tax collected is incremental, based on the increase in value of a product or service at each stage of production or distribution. VAT is an alternative system to the sales taxes that are levied by many states in the United States.
- VAT is sometimes known as a goods and services tax (GST). Another term used in some geographies is "consumption tax." These terms are all synonymous.
- VAT was conceived in Germany in 1918. The modern implementation of VAT began in the 1950s.
- The United States has considered using VAT but as of this writing has not implemented it yet. However, VAT does impact veterinarians in certain circumstances, even in the USA, so it is worth exploring what it is and how it works.
- Canada uses a GST system at the federal and provincial levels.
- There are two distinct methods used to calculate VAT.

TERMS DEFINED

Goods and Services Tax (GST): A tax paid by consumers on goods and services sold for domestic consumption. The tax is remitted to the government by the businesses selling the goods and services.

Value-Added Tax (VAT): An indirect tax on consumption of goods and services in which the tax is incrementally added at each stage where value is added to the supply chain, from production to sale.

ISSUES AND OPTIONS

- Although US-based veterinary practices do not charge VAT as of the time of this writing, it is useful to understand how it works, because even American veterinary practices and veterinary professionals may need to pay it under a few circumstances, including:
  - veterinary professionals who are members of global professional organizations;
  - veterinary professionals who attend foreign conferences or who travel abroad;
  - veterinary practices that purchase goods or services from outside the United States.
- One hundred and sixty-six out of 193 countries use VAT as of 2018. So, in many countries outside of the United States veterinarians need to charge VAT and submit payments to the government.
- The tax rate for VAT is usually based on the location of the customer, not the supplier/retailer.
- Not all localities require VAT. Often, exported goods are duty free.
- Businesses who will calculate and pay VAT must register with the applicable localities.
- VAT-registered businesses are required to add VAT on goods and services that they supply to others (with some exceptions, which vary by country) and account for the VAT to the taxing authority, after deducting the VAT that they paid on the goods and services they acquired from other VAT-registered businesses.
- Ultimately, VAT levies taxes on the same people and businesses for the same amounts of money, despite its internal mechanism being different from the sales tax model.
- There are a few key differences between VAT and the sales tax model:
  - With the sales tax model, there is a burden on raw goods suppliers and manufacturers to verify that a retailer is not the final consumer, so that taxes do not need to be charged. No such burden exists with VAT since incremental taxation occurs throughout the value chain.
  - With the sales tax model there is a burden on retailers to comply with local, state, and federal sales tax differences. No such burden exists with VAT.
  - With the sales tax model there is a burden on consumers to pay a use tax in applicable jurisdictions when sales tax is not charged (e.g., online sales, sales across state borders). There is no such burden with VAT.
- VAT supports two different collection methods: accounts based or invoice based.
  - The invoice-based method, also called the credit-invoice method, requires each sale to be taxed and the tax amount reported to the customer. The tax is then remitted to the taxing authority. The seller then receives applicable credits for VAT paid on raw goods, materials, or services. This is the most commonly used method for VAT.
  - The accounts-based method, also call the subtraction method, requires the business to calculate two items: the value of taxable sales at the end of a reporting period, and the sum of taxable purchases it made during the reporting period. The difference between these two calculations is then taxed at the applicable VAT rate.

EXAMPLES

With a traditional sales tax, the entirety of the tax is remitted to the government by the retailer and is ultimately paid for by the consumer. In the following example, a 10% sales tax is levied. The raw goods producer receives $100 from the manufacturer and recognizes a $100 gross profit. The manufacturer receives $120 and recognizes a $20 gross profit by selling to the retailer. The retailer gets a $30 gross profit and remits the $15 tax (calculated as $150 purchase price × 10%) to the government.

Transaction	*Seller's gross profit*	*Tax paid in transaction*	*Total tax paid*	*Total amount paid to seller*
1. Raw goods → manufacturer	$100	$0	$0	$100
2. Manufacturer → retailer	$20	$0	$0	$120
3. Retailer → consumer	$30	$15	$15	$165

With a VAT model, the tax is remitted to the taxing authority in each step by the entity selling the item. Ultimately, the tax is paid for by the consumer through the incremental increase in the amount paid. In the following example, a 10% VAT is levied. The raw goods producer receives $110 from the manufacturer with a gross profit of $100 and pays $10 to the government. The manufacturer recognizes a $20 gross profit by selling to the retailer and remits a $2 tax to the government (10% × $20 gross profit). The retailer recognizes a $30 gross profit and a $3 tax to the government (10% × $30 gross profit). Ultimately, the same tax was paid to the government and the consumer absorbed the entirety of the tax.

8.23. VALUE-ADDED TAX AND GOODS AND SERVICES TAX

Transaction	*Seller's gross profit*	*Tax paid in transaction*	*Total tax paid*	*Total amount paid to seller*
1. Raw goods → manufacturer	$100	$10	$10	$110
2. Manufacturer → retailer	$20	$2	$12	$132
3. Retailer → consumer	$30	$3	$15	$165

CAUTIONS

Import/export issues between nations that charge VAT and nations that charge sales tax – there is the potential for being taxed twice. To fix this problem, nearly all countries that use VAT use special rules for imported and exported goods:

- all imported goods are charged VAT for their full price when they are sold for the first time;
- all exported goods are exempted from any VAT payments.

8.24. CASH CONTROL: PREVENTING EMBEZZLEMENT

BASICS

OVERVIEW

You and your team work very hard to make a living. Losing your profit to a thief, either a stranger with a gun or a trusted employee, is never a good thing. Although few veterinary practices are the subject of an armed robbery, many practitioners have either been on the receiving end of employee theft or know one of their acquaintances that suffered from embezzlement. What is sadly the case is that much of this could have been prevented by controls.

TERMS DEFINED

Embezzlement: To take property or money entrusted to your care.
Fraud: Generic term embracing all multifarious means by which an individual is cheated out of something he or she owns. The term describes behavior that may have both a civil and a criminal component. Criminal fraud may result in fines, restitution, and/or prison sentencing of the perpetrator. Civil fraud may result in a judgment for restitution from the perpetrator but does not result in jail time. Misdeeds may also be investigated to obtain enough information to file a fidelity insurance claim in the case of a bonded employee.
Fraud Triangle: Three key factors that identify individuals who may be susceptible to committing fraud: situational pressures, opportunities to commit fraud, and personal integrity.
General Ledger: Detailed listing of the activity that occurs in each account on the financial statements.
Imprest System: A financial accounting system, most commonly used for petty cash, in which a fixed amount is reserved and then replenished at the end of the period or when circumstances require. So, if the period begins with $100 in the petty cash "float" and by the end of the period $75 has been spent from petty cash, then $75 is replenished and credited to the cash account, and the debits go to the appropriate expense accounts based on the petty cash receipts.
Internal Accounting Controls: Process and mental controls set in place to provide management reasonable assurance that no practice resources are being lost, that financial reporting is reasonably accurate, and that profitability targets are achieved.

ISSUES AND OPTIONS

• As part of the prospective employee interview process, be sure to obtain permission to conduct a background check and to obtain a credit report on all potential new hires (see 3.8 – Screening Potential Hires). Big personal debts, poor credit, or inability to obtain credit are pressures that motivate people to misappropriate funds. Even though the individual may not have direct access to funds or is not responsible for accounting or business functions, it does not mean that he or she does not have the opportunity to embezzle from the practice. Some people advocate that only individuals having access to cash have a background check and credit report pulled. However, there are too many opportunities in any practice to walk off with items of value to not do this for everyone being considered for employment. While you can test all candidates for a particular position and not for others, because of the street value of many products in the clinic, it is recommended doing checks on all new hires.
• Pay attention to your employees. Living beyond one's means, preoccupation with being successful, unexpected financial pressure, excessive use of alcohol, and gambling are all potential stresses that can push someone into fraudulent behavior. Work-related pressures can also contribute to the belief in some employees that they are "entitled" to more than their paychecks because they are not appreciated, because they are not treated fairly or not respected, or a host of other emotional or perceived psychological issues.
• Separation of duties is a basic tenet of internal control. This means that you have one person in your practice handling the receipt of money, another recording the cash, and a third depositing the money, credit cards, checks, and so forth at the bank. This can work well in large businesses; can be an issue when your total team consists of less than 10 people.
• Even in a small practice, you can have the bank statement mailed to your house rather than to the office, or access the statement online regularly. If you scan the banking activity, you can generally spot things that do not seem right. If nothing else, you give the appearance of checking on things, and perception is sometimes as good as reality. (Do not forget to bring the statement to the office in a timely fashion and give it to whoever is responsible for doing the bookkeeping.)
• Pay attention to the amount of credits, discounts, and other write-offs that take place in your practice. Insist that every discount given to a client be recorded on the invoice. By reviewing your financial statements and practice management reports on a regular basis, unusual or large balances would be an indication that something is amiss. Even in a practice that does not carry large accounts receivable balances, cash can be misappropriated through the use of credits, discounts, and refunds.
• Familiarize yourself with the management summary statements available on your practice management software. Scanning these reports frequently will let your staff know you are looking at things. You can generally tell by looking at selective reports if things "feel right." If the number of patients you see or medications you prescribe or procedures you have done do not jibe with what you remember, ask. Again, even if the staff jogs your memory correctly, it shows them that you are looking.
• Many practice management software programs have audit trail capabilities that will allow you to check to see if changes are made to client accounts. Get familiar with this feature and use it, if your software has it. Not only can you check for embezzlement issues, but you can also spot areas of trouble with staff accuracy, coding issues, or other areas that may need attention.
• Insist on timely prepared financial statements, including a full reconciliation of each and every bank account your practice has, including the credit card account. If your practice has a bookkeeper on staff or if your practice manager prepares the statements, be sure you have a basic understanding of how the statements are prepared and how the bank is reconciled. Again, scanning the general ledger and the bank reconciliation report will help to tell you if things are in order. As an alternative, you can use a competent accountant or consultant to analyze the statement, including the bank reconciliation, for accuracy. Insist that this be done in a timely fashion.
• Monitor the activity in your credit card account; specifically, you are looking for suspicious credits or refunds. A common trick of unscrupulous employees who have access to credit card machines with little control is for them to credit their own card with refunds from their employer's account.
• Be very watchful of payroll scams. With the increase in electronic involvement in payroll activity (calling in payroll deposits, doing payroll tax returns online, using payroll services), it is very easy for someone to change the gross amount of a paycheck and the related withholding without your knowledge. It may take a while for them to receive the benefit of this scam – they have to file their individual tax returns and receive a much larger refund than what they would normally be entitled to – but they took money nonetheless. It is very difficult to spot these types of scams because the net amount of the paychecks does not change. Again, become familiar with the payroll reports from your accounting software or payroll company, and periodically scan them for reasonableness.

8.24. CASH CONTROL: PREVENTING EMBEZZLEMENT

• Set up protocols for dealing with petty cash. These include using the imprest system for petty cash drawers or boxes. Under the imprest system, the petty cash custodian is responsible for the amount of the fund either as cash or signed receipts. Surprise cash counts of the drawer will reveal any discrepancies in this area. Common embezzlement issues of petty cash funds include trading personal checks for cash. Periodically, the check may be replaced by a check with a later date or simply the "loan" may never be repaid. Claiming reimbursement for purchases made for the practice out of personal funds can often be handled through petty cash with less documentation than would otherwise be the case if handled through normal reimbursement procedures. Paying false vendors with disbursements from the petty cash drawer is another common way to divert funds. Be sure to cancel petty cash vouchers after they have been submitted for reimbursement to prevent multiple reimbursements for the same expense. Making it a point to reconcile the petty cash drawer regularly in a public fashion is a good deterrent to misappropriation of petty cash funds.
• Insist that every transaction be rung through the practice management software. This means that if you take a bag of dog food and pay cost for it, an invoice is entered into the computer. If you take the bag and it is agreed that there will be no charge, it is rung through the computer as a "no charge" transaction. Not only does this set the example that everything is tracked in the office, but it certainly helps with monitoring what is going on with your inventory.
• Set a good example. There is no such thing as a "limited license to steal." If you take food or product without paying for it, your staff learns from you. If it is alright for you to do it, it is difficult for them to make the case that they cannot follow your example. The number one deterrent to embezzlement happening in a practice is the role model that the owner provides. If the owner brags about cheating on their taxes, taking advantage of errors on invoices from vendors, or other situations where you set the example that stealing is okay when done by you, but not okay when done to you, do not expect staff to "get the right message."
• Consider posting a sign at the front desk indicating that if the client does not receive a receipt, his or her visit is free. I know this sounds like you are a retail shop; however, there is a reason that large corporations have this policy. If you do not post or save a transaction in your practice management software, the software does not know you did anything. Therefore, if an invoice is opened, payment is accepted, and then the invoice is cancelled without saving it, you have no way of tracking that your staff just pocketed the client's payment.
• Pay your staff appropriately. If your staff is paid commensurate with their position, training, skills, and attitude, the temptation to steal is lessened.
• One of the biggest assets in any companion animal practice is the inventory. Losing a box of heartworm preventative is just as much of a loss to you as an employee taking $60, $70, or $80 out of the cash drawer. Being extremely zealous in the area of inventory controls is as important as monitoring cash receipts.
• Make sure that you cancel every bill or invoice that you pay. Have a procedure for paying vendor amounts due. Generally, distributors will send packing slips and/or invoices with each order received and then send a statement at the end of the month. Make sure that invoices match the statement and that you only pay once for items received. A properly drafted protocol will prevent any problems in this area. Look at the invoices you are paying to be sure they are for practice-related expenses. Paying your bookkeeper's electric bill because you did not monitor the location makes you a nice person, but it does not help the bottom line of the practice.

Section 9

Operations Management

9.1. MEDICAL RECORDS AND PATIENT DOCUMENTATION

BASICS

OVERVIEW

• Medical records are the basic ingredients for any successful veterinary practice. The issue usually is not if medical records are kept, but rather if they are adequate or complete compared with the practice acts and the need for veterinarian legal defense in a malpractice case.
• There is great variation in medical record requirements when compared with different state practice acts; there is no variation in records needs when comparing the detail required for an adequate malpractice defense. The more complete information there is, including details of client consultations, the better the defense is when needed.
• Medical records are mandated by veterinary practice acts.
• Veterinarians are commonly in noncompliance with record requirements when responding to license board complaints.
• Lawsuits are commonly won or lost based on the facts of the case and/or client communications being documented in the needed medical records.
• Every state's veterinary practice act has differing degrees of detail required for properly completed medical records.
• The American Veterinary Medical Association's (AVMA's) Principles of Veterinary Medical Ethics spells out the importance and minimal requirements of medical records.
• Medical records are the property of the practice and the practice owners.
• Veterinarians are obligated to provide copies to clients upon request.
• Ethically, the information in the records is considered privileged and confidential and should not be released except by court order or consent of the owner of the patient, with exceptions only as provided in state law.
• In litigation, an event or treatment is presumed to "not have happened" if it is not documented in the medical records.

TERMS DEFINED

Client Communications: The medical records must include documentation of explanations made to the client and the client's acceptance or rejection of the explanation and/or offer of treatment.
Medical Records: Daily written reports by veterinarians on the animals he or she treats. They are required to be kept for each animal or companion animal. They may also be kept on herds or flocks, and for food- and fiber-producing animals.
Noncompliance: This describes the veterinarian's lack of maintaining adequate medical records to meet the minimum requirements stated in a veterinary practice act.
Waiver: A client may sign a form explaining that they have declined to accept (or have waived) the doctor's recommendations or advice.

ISSUES AND OPTIONS

GENERAL

• Privileged and confidential information. The medical records are presumed to be privileged and confidential or held in confidence between the doctor and the client owner of the patient. Some state laws, or common law in some states, have changed the presumption of privilege and confidentiality.
• Medical records minimum inclusions. Medical records are the daily written reports provided by the treating veterinarian on the patients or herd of patients. The medical record must include at a minimum the following information:
  ◦ name, address, and telephone number of the owner;
  ◦ name, number, or other identification of the animal or group;
  ◦ species, breed, age, sex, and color of the animal;
  ◦ immunization record;
  ◦ beginning and ending dates of custody of the animal;
  ◦ a short history of the animal's condition as it pertains to its medical status;
  ◦ physical examination findings and any laboratory data;
  ◦ provisional or final diagnosis;
  ◦ treatment and medication administered, prescribed, or dispensed;
  ◦ surgery and anesthesia;
  ◦ progress of the case;
  ◦ radiographs and laboratory results pertaining to a given patient.
• Medical records commonly are too brief and exclude the communications between the veterinarian and the client.
• Medical records must include all patient data and patient information, including laboratory results and radiographs.
• Medical records should, but commonly do not, include authorization forms or waiver forms signed by the client, allowing or denying patient treatment.
• Records should include estimates for services to be provided.
• Practice acts from state to state usually include the previously mentioned minimum requirements, but some statutes greatly expand the physical examination findings requirements.
• Physical examination requirements in some states include requiring a report on all the following, which is obviously more than the minimum previously mentioned:
  ◦ temperature
  ◦ weight
  ◦ mucous membranes
  ◦ auscultated chest
  ◦ abdomen
  ◦ lymph nodes
  ◦ musculoskeletal condition.

EXAMPLES

• Examples of records violations before license boards include the following:
  ◦ Lack of complete patient and client identification.
  ◦ Lack of complete system-by-system description, with annotated physical examination (as previously stated).
  ◦ Lack of tentative diagnosis.
  ◦ Lack of prognosis.
  ◦ Lack of treatment specified, especially the lack of the client's waiver or denial of a recommended procedure or treatment.
  ◦ Illegible entries.
  ◦ Changes or deletion of records after a reasonable contemporaneous period.
• If a client declines a doctor's recommended treatment, then a waiver form must be signed by the client and filed with the medical record to document why the patient was not treated to the standard of care. In later litigation when a client complains that a patient outcome was less than expected, the veterinarian will be without an adequate defense if the waiver or denial forms were not signed by the client to prove the explanation and the client's initial directives.
• Veterinarians can be fined and reprimanded by state boards for falsifying, altering, or correcting records noncontemporaneously.
  ◦ For example, a veterinarian received a notice from the state board of a client complaint. The state sent the letter with the wrong date of the incident, and the veterinarian assumed he had wrongly dated the medical record and changed it in his medical records to comply with the erroneous state notice. He was fined and reprimanded for altering medical records.

◦ A client complained to the state licensing board that the patient's death was unexpected and the fault of the practicing veterinarian. The veterinarian subsequently was fined for failure to meet an adequate understanding of informed consent by the owner to proceed with a treatment that included some risk by performing surgery of the respiratory tract.

CAUTIONS

• If a treatment or diagnosis is not recorded in the record, it is presumed not to have happened.
• Medical records violations are a part of almost all veterinary investigations by the state licensing boards.
• Even though the client complaint to the state veterinary board is not about records, when the state board investigates the case they always request copies of the medical records for review for compliance with the statutes.
• When those medical records do not meet the standards of care for the community and/or as spelled out in the practice act, the veterinarian will be cited for medical records violations even though the veterinarian may be acquitted or found not guilty as to the client's original complaint.
• Medical records requirements for contemporaneous drafting requires that, if they are on a computer, they must have some security mechanism to lock out staff and doctors from changing them after a certain specified time, usually less than 48 hours.

MISCELLANEOUS

• Medical records corrections or additions can be made after the contemporaneous timeline if it is noted as an addendum with an explanation.
• Medical records can be written by technical staff, if the doctor signs off as to accuracy and authenticity.
• Medical records must be legible.
• Illegible medical records are the same as no medical records if a third-party reviewing board cannot decipher what was intended in the medical records.
• Even though laboratory results and radiography reports are part of the medical records, owners can and will request copies of them, which must be provided in a reasonable time.
• If radiographs are shared with second-opinion practitioners, they should be requested to be returned within a reasonable time to be part of the original records kept by the original treating practitioner.
• Medical records must be kept at the treating hospital for a minimum of three to five years, subject to state statute variations.

9.2. PATIENT AND PROCEDURE LOGS

BASICS

OVERVIEW

• Patient and procedure logs play a vital role in any practice and work best in conjunction with well-designed and well-prepared procedure manuals.
• Patient and procedure logs serve three primary functions in the support of practice operations. First, they allow for the convenient storage of important data (see Table 9-2-2). Second, they improve the quality of patient care and customer service by helping to standardize how procedures are performed. They also help facilitate charge capture and auditing processes. Logs are essential if supplies such as laboratory tests kits are recalled. Without a log, it would be impossible to know which patients were impacted by the recall (see Table 9-2-2).
• Many successful practices find it challenging to maintain quality standards as the practices grow in both size and volume. Developing system of logs is an important component in maintaining the success of your practice.
• Practices with a well-run system of logs and audits may increase net revenues as much as 10–15%.

TERMS DEFINED

Audit: Methodical examination and review of practice records to assess accuracy and completeness. A large practice may have one or more staff members whose sole responsibility is to perform audits.
Hybrid Logs: These logs are a combination of patient and procedure logs. For example, a final care log lists the names of deceased pets and the actions that need to be completed, such as requesting cremation or burial services. These logs may also serve as task checklists to ensure that all paperwork and communication related to a specific procedure are completed in a timely manner.
Patient Log: Any record or list of patients that have received a particular service or product. The log generally has additional pertinent information, such as excerpts from the patient's medical record and/or items helpful in the billing process (e.g., laboratory logs and new-patient lists).
Procedure Log: Procedure logs help ensure that tasks have been completed and/or completed in a specific manner (e.g., a practice housekeeping checklist or a record of dates evidencing that someone has calibrated the in-house laboratory instruments).

ISSUES AND OPTIONS

CREATING A LOG

• The first step in the preparation of a patient and/or procedure log is to determine whether or not a need exists for such a log. This is not as simple as it sounds, because almost every process within a veterinary practice could benefit with a little extra quality control. In human medicine, they have entire departments dedicated to quality control and quality assurance.
• Once you determine that a need exists in a particular area, you should make a list of the data that need to be collected and the steps that need to be completed in order for the function to run smoothly. Quite often, logs are created in response to specific disasters that the practice leadership hopes to prevent from recurring, so the information gathering can be quick and easy. For example, most final care logs are developed after a pet that was supposed to be sent to the crematorium for a private cremation with the ashes returned to the owner ends up going to the pet cemetery for a group burial in an unmarked grave.
• As always, the more input you receive, the better the final product. It is best if multiple team members offer input and/or review drafts of the proposed log. In this way, you can ensure that a more complete and functional log is developed.
• The use of the log should be announced to the staff along with its date of implementation.
• The staff should also receive training on how to complete the steps in the log. Such training serves multiple purposes. It ensures that everyone has the same expectation regarding the function and purpose of the log, and it reduces the margin of error. This training also helps elevate the importance of the log with the staff, which, in turn, increases staff compliance and acceptance.
• Someone should be responsible for making sure that the log is being properly completed and that it is indeed solving the problems it was designed to solve.
• If the log is performing as desired, a regular schedule of audits should be implemented to maximize the log's effectiveness.
• If the log is not performing as desired, it should be revised. At no time, however, should the log's use be discontinued – interruptions in protocol will reduce its efficiency.

EXAMPLES

• Simply put, logs and audits are designed to solve problems. One of the simplest problems to solve in a practice through the use of logs and audits is lost revenue due to missed charges. The laboratory, for example, is a common site for lost charges, and a log that records the results of fecal exams alone can generate thousands of dollars in additional revenues for a practice each year.
• Advancements in veterinary practice management software have reduced the need for several types of manual logs, such as a new-patient list. For example, software that automatically invoices the client when you order a laboratory test has decreased the need for auditing for missed charges. The same software can label samples for

Table 9-2-1. Sample laboratory result log (heartworm test).

Client	*Patient*	*Client ID*	*Date*	*Result*	*Technician*
Jane Smith	Rusty	362598	08/31/18	Negative	Sally J
Bill Jones	Blackie	45826	08/31/18	Negative	Sally J

ID: identification.

Table 9-2-2. Sample laboratory reporting log (heartworm test).

Medical record	*Client contacted*	*Assistant who called*	*Date*	*Time*	*Test manufacturer*	*Lot number*
Yes	Yes	Jane B	08/31/18	5:21pm	ABC Co	XY123
Yes	Yes	Jane B	08/31/18	5:22pm	ABC Co	XY123

sending out and receiving test results into the medical record. This eliminates the need for logs to chase missing test results. However, you may still need to print the computer log to compare against the monthly statement from the laboratory in order to check them for billing errors or to confirm that required communication has occurred, such as informing the client of the test results.

- The data to be collected in the log need to be determined by surveying the staff. Fecals are notorious for lost charges because they are sometimes given to a receptionist, sometimes to a technician, and sometimes to the doctor. Clients may initially forget they even brought a sample with them, so you might not even get it until they are ready to leave. The staff member who sets up the sample may not be the person who reads it; therefore, it is important to have these procedures spelled out in a procedure manual so that the entire staff has the same expectation. Each data point collected should have a specific purpose (no one enjoys extra paperwork for no reason).
- The date tells us when the test was run; the client and patient names identify the origin of the sample. Inclusion of client and patient identifications (IDs) makes it easier to check in the computer that the client was charged for the examination.
- The initials of the staff member who set up the sample for examination help identify that individual if there is a problem to be addressed. In the majority of practices, the person who sets up the sample is also the person responsible for putting the proper charge on the client's invoice.
- The time the sample was set up is helpful if the type of test you are running is time sensitive. For example, one popular test says the sample needs to sit for 7–15 minutes in order to be accurate. Too little time or too much time and you could get a false-negative result.
- The initials of the staff member who reads the sample and records the results are also required. In this example, results must be recorded in the log and in the patient's medical record. This is especially important for those practices that require the person who read the sample to report the results to the client.
- The frequency of checking the log against the computer varies from practice to practice. Most practices check laboratory logs twice daily, so if a charge was missed the client can be contacted immediately and their invoice can be properly revised.
- Waiting days or weeks to report a billing omission to a client usually results in a lost opportunity to collect the fee, as well as a less than enthusiastic client.

CAUTIONS

- Blanket policies such as "everyone is responsible for checking for lost charges" are rarely effective. When practices get busy, most staff members assume that someone else is following through because they are otherwise occupied. If everyone is responsible for completing a task, then no one is responsible for completing the task! The results can sometimes be devastating on a practice's bottom line. Thus, it is imperative that one individual ultimately owns each log and audit process to ensure compliance and accountability.
- As with most new initiatives within a practice, it is best if you can put a new log into service when you are confident that you will be able to follow through with the audits and analyses in a timely manner. If you initiate a log and do not follow through, many staff members will quickly become noncompliant, making it harder to reinforce the desired new behaviors.
- Most practices fall into a routine of only telling staff when they have made a mistake. If a log is audited and there are fewer errors than last time or no errors at all, then these results should be celebrated by the practice team. For example, one practice reinforces excellent work by giving small cash bonuses to the receptionist who has the lowest number of invoicing errors each week.
- Do not fall into the trap that your computer is magically auditing all of your records. Manual systems existed for decades, which gave practices ample opportunity to build in quality control procedures. Many practices abandoned these procedures when they computerized, falsely believing that all the opportunities for errors had been removed. In reality, many practice management software programs have few quality control features. Those that do are rarely set up correctly or monitored as they should be.
- Though not capable of independently auditing your entire practice, technology can aid the auditing process. For example, spreadsheets are powerful tools for identifying trends in your results. Contact your software support department to determine what standard features come with your software package. Set them up and utilize them.

MISCELLANEOUS

Those individuals charged with auditing responsibilities should record their results each and every time an audit is performed so they can look for possible trends. For example, if, within a month's time, five technicians each miss two fecal samples, then all the technicians should probably receive some refresher training. If, however, two technicians each miss one sample and a third technician misses the remaining eight samples, then that specific technician should receive additional training, coaching, and/or counseling on how to properly process fecal samples.

9.3. Standards of Care and Care Pathways

BASICS

OVERVIEW

In many veterinary practices, veterinarians function relatively independently and autonomously, and although some may cherish this personal freedom, it leaves client care quite variable, even within a single hospital.

Standards of care and care pathways are used to preserve best practices, so that clients receive consistent evidence-based care regardless of the level of expertise and experience of individual staff regarding both common and uncommon conditions.

Standards of care and care pathways not only recognize best practices for many different preventive and treatment options, but also comprise one of the best ways of realizing appropriate hospital revenue and patient care (see 4.8 – Pet-Specific Care).

TERMS DEFINED

Care Pathway: Also known as clinical pathways and care maps, care pathways are evidence-based practices for specific groups of patients with a predictable clinical course in which professional intervention can be defined, optimized, and sequenced, and in which the outcomes can be measured, contributing further to evidence-based evaluation.

Evidence-Based Practice: Use of the best currently available resources (research and clinical expertise) in making decisions about patient care.

Guidelines: Routine or sound practices, often formed by consensus within veterinary organizations.

Standards of Care: The level of medical care that is expected for a competent veterinary professional to deliver to a patient within a specified veterinary practice. In veterinary medicine, the term *standard of care* is often used synonymous with *protocol*.

ISSUES AND OPTIONS

STANDARDS OF CARE (PROTOCOLS)

• Most standards of care begin as guidelines, which are typically created by veterinary organizations, associations or specialty colleges. The guidelines are general in nature to be applicable to a wide audience and geographic area (see Figure 9-3-4).

• When guidelines have been customized to meet the needs of a specific hospital or organization, it is then that they typically become referred to as standards of care.

• Standards of care are critical for veterinary practices, and they provide the foundation for evidence-based veterinary medicine. At a time when compliance has been documented to be significantly less than estimated by most veterinarians (see 4.11 – Compliance and Adherence), standards of care are needed not only for the financial wellness of the veterinary hospital, but also for the ultimate benefit of both clients and their pets.

• Practice protocols are easy to understand and comforting for clients, and they allow the hospital to use best practices, regardless of the experience levels of individual doctors and staff members. These protocols need not be rigid, and can and should change based on circumstances and accumulated data.

• Lapses in the adherence to protocols can be costly for practices and potentially dangerous for clients and their pets, and they may even open the hospital to liability on the basis of substandard care. Clearly, a consistent level of service is good for hospital revenue and good for the pet owner and pet.

• It can be confusing for both clients and staff when doctors in the same practice follow different directives for routine care. Protocols allow all staff to reinforce the practice message about desirable care options, and even relatively small changes in protocol adherence can make large differences in healthcare compliance – as well as revenue generation for the hospital.

• Although many like to believe that veterinary medicine is as much an art as a science, and nobody likes to be dictated to, standards of care allow everyone in the practice to deliver the same consistent high quality of medicine.

• Guidelines are commonplace in human medicine, where evidence-based standards of care are relied upon to ensure patients are receiving appropriate care within hospitals.

• To successfully implement standards of care into practice, it is worthwhile to first examine the potential benefit to everyone involved, including pets, their owners, and the practice itself.

• To be accepted by everyone as a hospital-wide standard of care, it is worthwhile building consensus, and that might involve soliciting fact-based evidence for protocols from outside experts, if necessary.

• Although it is possible to create protocols for almost every medical presentation, it is best to concentrate on wellness protocols first, because these should be less controversial and should have the most impact on clients, pets, and hospital revenues (Figure 9-3-1). This allows doctors the personal freedom to handle most other medical presentations but agree to follow accepted standards of care for most of the routine wellness situations.

• To be successful, protocols must be universal in their application to ensure compliance and positive benefit to all pets in the practice. These standards of care must not be ambiguous, or selective, or they will not be embraced by staff or clients. Criteria for these wellness protocols can be determined based on risk assessment, and the criteria should be easily understood by all staff members (see 4.9 – Lifelong Excellence in Healthcare).

• Most pet owners have experienced accepted protocols associated with human health, so they may be even more comfortable with the concept than hospital staff. Some of these human healthcare protocols may have to do with dental care, vaccination to enter the public school system, mammography recommendations, colonoscopy, and so on.

• Different doctors within the same hospital having different standards of care for pets, without a good explanation, may create controversy among staff and clients (which doctor is right?). Therefore, the goal should be to have standards of care that can be universally adopted by all staff members, whenever medically prudent to do so.

• When creating standards of care, it is important to realize that there is unlikely to be complete consensus for all given protocols. Standards of care are more about compromise for the greater good, realizing that no standard will be appropriate for all pets in all circumstances. Therefore, there need not be endless debate on medical minutiae, and the hospital team should instead focus on standards that are sensible, defensible, and that can be readily understood and implemented by all staff.

• When the protocol is adopted, set a firm time period when it will be reevaluated, so it becomes a dynamic process and not dogma. It is

- Lifetime wellness schedule
- Vaccination
- Integrated parasite control
- Nutritional and weight management
- Oral healthcare and prophylaxis
- Breed-specific screening
- Prescription refills (by medication)
- Pre-anesthetic requirements
- Senior evaluation

Figure 9-3-1.

Basic standards of care that are applicable for most veterinary hospitals.

- Achromatopsia
- Black-haired follicular dysplasia
- Canine leukocyte adhesion deficiency
- Cardiomyopathy
- Catalase deficiency
- Cataracts
- Centronuclear myopathy
- Cerebellar ataxia
- Cerebellar cortical degeneration (neonatal)
- Chondrodysplasia
- Cleft palate
- Cobalamin deficiency
- Collie eye anomaly
- Cone degeneration
- Congenital stationary night blindness
- Copper toxicosis
- Cyclic neutropenia
- Cystinuria
- Degenerative myelopathy
- Dermatofibrosis
- Enamel hypoplasia (amelogenesis imperfecta)
- Encephalopathy (Alaskan husky)
- Episodic falling
- Exercise-induced collapse
- Factor VII deficiency
- Factor VIII deficiency (hemophilia A)
- Factor IX deficiency (hemophilia B)
- Factor XI deficiency
- Familial nephropathy
- Fanconi syndrome
- Fucosidosis
- Gallbladder mucocele
- Glanzmann's thombasthenia
- Glaucoma (primary open angle)
- Globoid cell leukodystrophy
- Glycogen storage disease II
- Glycogen storage disease IIIa
- GM-1 gangliosidosis
- GM-2 gangliosidosis
- Hairlessness
- Hereditary necrotizing myelopathy
- Hereditary recessive nephropathy
- Hyperekplexia (startle disease)
- Hyperuricosuria
- Hypoadrenocorticism (juvenile)
- Hypo/dysmyelinogenesis
- Hypothyroidism with goiter
- Ichthyosis
- Ichthyosiform dermatitis with keratoconjunctivitis sicca
- Improper coat (RSPO2)
- Junctional epidermolysis bullosa
- Juvenile epilepsy
- Kindlin-3 (LAD) deficiency
- L-2-Hydroxy glutaric aciduria
- Lafora-body disease
- Late-onset ataxia
- Macrothrombocytopenia
- Malignant hyperthermia
- Merling
- Mucopolysaccharidosis I
- Mucopolysaccharidosis IIIa
- Mucopolysaccharidosis IIIb
- Mucopolysaccharidosis VI
- Mucopolysaccharidosis VII
- Mullerian duct syndrome
- Multi-drug resistance (MDR)-1
- Multifocal retinopathy 1
- Multifocal retinopathy 2
- Multifocal retinopathy 3
- Muscular dystrophy
- Musladin–Leuke syndrome
- Myasthenia gravis
- Myostatin deficiency
- Myotonia congenita
- Narcolepsy
- Nasal parakeratosis
- Necrotizing meningoencephalitis
- Neonatal ataxia (Bandara's)
- Neonatal encephalopathy
- Nephritis (COL4A5)
- Neuronal ceroid lipofuscinosis
- Osteochondrodysplasia
- Osteogenesis imperfecta
- Pancreatitis (SPINK 1,2)
- Perianal fistulae
- Phosphofructokinase deficiency
- Pituitary dwarfism
- Platelet disorder
- Polyneuropathy (greyhound)
- Polyneuropathy (Leonberger)
- Prekallikrein deficiency
- Primary ciliary dyskinesia
- Primary hyperoxaluria 1
- Primary hyperparathyroidism
- Primary lens luxation
- Progressive retinal atrophy – rcd1
- Progressive retinal atrophy – rcd1a
- Progressive retinal atrophy – rcd2
- Progressive retinal atrophy – rcd3
- Progressive retinal atrophy – rcd4
- Progressive retinal atrophy – prcd
- Progressive retinal atrophy – cord1
- Progressive retinal atrophy – cord2
- Progressive retinal atrophy – dominant
- Progressive retinal atrophy – X-linked
- Progressive retinal atrophy – crd
- Progressive retinal atrophy – crd1
- Progressive retinal atrophy – crd2
- Progressive retinal atrophy – crd3
- Progressive retinal atrophy GR_PRA1
- Progressive retinal atrophy GR_PRA2
- Progressive retinal atrophy – type A
- Progressive retinal atrophy – night blindness
- Pyruvate kinase deficiency
- Pyruvate dehydrogenase phosphatase-1 deficiency
- Renal cystadenocarcinoma/nodular dermatofibrosis
- Renal dysplasia
- Retinal dysplasia/oculoskeletal dysplasia
- Rod–cone degeneration
- Severe combined immune deficiency
- Short tail
- Signal transduction disorders (thrombopathia)
- Spinocerebellar ataxia
- Superficial keratitis (chronic)
- Trapped neutrophil syndrome
- Von Willebrand disease type I
- Von Willebrand disease type II
- Von Willebrand disease type III

Figure 9-3-2.

Just some of the genetic disorders for which DNA testing is currently available. Abstracted from Ackerman, L. *The Genetic Connection*, AAHA Press, Lakewood, CO, 2011.

9.3. Standards of Care and Care Pathways

- Atopic dermatitis
- Glaucoma
- Diabetes mellitus
- Hypoadrenocorticism (Addison's disease)
- Hyperadrenocorticism (Cushing's syndrome)
- Osteoarthritis (degenerative joint disease)
- Congestive heart failure
- Colitis
- Keratoconjunctivitis sicca
- Seizure disorders
- Urolithiasis

Figure 9-3-3.

Conditions for which hospitals might consider creating care pathways.

important to involve all hospital members in the discussion, because veterinarians themselves are sometimes poor judges of what clients want and what they consider to be acceptable risk. Nonveterinarians in the practice are often more likely to identify questions and concerns of the pet-owning public that might be nonmedical in nature.

• As protocols get developed, it is important to keep them technologically sound, current, and consumer driven. That includes keeping profiles customized for individual patients and utilizing all available tools, including genetic screening (see Figure 9-3-2, and 4.10 – Personalized Pet Profiles).

• Protocols are extremely important for practices, in terms of building consistency into wellness, decreasing confusion of pet owners and staff, and setting expectations regarding optimal pet care.

CARE PATHWAYS

• In addition to protocols, which are standards of care for particular situations, "care pathways" are also important to practices, especially for chronic or lifelong conditions.

• Care pathways help practices focus on the long-term but predictable aspects of patient care, including complications to monitor for, unexpected events, and even the point at which referral to a specialist is indicated (see Figure 9-3-3).

• It is the care pathway that can often serve as the template for client education materials, because it focuses on aspects of particular significance to the pet owner, such as the evolution of the condition, anticipated effect on lifespan, whether the condition can be cured or managed, a time frame for when clinical improvement can be expected, when referral is indicated, and likely price points of extended care (veterinary visits, diagnostic testing, therapies, referral, etc.).

EXAMPLES

Mrs. Gardner presented her five-year-old Airedale terrier, Maggie, for routine evaluation and vaccination. Maggie had been diagnosed with mild hip dysplasia at two years of age when screening radiographs had been taken and now was just starting to show some mild discomfort when first waking. Repeat radiographs revealed some early-stage osteoarthritis. The hospital's care pathway for osteoarthritis, which had been previously shared with Mrs. Gardner, suggested that treatment would be started with nonsteroidal anti-inflammatory drug (NSAID) therapy and nutraceuticals, there would be some changes to the dietary regimen, and the staff would demonstrate some physiotherapy maneuvers that Mrs. Gardner could consider starting at home. Prior to starting therapy, some laboratory testing would be done and then an abbreviated panel would be run 10–14 days after starting the NSAID to ensure there were no idiosyncratic adverse reactions. It was anticipated that NSAID therapy would be continued long term to control inflammation, repeat laboratory work would be scheduled every six months, and the radiographs would be repeated annually. If Maggie did not respond as anticipated, a referral to a specialist would be considered.

CAUTIONS

Standards of care and care pathways are intended for typical case presentations, but ultimately the care delivered must meet the specific needs of owner and patient.

MISCELLANEOUS

It is not necessary for each hospital to create standards of care and care pathways in isolation. There are many resources currently available (see Figure 9-3-4) and many more surely to be developed in the future. Each guideline is just that, a guideline, and should be customized based on local circumstances.

9.4. CONTINUITY OF CARE

BASICS

OVERVIEW

• Continuity of care is a critical responsibility of every veterinary staff member. It is important to recognize that although the ultimate burden rests on the doctor who is managing the case, it is the responsibility of the entire staff to ensure that each patient receives complete and proper care.
• Continuity of care is a broad term that encompasses all aspects of medical recordkeeping and corresponding communications. Such administrative measures ensure that the patient receives complete and seamless veterinary healthcare. Ideally, a single individual would be able to monitor and manage a case from initial presentation through final resolution, but this is rarely the case. Through proper documentation, all team members can track a patient's progress and respond appropriately to client concerns and issues.
• Today, continuity of care has broadened to include all who have a role in patient care. There may be significant time and geographic variances, which increases the need for accurate recordkeeping. Care may be provided by the primary care veterinarian, the pet-owning family, the emergency hospital, numerous specialists, trainers, physical therapists, chiropractors, acupuncturists, and so on.
• The backbone of continuity of care and the doctor–client relationship is communication. The majority of breakdowns in patient care and customer service are rooted in incomplete, untimely, and/or incorrect communication. For the quality of care to be maintained over time, care providers must be able to become rapidly acquainted with previous medical history. Thus, we have seen an increase in record sharing through the advent of digital information portals that facilitate rapid (and often real-time) access to medical information.
• Complete, problem-oriented medical records identify the patient and document all medical information in a logical, well-organized manner (see 9.1 – Medical Records and Patient Documentation). Such records define each problem while facilitating "total care of the patient." Proper medical records facilitate rapid retrieval of information and a thorough progression of care despite the involvement of multiple veterinary healthcare providers. Never overlook the pet owner's role in patient care. Discharge instructions should always be written and easy to follow. Utilize technology to allow clients to access care instructions and related information online 24/7.

TERMS DEFINED

SOAP: An acronym that identifies the most common data entry format used by veterinary practices. The data are generally located in the progress notes portion of a problem-oriented medical record. **S** stands for subjective. Includes the chief complaints as well as the patient history. **O** stands for objective. Includes objective and observed information derived from the physical examination, laboratory reports, and other diagnostic data. **A** stands for assessment. Includes a provisional diagnosis, summary of abnormal findings, and differential rule-outs. **P** stands for plan. The most critical section for continuity of care, the plan should include plans being made for further diagnostic studies, treatments, and/or surgery.

ISSUES AND OPTIONS

• To ensure continuity of care, even simple procedures such as recheck examinations require the implementation of a systematic, decision-making process. Without proper "setup" and communication, customer service and patient care will suffer.
• Before the client leaves the office, the staff, if possible, should schedule the patient's recheck examination, preferably with the same doctor. This type of immediate follow-up helps increase client compliance and improves the probability that the original doctor, rather than one of their associates, will see the patient at the recheck. When using a flexible scheduling system such as a 10-minute flex, it is important to specify the appropriate time slot for the recheck (e.g., a 10 or 20 minute time slot; see 4.15 – Client Appointment Scheduling).
• If, after checking your schedule, you realize that you are not scheduled or are not available when the recheck is due, check the practice schedule to determine if one of your colleagues who is on duty today will be on duty when you schedule the recheck. If so, introduce your colleague to the client and allow that doctor to have a quick look at the patient so that he or she is better informed.
• It is important to provide a detailed description of each condition your colleague will review at the recheck. The more detail you provide, the easier it makes everyone's job. For example, if you have located a mass and wish to monitor it, you should measure its exact size with calipers or a ruler. You should also mark on a diagram of the pet the exact position of the mass. Never estimate sizes, always use a calibrated measuring device. You should also document your expectations as to what the desired response or recovery should be at the time of the recheck. Have detailed plans developed (see Examples section) that include references to further diagnostics, treatment options, and client expectations.
• In today's digital age, we have many modes of communication at our disposal. In many practices, clients may elect e-mail or text messaging as their preferred method of communication. However, we have found that medical recordkeeping is not keeping up with this technology, and much of this vital communication is not being captured properly in the medical record. Does your practice have a way to document a post-op text message? Do you have proof that you emailed laboratory results? If an associate regularly texts clients on their cell phone, then that associate leaves your practice, do you have a record of those communications?

EXAMPLES

• There are numerous examples of tips and techniques that you can use to help improve the continuity of care within your practice.
• Scheduling doctor rounds is an extremely important component that contributes enormously to improving the continuity of care. Regularly scheduled rounds are even more important in practices with new or less-experienced doctors, in larger practices, and in 24-hour environments.
• In addition to the standard morning rounds that most practices employ, larger facilities will also implement rounds at the end of the day. In a 24-hour environment, rounding at the end of each shift is critical, especially because many of the cases found in a 24-hour environment typically require a higher level of care. Establishing a 24-hour schedule with intentional shift overlap is one easy way to help increase rounding compliance. Sample shifts may include 7:00 a.m. to 4:00 p.m., 3:00 p.m. to 12:00 a.m., and 11:00 p.m. to 8:00 a.m. The guaranteed overlap helps facilitate rounds. If the practice is extremely busy and work continues into the overlap, it is generally the responsibility of the doctor coming on duty to release the doctor going off duty. Such practices ensure that the oncoming doctor is comfortable with the status of all of the cases in the hospital and is able to take over their care until the next shift comes on duty.
• In many practices, the skill and talent of the support staff may be overlooked. Veterinary technicians can play a significant role in helping to improve continuity of care. In many practices, the treatment

technicians round simultaneously with the doctors. Technicians often have added insights on how the pet is responding (e.g., alert, lethargic, uncomfortable, or tearing out intravenous lines). They may also have additional input regarding how well the pet is eating, drinking, and so on. Even small tips can be helpful (e.g., recommending an alternate route of administering medications). Depending upon individual skill levels and practice environments, many doctors will round with a technician if the oncoming doctor is unavailable. Many hospitals also have a technician-round journal, where the technicians enter helpful comments regarding each patient's care (e.g., whether or not restraint is needed and, if so, what type is the most effective).

- In the emergency/referral setting, prompt communication with the referring veterinarian, including results of all tests performed and follow-up recommendations, is crucial for continuity of care.[1]
- Utilize technology as much as possible. Digital photographs can be taken and stored in most software systems for a nominal amount. A picture is worth a thousand words, so save yourself all the writing. Photographs are an effective way to document lacerations, skin problems, masses, external parasites, dental problems, and so on. If you forget to communicate everything you wish to the doctor who is taking over the case, it is never too late to follow up with an e-mail or voicemail message from home or on the road. Always assume that the piece of information you left out is the first question your colleague will be asked.

CAUTIONS

- Standardize the abbreviations that your practice uses in its medical records. Multi-doctor practices employing graduates from different veterinary schools often have trouble understanding one another's abbreviations. The full scope of abbreviations for medical records is far too extensive to even begin to identify here; the best approach is to have a staff member develop a standard list of abbreviations approved for use within your practice. You could also consult a reference such as the American Animal Hospital Association book listed in the Recommended Reading section.
- Always prepare clients before you turn cases over to other doctors. The more informed a client is and the more proactive communication they receive, the greater their confidence and trust level will be. If you do need to turn cases over, it is often best to identify a doctor with whom the client has had prior contact. Working from established, positive relationships is always easier than initiating new relationships, especially during stressful times (such as when a pet is hospitalized for emergency treatment).
- Using vague entries such as "follow-up blood work" or "liver panel" instead of identifying specific tests may jeopardize the patient's life or cause the patient's owners to incur unnecessary costs (e.g., if the correct diagnostics are not done).
- Laboratory tests such as cultures that may have preliminary and final results need to be tracked and the owner contacted as soon as final results are received. Follow-up should be completed by the doctor who ordered the test, or specifically delegated to another doctor if the initial doctor is unavailable.
- The same rules that apply for treatments and diagnostics also apply for medications. Telling a client, "Let's try this medication for a few days, and if you do not see an improvement we will change medications" may be an acceptable verbal report to a client, but the medical record should identify the specific medication and dose you expect to try next. If the client contacts the practice and you are unavailable, the doctor looking at the medical record can easily explain to the client that, "Dr. X noted that she would like to change Fluffy to XYZ. I'll have the technician get some ready for you." This approach provides better patient care and customer service than the following response: "I don't know which medication Dr. X wanted to try, because there are several that could work. I'll leave her a note to call you when she gets back." Making a complete entry in the medical record may require a little more effort; however, spending a few extra minutes to make it is easier than dealing with an unhappy colleague and a very unhappy client upon your return.

MISCELLANEOUS

One common test of the quality of a medical record and its ability to facilitate excellent continuity of care is the "telephone roundtable game." Many teaching hospitals require their interns to participate in this exercise each month to reinforce the importance of quality medical records as well as to demonstrate to the interns how much their recordkeeping abilities will improve throughout their tenure. The game is played by having each participant select a record of one of the cases they are managing in the hospital. The participants then sit around a table and pass their record to the doctor on their right. The facilitator then engages each doctor in a role-playing exercise by pretending to be the pet's owner and calling him or her on the telephone for a progress report. The "pet's owner" asks the doctor numerous questions, and the doctor only has the medical record and their own personal knowledge of the case (such as from rounds) from which to draw. Needless to say, the first few games are a little frightening, but after a while the medical records become more complete and the participants are much more articulate.

9.5. Profit Centers

BASICS

OVERVIEW

• To monitor ongoing operations in a veterinary practice, owners, administrators, and practice managers produce and review a variety of reports, including an assortment of income, expense, and production numbers.
• Although these reports have a lot of numbers, they do not necessarily provide much useful information to an owner/veterinarian.
• Monthly profit and loss reports do not tell all the relevant information about a practice's operations, especially if the practice records income when it is received and expenses when they are paid.
• There is generally a time lag between when costs rise and when a practice adjusts its fees. That time lag lowers profitability for as long as it exists. Some practices seem to have a permanent lag; they never quite get caught up, so even though revenue is rising, profits are falling.
• Practice management software produces reports showing production by doctor, by service code, average transaction charge, and may also track the cost and quantity on hand of drugs and supplies.
• Production reports do not track the actual expenses that relate to each category of revenue.
• Some practice management software packages can link with the hospital's general accounting system, but the complexity of doing so frequently outweighs the benefits, especially for smaller practices.
• Traditional reports do not allocate doctor and technician/nurse/assistant wages among service codes, so there is no way to know if you are recovering the cost of their time, especially in very labor-intensive procedures.
• Boarding revenue is not earned equally over the year, yet some level of kennel staffing is required all year long. How much kennel staff can the practice afford without raising boarding fees? Over the course of a year, does boarding actually add to the bottom line?
• Traditional reports will not tell you if your fees for individual kinds of services are actually covering your direct costs, especially the cost of drugs, supplies, and equipment related to those services.
• If you only have a profit and loss statement and production reports, there is no way to know which groups of services are contributing the most to your bottom line. Do you want to do more of all kinds of services, or will doing more of some cause you to lose more money?
• A well-designed profit center report will give you the missing information by bridging the gap between your practice management software and your general accounting system.

TERMS DEFINED

Production Report: Report produced by your practice management software which shows fees by service code; that is, surgery, examinations, vaccinations, retail sales, and so on.
Profit and Loss Statement (or Income Statement): Type of financial report that reflects income and expenses for a specific period; that is, a month, a quarter, or a year.
Profit Center Report: Report that tracks income from related service codes (e.g., all dentistry codes) and expenses related to producing that income (doctor and tech time, dental supplies, dental equipment, etc.), arriving at the profit (or loss) for those practice areas.

ISSUES AND OPTIONS

WHAT PRACTICES OUGHT TO BE MONITORING

• In 7.2 – Financial Statements, there is a list of information that practice owners and leaders should review at least monthly.
• Reports that show figures for the current month as well as the same figure categories for each of the prior months (the comparable month last year plus each month since then) are very useful.
• Where possible, view expense categories both as actual numbers and as a percentage of gross fees. Most find it much easier to compare percentages than actual numbers. For example, if nonveterinarian salaries were 19.8% of gross fees a year ago but in the current month they are 21.6%, further investigation may be in order. Why have salary costs risen faster than fee income?
• Monitor income and expense by profit center by generating a monthly profit center report. This is the missing report for most practices – the report they never see, yet practices likely have all the information needed to generate it. The easiest way to do so is (1) export the monthly profit and loss statement from your in-house accounting software (such as QuickBooks) into Microsoft Excel, (2) enter the production totals by service code into a spreadsheet, and then (3) run a custom Excel macro that allocates the expenses among the profit centers. Once the spreadsheet is set up, entering the production data takes less than five minutes, and the profit center report can be produced in-house using only two keystrokes.

CHOOSING WHICH PROFIT CENTERS TO TRACK

• General companion-animal practices usually track these profit centers:
  ◦ anesthesia
  ◦ dentistry
  ◦ diagnostics
  ◦ diets and retail
  ◦ examinations
  ◦ hospitalization
  ◦ laboratory
  ◦ pharmacy
  ◦ surgery
  ◦ treatment.
• Additionally, if boarding and/or grooming are provided, those should each be added to the list.
• Specialty, food animal, and equine practices use some of the same profit centers, but add additional ones relating to their specialty.
• Additional profit centers can be added as well, depending on which services you wish to track separately.
• Be careful to select no more than 10–15 profit centers in total, or the allocation of expenses will likely become too complex and the report will become less meaningful.

WHAT COSTS TO INCLUDE (AND NOT TO INCLUDE) IN A PROFIT CENTER

Expenses to allocate against the relevant profit center include:
• Doctor and technician salaries, wages, benefits, payroll taxes, continuing education (CE), uniforms, and similar costs.
• Drugs and supplies used during the month.
• The cost of diets and retail items.
• Equipment costs related to those service codes (prorated over the life of the equipment).

Though not all consultants would agree, consider *not* allocating rent, utilities, and management expenses against profit centers. Instead, offset the combined net income from all the profit centers by these overhead expenses. By doing so, the net profit for the month will tie to net income on your profit and loss statement, a good cross-check to ensure that no revenue or expenses were overlooked. In the short run, you cannot have much impact on overhead costs, so tracking them by profit center does not add a lot of useful information to assist in day-to-day management. The notable exception is boarding. Because boarding can occupy a significant portion of a facility, we suggest making a separate calculation that subtracts a pro rata portion of the facility costs (based on square footage) from the profit shown for the boarding operations on the profit center report. Such a calculation is

especially useful in determining whether or not to expand boarding services.

TRACKING REVENUE INFORMATION IN YOUR PRACTICE MANAGEMENT SOFTWARE

- At the time your practice management software was set up, service codes were selected to capture detail about fees and product sales. As a result, no two practices have an identical setup even if they are using the same version of the same software. That fact, combined with the number of practice management software packages available today, means that there is no standardization of service codes nor report titles to select and get monthly production information.
- In addition, many practices report income in their general accounting system (like QuickBooks) on the cash method, meaning that income is reported when the client pays for the services. The cash, checks, and credit card charges that make up the daily deposits are not broken down by service code, so most practices using the cash method of accounting simply report the total as "fee income."
- On the other hand, production software is, by definition, designed to track income on an accrual basis, meaning that income is recorded at the time the services are performed, and accounts receivable balances by clients are tracked to report income that has been earned but not yet collected from the client.
- As a result, the income that is included in a profit center report must be taken from the production reports and will, therefore, be reported on the accrual method of accounting. Only by using reports from the production system will income data be broken down by service code.
- Combining revenue figures from the production system with expenses from the general accounting system will probably offend most accountants on a theoretical basis, since the method of accounting may well be different. However, this report is not suggested as a representation of generally accepted accounting principles. Rather, it is a very useful tool for veterinary practices to monitor internally how well their fees are actually covering their expenses. (Over time, the differences between the various methods of accounting will even out anyway.)
- Since revenue figures for the profit center report will come from the practice management system, first review the service codes and report formats to see if modifications are needed. You may need to add some categories, and you might choose to combine some others in your veterinary software. This process provides a good review of why you set up those categories in the first place – are they giving you the information you want?
- You need to be able to run a report that provides the monthly revenue in the same categories as the profit centers you have chosen to track. The production report can show *more* categories than your list of profit centers (since you can combine some as you produce the report), but it cannot have *fewer* categories (since you would have no way to accurately break down the total).

HOW TO ALLOCATE EXPENSES FROM YOUR GENERAL ACCOUNTING SYSTEM

Whereas the revenue figures come from your practice management system, the source of the expense data is your general accounting system. At the time that system was set up, either by you or by your accountant, a chart of accounts was established. For many practices, that chart has been based on the American Animal Hospital Association (AAHA) Chart of Accounts. Recently, a group of veterinary management associations has developed the AAHA/VMG Chart of Accounts (which is available free).[1] But even if you use a totally different classification system, you can still produce a profit center report based on your financial records.

ALLOCATING DRUG AND SUPPLY COSTS

- Almost all practices have an expense category called drugs and supplies or something similar. They may have additional subcategories as well, but the data to track these kinds of expenses is already available for your practice.
- What you do not know, and could not easily track, is exactly how these drugs and supplies are used. That is, in which profit center are the fees recorded so that you can allocate the related costs to the same profit center?
- This category becomes even more complicated depending on how you record purchases of drugs and supplies. Many practices record the purchase of these items directly into an expense account, whether or not the items are used in the same month. If such items are bought periodically (but not monthly), then the expenses for a particular month may be very high (because a purchase was made), whereas the same expense in the next month might be zero (because the practice is using up the items bought previously).
- In addition, many practices stock up on seasonal medications, purchasing a six-month supply of heartworm or flea preventatives in a single month. Payment on that purchase might be deferred for many months, so some practices would record the purchase at the time the order was placed, and others would only record it when the actual payment to the vendor was made months later.
- Many other practices track these purchases differently. Instead of recording the purchase in an expense account, they record it as an asset called inventory. Assets are not shown on the profit and loss statement, so the purchase of inventory does not reduce net profit. Instead, these practices make an adjustment at the end of the month to adjust the inventory account to the amount actually on hand (according to the practice management system or an actual count), thereby recording an expense for the amount used or sold during the month.
- Periodically, but at least once a year, they actually count the inventory to verify that the practice management system reports are accurate and make any necessary adjustments at that time. This method is a better matching of revenue and expense, since the drug and supply costs are expensed as the items are used or sold, not as they are purchased.
- Over the life of a practice, both methods get to the same place – the practice starts with no drugs or supplies and ends with none. But meanwhile, the monthly profit and loss statements will look quite different.
- Either method will work for the purposes of the profit center report, but if the first method is selected then the practice's bottom-line profit will vary much more from month to month than if the second method is used. Readers of the resulting profit center report should keep that in mind.
- Not only is the purchase complicated, but the allocation of these costs among profit centers can be made very complex – so complicated, in fact, that the profit center report could never be generated because there would never be enough real data. That defeats the purpose of creating the report in the first place.
- Therefore, under either method, estimates must be used to allocate the costs. Orthopedic plates and screws might logically belong only in the surgery profit center, and lab supplies logically relate to diagnostics. But classifying other items by profit center may not be so easy. In small practices, the person responsible for ordering has a good idea where the various items are actually used. If so, having this staff member suggest the cost allocations may be the best solution. In larger practices, the person ordering the items has less information as to how the items are actually used than the technicians or doctors. If so, a team approach to estimating usage may produce a better result. No matter how the estimate is determined, it can be adjusted periodically if better facts become available.
- Finally, adding additional expense categories in the general accounting system may increase the accuracy of the report. For example, recording purchase detail in various subcategories such as items for retail sale, hospital supplies, vaccines, anesthesia, and so on may produce more usable detail for the profit center report.

9.5. Profit Centers

ALLOCATING SALARIES, WAGES, BENEFITS, AND PAYROLL TAXES

• Most practices are astounded when they see their combined monthly totals for salaries, wages, benefits, and payroll taxes; yet this is precisely why it is critical to know that your fees by profit center are actually covering these costs.
• One of the recommendations in both standardized Charts of Accounts is that salary expense be broken down by staff category; that is, owner(s), associates, technicians/nurses, veterinary assistants, receptionists, kennel workers, and administrative staff, or some similar grouping.
• Payroll taxes and benefits should be broken down into the same groupings or subaccounts. CE, uniforms, and similar people-related costs should be included in the cost of benefits that goes into the profit center report.

The best way to determine a proper allocation of these costs is to ask all practice employees, including doctors, to record their time by profit center for a two-week period. Most people, of course, resist this, but the process is actually quite enlightening for everyone. To get the most accurate and useful results, follow these steps:
• Select a two-week period that is fairly "normal." That means excluding weeks with holidays, CE, and vacations, if possible.
• Hold a staff meeting in advance and explain the purpose of a profit center report. Discuss why it will be useful information for the practice.
• Explain that all people-related costs will be allocated in the report on the basis of estimated time spent on each profit center by each employee classification (doctor, technician/nurse, etc.)
• Acknowledge that no one is 100% productive every day. Suggest that employees include a category called "downtime" or "available" or "administration" into which they put time that is not related to one of the profit centers. "Administration" or "practice management" can actually be set up as a profit center, although it will always have costs but no direct revenue. If administration is not set up as a profit center, the time allocated to these categories will be placed into general overhead expense at the bottom of the report.
• Encourage accuracy for the two-week period. Knowing whether a technician spends an hour and a half or 30 minutes on a particular dental task makes a significant difference in the final allocations.
• Plan to report back to the staff on the results of the two-week survey. Not only does the survey generate the information for the profit center report, but it frequently uncovers inefficiencies in hospital procedures. Often, barriers to efficiencies or work being performed at the wrong staff level will be discovered and can be corrected almost overnight.

ALLOCATING EQUIPMENT COSTS

• Some practices have a bad habit of buying expensive equipment and then not getting the training to use it efficiently and effectively. In a perfect world, a practice would analyze the cost/benefit and determine how many procedures need to be performed over a given period of time for the equipment to pay for itself.
• In the absence of that pre-purchase analysis, the profit center report helps a practice match the actual equipment cost against the related revenue.

Two equipment issues are relevant:
• Which equipment should be allocated to the various profit centers and which equipment should be treated as part of general overhead?
• For equipment to be allocated to specific profit centers, what allocation method is appropriate?
  ◦ Most practices allocate only specialized equipment to profit centers, leaving the rest in general overhead. For example, ultrasound equipment might be allocated to the diagnostic profit center and an air abrasion system might be allocated to the dentistry profit center.
  ◦ The hospital's computer system, however, would likely not be allocated to any profit center; instead, its cost would remain in unclassified overhead expense.
  ◦ Determining the allocation of equipment costs is more difficult than deciding which equipment to track in which profit center. Practices tend to acquire equipment in one of two ways: purchase or lease. If the equipment is *purchased*, its cost is expensed over a number of years, with the method and life determined by current tax law. That expense is shown each year as "depreciation" on the practice's profit and loss statement. However, depreciation is computed at year-end by the practice's tax preparer, so those figures are frequently not available during the year as the monthly profit and loss statement is generated. If you ask, however, then your accountant can give you a report showing an estimate of the current year's expense.
  ◦ Another issue is that current tax law allows practices to write off the cost of certain equipment in the first year, rather than depreciating it over several years. That reduces income tax, but distorts net income from one year to the next.

Purchased Equipment

For purchased equipment, the easiest way to get the appropriate expense into the profit center report is as follows:
• Estimate the equipment's useful life – how long will it reasonably last and be productive? Some practices use a 10-year life for all equipment under the theory that, even if it still works 10 years from now, there will be a newer and more efficient model available then.
• Divide the cost, including sales tax and delivery/installation charges, by the useful life determined above.
• Record 1/12th of that amount as depreciation expense each month during the year. (Ask your accountant how to record this entry on your accounting system.)
• At year-end, your tax preparer will reverse these entries and substitute the actual tax depreciation amount prior to preparing your income tax return. However, for each month during the year, you will have recorded a reasonable estimate of the cost of that equipment for profit center purposes.

Leased Equipment

If the equipment has been *leased* rather than purchased (even if you will only pay $1 at the end of the lease to "buy" the equipment), you should ask your accountant how the lease should be recorded.
• Many practices simply record the monthly payment as "equipment lease expense," which is shown as an expense on the practice's profit and loss statement.
• Although the life of the lease is probably shorter than the life of the equipment (thereby artificially reducing net income during the term of the lease), most practices simply allocate the lease payment to the appropriate profit center or to general overhead.
• On the other hand, if your accountant suggests that you record the lease as a purchase, he or she will give you the appropriate entries to make to record the cost. You would then compute depreciation expense as already explained.

9.5. PROFIT CENTERS

MISCELLANEOUS

- For most practices, owners are being provided with operating data from several sources, but with no way to see the larger picture. A profit center analysis bridges the gap between the general accounting system and the veterinary practice management software.
- By combining data from each of these sources, owners can monitor which services are contributing to the bottom line and identify those areas where fees are not keeping up with expenses. As a result, these owners can make better business decisions and can react in a more timely way to changes in their practice's costs and service mix.

9.6. VALUE-ADDED ANALYSIS[1]

BASICS

OVERVIEW

• For discretionary expenses, consumers will pay fees that reflect the real or perceived value of the service. For commodities, the price is typically dictated by supply and demand. It is therefore in the best interests of veterinary practices to deliver value in the services they provide, so that clients will be prepared not only to pay for the costs incurred in offering the services, but also a premium based on the value added during the process.
• Value added is actually independent of cost, in contradistinction to a commodity. Consumers spend money on fads, sporting events, entertainment, and luxury items at rates far above cost recovery. They willingly pay a premium because they perceive a value in the purchase that far exceeds the costs involved.
• Companion pet healthcare involves the provision of veterinary services to animals whose worth to their owners far exceeds any monetary value of the animals themselves. Similarly, the care provided to those animals is a value-driven expense, and one not necessarily limited to the laws of supply and demand. Veterinary practices should concentrate on delivering value to pet owners and are entitled to fair compensation to reflect the value added. The value added in any transaction can be assessed with a value-added analysis.
• In creating service offerings for clients, a hospital builds on the value proposition that clients will directly benefit from such intervention in a win–win scenario.

TERMS DEFINED

Commodity: Product that is interchangeable with another product of the same type. The price is a function of supply and demand.
Economic Value Added: Monetary value of an entity at the end of a time period minus the monetary value of that same entity at the beginning of that time period; that is, after-tax earnings minus the opportunity cost of capital.
Value Added: The increase in real or perceived value of a product or service is the value to the client after intervention less the value before the intervention. For example, "value added" might reflect the difference between when an animal is ill versus its value when it has returned to health.
Value Proposition: The assurance that value will be delivered in an offering, and the customer's belief that value will be experienced.

ISSUES AND OPTIONS

VALUE CHAINS

Value chains represent all opportunities for adding value: from first identifying the client's need until postservice care. At any point along the chain, value can be added from a variety of stakeholders, including staff, pharmaceutical companies, laboratories, specialty hospitals, veterinary associations, and marketing efforts. By looking at the different access points along the value chain, it is possible to imagine all the different places at which we and our stakeholders can add value to the proposition. The chain just constitutes a visual representation of the situation so that solutions can be more easily recognized (Figure 9-6-1).

VALUE RARELY DEPENDS ON GADGETRY

• Operating a veterinary hospital is an expensive undertaking, but value added is mostly independent of cost. Clients expect that veterinarians will advise them of the best care for their animals; they rarely want to get involved in the particulars of how this is best accomplished. For example, clients have little interest in selecting the type of suture material that will be used in a procedure. They rely on the expertise of the veterinarian that an appropriate product will be selected, and that the fee they are quoted reflects the use of appropriate materials. Similarly, they expect that their veterinarian will spare their pet pain in the process. Most clients are appalled when pain management is offered as a fee-based option, wondering if the veterinarian would otherwise allow their pet to suffer if they elected not to pay for pain medication.
• Clients are not interested in paying for equipment; they pay for the care given to their pets. There is a tendency for veterinarians to acquire equipment with the notion of creating additional profit centers, but this does not always make sense from a value-added perspective. There are typically many cheaper and less labor-intensive ways of delivering value to clients and having them willingly pay for the service.
• For example, some large pharmacies use a pharmaceutical dispensing machine that will count and dispense medications with fewer errors than pharmacy technicians do. However, the cost of the machines would add significantly to the cost of clinic prescriptions. Would clients pay a premium to have their medications dispensed by a machine? The likelihood is that they would not; clients pay for value, not equipment.
• It is also important to realize that value is interpreted by the individual, and there may be many different components to their assessment of value. For example, in addition to quality of care, which is a basic assumption in most peoples' minds, value can also be functional (saves time, reduces risk, reduces effort), emotional (reduces anxiety, provides wellness or therapeutic value), or can be life-changing (provides hope, specialized care, end-of-life care). All provide value to clients, but not necessarily in equal measure.

THE VALUE-ADDED ANALYSIS

To correctly perform a value-added analysis, it is necessary to think like a consumer, not necessarily a healthcare professional. The analysis is performed by evaluating any hospital process and breaking down the processes into the following three activities:
• client value-adding activities (CVAs) – those activities that provide value to clients;
• medical value-adding activities (MVAs) – those activities that are medically necessary from a medical or hospital perspective;
• nonvalue-adding activities (NVAs) – those activities that are neither medically necessary nor perceived as adding value from the perspective of the client.

The goal of such an exercise is to maintain or enhance the CVAs, minimize the MVAs to those that are truly necessary, and try to eliminate the NVAs as much as possible. The analysis may suggest changes that both cut costs and increase value, for which clients may be prepared to pay a premium. At a minimum, there should be increased profit by decreasing unnecessary costs.

CALCULATIONS

There are many complicated methods of calculating the economic value added (EVA) in a procedure, some of this involving complex calculus. However, incorporating the cost of capital into a return on investment (ROI) calculation is at the heart of EVA. For example, if a $40,000 investment led to a return of $8,000 in benefits after all costs were deducted, then the ROI would be calculated as

$$\text{ROI} = \frac{\$8{,}000}{\$40{,}000} \times 100 = 20\%$$

[1] Some material was reproduced with permission from Ackerman, L.J. *Business Basics for Veterinarians*. ASJA Press, New York, NY, 2002.

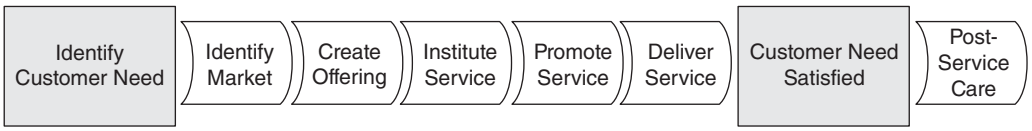

Figure 9-6-1.

A veterinary value chain. *Source:* Ackerman, L.J. *Management Basics for Veterinarians*, ASJA Press, New York, NY, 2002. Reprinted with permission.

The EVA requires including the cost of capital. If that rate is 10% in our hypothetical example, and the net operating profit after taxes (NOPAT) is the same $8,000, the EVA can be calculated as

$$\begin{aligned}\text{EVA} &= \text{NOPAT} - (\text{Capital} \times \text{Cost of Capital}) \\ &= \$8{,}000 - (\$40{,}000 \times 10\%) \\ &= \$4{,}000\end{aligned}$$

Now, ROI = ($4,000/$40,000) × 100 = 10%.

EXAMPLES

ABC Veterinary Hospital had their management consultant perform a value-added analysis on a procedure that has remained relatively unchanged for years, and one that has only been marginally profitable at best: the canine ovariohysterectomy. The analysis revealed some facets of the procedure that could be altered to be more profitable and provide additional value for clients. There were also nonvalue-added components that could be removed, saving money without compromising the value to clients.

ABC Veterinary Hospital routinely admitted animals for ovariohysterectomy and charged a comparable amount to other veterinary hospitals in the area, but significantly less than for other abdominal surgeries. They had previously considered several options for this procedure, including charging a premium to accomplish the procedure with high-energy surgical modalities. In a survey that was done, clients valued several aspects of the existing procedure: that the pet be spared as much pain as possible, that it not be a bad experience for the pet, and that the pet be returned to the owners as soon as possible. Several owners who completed the survey actually wanted to be with their pet until the last possible moment, and to be there when it was waking up, and then take it home as soon as possible.

The consultant sought to maximize the client value-added activities, keep the medical value-added activities to those required for the procedure, and eliminate as many nonvalue-added activities as possible. The most evident nonvalue-added activity seemed to be the overnight hospitalization that was recommended to pet owners for the pet's safety. However, it was apparent that there was no staff present overnight to monitor the pets postsurgically, so it was questionable how much value was added. In fact, if owners realized that their pets were left alone in a cage all night following surgery, it would have a potentially very negative impact on the value being delivered. Regarding medical value-added activities, clients did not really care if the veterinarian selected isoflurane over sevoflurane, staples over sutures, or laser over radiosurgery or scalpel, as long as the outcome for the pet was similar. The doctors in the hospital decided on a protocol that was both safe and economical. Preemptive analgesic regimens were instituted, and pain management was continued intraoperatively and postsurgically.

To augment the client value-added activities for owners, several changes were instituted. Owners were allowed to either drop off their pets early in the morning at the surgery, or stay with their animals until they were admitted for surgery. For those owners who elected to stay, they were allowed to remain with their pets until it was time for the pet to be "prepped" for surgery. Because the alternative would have been for the pet to be placed in a cage, this was a good compromise for both parties. Following the procedure, an attendant whose job it was to keep the pet quiet and comfortable would personally "recover" the pet once it was awake enough to safely return it to the owner in a multipurpose room. The attendant would then check on the pet and owner every 5–15 minutes. Later in the day, the pet was discharged as a day-surgery patient. A waiver had been prepared and the owner agreed to monitor the pet closely at home over the next 24 hours, and to go immediately to the emergency clinic if there were any problems.

The change in protocols actually saved the hospital money, especially in terms of hospitalization, and the clients who selected the service happily paid a significant premium for the day surgery and personal recovery (see 9.3 –Standards of Care and Care Pathways).

CAUTIONS

Value is a personal interpretation, and value analysis is different in each practice and each region of the country. What clients consider value added in one practice may not be value adding in another.

MISCELLANEOUS

The veterinary community is slow to welcome change, but there are those outside the industry who are always seeking to provide value to pet owners that veterinarians fail to recognize, and to profit from that advantage. Pharmacies that provide medications to pet owners at significantly lower cost than veterinary hospitals are only the latest to reflect CVAs for pet owners that have been largely ignored by the veterinary profession. In this instance, retailers were quick to seize an opportunity in which some veterinary hospitals were providing commodities at premium prices, without being able to differentiate their products and prices from those made available by others.

9.7. CONTINUOUS QUALITY IMPROVEMENT

BASICS

OVERVIEW

• Continuous quality improvement (CQI) is a management approach used to enhance quality.
• The management approach is applied to processes within a hospital.
• It involves teamwork to develop and to improve the systems and processes.
• "Continuous" implies that it is a never-ending process.
• Application of CQI results in incremental improvements in quality. CQI is about making changes. It is not about settling for the status quo.
• CQI is applied to problematic processes to improve upon them. It is also applied to processes that appear to be functioning adequately.
• The goal of CQI is to improve processes for both internal stakeholders (employees) and external stakeholders (clients and patients).
• CQI implementation assists hospitals with meeting and exceeding client expectations.
• The end result of CQI is improved quality of patient care.

TERMS DEFINED

Continuous Quality Improvement (CQI): Method of continuously examining processes and making changes to them to make them more efficient and effective. It is a team approach to improving quality.

ISSUES AND OPTIONS

• CQI was first introduced and applied to businesses outside of healthcare.
• CQI requires an understanding of the processes and the systems that result in poor quality.
• It also requires an understanding of the processes and systems that do not appear to contribute to poor quality but that can be improved through the application of CQI.
• It does not put blame on an individual for poor quality.
• CQI identifies a poorly designed process or system as the cause of poor quality, and/or it identifies a process or system that can be improved to further enhance quality.
• CQI can be applied to any process within a hospital (medical, surgical, administrative, etc.)
• The definition of quality varies depending upon the stakeholder involved – the veterinarian, the hospital manager, the client.
• Veterinarians are more likely to define quality in terms of clinical quality. Examples: disease management, medical errors, surgical errors, and cure rates.
• Hospital managers may define quality in terms of administrative outcomes. Examples: employee turnover and financial results.
• Clients are more likely to associate quality with quality services. Examples: waiting times and communication.
• A hospital's quality improvement efforts should consider the definition of quality from the perspective of all the stakeholders involved.

BENEFITS

• Today, veterinarians are more aware of how important service quality is to their clients. CQI principles can be applied to processes to improve service quality and, ultimately, client satisfaction. Clients who perceive a quality service are more likely to remain loyal to the practice and are more likely to make referrals.
• CQI can be applied to processes to decrease costs and thereby improve profitability.
• Medical errors, surgical errors, patient record errors, lab errors, and administrative errors can be reduced by applying the principles of CQI to the processes resulting in the errors.
• Competitive advantages can be gained by a veterinary practice that implements a quality improvement program. Practices that track and measure data pertinent to quality are able to demonstrate to clients and potential clients their ability to provide quality care. This information can be used to market a practice and distinguish a practice from competitors.

CQI IMPROVEMENT MODELS

There are many models used to organize a quality improvement project. The FOCUS–PDSA model will be discussed here.
• FOCUS is an acronym for:
  ◦ Find a process to improve
  ◦ Organize a team for the improvement project
  ◦ Clarify the problem and current knowledge of the process
  ◦ Understand process variations
  ◦ Select improvements.
• PDSA is an acronym for
  ◦ Plan
  ◦ Do
  ◦ Study
  ◦ Act.
• The PDSA portion of the model is a repetitive cycle.

EXAMPLES

CONTINUOUS QUALITY IMPROVEMENT USING A FOCUS–PDSA MODEL

FOCUS

1. Find a process to improve.

• Continuous quality improvement begins by identifying a process that can benefit from improvement. Focus on problematic processes first. Quality improvement involves a commitment to continuous improvements, allowing for other nonproblematic process improvements to be addressed and enhanced in the future.
• Brainstorm with staff to help identify processes that can be targeted for improvement:
  ◦ Is there a trend in client complaints?
  ◦ Do the financial statements indicate any problem areas?
• Identify areas that do not add value from the employee's perspective – time spent looking for technician assistance, finding lost files, and deciphering doctor's handwriting, for example.
• Survey your clients to determine areas for improvement.
• Identify areas that do not add value from the client's perspective – waiting on hold on the telephone, waiting for lab test results, or not understanding the medical jargon used by the doctor.
• Other examples:
  ◦ Clinical quality. Higher than normal postsurgical complication rates; for example, doctors providing treatment for animals that do not have an accurate diagnosis, inaccurate diagnoses resulting in readmissions, or vaccine protocols involving unnecessary use of vaccines in pets.
  ◦ Administrative/management quality. High employee turnover, declining doctor productivity.
  ◦ Service quality. Increasing numbers of client complaints involving higher than average waiting times, or communication problems.
• Evaluate the list of potential improvement projects by:
  ◦ Benefits anticipated.
  ◦ Cost to improve.
  ◦ Resources to improve them.
  ◦ Start with a small project that can be easily addressed. For the purposes of this example, we will assume the problem to be a 25%

9.7. CONTINUOUS QUALITY IMPROVEMENT

Receptionist books appointment ⇨ receptionist admits patient ⇨ pre-anesthetic examination ⇨ anesthesia ⇨ surgery ⇨ recovery ⇨ patient discharge

Figure 9-7-1.

Flow chart of the process related to increased surgical complications associated with routine spays and neuters.

increase in surgical complications following routine spays and neuters.
2. Organize the team.
• The project team should consist of employees who are knowledgeable about the process and/or will be affected by improvements in the process.
• Ideally, the team would be made up of a mixture of veterinarians, technicians, front-line support staff, and management.
3. Clarify the problem.
• Clarify current knowledge.
  ◦ The team should develop a list of possible reasons for increased surgical complications, such as:
    ▪ preexisting health problem
    ▪ pet's age
    ▪ lack of communication at discharge
    ▪ sterilization unit
    ▪ surgical technique.
• Conduct more research.
  ◦ A search of the literature may lead the team to more possible causes of surgical complications. For example, a literature search may discover surgical site preparation processes that reduce complications or may reveal a particular suture material that is associated with increased complications.
4. Understand variations and analyze the data.
Develop a flowchart of the process from beginning to end. The team can then evaluate the process in detail and identify problem areas.
• For example, a simplified flowchart of the process related to increased surgical complications associated with routine spays and neuters is shown in Figure 9-7-1.
• Analyze the cases that resulted in surgical complications and develop a list that identifies where problems related to surgical complications are occurring at the various stages of the process:
  ◦ surgical preparation techniques are out of date;
  ◦ older animals and obese females who appear to be at greater risk are being discharged with the same communication information as younger animals.
5. Select improvements.
• The surgical preparation process needs to be changed.
• The discharge communication and follow-up with animals that are older and/or obese needs to be changed.

PDSA cycle

The PDSA cycle is a method to test a change to a process that has been targeted for continual quality improvement.
1. Plan.
• The objectives of the test should be stated; for example, "To determine if changing the surgical preparation process and the discharge communication will decrease the number of surgical complications."
• The plan should answer who, what, when, where, and how the test will take place:
  ◦ Determine who will be responsible for developing written communication regarding the new surgical preparation process and the discharge communication. Determine a timeline.
  ◦ Determine who will be responsible for educating staff on the topics. Determine a timeline.
  ◦ Determine who will be responsible for implementing the surgical preparation process and the client discharge communication.
• Determine what data will be collected; that is, the number of surgical complications from the start date of implementation of the test.
2. Do.
• The plan is executed by the team.
• If possible, the plan is executed by the team on a small scale before it is implemented throughout the hospital.
• Document any problems with the change.
3. Study.
• The team measures the results of implementing their plans over a period of time to determine whether or not the plan is successful. Did the number of surgical complications decrease?
• Evaluate the problems that arose because of the changes.
4. Act.
• Given the problems that arose and the results of the test, determine what modifications, if any, are needed to the process.
• Begin the cycle over, starting with the preparation of a plan.

CAUTIONS

9.8. Digital Imaging Systems in Practice

BASICS

OVERVIEW

- Purchases of diagnostic imaging equipment constitute one of the largest capital outlays in many veterinary practices. This may include radiography systems and ultrasound equipment.
- New imaging equipment can increase quality of patient care while increasing ease of image storage and communication.
- Diagnostic images in veterinary practice are moving more and more away from analog (traditional) format and into digital format.
- All new imaging systems are capable of capturing digital images. One must ensure the capability of the system to store, transmit, and allow communications between equipment.
- A practice will need to develop and implement infrastructure to manage and maintain these digital imaging systems.

TERMS DEFINED

Charge-Coupled Device (CCD): Similar in function to a digital camera; light is detected and focused with lenses onto a computer chip, which generates the digital image.

Computed Radiography (CR): Similar in function to traditional film screen radiography; the image is captured on photostimulable storage phosphor and read by a separate machine to produce the digital image.

Digital Imaging: Any imaging that captures image data in a digital format, for storage, manipulation, viewing, and distribution. All imaging modalities are capable of producing digital images, either inherently or through analog-to-digital converters built into their hardware.

Digital Imaging and Communications in Medicine (DICOM): Image standard that allows communication between image capture devices, viewing software, storage, and print devices.

Digital Imaging Viewing Software: Image interpretation software that allows for viewing, manipulation and comparison of digital images. This will integrate with, and may be built into, a picture archiving and communications system (PACS).

Digital Radiography (DR): A term often used to encompass all methods of digital radiograph image capture. When used in this manner, it may include CR, CCD systems, and image capture with digital panel systems. DR is also used to refer more specifically to the latter of these (CCD and digital panel systems).

Picture Archiving and Communications System (PACS): A system that stores, distributes, and may be involved in viewing of digital images.

Radiology Information System (RIS): System that integrates hospital management software with PACS and viewing software.

ISSUES AND OPTIONS

Three distinct radiographic image capture modalities produce digital images. These include CR, CCD DR, and panel DR imaging systems (Table 9-8-1).

- CR systems are most similar to traditional film-screen radiography:
  - Images are captured on plates that are the same size as traditional radiography cassettes. This allows easy integration with current radiography tables. Also, imaging plates can be distributed and shared among multiple radiography tubes/tables.
  - Similar to film-screen radiography, a latent image is stored on the imaging plate (photostimulable phosphor).
  - This must be processed in an image-processing machine to generate the digital image. This machine also erases the plate and prepares it to capture the next image. This process takes between 45 and 120 seconds.
  - Cheapest of the digital systems: $10,000 to $40,000 (2017).
  - This is the only system that requires the intermediate, manual, processing step.
- CCD DR systems are similar in function to a digital camera.
  - When exposed to x-rays, a scintillator built below the table generates light, which is focused with lenses or fiber optics onto a CCD silicon chip. The light is captured and a digital image is produced.
  - Cost and size of CCDs have been the limiting factor for image quality, though improvements to both have increased image quality to a level and price point that is acceptable for general practice.
  - Mid-range cost is $30,000 to $850,000 with table, tube, and generator (2017).
  - Because of the lenses and optics involved, these systems are often sold as a package with radiographic tables, tubes, and generators. They are difficult to impossible to retrofit into an older table.
  - Image quality depends on CCD and lens quality, as well as the image capture and processing software. There is more variability in image quality between CCD systems than may be present between panel DR systems.
- Panel DR systems:
  - When exposed to x-rays, a scintillator in the panel generates light that is captured, or the panel directly detects x-ray energy, and a digital image is produced.
  - Highest initial start-up costs are $65,000 to $110,000 (2017).
  - Image quality is high, and it continues to improve.
  - Can often be retrofitted to existing table, tube, and generator.
- Ultrasound continues to become more and more prevalent in veterinary practices.
  - Systems range widely in quality, function, and price.
  - Typical new systems range from $25,000 to $100,000 (2017), depending upon the number of transducers and functions of the machine.
  - Refurbished and used systems can be obtained from $5,000 to $25,000 (2017).
  - A basic system should include two transducers, color flow Doppler capabilities, and have software for abdominal and cardiac imaging.
  - Imaging short courses are available (admission is often included in machine purchases) for basic training.
  - Imaging common disease entities (effusions, masses, bladder pathology, etc.) can improve patient care and add value to the practice.
- PACSs are the backbone of image storage, distribution, viewing, and manipulation.
  - PACSs range from free software on a desktop computer to server racks with duplicative storage and backup, to cloud computing solutions with offsite image storage.
  - The main functions are to store images for medical records, retrieve images from storage, receive and distribute images from image capture devices.
  - Additional functions, which can be achieved with independent software, include image viewing and manipulation for diagnosis (typically on a workstation dedicated to this function).
  - The complexity of the PACS should reflect the practice needs. A single-doctor practice with one radiography system may only require a simple PACS, which may be maintained by the practitioner or a staff member. Conversely, a 10-doctor practice with multiple exam rooms (viewing stations), multiple imaging modalities (DR, ultrasound) may require a robust system that integrates with current practice management software. This system may require onsite or offsite technology support.
  - PACSs and their component modalities communicate via an image standard known as DICOM. This standard integrates hospital data,

Table 9-8-1. Comparison of CR, CCD, and panel DR.

	CR	*CCD*	*Panel DR*
Ease of integration with current radiography table and generator	Easy	Difficult to impossible to retrofit table	Moderate
Cost	$	$$	$$$
Speed	Similar to film-screen (1–2 minutes per image)	1–2 seconds to image	1–2 seconds to image
Flexibility (use with multiple tubes, horizontal beam, etc.)	+++ Same as traditional	–	+

patient data, and image data into a standard format that allows communications between equipment and viewing software. Not all machines are DICOM compliant. DICOM conformance statements are available from vendors of equipment and should be evaluated closely prior to purchase.
  - PACSs may integrate with practice management software through an RIS. This may allow for scheduling, and basic image storage and viewing within practice management software.
- Advantages of DR over film-screen radiology include:
  - Speed. Decreased technician time, particularly evident with retake images.
  - Equipment. No need to maintain film processor/darkroom.
  - Film storage. Eliminates physical storage needs. Cost of digital storage is minimal.
  - Film retrieval. No loss of films; no need to mail films or send out to referral practices.
  - Consultation. Eliminates obstruction (mailing, delay, etc.) in obtaining imaging consult from specialists.
  - Image manipulation. Images can be magnified, contrast can be adjusted, and processing algorithms may be applied to increase lesion conspicuity and diagnostic yield.
- Disadvantages of DR:
  - Cost. Potentially high start-up costs compared with film-screen; high cost to convert in established practices. High cost of maintenance and service.
  - Infrastructure. May need significant upgrades to workstations, networks, and current radiography equipment, as well as information technology (IT) support staff.

N/A

CAUTIONS

There are a number of "hidden" costs that practitioners often fail to account for, and vendors are reluctant to divulge, when purchasing imaging equipment.

COSTS OF IT SUPPORT

Often, an in-house or remote IT support group is necessary if managing a large network. If a large network, and support infrastructure already exists in the practice (for hospital software and hardware), increased costs may be minimal.

COST OF REPAIR AND MAINTENANCE

Annual preventive maintenance and repair costs may be significant. It is not uncommon for a minimum charge for a service call of $500 (2017). In remote areas, practices may need to cover travel expenses. Service contracts may cover these costs.

COSTS OF SERVICE CONTRACTS

Cost of repair on equipment requires special expertise, and often vendor-specific parts. These costs mount quickly if equipment is not covered under service contract. As such, most facilities carry service contracts, either through vendors or independent contractors, once manufacturer warranties expire. These may cost $2,500 to $15,000 per year (2017), depending upon the equipment.

Making the decision to go forward with capital expenditures of this magnitude can be intimidating. A number of resources are available to aid in the decision-making process:
- Seek reputable equipment and sales team. Ask for a list of practices that use the system, and then ask other practitioners if they are happy with their systems.
- Seek equipment that can be repaired and maintained in your area. Ask for the name of the service provider and speak with them.
- Many veterinary radiologists offer a consultation service when purchasing equipment. Often, they are familiar with many brands and have seen the quality of images produced. Additionally, they may be familiar with terms of a sales contract that can otherwise seem confusing. Local radiologists can be found on the American College of Veterinary Radiology website at www.acvr.org.

9.9. LABORATORY CONSIDERATIONS

BASICS

OVERVIEW

It is commonplace today for veterinary clinics to provide in-house laboratory testing. The extent of this testing varies as new and advanced equipment and tests periodically become available. In veterinary hospitals that make full use of these laboratory testing skills, the healthcare team will perform complete blood counts, differential counts, and morphologic examinations of blood. They perform urinalysis, including examination of urine sediment, and fecal analysis for evidence of parasites. Additionally, veterinary teams are trained in the use of enzyme-linked immunosorbent assay test kits, dextrometers, refractometers, and dry chemistry analyzers. Also performed in hospitals are common cytologic preparations, such as ear swabs and vaginal smears.

Hospitals that have the capability will oftentimes run everything in-house. Other hospitals find they use their laboratory primarily for emergency/critical care purposes. Essentially, all clinics find it necessary to utilize a blend of both their in-house laboratory and a reference laboratory to meet the needs of their clients.

The decision for a veterinary practice regarding which tests should be run in hospital and what is the appropriate mix of in-hospital versus reference laboratory is dependent on a variety of factors. Once these factors are understood and researched it becomes easier to make an appropriate decision on the mix. The decision should be made by the veterinary team as a whole and should be based upon practice philosophy, culture, practice setup and size, skill set of the team, and the results of researching the issue.

TERMS DEFINED

In-House Laboratory Services: All laboratory testing that can be readily completed at the hospital by the hospital team: chemistry profiles, complete blood cell counts, urinalysis, intestinal parasite testing, cytology, in-house testing kits, and so on.

Integrated Diagnostic Systems: Diagnostic tests that are linked to practice software; often entering the diagnostic code will both order the test (in-house or outside) and input the charge for the test. Results typically are downloaded into the medical record and manual entry is not required.

Real-Time Laboratory Testing: Laboratory testing performed at the hospital (in-house), by the hospital team, for immediate results.

Veterinary Reference Laboratory: A laboratory that performs comprehensive diagnostic testing for veterinary medicine.

Workflow Dynamics: How the flow of work is organized to occur at the business place/hospital. This may or may not be the most efficient; the status quo is often evaluated to come up with a process that might lead to better efficiencies or better customer service.

ISSUES AND OPTIONS

Deciding the correct mix of laboratory services for a particular practice involves the veterinary team. Careful and detailed consideration should be given to the following advantages and disadvantages.

IN-HOUSE LABORATORY SERVICES

Advantages

Significant advantages to in-clinic testing exist. One advantage is rapid turnaround time, consequently improving client satisfaction by eliminating the need to delay treatment or surgery until results are received from a reference laboratory.

Additional advantages include the following:

- potentially lessening preanalytical errors associated with the transportation of samples;
- providing an additional source of revenue for the clinic;
- increased integration of biochemical profiles into presurgical screens, geriatric screens, and routine health maintenance examinations;
- improved team morale, as they utilize their skills for which they were educated and trained to do.

Disadvantages

Disadvantages associated with in-hospital testing include the costs necessary to purchase the laboratory equipment and subsequently maintain adequate stock of reagents, the need to perform quality control (QC) testing, and the need for additional staff time to properly perform assays in the laboratory.

QUESTIONS TO CONSIDER

Accuracy

A majority of clinics rely on in-house testing for critical care/sick pet visits because they need quick answers. But are these results as accurate as they would be if they were sent to the reference laboratory? How do they compare? Can you expect an in-house laboratory station to get as good results as those performed by a reference laboratory? Does the QC of an in-house laboratory compare with that of a reference laboratory?

- There is not much dispute that blood chemistry results run in-house or at the outside laboratory yield comparable results. In-house, however, may have limitations on the scope of available tests and panels.
- Hemogram results from the reference laboratories likely yield more reliable results on a consistent basis.
- Regarding results for fecal and urine samples, preparation, handling, and experience of the reader have a big impact on the final result.
- The reference laboratory provides a degree of QC on these samples; in-house, this is more likely to be variable and also would be expected to vary depending on how reliably the equipment is calibrated.
- Overall biggest areas of discrepancy/reader error are hematology and tests that require use of the microscope.

Efficiency

Veterinary hospitals have to consider the issue of efficiency and any potential impact this will have on customer service. The question to consider is how performing laboratory services in-house impacts your clinic's efficiency versus sending out your samples to a reference laboratory.

The Argument for Sending to a Veterinary Reference Laboratory

Many clinics see the value (timewise) of sending out routine wellness tests: blood, urine, and stool. If the patient does not have a pressing medical concern, does it not make sense to send testing that is not time sensitive to a reference laboratory?

- The results from these tests are not crucial and not time sensitive, so sending them to the reference laboratory saves valuable staff time.
- Clinics that prefer using a veterinary reference laboratory believe it is efficient, and a good use of team and client time.

The Argument for In-House Testing

Based on the previous discussion and the touting of efficiency, why is there a growing body of practices that prefer real-time testing and immediate results? Although the majority of clinics outsource routine laboratory work, there is a small but growing percentage of clinics that prefer processing results immediately with clients present. These practices see major advantages to this:

- They find it efficient to run almost all laboratory work in-house because they can provide the client results right away, explain the results, and educate clients as needed.

• They feel there is much value in this approach, as the client can readily discuss results and better understand the purpose of the tests performed.
• When results are available right away the doctor does not need to reconnect with the owner to discuss them and does not need to leave messages the client may not understand or may misinterpret.
• For preanesthetic laboratory testing, the pet can be admitted and the laboratory work performed prior to anesthesia. This is convenient for the client and provides current results for the clinician.
• When practices have invested heavily on in-house laboratory equipment, they can only achieve cost efficiency by running as many samples as possible through that equipment.
• Advances in technology are making the real-time approach more feasible and realistic for many clinics. The new analyzers often use minimal amounts of blood, require minimal preparation, have faster turnaround time (5–10 minutes), and have the potential to run multiple samples at one time.
• Practices that fully embrace this approach may have all samples collected from pets before the doctor sees the pet, and results are ready before the pet leaves.
• Clinics that focus on workflow dynamics prefer the efficiency of this system; if a problem is detected, medication or treatment can be provided at the time, rather than inconveniencing the client to return and potentially letting a problem linger.
• It is also often much easier for the team or doctor to educate clients when they are there and can see the actual results.
• Another benefit and time saver is that if laboratory testing and reports occur on a real-time basis, then there are not inefficiencies associated with reviewing accumulated patient laboratory work, remembering the specifics of each case, and then telephoning the clients to discuss the results.

EXAMPLES

N/A

CAUTIONS

N/A

MISCELLANEOUS

BEST MIX FOR YOUR HOSPITAL

Many factors influence the proper mix of in-house and outside laboratory services for a practice.
• Many clinics believe sending out all laboratory tests except critical care cases makes sense, as this approach keeps the client flow running smoothly and allows the team to focus on the client rather than running tests. Furthermore, it is cost effective for the clinic and client, allows for expanded testing, and is very accurate. Laboratory results are typically downloaded directly into the client's medical record, if the system is fully integrated.

In contrast, clinics that prefer running testing in-house, likely charge a little more for what they consider a premium service.
• They feel that having results at the time of the clinic visit provides excellent service to clients and allows for prompt treatment of problems and saves the clinic time by not relegating additional work (file review, client call back) to the next day.
• Also, most in-house blood analyzers now integrate/download results right into practice management software, another time saver versus manually entering results.

The mix a practice ultimately chooses is influenced partially by practice philosophy that is based on *cost*, *accuracy*, and areas of *efficiency*, which they feel will work best for their clinic.
• Practices do change the mix occasionally as well; a clinic that upgrades equipment may be excited to switch to real-time results.
• The size of a clinic often influences what works best for the flow of that hospital: A multidoctor practice that is trying to improve workflow dynamics may find it easier to have results done in-house so that the next day if different doctors are at the hospital they do not need to interpret results on cases they did not see.

What is found is that the majority of veterinary hospitals tend to be hybrids. Some may send noncritical blood samples to the reference laboratory, while running fecal and urine samples in the clinic. Others send the majority of this work to the reference laboratory, but they may run preanesthetic blood work in-house the morning of the procedure. Other hospitals may hire a consultant to analyze their workflow to help determine the best approach for their clinic. There is not necessarily a right or wrong mix; a lot of the decision-making may be based on your particular team and practice philosophy.

9.10. MEDICAL EQUIPMENT AND FIXTURES

BASICS

OVERVIEW

- Equipping a veterinary facility is influenced by the type, style, financial limits, and location of the practice.
- Prior to deciding on which equipment to purchase, a list needs to be generated outlining what you could expect to find in each area of a practice (i.e., exam room, surgery, front office).
- From this list, add equipment that could make the practice more efficient or improve the quality of medicine provided, or could enhance a particular skill you have acquired.
  - Prioritize the equipment into (a) absolutely essential, (b) need to improve the level of care or efficiency, (c) if money is available you can consider, and (d) wish-list items.
- Do a financial assessment of whether it will be better to purchase or lease new or used equipment (see 8.18 – Practice Reinvestment and 8.20 – Buying versus Leasing).
- Develop a logical plan based on the pro-forma budget, practice needs, and actual cash flows of when additional equipment will be considered for acquisition.
  - Most banks look at the three Cs:
    - Cash flow of the projected purchase.
    - Credit history of the business and/or the owners. Even though the business is the one borrowing the money, they will typically ask for the owners to guarantee (co-sign) the loan.
    - Collateral. Is the collateral worth the value and risk?
  - Professional presentation to the bank is essential.
    - If you are expecting a bank or any lending institution to loan you money, look professional. Come prepared with documentation, tax returns, equipment information, and dress appropriately (you are professional … a doctor).
    - Be honest with them. Bankers are approached by everyone for every type of purchase. They need to know you did your homework and that you are not trying to hide anything. Do not get caught up in a lie; bankers hold the purse strings for a lot of your future business needs.
- What does your financial picture look like?
  - Banks will typically look at your debt load and would prefer for it to be less than 35% of your gross income.
  - A lending institution may ask for at least a 20% down payment on your part. This puts some of your monies at risk in the acquisition, thus making it less risky for them.
  - If you have a home mortgage, a bank looks at the total of principal, interest payment, taxes, and insurance, and would like it below 28% of your income.
  - Plan on having a personal financial statement prepared along with your other documents for the lender.
  - Be prepared when visiting with a lender. You can only make a first impression once.
- Research leases for some equipment needs.
  - Leases are better for items of equipment that utilize high technologies and become outdated in several years (e.g., ultrasound).
  - Leases can be very expensive, even though the payment is completely deductible.
  - Seek advice from your accounting professional and/or attorney before signing any lease.
- Researching different equipment is essential. Exploring the exhibit hall at a national or regional conference is a great way to compare equipment and ask questions of the vendors.
- Develop strong relationships with trusted advisors:
  - a banker
  - an accountant familiar with veterinary medicine
  - a practice consultant
  - an attorney
  - drug or distributor representatives
  - insurance agent
  - building contractor.
- Each year a new budget needs to be developed.
  - Each department needs to submit their budget with requests for updating equipment or new purchases.
- Practices need to plan on reinvesting in their business. To accomplish this, approximately 1% of the gross revenues should be earmarked for replacing or acquiring new technology equipment yearly.
  - These monies can be placed in an interest-bearing account; for example, a money market account.
  - The funds may not be completely used in the year they were placed there, yet they will be available for future needs plus earning interest for you.

TERMS DEFINED

Capital Budgeting: Involves the analysis of all the financial plans associated with the acquisition of all capital assets for a business.
Debt Service Coverage Ratio: A capital structure ratio that measures the ability to pay both the principal and interest with available net cash flow (NCF).
Leasing: Method of acquiring equipment without using large amounts of cash to purchase, thus freeing up dollars for the practice.
Net Cash Flow (NCF): Reflects revenue less expenses plus noncash expenditures (e.g., depreciation and amortization expenses).
Present Value: Today's value for a series of NCFs over a period of time. The principle is to aid in determining if purchasing the equipment will give you a positive cash flow for the investment. This topic is covered more thoroughly in 8.18 – Practice Reinvestment.
Pro-Forma Budget: Budget that charts a course of future action for the practice by outlining and defining the plans of the practice in financial terms.

ISSUES AND OPTIONS

BUDGETING

Generalist

- A generalist (primary-care) type of practice may not require the expense of the high-technology equipment that a specialty practice will likely need. An example would be a wellness clinic where the services are limited to maintaining or improving the wellbeing of patients. A limited amount of equipment is required.
- Equipment and fixtures will be one of the largest budgeted items in a pro-forma budget, especially for a start-up practice.
- A general budgetary figure for a typical companion-animal start-up practice can be from $75,000 to $125,000.
- Develop your list of equipment and fixtures by visiting practices, attending hospital design seminars, visiting with vendors at trade shows, consulting an American Animal Hospital Association listing of practice management software companies, reviewing the floor plans and equipment lists of *Veterinary Economics* design winners, searching the Internet for different companies, and envisioning the equipment that best fits your practice style.
- Break your list down into medical equipment, office equipment, furniture, and ancillary equipment.
  - This can be done on an Excel spreadsheet with columns for New, Used, Suggested Retail price, Contract price, Cost savings (if any), Name of dealer and the representative generating the quote, and Contact information (see Table 9-10-1).
  - A spreadsheet allows you quick access to the information, is easy to tabulate, and can demonstrate cost savings to your lender.

Table 9-10-1. Sample equipment list.

Equipment list for Biltmore Veterinary Associates, P.A.						
Office equipment	Company	Contact person	Phone number	Price quote	MSRP	Savings
Telephone system						
Spaces for system						

MSRP: manufacturer's suggested retail price.

- Make a tentative list of which items will be new and which will be used.
  - In evaluating whether to purchase new or used, ask yourself questions about the importance of the item.
  - Certain items should be new purchases from the onset; for example, computers and software programs, surgical instruments.
  - Other items may be used items, such as file storage units, desks, or a certified rebuilt radiographic unit.
  - You may acquire items that start out as good, used items and replace them with newer models at a later date as money becomes available.
- To find medical equipment, enlist the services of a distribution representative that you trust and plan on using on a regular basis in your practice. Remember, loyalty and strong relationships with individuals will pay dividends for you and the practice now and in the future.
  - Challenge this individual to find the best prices on the equipment.
  - These individuals have a network of resources to find new, used, or discontinued models that will fit your needs.
- Once you have assembled the wish list of equipment, prices, and whether it is new, used, or a discontinued model, review your needs list.
  - The needs list will be broken down into three categories: Must have, Need if monies are available, and When business justifies the purchase.
- The Internal Revenue Service improved several benefits for small business owners in the Tax Act of 2003.
  - Section 179 increased the amount for eligible property that can be written off in the first year of up to $500,000 with a bonus first-year depreciation of 50% in 2017. Check with your accountant about current specifications relative to Section 179.
  - Eligible property is machinery, equipment, furniture, fixtures, off-the-shelf computer software, and certain other items.

Specialist

- Office equipment, computers, and software programs needed will be the same as the generalist.
- Equipment needs for a specialist practice will contain some similar equipment, yet will include other pieces of high-technology importance.
- Depending upon the type of specialty, the dollar amounts to anticipate spending will vary:
  - A surgical specialty practice can have start-up equipment costs of $150,000 or more.
  - A dermatology practice may have equipment and fixture costs of $50,000.
- A specialty practice is in the position of needing more technologically advanced equipment from the very beginning, versus the generalist who can add certain equipment after achieving more advanced training or when the need allows for the purchase. The equipment list will be driven more by the specialty (or subspecialty).
- In most cases, specialized equipment will be driven by the experience and familiarity of the equipment by the doctor.
  - Research equipment with former instructors, check with vendors at trade shows, and search the Internet for companies.
- Develop a needs list with price quotes and check it for completeness.
- There are specific referral practice management software programs available. Ask vendors if they support referral practices, and request references from existing users before purchasing.

EXAMPLES

ABC Veterinary Hospital purchases $550,000 of equipment. In the first year the practice could write off $145,600, calculated as follows:

Cost	$550,000
Section 179 Depreciation	$500,000
Remaining balance	$50,000
Section 168 K (50%)	$25,000
Depreciable basis	$25,000
Modified Accelerated Cost Recovery System depreciation	$5,000
Remaining balance	$20,000

CAUTIONS

- To utilize Section 179, the taxpayer must purchase, install, and use it between January 1 and December 31. It is not automatic. Check with your accountant.
- There are limitations to using Section 179. You cannot, for example, use it to create a loss in your business.
- Consult with your tax advisor on the specific use of Section 179 and/or Section 168 K for your particular business.

9.11. EFFECTIVE INVENTORY MANAGEMENT

BASICS

OVERVIEW

• Developing an inventory system is a process, not an event. Although the hospital team members may be experts at evaluating the efficacy of drugs, many have not looked closely enough at their inventory management processes. As a result, hospitals average relatively low inventory turns per year, lose compliance opportunities, and continue costly process inefficiencies.
• There is also the matter of internal control. Internal control is the means by which a hospital's resources are directed, monitored, and measured. Not only do you need internal controls to be sure your success factors are in place, but it also helps prevent fraud and loss. Many hospitals have internal controls in place for cash, and yet it is rare to see the same attention paid to inventory, which is just cash tied up in products used and dispensed. If you were to look at inventory as cash on the shelf until it is sold, then why are internal controls not put into place to monitor inventory in more practices? You do not have your entire bank account in your cash drawer, but yet your hospital's entire inventory supply is often out in the open.
• Taking control of inventory is much easier than it was a few years ago. Your inventory process redesign includes four components: buyer experience, technology, change management, and internal controls/testing the system.

TERMS DEFINED

ABC Analysis: An assessment of inventory items based on their economic value with usage, sales, and cost. An ABC analysis is an extension of the 80/20 rule and a method of grading products based on their usage and turnover.
Cycle Counting: An inventory management tool in which select products are counted on a periodic basis to detect inventory errors and for continuous quality improvement, so process problems can be detected before official inventory counts or audits.
Inventory Chart of Accounts: A directory of codes related to products that will be used to determine cost centers and profit centers to be monitored within the accounting and practice management software.
Inventory Turnover: Also known as inventory turns, merchandise turnover, stockturn, stock turns, turns, and stock turnover, this refers to the cost of goods sold divided by the average inventory. It is a measure of the number of times inventory is sold or used within a time period.
Key Performance Indicators (KPIs): Key drivers that give an "at a glance" view of the inventory expenses and cash flow. They also allow the hospital to identify hot spots/red flags to set goals to make inventory expenses low and the pharmacy more profitable.
Perpetual Inventory: System of inventory control in which the number and value of inventory items can be determined directly by stock records and are updated directly as transactions occur. By adhering to perpetual inventory principles, such as the cycle of ordering, receiving, selling, and cycle counting, practices can develop an accurate quantity on hand (QOH) within an automated inventory system, such as through your practice information management system (PIMS).
Shrinkage: Product reduction due to wastage, loss, or theft.
Stockout: A stockout, or out-of-stock event, is a situation in which the demand for an item cannot be met from the supply in inventory; the amount on hand is insufficient for the amount needed or wanted.

ISSUES AND OPTIONS

ABC ANALYSIS AND VITAL/ESSENTIAL/DESIRABLE MATRIX

An important measuring tool to manage your inventory is an ABC analysis. The ABC analysis is an extension of the 80/20 rule (see 6.15 – Practice Differentiation) and should be performed quarterly and yearly. It is key to an inventory strategy because of the following assistance it provides:
• assists with time management;
• combines economic value with usage;
• helps determine reorder levels and reorder quantities.

The "A" class items are the top 20% of total items that account for about 80% of sales, usage, and cost. The "B" class items are the next 30% of total items that account for 15% of sales, usage, and cost. The remaining 50% of items are the "C" class items, which account for only 5% of the sales, usage, and cost.

Software reports that measure sales and consumption (even if you do not currently utilize your software for tracking inventory) can easily be exported to a spreadsheet and manipulated into the ABC analysis. Develop an ordering template based on your "A" items. A common challenge for purchasers is having too many orders within a week because of stockouts. Inventory stockouts are a consequence of not identifying the "A" items of the hospital. When placing an order, be sure to verify that you have enough of all "A" items to get you through until your next order.

Take your ABC analysis to the next level with a vital/essential/desirable matrix. This matrix allows the hospital's veterinarians to identify first the vital products, which are items that you need at all times. This will allow the purchaser to verify that there are always enough of these items in stock. A product that is a "C" item may still be a vital product (emergency/critical drug). Always be proactive with vital products to have a plan if any ever are on backorder. Next, identify the essential products. These are items that are acceptable to receive in 24–48 hours. A purchaser may decide to have a lower reorder point and/or order quantity on these items. Finally, identify the desirable items. These are items that may not have prevalence to the hospital formulary and/or can be duplicates of a similar item – such as being a back up to preferred different nonsteroidal anti-inflammatory drug (NSAID) already in use. Begin to eliminate your desirable items and make them available through home-delivery programs or the hospital online store.

The 80/20 rule also relates the sales to your clients. You will find that the top 20% of your clients generate 80% of your sales. Periodically spot-check what products these clients purchase and mark those products as vitals.

KPIS

Identify the KPIs for inventory (see 7.8 – Key Performance Indicators). This will be the starting point for you to measure your success with your inventory program. A common and easy KPI is to know your cost of goods sold (COGS) as a percentage of your gross revenue. Depending upon your chart of accounts, this percentage may constitute all inventory within the hospital or you may have a percentage for drugs/supplies, diets, over-the-counter (OTC) medications, and so on. These percentages can be measured against veterinary industry benchmarks. This can help determine how much

improvement is needed. The average COGS for drugs/supplies is typically 9–15% of total revenue, depending upon the hospital's revenue and efficiencies. Additional examples of benchmarks include diets at 3.4% and laboratory around 3.6%.

Become familiar with the inventory chart of accounts (general ledgers) within the hospital's accounting software. Utilize resources such as American Animal Hospital Association's Chart of Accounts (https://www.aaha.org/professional/resources/chart_of_accounts.aspx) for suggestions on how to break down the accounting of inventory (e.g., drugs/supplies, diets, OTC medications, laboratory expenses).

Another KPI to consider is your vendor billing terms. Be familiar with the billing dates for your distributors and credit cards used to purchase inventory. For example, if your distributor's billing date is the 25th of the month, keep your inventory orders limited the week before that billing date (because if you buy too much at this time it will be due right away) and do your monthly purchases after the 25th. Ordering based on billing dates can give you 45 days to use your inventory up before the bill is due, limiting too many orders in a week/month, which would result in increased ordering costs.

To limit the number of orders created in a period, it is worth limiting the number of distributors and manufacturers from which the hospital makes purchases. In general, following the 80/20 rule: 80% of orders should be done through a primary distributor and 20% of orders using backup distributors. When determining a primary distributor, choose based on important criteria, such as online ordering and practice information management software integration for efficient ordering, not just price. The primary distributor should also offer services such as pharmacy and home delivery/online stores for your clients to expand the hospital formulary without having to bring products into the hospital. Limit frequent price checking by doing yearly and quarterly price comparisons based on your "A" product list.

BUDGETING

One of the single most important tools to incorporate in a successful inventory plan is a budget (see 8.21 – Controlling Cash Flow: Budgeting). Traditional budgets should have a projection of what to spend on a yearly, quarterly, and monthly basis based on the previous period and anticipated future growth. These projections become the pulse of your hospital. Inventory budgets can simply be done on a weekly and monthly basis. Having frequent inventory budgets not only allows you to purchase inventory based on the hospital's current cash flow but can trigger alerts that can be due to shrinkage (loss of inventory) or performance/revenue issues. By simply setting a COGS percentage goal, you can look at the previous week or month's gross revenue and calculate into that your goal percentage. For example, the purchaser has a goal of 10% to spend on their inventory once a week. They will look at what the hospital's gross revenue was from the previous week and take 10% of that revenue. This will give them their spending amount for the following week. Developing a simple spreadsheet is an easy way for the purchaser to type in revenue, see what they have to spend throughout the week and/or month, and then track invoice expenses on that spreadsheet.

INVENTORY TEAM

Having the right inventory leader and right inventory team can be the difference in making your inventory system work rather than flounder. Many hospitals make the mistake of putting the wrong person in charge of inventory and not having enough people involved in the process. When choosing your inventory leader, their qualifications should include:

- Ability to look creatively at the "big picture." The inventory vision of the hospital must be set and the leader needs to be able to work toward that. Being able to work by the "big picture" instead of the smaller details will help defy time-management challenges.
- Ability to differentiate between major and minor issues.
- Have a supportive and encouraging attitude toward the inventory team.
- Willingness to do what it takes to get the job done.
- Computer skills that include, but are not limited to, the inventory function of the PIMS, spreadsheet programs, and the Internet.

A common question that gets asked is, "How much time should be spent on inventory?" Recognizing that inventory is one of the largest expenses of a hospital with the most potential loss, inventory deserves critical time and attention. However, having efficiency and a team to support the system will make inventory more profitable. Having an inventory team gives more than just one-person ownership and creates a collaboration to emphasize the importance of inventory.

Having an inventory team provides internal control by having one person place an order, another person receive the order, and then a third person do the inventory bookkeeping (see 7.15 – Internal Accounting Controls). This will create a well-managed system of checks and balances. Although the inventory leader makes the final purchases and ensures inventory accuracy, having different team members responsible for different areas of the hospital (surgery, pharmacy, treatment, laboratory, etc.) helps minimize errors in the process. Team members should spot-check weekly for products/supplies needed, track accuracy of their area, and develop an overall organization system for that area. This team system works for any size of hospital.

Incorporate incentives and bonus programs for the inventory team (see 3.4 – Employee Bonus Criteria). Taking a percentage of the savings from the inventory budget and dividing that in the form of bonuses can easily be accomplished and benefit both hospital and staff. Nonmonetary incentives should also be considered when smaller achievements are made within the inventory vision.

Every staff member in the hospital who handles drugs and supplies needs to be aware that they are responsible for inventory. Not only have a job description for the inventory leader that outlines your expectations, but also be sure the responsibility for inventory is on every hospital employee's job description.

A hospital inventory makeover begins with overall organization. Begin with identifying the number of locations throughout the hospital that have drugs/supplies, which may be more areas than necessary.

ZONING AND CENTRAL SUPPLY

Two important inventory organization techniques include zoning and central supply.

Zoning your inventory throughout your hospital is like creating a map. If you have mobile vehicles, this technique should also be incorporated. Start by having each team member that is responsible for inventory in their area develop a list of all their supplies and on which cabinet, shelf, and/or drawer the supply could be found. This ensures that products/supplies do not constantly change locations, which would make it difficult to have an efficient inventory system. Also create a stocking list for each area that has reorder (minimum) levels

9.11. Effective Inventory Management

with the item. This way, anyone who goes through that area to spot-check what needs to be ordered can follow the stocking sheet, and if the product/supply is below the reorder level listed then they check off that it needs to be either restocked or ordered. Stocking sheets with restocking levels can be a great tool for managing mobile trucks also.

Central supply is an organizing technique to control the hospital's safety stock and "A" product overstock by limiting access. It also helps centralize bulk items such as syringes, needles, and other disposable items. You can easily track disposable items in your PIMS by having a central supply. Manage your QOH for disposable items by the full box or package. For example, track your syringes by full box in your PIMS. When a full box leaves central supply, that is when the transaction happens to deduct that box from your QOH. You can also track disposable items with a central supply technique called "double-bin system" or "two-bin system." This can help with limited space by designating one area (such as a set of cupboards) that stores the unopened boxes and then another area that stores the opened boxes for stocking drawers. When a box is opened and moved to the other set of cupboards, that is when your PIMS inventory transaction happens and you do inventory based on the cupboard of unopened boxes/packages. Do not forget to utilize your central supply to limit access to office supplies as well.

INVENTORY AUTOMATION

A common goal of most hospitals is to incorporate inventory automation within their PIMS. Your PIMS inventory is developed based on the perpetual inventory cycle. The flow of the perpetual inventory cycle includes having a system that determines when a product/supply needs to be ordered, how much and from whom an order is placed, a purchase order (PO) is verified, inventory is put away and priced, and then the inventory is used/sold. The challenges that hospitals face when using their PIMS for inventory automation are that they are not consistent within this perpetual inventory cycle. To utilize your software to the fullest, incorporate the following:

- Reduce double steps by incorporating the electronic want list/needs list within your PIMS instead of a written want book. Most PIMS have this as an option for both a team member to manually enter what needs to be ordered and the software notifying staff when a product needs to be reordered based on reorder levels within the system.
- After reviewing the want list/needs list within the PIMS, create a PO. Not only will creating a PO in your PIMS help receive inventory more efficiently, but it will also let you know the current QOH, which allows you to verify what is truly in stock and if any adjustments need to be made in the PIMS at that time.
- Once shipments arrive, utilize the PO that was created to receive the inventory. The cost of the inventory should be updated each time items are received. One of the most common reasons the QOH within the PIMS becomes inaccurate is because products are sold before they are ever received in the PIMS. For this reason, systems need to be in place that enforce that all items are received in the PIMS before they are sold.
- Some PIMS have a section of the inventory module where you can inventory items that are used in house. If your PIMS does not have this, develop a "house account" where you can deduct inventory used in house (internally).
- Have categories/classifications that are significant to the practice created within the PIMS. You may decide to have a limited number of categories/classifications based on your profit centers (surgery, dentistry, pharmacy, etc.) or you may have more detailed categories/classifications, which may include drug classifications (e.g., NSAIDs, antibiotics, injectables, flea prevention, heartworm prevention). Periodic audits to ensure products/supplies are within the proper category/classification should be done.

Common reasons for errors within the PIMS can be due to:

- lack of consistency when using units (by tablet or bottle);
- too many inventory/product codes;
- inventory not being set up to be deducted from QOH when sold;
- items not invoiced;
- routine counts not performed;
- wrong product invoiced to the wrong species of patient and products not received in the PIMS before selling.

Reduce the number of codes within PIMS by having one code for a product with price breaks based on quantity rather than different codes. For example, have one code for a specific NSAID and have a price break created when a quantity of 30 is entered and another price break if the quantity is 60, instead of having one code for per tablet, another code for bottle of 30, and another code for a bottle of 60.

Other alternatives to automation include an automation medication storage system. These are systems that provide inventory automation by incorporating charge capture within your PIMS. They are cabinets that require an employee identification (ID) or biosecurity (e.g., fingerprint) and a patient ID to enter the cabinet to remove a product. These systems are designed to incorporate the perpetual inventory cycle.

A form of inventory shrinkage is due to outdated products. PIMS have expiration date options for both tracking the dates and for generating reports. When utilizing expiration date reports within the PIMS, review the expiration date report monthly and generate the report for three months ahead. By generating the report for three months ahead, you can be compliant with manufacturer's return policies or use the items before the expiration date. A noncomputerized tool to track expiration dates is the use of color stickers. Have one color sticker on products that expire during the current year (you can write the month on the sticker), have another color on products that expire next year, and so forth.

Reorder tags can be a useful noncomputerized communication tool. Reorder tags can be rubber banded onto the last bottle or the bottle that meets the reorder point level. When that bottle is opened, the reorder tag is removed and put into an order basket. Have your "A" items as one color reorder tag and have your "B" and "C" products be another color.

9.11. EFFECTIVE INVENTORY MANAGEMENT

CYCLE COUNTING

Test your inventory system as well as track shrinkage with a cycle count system. A cycle count system ensures continual improvement by finding and researching errors. "A" products should be counted monthly by selecting a few "A" items to count each week. "B" products can be counted quarterly and "C" products counted as needed. Cycle counts can also be done by location of the hospital, as well as by selected categories to count each week. Blind counting should be done when there is a team of counters. This is done by giving a list of items to be counted to the team members, but they do not know how much product there should be. Offer incentives for accuracy and finds, such as the inventory team member with the most accurate area for the month gets the incentive reward. Be sure to measure your shrinkage and loss, as well as set a goal to reach. Although there are limited benchmarks for inventory shrinkage within veterinary hospitals, retail industries try to be within 1–2% shrinkage.

9.12. INVENTORY MANAGEMENT: NUTRITIONAL PRODUCTS

BASICS

OVERVIEW

• Many common diseases are managed with nutrition as their sole treatment or as a significant part of their treatment or prevention.
• Nutritional products intended for use to treat or prevent disease are considered unapproved drugs by some regulatory bodies such as the US Food and Drug Administration. This limits their sale to the public only through licensed veterinarians or through retail or Internet stores provided the individual purchasing the food is doing so under the direction of a veterinarian.
• These two factors result in therapeutic food sales being estimated at 6.3–7.1% of an average practice's gross income.
• Given the wide range of commercially prepared therapeutic pet foods and supplements, their perishability, and their importance to a practice's financial health, successful inventory management is a key aspect of practice management.
• Successful inventory management maximizes the available amount of needed and fresh nutritional products while concurrently minimizing demands on labor and physical space.

TERMS DEFINED

First In, First Out: Method whereby items first placed into inventory are the first taken out of inventory or sold.
Holding Cost of Inventory: The cost a business incurs over a certain period of time, to hold and store its inventory.
Shrinkage: The loss of product from inventory not resulting from sale, including product lost to employee theft, shoplifting, administrative and paperwork errors, and vendor errors/issues.

ISSUES AND OPTIONS

SELECTING WHAT TO CARRY

Commercial products considerations/criteria are as follows:
• Products that meet the practice type (e.g., a veterinary dermatologist might carry many, if not all, novel antigen and hydrolysated foods but likely does not need to carry severely sodium-restricted foods for the management of congestive heart failure, *or* a feline-exclusive practice likely will not carry dog food).
• Products that are veterinary exclusive or can only be used in a therapeutic way under the direction of a veterinarian. Competing with nonveterinary retailers with products generally available is likely to be unsuccessful, as being a retailer is typically not within a veterinary practice's core competencies.
• Products that have been proven to be successful for the conditions for which they are intended to manage, or products that use nutritional strategies that have been proven.
• Products from companies with the technical resources to support their clinical use. Most preferable are companies that have board-certified veterinary nutritionists on staff that can provide specialized technical assistance.
• Products from companies that have delivery practices that maximize product availability and minimize physical storage needs (e.g., no or small minimum order quantities, no- or low-cost delivery to the practice or client, frequent delivery schedules or availability).
• Practice-friendly ordering system(s) and return policies.
• Products with sufficient margin to justify the holding (carrying) cost of inventory.

DETERMINING HOW MUCH TO STOCK

• Once the products are selected, determining the amount, both product size and quantity, to carry is crucial to minimizing running out of stock, returns for unsold product, and storage space (see 8.8 – Ordering Inventory Economically).
• Generally, stocking the smallest product size is preferable, especially if delivery is readily available or frequent for larger versions. This approach enables more products to be carried for trial and use (as less space is needed and one can generally stack higher) and focuses larger product sizes on known patient use. Some practices rely on a separate special order process for all recurrent purchases to manage available trial products.
• Keeping and reviewing records for average sales volume by product over time can lead to fine-tuning of order quantities. Reviews should be conducted at least quarterly to identify and adjust to changes, or if out-of-stock products or returns of unsold expired product are becoming more frequent.
• Reorder reminder systems contacting the client can be useful. Similar to an appointment reminder system, one can create a simple spreadsheet to estimate how long a client's product purchase will last so that a reminder to reorder can be set up in time for a special order delivery. This process not only can increase compliance and sales, but also can help prevent out-of-stock products or the maintenance of larger unused inventory and all the associated carrying costs.

HANDLING RETURNS

• Many manufacturers will refund veterinarians for expired product. This should not mean that there is not a cost to the practice in having product that ultimately does not sell. There is a cost associated with ordering and handling products as well as dealing with returns to the vendor. In addition, the space taken up by unsold product may have been better used for another product or for a different type of product or service altogether that could generate revenue for the practice (i.e., opportunity cost).
• Not all products will be a match for a particular client or patient. To minimize returns from clients, handling product appropriately as well as using a "first in, first out" approach to inventory will increase the quality of the product that the client receives. It can also be helpful to have a client that, say, is ingredient-declaration concerned and has read a label before purchasing a product, and to offer smaller trial-sized bags to determine if the product will be accepted by the patient/pet. This will help reduce the volume of returns and often will improve overall compliance.
• Gathering reasons for returns can be useful to learn why a product was unsuccessful. This can guide how recommendations are made in the future, how client education is provided, the amount of follow-up or support provided, and to help refine product offerings to those that perform well.

STORAGE

• Products should be stocked in groups, with the oldest placed above or in front of newer product.
• Locating the optimal location for storing nutritional products may depend on many factors. Ideally, the products would be at a convenient location to enable easy retrieval for selling. This may mean a highly visible part of the practice or a room near the reception or checkout area.
• Securing the storage area to avoid "shrinkage" can be important to minimize monetary losses. Unfortunately, shrinkage can come from both employees and clients. Some of it may be unintentional, but one should also attempt to protect from intentional theft.
• If certain products are to be used for a hospitalized patient, one should work on a method to make sure that this use is properly accounted for. It also can be helpful if products for hospital use are physically removed from inventory for sale to avoid confusion and limit seemingly unaccounted-for losses.

POINT OF SALE PROCEDURES

• Owing to regulatory guidelines, many products have brief and easily confused nomenclature. Products that differ by one letter like "i" and

"l" exist, and their indications are quite different. Therefore, care should be taken to ensure that the food offered matches the intention of the recommending or prescribing veterinarian. Without care, it is potentially easy for a client to take home and feed the wrong product to a patient/pet.
• Besides checking that the correct product is being sold, care should be taken to ensure the product with the closest expiration date is sold first and that any such date is not past or too soon that the pet/patient will not use it in the remaining available time.
• Product packaging should be checked to be clean and undamaged.
• Although it is recommended that initially smaller-sized products are offered, later orders for established cases may come in large, more economical, and more important, heavy sizes. It is generally good practice to have a veterinary staff member assigned to carrying such products out to the client's vehicle or means of transportation. Review of business liability insurance and worker's compensation insurance, including employee classification, is advised when considering this issue (see 2.27 – Practice Insurance Needs).
• Clients may come up with questions at the time of sale that they had not previously thought of when with the veterinarian. It is best to have technical staff address these questions prior to the sale to ensure that the product will be the right fit and not result in what otherwise could have been an avoidable return or poor compliance.

EXAMPLES

N/A

CAUTIONS

HANDLING PERISHABLES AND PRODUCT RECALLS

• Temperature, moisture, and pest control are important to ensuring that food or supplements retain their quality and are safe.
• High heat can degrade vitamins faster than anticipated by manufacturers when establishing best by or expiration dates. This could potentially lead to a food or supplement not having the expected vitamin content and theoretically could lead to a deficiency. Similarly, high heat can cause fat oxidation to become more rapid and outstrip any antioxidant preservation system. This can lead to rancidity and, at the very least, off odors and reduced palatability.
• High moisture is of greater concern with dry products than with "wet" products. Typically, the packaging for wet products is impervious to exterior moisture. Dry-product packaging often does not provide complete moisture protection. This means that storing products at high humidity or where moisture can come into contact or form on packaging, represents a risk of fungal or mold growth on products.
• Pest control should be in place to avoid both rodent and insect access to food or supplements. If insect control with pesticides is used, there should be specific protocols to avoid contamination of products with possible toxins.
• Under no circumstances should an opened, returned product be resealed and/or resold.
• Although fortunately rare, pet food recalls do occur. One should make sure that one's contact information with all manufacturers and distributors of carried products is current and up to date. This enables companies to quickly notify you of any products that have been recalled, and thus enable their rapid removal from inventory and prevent their sale or feeding. One should also check that one's general business liability covers retail sales in the event that there is a product quality or safety issue resulting in litigation.

SUPPLEMENTS

• A vast number of supplements come to market on a regular basis, but care should be taken to look at the credentials of those marketing the product. Often, they have little or no specific expertise in the management of medical conditions. In addition, one should ask if there is any peer-reviewed evidence to support the ingredient(s) being used at the dose provided for the reason indicated in the species of interest.
• All supplements that are strong enough to do good are strong enough to do harm. Thus, one should select supplements to carry that are not only efficacious but also safe.

9.13. MEDICATION DISPENSING, COMPOUNDING, AND PRESCRIBING PRACTICES

BASICS

OVERVIEW

Good pharmacy practices and medication therapy management are a winning combination. But having a pharmacy in your veterinary hospital is much more than just having inventory on the shelves. It is about having good practices in place when it comes to accountability (both from staff and pet owners), pharmacy environment, dispensing, and prescribing. Medication mistakes can potentially become more prevalent in veterinary practice as more pharmacies fill prescriptions written by veterinarians for clients who then give those medications to their animals.

TERMS DEFINED

Compounding: Customized manipulation of an approved drug(s) by a veterinarian or pharmacist to meet the needs of a particular patient.
Extra-Label Drug Use: The use of an approved drug in a manner that is not in accordance with the approved labeling (e.g., the use of the product for another species, different indication, or dose).
Generic Drugs: Generic drugs are US Food and Drug Administration (FDA) approved, which requires a demonstration of bioequivalence of safety and efficacy with the pioneer drug product.
Legend Drug: A drug that can be dispensed to a client only with an order from a properly authorized individual (such as a veterinarian). Legend drugs are often more commonly referred to as prescription drugs.

ISSUES AND OPTIONS

PHARMACY MANAGEMENT

Medication errors can be traced to the environment and organization of your pharmacy. Incorporate checklists to do self-audits of your pharmacy. The checklists may include:

- All legend drugs must be dispensed in child-resistant containers (CRCs). Have a good selection of vials including 60-dram vials for oral medications in syringes. A medication going home with the client in an appropriate container conveys a professional intent. An example of this is ophthalmic medications. If an ophthalmic medication is sent with the client in a vial rather than a box it can increase the medication adherence from the client. When you question what is considered child resistant, you may want to consider what a two-year-old child can get into. Manufacturers of drug products can be a good resource as to whether or not their product is acceptable to be dispensed in a non-CRC. If a client such as an elderly citizen requests the medication be dispensed in a non-CRC, a statement must be documented, signed by the client, and kept in your medical records.
- A system for tracking and removing stock that has exceeded its expiration date. Most practice information management systems (PIMSs) have a way to report expiration dates, often designated as an outdate report. It is recommended to generate an outdate report monthly for three months ahead. This allows you to work with the manufacturer in advance for the most economical way to return and get credit or to have the veterinarians in the practice use the medication up before the date is exceeded. A noncomputerized tool for tracking expiration dates is a color sticker system. Designate a color for each year you have products with dating. For example, a product that will outdate this year will have a red sticker (with the month written on the sticker), a product that will outdate next year will have a yellow sticker, and then a green sticker for the following year. This allows expiration dates to be easily visible for everyone in the hospital. Have a reverse distributor that you work with to destroy obsolete or outdated controlled substances.
- Be sure to have up-to-date reference material to help furnish veterinarians with drug information. Have the veterinarians trained on how to access the electronic FDA's Center for Veterinary Medicine *Green Book* (veterinary drugs)[1] and the FDA's *Orange Book* (human drugs).[2] The electronic books are typically updated daily and monthly.
- Audit prescription labels for required information, such as hospital name and address, veterinarian name, complete directions (the term "as directed" is prohibited), drug name and strength, date filled, expiration date as determined by the veterinarian (but should not be later than the manufacturer's expiration date), and a statement "For Veterinary Use Only" and "Keep out of reach from children." Also add any special precautions, such as refrigerate and/or shake well. Include not only the number of refills available to the client, but also the date by which any refills need to be filled. For accountability purposes, have the veterinarian and technician filling the prescription have their initials typed on the label.
- Procedures need to be in place for monitoring the refrigerators that store biological drug products and vaccines. A log should be available to document refrigerator temperature daily and/or weekly, as well as a good thermometer in the refrigerator. The most accurate time to measure the temperature in the refrigerator is on Monday mornings when the weekend had less traffic in and out of the refrigerator. The temperature of the refrigerator should be maintained between 35° and 45 °F (2–7 C). Not only should you not overstock your refrigerator, but also vaccines should not be stored in the door, against the walls or near the cold air inlet. The refrigerator must also be clean and defrosted, and food and drug items must be separated. Vaccines becoming too cold can contribute to adverse reactions.

The hospital pharmacy should be situated so the general public does not have access to the area where legend drugs, controlled substances, and other drugs are stored.

Counter space for filling medications needs to be kept clean and clear of all extraneous items. The minimum space that should be made available to fill medications is a space of three linear feet (90 cm) by 18 inches (45 cm) in depth.

PHARMACY TRAINING AND ACCOUNTABILITY

- Your hospital should have written policies and procedures for the pharmacy. This will assist in pharmacy training as well as accountability.
- The hospital team should have in-house pharmacy training yearly, if not more frequently. Training should be based on testing product knowledge as well as the "five rights" of medication administration: the right patient, the right drug, the right dose, the right route, and the right time.
- Within the written policies, there should be achievements and consequences to hold team members accountable in pharmacy. You can develop levels of training within the pharmacy that will dictate what an employee can fill. For instance, a technician level 1 may only be able to fill over-the-counter medications and a technician level 2 can fill any product drug except for controlled drugs. Have a list posted in the pharmacy of all employees and what role they have in the pharmacy. Employees should be held accountable for pharmacy mistakes, and consequences can be from anything such as pharmacy probation, limitations to what can be filled, and verbal or written warnings. These consequences and warnings need to be documented in the written policies.

QUALITY CONTROL

- Quality control procedures should be in place to prevent errors and to identify why/when an error happens.

9.13. Medication Dispensing, Compounding, and Prescribing Practices

• Latent errors are the most common reason for mistakes in the veterinary pharmacy. This can be due to incomplete patient information, unclear communication (e.g., medication changed after laboratory results but not changed in medical records), a lack of a double-check system, and the lack of using PIMS for warnings, storage issues, and look-alike/sound-alike medications.
• Illegible handwriting can lead to transcription errors for the technician trying to read the medical record or the prescription that was sent to a pharmacist. Utilize electronic medical records within your PIMS to eliminate errors due to illegible writing, or print prescription labels out first and then give the label to someone to fill the medication. Having a double-check system in which the medication is checked by multiple staff members will help eliminate errors.
• Look-alike drug names and/or containers can cause errors (such as prednisone and prednisolone). Steps that can be used to prevent look-alike errors can be to keep similar products separated, change appearance on the bottle, change the color on the computer screen for a drug, or simply have the shelf label be a different color from a like product. An automation medication storage system can assist in storing and the proper selection of drugs by indicating in which compartment the proper product resides.
• Ambiguous errors can happen because directions can be unclear or have a different meaning. Knowing when to use and not use zeros and decimals on written prescriptions is imperative. Never follow a whole number with a decimal and a zero because the decimal may not be noticed. Write a medication out as 1 mg instead of 1.0 mg (which could be mistakenly read as 10 mg). Always lead with a zero before using a decimal, such as 0.125 mg. You can use alternatives to clarify intent; instead of Digoxin 0.125 mg, it would be better to write 125 mcg instead. Avoid using a lowercase "l" before a number because if there is too much spacing in the word that has the lowercase "l" it can appear as the number "1". Use caution when using abbreviations. A common abbreviation is the letter "u" for units. This can be mistakenly read as a zero. For intervals between doses, it is better to specify the interval rather than the number of administrations. Accordingly, whereas BID indicates that the medication should be given twice daily, designating the administration as q12 hours more clearly indicates that the medication should be given every 12 hours rather than just twice a day. Abbreviation systems can be different in veterinary medicine than what a pharmacist might be used to for human patients, so be sure to communicate intent as clearly as possible.
• For products with sound-alike names, errors can happen when the medication name is communicated verbally and is misheard. Try to discourage verbal orders, especially with critical drugs. Have procedures in place that when a medication order is verbally communicated that the person on the receiving end of the communication not only writes down the medication but also reads back what was written.
• An error called confirmation bias is a phenomenon where people see what they are looking for but then immediately stop looking. They pick the product by a mental picture rather than thoroughly looking at the product item. The confirmation bias error can also happen to those who double-check the medication and label. When quickly scanning over a label you may read what you think you are expecting to see. To slow down the double-check system, read the prescription label from bottom to top and right to left, instead of the traditional reading style.
• Be sure there is a double-check system in place with filling and administering medications. There are a number of opportunities to check. You can have a system that checks against the label that was generated, which is then checked against the medical record for what was documented and then checked against the container that the medication was filled from. A medication should be initialed by both the person filling it and the person double-checking it.
• Many times when pharmacy errors are found, they are corrected but not documented. Keep a quality control log of pharmacy errors that occur so the reason the mistake happened can be identified and fixed, not to mention to keep track of who makes the error. Keeping a log will help you find gaps in your pharmacy-training program.
• Your software can be set up to have a weight pop-up to request the newest weight of a pet for weight-specific products. This will ensure the correct product by weight is selected. You can do the same for products that are species specific. For example, you can have your software set up to only be able to sell a feline diet to a feline patient.

MEDICATION ADHERENCE FROM CLIENTS

• Another challenge that is faced in our pharmacies is medication adherence or compliance from clients (see 4.11 – Compliance and Adherence). This can be from ensuring that a client picks up the medication (from the hospital or pharmacy), gets a medication refilled as needed for treatment, and gives the medication as directed by the veterinarian.
• A report published by the American Medical Association (AMA) ad hoc committee indicated that one-fourth of all Americans have illiteracy and read at or below fourth-grade level. Most medical information or labels are typically written at or above 10th-grade level. An example on a prescription of this level is terminology like "give orally" or "give by mouth." Some clients may not even know what give orally means; others might confuse orally and aurally. Be sure labels give easy-to-understand directions.
• The AMA also indicated that only half of all human patients take medications as directed.
• If you are working with a client that you suspect may not be compliant with giving medications to their animal, request they have a sponsor for their pet's health. This can be a friend or family member that you can educate and counsel along with the client to ensure compliance. For potentially noncompliant clients, also consider whether an injectable medication might be medically suitable.
• Ask the client questions to fully appreciate their concerns. They bring their pet to see a veterinarian because they are concerned about its health, but with further questioning you might determine that they are actually most concerned with some aspect of the appearance of their pet (e.g., hair loss) or the destruction to their home that happens due to the pet's behavior. This will help in the medication counseling process by ensuring that the medication not only will help the animal but will also manage the underlying concerns of the client.
• Have the client keep a list of drugs that their animal is taking, including over-the-counter products. This will be a reminder for the client and will be helpful for them to bring to hospital visits.
• Whether a medication is filled in the hospital or at a pharmacy, follow up with the client to make sure they understand the following: the name of the drug and what it is supposed to do; how much medication should be given and at what time; the interval at which it should be given; how many days they should give the medication; if it should be given with meals; how it should be stored; what happens if they forget a dose; it should all be finished; and anticipated and possible adverse reactions.
• For medications that require phases (e.g., corticosteroid taper doses), give a client a calendar or dosing schedule so they know each day how many tablets and how often it should be given.
• Utilize your reminder system to have reminder calls or cards generated to remind a client when a medication is due for a refill or when laboratory work is needed for monitoring purposes (see 4.16 – Client Reminder Systems).
• When medically prudent, use injectables to improve compliance and convenience. Clients may value convenience over savings to ensure compliance.

9.13. Medication Dispensing, Compounding, and Prescribing Practices

CONTROLLING YOUR PRESCRIPTION PAD

• Prescription requests to have medications filled by pharmacies are becoming more commonplace. Having good written prescription practices in place is best not only for the animal but also for your medical records. Most states now clearly state that a hospital must provide client prescriptions on request that can be filled elsewhere. However, if the medication is filled in the clinic, it is easier to track, as well as more directly guide and educate clients.
• Even though you should look at your local pharmacist as a partner, keep in mind that they might not be familiar with veterinary-labeled drugs and generic equivalents. This can cause errors if the pharmacist dispenses a human generic or similar product but not the product for which you wrote a prescription. If you want your client to pick up the drug you wrote on a prescription, be sure you write "dispense as written." Communicate regularly with pharmacists to support the professional partnership, and to educate them about concerns and potential areas where problems could occur. For instance, human pharmacists provided with a prescription for thyroxine might question the correctness of the dose with the owner (the weight-based dose being much higher for dogs than for humans), undermining your credibility with the client. This can be avoided by having a discussion prior to the client filling the prescription, and can be further reinforced by providing appropriate documentation for the pharmacist to keep on file.
• Another challenge with written prescriptions is that you lose control over monitoring what the client received and/or if they even picked up the medication. If a written prescription is filled out and given to a client, be sure to make a photocopy or scan it into your medical records. Follow up with the client to verify the medication was picked up and that they fully understand the instructions.
• Medication refills (for noncontrolled substances) can only be filled up to one year from the last veterinarian–client relationship visit.
• If a client requests a prescription for a retail online pharmacy, have clients review the FDA resources such as the handout *Buyer Beware* (www.fda.gov),[3] so they can appreciate some of the risks of buying medications online. You can even request that a client sign a consent form indicating that they have read and understood the FDA warnings. Some hospitals will incorporate a written prescription fee. Be sure to verify state requirements on written prescription fees, which may include that, if a written fee is incorporated, it must be used for all written prescriptions.
• Many states now require tamper-resistant prescription pads. This prevents a client from being able to fax a prescription to multiple online resources or add medications to a prescription.

GENERICS AND COMPOUNDED DRUGS

• The difference between generic and compounded drugs is that generic drug products are FDA approved, which requires a demonstration of bioequivalence of safety and efficacy to the legend drug of the same form and indications. A compounded drug is a medication that has been created by combining or altering ingredients for an individual patient and must be done by a licensed veterinarian or pharmacist. Compounding can be as simple as changing the dosage form of an approved drug or adding a flavoring agent for ease of administration. Compounded drugs are not FDA approved because safety, efficacy, stability, potency, and other securities may not be in place (see 9.14 – Medication Dispensing, Compounding, and Prescribing: Legal Considerations). Even if only a flavoring agent is used with a drug, it does not mean it is stable throughout the treatment period.
• When using a generic drug, be sure it is a prescription drug that is FDA approved for use in the species being treated, and not a compounded product.
• To determine if a product is a generic, visit the FDA and Center for Veterinary Medicine's homepage for the *Orange Book* (human drugs)[2] and the *Green Book* (veterinary drugs).[1]
• When working with generic drugs, be familiar with the Animal Medicinal Drug Use Clarification Act of 1994. This act sets the guidelines for when a human generic product drug can be used. In some cases, such as in food-producing animals, if a veterinary-approved or veterinary-generic drug is available it must be used over a human generic that is used as an extra-label-use product. For small animals, extra-label-use human generics can be used if they are in the best interest of the animal (in some cases economics can be considered), but generally there should be strong evidence to explain why a human-approved drug is used over a veterinary-approved drug, based on something other than cost. Veterinarians need to remember that the bioequivalence was established for people and it may not apply to another animal species. This needs to be part of your product education with clients, as well as your staff.
• When using a generic drug product, recordkeeping a prescription label should acknowledge just the chemical name not a trade name. For example, if you are using a generic metronidazole, that is all you would have as a description name. If you use a trade name product, you do want to give as much information as possible. So, for example, if you were using a trade name product of metronidazole, your description might read *metronidazole* and then *Flagyl* in parentheses. This way, you have the chemical name as well as the trade name. If you are dispensing a generic product, it is inappropriate to place the brand name of a similar product on the label just because you think the brand name has owner recognition; that is misrepresentation.
• Compounded drugs should be reserved for circumstances in which there is not an FDA-approved product to relieve the animal's suffering or if the approved drug cannot be administered due to poor palatability or patients' unwillingness to cooperate.
• Inappropriate compounding practices include:
  ◦ You cannot compound a drug that mimics an FDA-approved product. Compounded drugs that are similar to a current FDA product may be inappropriately marketed as a cheaper alternative.
  ◦ The FDA considers products compounded from bulk active ingredients to be unapproved new animal drugs.
  ◦ In general, FDA-registered products have no extra-label-use provision and cannot be compounded.
  ◦ Regarding wholesale distribution of compounded preparations, veterinarians cannot purchase compounded drugs from a pharmacy and then resell the drug product to the client. If a veterinarian compounds their own medication for a specific animal, they can sell that product to the client. Otherwise if a veterinarian is working with a compounding pharmacy, the medication will be compounded for that patient and sold to that client directly by the pharmacy.

PHARMACY CHALLENGES

• Managing drug product shortages is becoming a challenge for most veterinarians and pharmacies. According to the American Society of Health System Pharmacists, contributing factors for why drug products become backordered include raw and bulk material being unavailable, manufacturing difficulties and regulatory issues, voluntary recalls, change in product formulation or manufacturer, manufacturer's production decisions, economics, industry consolidations, restricted drug allocation, inventory practices, and unexpected increases in demand, such as during natural disasters.

9.13. MEDICATION DISPENSING, COMPOUNDING, AND PRESCRIBING PRACTICES

• Develop a plan for drug product shortages. Be proactive rather than reactive. Keep a list of all your vital drug products (these are products you cannot practice effectively without). Do a therapeutic assessment on your vital drugs to identify any alternatives. On your vital list of drugs, keep a usage history for how much is commonly used on a monthly or weekly basis. Always monitor your vital products for potential shortages and keep your distribution representatives aware of what your vital products are. Practices should refrain from stockpiling; this causes artificial shortages in the supply chain because of fear, and the increased inventory is costly and may not be absorbed by normal usage.

9.14. MEDICATION DISPENSING, COMPOUNDING, AND PRESCRIBING: LEGAL CONSIDERATIONS

BASICS

OVERVIEW

Dispensing tends to be the largest profit center in veterinary hospitals, often accounting for 25–30% of earned revenue (see 9.15 – Pharmacy Management as a Profit Center). The sale of pharmaceuticals, either dispensed or administered, represents the largest proportion of this amount, with the sale of over-the-counter products and diets representing lesser amounts, and over-the-counter sales – mostly US Environmental Protection Agency (EPA)-registered parasiticides – diminishing with each passing year due to retail competition.

Despite the fact that there are many excellent products licensed and labeled specifically for veterinary use, many veterinarians continue to dispense and prescribe products that are not licensed for such use. Off-label or extralabel drug use (ELDU) occurs when a veterinarian uses a drug other than in accordance with US Food and Drug Administration (FDA) regulations, such as for an unapproved (i.e., not "on-label") species or disease indication, or at an unapproved (i.e., not "on-label") dose, frequency, or route of administration, but pursuant to conditions set forth in the Animal Medicinal Drug Use Clarification Act of 1994 (AMDUCA). AMDUCA made ELDU legal for non-food-producing animals and for certain drugs in food-producing animals, bestowing upon veterinarians the flexibility occasionally needed to treat nonhuman animals when the relatively few per-label medications on hand did not suffice. Compounding constitutes ELDU, but only when sourced from approved finished dosage form drugs.

Topical parasiticides, like imidacloprid, permethrin, fipronil, and amitraz, are not regulated by the FDA or its Center for Veterinary Medicine (CVM), the arm regulating ELDU and AMDUCA violations. Instead, the US EPA regulates them as pesticides under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). Vaccines are not regulated by the FDA either, but by the US Department of Agriculture (USDA) Center for Veterinary Biologics.

At every stage of the veterinary–client–patient relationship (VCPR), standards of care apply. Therefore, in the course of diagnosing a patient, prescribing and dispensing a medication, and compounding medications in-house, the veterinarian may face legal responsibility. At the outset, it is not advisable to write or fill a prescription without a VCPR. Some states, such as Alabama and California, prohibit such conduct without the established relationship, and Arizona requires a preliminary physical examination.

Recently, Congress considered but rejected HR 1406, the "Fairness to Pet Owners Act," legislation that would require veterinarians to provide a written prescription at no charge so clients could fill it at an off-site or Internet pharmacy more cheaply. It is unlikely this concept will disappear entirely, and it is probable that it will resurface at some point in the future.

Veterinarians do write several million prescriptions a year that are filled by retail and online pharmacies, and that is likely to continue. Provided the veterinarian has accurately and precisely prescribed a medication for the particular patient or herd, complied with AMDUCA for ELDU, and discussed administration instructions with the client, veterinarians will likely remain impervious to blowback from pharmacist malpractice, with one added proviso. Because pharmacists do not typically receive training in veterinary pharmacotherapy, with respect to compounded prescriptions filled by human-grade pharmacies, veterinarians should ensure that the pharmacy possesses satisfactory credentials and accreditation through the Pharmacy Compounding Accreditation Board (www.pcab.org). The American Veterinary Medical Association's Principles of Veterinary Medical Ethics urge honoring a client's request for a prescription in lieu of dispensing.

To avoid undesired consequences once the prescription or dispensed medication enters the client's hands, clearly identify the animal's name, species, sex, and age if room permits, the dosage in lay terminology, and any warnings that could avoid fatalities (e.g., imidacloprid and imidacloprid–permethrin can be confused, yet the latter can be lethal to cats).

TERMS DEFINED

Compounding: Customized manipulation of an approved drug(s) by a veterinarian or pharmacist to meet the needs of a particular patient.
Extralabel Drug Use (ELDU): Actual use or intended use of a drug in an animal in a manner that is not in accordance with the approved labeling. This includes, but is not limited to, use in species not listed in the labeling, use for indications (disease or other conditions) not listed in the labeling, use at dosage levels, frequencies, or routes of administration other than those stated in the labeling, and deviation from labeled withdrawal time based on these different uses (21 CFR 530.3(a)).

ISSUES AND OPTIONS

ELDU

The decision to engage in ELDU requires a valid VCPR, cannot be delegated to a veterinary technician or assistant, and is authorized only after examining, diagnosing, and evaluating the patient to confirm that his or her health is threatened, or that suffering or death will occur without treatment (see 13.13 – Extralabel Drug Use).

ELDU requires that (1) no approved drug for such species-condition exists; (2) no on-label drug with the same active ingredient in required dosage and concentration exists; or (3) an on-label drug exists for the species, condition, and in the required dose and concentration but will not prove clinically effective for the intended use. When implemented, ELDU requires that the identity of the treated animal be carefully maintained, along with strict compliance with record and label requirements.

ELDU recordkeeping obligations model those for on-label drug use with the added requirements that the active ingredient of the drug, and specified withdrawal, withholding, or discard times, if applicable, are charted, the records kept at least two years posttreatment and accessible by the FDA. ELDU labeling obligations resemble on-label drug use with the added requirements that cautionary statements restricting use to or on order of a licensed veterinarian, and any withdrawal, withholding, or discard times, if applicable, are listed.

When engaging in ELDU, your state veterinary practice act or regulations may require informed consent, prompting discussion with the client about the reasons for deviating from on-label use and potential risks involved.

PARASITICIDES

There are many FDA-registered parasiticides (e.g., selamectin, moxidectin, spinosad, pyrantel), and these are prescription products meant to be dispensed as other prescription medications. There are other parasiticides, notably those that have surface effects against parasites that are EPA registered and could be sold over the counter, without a prescription. As noted previously, prescribing topical EPA-registered parasiticides for an unapproved species, dose, frequency, or route of administration does not implicate ELDU because off-label use of pesticides is per se illegal (e.g., dispensing an EPA-registered once-monthly flea-control product to be used at a different interval). Of course, parasiticides need not be "prescribed" by a veterinarian at all, as they increasingly find their way onto pet supply retail shelves for over-the-counter sale. That said, the EPA gives some latitude to veterinarians repackaging and prescribing topical parasiticides, as discussed in 44 FR 62940 (Nov. 1, 1979) *Pesticide Use*

9.14. Medication Dispensing, Compounding, and Prescribing: Legal Considerations

and Production by Veterinarians; Statement of Policy on the Applicability of the Federal Insecticide, Fungicide, and Rodenticide Act to Veterinarians. Thus, a veterinarian may repackage a pesticide delivered in bulk, draw out a measured dose in syringes, and sell them to a client as a "producer" under FIFRA (i.e., one who repackages or otherwise changes the container of any pesticide). In so doing, however, generally the veterinarian would need to register the new product with the EPA, register the hospital, comply with all labeling and repackaging standards of the EPA, and keep all records required of producers under FIFRA and its implementing regulations, such as 40 CFR 167.5.

However, any such veterinarian who satisfies four conditions may bypass the registration, recordkeeping, and labeling requirements imposed by FIFRA. The conditions are: (1) ensuring the repackaged pesticide is registered by the EPA for a use consistent with the use for which the pesticide is prescribed, and the EPA registered use is nonrestricted; (2) complying with six labeling conditions (common or trade name and percentage of active ingredient, EPA product registration number, use directions for use prescribed, name and address of veterinarian, antidote statement, directions for disposal of pesticide and package dispensed to client, human safety precautionary statements, including but not limited to "For application to animals only," "Keep out of reach of children," and "In case of accident, contact local physician immediately"), which must be "physically attached" to the package or, if there is not enough room, to supply the antidote and disposal statements in a supplemental label, and the human precautionary statements physically attached to the container; (3) putting the pesticide in a child-resistant package unless the veterinarian finds no reasonable possibility a child will gain access; and (4) prescribe and dispense to the client for treatment of a specific pest problem, on a case-by-case basis, as part of the veterinarian's normal practice. The EPA urges veterinarians to discuss labeling instructions with the client at the time dispensed.

COMPOUNDING

Compounding of finished form animal drugs is ELDU, so the veterinarian should mind the AMDUCA and implementing regulations, as well as state pharmacy and veterinary practice acts. See also FDA Compliance Policy Guide § 608.400 *Compounding of Drugs for Use in Animals* (http://www.fda.gov/ICECI/ComplianceManuals/CompliancePolicyGuidanceManual/ucm074656.htm). Remember that cost savings to the client does not furnish a basis to engage in ELDU. Compounding includes flavoring, mixing injectables, and/or converting to a drug form administered through a different route (e.g., pill to injectable, oral suspension, or transdermal gel).

With respect to autogenous biologics, which are not regulated by the FDA but instead by the USDA Animal Plant Health Inspection Service Center for Veterinary Biologics, veterinarians may produce them when nonautogenous products are unavailable or ineffective, and then only under sterile and safe conditions in compliance with USDA regulation 9 CFR §§ 101.2 and 113.113, as well as VS Memos 800.69 and 800.103. See http://www.aphis.usda.gov/animal_health/vet_biologics/vb_cfr.shtml and http://www.aphis.usda.gov/animal_health/vet_biologics/vb_vs_memos.shtml.

THERAPEUTIC DIETS

Whether "prescription" or therapeutic diets are regulated by the FDA as food, drugs, or nutraceuticals remains unclear, although the intended marketing message that they cure, treat, or prevent animal disease certainly gives the FDA considerable regulatory leeway. On September 10, 2012, the FDA-CVM published a draft compliance policy guide titled *Labeling and Marketing of Nutritional Products Intended for Use to Diagnose, Cure, Mitigate, Treat, or Prevent Disease in Dogs and Cats*, § 690.150 (77 FR 55480), recommending a soft regulatory touch against therapeutic food producers provided they comply with nine enumerated factors (including, most notably, limiting distribution to veterinarians where disease indications are labeled, and stripping the label of disease indications if sold from outlets other than veterinary clinics) and clarifying its position that such diets constitute "drugs" as defined by 21 U.S.C. § 321(g)(1)(B) and "food" under 21 U.S.C. § 321(f), which may further be deemed "adulterated" under 21 U.S.C. § 351(a)(5) and 21 U.S.C. § 351(a)(2)(B).

9.15. PHARMACY MANAGEMENT AS A PROFIT CENTER

BASICS

OVERVIEW

• The role of the pharmacy continues to evolve in veterinary practices, especially in the United States.
• Dispensing still makes up 25–30% of revenue in many practices, but it seems to be trending downward as there is increased competition from alternate retail channels.
• In most veterinary practices, dispensing is divided into prescription, over-the-counter, and diet sales. As a subcategory, parasite-control products (both prescription and nonprescription) are the leaders in revenue generation, but these product sales are also most vulnerable to outside retail competition.
• Pharmacy management requires attention to inventory management, but also to strategic opportunities and challenges that can impact this important profit center.

TERMS DEFINED

Acquisition Cost: The unit cost at which a product or service can be purchased, including any delivery fees and/or taxes.
Inventory Turnover: Also known as inventory turns, merchandise turnover, stockturn, stock turns, turns, and stock turnover, this refers to the cost of goods sold divided by the average inventory. It is a measure of the number of times inventory is sold or used within a time period.
Production: A form of commission paid to veterinarians on the basis of their revenue generation.
Shrinkage: Product reduction due to wastage, loss, or theft.

ISSUES AND OPTIONS

• The pharmacy has become an extremely competitive revenue center for veterinary hospitals, as the marketplace has become crowded with retailers offering similar or even identical products.
• There was a time when many products sold by veterinary practices were available almost exclusively through veterinary channels, but that may just be a fond memory for many veterinarians as they are faced with a new reality in dispensing.

THE PHARMACY AS PROFIT CENTER

• The main marketplace changes that have occurred that have had the most impact on veterinary practices are the more mainstream sale of products through retailers, and the increased "share of voice" these retailers have with pet owners. It is now very easy for consumers to find their products of interest from various retailers, online and otherwise, and to shop for the best prices and delivery options as well.
• The other aspect of dispensing that cannot be ignored if veterinarians want to dispense profitably is that inventory is not typically managed efficiently and effectively, given its critical contribution to hospital income (see 9.11 – Effective Inventory Management). Thus, many practices carry too much inventory given their small retail footprint, and so the typical ordering and carrying costs are often excessive given turns associated with those products. Because of this, even if such inventory generates "revenue" for the practice, it may not generate sufficient "profit" given the costs involved.

PRICING

• Most veterinary practices use a combination of markup, margin, and community pricing for pharmacy items (see 7.12 – Pricing Strategies). Markup involves calculated additions to the acquisition price, margin involves calculating the profit margin on a fee after factoring in direct and indirect costs, and community pricing involves matching the price of value leaders for the same or similar products.
• Pet owners may not bother comparing costs on a one-time prescription (such as for treating a urinary tract infection), but comparison shopping should be anticipated for medications used chronically and those used for parasite control.
• This loss of business can be insidious, but it can also be devastating to the long-term success of the veterinary pharmacy. For instance, veterinarians may not be aware that parasite-control products typically represent the majority of their prescription dispensing revenue, and we have now reached a critical point in which over half of pet owners are buying their flea and tick control products through nonveterinary channels.
• In some practices, dispensing is not strictly a retail activity, and a commission (production) may be paid to veterinarians based on the products they recommend and dispense. There is nothing wrong with this in principle; but since retailers do not do this, it serves as one more impediment to competitive pricing, since the veterinary price to consumers must reflect both fair pricing for the product itself and the commission to be paid to the veterinarian, making the veterinary price often significantly higher than that of the retailer.
• Similarly, adding a dispensing fee is something that veterinarians have historically done, but it also inflates final product costs to the consumer when our competition does not do the same.

MANAGING INVENTORY COSTS

• The best ways for veterinarians to profitably provide dispensing is to limit the number of products stocked to those that make medical and financial sense, ensure that product recommendations are routinely made by the hospital team so that product turns are optimized, promote compliance so clients give the medications as directed and for the correct interval (including refills), and price fairly so that there are few or no obstacles to client acceptance and purchase.
• From a medical standpoint, the best way of limiting inventory is to create standards of care within the hospital, and primarily stock products that satisfy those standards of care (see 9.3 – Standards of Care and Care Pathways).

PARTNERING WITH AN ONLINE PHARMACY?

• Veterinarians do not need to stock everything in their own pharmacies in order to provide more complete retail options to their clients.
• If hospitals concentrate on stocking products for which they have good turnover, profitability, and compliance, then it makes sense to let someone else shoulder the inventory costs for other products that might be used infrequently, or for which there is not adequate profit margin, or that did not make it into the hospital's standards of care.
• The only other products to stock that do not meet those criteria are emergency drugs (which are not "shopped" and thus do not require competitive pricing) and "starter" packs to commence treatment and for which longer term therapy may eventually be outsourced (e.g., diets, parasite-control products, nonsteroidal anti-inflammatory drugs).
• Online pharmacies that work with veterinarians (such as VetSource, Covetrus, and others) allow veterinarians access to a wide range of products that can be provided for home delivery, but the inventory itself is held and managed by the online pharmacy.
• The online pharmacy has its base price on products for the veterinary hospital, to cover the product direct and indirect costs and a profit margin for the online pharmacy. The veterinary hospital can then establish the retail price for its clients and the difference between the base price and the retail price (less any merchant fees) is paid back to the practice as margin. In this way, practices can make profit on inventory that they never have to stock.
• Veterinarians can sometimes fool themselves into believing that they make more money selling the products from their in-house pharmacy because it is cheaper to buy the products directly from the manufacturer or distributor, but that often neglects the fact that there

are very real ordering and carrying costs for inventory (often 20–45% of the direct product costs), and for many products it is actually more profitable to dispense them from an online pharmacy than to stock them in the hospital.
• Online pharmacies not only allow veterinary hospitals to limit their in-house inventory expenses, but in many ways they may actually improve profitability of dispensing in general. They virtually eliminate shrinkage (product reduction due to wastage, loss, or theft) since those products are not available in the hospital to be diverted. Without having to contend with inventory costs, every online product sale can be profitable. The same cannot be said for in-hospital pharmacy sales.
• When it comes to online pharmacies, pricing can be competitive by design. There may be less profit margin for some products than others based on retail competition, but since there are no direct or indirect inventory costs it is possible to compete even with slim margins.
• Another benefit of online pharmacies is that compliance is often much improved, especially for chronic medications and parasite-control products. Once the medication has been prescribed and the number of refills documented, it is typically the online pharmacy that follows up with clients to ensure they are getting their refills in a timely manner. Not surprisingly, this feature alone has been responsible for increased pharmacy profitability and customer satisfaction in many instances.

HOSPITAL TEAM CONSIDERATIONS

• Paying production (commission) on products tends to inflate the costs of those products to the consumer and so is likely not sustainable in the long run as practices attempt to keep the price of products competitive for clients. Clients who purchase products outside of the veterinary channel, such as buying from a retailer or an unaffiliated internet pharmacy, do little to support veterinary hospitals directly or indirectly. That represents lost opportunities for everyone concerned.
• For hospitals that compensate their doctors based on "production," online pharmacies can cause some trepidation as veterinarians wonder if they are going to make less money when fewer products are being dispensed directly and for which they would otherwise receive a commission. It is certainly a concern, but there are ways of structuring things to minimize that angst.
• Interestingly, clients may pay the online pharmacy for products and characterize that spend as separate from the veterinary hospital, and still spend comparably at the hospital because that is their expectation. Thus, if clients are used to spending $*x* during a veterinary visit, many will still spend close to that amount (perhaps opting for additional diagnostics, dental care, etc., if offered), and consider the bill from the online pharmacy as a separate expenditure.
• If that does not happen, some hospitals have altered the percentage compensation on professional services, or even switched from revenue-sharing (production) to profit sharing based on the margins that the online pharmacy pays to the hospital. It is worthwhile to everyone to make this a win–win situation, since it lowers costs for the hospital, which in turn allows the hospital to lower costs to clients, which itself leads to greater compliance and client satisfaction.

EXAMPLES

N/A

CAUTIONS

• Veterinary hospitals need to evolve in their handling of dispensing, or they run the risk of ongoing erosion of this important revenue stream.
• Since pharmacy is still the largest revenue-generating category for most practices, veterinarians need to consider strategies to maintain a meaningful share of this dispensing revenue, or change the veterinary business model so that it is not quite so dependent on this source of income.

MISCELLANEOUS

Veterinarians are not retailers, and most hospitals do not adequately track their inventory and its profitability, so adding some rigor to the process can greatly improve the sustainability of this service.

9.16. RETAIL SALES: THE ART AND THE SCIENCE

BASICS

OVERVIEW

The American Pet Products Association's (APPA's) *2017–2018 APPA National Pet Owners Survey* (americanpetproducts.org) indicates that 68% of US households own a pet, which equates to 84.6 million homes. APPA also indicated that the estimated expenditure these households spent in the year 2018 was $72.13 billion.

The American Animal Hospital Association's *Financial & Productivity Pulsepoints*, 9th edition, indicates that product sales account for more than 25% of hospital income. Though these studies show that pet owners will spend record amounts on their pets, the marketing mix for veterinary hospitals is changing, especially with placement of products. The theme of "pet products sold here" is increasing through a variety of retail outlets. Veterinary hospitals need to look at the products they sell as a commodity and have the goal of satisfying a client's needs through providing sufficient information about products they sell as well as providing convenience by using other outlets, such as online stores and home delivery.

Retailing and merchandising is an area of practice where many veterinarians feel uncomfortable. Some hospitals feel offering retail is unprofessional and they should only provide veterinary services. The reality is that clients go to the veterinarian for advice on products, as well as services. If they do not buy product from their veterinarian, they will buy from somewhere else. The other misconception is that "retail" only consists of over-the-counter supplies (e.g., leashes, toys, collars, flea/tick products), when in fact most products within the hospital can be well marketed with proper retail placement techniques.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

SIGNS, TAGS, AND STICKERS

If you have any products on display in your hospital lobby or exam room, be sure to have a simple identifier that categorizes what type of product it is. For example, if you have shampoos, have a sign above it that says "Shampoos." When many products are on display without signs to help direct clientele, it can be difficult to get them engaged in the items because they do not know what the products are. You can also have on your sign a statement emphasizing the frequency the product needs to be used. For example, you may say, "to be used monthly" for flea/tick products and some heartworm preventives.

If you have products on display without a price tag, your sales could be decreased by as much as 60%. This is because without a price it can develop a fear within the client that they cannot afford the product.

If you are competitive on pricing, be sure that your price tag represents not only the cost to the client but also the savings that they are getting from not purchasing elsewhere. Price stickers should never cover the product name. Price stickers should be placed in the same place on each product. Prices ideally should be on the left side of the product at either the top or the bottom. To make a product more exclusive, place the price sticker on either the back or bottom of the product. This will engage the client by having them need to feel and touch the item.

All products that leave with a client need to have the hospital name and phone number on them. If it is a nonprescription product, this can be simply done with an address label. Some distributors and manufacturers offer private labeling for items such as shampoos, ear cleaners, and joint products. Private labeling looks very professional by branding the hospital logo and contact information on the bottle.

For any signs, stickers, and tags, be sure to:

- check spelling and grammar;
- avoid having signs handwritten, as it can appear sloppy and unprofessional;
- ensure text is not too long;
- use clear and simple typeface;
- remember price gun and label stickers will fade, so change stickers as needed.

REMERCHANDISING/PRODUCT PLACEMENT/DISPLAY

- By regularly changing displays, you can increase product sales by 100%. Displays with products that have special pricing can increase by as much as 300%.
- Designate a creative staff member to change displays at least monthly, because many of your clients come to your hospital monthly (for refills, puppy and kitten visits, diets, etc.). Utilize marketing pet observances (e.g., senior care month, diabetes month, animal safety month) to creatively market your lobby and exam rooms.
- Make sure every product is divided evenly (same space in between) and in a separate compartment or hook.
- Organize products by similarity, size, and color.
- On a daily basis, products should be "faced" forward and not be pushed backward on hooks or shelves. Facing products can make your shelves look full without having to clutter with a large quantity. Find the right balance of how much of each item to have on the shelf. Try to avoid having only one of each item on display, because it makes the product appear too exclusive; but avoid having too much, which will make your shelf appear messy or increase the risk of theft (or create the impression that the products have not sold well). A good quantity balance is to have three of every item on display.
- Keep all shelving and displays clean and dust free.
- Incorporate focal points and props when merchandising new products or seasonal items. Focal points and props are used to catch the eye of your clients. Manufacturers can be a good resource for getting props, or online resources such as www.stuffedanimals.com can allow you to purchase items like stuffed fleas, ticks, heartworms, and so on.
- Utilize display cases for your more expensive or exclusive products.
- Composition is a key to successful merchandising. You should compose your products into a pyramid shape to ensure all elements are visible. Plan the highest point of the composition in the center of the grouping and reduce the height of items toward the outer edges. There can be small pyramids within the larger pyramid composition.
- Use caution when products are placed close to the floor (e.g., food), as dogs can easily soil or otherwise damage these items.
- Follow the "rule of the right." When dealing with products that come in variable sizes or number of doses, it is recommended for these items that the larger sizes be placed to the right of the smaller sizes. Because the majority of people are right handed, it is thought that people have an increased tendency to purchase product on their right side regardless of size as long as it meets the needs of the client/patient. If you have any "slow-moving" retail items, place them to the right of popular or "fast-moving" items.
- Be sure to choose the correct retail fixtures for your hospital. Gondola (a type of display shelving) fixtures are the most common and easiest to use for a standup fixture. They are sturdy and can have accessories such as shelf dividers and peg hooks to hang small retail items such as toothbrushes. If you are limited on space, slat boards or slat walls can be a good option. Slat boards are a retail storage system that hangs on a wall. You can incorporate shelving and peg hooks without having to take up floor space.
- Because a client's comprehension rate is only 10% from reading, try to avoid having too many brochures in your lobby and exam room. Only use brochures for your "A" products or have a brochure next to a product you already have on display for the client to take as a reminder.

9.16. Retail Sales: The Art and the Science

POINT-OF-PURCHASE RETAIL

- Treats, toys, or seasonal items (e.g., first-aid kits, dental care packages) should be considered point-of-purchase items.
- Point-of-purchase items should be on display within 40 feet (12 m) of where clients check in and check out.
- Point-of-purchase items should be at eye level. Treats should be easily reachable for the elderly and identifiable to children.

ONLINE STORE PRODUCT PLACEMENT

At this point in time, it is safe to assume that most veterinary clients have Internet access of some kind, and many or most will be using smart devices. Online sales are even beating bricks-and-mortar store sales in many categories. A veterinary hospital needs to offer convenience to their working demographics (see 10.22 – Online Retail: Making it Work).

Internal Value of Hospital's Online Store

- A hospital online store and/or home delivery program allows you to expand your formulary without expanding your inventory.
- You can reduce redundancy of product lines.
- Shift expensive products to online stores so you pay only as you need them.
- Offer cans and small bags of diets for sale in the hospital to get a client started on the diet, but then have the client purchase large bags from the online store.
- Getting clients to purchase chronic-use products through the hospital's online store will reduce the staff time of in-house dispensing, as well as increase compliance.

Client's Value of Hospital's Online Store

- Convenience, by being able to order 24/7 and products delivered.
- Save money, as the hospital can offer more competitive pricing through their online store.
- Pet owner is in control of their purchases.
- Pet owner is able to maintain a relationship with a trusted source.

Keys to a Successful Online Store

- Have a project leader to monitor and set goals for the online store.
- Have training programs for the entire staff to ensure they are confident in recommending the online store to clients.
- Set goals to reach each month for sales made through the online store.
- Offer incentives to staff members that get a client to purchase from the online store.
- Review the current compensation program for veterinarians regarding medication refills. Associate veterinarians might be reluctant to recommend a client purchase from the hospital's online store because they may feel they will not be compensated for the sale. Some practices will offer compensation for the first time a prescription is filled only and build a higher compensation package with professional services rather than prescription refills.
- Incorporate a computer station in the hospital lobby. This computer station will be for clients to learn how to use the hospital's online store as well as how to navigate the website.

9.17. VETERINARY FEED DIRECTIVES

BASICS

OVERVIEW

The US Food and Drug Administration (FDA) created federal regulations that require veterinary oversight of commonly used antibiotics in food animal feedstuffs. The antibiotics affected by these rules are labeled as Veterinary Feed Directive (VFD) drugs and are classified as medically important antibiotics.

For a producer to purchase VFD drugs, they must have a written VFD order from a veterinarian. To write and issue the VFD order, a veterinarian–client–patient relationship (VCPR) must be established with the client and their animal(s). Prior to 2017, many VFD drugs were labeled for over-the-counter purchase, but now a veterinarian must oversee the usage of these drugs.

TERMS DEFINED

Category I Drugs: These drugs do not require a withdrawal period when used in a food-producing species.

Category II Drugs: These drugs require a withdrawal period when used in food-producing animals and are regulated on a "no-residue" basis.

Combination Veterinary Feed Directive (VFD) Drug: An approved animal drug that is intended for use in
or on animal feed in combination with at least another animal drug under the professional supervision of a licensed veterinarian. Animal feed containing a combination VFD drug must be authorized by a lawful VFD order.

Duration of Use: The length of time that an animal feed containing the VFD drug is allowed to be fed to the animal(s).

Expiration Date: The specified period of time for which the VFD is valid. After the expiration date of the VFD order the drug should not be fed. The expiration date cannot exceed 6 months after the issuance date of the VFD order.

Major Species: Cattle, horses, swine, chickens, turkeys, dogs, and cats.

Medically Important Antibiotics: Antibiotics that are used in both veterinary and human medicine and are characterized by the World Health Organization and the FDA as important for therapeutic use in humans. For example, macrolides and tetracyclines are "medically important" but ionophores are not, because they are not used therapeutically in humans.

Minor Species: Animals, other than humans, that are not considered major species (i.e., cattle, horses, swine, chickens, turkeys, dog, cats).

Production Label Claims: A label claim that was not for disease control, treatment, or prevention, but was for an enhancement to production, such as "increased rate of weight gain" or "improved feed efficiency." These label claims were voluntarily withdrawn by drug manufacturers in 2016, and the FDA will no longer approve a drug application with a production claim.

Refills: The VFD cannot allow refills unless the label specifically allows refills. If a label is silent to refills, then refills cannot be authorized.

Type A Medicated Article: This is a drug in its most concentrated form and is intended for creation of another type A article or mixture into a type B or C medicated feed.

Type B Medicated Feed: This feedstuff contains an animal drug that is mixed with vitamins, minerals, and/or other nutritional ingredients by weight.

Type C Medicated Feed: This is a complete feed that is mixed from a type A or type B feed and is ready to directly feed "free-choice" or "top dress" another feed.

Veterinarian–Client–Patient–Relationship (VCPR): Regarding veterinary feed directives, a relationship with the client and veterinarian that is required at the federal level and by most states. The veterinarian must have "sufficient knowledge" of the animal before issuing a VFD order. This relationship can only exist if (1) the veterinarian has personally examined or visited the premises where the animals are kept, (2) the veterinarian has assumed responsibility for the medical judgments regarding the animals, (3) the caretaker of the animals has agreed to follow the instructions of the veterinarian, and (4) the veterinarian is readily available for follow-up.

Veterinary Feed Directive (VFD) Drug: A drug intended for use in or on animal feed that is limited by an approved application to use under the supervision of a licensed veterinarian. Use of animal feed bearing or containing a VFD drug must be authorized by a lawful VFD order.

Veterinary Feed Directive (VFD) Order: A written (nonverbal) statement issued by a licensed veterinarian in the course of the veterinarian's practice that orders the use of a VFD drug or combination VFD drug in or on an animal feed. This written statement authorizes the client (owner or caretaker) to obtain and use animal feed bearing or containing a VFD drug or combination VFD drug to treat the client's animal(s) only in in accordance with the conditions for use approved by the FDA.

ISSUES AND OPTIONS

- A federal VCPR requirement exists for issuance of a VFD order, but many state veterinary practice acts also contain a VCPR. If the state VCPR requirement is more rigorous, then it controls. If the state either does not have a VCPR requirement or if it is less rigorous, then the veterinarian must follow the federal VCPR requirement. The FDA publishes a resource of which VCPR controls in each state.[1]
- The issuance of a VFD order requires the creation of at least a presumptive diagnosis by the veterinarian. This presumptive diagnosis must match a labeled indication for the VFD drug.
- A requirement of the VCPR is that the veterinarian must either examine or make timely visits to the premise where the animals are housed. Since a VFD cannot be issued for more than 6 months before it expires, then an examination or site visit must be made in the previous 6 months before issuing the VFD order. The regulations also require a "personal" visit by the veterinarian, not an assistant/technician, or video/teleconference.
- The medical record should reflect the issuance of a VFD, the indications for the VFD, and either a presumptive or definitive diagnosis that matches the labeled indication for the VFD drug used. The medical record should also state how the veterinarian gained the sufficient knowledge about the animals to issue the VFD order. This would be the examination findings or notes regarding the site visit to the premises where the animals are housed.
- The veterinarian issuing the VFD must be licensed in the state where the animals are being fed the medicated feed.
- Although a veterinarian can charge the client for writing a VFD order, it is unlikely to equal the revenue production of other areas of mixed animal or food animal practice. To provide value, use VFD site visits as consulting opportunities on vaccination protocols, nutritional advice, husbandry techniques, or other value-added veterinary advice. The VFD order could be an opportunity to educate and consult with a client to prove the value of veterinary expertise and advice. Also, from an efficiency standpoint, combining trips with other close-by facilities, or other site visits for veterinary work, and good recordkeeping could reduce the number of trips and costs associated with issuing a VFD order.
- The FDA has issued guidance for completing VFD orders. The client is the caretaker of the animals, who may be the owner or a person that is responsible for the care of the animals. The address is the physical address of where the animals are housed, which may not be the mailing address of the owner or caretaker. If a mailing or physical address does not exist, Global Positioning System coordinates may be used to identify the location of the animals. If the animals are to be moved

during the feeding of the VFD, the best practice would be to issue two VFDs, one for each location.

- When writing a VFD, follow the label for the drug and indication that you are using. Extralabel use of VFD drugs is never allowed. Use caution when writing VFDs for trade name legend drugs and generic equivalents that may have different labels and for drugs used in combination therapy, which may have different labels for combinations with other drugs. Other fields on the VFD that must match the label include the duration of use and the indication.
- The VFD rules require that the "approximate number of animals" being fed the VFD drug must be recorded.
- The VFD rules require that the veterinarian takes responsibility for transmitting the VFD to the feed mill for mixing of the VFD feed. This allows for the paper production of the signed VFDs and scanned electronic transmission via e-mail or fax. The VFD order could also be hand delivered or mailed. Programs exist for fully electronic transmission of VFD orders, but they must be compliant with other FDA electronic transmission rules.
- The VFD rules require that the veterinarian store the VFD order for two years after issuance. State veterinary practice acts may require storage of medical records longer than two years.
- Antibiotics that are not fed to food-producing species, in their feed or water, are not affected by the VFD rules. Oral boluses or other oral administration, injectable, and topical antibiotics are not affected. Antibiotics fed to non-food-producing animals that are members of a food-producing species are affected. For example, backyard or pet chickens receiving water-based tylosin and pot-bellied pigs receiving chlortetracycline mixed in feed would be subject to the VFD rules.

EXAMPLES

Specific classes of drugs that are affected include aminoglycosides, lincosamides, macrolides, penicillins, sulfas, and tetracyclines.

CAUTIONS

OVERSIGHT AND ENFORCEMENT

The FDA has jurisdiction over veterinarians that write, issue VFD orders, and use VFD drugs negligently. Currently, there are no plans to collect or gather VFD orders from veterinarians, feed mills, or producers. The state veterinary boards and the veterinary licensing agency have jurisdiction over licensed veterinarians in the state. If a complaint is received regarding the issuance of a VFD, then the state board will investigate the standard of care gaining the sufficient knowledge in the VCPR, forming the presumptive diagnosis and the usage of the VFD drug.

The extralabel use of VFD drugs in minor species is technically illegal, but the FDA has indicated that it will use enforcement discretion when a veterinarian is faced with no other viable options for treatment.[2]

9.18. ADDING EMERGENCY SERVICES

BASICS

OVERVIEW

Primary care practices and specialty practices (see 1.25 – Specialty and Emergency Centers) often consider "going 24/7" through the addition of after-hours emergency services as a growth strategy. There are important strategic and operational issues to be evaluated in planning for adding after-hours emergency services. Planning tools such as feasibility studies and strengths, weaknesses, opportunities and threats (SWOT) analysis can help to evaluate the likely success of adding emergency services. Review of the practice's readiness by areas of key business function and mitigation of key risk factors can lead to successful implementation.

TERMS DEFINED

Feasibility Study: Feasibility studies aim to objectively and rationally uncover the strengths and weaknesses of an existing business or proposed venture, opportunities, and threats as presented by the environment, the resources required to carry out the venture, and ultimately the prospects for success.[1]

Intensive Care Unit (ICU) Flow Sheets: These are records of treatments, observations, and nursing notes that are often kept with the patient while in the hospital. Also known as treatment sheets.

Pros/Cons Analysis: A decision-making tool that weighs advantages (pros) and disadvantages (cons) of a contemplated change. Weighting may be assigned to various pros and cons.

Talent Acquisition: The process of finding and acquiring skilled human labor for organizational needs and to meet any labor requirement.

SWOT Analysis: A strategic planning method used to evaluate the strengths, weaknesses/limitations, opportunities, and threats involved in a project or in a business venture.

ISSUES AND OPTIONS

FEASIBILITY STUDY

The feasibility study for adding emergency services should weigh the strategic factors in terms of fit with the practice's mission and vision. It should also consider strategic and operational issues regarding the practice's readiness and the resources that will be required for implementation. Use of a SWOT or pros/cons analysis can be very useful as part of the feasibility study (see 6.7 – Basic Tools of Marketing). Useful questions to consider include:

- Will providing these services change our position in the local or regional marketplace?
- What value will these services provide to our clients?
- How could it augment or diminish the quality or reputation/brand of our practice?
- Can the emergency services and 24/7 operations be successful based only on caseload from the current practice or will referrals from or alliances with other providers be needed? If referrals are needed, what are the current relationships with key sources of referrals?
- How do you ensure successful talent acquisition for qualified experienced clinical staff, notably clinicians and technicians/nurses? This is a critical risk factor for any new or expanding emergency service, and much more importance should be placed on this than in years past.
- Are these services currently being provided in the community and, if so, by which providers?
- How can the feasibility analysis be supported by data rather than by intuition? Consider demographic analysis (see 1.4 – Veterinary Trade Areas) of the community, evaluating the number of supporting veterinary clinics, the number and types of similar services that exist currently, and the trends in community economics, such as unemployment rate, per capita and household income, and rates of pet ownership. Evaluate the number of existing emergency cases from the practice that are currently being treated by other providers.
- What are the risks if the service does not succeed as planned, and how might these risks be mitigated? Typical risks would include fewer referrals or lower revenue, profit, and cash flow than anticipated.
- Are there resources available to support the project, such as management capacity, facility space, money, and smoothly running existing operations?
- How will the performance of the new operations be monitored, in terms of data, profitability, and milestones?

SWOT ASSESSMENT

The SWOT assessment is essential because subsequent steps in the process of planning for achievement of the selected objective may be derived from this analysis (see 6.7 – Basic Tools of Marketing).

- Strengths: characteristics of the business or project team that give it an advantage over others.
- Weaknesses: characteristics that place the team at a disadvantage relative to others.
- Opportunities: external chances to improve performance (e.g., make greater profits) in the environment.

• Threats: external elements in the environment that could cause trouble for the business or project.

OPERATIONAL ISSUES

The operational issues for starting emergency services within an existing practice are complex and require a considerable amount of planning. A good approach is to review the impact on key dimensions of the practice, as shown in the following examples. Policies or protocols may be needed in some or all of the areas listed.

EXAMPLES

CLIENT SERVICE

• **Client communication.** These include progress updates, visitation and discharge policies, call routing, and handouts for common conditions. Develop scripting to ensure extensive medical advice is not being provided without a valid VCPR and that clients are encouraged to bring their pets in for examination.
• **Referral communications.** These include protocols for accepting referrals, progress reporting, involvement in case management, transfers internally and back to referring hospitals, patient death notifications, referral forms, and transmission of medical records.
• **Grief support:** Identify useful bereavement resources for clients.

CLINICAL OPERATIONS

• **Case transfer.** How to involve referring veterinarians in patient care and transfer decisions.
• **Clinical workflow.** Consider impact of emergency services on workflow of current operations, notably at transition times between services. Rounds protocol to facilitate case management quality and continuity.
• **Critical care.** Treatment of critically ill patients often requires advanced knowledge in triage, nursing care, and pain management. Advanced training in these areas may be needed for support staff.
• **Euthanasia.** Frequency of euthanasia is often increased relative to other types of practice. Consider systems and training regarding euthanasia processes, including supporting materials for clients, condolence cards, and memorial items. Consider training in bereavement (see 5.23 – Dealing with a Grieving Client), compassion fatigue (see 2.8 – Compassion Fatigue and Burnout), and compromise fatigue (see 2.10 – Compromise Fatigue).
• **Equipment usage policies.** Regarding usage of specialized equipment, such as surgical, ultrasound, or endoscopy equipment.
• **Hours of operation.** Identify hours of emergency service operations, giving special attention to weekends and holidays.
• **Medical records policies.** Format, timeliness, and review processes (see 9.1 – Medical Records and Patient Documentation). Internal documents such as ICU flow sheets may need review and modification.
• **On-call.** Review needs for staff and veterinarian on-call availability to cope with high volumes of caseload, sudden absences, or the need for advanced medical expertise.
• **Operating room policies.** Use, cleaning, and readiness of the operating room, and cleaning and prep of surgical instruments and packs.
• **Surgery.** Many of today's emergency veterinarians are not trained to perform the typical major (mostly abdominal) surgical procedures that were often performed by their counterparts in the past. Developing surgical capacity in the emergency service is essential, whether it is achieved through selective hiring of emergency veterinarians for this increasingly uncommon skillset, by training to develop surgical skills, or through coverage by veterinarians experienced in emergency surgery (possibly including board-certified veterinary surgeons).

EQUIPMENT/INVENTORY

• **Equipment.** Identify service agreements, training, or repair vendors for any new equipment.
• **Inventory management protocols.** New inventory items, including medical, janitorial, and office supplies. Modified stocking levels may be needed for certain items.

FACILITY

• **Hospital cleaning.** Prepare for markedly increased wear and tear on all parts of the hospital. May need to adjust timing or scope of cleaning and repair services.
• **Staff security.** Plans may include locking the facility at certain hours, alarms, panic buttons, webcams/video security, and handling of cash. Secure any high-value items in lobby.
• **Vendors.** May need to adjust frequency of services such as cremation pickup, oxygen delivery, and cleaning.

FINANCIAL

• **Compensation systems.** Increasingly, emergency departments are paying their staff doctors on pooled production methods. Other common variations include pure production, shift pay, ProSal (see Glossary), and pure salary (see 3.1 – Compensation).
• **Discounting.** Policies for referring veterinarians and their staff, and allied organizations such as animal shelters, law enforcement, etc. (see 8.17 – Discounting).
• **Invoicing and payment.** Training for invoicing, charge capture, invoice auditing, deposit policies, and payment and credit options.

9.18. Adding Emergency Services

• **Financial reporting.** New revenue or expense categories for reporting on financial statements may be needed. Prepare three-year projections for the new operations and develop processes for reporting results and annual budgeting.
• **Veterinarian production tracking.** Track total department production, individual doctor production, average client transaction, and caseload.

HUMAN RESOURCES

• **Communications.** Communicating with staff working on a 24/7 basis can be challenging. Planning should consider team meetings; many 24/7 practices use split, duplicate, and recorded meetings. Consider ancillary methods of communication, including video, e-mail, newsletter, and intranet.
• **Compensation plans.** Include method of compensation for veterinarians and any differential shift pay for hourly staff.
• **Development and training.** Evaluate training needs for current or new staff regarding new processes, equipment, and software (see 3.10 – Staff Training).
• **Organizational culture.** Plan for integration of new staff and what will be the effects of change on current staff, including scheduling of practice social activities.
• **Regulatory and compliance.** If staffing changes lead to increased headcount, evaluate ramifications for legal and regulatory such as Consolidated Omnibus Budget Reconciliation Act, Family and Medical Leave Act, overtime, and other reporting and compliance issues.
• **Scheduling.** Develop staff schedules, and plan for holiday coverage and holiday pay rates. Develop on-call provisions, if needed (see 3.18 – Staff Scheduling Options).
• **Talent acquisition.** Evaluating and implementing overall staffing for a 24/7 environment is typically quite complex, and often requires transformation to a more strategic approach. Finding and retaining key clinical staff is increasingly a pivotal issue for successful long-term operation of an emergency service. The practice will need to systematically focus on all aspects of the talent acquisition cycle, including:
  ◦ **Staffing needs.** Carefully analyze the clinical staffing needs, which should include an intentional design of clinical workflow (see Clinical Operations section).
  ◦ **Recruitment.** Develop an awareness about best recruiting channels and practices, and understand the highly competitive environment that currently exists in most markets (see 3.7 – Effective Staff Recruitment).
  ◦ **Hiring.** Refine current hiring practices to accommodate current competitive nature for emergency veterinarians and technicians/nurses.
  ◦ **Retention.** Develop a formal plan for retention of key clinical personnel (see 3.20 – Staff Turnover and Retention). This becomes more important given the competitive recruiting and hiring environment, since recruiting and hiring will be wasted efforts if hired clinical staff cannot be retained. Retention plans should include various elements of communications, compensation development and training, and organizational culture plans.

INFORMATION TECHNOLOGY

• **Data.** Evaluate backup and disaster recovery, especially if backup typically occurs after hours (see 10.7 – Information Security: Backing Up and Archiving Your System).
• **Applications.** Evaluate licensing, usage, and capacity of applications (such as Microsoft Office) and e-mail.
• **On-call information technology (IT) vendor.** Make provisions for IT vendor availability after-hours in the event of network or equipment malfunction.
• **Practice information management software (PIMS).** Evaluate licensing (number of users), support, and upgrade status. New templates and new codes may be needed.
• **Ancillary software/applications.** Evaluate related software and applications interconnected with PIMS, including but not limited to clinical treatments, referral relationships, and pet owner engagement.
• **Workstations and printers.** Evaluate numbers, condition, and location of current equipment.

MANAGEMENT

• **Advisory.** Identify key sources of advice to avoid making common mistakes. Review plans with the outside advisory team, such as legal counsel, accounting firm, marketing firm, practice consultant, and so on.
• **Expertise.** Evaluate internal expertise in managing after-hours emergency services and plan to mitigate any shortfall. Hiring an experienced emergency veterinarian or criticalist can add a great deal of value to planning and implementation.

MARKETING

• **Community outreach planning.** May include law enforcement, animal control, breed groups, rescue organizations, and pet stores.
• **Promotional materials.** Evaluate the need for new or modified promotional materials, according to target groups of referring veterinarians and pet owners.

• **Publicity.** Methods of publicity for launch of the new services, including press releases, open house, newsletters to existing clients, website announcements, Internet listings, and direct mailing to referring veterinarians.
• **Referral outreach.** Plan outreach to referring veterinarians and practices. Methods may include open house, visits to referring veterinarians by management and/or clinical staff, continuing education offerings, and loyalty programs. Develop plans for conversion of answering services to ensure clients of referring practices know your services are recommended by their veterinarian. Conversion of answering services is often reported as one of the most challenging hurdles faced by new emergency services.

REGULATORY

• Evaluate compliance needs regarding controlled substances, hospital licensing, recordkeeping, and Occupational Safety and Health Administration.
• Verify planned operations are a permitted use according to zoning codes.

CAUTIONS

When adding emergency services, no single person or practice will be able to plan for every possible issue, but a good planning process will go a long way toward ensuring a successful implementation. Be sure to involve the practice staff and key advisors in the planning processes.

It is truly critical for practices to understand the current competitive landscape in recruiting clinical emergency staff, notably veterinarians and technicians/nurses. Failure to understand and plan for these dynamics is the most common reason for new emergency services to fail, or fail to thrive.

9.19. Integration of Hospice and Palliative Care into Practice

BASICS

OVERVIEW

• The number of geriatric pets has increased significantly, and this upward trend is expected to continue.
• In the United States, the percentage of pet cats over six years of age has increased from 24% in 1995 to approximately 47% in 2017; and in Europe, between 1983 and 1995, the number of geriatric cats more than doubled, and the number of geriatric dogs increased by 50%.[1]
• Pet owners are now seeking more specialized and personalized care during this senior life stage, and there is a rapidly growing, consumer-driven demand for veterinary hospice and palliative care (HPC) services.
• To better meet these client needs, primary care practices should consider implementing HPC services for patients who are geriatric or nearing end of life (EOL).
• A veterinary practice that gains a reputation for providing elevated, skilled, and compassionate HPC and EOL services will not only retain clients but will gain referrals as a result.

TERMS DEFINED

Compassion Fatigue (CF): A phenomenon defined as the emotional, social, and spiritual cost of caregiving leading to a decline in the desire, ability, and energy needed to empathize with and care for others that ultimately results in the loss of satisfaction in both the professional and personal life of the caregiver.
Hospice: A philosophy or program of care that addresses the physical, emotional, and social needs of animals in the advanced stages of a progressive, life-limiting illness or disability. Provided to the patient from the time of a terminal diagnosis through death, inclusive of death by euthanasia or by hospice-supported natural death. Addresses the emotional, social, and spiritual needs of the human caregivers in preparation for the death of the animal and the grief experience. Animal hospice care is enhanced when provided by an interdisciplinary team approach.
Palliative Care: Treatment that supports or improves the quality of life (QOL) for patients and caregivers by relieving suffering; this applies to treating curable or chronic conditions as well as EOL care.

ISSUES AND OPTIONS

ADDING HPC TO YOUR PRACTICE

HPC is appropriate for any pet that is facing EOL, regardless of life stage (see 1.24 – Hospice and Palliative Care). An HPC service is best delivered utilizing a dedicated and interdisciplinary team and involves a collaborative approach between the entire veterinary staff and client.

PRACTICAL CONSIDERATIONS WHEN IMPLEMENTING AN HPC SERVICE

Seeking Advanced Education and Training in HPC

The International Association for Animal Hospice and Palliative Care (iaahpc.org) offers a 125-hour RACE® -approved advanced education program, certifying licensed veterinarians and technicians in HPC.

Individual Responsibilities

• The practice will need to determine who will provide the various aspects of care.
• Utilize and invest in your veterinary nurses! The vast majority of hospice and EOL care centers around education and communication, which are often the most time-consuming aspects of the appointment.
• Educate and train nurses in areas of pain management, quality of life, and EOL decision-making to help streamline appointment processes and time.

Consider Extending Appointment Times

• There is a great deal of information and education that needs to be discussed with clients regarding EOL, and offering extended appointment times for HPC patients will greatly benefit your staff and your clients.
• Consider adding 15 minutes to HPC appointments, and track metrics such as average client transaction, owner compliance (willingness to perform diagnostics, administer medications), overall client satisfaction, and improved QOL for patients.
• Charge accordingly. Many people will willingly pay more to have more time with you, and it is important to meet these client needs. If you do not, someone else will.
• If longer appointment times for HPC are a concern to the practice, consider starting with one or two of these appointments per day and assess metrics. These appointments should be considered a longer term practice investment and a barrier to competition.
• Consider offering "split" appointments or a virtual patient intake utilizing telehealth. Nurses trained in HPC can obtain a thorough history and begin to educate and prepare clients for the medical portion of the appointment. Nurses can skillfully screen patient history and client concerns using various assessment tools (behavior assessments, geriatric intake forms, Subjective Nighttime Restlessness Evaluation, Feline Musculoskeletal Pain Index, Colorado State University pain scale). The doctor can then spend 20–30 minutes discussing medical recommendations, already having a focused plan based on information gathered by the nurse, thereby increasing efficiency while decreasing cost of care to the practice.
• This approach to appointments will not only allow for sharing the burden of client care between the doctors and nurses but will also increase the nurse's autonomy and improve job satisfaction, as well as decrease the risk of CF and burnout for both staff members.

Treatment Locations

• The veterinary staff and client will need to determine the frequency of recheck exams and where care will be delivered; options can include in the hospital, in the home, or a combination of both locations.
• Emphasis should always be placed on maximizing care in the home whenever possible.
• Consider offering in-home appointments, even if just one day a week. Appointments can be done by a veterinarian, by a technician/nurse, or a combination of staff.
• If veterinary staff cannot provide in-home care, telehealth is an excellent assessment and communication tool, and this option should be utilized whenever possible to reduce return visits to the clinic. A real client concern is subjecting their debilitated pet to a car ride or exposing them to a stressful hospital setting, and you can address these pain points by offering alternative options for patient evaluation and client communication.

Client Education

• Always ensure the client is willing and able to provide the recommended home care interventions.
• All clients should be provided with detailed education regarding the HPC plan in a language they can understand.
• Education should include various forms of delivery, including verbal, written (using both words and illustrations), and video whenever possible.
• When giving instruction to various care tasks, such as subcutaneous fluid administration, take a "see one, do one, teach one" approach to client education.

9.19. Integration of Hospice and Palliative Care into Practice

Environmental Modifications

If a staff member is unable to visit a client's home, have families provide video of their pet's environment to assist with home modification interventions to ensure patient safety.

Safety and Hygiene Education

- Discuss considerations for safe handling of patient medications.
- Discuss considerations for safe and humane handling of pets with pain, including bite injury prevention.
- Discuss considerations for safe handling of body fluids, such as urine or secretions from nonhealing wounds.

Periodic Plan Assessments

- Ensure frequent assessment of plan efficacy, and implement changes to the treatment plan based on patient response.
- Ensure frequent evaluations of the client's compliance and their impressions of plan efficacy.
- Ensure frequent assessment and revision of personal treatment and QOL goals based on current patient and client status.
- Ensure frequent reassessment of patient prognosis based on response to interventions.
- Revisit discussion of euthanasia if patient suffering or diminished QOL is present (due to lack of compliance, failure to respond to therapies, progression of disease, etc.).

ELEVATING PERCEPTION OF VALUE BY IMPROVING THE IN-CLINIC EXPERIENCE FOR YOUR HPC PATIENTS

Show You Care with a Focus on Comfort

- Take senior pets directly to the exam room to avoid unnecessary "getting up and downs," *and* be sure to let clients know in conversation that this is what you are doing; they will appreciate the thoughtfulness.
- If pets do need to stay in the waiting room, provide cushioned seats for additional comfort.
- Bring clients a blanket that has been warmed in the dryer (or invest in a towel warmer); this extra touch goes a long way. Share with owners that warmth feels good for pets with arthritis and that some older pets are more affected by the cold due to loss of muscle and fat as they age.
- Always employ gentle holding and "fear-free" techniques (see 4.14 – Developing a Fear-Free Hospital). Senior pets can be fragile and more prone to injury.
- Place yoga mats or interlocking foam mats in waiting room and exam room areas for improved traction.
- Ensure you have thick blankets or bedding already waiting in exam rooms.
- Use appropriate padding and support when obtaining diagnostics; share this with your clients to build trust when diagnostics are performed.
- Promote a calming environment, such as lighting, pheromones, using an exam room that is in a quieter part of the hospital if possible, being mindful of body language and tone of voice.
- Always examine medium and larger patients on the floor, not on tables.
- Use harnesses instead of leashes when indicated.
- Perform as many tasks and sample collection in the exam room as possible. When obtaining blood, utilize local anesthetic cream (lidocaine, prilocaine, etc.) for pain-free venipuncture; clients will appreciate this additional caring step and concern for patient wellbeing.
- Consider reserving a dedicated parking spot near the front entrance for elder pets.

DEVELOPING AN HPC TREATMENT PLAN

The following four-step process will help the veterinary team implement an effective HPC plan and provide consistency of care.

Step 1: Educate the Client about the Pet's Disease

- The more a client understands about general disease progress and progression, the better they will be able to execute their caregiving role.
- Education regarding the expected disease trajectory is vital and should include discussion of diagnostic and treatment options, therapies, prognosis, and anticipated cost associated with care.
- Detailed descriptions of each diagnostic, *especially how results will influence a patient's care and plan*, are a vital part of communication and will allow the client to make informed decisions.
- The care team should communicate information in a language that the client can easily understand (see 5.5 – Translating Medicalese: Client-Centered Communication).

Step 2: Evaluate the Pet Owner's Needs, Beliefs, and Goals for the Pet

- It is vital for the veterinary team to explore the client's needs, beliefs, and goals for their pet's EOL care.
- Treatment goals should be as specific and as measurable as possible, as well as recorded in the patient's medical record.
- It is helpful to have a checklist of questions to discuss with the client; this can serve as a guideline for developing a personalized HPC plan (see online resource, *Hospice Intake Form*).

Step 3: Develop a Personalized HPC/EOL Treatment Plan

- All HPC plans begin with a thorough assessment of the patient's physical, social, and emotional needs (see "Address the patient's physical, social, and emotional needs" section).
- It is essential for the veterinary team to understand the client's ability and willingness to provide the increased level of care that is often needed for a pet with a terminal status; this is an important consideration when developing an HPC plan, since the majority of care will rely on the client's active involvement and will help determine the best treatment course.
- Of equal importance is the assessment of the *patient's* willingness and capacity to receive care, such as willingness to take medications or receive subcutaneous fluids.
- The HPC plan should be entered into the patient's medical record.
- The HPC plan should include, at minimum, the following:
  - Disease sheets with information about the illness, anticipated disease trajectory, and signs to monitor for that may indicate a change in condition or clinical decline.
- Client-directed pain scales that are appropriate for use in the home setting (see online resource, *BEAP Pain Scale for Dogs* and *BEAP Pain Scale for Cats*; refer clients to the "Recognizing Pain in Pets" learning module at pethospice.com).
  - Euthanasia-specific information, including how and when to plan for this time, discussion of aftercare options, options of in-home euthanasia versus in-clinic euthanasia, and options for memorialization or ceremony if wished for.
  - Information regarding what to do in an emergency or after-hours situation, including address and phone number of nearest emergency clinic.
  - It is the author's opinion that every client with a pet in an HPC program be dispensed a "comfort kit." A comfort kit consists of several preloaded syringes containing a sedation and opioid to be administered subcutaneously to the pet at home in the event of an acute crisis. This allows the client to provide mild sedation and pain relief for their pet pending euthanasia, offering comfort in those last hours, and it is perceived by clients to be one of the most valuable aspects of the HPC relationship.
  - Information on what to expect with a natural death, should this occur before euthanasia intervention can take place.
  - Resources such as QOL assessment tools.
  - Grief and pet loss resources (both in person and virtual).

9.19. Integration of Hospice and Palliative Care into Practice

- ◦ Referrals to adjunct mobile services, if available (in-home euthanasia if a practice does not offer this service, acupuncture, grooming, in-home pet sitting and respite care).
- ◦ An estimate of costs for medications, supplies, and diagnostic procedures such as blood work or blood pressure monitoring.

Step 4: Implement the HPC Plan

- As soon as a pet enters a hospice program, flag the medical record so that the entire staff is aware. In this way, a family can elect euthanasia at any time without having to repeat history, which can be especially helpful if the attending staff have not previously been involved with that patient's care.
- Whenever possible, care should be administered at home; if in-home options are not feasible for the practice, telehealth should be utilized whenever possible.
- Education is a cornerstone of implementation, and caregivers should be taught therapeutic techniques, how to assess their pet's response to therapies, and symptom recognition.
- Encourage clients to record daily activities and monitor for changes in their pet's clinical status. Include such parameters as the level of pain present, appetite, activity, overall happiness and engagement, respiratory rate and effort, mucus membrane color, and abdominal girth. This information will help assess response to therapies and allow for early intervention should a clinical decline occur.
- Include a plan for follow-up care and monitoring. Based on the stage of disease and current QOL, the veterinary team can implement general guidelines for frequency of communications:
  - ◦ For patients who are in stable and in the early stages of hospice care, monthly updates via phone, e-mail, or telehealth may be adequate.
  - ◦ For patients in advanced stages of disease, or if clinical decline is occurring, weekly or daily updates are often needed.
  - ◦ Determine which form of assessment is in the patient's best interest, such as a telehealth consult (video conferencing), home visit, or an in-clinic visit.
  - ◦ Telehealth can be instrumental in assessing changes in the patient's status with the least amount of stress. It is appropriate to charge for these consultations.
- It is important to share that hospice remains appropriate as long as pain and other symptoms of disease are controlled, and it is vital to discuss and determine clear stopping points, or "lines in the sand," which would indicate an inadequate QOL and need for euthanasia.

ADDRESS THE PATIENT'S PHYSICAL, SOCIAL, AND EMOTIONAL NEEDS

The physical, social, and emotional health of veterinary patients are strongly intertwined, and it is difficult to achieve optimal QOL when any one of the components is missing.

Physical Needs

- Implement a multimodal pain management plan that includes anticipating, controlling, and preventing pain.
- Ensure adequate symptom management of organ system disease or failure, such as gastrointestinal signs (nausea, vomiting, diarrhea, anorexia), anxiety, and dyspnea.
- Meeting hygiene needs.
- Ensure adequate nutrition and hydration.
- Provide mobility assistance when indicated, such as nonskid flooring, assistance devices, and accessible litterbox location and height.
- Ensure environmental safety and offer protection from environmental hazards (use baby gates on stairs, prevention of accidental drowning in pools).

Social Needs

- Involve the pet in family activities and maintain normal interactions.
- Minimize periods of isolation.
- Monitor for the development of pet-to-pet hierarchal changes, such as the potential for aggression toward the compromised pet.
- Offer environmental enrichment and engagement with surroundings.
- Offer mental enrichment, especially when mobility is compromised.

Emotional Needs

- Ensure preservation of dignity by minimizing house soiling and helping to maintain hygiene and grooming.
- Minimize exposure to stress and changes in routine.
- Respect a pet's willingness to receive treatments such as subcutaneous fluids or oral medications.
- Be aware of a pet's will to live by monitoring behaviors and observing for signs of withdrawal or depression.
- How to achieve a balance between QOL and duration of life should always be a primary focus of care.

FINANCIAL CONSIDERATIONS

- HPC may not become the practice's largest profit center, but services will offer a return on investment and the long-term benefits will be immeasurable.
- In one study, 14% of clients changed their veterinarian following the euthanasia event due to overall EOL experiences.[2]
- It costs 10 times more to acquire a new client than to retain one, and how a practice handles a pet's EOL event will greatly influence a client's loyalty and their willingness to return to the practice.
- Well-delivered HPC services will not only lead to client retention following the loss of a pet but will provide positive word-of-mouth referrals.

EXAMPLES

SUPPORTING CLIENTS' DECISIONS

If a client wishes to decline diagnostics or treatment, avoid making them feel guilty and instead support them in this difficult decision (see 5.22 – Discussing Quality of Life and End of Life Issues). For example, if a client decides against monitoring blood work every six months to assess nonsteroidal anti-inflammatory drug administration, do not cease medical treatment, such as no longer dispensing the medication to the client. Take measures to ensure the family feels supported and comforted in the decisions they make.

CAUTIONS

AVOIDING COMMUNICATION PITFALLS

- The veterinary team should be aware of the range of emotions that can occur when delivering a terminal diagnosis; it is important to recognize that communication and education are often ineffective following the delivery of a "gut shot" diagnosis (see 5.22 – Discussing Quality of Life and End of Life Issues).
- A more effective communication approach is to briefly identify the need for an HPC plan, and schedule a dedicated follow-up appointment for exploration and discussion of care options. This allows the client time to come to terms with the diagnosis and be more readily able to receive information being shared.
- Follow-up appointments are best scheduled as the last appointment of the day, or as the last appointment before lunch, allowing adequate time to listen to the client's questions and concerns.
- When having conversations with clients, the veterinary team should employ core communication skills, including active listening (nonverbal cues such as nodding or repeating in your own words what the client has just shared), maintaining eye contact, using empathetic body language and tone of voice (see 5.1 – Effective Client Communication).

9.19. Integration of Hospice and Palliative Care into Practice

• Check yourself. Avoid a biased presentation of information designed to steer a client's HPC/EOL choices in the direction of the veterinary team's preference. It is helpful to continually ask yourself, "What would I do *for my own pet*?"
• Regardless of decisions that are made, clients should always feel supported, never judged, and the veterinary team should remember that their values and beliefs may be different from their clients.
• Clients should be informed that some diagnostic procedures or treatments can be painful for their pet, and a thorough description of each test, including how the results will influence patient care, will allow the client to make an informed choice about whether or not to pursue further.

COMPASSION FATIGUE

• Veterinary team members who work with EOL patients and their owners can be at higher risk of developing CF, especially those staff members who are particularly empathetic and motivated to provide patient or client support (see 2.8 – Compassion Fatigue and Burnout). It is important for the veterinary team to recognize the signs of CF.
• CF can manifest itself in a variety of ways. Signs can include anger, frustration, depression, crying, insensitivity, a negative attitude, anxiety, and irritability. Physical symptoms can occur and may include changes in sleeping behavior, somatic illness, lethargy, and impaired immune response. Psychological indicators include a loss of hope, increased skepticism, and excessive guilt.
• These changes can result in avoidance of certain clients, patients, or procedures, loss of enjoyment in work, and fear or guilt about letting clients or patients down.
• CF can affect the morale of the team, individually or collectively.
• The risk of CF is reduced when practices actively support staff self-care, including promoting good nutrition (healthy snacks in the break room), enforcing periodic breaks and "time outs," allowing time for debriefing sessions at the end of each day, being receptive and open to listening to staff concerns, and not overscheduling.
• Awareness is key, and staff education on the realities of emotional exhaustion and overload that can accompany EOL cases is the best approach to avoiding, recognizing, and controlling CF.

MISCELLANEOUS

ABBREVIATIONS

CF: Compassion fatigue
EOL: End of life
HPC: Hospice and palliative care
QOL: Quality of life

9.20. KENNEL MANAGEMENT AS A PROFIT CENTER

BASICS

OVERVIEW

In the environment of one-stop shopping, today's consumer/pet owner is mindful that engaging a veterinarian for their pet's care is most likely to be a substantial long-term commitment that, if initiated, will probably last a lifetime. Those providers of veterinary medical care who also provide ancillary services such as boarding kennel and day-care services may be termed the efficient provider in the area over other providers. There is a high demand among pet owners for high-quality boarding facilities with a caring, attentive staff. Pet owners also realize that their comfort level increases by knowing that qualified veterinary care is available should their pet require treatment in their absence.

What is important, though, is for the veterinary practice owner to remember that the involvement of a kennel in the overall operations of the practice requires planning. A seemingly mundane operation such as kennel management is actually quite a complex undertaking. Kennel operations must run efficiently and profitably to ensure continued long-term viability, ability to fund structural upgrades and improve facility scope of services, and to retain kennel staff. In addition, the kennel may be a potential client's introduction to your combined veterinary practice and kennel facility. Problems in the operation of the kennel may reflect poorly on the veterinary practice.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

A comprehensive set of operational standards was developed by the now defunct American Boarding Kennels Association, but many operators of commercial boarding kennels still adhere to them. The standards reflect the views of kennel operators, veterinarians, pet owners, and humane organizations, and thus represent an acceptable standard of care for animal housing and management.

In deciding to offer or upgrade the provision of kennel services, there are many issues to consider.

- **Noise:** Noise is a tremendous issue in kennel ownership, depending upon the particular geographic area in which the kennel is located (rural, suburban, or urban). Noise creates stress for animals, employees, neighbors, and owners alike (see 11.15 – Noise and Odor Control). To facilitate noise reduction, having fewer dogs in a single kennel area is one of the best ways to reduce noise, as the more dogs there are in any particular building the more the noise levels compound. Utilizing a smaller kennel facility means the dogs can focus more on the staff member looking after them rather than being disturbed by other dogs and high noise levels. Smaller buildings, with a higher staff-to-pet ratio per enclosed building, will tell customers a lot about the standards of care they can expect from a kennel. Once a pet owner has left their pet in a noisy kennel environment, they may seek better standards for future stays elsewhere, thus destroying a potential long-term relationship (and revenue stream) with a pet owner.
- **Cleaning and odor control:** Eliminating all areas where caulking could be used and using maintenance-free materials on the floors, walls, and drain system that do not absorb odors are key factors in ease of cleaning and odor control. Frame buildings may be used, but they can present problems. Dogs will usually chew on wood unless it is specially protected, and this not only creates an unfavorable appearance, but also provides hiding places for bacteria and parasites. Wood absorbs more urine and urine odors than concrete does, and wet wood deteriorates rapidly. The higher initial cost of a concrete or concrete block building is usually offset by lower maintenance costs, ease of cleaning, and reduced insurance premiums.
- **Construction:** Concrete and concrete block construction is generally recommended for kennel building materials (see 11.20 – Pet Boarding and Luxury Accommodations). Walls of this type, with concrete floors and kennel runs, make for a durable and economical commercial kennel structure. For example, concrete block walls may be used throughout, with exterior walls comprised of eight-inch blocks in any two-story section, and six-inch blocks in any one-story section. Local building codes should be checked to determine what size blocks are acceptable. For added strength, reinforcing mesh may be used at every third row during the construction of exterior walls. Four-inch concrete blocks are used for interior walls and partitions, and volatile organic compounds-free epoxy paint is utilized to seal new surfaces to provide easy cleaning, which helps protect against disease and parasite infestation.

EXAMPLES

In designing rules of engagement for kennel clients, the "warm body" theory of client acceptance should be discouraged to boost occupancy rates and thereby increase cash flows. Instead, target the educated, although demanding, client who may be a much better referral source for the kennel when a positive experience is obtained for both the pet and owner.

The following dog acceptance guidelines should be instituted as a recognized standard of care in your kennel:

- All pet owners must complete a comprehensive application.
- All dogs must be four months or older.
- All dogs must be spayed or neutered by seven months of age.
- All dogs must have up-to-date vaccinations. Owners must submit written proof that their dog(s) have received regionally appropriate vaccines, such as rabies, distemper, adenovirus-2, leptospirosis, parvovirus, parainfluenza, influenza, and *Bordetella* (canine cough) vaccinations.
- Pet owners need to certify that their dog(s) are in good health and have not been ill with a communicable condition in the last 30 days. On admission, all dogs must be free from any condition that could potentially jeopardize other dogs. Dogs who have been ill with a communicable condition in the last 30 days will require veterinarian certification of health to be admitted or readmitted.
- All dogs must be nonaggressive toward people or other dogs. Clients must certify that their dog(s) have not harmed or shown any aggressive or threatening behavior toward any person or any other dogs.
- A trial day of daycare is required for all dogs.
- No dogs may be able to jump a six-foot (1.8 m) privacy fence.
- All dogs must have a soft collar.

Cat acceptance guidelines to the cat boarding facility should be instituted as follows:

- All cats must be at least four months old.
- Cats must have all sets of regionally appropriate vaccinations, such as feline viral rhinotracheitis, calicivirus, panleukopenia, feline leukemia, and rabies, and they must be current.
- Negative feline immunodeficiency and feline leukemia test.

In the desire to maintain a "niche" kennel service to distinguish itself from other kennels, some veterinarian-run kennels are offering the following services to appeal to a higher-end (and higher-paying) clientele (see 11.20 – Pet Boarding and Luxury Accommodations):

- webcam access for pet owners to watch their pets;
- aquariums, waterfalls, and fountains;
- soothing music, animated movies, and television;
- kitchens for preparation of special diets, and refrigeration for raw diets;

9.20. KENNEL MANAGEMENT AS A PROFIT CENTER

Table 9-20-1. Annual gross revenues for boarding/kennel facilities (based on sliding-scale fees assuming 365-day coverage).

Animal occupancy	*Daily rate $20*	*Daily rate $25*	*Daily rate $30*
10	$ 73,000	$ 91,250	$109,500
15	$109,500	$136,875	$164,250
20	$146,000	$182,500	$219,000
25	$182,500	$228,125	$273,750
30	$219,000	$273,750	$328,500
35	$255,500	$319,375	$383,250

- quiet areas designed to meet the needs of pets who may be shy, timid, or older and who require a very calm environment;
- individually decorated suites furnished with beds, blankets, and baskets;
- personal attendants;
- grooming salon and day spa treatments.

CAUTIONS

Today's pet owner has a much higher degree of awareness of pet care issues. Dog and cat owners, either through education programs or through the Internet, are much more educated regarding the standards and care levels they require, and demand, for their pet(s). It is better to cover all bases of pet care needs than to be deficient in one aspect and held accountable for that deficiency.

Demographic studies and surveys of current pet owner clients must be generated before engaging in the development of a new kennel or expansion of current facilities (see 1.4 – Veterinary Trade Areas and 6.8 – Demographic Assessment). Even though pet owner demand may be high from the outset, veterinarians can learn from operating guidelines taught in the hotel and travel industry. To run kennels profitably, it is recommended to maintain very high facility occupancy rates than operate a kennel facility that is partially full in anticipation of gaining market share and, ultimately, sufficient pets to fill empty kennel spaces. Building a smaller facility that can obtain a short-term filled capacity will generate cost savings over the associated operation and construction costs of a larger kennel that would take time to fill with an emerging client base.

MISCELLANEOUS

As noted in Table 9-20-1, the rate charged of $20 to $30 per animal per day leads to a significant variation in the amount of gross revenue recognized by the kennel over the course of a one-year time period. Charging an additional $5 per animal, at the same time providing $5 or more of perceived value to the pet and pet owner, yields an additional $36,500 when the shelter is occupied by 20 animals.

It is highly recommended that a similar spreadsheet be developed for kennels to evaluate boarding rate development, annual budgeting for personnel and operating costs, and capital additions (should there be sufficient demand). There should also be development of "worst-case models" using the aforementioned principles at typical one-third and one-half occupancy rates, to see if those annual gross revenues are sufficient to fully fund the kennel project.

Projecting kennel-building costs is a difficult task, as different regions in a particular state may have disparate construction costs for land, design fees, permit fees, materials, labor, landscaping, and particular environmental concerns.

9.21. WASTE MANAGEMENT

BASICS

OVERVIEW

The management of solid waste materials generated by a veterinary hospital is a complicated topic involving:

- knowledge of federal, state, and local regulations regarding waste disposal;
- protocols for the proper handling, sorting, and collection of waste;
- facility design to facilitate best practices for waste staging and disposal;
- reduction of waste materials for environmental reasons.

Every veterinary practice should develop a solid waste management plan. A plan can assist in removing the guesswork from handling waste, thereby increasing efficiency, ensuring compliance with laws, and protecting the health and safety of staff. A waste management plan can also identify waste materials that can be recategorized, reduced, or eliminated to limit damage to the environment.

TERMS DEFINED

Clinical Sink: A wall- or floor-mounted flushing fixture that is used to dispose of large quantities of feces.
EPA Regulation 40 CFR 261: The regulation that lists the categories of hazardous waste.
Hazardous Waste: Waste products harmful or toxic to humans, animals, or the environment. Chemotherapy drugs fall under this category.
Radioisotopes: Versions of an element that have a greater atomic weight due to additional neutrons. Unstable isotopes that emit ionizing radiation are known as radioisotopes.
Regulated Medical Waste (RMW): A subcategory of solid waste covering biohazardous or infectious waste produced by the diagnosis, treatment, or vaccination of animals.
Solid Waste: A term defined by the US Environmental Protection Agency (EPA) that covers a broad range of solid and liquid waste products. Most of the waste that is produced by a veterinary hospital is solid waste. Solid waste is then broken down into many different categories and subcategories.
Universal Waste: A subcategory of hazardous waste that includes, but is not limited to, pesticides, mercury-containing equipment, fluorescent bulbs, and batteries. Most veterinary hospitals fall under the federal designation for small-quantity handlers of this material.

ISSUES AND OPTIONS

The first step in developing a waste management plan is to understand the federal, state, and local regulations that apply to the disposal of waste and to develop standard operating procedures for handling various waste materials (see Figure 9-21-1). The following summarizes the categories that will be of greatest concern.

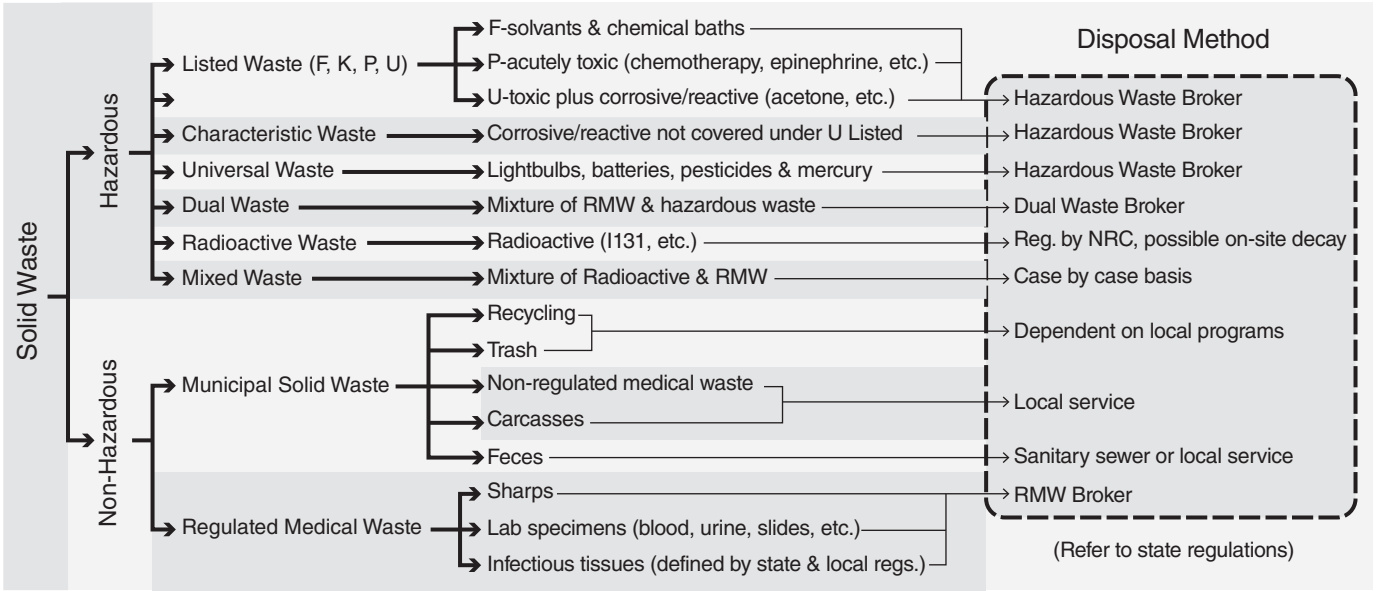

Figure 9-21-1.

Waste management flowchart.

9.21. WASTE MANAGEMENT

HAZARDOUS WASTE

- All veterinary practices generate materials that are classified as hazardous waste, including some chemicals and pharmaceuticals, particularly cytotoxic drugs used in chemotherapy, sterilants and disinfectants, and radiological materials.
- Hazardous waste is regulated primarily at the federal level, with state and local overlays. The federal Resource Conservation and Recovery Act (RCRA) designates categories for hazardous waste.
- Regulatory burden for the handling and disposing of hazardous waste is dependent on the quantities that are generated in a facility. There are three categories that define the amount of waste that is generated:
  - conditionally exempt small-quantity generators;
  - small-quantity generators;
  - large-quantity generators.
- Most veterinary practices will be small-quantity generators. Veterinary practices generating hazardous wastes above the regulation threshold are required to obtain an EPA identification number.
- Tracking, storing, and disposing of hazardous waste should be taken seriously. Small-quantity generators are prohibited from sending waste to the municipal landfill. These wastes must be handled by an RCRA treatment storage and disposal or recycling facility.
- The handling and storage of chemotherapy drugs is regulated at the federal level. In 2016, regulations were revised, and new standards were published by United States Pharmacopeia (USP) under the title "<800> Hazardous Drugs – Handling in Healthcare Settings," implementing many more regulations to the handling, storage, use, and disposal of cytotoxic drugs. The following design considerations may apply:
  - Access to hazardous drug handling areas must be restricted to authorized personnel.
  - Unpacking of hazardous drugs must be done in an externally vented room with negative pressure.
  - Group 1 hazardous drugs must be refrigerated in a designated refrigerator in a room with negative pressure.
  - Vented biological safety cabinets, with type designated based on drugs mixed, must be used. Refer to the Occupational, Safety, and Health Administration (OSHA) and USP <797> for information on the type of cabinet that is needed based on drugs handled.
  - Hazardous waste from chemotherapy drugs must be separated from other waste streams.

REGULATED MEDICAL WASTE

- The handling of RMW is regulated primarily at the state level and sometimes by more than one agency.
- Despite these complexities, the management of RMW in most veterinary medical practices is limited to sharps and a small amount of biohazardous waste that is collected at the laboratory (slides, blood products, etc.). These items can be collected in marked containers and retrieved by or mailed to an RMW broker for disposal.

RADIOACTIVE WASTE

- A variety of local, state, and federal agencies govern the handling and disposal of radioactive waste. Practices handling radioactive materials must follow the requirements of the US Nuclear Regulatory Commission (NRC), as well as the state and local laws as they apply to veterinary hospitals, to maintain a license to handle radioactive materials and waste.
- Most of the radioisotopes utilized in veterinary practice have short half-lives. It is often possible to provide a location for waste by-products containing radioisotopes to safely decay over the course of a few hours or days until they can be disposed of in the regular waste stream. This includes the urine and feces of cats receiving iodine-131 treatment and horses after scintigraphy.
- Note that mixed waste, which is a combination of hazardous waste and radioactive waste, is regulated by both the NRC and the EPA.

ROUTINE WASTE CONSIDERATIONS IN FACILITIES

- It is important to consider the disposal of feces in the design of veterinary facilities. Numerous infection-control guidelines recognize the importance of removing organic material prior to disinfecting surfaces, because organic materials deactivate disinfectants.
- The most effective method for the disposal of feces depends on the amount that is collected.
  - Forcibly hosing feces to a drain is not a good method because of the risk of aerosolizing pathogens.
  - Many veterinary practices manually remove feces prior to hosing runs. Disposal in the trash is the simplest method, but this may be undesirable because of odors and sanitation.
  - Another option is to use a clinical sink to collect and flush the material into the sanitary sewer system. Clinical sinks should be placed in a durable, washable janitor's closet that is equipped with an exhaust fan to reduce odors.
- The movement of supplies throughout a veterinary hospital can be a complicated matter. Materials are delivered, sorted, stored in bulk, and then transferred to point-of-use locations. Inventory must be controlled throughout all this movement.
- For movement of waste, the design must consider collection strategies, handling protocols, storage, and disposal. The following is a summary of some of the design considerations specific to RMW and hazardous waste:
  - Design for the placement of *approved receptacles* at all places where waste is generated. For example, red sharps containers, although appropriate in some areas, are inappropriate for needles containing chemotherapy drugs.
  - Design the space to support the tasks that are needed for safe handling of hazardous materials. For example, chemotherapy rooms need to be designed with the OSHA-approved biological safety cabinets, places for storage of gowns, gloves, and goggles, and an eye-wash station.
  - Store hazardous materials in designated, clearly marked locations away from other stored materials. If a facility is storing larger than typical amounts of hazardous materials, additional building and fire code requirements may apply.
  - Consider the methods for collection of hazardous materials. If materials are picked up by an outside contractor, the storage location should be near a back entrance.

ENVIRONMENTAL CONCERNS

Limiting Hazardous Waste

There are two reasons to limit the production of hazardous waste in a veterinary facility. The first is to reduce the regulatory burden and expense of dealing with large quantities of hazardous waste. The second is to reduce the negative effects on the environment. For both reasons, the best practice is to reduce the use of hazardous materials. Veterinary and healthcare facilities have employed the following strategies:

- Eliminate mercury from medical procedures and devices. Several initiatives are ongoing in the human medical field to go mercury free.
- Be cautious about the use of sterilants, such as ethylene oxide, which are heavily regulated.
- Do not use pesticides within the facility or to maintain the grounds.
- Find less-toxic alternatives to hazardous chemicals and procedures.
- Fine-tune the inventory procedures to limit the quantities of hazardous materials that are purchased, eliminate duplication of similar materials, and ensure that materials are used by the expiration dates.

Reducing Trash

A certain amount of trash is necessarily generated by the practice of veterinary medicine. However, some states and local jurisdictions already require recycling in commercial facilities, and there is a general trend toward businesses implementing recycling and composting programs depending on availability of local services.

9.21. Waste Management

The key to the success of recycling programs is to consider convenience. Place bins in the locations where waste is generated. For example, employees are more likely to use recycling bins for paper if they are placed directly under copy machines.

EXAMPLES

N/A

CAUTIONS

Hazardous waste misclassifications are common in veterinary facilities. There are many reasons for taking the time to fully understand how to handle hazardous waste, from creating a safer environment for employees to avoiding citations and fines.

Section 10

Information Technology

10.1. INFORMATION TECHNOLOGY IN VETERINARY MEDICINE

BASICS

OVERVIEW

• The digital age has quickly reached the veterinary industry. Information technology (IT) offers avenues for greater work and cost efficiencies, improved diagnostic capabilities, more effective client communication, and a more direct way to reach local pet owners.
• Advances in diagnostic and laboratory technology have necessitated a change in the way a veterinary practice utilizes software. Once disparate systems have become deeply integrated, allowing decentralized access to critical information. This creates diverse and significant benefits.

TERMS DEFINED

Cloud-Based Storage: The ability to access files through the Internet, as opposed to local storage.
Data Architecture: Models, policies, rules, or standards that govern which data are collected and how it is stored, arranged, integrated, and put to use in data systems and in organizations.
Democratization: The process of making something accessible to everyone.
Electronic Medical Records: The systematized collection of patient health information in a digital format.
Telemedicine: The remote diagnosis and treatment of patients by means of telecommunications technology.
Workflow: The consistent series of steps by which processes are completed within the organization.

ISSUES AND OPTIONS

DATA ARCHITECTURE

There is a continued trend toward the democratization of data in a veterinary practice. Even smaller veterinary practices are now able to easily integrate scheduling, charting, testing, bloodwork, and ongoing logistical tasks into a single platform.
• Data architecture has undergone a paradigm shift toward cloud-based storage (see 10.5 – Cloud-Based Solutions). The practice's data can be accessed anywhere and at any time by members of the veterinary team or by other veterinary professionals who are granted access.
• New software tools support the integration of automatic data inputs, such as patient records, inventory management, logistics, payment collections, and more. This creates greater work efficiencies and reduces labor needs related to data entry.
• The shift away from local storage to cloud storage reduces financial burdens, as practices are no longer required to invest in local servers and maintenance, which can have substantial initial and ongoing costs.
• The integration of business logistics into a central platform allows for a more metrics-driven approach to business health. Practices can more effectively measure and monitor business efficiency and profitability and can run reports and review analytics on key performance indicator (KPIs) such as new client growth, customer loyalty, revenue growth, and retention.
• Innovations in diagnostic and laboratory technology can be integrated into the practice's data architecture. This information can be remotely shared with outside professionals and specialists for diagnostic and collaborative purposes, elevating standards in patient care.
• In large-animal practices, data architecture can be used to track herd data. Veterinarians can better predict the spread of disease and can practice medicine for the herd more efficiently.

CLIENT COMMUNICATIONS

Closing the gap between visits is a valuable avenue to address for veterinary practices. With new digital tools, veterinary practices can improve compliance, appointment show rates, boost awareness about essential services and wellness options, and more.
• Reminder systems offer an automated way to boost show rates for appointments (see 4.16 – Client Reminder Systems). These are commonly done via postcard, e-mail, text, or push notifications via a smartphone app. These systems can also automate reminders when a pet is due for a checkup, vaccination, dental cleaning, or other essential visits. The automation of this task not only improves profitability, but it also reduces manual labor needs in contacting pet owners for upcoming appointments.
• Software companies have created systems (often referred to as "portals") that allow the pet owner remote access to healthcare information for their pet (see 10.18 – Patient Portals). Pet owners can log in to see their pet's medical history and interface with the practice's appointment scheduling. This removes barriers to essential information and can reduce phone volume burden on front desk staff.
• Compliance issues often stem from gaps in client education. Digital tools allow for text or video resources to be sent to clients between visits or stored in a central and accessible location, such as a website. This can be a useful way to address longstanding compliance opportunities such as dental health, feline physical exams, and more.

DIGITAL MARKETING

Digital marketing can offer a more cost effective and precise way to acquire clients (see 10.12 – Digital Marketing Strategies). These digital mediums can be heavily automated and continuously refined based on performance data.
• The underlying psychology of relationships is unlikely to change, even though we now use digital channels to investigate local businesses (see 4.7 – The Client's Buying Journey). The biological imperative that a veterinary practice faces is to communicate a feeling of trust and safety for the pet owner. Elevated cortisol levels create resistance to action in a relationship.
• The maturation and sophistication of the web design field offers transformative possibilities for a veterinary practice in the way they engage and communicate with local pet owners (see 10.13 – Websites). A practice can more clearly and effectively communicate why a client can and should trust the practice with their pet's healthcare. A practice can also articulate their differentiators, brand messaging, and unique story.
• Social media has ushered a paradigm shift in the way that people communicate (see 10.16 – Social Media). A veterinary practice is now able to market its brand in a much more targeted and controlled way. This can be accomplished through multiple avenues, such as advertisements targeted by demographics and geographics, review solicitation and response, media production, immersive storytelling, and other forms of community outreach on Facebook, Yelp, Instagram, Pinterest, Twitter, and other social platforms.
• The advent of search engines has created a new form of advertising: search marketing. There is a stark difference between search marketing and old media advertising; in old media advertising (such as television, radio, and print marketing), a veterinary practice would broadcast a message to a wide range of potential recipients. With search marketing, a veterinary practice can choose to exclusively market to people who are actively searching for veterinary providers (see 10.14 – Search Engine Optimization). The veterinary practice can also tailor its message based on the nuance of the search, or different services being searched for. This can significantly lower client acquisition costs in marketing efforts.

TELEMEDICINE

• Telemedicine can be instrumental in solving very old challenges. In cases where speed or distance is an imperative, the use of file sharing or video can help a veterinarian quickly assess a case and instruct the pet owner on next steps. For example, a client can send a video of a pet's limp, and the veterinarian can determine how to localize the problem

and where radiographs should be taken to diagnose the source of the injury.

- Telemedicine can offer fast and efficient access to specialists who can review diagnostic data such as radiology or pathology slides. This can be especially useful in rural settings where pet owners do not have proximal access to veterinary care.
- Telemedicine start-ups are offering pet owners the ability to consult remotely with veterinary professionals. This can be useful in offering sound advice in how and when to seek treatment for their pet, along with answering basic questions about pet health and clinical signs.

EXAMPLES

INTEGRATING IT INTO YOUR PRACTICE

Analysis

It is important to first have a clear understanding of the challenges that you want IT to address in your practice. Are your client retention rates uncomfortably low? Does your staff need to spend significant time doing remedial tasks such as data entry? Are your new client numbers stagnant? Do you have a poor feel for your practice's KPIs and how they are changing? Adopting new IT can be a complex and laborious venture, and it is important that you have clear goals in mind.

Investigation

Assess the vendors in the market that have products related to the needs you are looking to address. Create a framework of the needs and features that you are looking to gain. Make sure that you refer back to this document during each stage of the investigation to limit risk of making an emotional decision instead of a logical one. Conduct thorough demonstrations with multiple vendors in the space and choose one that you feel best fits the criteria you had previously laid out. If a vendor makes an insightful point about adding a list to your criteria, it can be wise to adopt it to the document.

Decision

Once you have isolated the best fit for your practice, it is important to make sure that the staff is fully trained on its integration into your workflows. If you do not do this, you risk underutilization of the product, as staff members will be tempted to gravitate back to workflows they are more familiar with.

Refinement

Every three months, revisit the initial document that you created and the supporting analytics provided by the new IT. Are you on track to accomplish your goals? Why or why not? Are there bottlenecks in the implementation of the technology? Are there unintended consequences? Do you need to refine how you integrate the technology into your workflows?

CAUTIONS

- Decentralized access to veterinary medicine via telemedicine could blur the line between service and commodity in consumer attitudes. Pressures to provide fast, remote access to veterinary care could create incentives that are not totally aligned with providing the highest quality care.
- IT encourages practitioners to measure practice success through metrics. Though there are many positive benefits to this, the additional layer of abstraction can erode compassionate perspectives.

10.2. SELECTING COMPUTER HARDWARE

BASICS

OVERVIEW

Computer hardware is a collection of physical components that comprise a computer system (i.e., workstation, tablet computer, server, mouse, keyboard, flash drive, external hard drive, printer, and camera).

TERMS DEFINED

Backup: The process of backing up refers to the copying and archiving of computer data so it may be used to restore the original files after a data loss event.

Cloud: A communications network that often refers to the Internet, and more precisely to a datacenter full of services that is connected to the Internet.

External Hard Drive: External removable hard drive that typically connects via Universal Service Bus. Plug-and-play drive functionality offers system compatibility and features large storage options and portability.

Flash Drive: Data storage device that includes flash memory with an integrated Universal Serial Bus (USB) interface. USB flash drives are typically removable and rewritable, and physically much smaller than an external hard drive.

Gigabyte: Unit of computer memory or data storage capacity equal to 1,024 megabytes.

Laser Printer: Digital printing process that rapidly produces high-quality text and graphics on plain paper.

Memory: The term memory is used for the information in physical systems which functions at high speed (i.e., random access memory).

Network: A collection of computers and other hardware components interconnected by communication channels that allow sharing of resources and information.

Operating System: A collection of software that manages computer hardware resources and provides common services for computer programs. The operating system is a vital component of the system software in a computer system. Application programs require an operating system to function.

Processor: Processes the critical information and instructions that make your computer perform.

Server: Physical computer (a computer hardware system) dedicated to run one or more services (as a host), to serve the needs of the users of other computers on the network.

Stylus: Computer accessory that is used to assist in navigating or providing more precision when using touchscreens.

Tablet Personal Computer (PC): A tablet PC is a kind of mobile computer, usually having a touchscreen or pen-enabled interface.

Terabyte (TB): Unit of computer memory or data storage capacity equal to 1,024 gigabytes.

Thin Client: Computer or a computer program that depends heavily on some other computer (its server) to fulfill its traditional computational roles.

Workstation: A high-end microcomputer designed for technical or scientific applications. Intended primarily to be used by one person at a time, they are commonly connected to a local area network and run multiuser operating systems.

ISSUES AND OPTIONS

PURCHASING A SERVER

Choosing Operating Software

- The most common servers used in businesses are servers that operate the Windows Server operating software.
- It is important to follow the recommendation of your practice management software provider to ensure compatibility (see 10.3 – Selecting Computer Software).

Choosing a Processor

- The processor plays an important role in your network's ability to support internal applications.
- Processors are constantly changing, making it difficult to determine which is right at the time of purchase.
- Small practices are recommended to start with a mid-grade processor.
- Large practices or practices that intend to grow their network over time are suggested to make the investment for the higher grade processor.
- Processors can be upgraded at a later time but typically require additional hardware upgrades, making it costlier to do so.

Choosing Memory

- Memory is another key component to look at when thinking about the overall speed of the network.
- Memory is not to be confused with the size of space the computer has available on the hard drive to install applications.
- The size of your network will ultimately determine the amount of memory that is recommended.
- The greater the memory the faster the server will perform.
- Additional memory can be added at a later point with minimal investment and downtime.

Choosing a Hard Drive

- Choosing a hard drive will depend upon the amount of data and applications you plan to install on the server.
- It is best to consult with your IT company and software vendor to best determine the appropriate size hard drive for your practice.

PURCHASING WORKSTATIONS AND TABLET PCS

Workstation Types

There are two types of workstations, a desktop PC and a thin client:

- A desktop PC is typically costlier but will allow you to do more because it is designed to install and navigate through various applications at the same time with a faster processor.
- A thin client is designed to have minimum hardware installed to access the network. Thin clients are less expensive and are only used to access the practice management software and operate select applications already installed on the server.

Choosing Operating Software

- The most common workstations operate Windows operating software.
- Choose the operating software version that is optimized for network use (i.e., Windows Professional)
- It is important to follow the recommendation of your practice management software provider to ensure compatibility with the software and the network.

Choosing a Processor

- Most laptops and tablets come with mobile optimized processors (e.g., Intel Mobile)
- Computer processors should be fast enough to handle speedy network connections and the practice management software application.

Choosing Memory

- Memory for mobile devices is pretty standard and does not require any specific suggestions. Let the vendor know the mobile device will be used on a network.
- Memory for workstations should meet, and in most cases exceed, the recommendation of the practice management software vendor. Exceeding recommendations will prolong the life of the computer.

10.2. SELECTING COMPUTER HARDWARE

Choosing a Hard Drive

• Most tablets and workstations should not require large amounts of hard drive space.
• Computers and tablets come standard with plenty of hard drive space for their recommended use.

Workflow

Look at the workflow in your practice and think about where each team member would benefit having a workstation (i.e., exam room, hall, pharmacy, surgery, ward, doctor's office, management office, etc.).
• Purchase the number of workstations based on the need of accessing information in the various locations. Consider client value when purchasing workstations. Having a workstation in an exam room allows you to view digital radiographs and laboratory work with the client to show value for the services.
• In places where a workstation cannot be wired or to save cost on the number of workstations purchased, think about tablet PCs. Tablet PCs allow you to take the practice management software mobile within the practice while still being connected to the network.
• To save on cost, you can purchase one tablet PC that can flow between multiple exam rooms as needed. When the tablet PC is not being used in an exam room it can be placed in another location where it could be used.

ADDITIONAL HARDWARE

• **External hard drive:** Most commonly used in a veterinary practice as a form of backup for the practice management software and/or digital radiology images.
• **Flash drive:** Used for sharing information from one source to another (e.g., copying a group of files from one computer to another computer).
• **Signature capture device:** Allow clients to sign electronic forms through the practice management software. Most tablet PCs allow you to electronically capture a signature by using a stylus.
• **Laser printer:** These printers allow for rapid printing speed without slowing down the workflow in the reception area. Purchase a black-and-white laser printer for most parts of the practice. Purchase a color laser printer if you print color images for clients (e.g., before and after dental images).

THE CLOUD AND HARDWARE

• The cloud is a form of remote data storage, which is rapidly gaining popularity across the World Wide Web as a whole, and within thriving veterinary communities (see 10.5 – Cloud-Based Solutions).
• The cloud transitions our data away from local devices (think bulky servers and clunky external hard drives) and instead moves them to secure offsite servers, allowing you to access the files from anywhere with a simple login.
• While such a transition might not seem entirely drastic, it is actually reshaping the way that we look at data and changing the way that we set up our veterinary practices for maximum security and efficiency.
• Early adopters toward cloud-centered technology are reaping huge benefits already; from saving thousands of dollars annually, to preventing potential data loss from floods, fires, or other unpredictable occurrences.
• Cloud computing is simply the nature of an industry that continuously seeks to make things lighter, faster, and easier.
  ◦ For example, if you have 10 TB of veterinary data, would you rather stack 10 external hard drives behind your veterinary practice's central computer to hold it all, or send that information at lightning speeds to a remote server for a low monthly fee?
• Sending information to the cloud happens remotely, and files securely saved onto the cloud can then be accessed from any location.
• Many veterinary practices are already considering the transition toward the cloud when it comes to veterinary practice information management software.
• The software itself is very affordable (increasingly so) and eliminates the need for IT support that comes with updating and replacing expensive servers.
  ◦ Since it is web-based, there is no need to update software, as this instead occurs automatically upon login.
  ◦ This brings the added benefit of not requiring you to shut down your veterinary clinic and install software on a server and multiple workstations, which is a cumbersome process at best.
  ◦ If your Internet fails (from a local outage or otherwise), your information is still safe and secure since it is independently stored on the cloud.

10.3. SELECTING COMPUTER SOFTWARE

BASICS

OVERVIEW

• Software affects all areas of practice operations.
• When ranking factors that determine a practice's overall success and profitability, only staff selection outranks the significance of software selection.
• In the majority of veterinary practices, the veterinarians are in charge of strategic planning and capital investment for the practice. Because veterinarians are highly trained in medicine, they are most comfortable selecting medical instrumentation. Therefore, most practices are equipped with state-of-the art diagnostic and treatment instrumentation and severely outdated computer software. Operating outdated software on outdated hardware only compounds the problem.
• Contemporary software coupled with state-of-the-art hardware will positively impact virtually every component of practice operations. As a result, software and hardware investments often have a return on investment that far exceeds any other capital investment in the practice.

Any quote from a vendor should include an itemized list detailing exactly what is being provided, especially if the software is sold by individual modules and has a fee associated with each license. Operating system licenses and other fees should also be detailed, including data conversions and training fees. If interfaces with other products and or specific claims of scalability, and so on were made, they should also be supported by written detail. Given the price and potential impact of some software selections, it may be best to have all agreements reviewed by the practice accountant and attorney before executing them.

TERMS DEFINED

Customization/Flexibility: Regarding software, these terms describe the ability of software to adapt from general usage to the needs of your specific practice. There are two major types of customization. The first type includes those features that your staff members can modify with little or no assistance from the vendor. The second type requires the vendor to modify the features for you. This latter practice frequently results in extra costs and could negatively impact operations if valuable time is wasted waiting for the vendor. It is wise to avoid a purchase that relies on future changes to meet the practice's current needs.
Hardware: The physical equipment used in computer systems. If you can touch it with your hands, it is hardware.
Peripheral: Generic term for all pieces of hardware excepting, of course, the computer itself. Accessory pieces such as printers and scanners, however, are considered hardware peripherals.
Software: Programs that run on computers. The simplest working description of software is that if you can read it on a display screen, it is software.
Support: Regarding software, this is technical assistance offered by the software vendor that helps you properly use the software product (i.e., technical support helps users troubleshoot and resolve problems). The two most important factors in evaluating the quality of support offered by a vendor are hours of availability and responsiveness to a user's inquiry (i.e., how quickly technical support contacts you to help you resolve your software problem).
Training: Regarding software, this describes the vendor's responsibility for training you how to use its software. Education options can range from an expert educator being placed onsite to train your staff, to a trainer guiding your staff via telephone or interactive webinar, to a vendor supplying your staff with a printed manual and telling them to "read the book."

ISSUES AND OPTIONS

Most contemporary veterinary practices require multiple software products to meet all their operational needs. Medical records and practice management software generally account for the most significant purchase and have the greatest impact on practice operations. Accounting and spreadsheet software often handle a variety of functions, such as budget maintenance or management of accounts payable, and so on. Many practices are now using advanced diagnostic technology such as ultrasonography and digital radiology (see 9.8 – Digital Imaging Systems in Practice). The images that these modalities create can be stored in special software programs called PAC systems (picture archival and compression software). Additional office functions may be handled by specialized software applications such as time/clock software, scheduling software, and human resources information systems software, including but not limited to applicant tracking software and performance management software. Staff communications can be improved by utilizing electronic mail and other software products such as SLACK (slack.com). Some practices also use very specialized software to meet specific practice needs, such as boarding kennel management and the publication of client education materials (e.g., brochures and handouts).

EXAMPLES

The following is one example of the methodology that can be used by a practice to select software. In this example we may use practice management software for illustration purposes, but the steps involved apply to selection of any type of software.

• Develop a thorough needs list. It is best to gather input from all of the staff members that you expect will need to interact with the specific type of software. For example, practice management software may impact the entire staff, whereas accounting software may only impact the bookkeeper and practice manager. Involving the stakeholders in the selection process dramatically improves the odds in favor of a successful software selection.
• Conduct an extensive search to identify all of the vendors offering products best suited to your practice. You can learn about prospective vendors from a variety of sources, including, but not limited to, Internet searches, software reviews from trade journals, consultants, and other professionals. Attending a conference that has software vendors is a way not only to learn about their product, but also a way to gain access to users of the product that may not be on the vendors' reference lists, allowing you to obtain additional feedback regarding the product and important company elements such as the quality of their technical support, frequency of program enhancements, and so on. When researching accounting software, you should seek input from your accountant. It is important to evaluate the business practices and stability of each potential vendor. In so doing, you can distinguish fly-by-night operations from vendors with true staying power. If you do the proper homework, the vendor you ultimately select should remain in business for many years. Thousands of veterinary practices have purchased software only to have their supplier declare bankruptcy or cease operations within days, months, or years of the purchase date. Software vendors earn revenue from two primary sources. The first source is new product sales. The second, and generally the more important source (at least for the software vendor), is composed of support and development fees that maintain the operations of the organization. Depending upon the specific type of software, a vendor may need hundreds or thousands of users to support its ongoing operations. New entrants into the marketplace may offer exciting products, but they bring with them tremendous risk until they have established a sufficient client base to support their operations. Until that balance is achieved, a vendor's future remains questionable.
• Once you have identified a list of stable, reputable vendors, demonstrations of their software product(s) should be scheduled. Demonstrations are typically handled in person, via a web-based demonstration, or by loading a demonstration version of the software onto your computer.
• Building upon the knowledge you gain from the demonstration process, you should continue to revise and expand your needs list. Vendors are often familiar with the weaknesses of their competitor's products and, therefore, can educate you on how to select a full-featured product that meets all of your practice's needs. You should also consider security features and features that limit access to important parts of the software; namely, areas that allow the user to change the structure of something (e.g., pricing), access confidential information, and delete information. It is important to safeguard these areas so that the software cannot be modified either by accident or on purpose by a disgruntled employee.
• Even if at the beginning of your search a single product stands out as the product best able to fit your needs, you can gain leverage in pricing negotiations by leading vendors to believe that you are still considering alternative software products.
• In most cases, you should opt for the maximum amount of education offered. Optimizing educational opportunities ensures that the staff will be well trained on your new product, which, in turn, will decrease the implementation timeline, decrease staff errors, improve the client experience, and improve staff morale and productivity.
• Many software products are so full-featured that you may need to create a phasing plan. By phasing in the software, you can implement the most important features first at a rate that the staff can manage without undue stress.

CAUTIONS

• There is no such thing as the "perfect" piece of software. There always will be some features that you do not need to use (but will nonetheless pay for), and there will be some features you want that the software does not offer. Regardless of the software you select, you will inevitably have to develop some alternative solutions to meet your needs.
• Sales representatives from reputable companies rarely lie. Instead, they frequently deliver half-truths, omitting valuable information. For example, one company stated that their management software exports financial data to accounting programs. What they "forgot" to tell you was that their software only exports income data and does not export expense data. In another instance, one company demonstrated how

10.3. Selecting Computer Software

their medical records system could list treatments the patient needed in order to facilitate nursing care. The vendor failed to mention that this feature was limited to a maximum of five treatments per day and that the software had no way of coping with pets that required a more extensive treatment plan.

- Never assume that a software product can perform a function until you have witnessed it yourself. Sometimes, software products will have very advanced features yet lack simple features that you would expect them to have.
- Never purchase any software based upon promises of future development or future releases. A company may represent that a specific enhancement to the software is on their "to-do" list but fail to tell you that it is item #847 scheduled for five years from now. If you need this function today, you will be in trouble.
- Always require vendors to verify any claims they make regarding their software's ability to interact with other software products or to function with specific pieces of hardware. Requiring vendors to prove these claims is referred to in the industry as "proof of concept." You should verify these claims prior to signing any purchase agreement or making any nonrefundable deposits with a vendor.
- A "proof of concept" is a critical step in confirming that your software will communicate with other products your practice may utilize, such as in-house laboratory equipment, outside reference laboratories, and diagnostic imaging equipment. It is important to determine if the software supports "one-way" or "two-way" data communication. For example, your software may import data from your lab instrument but is not able to send client patient information to the lab instrument. Without data transfer in both directions, your staff will spend a lot of time typing basic information.
- More and more practices are utilizing specific, single-function add-on software in conjunction with their practice information management system, such as digital treatment sheet software. Knowing that a vendor is open to working with other companies to build and support the proper interfaces is another critical component of the selection process.
- Because most veterinary practices are currently using one or more software products, the purchase of new products may require you to convert information from your existing software and to preload it into your new software. This process is referred to as "data conversion." Depending upon the software involved and the amount of information to be converted, this process may require significant time and expense. Always have the vendor perform a test conversion on sample data to ensure that your practice's data can be converted. This exercise will allow the vendor to provide you with a more accurate estimate of the costs associated with the data conversion.
- Make sure prospective software can interface with all of the potential types of hardware your practice desires to utilize. This includes tablets, digital scanners, credit card machines, bar code scanners, and digital signature capture pads. Computers with built-in redundancies, such as hard drives and power supplies, are also highly desirable, because they reduce the risk of data loss and/or downtime.
- During the early part of your software search, never eliminate a vendor solely on the basis of price. As with most things, you get what you pay for. A more expensive product may offer many more features that will provide you with a greater level of office automation and capabilities. Consequently, a higher priced product may actually provide you with a greater and faster return on investment. In some cases, software can be so powerful it can allow the practice to deliver better service with fewer staff members. Under such circumstances, a practice may be able to pay for the more expensive software faster than it could pay for less expensive software offering less functionality. Always request written proposals from vendors and have multiple individuals review the proposal for completeness. Have the vendor identify any additional charges that would be related to future system expansion.
- The safety and security of your computer system is a key priority. You should make sure that individuals responsible for system design include antivirus software, firewall, power backup, and other features that will help prevent problems with daily operations.

MISCELLANEOUS

- Many vendors can support software from a distance, but hardware must be supported locally. Finding a local company that can support hardware as well as the network (the means by which multiple computers work collectively) can be a critical factor in the

10.3. SELECTING COMPUTER SOFTWARE

performance of your system (see 10.2 – Selecting Computer Hardware). It may be a wise investment to pay a few dollars more for local hardware if it guarantees you great service. Software is of virtually no value if you are attempting to run it on broken hardware. Veterinary medicine is a business and should always be run as such. Many hospitals experience poor performing networks and increased system down time by not paying professionals to maintain their system. A highly trained information technology professional is always a better choice than having the practice system maintained by a friend or relative.

- Many practices need to develop procedure manuals for how information technology should be utilized in the workplace. Such manuals may address security issues, privacy issues, standard operating procedures, Internet use, and personal use of company resources.
- A backup is an additional copy of the information that is on your computer system (see 10.5 – Information Security: Backing Up and Archiving Your System). In order to protect this valuable data, a mechanism should be in place that establishes additional backups offsite. The ability of the software to support and automate this process can be another factor in the purchasing decision.

10.4. SELECTING FINANCIAL/ACCOUNTING SOFTWARE

BASICS

OVERVIEW

The financial module in veterinary practice information management software (PIMS) is not designed to provide the detailed financial information needed to run a veterinary practice. Though PIMS collects important data about client transactions, patient medical histories, and inventory, it is not intended to collect and track critical information related to payroll, payments to vendors, cash flow, or overall practice profitability. For these, veterinary hospitals rely on standalone financial/accounting software.

TERMS DEFINED

Cloud-Based Software: Software available online, usually through a paid subscription.

Practice Information Management Software (PIMS): The software that tracks client and patient data and interactions in a veterinary hospital.

Up Time: A metric that represents the percentage of time a system is operational and available to users.

ISSUES AND OPTIONS

Choosing financial/accounting software can be challenging, particularly when features are described in vernacular more applicable to accountants than to veterinary hospital owners and managers. In addition, there are many software packages available, and the choices continually expand. The good news is that accounting software is much easier to use than it once was, and many are designed for people with little or no experience with bookkeeping.

Before shopping for financial/accounting software, it is important to determine the role this software will play in the hospital. For example, a complete financial/accounting software package should be able to track income and expenses, import transactions with one or more of the hospital's banks, include a budgeting feature, and allow multiple users with different permissions. In addition, integrated payroll programs are available within a number of software packages.

Not surprisingly, the more features the software includes, the greater the price to use it. Sometimes, that higher price comes with time-saving features; so, before defaulting to the lowest price option, consider whether freeing up staff time is more advantageous. For example, if the ability to download bank transactions will cost an additional $20 per month, consider whether the time saved from not needing to key in every check, debit card, or credit card transaction is worth that same $20.

USEFUL FEATURES FOR VETERINARY HOSPITALS

- Ease of use is important, particularly when the users have little or no experience with accounting tasks. Clear navigation and menus with common terms make learning the software easier.
- The ability to accommodate the industry-specific charts of accounts, specifically the American Animal Hospital Association (AAHA)/Veterinary Management Group Companion Animal Chart of Accounts or the American Association of Equine Practitioners Chart of Accounts. The 2017 updated released by AAHA includes over 250 accounts, which exceeds the limits of some software (https://www.aaha.org/professional/resources/chart_of_accounts.aspx).
- Number of concurrent users. In small practices, a single user may be sufficient. In larger practices, it is advantageous to have more than one concurrent user. A hospital owner may wish to review reports while the manager is recording payroll and the head client service representative (CSR) is entering deposits.
- Limits on access for some users. To safeguard data, limit what users can access. For example, if the head CSR only enters deposits, this person does not need the ability to run reports or add new users.
- Preformatted reports. The primary reason to use financial software is to retrieve consolidated information from it and to use that information to manage the hospital. Common reports, such as a balance sheet or profit and loss statement, should come preformatted and be easy to run. Some accounting software offers a limited choice of prepared reports and no ability to modify the selections. While having a variety of report options is seldom the best way to evaluate software, limited reporting makes managing the financial side of the business more difficult. Exporting reports to Excel and emailing reports from within the software are other important features.
- Payroll module. Several financial/accounting packages include integrated payroll modules. Generally, the practice can choose how hands-on it wishes to be in the process. For example, the practice owners may choose to make payroll tax deposits themselves, rather than paying more to have the software vendor initiate those payments.
- Integration with PIMS. Veterinary accountants are split as to whether the hospital's financial/accounting software should integrate directly with the practice management software used in the practice. What these accountants agree on is that breaking out revenue by category and matching the costs associated with generating that revenue is critical. By doing so, practices can calculate the ratios of income to expense to determine if those ratios are increasing, decreasing, or remaining the same. Particularly when a practice wishes to reduce overall costs of goods, tracking these costs by category is imperative. If the practice cannot or chooses not to integrate the PIMS and the financial software, the information can be summarized in the PIMS and entered by hand into the accounting software on a regular schedule (e.g., once a month).

FEATURES VETERINARY HOSPITALS DO NOT REQUIRE

Veterinary PIMS are, themselves, feature rich and designed to manage many of the hospital's vital functions. Therefore, some features common among accounting software packages will not be utilized by the hospital. Examples include client invoicing, accounts receivable, inventory, and employee time tracking. Although these functions should not be duplicated in the accounting software, the values in each system should tie. For example, an accounts receivable report from a PIMS system will list client names, contact information, and dates of charges and payments. The same detail should not be tracked in the accounting software, but the total dollars in accounts receivable should be the same. Let us use inventory as another example. Do not track quantities of inventory in the accounting software. However, the total dollar value on hand according to the accounting software reports should match the value in the PIMS.

DESKTOP OR CLOUD BASED?

Though desktop software has long been the standard, more and more businesses choose to use cloud software. When choosing between desktop and cloud-based software, consider the following advantages and disadvantages of each.

Advantages of Desktop Software

- In the short run, desktop software is usually less expensive than cloud software, because once the desktop software is installed it is up to the user to decide how frequently to upgrade to a newer version. Although most financial/accounting software is upgraded annually, there is not always a compelling reason to buy the software this often.
- Desktop software is feature rich. Cloud software does not have the same lengthy history as desktop software, and generally does not include all of the same features.
- Desktop software is available when/where there is no Internet service.

10.4. SELECTING FINANCIAL/ACCOUNTING SOFTWARE

Disadvantages of Desktop Software

- New features are not available without upgrading to a newer version of the software for an additional charge.
- Hospital employees must make an effort to install routine software updates, patches, and bug fixes, all of which take time and create the inconvenience of rebooting each computer where the software is installed.
- If the financial/accounting software is installed on a laptop and the laptop is lost or stolen, the practice's financial records are also lost. It is imperative to regularly backup desktop software to a separate device or cloud storage service to prevent the loss of critical data.

Advantages of Cloud Software

- Availability 24/7/365.
- The software can be accessed from any Internet connection. Some packages also have mobile apps.
- Data are continually and redundantly backed up, greatly reducing the chance of a costly loss.
- The software is always up to date with new features.
- Independent platform that is compatible with multiple browsers.
- Software vendors spend most of their development dollars on cloud-based software.

Disadvantages of Cloud Software

- In areas where Internet service is unreliable, there will be periods when the hospital's data cannot be accessed.
- Because cloud software is continually updated, there will be periods when the software is unavailable. Request "up time" statistics to ensure the software is available when it is needed. Up times of >98% are reasonable and desirable.
- Unlike desktop software that is installed and used until upgraded, cloud software subscriptions must be kept current or access to the hospital's file may be denied.
- Users who switch to online software and then elect to revert to desktop software may lose all of the new data input into the cloud software. Utilize free trial periods to ensure the software meets all the practice's needs before switching.

EXAMPLES

N/A

CAUTIONS

- No financial/accounting software will ever replace the expertise of a good accountant. Always consult the hospital's accountant on matters of taxation, before entering into new loans, when establishing retirement accounts, making hiring decisions, and changing payroll providers.
- Do not use price as the primary determiner. It is more important to have robust software that will support the hospital and its owners than it is to save a small amount of money. Consider staff time as a limited resource when evaluating potential savings.
- For both desktop and cloud financial/accounting software, the hospital's information is only as secure as the passwords to access it. Though it may be annoying to change passwords often, the effort may prevent criminals from gaining access to sensitive data.

10.5. Cloud-Based Solutions

BASICS

OVERVIEW

Cloud-based computing refers to utilizing software that is accessed remotely through the Internet. Cloud-based software is typically paid for by a monthly subscription fee. This monthly subscription fee includes an unlimited number of updates to the software. The advantages of cloud-based software are:

- You do not have to keep reinvesting in software for each upgrade.
- Upgrades are completed for you by the software vendor.
- You can access the software anywhere there is Internet access.
- Reduced cost, allowing you to not have to purchase expensive software all up front.
- Hardware requirements generally do not change because the software is not being stored on the computer (i.e., if you are using more space within the software it does not take up more space on the computer because all the data are stored via secured server).
- Information technology needs lessen because all software updates and server updates are completed remotely.

TERMS DEFINED

Archive: A collection of historical records, or the physical place they are located.

Cloud Computing: The use of computing resources (hardware and software) that are delivered as a service over a network (typically the Internet).

Computed Radiography (CR): Uses very similar equipment to conventional radiography except that in place of a film to create the image an imaging plate made of photostimulable phosphor is used. The imaging plate is housed in a special cassette and placed under the body part or object to be examined and the x-ray exposure is made. Instead of taking an exposed film into a darkroom for developing in chemical tanks or an automatic film processor, the imaging plate is run through a special laser scanner, or CR reader, that reads and digitizes the image.

Digital Imaging and Communications in Medicine (DICOM): A standard for handling, storing, printing, and transmitting information in medical imaging. It includes a file format definition and a network communications protocol. The communication protocol is an application protocol that uses Transmission Control Protocol/Internet Protocol (TCP/IP) to communicate between systems. DICOM files can be exchanged between two entities that are capable of receiving image and patient data in DICOM format.

Digital Radiology (DR): Form of x-ray imaging where digital x-ray sensors are used instead of traditional photographic film.

Hardware: The collection of physical elements that comprise a computer system. Computer hardware refers to the physical parts or components of the computer, such as monitor, keyboard, hard disk, mouse, and so on.

Information Technology: Concerned with the development, management, and use of computer-based information systems.

Picture Archiving and Communication System (PACS): A medical imaging technology that provides economical storage of, and convenient access to, images from multiple modalities (source machine types). Electronic images and reports are transmitted digitally via PACS; this eliminates the need to manually file, retrieve, or transport film jackets.

Remotely: From a distance or without physical contact.

Software: A collection of computer programs and related data that provide the instructions for telling a computer what to do and how to do it. Software refers to one or more computer programs and data held in the storage of the computer.

Subscription: A purchase made by signed order, as for a periodical for a specified period of time or for a series of performances.

TCP/IP: TCP handles host-to-host communication. IP connects local networks, thus establishing internetworking.

ISSUES AND OPTIONS

TYPES OF CLOUD-BASED SOFTWARE

Within the veterinary field there is a variety of cloud-based software:

- Reference laboratories that allow the practice to access laboratory results remotely (see 9.9 – Laboratory Considerations).
- PACS servers that allow practices to store and share digital diagnostic images (DR, CR, computed tomography, ultrasound, etc.; see 9.8 – Digital Imaging Systems in Practice).
- Remote desktop applications allow you to access your practice management software remotely. The software is still stored on your server, therefore requiring manual updates and hardware upgrades. This type of cloud-based software reduces savings that are typically offered with true cloud-based software that is hosting outside of the practice's network.
- Backup software provided by an online backup service company (e.g., Carbonite).
- Patient portals, which allow clients to access their pet's information online. The information transmitted to the portal is provided directly by the practice management software and hosted through the cloud-based pet portal software (see 10.18 – Patient Portals).
- Web design management software that is hosted through a web provider's servers.
- E-mail management and design software. This software is managed by the e-mail software provider (e.g., Constant Contact, MailChimp), which allows you to easily design professional e-mail newsletters, store e-mail addresses, send out e-mail newsletters, and archive previously sent e-mail newsletters.
- Webmail management software that allows users to easily send and receive emails. Users can easily archive received messages to reference again at a later time.

WHEN TO CHOOSE CLOUD-BASED SOFTWARE OVER PHYSICAL SOFTWARE

- When the software is rather expensive to purchase all at one time.
- If you plan on utilizing the software over a period of a couple of years or the lifetime of the business.
- When you expect the software's abilities to change over a period of time, which coincides with the changes in technology and business needs.
- If you work in multiple places at any given time that require you to access the software from wherever you are located. For example, if you have a home office, work office, and if you work while on the road and/or while traveling to different locations.
- When the software plans on storing data with high file sizes that could end up requiring a hardware upgrade soon after it is installed.

EXAMPLES

- Small practices with minimum hardware that are seeking to make an upgrade to DR or CR should consider purchasing a PACS subscription to allow images to be stored and shared remotely. In most cases, this will help save initial investment costs by not having to invest in a new server with increased storage size.
- Practices that currently utilize practice management software that does not integrate with laboratory equipment or connect with reference laboratories should consider utilizing a veterinary laboratory that will allow the veterinarians the ability to easily access patient

laboratory results via the cloud-based software. With the software you should have the ability to access patient laboratory results, trend results, share the results with consulting veterinarians, and e-mail to clients and/or upload to a patient portal.

- Remote desktop applications allow you to access the practice's practice management software remotely through an application installed on your server. Although this is considered a "private cloud" it still allows you the ability to access information from anywhere there is Internet access. The practice management software is still installed on your server and updates are still for the most part completed manually. Therefore, this reduces your cost savings from true cloud-based software applications.
- Practices that do not have the money to invest in custom websites nor the ability to design a website from scratch should consider veterinary cloud-based web design management software. Rather than spending thousands of dollars purchasing an expensive web design software, you can pay a monthly subscription fee to access cloud-based design software that will easily allow you to create a website, make changes, manage content, add new pages, create contact forms, and so on. This type of cloud-based software typically requires no Hypertext Markup Language coding or web design experience.
- E-mail management software through cloud-based programs allows you the ability to design professional e-mail newsletters to send to your clients. The advantages of utilizing a cloud-based software over software installed on your computer, such as Outlook or iMail, include: the ability to easily design professional-looking e-mail, easily store client e-mail address in a secure place that allows you to categorize them in different groups (e.g., cat owners, dog owners, mixed pet households), send e-mail messages without having to expose all of your clients' e-mails in each message sent (similar to using the blind carbon copy feature, also known as BCC), the ability to scan e-mails before they are sent to prevent them from being flagged as spam, and easily give your clients the ability to unsubscribe with the click of a link. This type of software would cost a significant amount of money to purchase and constantly keep up to date unless you are subscribed to a cloud-based software subscription.

10.6. KEEPING TECHNOLOGY IN PERSPECTIVE

BASICS

OVERVIEW

• Emerging technologies from human medicine are quickly being adopted in the veterinary field. These technological advances can be harnessed to solve old and important problems. Diagnostics have significantly improved across the field in the last 20 years, leading to important advances in patient care. Exciting advances in treatment hold great promise, and it is likely that biotechnology and genomics will fundamentally alter the field in the future. Moreover, the emerging tools in which we can integrate our data and interact with clients and prospective clients provides wide-ranging performance improvements.
• While it is important to explore and embrace these positive ramifications, it is equally important to keep technology in perspective. There may be associated negative consequences with the continued integration of technology in our daily lives. It is ironic that, at a time where the world is better connected than ever before, the population feels lonelier than ever. We must sincerely explore what is happening here, ask how this can affect wellness in the veterinary industry, and take steps to address this phenomenon.

TERMS DEFINED

Client Lifetime Value: A prediction of the net profit attributed to the entire future relationship with a customer.
Cloud Computing: The practice of using a network of remote servers hosted on the Internet to store, manage, and process data, rather than a local server or a personal computer.
Customer Acquisition Cost: This is the total cost of acquiring a client.

ISSUES AND OPTIONS

There has been an incredible amount of innovation and advancements in the veterinary field since the dawn of the digital age. We are better able to collect data, interpret it, treat patients, and communicate with clients. Burgeoning fields hold exciting promise, and the future of the field seems incredibly bright.

DIAGNOSTICS

• Digital radiology is reaching mass adoption. The image quality is substantially superior to film and does not have the same per-shot constraints as film radiology. It also affords the ability to access the radiographs virtually, and to quickly send the information to others, such as board-certified veterinary radiologists. This improves collaboration, efficiency, and patient care.
• Ultrasound technology being adopted on a wide scale. An ultrasound allows the clinician to look at the entire structure of an organ. It is commonly used together with radiographs to be a central component of diagnostics in veterinary medicine. It is noninvasive and safe and has the potential for universal adoption owing to its relatively low costs.
• Magnetic resonance imaging (MRI) technology reshaped neuroscience in human medicine and is now being harnessed in veterinary medicine. MRI technology also offers powerful diagnostic advancements in orthopedic and soft-tissue structures. This improves surgical ability and efficacy. Though MRI is a powerful tool, the machines are still relatively expensive and require the use of general anesthesia, limiting its potential routine use.
• Microfracture technology is saving the lives of horses. A large threat to the health of thoroughbred racehorses is bone failure. These horses are at risk of developing small bone fissures during training. These can quickly turn into fractures that prove fatal to the horse. Using sonic waves, diagnosticians can detect these microfissures and treat them before fractures develop.

TREATMENTS

• Laparoscopy and laser surgery techniques are quickly making their way into veterinary medicine. For many types of surgical procedures, minimally invasive techniques offer a safer, more effective surgery, with fewer postsurgical complications and a better long-term prognosis.
• Stem cells have begun to be used in therapeutic applications to treat musculoskeletal injuries. Though they are primarily used to treat tissue injury and wound healing, the technique may have transformative potential. Wider human and animal studies are being conducted to evaluate the use of stem cells to treat heart disease, immune disorders, blindness, and more.
• The field of genomics is still in its infancy, though is beginning to bear fruit, such as the use of recombinant DNA to create vaccines. Genetic tools hold great promise in treating a range of illnesses and creating a next generation of pharmaceuticals.

THE DIGITAL AGE

• The digital age has quickly allowed even the smallest veterinary practices to easily integrate scheduling, charting, testing, bloodwork, and ongoing logistical tasks into a single platform. These platforms are quickly moving to the cloud, where they can be accessed anywhere and at any time by the veterinary team (see 10.5 – Cloud-Based Solutions). This creates greater efficiency and productivity and can improve patient care.
• With burgeoning diagnostic capabilities, software tools have quickly evolved to integrate with laboratory and diagnostic equipment, which can be automatically integrated to a patient's medical record. This can be shared with other professionals and specialists for diagnostic purposes and can be helpful as an educational tool.
• Software companies are beginning to address opportunities in the industry, such as inventory management, staff training, data security, payment and collections, and logistics.
• Automated digital communications can improve compliance with existing clients, which improves patient care and increases a client's lifetime value to the veterinary practice.
• In large-animal practices, digital tools can be used to track herd data. This can allow for more efficient healthcare visits and can better predict the spread of disease.
• Social media has fundamentally changed the way people communicate. A veterinary practice is now able to market its brand in a much more targeted and controlled way through the use of targeted advertisements, solicitation of reviews, video, storytelling, and other forms of community outreach on Facebook, Yelp, Instagram, Pinterest, Twitter, and other social platforms (see 10.16 – Social Media).
• The rise of search engines has created a new form of advertising: search marketing. In old media advertising, a veterinary practice would broadcast a message to a wide range of potential recipients. With search engine advertising, a veterinary practice can choose to market only to people who search for veterinary services. This can significantly lower customer acquisition cost in advertising efforts.
• The maturation of the web design field allows for a veterinary practice to address deeper human needs when a prospective client is searching for a veterinarian. A practice can more clearly and effectively communicate why a client can and should trust the practice with their pet's healthcare.

EXAMPLES

N/A

10.6. KEEPING TECHNOLOGY IN PERSPECTIVE

CAUTIONS

HIDDEN COSTS

Our world is becoming vastly more technological. With that, our comfort with technology grows, and our dependency on technology increases. This likely has unintended consequences for a wide segment of the population, much of which affects the veterinary industry. It is important to understand how technology affects both the mental health of our clients and ourselves.

- Sustained happiness largely originates from our ability to connect and form meaningful relationships with our social group, community, and wider environment. The capacity to do this may be weakened by an overreliance on technology.
- The rise of social media and mobile computing has led to an extraordinarily quick change in behavior amongst the general population. If you walk into a coffee shop, it will immediately become apparent. Where before people may be looking around, talking, or otherwise enjoying the scenery, eyes are typically now glued to their phones.
- A hypothesis for this behavior is that these devices are tapping into our brain's rewards systems, namely the release of dopamine. We feel compelled to look at our phones because every time we do so our brain releases a dose of dopamine. It makes us feel like we have accomplished something, even though we really have not. It can make smartphone and social media usage effectively addictive. This can at least partially explain why US consumers now spend nearly five hours per day on mobile devices.[1]
- A recent study found an increase in depressive symptoms and suicide rates among young adults that was strongly linked to new media screen time. It is possible that these new media technologies are, for many of us, causing harmful feedback loops and creating global impacts on mental health.[2]
- The continued journey into a technological society may be making us lonelier, less able to form meaningful relationships with others, and less able to enjoy the world around us.
- There are clear benefits to getting away from glowing screens and spending time in nature. There are a range of studies that show clear boosts in mental health and ability after time spent in nature: improved short-term memory, restored mental energy, stress relief, reduced inflammation, better vision, and improved concentration. Among office workers, even the view of nature through a window can reduce cortisol levels and is correlated with higher job satisfaction.
- We must ask: why? Could it be that we were designed for an environment that we are slowly losing? Humans evolved at a time where we could create meaningful bonds with our social groups, explore that natural landscape, and enjoy long uninterrupted periods in thought or conversation. This is quickly giving way to a society where conversations are byte sized and impersonal, our preferred environment is a glowing screen, and we consequently feel increasingly isolated and lonely.
- Keep technology in perspective. It can never replace the bonds we form with others, the way we interact with the world, or the way we fulfill our deepest human needs.

10.7. INFORMATION SECURITY: BACKING UP AND ARCHIVING YOUR SYSTEM

BASICS

OVERVIEW

• Backing up and archiving system data is a vital part of information management.
• Disaster can strike at any moment, and it is important to have a system in place to prevent data loss (see 14.20 – Business Contingency Planning).
• Backing up data refers to the copying of computer data so it may be used to restore the original system files in the event of data loss.
• Archiving data refers to primary source system files that have accumulated over the course of an organization's lifetime.
• It is easy to set up a backup system within your practice to prevent data loss.
• The use of your network and the amount of data being backed up will determine the backup and archiving solution best suited for your practice.
• The cloud is a form of remote data storage, which is rapidly gaining popularity across the World Wide Web as a whole, and within thriving veterinary communities.
• The cloud transitions our data away from local devices (think bulky servers and clunky external hard drives) and instead moves them to secure offsite servers, allowing you to access the files from anywhere with a simple login.

TERMS DEFINED

Archive: A collection of historical records, or the physical place they are located. Archives contain primary source documents that have accumulated over the course of an organization's lifetime.
Backup: In information technology (IT), a backup, or the process of backing up, refers to the copying and archiving of computer data so it may be used to restore the original after a data loss event.
Bandwidth: The average rate of successful data transfer through a communication path.
Broadband: An Internet connection with a much larger capacity than dial-up (e.g., cable, digital subscriber line, or fiber optics).
Cloud: A communications network that often refers to the Internet, and more precisely to a datacenter full of services that is connected to the Internet.
External Hard Drive: Typically connect via Universal Serial Bus (USB). Plug-and-play drive functionality offers system compatibility, and features large storage options and portable design.
Flash Drive: A data storage device that includes flash memory with an integrated USB interface. USB flash drives are typically removable and rewritable, and physically much smaller.
Gigabyte: Unit of computer memory or data storage capacity equal to 1,024 megabytes.
Operating System: A collection of software that manages computer hardware resources and provides common services for computer programs. The operating system is a vital component of the system software in a computer system. Application programs require an operating system to function.
Remote or Cloud Backup: Cloud based backup systems are typically built around a software program that runs on a schedule, typically once a day, and usually at night while computers are not in use. This program typically collects, compresses, encrypts, and transfers the data to the remote backup service provider's servers or offsite hardware.
Server: Physical computer (a computer hardware system) dedicated to run one or more services (as a host), to serve the needs of the users of other computers on the network.
Thin Client: Computer or a computer program that depends heavily upon some other computer (its server) to fulfill its traditional computational roles.
Universal Serial Bus (USB): A connect standard for attaching peripheral devices to a computer, allowing fast data exchange.
Workstations: A high-end microcomputer designed for technical or scientific applications. They are commonly connected to a local area network and run multiuser operating systems.

ISSUES AND OPTIONS

AUTOMATION

• Certain types of software, such as virus and spyware scanners, figure their own automatic processes and schedule them. Backup software is no different and can be scheduled to automatically occur based on the time and frequency you choose.
• The software can schedule the backup task during times where the network will be used less frequently.
• You can create multiple schedules and notifications and even back up data to remote servers.

LOCAL BACKUP

• Local backup is defined as a backup that occurs on a local device such as flash drives or external hard drives.
  ◦ Local and cloud backups are great for quick recovery when your internal hard drive crashes.
  ◦ Local and cloud backups can typically store larger amounts of data such as a larger practice management software database, diagnostic images (e.g., digital radiology images, ultrasound images, digital pictures).
• Local devices for backups completed on-site include flash drives or external hard drives.
• Local backups completed on a compact disk are no longer recommended due to the limited storage size, therefore narrowing down the amount of data that can be backed up at any given time.

CLOUD BACKUP

• Cloud backup is defined as a backup that is transmitted through the Internet to a remote server, and therefore stored offsite.
• Remote backups are great in the event your practice gets burglarized, catches on fire, or if other natural disasters occur.
• Broadband Internet access is highly recommended for backups completed over the Internet.
• Cloud backups can store large amounts of information, but the time it takes to transmit large amounts of data over the Internet can vary based on the Internet bandwidth (speed) in your practice. For example, if you were transmitting 10 gigabytes of data to your online backup system, it may take up to 12 hours to complete your backup based on your Internet bandwidth.

BACKUP TYPES

• Full backups should include files such as network settings and configurations, data stored on all practice thin clients, practice management software data, and diagnostic images.
• Partial backups should include files such as network settings and configurations and practice management software data.
• Mirror image backups are an identical copy of your hard drive. Mirror image backs up your operating system and programs stored within the hard drive.

LOCAL DEVICES

• Local devices for backups completed on-site typically include flash drives and external hard drives.
• In most instances, backups completed on a compact disk, tape drives, and memory cards are no longer recommended due to reliability and the limited storage size.

10.7. INFORMATION SECURITY: BACKING UP AND ARCHIVING YOUR SYSTEM

BACKUP SOFTWARE

- There are a variety of options for backup software, including options that are free.
- When choosing a backup software look for these key features:
  - ability to work on your operating system;
  - ease of restoring data;
  - ease of creating backups;
  - automation capabilities;
  - ability to create local backup;
  - ability to create remote backup;
  - mirror image backup;
  - 24/7 technical support options.
- Check with your practice management software vendor and/or your IT company for their suggestions. They often provide software at an additional cost, but they will set it up for you and support your backup needs. This makes managing backups and potential restoration much easier.

ARCHIVING DATA BACKUPS

- In many cases, archived backups can be stored on one device. For example, if you are backing data up to an external hard drive or to the cloud, you will be able to store weeks' worth of backup data on a single device or cloud-based server.
- In the event you are archiving backups to a single device, make sure to plan to have an additional device to allow you to take the recently stored backup offsite while leaving the additional device on property to back up the current day's data.
- Save each device once it becomes full and store them in a safe and secure location offsite.

EXAMPLES

LOCAL OR CLOUD BACKUP

Both types of backups can occur for any practice type:

- You can create a full backup to your local devices.
- You can create a partial backup to your remote online backup system.

SAMPLE BACKUP PLAN

Full local or remote daily backups should be scheduled through the backup software to be completed at the end of each practice day. In the event the practice operates 24/7, the backup should be completed during the time when the network is least used to ensure optimal network performance. Each morning, a team member will be responsible for verifying the completion of the scheduled backup. In the event of a backup error, the team member should restart the backup immediately and contact their IT company or software vendor to make sure it is an isolated incident. If the backup is completed locally, the backup device should be ejected and taken offsite at the close of each day by an owner or designated manager of the practice. An alternative device must be put in its place to allow the next scheduled backup to be completed.

All archived backups completed should be stored in a safe location offsite. If the archived backups are all completed on one local device, make sure to keep the device secure at all times.

In the event where data recovery is needed, immediately contact your practice management software vendor and/or IT company to assist you with providing new hardware required to quickly restore your data. Do not attempt to restore any data without consulting with your practice management software vendor and/or IT company.

SAMPLE BACKUP PROCEDURES

All network resources are backed up nightly, and devices (if applicable) rotated on a schedule and stored offsite. Data stored on the local personal computer drives of practice owners, management team members, associate veterinarians, and marketing personnel should be routinely backed up (locally or in the cloud). Computer users will be responsible for ensuring that the data stored on their local machines are backed up as required by the IT company and/or software vendor.

10.8. CYBERSECURITY AND NETWORK SECURITY

BASICS

OVERVIEW

Information management is a major component of information technology (IT). Information management, as it relates to IT, is the practice of properly storing information on your computer systems. This includes, but is not limited to, recordkeeping and document management. Information management is an important part of your veterinary practice. The way we managed this information in the dawn of the computer age was more of a hassle than it was a help. However, with the rapid advancement of technology, you are now able to be more organized and efficient throughout the practice.

One of the biggest mistakes in information management and computer networking is the failure to set up proper policies and procedures of confidential access and security. Regulating the use of your system is essential to keeping your data secure. Most systems today are connected to the Internet to research, send e-mails, transmit laboratory results, send digital radiographs, and more. Having your server connected to the Internet is important for every practice to properly utilize their practice management software and integration capabilities. However, if your system is not protected properly, you may encounter major problems that can ruin your system. Proper policies and procedures must be taken to keep the system secure, reliable, and functional.

Internet Awareness

- The Internet can be a very useful resource, but it can also become a nightmare if you are not properly secured from the potential dangers.
- It is *extremely* important to set proper protocols in your practice for the use of the Internet.
- Each workstation that does not need the Internet should be blocked from Internet access.
- Workstations that require Internet access should contain site blocks to avoid websites that should not be visited during business hours from being accessed.
- Certain websites and e-mails download information onto your computer known as spyware or malware and will slow down your computer and ultimately pose a great risk to the information stored on your network.
- Spyware and/or malware eventually cause the computer to function so slow it becomes unreliable.
- Most important, if your computer/server becomes vulnerable to viruses or hackers, there will be a great possibility that your information and your clients' information may be stolen, exposed, or destroyed.

TERMS DEFINED

Antivirus Software: Used to prevent, detect, and remove malware (of all descriptions), such as computer viruses, adware, backdoors, malicious browser helper objects, dialers, fraudtools, hijackers, keyloggers, malicious layered service providers, rootkits, spyware, Trojan horses, and worms.
Cybersecurity: The protection against the unauthorized or unlawful use of electronic data.
Firewall: Software-based or hardware-based tool used to help keep a network secure. Its primary objective is to control the incoming and outgoing network traffic by analyzing the data packets and determining whether it should be allowed through or not, based on a predetermined rule set. A network's firewall builds a bridge between an internal network that is assumed to be secure and trusted, and another network, usually an external (inter)network, such as the Internet, that is not assumed to be secure and trusted.
Hacker: Someone who accesses a computer system by circumventing its security system.
Information Technology (IT): Concerned with the development, management, and use of computer-based information systems.
Malware: Short for malicious software. Software used or created to disrupt computer operation, gather sensitive information, or gain access to private computer systems. It can appear in the form of code, scripts, active content, and other software. *Malware* is a general term used to refer to a variety of forms of hostile or intrusive software.
Modem: A device or program that enables a computer to transmit data over, for example, telephone, fiber optic, or cable lines.
Network: A collection of computers and other hardware components interconnected by communication channels that allows sharing of resources and information.
Robust Password: Meaning "tough" or "complex" password. It must contain at least eight characters, including at least one upper-case letter, at least one lower-case letter, at least one symbol, and at least one number. It may not contain words in the dictionary or proper names.
Router: A device that forwards data packets between computer networks, creating an overlay internetwork. A router is connected to two or more data lines from different networks. When a data packet comes in one of the lines, the router reads the address information in the packet to determine its ultimate destination.
Spyware: A type of malware (malicious software) installed on computers that collects information about users without their knowledge. The presence of spyware is typically hidden from the user and can be difficult to detect.
Virus (Computer Virus): A computer program that can replicate itself and spread from one computer to another. The term "virus" is also commonly, but erroneously, used to refer to other types of malware, including, but not limited to, adware and spyware programs that do not have a reproductive ability.
Virus Protection: See *Antivirus Software* entry.
Wi-Fi: A system allowing devices to access or connect to an Internet network without needing to use wires.

ISSUES AND OPTIONS

INTERNET AND NETWORK SECURITY

- One of the most important things any computer/server should have is good virus protection software.
- Virus protection software comes in many different varieties. Virus protection for your server can vary based on your server's operating system.
- It is best to consult with your IT administrator or IT company to better help you choose the best software.
- Your full-access computers that are connected to a network and connected to the Internet (or directly connected to the Internet) should have Internet security that is firewalled, protected against viruses, and protected against spyware.
- There is a variety of software to choose from, and you want to stick with a brand (Norton, McAfee, etc.) that is known for its protection and has the ability to download daily updates.
- After the installation of the software, you will want to set the virus protection software to run automatically at a time that your computer is not being used (i.e., in the evening when the clinic is closed or in the morning before the clinic opens).
- Always remember that having Internet security does not mean you cannot have any harm done to your system.
- Viruses are created every day in different forms, so it is important to have protocols for Internet use in your hospital.

WIRELESS INTERNET ACCESS

- There are many kinds of modems, routers, and modem–router combos.
- Some are direct connect and require only minimal skill to install. However, some routers require more elaborate installations but possess more features. These routers can be simple to install but are often installed incorrectly.
- It is highly recommended than an IT professional install *all* router types for you.
- Some laptops, printers, and even computers in your practice access the Internet using your own Wi-Fi connection.
- Protect the router from being hacked by using a robust password and enabling the firewall.
- This allows only users with the correct login information to access your Wi-Fi.

ACCEPTABLE USE POLICY

Your network and practice management software should have an acceptable use policy. This policy explains the acceptable uses for the network, hardware, and practice management software. The goal of the policy is to help team members understand how they can and cannot use the network, hardware, and practice management software (see 10.24 – Internet Use Policy). This policy will help keep your network safe and promote proper use. A list of some acceptable uses is as follows:

- The use of practice management software.
- Educational or medical-related research.
- Viewing instructional videos.
- The use of pharmaceutical software.
- Strictly business-related e-mail.
- Uploading approved photographs and videos to place in patient medical files.
- Connecting only equipment that has been approved by your network administrator. Some examples of approved devices are:
  - signature pads;
  - clinic camera;
  - clinic laptops;
  - diagnostic medical equipment;
  - USB flash drives;
  - external hard drives.

Some unacceptable uses are as follows:

- Do not access areas within the computer and network with which you are not familiar.
- Do not access the server unless granted permission or under the direction of your IT company and/or practice management software vendor.
- Do not use any computer to access music, games, or nonbusiness-related videos.

Involve key team members, such as the practice owner, practice administrator, and an IT administrator, to form this policy.

EXAMPLES

SAMPLE INTERNET-USE POLICY

Internet use, on company time, is authorized to conduct company business only. Internet use brings the possibility of breaches to the security of confidential company information. Internet use also creates the possibility of contamination to our system via viruses or spyware. Spyware allows unauthorized people, outside the company, potential access to company passwords and other confidential information.

Removing such programs from the company network requires IT staff to invest time and attention that is better devoted to progress. For this reason, and to assure the use of work time appropriately for work, we ask staff members to limit Internet use.

Additionally, under no circumstances may company computers or other electronic equipment be used to obtain, view, or reach any pornographic, or otherwise immoral, unethical, or nonbusiness-related Internet sites. Doing so can lead to disciplinary action up to and including termination of employment.

10.9. BLOCKCHAIN

BASICS

OVERVIEW

Blockchain may be a foreign concept to many veterinarians, but it is an important topic because it is demonstrating real benefits in many aspects of human healthcare and is bound to gain more prominence in veterinary medicine as well.

Blockchain gained some notoriety with the introduction of bitcoin (see 8.15 – Cryptocurrencies), but it has been recognized as having many more applications, including its use in healthcare.

TERMS DEFINED

Blockchain: A database that is shared across a network of computers.
Hash Code: A form of cryptographic security that, unlike encryption, cannot be reversed or decrypted.

ISSUES AND OPTIONS

Blockchain is a database shared across a network of computers, but it differs from other databases in a number of important ways. For security, once a record has been added to the chain, it is very difficult to change. For consistency, the network makes frequent checks to ensure that all copies of records are the same across the entire network.

In a blockchain, individual records are bundled together into blocks and then linked sequentially within the chain. The three parts of the process are thus

- the record;
- the block;
- the chain.

For any given transaction, the process involves recording the details of the transaction (record), including the digital signatures of each party. The computers in the network, called nodes, then verify the details of the record to make sure it is valid. Accepted records are then added to a block and then the block of records is ready to be added to the chain. Each block contains a unique code, called a hash, that identifies where it belongs when assembled into a chain. These hash codes are created by a mathematical formula and contribute to the security of the system. In the final step, the blocks are added to the chain, and the hash codes connect the blocks in a specific order.

Any change to the original record, no matter how miniscule, would be detected and would warrant the generation of a new hash code. That change to the hash code alters the blockchain, making it extremely difficult for hackers to make changes that are not immediately detected within the network. It is not impossible, but attempting to change all the hash codes within the chain would require phenomenal computing power, making it much more secure than current systems.

A blockchain database is decentralized and computers in the network are nodes, so there is no master computer in the system. With a decentralized network, all of the participating nodes can access the information and compete to be the next to add to the database, so the system sets up tests of trustworthiness. These tests are referred to as consensus models and require network members to prove themselves before they are allowed to add to the chain.

To make sure only authorized users have access to the information, blockchain systems use cryptography-based digital signatures to verify identifies. Account holders have private keys that are nearly impossible for hackers to discern, but public keys can be generated for information sharing. In this way, anyone with a public key can receive information (or funds in the case of cryptocurrency), but only those with a private key can alter that information (or spend cryptocurrency funds). Third parties, such as pet owners, can be given limited access to records, while the audit trail capability of blockchain means there is complete documentation of the creation, modification, and deletion of records.

HEALTHCARE APPLICATIONS

Current systems for sharing electronic data among doctors, patients, referral hospitals, laboratories, and insurers are still quite error prone. Incorrect information can emerge as patient data gets re-entered time after time by different individuals, and it is difficult to conserve changes made by one party into everyone's version of the medical record.

Blockchain can be used to provide all clients and providers with identical content. The decentralized-ledger approach to information management gives all parties simultaneous access to a single record of strongly encrypted data at relatively low cost. It also creates an audit trail each time any data in the record is changed, helping to maintain the integrity of the system and its information. Eventually, blockchain could be used to provide secure and accurate medical information for all individual patients.

With blockchain technology, clients could actually play some role in managing the medical records of their pets and give permission to different providers and entities to access and modify those records.

If a pet has received treatments from multiple doctors at different facilities, all that information can be accessed from the blockchain, and there would be an audit trail for any changes made. Ultimately, the success of any such system depends on the participation of many medical providers, or there are few benefits over those seen with traditional electronic medical records.

One of the main benefits for blockchain use in healthcare is that it is decentralized, which provides enhanced security. Because the data record is replicated across many nodes rather than on one central computer, it is more resistant to a hacking attempt or manipulation. If any one computer is hacked, other separate computers in the network that are using the blockchain would still maintain accurate information.

Other areas where blockchain can prove very useful is with online directories of doctors and other healthcare providers. Hospitals, doctors' groups, laboratories, and insurers all try to maintain their own online listings, but these frequently become outdated, or require providers to notify the entities that the information has changed or is outdated. With blockchain, providers can update their own information at will. Especially in veterinary medicine, with so many clinics unaffiliated with one another and potentially using different practice management software, there can be many islands of information with very few opportunities for data bridges. Blockchain can help address that.

Another area of importance for blockchain is the management of personal data online. With blockchain, a patient's entire medical record can be stored in a ledger and encrypted with a private key. Changes in this information can be communicated to the ledger with the patient's authorization and securely shared with various providers. Because of the audit trail feature, everyone is aware exactly who made the change, when the change occurred, and what was changed.

There are many other potential applications, from managing prescriptions through the blockchain so that all participants know when and where a prescription was filled, to tracking laboratory results through the system, to verifying veterinary licensing and updating information directly.

EXAMPLES

The following is an example of a fictional veterinary blockchain application.

A veterinary blockchain project was established with participation of veterinary hospitals, laboratories, and pet insurance companies.

Dr. Smith of ABC Animal Hospital is a participant, along with many of her colleagues.

Mrs. Jones first presented her spayed female labradoodle, Daisy, to the clinic, and once she shared her public key with the clinic they were able to access information from all the clinics that they had visited previously. In those records were also entries from diagnostic laboratories, along with time codes and verified user stamps of all participants. In fact, there was even an entry from a genetic testing facility indicating that Daisy carried a variant for exercise-induced collapse, and that might prove very useful should she ever display evidence of weakness.

Over the next few years, Dr. Smith came to appreciate the importance of blockchain to medicine. Once, after hours, Daisy needed to be seen at an emergency clinic, and Mrs. Jones was able to provide that clinic with a key to access Daisy's healthcare information, including recent bloodwork that had been run. Similarly, when Daisy showed some evidence of lameness, she was referred to a specialist; the specialist appreciated access to the previous medical records, including the genetic screening, and was able to append the medical record with relevant findings, accessible to Dr. Smith and others that had been given permission. Laboratory testing that had been performed was similarly entered into the record, directly by the laboratory.

Mrs. Jones had purchased pet health insurance for Daisy, which was in effect since Daisy was a puppy. The pet health insurance company participated in the blockchain process, and the shared ledger of encrypted data allowed all parties to view the same accurate information about the insurance claim, without anyone having to send medical information back and forth. Mrs. Jones found it very convenient to see that the insurance company was able to quickly acknowledge and process the claim.

CAUTIONS

- Blockchain is more difficult to hack, and it tends to be more secure than traditional systems; but with enough computing power it is possible that even blockchains could be hacked. So, it is considered very secure but not completely impervious to hacking.
- One concern in this regard is that since most blockchain networks run the same code, any vulnerability detected could potentially put the network at risk.
- To be fully effective, blockchain requires that a large number of providers participate in the process. Without such participation, it loses much of its benefits of multiuser access.
- As with most systems, it is also important to determine that data are accurate when first entered into the blockchain ledger. Sometimes, such as when a medical record contains information from multiple sources, it can difficult to determine the "owner" of a piece of information in the first place (e.g., a laboratory result recorded in a medical record, but without the actual laboratory that performed the testing specified).

10.10. PAPERLESS PRACTICE

BASICS

OVERVIEW

• The majority of veterinary practices utilize one of the many veterinary practice information management software (PIMS) platforms to manage their day-to-day operations. Few use all the features available.
• Practices rely on their software to record patient history, track income, manage inventory, and market services.
• It is common for practices to simultaneously use paper charts for medical patient recordkeeping while also using computerized practice management software.
• With the advent of more reliable hardware, cloud-based software, and cloud-based backup, the double work required to keep paper records and digital records is no longer necessary or wise.
• The conversion to paperless records is often more of a fear of change than a fear of data loss.
• Moving from paper to paperless records saves hours of time for the medical team, managers, and front office staff due to increased efficiency and immediate access to the patient's chart by all.
• Many practices become *paper light* and convert patient charts to digital but still utilize some paper for forms, check-in sheets, and treatment sheets.
• Management reports are more complete as all the services, drugs, products, and income are recorded in the PIMS.
• Inventory should be better accounted for since products are depleted from stock as they are used. Automated ordering reduces staff time spent making lists and calls. Want lists can be generated and e-mailed to suppliers for fulfillment. Products can be coded by supplier and digital lists created for each provider. Minimum and maximum order trigger points are set for products and can even be set by month to account for seasonality. Bar code readers can be used for entry of received orders.
• In-house diagnostic tests are ordered and automatically billed to the patient invoice, avoiding missed fees. Results are automatically download to the patient history, removing the need for printed reports and eliminating lost laboratory results.
• Financially, paperless records should decrease missed fees because services are entered into the database as the work is performed. Procedures are templated into lists of service codes relevant to the patient problem, allowing the team to easily pick services from the list. Bundled packages also can be built for common services to aid in reducing human error.
• A practice can save thousands of dollars annually in reduced paper costs and be more environmentally friendly.
• Audit systems should be put in place to spot check for errors, since paper charts are no longer available. End of date reports will show overrides and no charge fees but will not catch services performed but not recorded in the software. Strong password protection and limitations on override permission are needed (see 8.24 – Cash Control: Preventing Embezzlement).
• Better patient history is possible through the utilization of templates, standardized chart notes, bundled services, and custom travel sheets built within the software (see 9.1 – Medical Records and Patient Documentation). In addition, records are legible and not subject to the handwriting of the recorder. It is faster to edit a standardized note than to type a new entry for every patient (see 2.23 – Enhancing Doctor Productivity and 2.24 – Enhancing Team Productivity).
• Retrieving diagnostic reports and sharing patient history with specialty or emergency room practices is simplified (see 4.23 – The Extended Hospital Team: Making Referrals Work). Applications can also be used for record sharing. Historical laboratory results can be consolidated into graphs to monitor patient progress or decline.
• Remote access to charts is an additional positive aspect of paperless practice. Veterinarians may work from home or other locations and easily see a patient's full history. This also applies if they share their work time over several practices in a group.
• Client forms, such as new client, surgical release, anesthesia permission, photographic release, and boarding, can all be digitally signed and stored. Copies can be e-mailed to the client. Utilize a digital clipboard for these documents.
• Expense of additional workstations, laptops, or tablets and their consequential need for support should be noted. The increase in efficiency, decrease in cost of paper, and elimination of time wasted searching for charts should more than compensate for the expense over time.
• Security and legal issues can be of concern with paperless medical records. It is important to set systems into place to prove medical charts have not been modified and that confidential information is protected. Review these questions with your software or backup provider to your satisfaction before committing to a purchase. Retrieving backups based on specific points of time and PIMS that allows for record corrections for short periods of time after data entry and then lock the patient chart are common solutions. Typically, close of business day is the cutoff for changes and corrections to medical history.

TERMS DEFINED

Cloud-Based Backup: Also known as online backup, this is a strategy for backing up data that involves sending a copy of the data over a network to offsite servers. The server is usually hosted by a third-party service provider. Fees are assessed per data storage usage.
Paperless Practice: Digital utilization of the practice management software for recording patient history, invoicing, inventory control, marketing, financial tracking, production reporting, and team communication pertaining to patient care and status. In-house and outside laboratory services are connected, and reports stored digitally. Digital diagnostic device reports, such as from radiography, ultrasound, magnetic resonance imaging, are also stored as part of the patient medical history. Paper patient history charts are no longer utilized.

ISSUES AND OPTIONS

• The primary issue with converting a paper-heavy practice to a paperless system is historical patient information held on the paper charts is no longer available to the medical team unless scanned into the computer system.
• One option is to move paper charts to a location where they can be accessed if necessary, but not so easily that old habits continue.
• Practices wishing to convert believe all this historical patient information must be scanned into the PIMS and foresee hours of staff time involved in this task.
• Option: scan in complex case patient histories but patients with good health and simple vaccination histories can be skipped. Their data is already available in the software through invoicing charges if the practice has been using the computer for billing. This saves space in the server and "cloud" and saves staff scanning time.
• A paperless system requires training veterinarians and others on the medical team to use digital charting and change years of habitual working systems to a new way of managing patient history recording.
• Utilize online training of staff provided by the PIMS company. Comfort with the system and confidence in how to record medical history, view diagnostic results, and enter chart notes aids in speed of acceptance of the new protocol. Front office staff should study appointment scheduling, medication lookup, client contact information setup, and patient information entry if all these actions have been previously performed on paper.

• Typing. To utilize paperless systems, the staff using the tool must be able to type (keyboarding) or find alternate methods of entering information. Several generations have now grown up using computers and are rapid typists, but older practitioners and staff may have slower typing skills.
• Voice dictation software is a simple option for record entry. Practices can choose to train basic versions on medical terminology to save money, but specialized applications are available preprogramed with a medical dictionary.
• Create a new flow by holding team meetings and discussing how a patient will move through your practice from appointment call to check-out. Discuss which team member will oversee each area of patient care and data entry. Plan how the team will use the computer to communicate with each other in different areas of the practice. Electronic whiteboards will replace traditional whiteboards, so proper training on this tool is a priority.
• It is a good idea to visit a paperless practice utilizing your PIMS and observe their workflow in a paperless setting. Often seeing another practice use their PIMS paperlessly works as a "show and tell" opportunity for the team. Ask your PIMS provider to advise you of a paperless practice within a reasonable travel distance and plan a visit.

EXAMPLES

N/A

CAUTIONS

• Existing servers and other hardware must be able to support increased amounts of data. If the plan is to utilize laptops, tablets, and other wireless devices, the practice would be wise to invest in hiring a technology specialist familiar with veterinary medical devices and software to come evaluate both hardware and infrastructure before committing to paperless work systems.
• Invest in redundant backups. Backing up your server to an outside device has always been a requirement of good data stewardship, but this is imperative when the practice is paperless (see 10.7 – Information Security: Backing Up and Archiving Your System). IT professionals suggest setting up cloud-based *hourly* backup and confirming the cloud backup is redundant. Local backup in a natural disaster is inadequate (see 14.20 – Business Contingency Planning). Your backup provider must have storage in multiple locations distant from each other in case one area is hit by the unforeseen fire, flood, or power outage.
• Use an IT specialist to monitor your system and keep firewalls, antivirus, and malware protection updated (see 10.8 – Cybersecurity and Network Security). A paperless practice cannot afford to have its database held hostage by ransomware. Proactive care is best.

MISCELLANEOUS

• Becoming paperless is often a dramatic change for a practice team. Having several staff meetings beforehand can help the team express their concerns and plan solutions to problems before the actual commitment (see 5.6 – Shared Decision Making).
• Discussions about how the change will improve workflow, communication, and efficiency are a good approach.
• Set a goal and a date for the conversion. Without a deadline, human nature is to procrastinate and the change will take much longer than necessary to accomplish.
• Set a date pre-conversion that all new clients are added only in the PIMS and no paper chart is created.

10.11. ELECTRONIC COMMUNICATION: E-MAIL AND TEXTING

BASICS

OVERVIEW

• In veterinary practices today, we are seeing a generation of clients who demand and crave changes in the way we communicate. It starts with members of Generation X, who were exposed to the start of the dot-com era – also known as the "the dawn of the Internet age" (see 1.13 – Generational Differences). The very start of online communication was initially slow to get started and adapt to. At the time, having this "luxury" was not easily affordable at home or in the work place.
• Millennials have been raised with the advent of the Internet and typically use technology as an absolutely integral part of their lives. They do research online, they Skype with friends, and they may be much more comfortable with online bookings and open to remote consults instead of in-office ones.
• Communicate with each client in a way that honors the individual and their specific preference.
• Leveraging new communication technology puts your practice a step ahead of the curve, allowing you to send friendly updates and messages to a pet owner that may be curious about how their pet is doing, or may have simply forgotten about an appointment.
• When you customize your communication approach to benefit each client individually, you make sure that everyone feels welcome at your veterinary practice and avoid the pitfalls that can come when you make an assumption about preferences.

TERMS DEFINED

Domain: An identification string that defines a realm of administrative autonomy, authority, or control on the Internet.
E-mail: Electronic mail, commonly referred to as email or e-mail, is a method of exchanging digital messages from an author to one or more recipients. Modern e-mail operates across the Internet or other computer networks.
Internet: Domain names are formed by the rules and procedures of the Domain Name System.
Text (SMS) Messaging: The act of typing and sending a brief, electronic message between two or more mobile phones or fixed or portable devices over a phone network.
Web-Based Application: An application that is accessed by users over a network such as the Internet. The term may also mean a computer software application that is coded in a browser-supported programming language (such as JavaScript, combined with a browser-rendered markup language like Hypertext Markup Language) and reliant on a common web browser to render the application executable.

ISSUES AND OPTIONS

PROPERLY IMPLEMENTING E-MAIL COMMUNICATION

• Have you decided to communicate with clients by e-mail because it is most convenient for your clients? If so, you are taking a great step forward toward adapting to our new generation of clients' preferred way of communicating.
• The need to understand how to properly communicate with pet owners using e-mail is extremely important for formality and legal reasons.
• Like any important information you communicate verbally to clients, you start by documenting it in the pet's medical record.
• Make sure you are using a branded or professional e-mail address. You do not want to communicate with clients using an e-mail that is intended for personal reasons or that is too creative (*not* a good e-mail address: kewldoc23@vetsrule.com).
• Try setting up branded e-mail with your web hosting company.
• If you do not have a website, set up an e-mail address at a reputable company such as Google, and keep it simple FIRSTNAME.LASTNAME@gmail.com or FIRSTNAME.LASTNAME@YOURDOMAIN.com.
• When communicating with clients, do not use short phrases or terms that only medical personnel tend to understand. Spell out exactly what you are trying to say so the client can understand it in an e-mail (see 5.5 – Translating Medicalese: Client-Centered Communication).
• If you are not going to be sending the e-mail yourself, make sure whomever you rely on communicating this information for you is trustworthy and able to write a great amount of information with no errors.
• Make sure you keep each e-mail that is sent and received, as this will serve as proof of communication.
• Any medical recommendations you make, such as a new treatment route, change of treatment, and medical dosage changes, should all be printed and put in the medical record or incorporated into an electronic medical record.
• If you store your medical records electronically, print your e-mail to a PDF printer and attach it to the patient file as a communication note.
• Make sure you check and reply to e-mails daily. If you do not check your e-mail daily, enable an auto reply to all e-mails sent to you that explains you have a 24- to 48-hour reply turnaround time.
• *Do not* allow your clients to use this to get out of a visit in your practice.

E-MAIL AND TEXT (SMS) REMINDERS

• It is unreasonable to expect that 100% of all mail makes it to its desired destination.
• An incorrect address can be the key reason for mail being delivered to the wrong destination.
• A majority of practices still rely on the postal service to deliver reminder cards to their clients, and there is a good reason why. Statistics show the return rates on postcards are still very high. It is not recommended to remove postcard mailings from your practice (see 4.16 – Client Reminder Systems).
• However, with our new generation of clients relying on e-mail and text as their primary form of communication, it is important to implement an e-mail and text reminder protocol for your practice.
• If the reminder postcard never makes it to the client, the probability of that client coming in to satisfy their reminders starts to decrease. Even though pets are a priority in households across the United States, they still rely on you to remind them of what medical attention their pet(s) needs.
• To implement e-mail and text reminders in your practice, start off by contacting your practice management software technical support team to see if there is a feature already offered to you at no additional cost.
• If not, consider moving toward a patient portal where clients will greatly benefit from not only e-mail and text reminders but also a variety of other online services (see 10.18 – Patient Portals). These services seamlessly integrate with your existing practice management software and will send text messages to clients automatically.
• Automation is absolutely imperative for this level of communication, and some services providers will offer two-way texting for appointment

10.11. Electronic Communication: E-mail and Texting

confirmations. A simple "Y" or "N" will allow clients to confirm or cancel appointments, and a list will automatically generate to display who has confirmed their appointments and who has yet to do so. You can then make follow-ups as necessary, leveraging the convenience and quick communication that these services have to offer.
• These features are an outstanding way to increase compliance and reduce missed appointments that cost your veterinary practice a significant amount of money over time.

E-MAIL NEWSLETTERS

When thinking about getting started with e-mail marketing, here are a few facts to think about:
• It is approximately six to seven times more expensive to gain a client than it is to retain a client. Repeat customers spend more money than new clients.
• E-mail marketing is about turning an idea into profits. Ask yourself before you begin e-mail marketing:
  ◦ Do repeat and referral clients help your business?
  ◦ Do you have a plan for delivering multiple communications?
  ◦ Is your audience interested in your message? Is it valuable to them?
  ◦ Can you make your e-mails look professional and reflect your brand?
  ◦ Do you have an e-mail service provider to help manage your strategy?
• E-mail marketing is designed to help you:
  ◦ boost client communication;
  ◦ talk to them with targeted marketing;
  ◦ get more referrals, more easily;
  ◦ get immediate response and action;
  ◦ track who reads and responds;
  ◦ save on paper and postage.
• Goal: deliver professional e-mails that contain valuable information to an interested client base.

Building your e-mail database:

• Before getting started building your e-mail newsletter, you first need to build your e-mail database.
• Are you asking for permission as well as contact information? Make sure you ask clients if you can have their e-mail address to send them e-mail newsletters. Do not presume that because they provide you with an e-mail address that they want to be communicated with in that way.
• Collect contact information at every client touch point:
  ◦ anytime you talk to a client over the telephone;
  ◦ when a client visits the practice for an office visit or whether they are picking up a prescription;
  ◦ at the checkout process;
  ◦ On your website.
• Are you clearly describing your e-mail frequency and content? Let clients know how often you plan to send them e-mails. If your plan is to send e-mails once every quarter, then make sure to let the client know. Also, let them know the content of your e-mail newsletters. For example, let them know you plan on sending them e-mail newsletters with updates about the practice, pet health education, and possibly promotions.
• Plan on using an e-mail service provider to add e-mail addresses into a database. Make sure you do not use programs like Outlook or iMail to send client newsletters. These types of programs are not designed for sending mass e-mails to clients and can often cause poorly developed, poor quality e-mails.
• Additional tips to build your e-mail database:
  ◦ Place clipboards with e-mail client collection forms in the lobby, reception desk, exam rooms, and the checkout counter.
  ◦ Incorporate in check-in process.
  ◦ Subscribe button on practice website.
  ◦ All incoming calls should have a telephone number verification, an address verification, and an e-mail address verification.
  ◦ Have an e-mail address collection competition among staff.
  ◦ E-mail reply signature.

Consistent Design/Layout

Make sure your e-mail design and layout include the following items:
• practice name
• logo
• consistent color scheme
• phone number
• general e-mail address
• social media contact information
• practice physical address
• affiliation logo [American Animal Hospital Association (AAHA), Companion Animal Parasite Council (CAPC), etc.].

Content Has to Meet Your Objectives

There are three key elements that make up an effective e-mail newsletter:
• **Informational.** Inform clients about latest happenings at the practice (events, new equipment, etc.), employee spotlight, and practice-specific news.
• **Educational.** Increase compliance through educational content. Sharing educational content related to services you offer can also serve as marketing. Sample educational topics include dental care, diabetes in pets, heartworms, fleas, diagnostics, laser therapy, stem cell therapy, feline preventative care, canine preventive care, and geriatric care.
• **Promotional.** Motivate purchases by offering promotions (e.g., special offers). If you do not offer discounts or promotions at your practice, consider offering existing coupons from manufacturers.

Coming Up With Valuable Content

• Share your expertise in pet care.
• Link to existing resources (e.g., American Veterinary Medical Association, AAHA, CAPC, etc.).
• Use facts and testimonials.
• Give guidance and direction such as at home-care tips.
• Offer discounts and coupons (optional).
• Hold contests and giveaways to encourage dialogue.

Keep E-mail Content Concise

• E-mail only essential information.
• Use bullets or summaries.
• Link directly to the information.
• Give instructions if necessary.
• Host large bodies of content:
  ◦ on your website
  ◦ or from the content's original source (e.g., use the introductory paragraph and then link the rest of the article to the website where the article can be found).

Frequency and Delivery Time

• Next, discover when you should send your e-mail newsletters and when your clients are most likely to read it.
• Mobile telephones increase open rates because clients are more likely to open your e-mail newsletter and read it on the go.
• Test for timing:
  ◦ divide your list into equal parts;
  ◦ send at different times and compare results.
• How often to send (recommended: quarterly)?
  ◦ Create a master schedule that includes when you plan to send your e-mail newsletters.

10.11. ELECTRONIC COMMUNICATION: E-MAIL AND TEXTING

- Include frequency on your website online sign-up process (i.e., state whether it will be a "Monthly Newsletter," "Quarterly Newsletter," etc.).
- Keep content concise and relevant to planned frequency.

Use an E-mail Service Provider

Using an e-mail service provider (e.g., Constant Contact) promotes best practices by providing easy-to-use templates, reinforcing brand identity, managing e-mail lists, tracking results, obeying laws, and providing the ability to share e-mail newsletters through social media to gain higher visibility.

TEXTING CLIENTS IN A VETERINARY PRACTICE

- Texting clients (also referred to as SMS) in a veterinary practice should be used only to communicate information regarding the care of their pet.
- Texting does not have to be completed through a mobile device; it is also not recommended.
- You can utilize web-based texting applications to send and receive messages.
- Many web-based programs allow you to send text messages using your main practice telephone number.
- Web-based programs are easy to use and are very similar to web-based e-mail applications.
- It is easy to extract client data and corresponding mobile phone numbers from your practice management software (consult with your vendor to learn more).
- Extract a file with the client name and mobile numbers and upload into the web-based application.
- Each time you send a message the client will receive a text, which will ask the client if they wish to receive text messages from the veterinary practice.
- If the client decided to opt in, the permission will be recorded in the web-based application, which serves as your proof of authorization.
- If the client decides to opt out of receiving messages from you, the system will block any messages from being sent to the client.
- Each text sent and received is saved in the web-based application for later reference if needed.
- You can easily capture this consent by adding a brief, additional section to any new client registration form, or a drop-off procedure/authorization form.
- Set up an auto-reply such as the following: *This is an unmonitored number; Please call our practice directly at (xxx) xxx-xxxx*. This allows you to send a particular pet owner in the right direction, without assuming the liability of the two-way text message.
- Thanks to rapidly accelerating forms of technology, text messages can be sent to any type of mobile device, including wearable technology.

Mass Texting

- You can send mass text messages to clients, but they should *never* be used for marketing services or promotions to clients.
- Mass texting is a great way to send client alerts such as clinic closures due to natural-disaster threats, unexpected closures, massive food recalls, pet care alerts, and so forth.

One-on-One Texting

- One-on-one texting allows you to send individualized private text messages to one particular client.
- One-on-one texting is a great way to send pet owners simple and concisely constructed text messages whenever a pet is dropped off for surgery, a procedure, or appointment, as well as boarding or grooming services. Even just a simple text message can help you to alleviate any potential worry from a pet owner, and it demonstrates your accountability and care.
- Sending individualized text messages is a great way to build rapport with clients and create a bond to the practice.
- Never use one-on-one texting to provide clients with medical information regarding their pet's health or care.

EXAMPLES

SAMPLE E-MAIL NEWSLETTER CONTENT

Introduction

Dear Valued Client,

Summertime is near! This edition of our newsletter will review special summertime pet care tips for you and your pet. As always, if you ever need us give us a call at (123) 456-7890, or send us an e-mail at info@yourdomain.com.

Sincerely,

The Doctors and Staff of Simply Done Veterinary Clinic

Education

Heatstroke occurs when a dog's body temperature exceeds normal limits. You may be surprised to learn how easily heatstroke can occur. We usually think of heatstroke occurring when a dog exercises too much in hot weather or is left in a locked, hot car, but there are reports of dogs suffering severe heatstroke while walking with their owner on a hot day, or when exposed to direct sun through the window of a moving car. ***Read more***

Promotional

One in three pets will become lost at some point during their lifetime. Without permanent identification, 90% never make it home. Does this worry you? If so, a microchip is your answer. A microchip is much more reliable than a collar and tag because there is no chance that it will fall off. Getting a microchip placed is quick, easy, and can be done at our practice during a 15-minute appointment. Come in during the month of January and receive 5% off our microchipping service for being a loyal e-mail subscriber.

SAMPLES OF TEXTING WITH CLIENTS

Texting is yet another great way to communicate with your clients. However, there are times when text messages are best used and there are times a telephone call should be made instead. Here are some samples of text messaging in a veterinary practice.

Sample CAN DO Text Messages

- Quick update on how a client's pet is doing while boarding or dropped off for a surgical procedure (Figure 10-11-1)
  - "Elvis is doing great Mr. Garcia! We will keep you updated."
  - "Elvis is recovering from his neuter nicely. We will call you soon!"
- Quick reminder of a service becoming due or overdue:
  - "This is a reminder that Elvis is due for his Bordetella vaccine!-Simply Done Veterinary Staff"
  - "This is a reminder that blood work is required before Elvis' next medication refill."
- Quick confirmation of a prescription filled:
  - "Elvis' meds are now ready to be picked up."

Sample DO NOT Text Messages

- Full doctor update on how a client's pet is doing while boarding or dropped off for a surgical procedure:
  - "Elvis is getting ready to undergo anesthesia. We just put his catheter in and we have him hooked up on IV fluids. He is in his cage waiting to go next."
  - "We gave Elvis his vaccines and exam. Everything is normal except his left eye has some discharge so I'm going to prescribe an ophthalmic ointment to clear that right up. His white blood count came back a bit elevated and I suggest medication ABC to go home and be given, starting tonight. Call me if with any questions."
- Abnormal blood work results:
  - "Elvis' liver enzymes came back elevated. I suggest we take an ultrasound and x-rays to work up the case more and find out the cause of it. In the meantime, I have some medications up front for you to pick up when you are able to."

10.12. DIGITAL MARKETING STRATEGIES

BASICS

OVERVIEW

• Marketing your veterinary practice on the Internet should be a crucial part of your marketing plan regardless of where the practice is located.
• There is a variety of Internet marketing options for you to choose from – some paid and some are free, with the only investment being your time.
• Though the term *digital marketing* is vague, it encompasses a large variety of services and options for you to choose from.
• Digital marketing will help your practice gain visibility through search engines, social media channels, and online directories.
• In addition, digital marketing includes marketing to your existing client base whether it is through e-mail, social media, or patient portals.
• Modern, competitive veterinary practices rely more than ever on the web, and consequently they rely on search engines too.
• Search engines, such as Google, set the tone for what exists on the Internet as a whole, controlling, monitoring, and distributing a large amount of data each day.

TERMS DEFINED

E-mail: Electronic mail, commonly referred to as email or e-mail, is a method of exchanging digital messages from an author to one or more recipients. Modern e-mail operates across the Internet or other computer networks.
Internet Marketing: Also known as web marketing, online marketing, web advertising, or e-marketing, is referred to as the marketing (generally promotion) of products or services over the Internet. Internet marketing is considered to be broad in scope because it not only refers to marketing on the Internet, but also includes marketing done via e-mail and other online media.
Search Engine Optimization: The process of affecting the visibility of a website or a web page in a search engine's "natural" or unpaid ("organic") search results.
Social Media: Interactive platforms that individuals and communities create and share user-generated content.

ISSUES AND OPTIONS

E-MAIL MARKETING

• E-mail marketing can be used to send clients educational information about pet care, the latest happenings at the practice, and offers or promotions.
• In addition to traditional marketing tactics, you can add e-mail marketing for even greater effectiveness.
• E-mail is one of the best relationship-management tools. It helps to remind clients of upcoming appointments, learn about the value of the services for which they are being reminded, and easily schedule appointments by being directed to a link from the e-mail.
• In most cases, with e-mail you can obtain a direct response.

ONLINE DIRECTORIES

• Online directories allow you to register your practice across multiple websites and ensure it is as easy as possible to get found online.
• Online directories allow you to include your business name in common directories that prospective clients might use to find a veterinary practice.
• Most directories offer a free listing but often include erroneous information. It is important to verify your listing with a variety of common online directories (e.g., google.com, yelp.com, superpages.com, Bing).
• Each online directory typically offers a paid listing to help increase your visibility. In many cases, these paid listings do not provide much of a return on investment.
• Basic information is included in the directory, such as your practice name, address, and phone number. In some cases, the online directory will allow you to list your website. Check with each directory to see if they offer the ability to do so at no additional cost.
• Reviews are also something that can be attached to various online directories (see 10.19 – Protecting and Defending Your Online Reputation).
• Regardless of whether you are paying to manage the listing or not, in most cases you are not able to remove or edit online reviews.

10.12. DIGITAL MARKETING STRATEGIES

PATIENT PORTALS

- Patient portals are also an effective means of digital marketing among veterinary practices (see 10.18 – Patient Portals).
- Patient portals allow clients to log in to a secure portal provided by the practice to access information about their pet.
- Such information provided by the pet portal includes, but is not limited to, all pets in the household, services each pet is due for and the due dates, the ability to become educated about the service each pet is due for, appointment scheduling, prescription refills, and much more.
- Patient portals often provide the practice with the ability to send e-mail newsletters, opt in to pharmaceutical-sponsored marketing programs, the ability for clients to enroll in text message and e-mail reminders, view compliance data, and more.

SEARCH ENGINE OPTIMIZATION

- Search engine optimization is the process by which an online entity manages its online information to be able to easily be picked up in common search engines (see 10.14 – Search Engine Optimization).
- Search engine optimization refers to your site's overall visibility and natural page rank. The higher your rank, the easier it is to get found on the web and, ideally, convert pet owners to clients as a result.
- Search engine optimization is one of the best ways that practices can appear higher up on popular search engines organically (for free).
- There are basic rules of thumb to follow for basic search engine optimization.
- Depending on the website, current visibility and local competition are factors that will depend on whether you need to hire a professional digital marketing company to manage your online rankings (position).

SOCIAL MEDIA

- Social media is defined as interactive platforms that individuals and communities create and share user-generated content.
- There are different types of social media:
  - Personality-based social media, which revolves around a particular person and/or business.
  - Blogging, which allows users to post information they want about any topic they wish.
  - Micro blogging, which allows users to post any information they want within a certain number of characters.
  - Video blogging, which allows users to post videos that revolve around a variety of topics.
  - Location based, which allows uses to "check in" to various businesses and share their experiences by using a Global Positioning System (GPS)-enabled smartphone.
- Social media can be used to market existing services to your clients in a unique manner that does not "turn off" the client (see 10.16 – Social Media).
- When planning your marketing efforts, choose topics with an abundance of pet healthcare information you can research and share (e.g., preventative care, dental health awareness, heartworm disease, and zoonotic disease).
- Social media should be used as a tool to engage with clients all year long.

WEBSITES

- Websites are one of the most important tools in digital marketing and are required to make any digital marketing plan successful (see 10.13 – Websites).
- Clients will use the website to learn more about your practice and the services it provides.
- Prospects will search for the website through search engines and search directories to learn more about you when searching for a pet care provider (animal hospital, veterinarian, pet hospital, pet clinic, animal clinic).
- The information listed on the website and the overall visual appearance of the website will be a key factor when prospects eventually find your website. With no other information about your practice, your website and information provided on the website will be the only information the prospect can use to determine if you are the right fit for them.
- Websites for a veterinary practice should serve two purposes: (1) to educate and market services to existing clients and (2) to attract new prospective clients.
- The website should include the following basic elements:
  - The following information should be included on every veterinary practice website and on every page of the website:
    - practice name
    - phone number
    - address
    - e-mail address
    - social media channel links
    - e-mail newsletter sign-up.
  - Each website should provide a brief introduction to the practice.
  - Include a mission statement.
  - A photo tour of the practice can be a big draw for prospects looking for a veterinary practice that is clean and professional looking. (When possible, include images of people in the photo tour to avoid

10.12. DIGITAL MARKETING STRATEGIES

dull-looking photos. Photo consent forms must be signed for any person in the photo.)
◦ Veterinarian page consisting of professional images and brief biographies for each veterinarian is recommended. Often, this is one of the most commonly visited pages for veterinary practices.
◦ Service page clearly outlining the services provided and the importance of each service. Do not just list the services without descriptions.
◦ "Contact us" page with an integrated map, which will allow prospects to easily obtain directions from their location to your practice.
◦ The unique beauty in your veterinary practice can be best shown with the authentic moments that are true to your specific practice.
◦ While displaying stock photos on your website may have helped you to launch your website initially, the influence of stock photos is something you should work to decrease over time.
◦ Personalized images that are taken within your practice that show compassionate moments (e.g., a technician restraining a cat using a cat-friendly technique or a receptionist with a warm smile in your front lobby) help to shed light on what your practice is really like on a day-to-day basis!
◦ Stock images might work in a pinch, but they can also give off a cold impression if they seem too generic, and especially if a pet owner has seen them previously elsewhere.
◦ You can gradually transition toward more personalized images over time *or* you can even decide to hire a photographer to help you get new images of the whole practice all at once.

MOBILE COMPATIBILITY

• Search engines incorporate the functionality of websites on mobile devices as a major component of search engine rankings.
• If a website is not optimized for mobile, it will now fall dramatically in search rankings conducted on mobile devices to reflect this shortcoming.
• If your veterinary practice website is not comprehensively optimized for both mobile and desktop, your business is at risk of losing traction and falling behind the competition.
• A good mobile website strips down the best of a desktop site and makes it easily available for the user to access on their mobile device.
• Mobile devices are smaller and more compact, and thus the esthetics and build of a proper mobile website reflect this.
• A good mobile site will emphasize big buttons that are accessible on the go. This might mean a tap-to-call button that lets the user call your primary business line with a single finger-tap. The same functionality can be lent to locators and GPS features that can ostensibly bring a new client right to your door.
• A proper mobile build will show off the best of your brand with a custom color pallet and seamless links to social media.
• Well-conceived and implemented mobile builds will also boast simple bits of information that any prospective or current customer might need to know (think location, phone number, slogan).

10.13. WEBSITES

BASICS

OVERVIEW

• There's a mind-boggling amount of new information where websites are concerned! In particular, the rules set by search engines and mobile devices are driving multiple changes to websites, to the point that a hospital needs to recreate their website every three to four years. Many veterinarians and their teams have missed these changes because of the misconception that websites are static, rather than dynamic and responsive.
• We often forget that search engine companies like Google are multibillion-dollar businesses that need to make money and have their own competition from companies like Facebook. Dollars are generated through Google because people utilize it trillions of times a year, including clicking on search ads.
• The reason that people search using Google is because they are given fast and relevant results to their queries. If Google rendered useless results, then people would utilize other ways to find answers. And what makes up the answers to these queries? Websites.
• The dizzying amount of changes that such companies generate are to make search results as accurate as possible. These changes encourage website owners to adapt their websites to these new changes, aka "rules."
• The Google "zoo" is the nickname given to the key rules for websites. Algorithms like Panda, Penguin, Hummingbird, and Pigeon are just a few that specifically dictate how a website should be built today. Because of the zoo, Google has provided much cleaner, more accurate search results than they did in 2011. This approach is anticipated to continue going forward.
• Search companies assume that businesses will play by their rules. Competition, behavior patterns, and search devices used require these companies to keep adapting. Do you know how most users are searching today? Mobile devices.

TERMS DEFINED

Duplicate Content: Content that is the same, or very similar, on two separate domains.
Mobile Friendly: A website that is easy to use on a mobile device or small screen size.
Page Speed: The time it takes for the content on a website page to load.
Responsive Design: A website design that automatically adjusts content based on screen size.

ISSUES AND OPTIONS

DUPLICATE CONTENT

• In 2011, under the pressure of Facebook users searching for information, Google rolled out its first major rule and called it Panda. Prior to this rule, Google contained lots of spam sites.
• Sometimes when a person clicked on a search result, a solid website would pop up, and other times a website full of hard to read information did instead. To keep people using Google, Panda dictated that each website had to have unique content that only lived on that one website. This meant that content found on a hospital's site in Minnesota should not also be found on a website in Maine. Duplicate content was no longer okay. However, many veterinary websites still have duplicate content many years later.
• Duplicate content for any reason is not okay. No company has exclusive privilege from search engines to use duplicate content. Period.

MOBILE USE AND TRENDS

• We now have the ability to search anytime, anywhere, using a smartphone. Because of this trend in user behavior, websites need to function quickly and easily on a mobile device.
• Google decided that, in order to keep people using Google, it would need to make business owners change their websites to be mobile friendly. Google said they were changing their search algorithm to favor websites that are mobile friendly with better search placement.
• Another factor being considered because of mobile devices is website page speed, or how fast a website loads on a mobile device over a cellular network – not Wi-Fi. Since people are using their mobile phones/tablets anywhere in the world, from an airplane to a subway station, and demand information NOW, search engines want to provide quick results. If a website is slow loading, they may get demoted in the search listings in the future, especially for searches conducted on mobile devices.
• Within the next few years, it would not be unheard of for search engines to only show mobile-friendly websites on search queries submitted from mobile devices.

ADDITIONAL FOCUS

• Besides not following rules or focusing on mobile compatibility, there are two other items people tend to miss with websites. One is domain name ownership, and the other is that there is more to marketing today than just a website.
• A business should own their domain name. Most veterinary hospitals think they do own their domain name (i.e., www.ABCHospital.com), but in fact the website company or marketing agency does. A domain name is a business asset to a company and has monetary value. Make sure the hospital owns it!
• Unlike 20 years ago, websites are not the only digital marketing avenue available to a hospital. In fact, websites are just one wheel out of four wheels of your marketing car.
• Besides having a website, a veterinary hospital needs search engine optimization (see 10.14 – Search Engine Optimization), which might include things like Google AdWords, online reviews, and social media marketing (including Facebook ads).

EXAMPLES

AVOIDING DUPLICATE CONTENT

• If a template site is purchased, all of the provided content that has not been uniquely created for/by the hospital must be removed and replaced with original content instead.
• If a library of content is licensed, make sure to ask if the "Do Not Follow" code is placed in the library to ensure that Google cannot "see it." This way, the hospital's website will not receive a penalty for duplicate content, while keeping the library accessible for users.
• If you are unsure if the content on your hospital's website is duplicated or unique, go to Copyscape.com. It is a free tool that searches a website's content and then compares it with all the websites on the Internet. Results will show if the content on a particular website is duplicate. In fact, Copyscape will even list all of the other websites where the duplicate content is found.

DETERMINING MOBILE ACCESSIBILITY

• Google created a website mobile-friendly tool that checks a website to see if it passes Google's mobile-friendly test, found at Search.Google.com/Test/Mobile-Friendly. The test shows whether or not a website complies with Google's mobile requirements. If not, the tool will list what needs be fixed on a website to bring it into compliance.

• It is not just Google requiring websites to be more mobile friendly in order to play; Facebook is in the same boat, especially for ads.

DEFINING ASSETS AND ONLINE PRESENCES

• To find out who owns your domain, search the Who Is database at GoDaddy.com/WhoIs. Simply insert the hospital's domain in the box on the front page and a database search will quickly be conducted. Results should appear that list the registrant of the domain name. Whoever is listed there is the owner of that domain name. If the owner of the veterinary hospital or the hospital itself is not listed, then it needs to be changed. Reach out to the current owner of the domain name and request it be changed to the owner of the practice.
• Big companies like Facebook and Google have coded their systems to rely on indicators from other companies. To have a website be seen in Google, this requires reviews and a solid social media presence. Do not stop at just a website; make sure to focus on other avenues of digital marketing as well.

CAUTIONS

Within your veterinary practice, you should:
• Focus on the search engine rules, such as Panda, to be sure your website is in compliance with current standards.
• Pass a mobile-friendly test.
• Know the other key algorithms, and their associated rules.
• Watch the page speed on your website, since that is likely to be an important determinant in search ranking and client acceptance.
• Invest in all aspects of digital marketing to bring tails through the doors.

MISCELLANEOUS

Consider setting up Google Alerts for the following terms:
• Google Algorithm
• Google Changes
• Mobile-Friendly
• Google Zoo.

10.14. SEARCH ENGINE OPTIMIZATION

BASICS

OVERVIEW

• Search engine optimization (SEO) tends to be the most confusing aspect of a digital marketing program. This is partly because Google, Facebook, and other companies are constantly changing the rules, and partly because it is hard to compare options when looking for a provider to do this service.
• Because it is confusing, it is unfortunately also the area where most hospitals may make unfortunate choices regarding marketing. Empowerment through education is the key to successfully finding and working with a vendor on an optimization program.

TERMS DEFINED

Click-Through Rate (CTR): Number of clicks a website has received, particularly in reference to advertising.
Google Ads: Google's search advertising platform.
Local Search: Search queries involving localized keywords such as "near me" or "nearby."
Mobile Search: Search taking place on a mobile device.
Optimization: In online terms, the strategy and tactics used to make a website favored in search.
Search Engine Optimization (SEO): The process of driving traffic to a particular website through search engines.

ISSUES AND OPTIONS

THE ROLE OF SEO

• Many people wonder why the discussion of SEO and its role revolves around Google. It boils down to search share, or where people go to conduct searches on the Internet.
• Currently, Google (google.com) has the largest search share on the internet with Google's search engine and maps.
• The second largest place people search is YouTube (youtube.com), which is owned by Google.
• The third and fourth tier of search are Yahoo and Bing. They switch between who is third and who is fourth in ranking, at the current time. The rest of the search engines hold a very small slice of the remaining minuscule search share.
• Each aspect of a marketing program has a role. For SEO, we can look at three main roles or jobs. Keep in mind, SEO is a big "tool" in a digital marketing program. Regardless of how many changes are being made with SEO, these jobs will remain the overarching goal of SEO. It is important when working with a marketing agency to ask often how these goals are being achieved for a practice.
  ◦ **Being found.** Optimization started early in the days of the Internet when it became apparent many businesses were creating websites. Quickly, human behavior showed that people did not want to search extensively for the information that was being sought. On Google, this translated to being at the top of the search results page in the early days. Today, regardless of where/how information is sought, being found in search is the key job of an optimization program.
  ◦ **Driving client traffic through the door.** Being found is one key to a good SEO program, but driving client traffic through the door is another. A marketing program should generate results for a business that increases revenue and/or awareness. There are ways to track client traffic coming through the door, and every year more ways are being generated to improve tracking.
  ◦ **Tracking goals.** Every single marketing program should have goals. A marketing plan is crafted around the goals and results are reported.
    ▪ For example, a hospital has a new emergency room. The goal is to build awareness of this new service and have it being used by pet owners. The result would be, is it being used? How often? By whom? What ages and demographics? How did people find it? On which device? This valuable information then helps you to tailor your strategy moving forward.
• Keep these roles in mind as this discussion moves to the types of SEO that are available today. SEO has grown up. It used to be simple to manage to create the results needed. Google has changed because people have changed. Humans want information in different packages and on multitudes of devices. Because of this behavior change, SEO has split into four categories (see Examples section).

EXAMPLES

FOUR TYPES OF SEO

• Consider the various ways and places where information is searched. Google watches human behavior and has whole jobs dedicated to usage patterns on Google. Searches are timed down to the millisecond; how people search from start to finish is monitored, and data are collected. From this data, Google changes how it delivers information to keep people using Google.
  ◦ **Original, traditional optimization.** At the dawn of Google, search queries were typed into a box, and results were shown in a list. Ads were displayed at the top, side, and bottom of the page. Business owners vied for the top three positions of the list on the page after the ads. Quickly, behavior analysts showed that people rarely went to page two of Google to find information. The goal for practices was to be on the front page of Google (preferably in the top three) for strong keywords like "veterinarian," "animal hospital," and so on for their area.
  ◦ **Mobile search.** When Apple launched the iPhone 3, the Internet was open to humanity wherever they might be. Searches could be made in cars, on top of a mountain, flying on a plane, and in the subway station. In fact, people demanded to be able to use their devices regardless of where they were in the world. Google responded by modifying their algorithm to focus on websites that are mobile friendly, and mobile search was born.
  ◦ **Local search.** The advent of mobile devices means that the Internet can be with us at all times. Because of this behavior, people are using smartphones to find local business and information about them.
    ▪ For example, "near me" and "nearby" types of searches have emerged. Pet owners have been looking for "nearby veterinarians." Studies have shown that there is a high action rate for local searches, meaning that people, after a search for a "nearby veterinarian," tend to go and visit a veterinarian.
    ▪ Local search is also displayed prominently on the first page of search results in a box. This box is placed above the original optimization list and under ads.
  ◦ **Google Ads.** Google has quietly done away with organic placement for mobile, local, and traditional search and replaced it with ads. Today, to have a successful search optimization program, you must include ads. The fantastic news is that ads drive client traffic through the practice doors to the point that ads sometimes have to be put on hold in order to accommodate all of the new business.
    ▪ Google Ads has grown and matured to the point where Google has created a program called Google Partners. These Partners have taken certifications (the same ones as Google employees) and have to follow rigorous guidelines on a daily basis for ads.
    ▪ To make a Google Ads campaign successful, it needs to be monitored and adjusted on a weekly basis. Therefore, it

is important to not set an ad and just leave it! Hire a Google Partner to make sure an ad program is getting the biggest bang for your buck.

THE COMPONENTS OF AN SEO PROGRAM

- In the beginning, like most programs on the Internet, SEO was simple to manage. Most people could do their own optimization on their websites with a few keywords and meta tags every few months. However, SEO has morphed, changed, grown, and expanded into a science.
- Changes are quick, key positions are precious, and competition is stiff. SEO has to be monitored on a daily, weekly, and monthly schedule, depending on what aspect of optimization is being utilized.
- As a hospital, optimization needs to be hired out and not done in-house. Here are some tips to help find a right fit with a vendor that will bring tails through the door:
  - Go to Google's Partner program (google.com/partners) and search for a badged Google Partner that has passed Google's requirements. Now, only qualified, knowledgeable candidates will be considered. Ask the Partners if they work with Google employees directly.
  - Ask a vendor to give examples of work they have done, including results of both CTRs and reach.
    - In addition, ask about the results that hospitals have seen. Did they see an increase in client traffic through the door?
    - Ask for benchmarks in comparison to averages. For example, the average CTR is 1%. How are they performing comparatively?
    - Be sure to ask for data on both mobile and desktop performance!
  - Make sure you are receiving a monthly report of the type of work done, the cost spent on Google Ads, what type of SEO efforts were utilized (local, mobile, ads, etc.).
  - Review the report monthly with a team member from the vendor to make sure the story behind the numbers is understood.
  - Track results in-house, including an increase in business in line with your goals for your SEO campaign.
    - For example, was the goal to increase the boarding bookings? Did this happen?
- It is impossible to have a successful marketing program without SEO. Just having a website is no longer enough. In fact, a website is not even needed with some click-to-call Google Ads campaigns!
- Working with a skilled, credited provider is a must. Remember, SEO is now a daily, weekly, monthly, ongoing program. Become empowered to make it work for you.

CAUTIONS

A major caution to consider is that, at the present time, Google is a dominant force in SEO and thus all advice related to SEO necessarily revolves around Google policies and practices. This might not always be the case. It is important to realize that this aspect of digital marketing is dynamic and quickly evolving, and it is best to consult with a digital marketing expert about SEO in real time or run the risk of basing important decisions on outdated information.

10.15. PAID ONLINE ADVERTISING

BASICS

OVERVIEW

• Advertising online used to be free. Post an article, picture, or link up on social media and everyone who "liked" a business page had the chance to see it. Want to be seen first in the list of results on search engines? No problem; work on the page's keywords and meta tags, and it should show up.
• The free days worked great until investors wanted a return on their investments from Google and Facebook. Both of those companies had paid employees, and investors were looking for a return on their investment. Where would the money to satisfy those demands be met?
• One place to look would be platform users. Facebook receives all of its content for free – from users. Why would it charge people and cut off its stream of free information that it uses to drive people to paid revenue through ads?
• Google is used because it is free and accurate. People would stop using Google if we had to pay for every search we generated. That leaves businesses as a source of income. Since Google and Facebook are the two largest places online to buy advertising, what do they have to offer that would make businesses willing to pay to place ads?
• The answer is targeted marketing.

TERMS DEFINED

Pay-Per-Click (PPC) Advertising: Online advertising in which the cost is determined by number of clicks obtained.
Pay-Per-View (PPV) Advertising: Online advertising in which the cost is determined by number of views.
Targeted Marketing: The ability to specifically target which users see an advertisement, based on hundreds of data points, including location, employment, gender, and so on.

ISSUES AND OPTIONS

TARGETED MARKETING

• Before the days of Internet marketing, veterinary advertising was done en masse via Yellow Pages, a business's sign, a billboard by the road, or newspaper/radio.
• Though the brand was seen by many people, a veterinary hospital never knew the exact demographic that was viewing the ad. Did the person who saw the billboard even have pets? One never knew.
• Google and Facebook changed this question into a certainty because of the amount of data they know about their users. The scary aspect is that Google and Facebook know everything about you, potentially even including where you are sitting reading this page right now.
• Typically, a company has thousands of "data points" or pieces of information about any individual. These include your location, credit score, whether or not you have a mortgage, number of children, marital status, state of employment, and many more.
• This information was either provided freely by people in their online profiles, or updates or purchased through companies called data brokers. Data brokers are companies whose sole job is to collect data on individuals and resell it to other companies who want to target specific individuals to market their services.
• Previously, this type of information was only accessible by large companies. These companies would pay people to call potential consumers (the annoying survey calls around dinner time) and quiz them about themselves and their habits. Then, the data would be collated and used to test a new product or create a marketing campaign.
• Facebook and Google disrupted this process in the marketplace by allowing small businesses to create ads that targeted their ideal client, for little cash.
• Now, if a pet hospital wants more cat owners to visit, it could place an ad that only women who are 35–55 years old, married, own a house, love cats, and make more than $75,000 a year would see. Anybody who did not meet that defined demographic would not see the ad. Powerful, economical, and business changing all in one fell swoop.
• Facebook, Google, and others leaned on businesses to pay their bills through ads. Small businesses saw the power of ads and decided that paying (while grumbling) for advertising online brought new business to their door.
• And to encourage hospitals and other businesses into buying ads, Google and Facebook changed their structure.
• Facebook throttled back how many people saw a post made on a business Facebook page, to only 2–6% of people who "liked" the page. This means that if 100 people "liked" a company, on average only two to six people would see it. The rest of the 94 to 98 people could see it if the practice paid for that exposure.
• Google, on the other hand, started doing away with organic placement, and instead put ads in the top viewing spots. Especially on mobile, ads will be seen first, and then, once a user scrolls, the organic searches can be viewed.
• Both companies changed their structure so that for a company to be seen it has to pay.

EXAMPLES

KEY ADVERTISING TERMS TO KNOW

To understand online advertising, it helps to understand some terminology and some best practices. It is easy to become lost in the new vocabulary that has organically sprung up from this concept. To start, here are terms to know:

PPV Advertising

• When online advertising started in the late 1990s, it was based off of the known advertising model of the time with billboards, Yellow Pages, and so on based on potential viewership of the ad.
• A learning curve happened around viewers' behavior. At first, companies were charged by how many "hits" an ad received – until businesses placing ads realized that a page could have multiple hits. Advertisers only wanted to pay for a "view," because it was a controlled measure.
• For example, one view, or seeing one page online, could translate into 10-plus hits based on the coding of the page.
• Paying for one view was a simpler way to track costs, but also cheaper and more accurate.
• At this time, please note, only big businesses could afford advertising. Targeted ads did not come about until Facebook changed the game starting around 2010.
• PPV still exists, and it will be seen as an option on ad configurations. Typically, hospitals will pay per 1,000 views.
• Google and Facebook will do their best to show that ad to as many people as they can until the budget for that ad campaign is reached.
• The practice is paying to be seen, not for an action. Action is preferred.

PPC Advertising

• As the learning curve of online ad behavior matured, businesses placing ads said, "I only want to pay for ads that DO something for me."
• The term PPC came about, meaning a veterinary hospital would only pay for an ad that was clicked on by a potential end user.

• With this method, the ad can be seen for free by thousands of people. The only cost comes when a pet owner engages (in the form of a click) with the ad.
• Now Google and Facebook have to be more accurate in showing the ad to potential clients who will engage, versus just throwing the ad up on their properties to be seen by thousands of people.
• PPC advertising, plus the ability to target a specific market, brought the cost down to a level that small businesses could afford.

CAUTIONS

A major caution to consider is that, at the present time, Google and Facebook are dominant forces in paid online advertising and thus all advice related to such advertising necessarily revolves around these companies' policies and practices. This might not always be the case. It is important to realize that this aspect of digital marketing is dynamic and quickly evolving, and it is best to consult with a digital marketing expert in real time or run the risk of basing important decisions on outdated information.

BEST PRACTICES FOR ONLINE MARKETING

• PPC advertising online has advanced to the point where it has become a specialization. Google and Facebook have recognized this evolution and have created certification courses for marketing agencies to take and pass.
• The final product is a badge that the agency earns, illustrating to the world that they know and understand the standards of Google and Facebook. Plus, to keep the badge, the marketing firm has to adhere to Google and Facebook's best practices and retake the certification tests on an annual basis.
• To see if a marketing company has taken these certifications, look for the Google Partner badge; and for Facebook, look for Blueprint certification.
• Best practice for any veterinary hospital is to hire an advertising company that has these credentials.
• Finally, know that advertising that is PPC *works*. It does drive client traffic through the door and produces results. Many veterinarians feel it is a hole that has no bottom.
• Make sure to work with a company that helps explain the process of online paid marketing, manages your expectations in terms of results, and keeps to a budget that makes sense for your practice.
• Require that reports are given on a monthly basis that explains the type of advertising that was used, the money spent, and the results each ad produced.
• Correlate that data with hands-on knowledge of people coming through the door. For example, if an ad is run to increase dental visits, did dental visits increase? It does not have to be complicated.
• Google and Facebook now require a business to pay for ads if it wants them to be seen. Do not be the company that does not exist because it cannot be found!

MISCELLANEOUS

ABBREVIATIONS

PPC: Pay per click
PPV: Pay per view

10.16. SOCIAL MEDIA

BASICS

OVERVIEW

- Social media is defined as interactive platforms that individuals and communities create and use to share user-generated content.
- Social media allows you to quickly engage with pet owners in an absolutely seamless manner.
- There are different types of social media:
  - Personality-based social media, which revolves around a particular person and/or business.
  - Blogging, which allows users to post information they want about any topic they wish.
  - Micro-blogging, which allows users to post any information they want within a certain number characters.
  - Video blogging, which allows users to post videos that revolve around a variety of topics.
  - Location-based social media, which allows uses to "check in" to various businesses and share their experiences by using a Global Positioning System (GPS)-enabled smart device.
- The latest enhancements in technology are continuously changing the way we communicate. Although it has become easier and more efficient for us to communicate, there is still a mindset that is withholding the willingness to adapt to all of the advances in communication. There are several reasons for the hesitation to jump on board with new technology. For instance, there is the cost factor and return on investment factor (see 10.20 – Measuring Performance of Digital Media Campaigns).
- At times, practice owners are unsure if using new methods of technology make client interaction less personal. It is very true to say there are many things to think about before getting on board with a new method of communication with clients. However, it is important to consider the statistics regarding the growing force of social media and its ability to appeal to a wide range of clients regardless of age or gender.
- A majority of social media platforms appeal to all generations of clients.
- Social media can easily help to communicate vital information to pet owners.
- Information is easily transmitted to your client's social media feed and various mobile applications.
- The user base is huge, and that means many of your clients are already there.
- Social media pages are free to create.
- Social media used correctly can lead to a community of supporters for your veterinary practice.
- Each practice should develop a social media policy prior to utilizing social media in your practice (see 10.25 – Digital Communication Policies for Staff).
- Multimedia content can be integrated within your profile.
- You can separate your personal and professional use.

TERMS DEFINED

3G: A third-generation mobile communications standard that allows mobile phones, computers, and other portable electronic devices to access the Internet wirelessly.
4G: A fourth-generation mobile communications standard intended to replace 3 G, allowing wireless Internet access at a much higher speed.
Feed: Data format used for providing users with frequently updated content.
Follower: An adherent or devotee of a particular person, cause, business, or activity.
Global Positioning System (GPS): A space-based satellite navigation system that provides location and time information in all weather, anywhere on the Earth.
Multimedia: Media and content that uses a combination of different content forms. Multimedia includes a combination of text, audio, still images, animation, video, or interactivity content forms.
Pro-Veterinary: Content that supports the message and recommendations of veterinarians and the veterinary profession.
Smart Device: An electronic device that is cordless (unless while being charged), mobile (easily transportable), always connected (via Wi-Fi, 3G, 4G, etc.), and is capable of voice and video communication, Internet browsing, "geo-location" (for search purposes), and that can operate to some extent autonomously.
Smartphone: Mobile telephone built on a mobile operating system, with more advanced computing capability and connectivity than a feature phone.
Social Media: Interactive platforms that individuals and communities create and share user-generated content.

ISSUES AND OPTIONS

GETTING STARTED WITH SOCIAL MEDIA

- There are a variety of social media platforms available. Make sure you choose a popular one when getting started, although social media preferences of people can certainly change over time. This will allow you to get the most out of your social media communication efforts.
- Find out who is going to be communicating for your practice. It is recommended to choose a member of the management team or a lead employee in the practice. The owner of the practice and/or practice administrator should not be the key communicator on social media but rather a contributor. Relying on extremely busy employees will leave a potential for "being too busy to communicate" consistently.
- Social media is simply an additional yet crucial form of new-age communication for clients.
- Social media is not all about marketing and generating revenue but rather about building relationships and loyalty with clients.
- There is a great opportunity to market existing services and put your practice name in front of the screen of hundreds of prospective clients if you communicate properly.
- When you find the social media platform you wish to start communicating with first, make sure you follow the setup process step by step.
- Each social media page should include the practice name, brief description, telephone number, website, and logo. This will make it easy for existing and prospective clients to clearly identify you.
- Make sure the overall appearance of the social media page coincides with the appearance and feel of your brand. For example, if you have a logo and it is blue then try and make every attempt for the social media page to match the style of blue shown on your logo.
- When filling in information about your business, utilize your website as much as possible to obtain this information (i.e., description, about us, mission statement, etc.).
- During the setup process, find an appropriate spot to enthusiastically describe the merits of your practice and what services you offer that will differentiate you from the competition.
- Note any certifications when possible (e.g., American Animal Hospital Association, Cat Friendly, Fear Free).

WHAT NOT TO DO WHEN COMMUNICATING THROUGH SOCIAL MEDIA

- Never relay any type of specific medical information to clients about their pet.

• Never post controversial topics that consist of politics, religion, bashing of any type of business or product, or mention of any service that could turn clients "off" to your business (i.e., declawing, tail docking, ear cropping, etc.).
• Never ignore a client's question or request just because you would rather the client obtain the information by calling or visiting you instead.
• Never sell products through social media.
• Do not use social media primarily to market clinic promotions.
• Never become defensive or rude because a client posted information that could potentially be seen as negative.
• Do not allow employees to engage in your social media postings (see 10.25 – Digital Media Communication Policies for Staff).

OVERALL GOALS WITH SOCIAL MEDIA

• Educate clients on the value of proper and preventative care for their pets.
• Market existing services to your clients in a unique manner that does not "turn off" the client (see Developing Quality Content section).
• Bond clients to the practice by socializing and acknowledging clients when they post information on your social media page.
• Encourage followers to share your content.
• Consistently communicate valued information.
• Have some fun in between educational postings.

TAKE A TEAM APPROACH

• Your veterinary practice is a team of unique individuals; creating a unified experience by combining the many talents of a diverse team.
• If you utilize this same diversity for your marketing, you may be able to generate far more content that is actually far more compelling.
• Rather than making a new hire solely for marketing, spread responsibility among a diverse staff that is interested in participating.
• A team can create a rotation of marketing and social media related tasks, easing the responsibility on everyone.
• Sharing responsibility can create accountability and a sense of true shared identity related to your veterinary practice. When members of your staff get to share a piece of their experience on social media or otherwise, they are supporting the practice and giving their unique point of view in the process. This can be very empowering for your staff.
• Appropriate rotations can involve each member of staff taking photos to share via social media, and creating a schedule of posts for your website, Facebook, Instagram, and so on.
• Content can be diverse and customized to fit the tone and feeling of your veterinary practice. You may decide to include staff photos, quotes, pictures of happy pets, stories, health tips, or more. All of these things help to convey a true sense of identity for your veterinary practice and exhibit your practice as a place of both work and community.
• Consider designating tasks based on skillset; maybe a staff member that studied photography touches up shots before they are posted to Facebook. Perhaps an English minor helps to proofread content before it goes live. Get creative.
• By working as a team, you can share responsibility, save money on a new hire, and teach your entire veterinary staff the various skillsets that it takes to remain competitive in an evolving veterinary industry.
• Many veterinary practices learn to enjoy the shared approach, creating a sense of camaraderie amongst staff, while enhancing their veterinary practice's marketing efforts in the process.
• There are many ways to facilitate this group effort. The "Round Table" approach means that at least once a week your staff gets together to discuss the strengths of your approach to marketing, what can be improved, and any other topics that may be deemed appropriate. You can facilitate this approach through a group e-mail where everyone responds, or a lunch where everyone gathers around. The details are up to you, but your staff will love a chance to be heard and enhance your veterinary practice:
  ◦ A weekly lunch where some of the top social media posts are shared to the staff or read aloud.
  ◦ A schedule or whiteboard that helps to delegate social media or marketing tasks amongst a team.
  ◦ An e-mail thread that encourages everybody to participate and chime in with tips for improvement, or accomplishments experienced over the course of the week.
  ◦ Anything else that may excite or motivate your staff to share the stories and perspective that are a unique piece of your veterinary practice. When marketing becomes a group effort, everyone wins.

DEVELOPING QUALITY CONTENT

• What makes any posting of "quality" are the opportunities that could come out of the posting.
  ◦ Think about the value the posting has to the client and the practice.
  ◦ Ask yourself if the information is relevant to the services you offer.
• Make sure you read the information and verify that it shares the same recommendation or information that you would provide in your practice.
• Prior to communicating information on social media, plan out your marketing efforts in advance. This will help avoid last minute "rushed" postings that might not have any value to your audience.
• When planning your marketing efforts choose topics with an abundance of pet healthcare information you can research and share (e.g., preventive care, dental health awareness, heartworm disease, and zoonotic disease).
• There are three parts to an effective social media posting:
  ◦ **Marketing mention.** Mention a particular service you are trying to market in the practice.
  ◦ **Fun, interesting, or engaging facts.** Provide an interesting and engaging fact that will draw the audience in. Use a relevant photo to enhance the visibility of the posting.
  ◦ **Socialize.** Ask your audience to provide an opinion, feedback, or an answer to a question you ask.

Tell Your Story

• People are often under the impression that social media is solely about peer-to-peer interactions. This, however, could not be further from the truth. Social media is a platform that has become as universal as the water cooler itself.
• Successful veterinary practices around the world leverage Facebook as a place to tell their unique story. Your veterinary practice has a narrative: a year it was founded, a founder (or two, or more), and a style and perspective that makes it entirely unique.
• Do not just simply capture, but captivate your audience.

Case Studies

• Tell followers about your success stories: the pets that you care for and the difference that you have made today. All of these things foster community, trust, interactions, and keep your trusted pet owners coming back for more.
• These case studies are of crucial importance for a multitude of reasons, but primarily because they help your audience to see firsthand the level of care that your veterinary practice provides.
• In a particular case study, be sure to provide your audience with:
  ◦ why the pet came in to receive veterinary care;
  ◦ what you did to provide care for the pet;
  ◦ how the pet is doing today;
  ◦ a photo, or quick video of the pet.
• By providing this level of in-depth information on a pet, you tell the story of your patient and ensure that you can deliver the same quality of care to any prospective pet owner who needs it.
• You will be able to forge an immediate bond with pet owners who appreciate your attention to detail, and the accountability needed to provide optimal care for a pet.

10.16. Social Media

• People want to hear of your successes, which will brighten their day and instill them with confidence about your veterinary practice.
• In exceptional circumstances, news coverage has even come about after particularly sincere and uplifting pet stories. This results in absolutely tremendous publicity, and simultaneously helps you to market your services to a wider audience. This wider audience can soon grow and enhance your veterinary practice online, and in the local community.
• Case studies are also a great opportunity to educate your clients. By highlighting a particular toxicity (like xylitol, grapes, or lily toxicity in a cat) you can spread the important information in a success story that will resonate with pet owners.
• These posts can be timed for specific times of year (the "chocolate holidays," the start of flea season, holiday dangers) to help your clients stay aware of how to best care for their pet, and to keep your practice at the top of their mind.
• Sample topics for case studies can include:
  ◦ dermatology – before and after skin cases;
  ◦ dental – before and after dental care (photo);
  ◦ surgical case examples;
  ◦ laser therapy cases (pets can often improve a limp in a matter of weeks after laser therapy).
• By sharing photos and videos on social media, you can create and communicate compelling stories that will enhance your marketing efforts, keep your practice on the cutting edge, and attract more pet owners to your veterinary practice.

IMPLEMENT A SOCIAL MEDIA CALENDAR

• It is not enough to simply logon to a popular social media platform and start posting left and right.
• You must be methodical, organized, and thoughtful to truly make the impact you are looking for. It is highly important to remain organized and deliberate when it comes to your overall marketing efforts.
• The Internet is flush with posts, fun facts, blog posts, and millions of tidbits. Your posts must be well crafted and inviting.
• Veterinary practices are so busy focusing on patients and clients (rightfully so) that they often do not know what to post on social media, or what sort of content they wish to deliver in the first place.
• Do not make rapid-fire posts across a wide-range of topics in a short span of time.
• Use a social media calendar to organize specific campaigns and focus on particular topics for longer periods of time. This has the added benefit of letting you explore your topic in-depth, allowing you to get your whole veterinary team on the same page and sparking more client engagement, which is a major goal behind utilizing social media in the first place.
• Using a social media calendar is also a great chance for your management team, doctors, and staff to discuss, engage, and truly understand what will be shared on a particular social media platform before it is actually posted publicly.
• It is important to remain unified as a veterinary practice, so members of your team should have a comprehensive understanding of which social media campaign is currently active and what topics are being shared with your target audience.
• Here are three tips for implementing a social media calendar:
  ◦ Share your social media calendar with your entire team. Before you begin presenting content to your community of followers, review content with your team to ensure everyone is well versed on the topic at hand and answer any questions that may pop up. Take this as an opportunity to poll team members about potential topics to focus on both now and into the future and refresh knowledge on existing protocols to get everyone on the same page. Your veterinary practice will benefit from this step, and so will your audience.
  ◦ Gather statistics related to the topic at hand, and begin to craft well-articulated, two- to three-sentence postings. Share direct case examples from within your practice.
  ◦ Use the native scheduling feature within certain social media networks to methodically schedule postings to go out automatically. During slow months, use your social media calendar to write out content in advance and plan for future months. Even if the content is scheduled to go out well in advance, be sure to monitor activity and engage with posts when necessary. Scheduling posts helps you to bring consistency to each campaign.

GET PERMISSION

You should receive permission from a pet owner to share their story, pictures, or a video of their pet on social media or elsewhere. This is an important thing to note and emphasize, as some members of your staff may be appointed to collect signed *photo/video release forms*, to ensure that you are permitted explicitly to share various types of media.

Most pet owners do not hesitate at the opportunity to share the joy of their pet with the world and online, but *receiving permission firsthand is definitely a must.*

MARKETING YOUR SOCIAL MEDIA PAGE(S)

• To increase the effectiveness of your social media communication, you must market the variety of social media platforms you are part of.
• To gain followers, use the following tips:
  ◦ Identify the link for each of your social media networks. If applicable, within the social media network create a unique link for your channel. This will make it easier to find. For example, www.facebook.com/SimplyDoneVeterinaryClinic.
  ◦ Place a link to your social media page(s) on every page of your website.
  ◦ Send out a social media e-mail blast that contains a link to all of your social media pages.
  ◦ Create a social media connect card that will have a link to all of your social pages, website, e-mail address, and how to access their pet portal (if applicable). The card should be the size of a business card and not serve as your primary business card.
• Place a message with the link to your social media page(s) on the footer of your invoices.
• Encourage users to "share" your content.
• Have a pet photo contest where pet owners can submit pet photos on your page. Encourage owners to have their friends vote for their pet by following the practice's social media page and voting.
• Have a link to your various social media pages on your outbound e-mail signature.
• Develop a social media connect card to market social media channels to clients easily (see Examples section).

HOW TO ADDRESS NEGATIVITY

• Although it is not common for veterinary practices to receive negative comments from clients, you should still be prepared in case you are faced with negativity (see 10.19 – Protecting and Defending Your Online Reputation).
• In many cases, "negative" comments on social media platforms are a good thing. Through social media you can remove comments that are truly negative and can hurt your practice. On various review-based websites, such as Google Reviews, Yelp, or many others, you cannot remove negative comments regardless of the efforts you put in. Comments on review-based websites are there to stay for good.
• Use the following steps if you are faced with negativity:
  ◦ Stop. Do not immediately reply based on personal feelings. Review the comment and present it to an administrator or business owner.
  ◦ Contact the commenter. Discuss the posting by commenting back (if not offensive or obscene comment) in a polite manner (not defensive) and/or contact the poster via telephone to discuss the comment.
  ◦ Find out what went wrong. Discuss the comment with the appropriate departments. Then, ask yourself if you can learn from this.

Figure 10-16-1.

Sample of a "social media connect card" to be used separately from your business card to promote your social media networks.

SOCIAL MEDIA COMMUNICATION WITH STAFF

- Although it may seem very easy to integrate communicating with your staff online via social websites such as Facebook, consider everything before making your decision.
- Social media can lead to getting more personal information on your staff and associates than you should know as an employer.
- Remember, there is a fine line between being an employer and being someone's friend.
- Social media websites tend to show personal information about staff members, and although some do not care if you know everything, there are some who would rather keep their information to themselves.
- Here are a few things to remember when considering communicating via social media networking websites:
  - You cannot require your staff member to communicate with you by using their personal social media channel.
  - Even if your staff is 100% on board you cannot hold anything against them that you find out online regardless of your personal beliefs.
  - You do not want to allow clients who are friends of employees to find out about information intended for staff only.
  - If you have already implemented communicating with staff online using a social media networking site, make sure you have all of the applicable security settings in place to avoid information about your practice from being leaked online.
  - It is recommended to avoid utilizing social media platforms as a form of communication. Consider other methods of web communication, such as e-mail, private team portals, Google Apps, and so on.

EXAMPLES

Figure 10-16-1 shows an example of a "social media connect card."

10.17. MOBILE APPLICATIONS

BASICS

OVERVIEW

Mobile devices are becoming more and more common for everyday use. As the devices continue to develop, they offer more convenience and portability to allow us to stay connected everywhere we go. Businesses can utilize mobile technology to assist them in staying connected with the business and the clients they cater to, all while on the go. In veterinary medicine we can utilize this technology to stay connected to our clients, social media initiatives, provide clients with express payment options, access the practice management software remotely, and much more.

TERMS DEFINED

Android: A Linux-based operating system designed primarily for touchscreen mobile devices such as smartphones and tablet computers. Google currently develops it in conjunction with the Open Handset Alliance.

iOS: Mobile operating system developed and distributed by Apple, Inc. Originally released in 2007 for the iPhone and iPod Touch, it has been extended to support other Apple devices such as the iPad and Apple TV.

Merchant: Type of bank account that allows businesses to accept payments by payment cards, typically debit or credit cards. A merchant account is established under an agreement between an acceptor and a merchant acquiring bank for the settlement of payment card transactions.

Mobile Application (Mobile App): Software application designed to run on smartphones, tablet computers, and other mobile devices. They are available through application distribution platforms, which are typically operated by the owner of the mobile operating system, such as the Apple App Store, Google Play, Windows Phone Store, and BlackBerry App World. Some apps are free, whereas others have a price. Usually, they are downloaded from the platform to a target device, such as an iPhone, BlackBerry, Android phone, or Windows phone, but sometimes they can be downloaded to less mobile computers, such as laptops or desktops.

Mobile Broadband: Term for wireless Internet access through a portable modem, mobile phone, Universal Serial Bus wireless modem, or other mobile devices.

Mobile Device: Small, hand-held computing device, typically having a display screen with touch input and/or a miniature keyboard and weighing less than 2 lbs (0.91 kg). Apple, HTC, Samsung, LG, Research in Motion (RIM), and Motorola are just a few examples of the many manufacturers that produce these types of devices.

Mobile Operating System: Also referred to as mobile OS, this is the operating system that operates a smartphone, tablet, personal digital assistant (PDA), or other digital mobile devices. Modern mobile operating systems combine the features of a personal computer operating system with touchscreen, cellular, Bluetooth, Wi-Fi, Global Positioning System mobile navigation, camera, video camera, speech recognition, voice recorder, music player, near-field communication, PDA, and other features.

Push Notifications: This allows a smartphone to receive and display alerts even when the device's screen is locked and the application that is pushing the notification is closed.

Remote Desktop: Remote desktop software refers to a software or an operating system feature allowing applications to be run remotely on a server while being graphically displayed locally.

Tablet: Tablet computer, a kind of mobile computer, usually having a touchscreen or pen-enabled interface.

Wi-Fi: An abbreviation for wireless fidelity, meaning you can access or connect to an Internet network without needing to use wires.

Windows Mobile: Family of mobile operating systems developed by Microsoft for smartphones and pocket personal computers (PCs).

ISSUES AND OPTIONS

APP FOR YOUR VETERINARY PRACTICE

- Mobile apps are powerful tools that can enhance the client experience and provide boosted engagement, retention, and business.
- Through a multitude of case studies across multiple demographics, mobile apps have proven themselves to be the most effective way of creating meaningful engagements with pet owners in-between their routinely scheduled visits.
- A great mobile app allows you to centralize the services and offerings of your veterinary practice into a single location.
- An app should help pet owners learn how to best care for their pet and to engage their veterinary practice for appointments, prescriptions, questions, and the everyday things that they need most.
- With a single download to their mobile device, a pet owner can now request an appointment or a prescription refill, check up on an upcoming appointment, services due, submit a question, or simply look up pet care advice from a trusted source.
- These services are not just convenient, they are becoming prerequisites for pet owners who are deeply dedicated to the overall health of their pet.
- As people of all ages and backgrounds begin to use their smartphones with increasing dependency, they also look for businesses they trust to provide solutions that fit within their lifestyle.
- In general, these apps provide an alternative to calling in to book an appointment (which millennials increasingly shy away from) and often lead to increased client engagement and appointment bookings.
- You are not requiring pet owners to simply call and schedule an appointment during a finite window of time. An app also serves as an extension of existing reminder delivery systems that are likely already in place, such as postcards. Though these methods of communication are still somewhat handy, they are quickly becoming supplanted by new techniques like e-mails, text messages and, perhaps most importantly, push notifications.

Features Within An App To Look For

- Personal branding.
  - An app needs to be branded to your individual practice. Pet owners should be able to search your practice by name within the app store and find your practice with your logo as the icon.
  - Though an app that is not personally branded is not a deal breaker, clear instructions need to be provided to pet owners so that they will successfully download the app and be aware of its associated features and your practice without confusion.
- Pet-specific information.
  - Some central information needs to be included in your app to make it truly useful. These core items include information on services pets are due for and when, details on upcoming appointments, an internal pet health library with quality content to help pet owners provide care, the ability to schedule an appointment or request a prescription refills directly within the app, and push notification capability.
- A little extra.
  - Though an app should be informational and functional, it should also be fun.
  - Let us reward pet owners for downloading the app and for taking an active interest in the health of their pet.
  - Clients should be able to share pictures of their pets doing fun or silly things. Veterinary practices can share these pictures in a digital frame at the front desk or print them to be on display – and share

on Facebook *of course*! Let us engage with pet owners in meaningful ways and share in those experiences that make pet ownership such a wonderful thing in the first place.

MOBILE PAYMENT OPTIONS

- Mobile payment options allow you to check out a client anywhere.
- How it works:
  - Mobile devices that allow mobile payments include mobile phones, tablets, and some laptop computers.
    - This mobile application requires mobile broadband Internet access or Wi-Fi.
    - The mobile device credit card reader can be ordered for low to no cost from the payment vendor, also known as the merchant, upon account setup (e.g., Square, Intuit GoPayment).
    - Once the credit card reader has been ordered for the mobile device, an application must be downloaded to the mobile device.
    - You can open the application, choose the amount to charge, and swipe the card using the mobile card reader connected to the mobile device.
    - The client will have the ability to sign for the transaction electronically.
- This is a great option for veterinarians who offer mobile veterinary services.
  - There is no need to wait to bill a client, because you have the ability to charge them at the time the services are rendered. This will save on mailing costs and late payments.
  - You can use mobile payment options as a form of convenience for clients as well.
  - Mobile payment options eliminate client hassles. Consider clients who are in an exam room and have to be moved to the checkout counter or exit area and may be overwhelmed with the process. Distractions such as other pets in the lobby area, traveling with a child, anxious pets and multiple pets are also examples.
  - Mobile payment options allow the opportunity for the utilization of the practice management software on a mobile device such as a tablet or a PC located in the exam room to charge out the client. When the invoice has been inputted into the management software, you can then charge the client credit card utilizing the mobile payment device.
  - The client can electronically sign the receipt and even have the option of having it sent to them via e-mail, text, or printed copy.

SOCIAL MEDIA APPLICATIONS

- Social media applications on the go allow you to have continued access to your practice's social media network communications from most mobile devices (see 10.16 – Social Media).
- How it works:
  - Mobile phones, tablets, and some Windows-based laptops can download social media applications (e.g., Facebook, Twitter, WordPress, Foursquare).
  - This mobile application requires mobile broadband Internet access or Wi-Fi.
  - Download and install the application from the mobile application store from your mobile device.
- Once you have downloaded and installed the device, log in using your log-in credentials for the practice social media network.
- With the application you will be able to update status, view current communications, notifications, and updates made to the practice social network profile.
- During community events you will be able to upload photos throughout the event into the social network application for client viewing pleasure.
- Uploading photos during an event is also a great way for prospects at the event to follow you on your social media network (to learn the value of prospects following you on social networks, see 10.16 – Social Media).

VETERINARY-SPECIFIC APPLICATIONS

- There are a variety of veterinary-specific applications for various mobile devices operating software, such as iOS, Android, and Windows Mobile.
- Veterinary-specific applications include:
  - Compendium of Veterinary Products
  - Small Animal DDx
  - MyVIN Mobile
  - DVM360
  - Dog CPR
  - Choc Tox
  - Petoxins.
- Each mobile application is designed to assist veterinarians by utilizing their mobile device to access the information from anywhere a computer might not be readily available.

10.18. PATIENT PORTALS

BASICS

OVERVIEW

• An online patient portal communicates certain patient information from your practice management software into an online secure client patient portal.
• Information that is transmitted usually consists of the patient's name, birth date, reminder dates, prescriptions recently filled, and educational material.
• Each patient portal provider transmits different information. Some examples of transmitted information include patient reminders, prescribed medications, diagnostic reports and results, future appointment dates, and so on.
• Clients register for their online patient portals by registering online via the clinic website or by inputting an e-mail address into the client's electronic file.
• Once clients register and access their portal, they will see all their pet's updated information.
• In most cases, the benefits of an online patient portal greatly exceed the cost.
• Clients who have access to an online patient portal assist in increasing compliance percentages in your practice.
• They are able to see when their pet is due for services and read about the importance of the service due, all in one place.
• Reminders are automatically sent to the client's e-mail address on file.
• Appointment reminders are automatically e-mailed to clients and also texted to clients who opt in.
• Prescriptions are listed allowing clients to easily request a refill reminder by e-mail and even request the refill online.
• An online patient portal is full of other fun features for clients. They can upload photos, blog with other pet owners, read about pet care, and more.
• By having an abundance of information on the patient portal for clients to view, you are increasing the likelihood of the number of client visits.
• Your practice name and information are made prominent throughout the portal so clients can familiarize themselves with you and your practice.

TERMS DEFINED

Portal, Patient: Healthcare-related online applications that allow clients to interact and communicate with their pet's healthcare providers, such as veterinarians. Typically, portal services are available on the Internet at all hours of the day and night.

ISSUES AND OPTIONS

Patient portals are offered by a variety of companies, so choosing the "right" company to work with can often become quite the task. The following are a few important services to look for when shopping for a patient portal company.

PATIENT PORTAL

Although each company provides patient portal options, not every portal is created the same. Look for the following options when considering your options:
• Make sure the portal looks professionally designed and easy to navigate.
• The portal should clearly display the practice name.
• As soon as the client logs in they should be able to see all of their pets at a glance.
• Pets should clearly have their service reminders displayed.
• The client should be able to control the type of communication they wish to receive (i.e., e-mail, text/SMS message, postcards, etc.).
• The user should be able to schedule appointments right from the portal.
• Portal customization is important for the client. Make sure the client can interact with the portal by uploading their pet's photo and inputting additional information about their pet.
• Allow clients to make updates to their account through the portal. When clients make updates such as phone number or address information, the practice should be notified within the administration portal so they can make the changes within the practice management software. This will ensure client contact information is constantly up to date.
• Portals that contain resource or education centers for clients can often lead to better client compliance. You want to allow clients to have the ability to access pet health information from a pro-veterinary resource whenever they choose.

PRACTICE MANAGEMENT REPORTS

Most portals allow the ability to obtain practice management reporting features from within the practice administration portal, and in many cases this is much easier than accessing the information from the practice management software. The following are a few valuable reports for practices.
• The portal should allow ease of accessing compliance reports from within the administration portal. The compliance reports will allow you to view compliance numbers for individual services reminded through mail, e-mail, and/or the portal. This will allow the practice to measure compliance with service reminders in real time. In many cases, without this feature practices are not able to track overall compliance easily, must do so manually, or do not do so on a routine basis.
• The portal will allow tracking of physical postcard reminders. If the practice does not reach desired postcard compliance numbers, there are many contributing factors to consider. Are the reminders being sent of high quality? Are there many returned postcards for incorrect addresses? Are the service reminders within the management software generating reminders properly? These are all important elements you can review by properly tracking reminder postcard compliance numbers.
• The portal should allow the practice to access heartworm, parasite, flea, and tick product compliance. This type of report will allow business owners to review current compliance within the practice to understand if there is a need to develop a program to increase compliance numbers should they be too low.
• Additional reports the portal should be able to provide are total active number of clients and patients (to be determined automatically based on client account activity based on a time frame).
• In many cases these numbers can be placed within a spreadsheet file to measure historical data.

REMINDERS

Reminders should be a big part of your practice (see 4.16 – Client Reminder Systems). Without proper notifications, clients are not reminded for the services their pets need. Practices who do not properly remind clients for the services their pets are due often see a negative impact on their overall revenue for services reminded (e.g., vaccines, laboratory work, dental procedures).
• The portal should include multiple options for service reminders, such as:
  ◦ **E-mail.** Easily remind clients for services through e-mail. E-mail reminders should only supplement traditional postcard reminders. E-mail reminders do not cost money per reminder and are often an all-inclusive service provided by the patient portal company.
  ◦ **Postcard.** Postcard reminder services are often an additional service provided by the patient portal company. However, these automated postcard reminders often increase compliance due to the strategic

reminder schedule the company develops. In addition, the quality of the reminder cards is often higher than those sent by the practice. Higher quality postcards do not become confused with junk mail. Finally, the patient portal company often runs client addresses through an address correction database provided by the United States Postal Service. This will help avoid sending out reminders to incorrect addresses or clients who have moved and failed to provide a forwarding address.

  - **Texting.** Easily remind clients for services through text/SMS messages. Text reminders should only supplement traditional reminder methods. Text reminders do not cost money per reminder and are often an all-inclusive service provided by the patient portal company.

- Reminding clients about services due for their pets is highly valuable when done using a patient portal. Clients not only have the ability to view reminders from the portal that their pets are due for services, but they can also easily become educated about the importance of these services. For example, Mr. Smith might see that "Fido" is due for a *Bordetella* vaccine but he notices it is not completed with "Fido's" routine vaccines. Rather than deciding to wait and postpone the vaccine because he does not understand why it needs to be done now, he can read about the importance of the vaccine by clicking on the name of the vaccine. By reading that this is a vaccine to help prevent forms of canine cough that can be obtained at places such as grooming facilities, dog parks, and boarding kennels he will understand why "Fido" needs the vaccine at the date mentioned within the portal. However, without the ability to learn about the importance of the vaccine he may have waited to obtain the vaccine months later with "Fido's" annual vaccinations.

WEBSITES

If your practice does not currently have a website at the time of researching a patient portal company this will be a valuable service worth considering (see 10.13 – Websites). However, each patient portal company offers different website options. The following are a few key features to look at when comparing website offerings.

- Does the portal offer an easy-to-use content management system (CMS)? CMSs allow a user to manage the content on the website without prior knowledge of website coding. Thus, this allows the ability for almost anyone to be able to log into the website and make changes to the information on an as-needed basis.
- The website should allow the ability for installation of Google Analytics. Google Analytics will allow the practice to track various traffic sources, page visits, and referral sources.
- The website should allow page descriptions and keywords places within the website in the form of meta tags (see 10.14 – Search Engine Optimization).

PORTAL MANAGEMENT

Regardless of the company you choose, managing the portal within the practice will become an important part of the process. The following are a few tips to ensure the portal communications are managed in a timely manner.

- All of the reception team should be trained on how to access the portal and manage client communication.
- Most or all of the receptionist team should have individualized access to the patient portal.
- On the practice opening procedures checklist, include checking the administration portal for client communications.
- During the lunch hour, assign a receptionist each day to be responsible for checking the administration portal communications.
- Checking the portal twice daily will ensure communications are resolved within a timely manner.
- Understand the value of the communications within the patient portal. Clients will often communicate with you through the portal after the practice is closed. Such communication could be scheduling an appointment or requesting a prescription refill. Allowing clients to request such communications with you 24/7 helps increase compliance – especially for forgetful pet owners.

Client and Patient App

Some portal providers allow clients to access patient portals through a branded or nonbranded practice app (see 10.17 – Mobile Applications).

10.19. PROTECTING AND DEFENDING YOUR ONLINE REPUTATION

BASICS

OVERVIEW

• Your online reputation is either driving people toward or away from your veterinary practice.
• If you have not started to secure positive reviews online to both maintain and enhance your reputation, you run the risk of the many pitfalls that may follow.
• Something as simple as a Google Review (https://support.google.com/business/answer/3474122?hl=en) can actually have profound implications on your veterinary practice and whether or not you are securing the volume of pet owners that your practice is capable of.
• When searching online for a local veterinary practice, customer reviews will gravitate toward the top of the screen, and instantly display the name, website, address, and phone number, along with one to five star average rating, of nearby practices.
• These scores can dramatically influence the number of new clients that find, and ultimately choose, your practice.
• When people are utilizing the Internet to research various types of businesses, it becomes important for any business to review the information that is listed about them online.
• Consumers use review-based websites to learn more about the business from other consumers who utilize their services at some point.
• In most cases, you cannot control the information posted online about your business, but you can influence positive information.
• In the cases where you can identify the client, make attempts to contact them. In most cases, clients do not leave you negative reviews to hurt your brand but rather to make you aware of a problem.

TERMS DEFINED

Abuse: Improper usage or treatment for a bad purpose, often to unfairly or improperly gain benefit.
Query: Precise request for information retrieval with database and information systems.
Review: An evaluation of a publication, a product, a service, or a company.
Social Media: Interactive platforms that individuals and communities create and share user-generated content.
Spam: The use of electronic messaging systems to send unsolicited bulk messages, especially advertising, indiscriminately.

ISSUES AND OPTIONS

The following information will assist you in creating awareness about your reputation online and how you can continue to manage it in the future.

CLAIM YOUR ONLINE LISTINGS

• First, search for your veterinary practice online. If you have never looked, you might be a bit intimidated at what you might find.
• Search on Google, Bing, and Yelp, and then "Claim Your Listing" once you have found the right result.
• Verify that this truly is your practice and follow the steps shown on your screen.
• Bookmark your top online listings in a folder within your browser. This will save you time when you wish to check back on your results, and it lets you easily review your listings at least several times a month.

SET UP ALERTS

Perch

• By using a free service called Perch (perchapp.com) you will have a powerhouse service monitoring the Internet for results about your practice.
• You will be notified by email or push notification whenever a new result or review is available.

Google Alerts

• Google offers a free service called Google Alerts (https://support.google.com/business/answer/3474122?hl=en). The service was designed to assist businesses in becoming aware about information that gets posted about them online.
• Google Alerts are e-mails sent to you when Google finds new results such as web pages, newspaper articles, or blogs that match your search terms. You can use Google Alerts to monitor your business information on the Web.
• Google Alerts allow you to create queries about various topics. Such queries could be the name of your business. Google Alerts checks regularly to see if there are new results for your query. If there are new results, Google Alerts sends them to you in an e-mail.
• For queries such as your practice name, you might not get an e-mail every day but you will find out when something new and relevant is published.
• If reviews are published about your practice online with Google Alerts you will be notified once Google picks them up.
• This will allow you to respond to reviews the moment they are left.

ONLINE REVIEWS

• Consumers can leave reviews on any popular website that allows reviews or recommendations, such as Google, Yelp, and even social media websites such as Facebook.
• Once reviews are posted online they cannot removed. This is important to understand, because many review-based websites might lead you to believe you can pay to become a business member and have control over your reviews. However, regardless of any membership level, you *cannot* remove reviews once they have been posted.
• You can report a review as "Abuse," "Spam," or "Scam," but this does not guarantee the review will be removed. What practices might see as abuses is not actually considered abuse, as they are genuine reviews of how a consumer feels about your business (many times considered acceptable by the review-posting guidelines of the website host).
• You can reply to reviews as someone who is representing the practice.
• When replying to a review that might be considered negative, it is important not to become defensive. Remember, the general public will be able to see how you respond.
• You should reply to a review and appear to take the concern genuinely.
• If you know who the client is, attempt to reach out to the client to find out what went wrong.
• Engage with positive reviews. The average veterinary practice receives one review per month. You can reply to a positive review online, call and thank the client, or get creative and send a personalized Thank You card. Engage how you see fit, but definitely reach back to those who have been impressed with your practice. This little bit of effort can most definitely go a long way when it comes to encouraging positive reviews and ensuring client retention.
• For an example of how to reply to a review, see the Examples section.

SOCIAL MEDIA

• Facebook allows consumers to leave reviews for a business.
• In many cases, the reviews about veterinary practices on Facebook are *usually* positive.

10.19. PROTECTING AND DEFENDING YOUR ONLINE REPUTATION

• The reviews appear on the Facebook page for the business and cannot be removed or relocated on the Facebook business page.
• Often times, clients do not leave you negative reviews to hurt your brand but rather to make you aware of a problem, or to alert others.
• Veterinary practices that often communicate with clients through social media encourage clients to share pet photos on the practice page. Pet photos are usually associated with a form of positive praise about the practice. This, too, can also serve as positive reviews.

ENCOURAGING POSITIVE REVIEWS

• Contrary to common belief, it is not illegal or against the guidelines of many review-based websites to solicit reviews.
• When encouraging reviews, it is, however, illegal or against the guidelines to provide incentives of cash, products, or services in exchange for positive reviews.
• You can encourage happy clients within the practice to leave you positive reviews on various review-based websites.
• Encouraging clients to leave you positive reviews increases your overall score on many websites. The more positive reviews you have the better you stand out against the competition.
• Do not encourage false reviews from family members or employees. Such conduct can hurt your online reputation.
• You should leverage Google Reviews to garner new business and make sure your visibility is maximized online by asking clients for reviews.
• You can engage directly with happy clients at checkout by encouraging them to leave a positive review for your practice. If they are onboard, send them a friendly reminder e-mail at the end of the week, with a direct link to help them leave a Google Review.
• It is important to make leaving a review as easy as possible for your client, so feel free to print a step-by-step guide that ensures all types of pet owners know how to leave a review.

EXAMPLES

HOW TO REPLY TO A NEGATIVE REVIEW

Bad Review

Mr. Smith: This clinic cares more about money than pets. They charge $80 for one x-ray and wanted $150 more just to look at it!

Reply

Hi, Mr. Smith. We are sorry you had a bad experience with us. We would like to fix the problem and continue our relationship. You can call our clinic director Dr. Garcia at 813-123-4567. – Eric, ABC Veterinary Team

SAMPLE E-MAIL FOR REVIEW SOLICITATION

Hi Mr. Smith,

We really appreciate you trusting us with your pet's veterinary care! As a small business we need as much help as we can get regarding our online presence. Would you mind giving us a review on Google? It really helps great owners like you to find us.

To do so, you just need to go to this link and click on the Write Review button: http://www.GoogleReviewLink.com. If you mention the words "Tampa Veterinarian" it would really help us out!

Thanks again, and we look forward to serving you in the future with your pet's health needs.

Warm Regards,

The Team ABC Veterinary Clinic

CAUTIONS

• Do not solicit reviews from clients by offering incentives. Such behavior is considered unethical.
• If your online reputation is being hurt by multiple review-based websites, then you should research companies that can assist you in enhancing your online reputation.
• Do not become defensive or try to retaliate for a negative review online, as it is public information and can often hurt your online reputation further.
• Do not encourage false reviews from employees or family members.
• Do not use comments as a forum for advertisement.

10.20. MEASURING PERFORMANCE OF DIGITAL MEDIA CAMPAIGNS

BASICS

OVERVIEW

• Measuring the performance of digital media campaigns can often be difficult due to the variations for each type of media.
• The question often asked is "What is the return on investment (ROI) for my initiatives?"
• There are tools in place to ensure that your marketing is as effective as possible and that your ROI is robust enough to ensure that the campaigns are worthwhile.
• In some types of digital media, the investment can often be the time spent involved with the particular digital media campaign.
• Digital media campaign performance and effectiveness can be measured but requires some perspective.
• Depending upon the investment made, the ROI should not be the priority, but understand that the return will still exist.
• The process for reviewing the ROI for a website will often be much different than determining the investment of social media communication.
• When possible, use traditional tracking methods to track the effectiveness of digital media.
• Digital media is often used to create awareness for your practice.

TERMS DEFINED

Analytics: The discovery and communication of meaningful patterns in data. Especially valuable in areas rich with recorded information, analytics relies on the simultaneous application of statistics, computer programming, and operations research to quantify performance.
Digital Media: A form of electronic media where data are stored in digital (as opposed to analog) form.
Return on Investment (ROI): One way of considering profits in relation to capital invested.
Social Media: Interactive platforms from which individuals and communities create and share user-generated content.

ISSUES AND OPTIONS

OBSTACLES IN DETERMINING RETURN ON INVESTMENT

• Digital media campaigns all vary based on the type of media used for communication.
• In cases where there are vague referral sources within the practice management software it becomes difficult to measure the performance of many marketing initiatives (online or offline).
• The practice management software must contain a full detailed list of client referral resources (see Examples section).
• The receptionist team must understand the importance of notating the referral source for each new client.
• When starting to properly track referral sources it will take at minimum 6–12 months to obtain true numbers to compare the value of each referral source.
• Having more than one company manage the same services for you can often pose a problem. For example, if you have two companies that assist with search engine optimization (see 10.14 – Search Engine Optimization), it will become difficult (though not impossible) to determine who is giving you the most visibility on various search engines.
• Tracking new client referral sources can often be difficult to determine your ROI. For example, a new client may start by seeing your advertisement in a local magazine. However, this might lead them to your website, and then eventually your Facebook page. This means that the new client's last impression was Facebook, and is likely what they will say if you ask how they were referred. They may also say that they found you on the "Internet," which is technically accurate but far from specific when it comes to marketing purposes.
• Obtain analytics from your digital media campaign providers.

TRACKING NEW CLIENTS

• It is important to ensure that your client management software does not count "no show" clients as new clients. This can throw off your measurement of revenue and growth, when the best digital marketing campaigns will only use data that is truly affecting your veterinary practice.
• Consider looking at new client revenue as opposed to just looking at new client numbers.
• Revenue that new clients generate within the first 12 months of doing business with a veterinary practice will help to determine if the veterinary practice has received return on the respective marketing tools used.
• Unless a certain amount of revenue and return is reached, you will not be able to justify certain marketing channels that may be consuming more resources than they are generating, or are keeping your margins paper thin.
• Be diligent about making sure that the figures reflected in your software are true to what is occurring day to day. For example, sometimes your management software might say that you have received a new client, when in reality you have not. This can commonly occur when an account is created for a client in advance of their appointment but the client cancels or is a no show. If this occurs, you should make the adjustments to reflect the most accurate information possible. A simple error during this stage can throw off your projections for revenue and your new client data as a whole.

ENSURING YOUR RETURN

• It is important to have certain parameters in place to ensure that your efforts are a success.
• If you spend $500 on a campaign and it returns $750, is this considered a success? What about the time and expenses required to measure and implement the campaign in the first place?
• As a rule of thumb, you will want a *minimum* of doubling your return.
• Though looking for higher return is a great place to aim, you want to at least double your return to justify the expense in the first place.
• Anything lower puts you at risk for losing your money toward ineffective marketing, and anything greater means that you are on pace for a truly successful campaign.
• Keep a close eye on your returns and the techniques used to achieve them; this way, you can refine and enhance your return with even more robust margins in the weeks and months to come, capitalizing on the successes you have already established.
• If, in fact, you do achieve a low return on an investment, this does not mean that you need to scrap the campaign altogether. For example, what is the best course of action if you achieve a return of $750 on a $500 investment in a local magazine advertisement? In this situation, you can keep a close eye on this and either consider canceling your renewal or renew but keep a very close eye on the success of the campaign. You may decide in this particular case the margins are sufficient, but that if improvement is not achieved within a certain amount of time it is time to pivot and try another avenue altogether.

NEW CLIENT SOURCES

• It is extremely important to be mindful of tracking your new client sources.
• The most common new client referral sources are as follows: search engines, website, social media, community-based print advertising, existing clientele (word of mouth) and community events.

10.20. MEASURING PERFORMANCE OF DIGITAL MEDIA CAMPAIGNS

• Tracking your new client sources is an imperative step to success.

SOCIAL MEDIA PERFORMANCE MANAGEMENT

• Social media should not be used solely to market the practice and generate revenue (see 10.16 – Social Media).
• When questioning the ROI for social media, first consider the following:
  ◦ Social media channels are free to develop and maintain.
  ◦ The investment for social media is time, but if managed correctly the time spent on a weekly basis should be very minimal.
  ◦ Social media is about engaging in educational conversations with pet owners.
  ◦ Education through social media can often provide the largest reach of any digital media campaign.
  ◦ Educated clients tend to become more compliant pet owners.
  ◦ Social media users follow and support brands such as their veterinary practice.
  ◦ Properly developed social media postings can become effective forms of marketing (see Examples section).
• To track the effectiveness of the minimal time investment in social media, make sure you have a referral source field within the practice management software that lists each individual social media channel (see Recommended Reading section) so you are aware of which social media channel is working best for you.
• Social media is not about marketing, but rather it is about cultivating relationships with your clients.
• You cannot easily track the value of educating clients about proper pet care and providing pro-veterinary resources to them on a continuing basis.
• Clients who follow you on social media often share positive testimonials for prospects.
• Listen to clients and ask about mentions of the social media network during a client visit.
• Use social media analytics (such as Facebook Insights or HootSuite for other social media networks) and view your reach.
• Through social media you can reach a larger number of people by simply posting effective information.
• Social media is simply an important form of communication. You do not question the ROI for telephone, Internet, or fax services. This is because they are recognized as important forms of communication, and social media is no different.

MEASURING THE PERFORMANCE OF YOUR WEBSITE

• The performance of your website is determined by numerous elements, such as the cost of development, monthly costs, and analytics (see 10.13 – Websites).
• If you have a website that does not cost you anything or is all-inclusive to another service subscription then the ROI is quickly gained.
• The cost of initial investment for a website should not exceed your maximum marketing budget for the year.
• Review your monthly subscription fees when considering the overall ROI.
• Make sure you are not paying multiple companies to provide search engine optimization for your website.
• To measure performance of your website, consider the following:
  ◦ Without any form of website analytics it will be very difficult to determine the performance of your website.
  ◦ Make sure you have your website listed as a referral source within your practice management software.
  ◦ Your online referral sources, which include Google, Bing, Yahoo, or even various social media networks, should include your website (e.g., they may find you on Google, but using the information on your website was the determining factor to call you).
  ◦ Enable Google Analytics within the website to track traffic sources.
  ◦ Traffic sources will help determine which websites online clients are linking to your website (e.g., Facebook or Google may be top traffic sources, therefore implying clients are finding you on Facebook and Google, and the investment into Facebook and Google is generating leads).
  ◦ Your monthly website subscription should not exceed double or triple the amount of your average new client transaction.

10.21. TECHNOLOGY: REDEFINING THE CLIENT VISIT

BASICS

OVERVIEW

- Effective use of technology can enhance your veterinary practice.
- It is the way that you choose to use this technology that is paramount to maximizing your effectiveness and the success of your veterinary practice's adoption of apps and technology.
- As practices explore new ways to generate revenue due to competition from retailers, pharmacies, low-cost veterinary care services, and the Internet, we are going to have to start to rely on the "technology" within our practice to help make up this revenue gap.
- Everyone's perception of what "technology" is can vary from person to person. Technology in a veterinary practice can be any of the following items:
  - integration;
  - computer network;
  - computers/workstations/tablets;
  - Practice management software (for the use of compliance assessments, financial productivity, electronic medical records, etc.);
  - Diagnostic equipment (including, but not limited to, laboratory equipment, digital radiology units, ultrasound, anesthetic monitoring units, etc.);
  - electronic whiteboard;
  - interactive educational tools.
- Those practices that do not make the investments in technology will be left behind struggling to make up lost profits.
- We will rely on "technology" not only to create value for our clients who will demand it, but also we will need it to generate revenue lost from existing but shrinking profit centers. For example, there are more and more practices that make the investment in ultrasound units even when there is not an internist or radiologist on staff to interpret results.
- Telemedicine has helped practice owners keep this revenue for themselves instead of sending clients to a local specialty clinic.
- This is just one of the many examples of how future practice owners will rely on technology to stay afloat.

TERMS DEFINED

Archive: An archive is a collection of historical records, or the physical place they are located. Archives contain primary source documents that have accumulated over the course of an organization's lifetime.
Download: Means to receive data to a local system from a remote system, or to initiate such a data transfer.
In-House Laboratory: On-site laboratory where tests are done on clinical specimens in order to get information about the health of a patient as pertaining to the diagnosis, treatment, and prevention of disease.
Integration: Specialized tools to simplify the sharing of medical and related data between medical equipment and electronic health records.
Portal, Patient: Healthcare-related online applications that allow clients to interact and communicate with their pet's healthcare providers, such as veterinarians. Typically, portal services are available on the Internet at all hours of the day and night.
Practice Management Software (PMS): Software that deals with the day-to-day operations of a medical practice. Such software frequently allows users to capture patient demographics, schedule appointments, maintain lists of insurance payers, perform billing tasks, and generate reports.
Reference Laboratory: Offsite laboratory where tests are done on clinical specimens in order to get information about the health of a patient as pertaining to the diagnosis, treatment, and prevention of disease.
Return on Investment: A measure of profitability reflecting the financial return on invested capital.
Telemedicine: The use of telecommunication and information technologies in order to provide clinical healthcare at a distance. It helps eliminate distance barriers and can improve access to medical services that would often not be consistently available in distant rural communities. It is also used to save lives in critical care and emergency situations.
Valuation: The determination of the economic value of an asset or liability.

ISSUES AND OPTIONS

CLIENTS WANT ANSWERS NOW

- Owing to technology, we have the power of real-time information at our convenience.
- If we have questions, they do not go unanswered for too long as we turn to the Internet more and more to obtain our answers.
- Who needs an expert when the Internet exists? Oftentimes pet owners turn to the Internet first for answers before calling their veterinarian.
- Pet owners want value when they pay for their veterinary services. For example, a client may pay a premium for laboratory results that are relatively immediate with in-hospital equipment; others might prefer the savings of a longer turnaround for samples sent to a reference laboratory (see 9.9 – Laboratory Considerations).
- Providing your clients with information now, rather than later, may further enhance the value of your services. Clients are used to having answers right away in today's society, where we often have the tools at our disposal to obtain answers without delay.

10.21. TECHNOLOGY: REDEFINING THE CLIENT VISIT

USING YOUR PRACTICE MANAGEMENT SOFTWARE TO REDEFINE THE CLIENT VISIT

- There are many tools within the veterinary practice management software that can assist practices with enhancing client value and patient care.
- When the client comes into the veterinary practice for their exam, utilize the tools in the practice management software to create a pet health report card. The pet health report card should include the following information:
  - The client's information as well as the pet's personal information, such as name, date of birth, and whether spayed or neutered.
  - Physical exam results, such as coat/skin, ears, eyes, gums and teeth, the musculoskeletal system, respiratory system, nervous system, and so on.
  - The results in each system should be noted as normal or abnormal.
  - In many cases, the practice management software will allow you to create the pet health report card and place NORMAL and ABNORMAL descriptions in the system already.
  - The pet health report card should outline important notes following the veterinarian's examination. These notes will allow clients to take home written information regarding healthcare needs of their pet.
  - Contain information to notate overall dental health within the pet health report card by using a form of grading scale (see 5.16 – Discussing Oral Health).
  - A grading scale can provide clients with a visual representation of their pet's overall health.
- When possible, use the practice management software to provide clients with visual educational pieces to take home (see 4.10 – Personalized Pet Profiles).
- Integration of the practice management software and the reference laboratory and/or in-house laboratory allows the results to download within the patient file in the veterinary practice management software (see 9.9 – Laboratory Considerations). Such information downloaded into the patient file can often provide trends for pet owners to see. This type of visual aid and archiving of laboratory results within the practice management software becomes a value to pet owners.
- Using automated technology (often built in within your practice information management software) to survey clients after the visit is a must. The importance of measuring client satisfaction cannot be overemphasized. Every client that leaves your practice without giving feedback on services and their overall experience is a lost opportunity to improve and gain invaluable information from the most important person to your veterinary practice: your client.
- In time, blockchain technology can even be used to synchronize pet healthcare information across multiple formats and users (see 10.9 – Blockchain).

USING IN-HOUSE DIAGNOSTICS TO REDEFINE THE CLIENT VISIT

- Clients are used to getting information when they need it. In-house diagnostics have helped veterinary practices also obtain information when they need it the most (see 9.9 – Laboratory Considerations).
- When clients come into the veterinary practice for routine evaluations, running in-house laboratory tests can provide clients with answers regarding the overall health of their pet aside from the physical exam alone.
- Pet owners can leave the practice confident in knowing that they have done everything possible to ensure the health of their pet.
- When pet owners pay for diagnostic testing after they have already received the results but prior to leaving the practice, it leaves fewer opportunities for the pet owner to complain about cost because they were able to see the value prior to leaving the practice.
- In cases where digital radiographs are an option, practices are able to send the radiographs to telemedicine consultants for a board-certified radiologist's opinion. This provides peace of mind and reassurance for the veterinarian and the client. In addition, because results are provided so quickly, the pet is able to obtain the care it needs much sooner. The rapid communication and results let the pet owner know this is your priority and you are doing what you can to treat their pet without delay (see 9.8 – Digital Imaging Systems in Practice).
- With the ability to send diagnostic images to telemedicine consultants, veterinarians are able not only to send digital radiographs but ultrasound images too. Many veterinarians obtain certification in the ability to properly utilize an ultrasound machine to obtain high-quality images. Therefore, practice owners are investing money on ultrasound machines and the proper education to utilize this diagnostic tool within their veterinary practice. With veterinarians educated on how to properly obtain images, they can send them to telemedicine consultants for either a board-certified radiologist or a board-certified internist consultation. This saves the pet owner the hassle and expense of having to take their pet to another location to obtain these services. This, in turn, creates less stress for the owner while enhancing the value of your services.

VISUAL TOOLS IN THE EXAM ROOM

- There are truly compelling apps that help with exam room communication between the veterinarian and pet owner.
- These tools, primarily used by veterinarians, allow you to educate pet owners directly in the exam room by using vivid and rich three-dimensional animations, radiographs, and instructional videos.
- Since, sometimes, the nuance of pet care can be difficult to explain, especially when it comes to anatomical function, this app helps to fill in the blanks along the way.

10.21. Technology: Redefining the Client Visit

• It allows you to drive home some of your most important medical recommendations and communicate precise care instructions for each pet clearly and carefully.
• Many of these apps come with a huge array of educational information.
• These apps work near flawlessly on tablets, allowing you to give overviews of pet conditions directly to your clients.
• Rather than fumble over the right words or explain in depth when there is a time-sensitive issue, these apps rely on captivating graphics and imagery to give comprehensive insight into the health and well-being of your pet.
• Many apps come with a huge array of program files and presentations, e-mail functionality, and ready-to-go client handouts for some of the most frequently encountered pet care topics.
• By spending a bit of time getting used to these apps, you can enhance client interactions and ensure that each time you explain a topic in detail each pet owner is satisfied with the answers provided.

THE NEW WORKFLOW FOR PET VISITS

The enhancements in technology often require us to change the practice workflow to adapt. The following is an example workflow for practices that utilize the technology within the veterinary practice to enhance client value and patient care.
• When the client enters the practice, their digital file is pulled up within the practice management software. The client is checked into their appointment.
• The client is taken into the exam room, where the technician obtains the patient vital signs and puts the results into the practice management software. The results can be aggregated as needed to view trending values such as patient weight gain or loss (common question among pet owners visiting the veterinary practice for a routine exam), periodontal scores, laboratory findings, and so on.
• The veterinary technician utilizes the patient's electronic record to quickly see the services for which the pet is due.
• The veterinary technician starts a new pet health report card for the doctor and inputs the patient's findings on behalf of the veterinarian.
• Based on the protocols and care pathways (see 9.3 – Standards of Care and Care Pathways) placed into the practice management software, the technician will know for which additional services the pet is due. For example, the protocol within the practice management software may state that pets of this breed between seven and nine years of age require senior blood work annually, and after that need geriatric profiles twice yearly (see 4.9 – Lifelong Excellence in Healthcare). If the breed is prone to certain orthopedic disorders, there may also be recommendations for radiographic screening and monitoring at certain ages. This type of notification will inform pet owners that you are well aware of their pet's specific needs.
• The technician will obtain proper samples and place them in the laboratory area while the veterinarian performs the clinical exam; or, if prior permission has been granted, the testing process can commence. Based on history, clinical findings, and established protocols, the doctor will discuss with the owner about all recommended diagnostics for their pet and will verbalize this with the technician as well. Once the consent is given for any additional diagnostics, the technicians can arrange for samples to be evaluated.
• During the physical examination, some of the laboratory testing can be in the process of being run in-house and the technical staff can enter any results of the pet health report card into the practice management software as the veterinarian discusses the results of the examination with the pet owner (creating value).
• When the exam is finished, the veterinarian will administer any necessary vaccines or provide any dispensed medications, and the technician will finish the pet health report card (if paperless, the technician will also finish up the electronic medical note).
• The veterinarian will exit the exam room to finish the pet health report card while the technician discusses the value of prevention and the recommendations of the veterinary practice (see 4.10 – Personalized Pet Profiles).
• If the results of any in-house testing become available, the technician can verify the findings with the veterinarian and review the results with the owner.
• The results will not only be discussed but also shown to the client using the practice management software (via laptop, iPad, or computer within the exam room). The visual aid is important for the client to see to confirm value received. In addition, the veterinarian can also view historical results with the pet owner so the pet owner can see the value of obtaining routine laboratory work and the value historical data provides to everyone.
• When the visit is completed, the veterinarian will review the pet health report card and make any final comments prior to having it printed for the pet owner.
• The receptionist can come into the examination room to invoice the client to avoid the stress of a crowded reception area. Using the practice's mobile phone device (see 10.17 – Mobile Applications), the receptionist will swipe the client credit card and provide a receipt (sent electronically by e-mail, text, or printed).
• The receptionist will provide the client with their invoice and pet health report card.
• Once the client invoice is completed within the practice management software, it will prompt the receptionist to schedule the next appointment prior to the client leaving the practice.
• The pet health report card will also be sent to the client by e-mail or sent to the client's patient portal for viewing online at any time.

10.21. TECHNOLOGY: REDEFINING THE CLIENT VISIT

TEXTING PET OWNERS

• One-way text messages allow you to dictate the content and tone of communication, insulating you from additional liability while still giving you the benefits of instantaneous communication. (see 10.11 – Electronic Communication: E-mail and Texting).
• Consider sending pet owners simple and concisely constructed text messages whenever a pet is dropped off for surgery, a procedure, or appointment, as well as boarding or grooming services.
• You can also send before and after photos of routine dental cleanings. Note: you should use your best judgement. It is ideal to send photos of perhaps a grade 1 dental but not of a grade 4.
• A simple text message can help you to alleviate any potential worry from a pet owner and demonstrates your accountability.
• Not only are you adapting to new technology, but you are going above and beyond to stay in touch and alleviate any possible concerns that could crop up along the way.
• This is a significant way to differentiate yourself from competitors, cut down on extra calls from pet owners wanting updates, and show that you are truly committed to every step of the client experience at your practice.
• Find a champion (or two) and try out texting clients. Assign these team members the task to begin sending out test text messages before rolling out the service to pet owners in real time. This extra measure will allow you to work out any bugs, and it will ensure that by the time it is ready for public use that the service is completely ready for primetime.

THE RETURN ON INVESTMENT FOR TECHNOLOGY INVESTMENTS

• Investments in technology made at the right time can increase the value of a practice (see 10.20 – Measuring Performance of Digital Media Campaigns).
• Such returns contain both soft and hard benefits for the prospective buyer.
• Potential buyers who will consider the purchase of a veterinary practice should be willing to pay more for practices that have already made the investments in "technology" and properly utilize it.
• Fully capitalize on the investments in technology you have already made and make sure they are reflected in a practice valuation.

GENERATIONS AND TECHNOLOGY

• Every age demographic can differ greatly with the way that they operate on a daily basis and what they consider to be effective methods of both conducting business and going about daily communication (see 1.13 – Generational Differences).
• It is more important to understand and respect all demographics, while learning to run your veterinary practice in a way that will benefit everyone.
• Technology is an incredible tool. But it still does not provide the peace of mind that a solid handshake can, especially to a more traditional demographic. If your next pet owner is a Baby Boomer, you may want to consider designating a bit of extra time to in-person communication and offering to answer any questions while they are with you during a visit.
• If you are going to enhance your veterinary practice with new offerings like an app or online portal for prescription refills or online bookings through your practice website, make sure everything is presented in a clear and methodical way.
• Do not assume that pet owners already know how to use the technology at hand, but instead make sure that everything that is integrated is clear and easy to use for everyone.
• Do not assume that Millennials do not want to chat with you in person about their pet. They may have booked their appointment online, and they may be flipping through social media in the waiting room, but the feedback you can get from them during their visit is still invaluable, and they crave information about the care of their pet.
• More than half of both generations want information on how to best care for their pet(s).
• Remember, every pet owner and every person is different.
• If you train your team staff to listen well, accommodate feedback, and respond directly to client reviews, you will be taking steps to get ahead of the curve and honor every client relationship in a meaningful way.
• You can take notes in a client's file about their preferred methods of communication and provide tips to make their next appointment even smoother than the current one.
• When you customize your approach to benefit each client individually, you make sure that everyone feels welcome at your veterinary practice and avoid the pitfalls that can come when you make an assumption about preferences.
• No one particular demographic is more important than the other. Valuing them both in the ways that you choose to communicate and conduct business is the only surefire way to make sure that every pet owner who comes to your veterinary practice leaves delighted and intends to come back again.

10.21. TECHNOLOGY: REDEFINING THE CLIENT VISIT

Simply Done Veterinary Clinic

Pet Health Report Card

Client ID: TEST
Garcia, Eric
123 Pet Owner Lane

Tampa, FL 33625
(813) 545-3044

Exam Date: 12/3/2013
Staff: Eric D. Garcia

Patient ID: ELVIS
Patient Name: Elvis
Species: Canine
Breed: Morkie
Weight: 3.5 kilograms
Birthday: 5/9/2009
Sex: Neutered Male
Technician: Stephanie Collins

Appearance, Weight, Temperature: (Normal)
Your dog is bright and friendly. It has good body conformation with normal weight and muscle mass for age and breed. Hydration (amount of fluid in the skin and other tissues) and body temperature are completely normal as well.

Breed Predispositions: (Normal)
No specific predispositions to be concerned about at this time.

Age-Specific Concerns: (Normal)
No age-specific concerns that need to be discussed at this time. Continue regular check-ups, vaccinations, flea and parasite control, and a high-quality diet to optimize your pet's health.

Eyes: (Normal)
Eyes are bright and clear. The cornea, sclera, conjunctiva, and eyelids are intact and healthy. The lens is transparent and the iris has a natural color and texture. The pupils are normally responsive to light. Vision appears normal.

Ears: (Normal)
The ear drums and canals appear normal and healthy with normal amounts of wax. The conformation of the ear flaps is normal for the breed of the pet. The skin of the ear flaps and inner ears is healthy with no signs of parasites or infection.

Mouth and Teeth: (Normal)
The gums and the insides of the cheeks appear sound and healthy. The tongue, tonsils, palate, and pharynx have a healthy color and appearance. The teeth appear clean, white, and properly aligned. There is no significant accumulation of tartar.

Respiratory: (Normal)
Respiration is normal. Each part of the lungs sounds clear and healthy and your dog has a normal breathing rate and depth. Also, your dog's nose is normally cool and moist and its trachea (windpipe) is of normal size and sensitivity for the breed.

Cardiovascular: (Normal)
The heart is strong and healthy. Each heart valve sounds normal. There are no murmurs (abnormal sounds). The pulse has a normal rate and strength with a regular rhythm. The capillary refill rate is rapid, indicating good peripheral circulation.

Abdomen and Abdominal Organs: (Normal)
The abdomen has a healthy conformation and is free of painful areas. The internal organs palpated, including the kidneys and loops of intestines had normal sizes, location, and consistency. No abnormalities were detected.

Gastrointestinal: (Normal)
There is no history of vomiting or diarrhea and the pet has a normal healthy appetite. Feeding a high-quality diet appropriate for your pet's life stage is recommended to help maintain optimal health.

Skin and Hair Coat: (Normal)
Your pet's skin is healthy, smooth, and normally flexible with no scabs, scales, growths, parasites, or irritated areas. Likewise, the hair coat is glossy and pliable with no bald areas or excessive oiliness. A flea prevention program is recommended.

Musculoskeletal: (Normal)
The skeleton is sound and fit. The muscles have normal tone and strength for the dog's age and breed. The pet's gait is normal with no signs of lameness or joint pain. No swelling or abnormalities such as arthritis or muscle wasting at this time.

Nervous System: (Normal)
Bright and alert, with a crisp, responsive mental attitude. Your pet has excellent body control, posture, balance, and coordination. Its reflexes are brisk and sharp. Perception of its environment and body position are well tuned.

Overall Health: (Normal)
Your dog is fit and in excellent health; a pleasure to examine and have here in our hospital. We look forward to seeing your dog again at the next checkup. Thank you

If you have any questions about your pet's physical exam, please call our office.

10.22. ONLINE RETAIL: MAKING IT WORK

BASICS

OVERVIEW

In the age of online retail, veterinary practices have struggled when competing with major online pharmacy retailers. Veterinary practices have lost significant amounts of profits to the major online retailers. However, there are still options left when considering an online pharmacy of your own.

TERMS DEFINED

Margin Pricing: Also known as cost-plus pricing, this involves taking all the direct and indirect costs in providing a good or service and adding a set amount or percentage that corresponds to a gross profit margin to arrive at a retail price.

Markup Pricing: Pricing based on taking the acquisition cost and increasing it by a percentage or factor to arrive at a retail price.

Merchant: Type of bank account that allows businesses to accept payments by payment cards, typically debit or credit cards. A merchant account is established under an agreement between an acceptor and a merchant acquiring bank for the settlement of payment card transactions.

Portal, Patient: Healthcare-related online applications that allow clients to interact and communicate with their pet healthcare providers, such as veterinarians. Typically, portal services are available on the Internet at all hours of the day and night.

ISSUES AND OPTIONS

CHOOSING AN ONLINE PHARMACY

- There are many veterinary distributors that offer online pharmacy solutions for veterinary practices (see 9.15 – Pharmacy Management as a Profit Center).
- Choose an online store solution that offers an easily navigable store. If the store setup is hard to navigate this will make it difficult for clients to use. This hard-to-navigate setup will lead to poor online sales.
- You will want to choose an online store that is easily accessible on mobile browsers.
- Product availability by store may vary. The online pharmacy distributor should offer the most commonly recommended products in your veterinary pharmacy (see 9.16 – Retail Sales: The Art and the Science). Items such as parasite-control products are among important items to compare.
- Pricing options are an important feature to consider (see 7.12 – Pricing Strategies). Make sure you have the ability to make changes to the prices within the online pharmacy easily. Features such as matching other major online retailers are convenient. By having this feature selected you will not have to worry about changing prices on a daily basis to match online retailers (if this is something you intend to do).
- Most veterinary practices will see up to three different types of fees involved with the store:
  - **Merchant fee.** The merchant fee is charged directly from the merchant (i.e., Visa, MasterCard, American Express, Discover, etc.). This fee is additional with any online pharmacy. Do not let this fee deter you from choosing an online pharmacy. You already pay merchant fees for accepting credit cards, so this is no different.
  - **Service fee.** The service fee is typically a fee the distributor adds on top of the actual acquisition cost of the product. For example, a product that typically costs you $10 when you have it shipped to the practice may carry the additional service fee (typically as a percentage). So, if the fee is 5%, they would add $0.50 to the cost of the product, making your cost to sell the product $10.50. If you sell the product in your online store for $20 and it costs you $10.50 you will make $9.50.
  - **Monthly maintenance fee.** In some cases, the distributor will charge you a monthly maintenance fee to cover the cost of the online store. This fee goes to maintaining the website and ensuring its continued development.
- Consider the practice costs of the products within the store. Look at the fee structure for each online pharmacy distributor. Determine how much you would profit from the online pharmacy versus selling the same product within the practice.
- Regardless of which online distributor you choose, the costs of shipping do not go to the veterinary practice.

DIFFERENT TYPES OF ONLINE STORES

- There are several types of online stores from which you can choose. Although there is not a "wrong" option, there are better options that can be based on your preferences and the needs of your practice.
- Some online stores offer the ability to obtain a free practice website. It is not recommended to use this free website because of the many limitations you will have in the overall structure of the website. The website also often appears too commercial and will not appeal to prospective clients researching you online.
- The following are a few common options when choosing an online store.
  - **Website-integrated store.** The store includes an integrated website for the practice. When a client visits the website, they will find basic information about the practice and advertising throughout various parts of the website. This is a popular solution for veterinary practices that do not have a website. Though this is an option, it is not recommended.
  - **Standalone store.** In addition to website-integrated stores, distributors also offer standalone stores. These stores are not hosted at the same place where your practice website is hosted. The store is easily visited by visiting a link that is placed on your website. The link will often come in the form of a banner or button. It is suggested to display the link on every page of your website or within a prominent location on your home page.
  - **Store within patient portals.** Perhaps one of the most useful store types would be a store integrated within your patient portal application (see 10.18 – Patient Portals). When clients are logged into their patient portal and require refills on medications they can easily log in to the portal and request a refill. When requesting a refill, clients have the option to choose to pick it up at the practice or to have it shipped directly to their home through the online store. The ease and convenience of this option increases prescription refill compliance and online pharmacy sales.

HOW TO PRICE PRODUCTS ONLINE

- It is important to understand that not everyone utilizing your online pharmacy is doing so because of the product pricing.
- You may have clients shop on your online store simply for the convenience of doing so right from their home without having to make a visit to the practice.
- When pricing products on your online pharmacy, make sure to match prices within the practice as closely as possible while ensuring profitability.
- When products are priced differently on the online pharmacy and in the practice, it often causes confusion when the pet owner needs to pick up the product in the clinic. This confusion can lead to client dissatisfaction.
- Price retail and pharmacy items fairly, competitively, and profitably (see 9.15 – Pharmacy Management as a Profit Center).
- In the instances where you match major online pharmacy prices, you can enable the "match major retailer" option within the online

store. Make sure to select only those items where you do truly want to match major online pharmacy prices.
• Why will matching all my online products prices from other online retailers not work? You do not have the advertising power and/or budget to advertise to your clients about the "deals" they can find on your website. In addition, this is not the type of advertising you should be spending your money on. Practices should focus their efforts on practice-building initiatives and selling appropriate products to their clients rather than focusing on selling cheaper pet products online.

MARKETING YOUR ONLINE PHARMACY

• Prior to marketing your online pharmacy, make sure you involve and educate your team (including employed veterinarians) about your online pharmacy.
• When you have your team aligned about the pharmacy, they will often help support the practice by recommending the online pharmacy to clients.
• Place professional signs throughout each examination room about the ability to shop for pet medications right from your website. Make sure to list your website on the sign.
• Create business cards that provide clients with instructions on how to access your store. These instructions include your website address, how to find the store on the website, and how to search and order products. Place the business cards inside of each bag containing prescriptions to be picked up.
• Make sure you have a link to the online store prominently displayed on each page of your website (do not use flashy banners).
• During patient visits to the practice, after you have filled or refilled a client prescription, let them know that they can refill the prescription in the future by visiting your online pharmacy. Repetition is key to marketing your store and making your clients aware of its existence.
• Let clients know they can refill their pet's medication through social media channels. Do not post this on social media any more often than once a month to avoid clients from feeling like the practice is constantly marketing a product or service to generate revenue.
• On each prescription label include one sentence that says, "To refill you pet's medication call us or visit our online pharmacy at …"
• On the footer of invoices add a sentence that says, "You can now refill you pet's prescription two ways: pick up or home delivery. Call us if you wish to pick up your pet's medication or visit our online pharmacy at … for home delivery."
• Include simple messaging on your "messages on hold" system.

10.23. VIRTUAL TEAM TRAINING

BASICS

OVERVIEW

Your team is different. Your training needs are different. The people you are training are also different. As the veterinary profession continues to mature, the way we train our teams requires us to provide greater options in meeting the needs of larger, more geographically disbursed, and more technically savvy audiences. Virtual team training, or training your team without a trainer or other team member in the front of the room, can be a robust method for providing training on new clinical techniques, office processes, management skills, acceptance, promoting consistency, and myriad customer service topics. It can also be an extremely effective method in environments where it is not feasible to gather all team members who require training in the same room and at the same time (see Figure 10-23-1).

Done well, virtual team training can be a powerful method in your practice's training arsenal. Done poorly, it can be an expensive failure. Herein are 10 rules for creating and delivering virtual team training that works.

TERMS DEFINED

Virtual Training: A medium of instruction where the trainer interacts with participants using web-based tools that mimic classroom experiences. These tools often include displaying slides, presenting video demonstrations, web conferencing, two-way chats, e-mail, and building a community of practice using social networking.

ISSUES AND OPTIONS

Social networking and inexpensive video cameras/recorders make virtual team training more cost-effective and robust than ever. There are still major cautions and considerations in adopting this type of training for your team.

RULE 1: PUT YOUR TRAINING ON A DIET

Virtual audiences will not tolerate long training sessions. Separate longer training classes into modules of approximately 20 minutes. Team members will feel that anything less is trivial and not worth their time.

RULE 2: GAIN ATTENTION FROM THE START

Before you can accomplish anything in a virtual training session, you need to gain the attention of your team members. Use the same type of icebreakers and creative introductions that you would employ in a face-to-face training class. For example, ask team members to introduce themselves through the eyes of their pet or share some significant and "relevant" experience of theirs that few would imagine.

Use a webcam or a slide with your picture and, if appropriate and possible, images of team members to establish a human element in your virtual training class.

Begin with a well thought out introduction that captures the essence of your virtual training session and the attention of the audience. Most team members switch to other tasks in a matter of seconds when you do not do something that holds their attention.

Be sure to quickly differentiate your virtual team training class from boring virtual meetings that your team members may have attended in the past. At the beginning of your virtual training session, demonstrate your interactive and casual style.

Never begin a virtual training session by having team members introduce themselves. Nothing is more boring at the beginning of a virtual training session than hearing an extended roll call. Instead, start out your virtual training session with a strong opening. Your opening should be scripted, memorized, and delivered with force. It should capture the essence of your virtual training session and the attention of the audience at the same time. A solid introduction will ensure that you start out strong and set the stage for building momentum as you continue.

Use more than just words. Have several pieces of multimedia at your disposal. Wow your audience by deploying well-timed movie clips, audio, or cartoons to liven things up. The Internet and availability of inexpensive digital cameras/recorders makes this easy.

Create a Facebook page using some of these techniques to pique learners' interest in your topic prior to and throughout your virtual learning experience.

RULE 3: ESTABLISH RELEVANCE

Team members who see no benefit in a virtual training session are much more likely to tune out of your class. You need to address this in the first 30 seconds. Once you demonstrate to your team how they will be directly affected by the content of your virtual training session, you will garner their attention. We sometimes refer to this as "What's in it for me?" Consider using a thought-provoking question or quote, a hard-to-believe statistic, a satirical cartoon, a compelling newspaper article, or a YouTube movie.

RULE 4: PRESENT INFORMATION WITH A TWIST

During training you probably spend most of your time presenting. Unfortunately, the "presenting" part can be the most boring portion of any training activity. It can be especially toxic (i.e., boring) in virtual training sessions, because time seems to go more slowly when team

	Yes	No
Total audience size is 25 or greater	✓	
People are dispersed in several locations or work a variety of shifts	✓	
Valuable to archive the training for future audiences	✓	
Need to establish trust		✓
Desire to change attitudes		✓
Message may be taken negatively		✓

Figure 10-23-1.

When to consider virtual team training.

members lack physical contact with a group. Make your virtual training as compact as you can. Try to economize by focusing on a few major points. If you are using PowerPoint slides, attempt to display a new one at least every three to five minutes. Supplement your virtual training sessions with demonstrations, question-and-answer sessions, and audience interactions. Finally, use a variety of content delivery types and media, such as Facebook discussions before and after the training, relevant YouTube presentations, and videos that you develop yourself using inexpensive video cameras to drive important points home.

The following are some additional practical hints to consider in presenting information during your virtual training session.

- Never be the "sage on the stage." Always attempt to be the "guide on the side."
- Everyone likes a good story. Use case studies or stories to engage team members. Ask team members to share their own experiences related to the content.
- Use strong instructional strategies. Present key ideas using different types of media. These include text, graphics, animations, illustrations, diagrams, schematics, videos, and models. Utilize strategies that include simulations, analogies, case studies, examples that showcase doing it "right," nonexamples that identify what not to do, mnemonics, jokes, war stories, and testimonials. The sky is the limit, and you are only restricted by your own imagination.
- Present familiar information from another point of view. Perhaps the animal's owner, or the animal itself.
- Focus on the delivery, not just the content. Although the content of your training is crucial, the way you deliver it plays a huge role in how the audience accepts your message. Stick to the schedule. Structure your virtual training session for maximum impact. Present information in short and logical chunks. Maintain a casual and effective tone. Keep a brisk pace. Roll with the punches. Finally, if there are outside distractions as you are presenting, let team members know what is occurring.

RULE 5: ASK COMPELLING QUESTIONS

Since the days of Socrates, we as a society have recognized the inherent value of asking questions. As children, most of us asked hundreds of questions a day to gain information about the world. Now, as adults, we continue to rely upon questions to gain information, especially during a virtual training session. You should spend at least 10% of your time asking and answering questions. Do not just use questions at the end of your class – pepper them throughout the entire event.

Many team members are reluctant to ask questions, especially when they know that they can hide. For others, questions and answers means that this is the end of the instructional portion of your virtual training session and that now is a good time to get back to work. The polling feature is one of the best tools in your virtual training arsenal of tools, but do not rely exclusively upon polling questions. As with most things in life, you never want to overuse a good thing. Even the most effective strategies become predictable and boring when they are overused.

Many major virtual training services and applications incorporate more complex multiple-choice, matching, and fill-in-the-blanks questions. Some even offer grading capabilities. The function of most questions and answers is to involve team members and to give them a chance to engage with the presenter.

RULE 6: CONDUCT REALISTIC DEMONSTRATIONS

When they are not talking, seasoned team trainers spend a substantial portion of their time performing demonstrations. Effective demonstrations do not happen by accident. While inexpensive cameras/recorders, such as GoPro, make creating demonstrations inexpensive and easy, good demonstrations require preparation. They are short and clearly focused, realistic, are easy to follow, incorporate visual elements, and get the audience involved.

Major Virtual Team Training Tools	*URL*

Citrix GoTo Meeting	www.gotomeeting.com
Adobe Connect	www.adobe.com
Microsoft Live Meeting	www.microsoft.com

Figure 10-23-2.

Major virtual team training tools.

RULE 7: PROVOKE DISCUSSIONS

Discussions are essential for team members to buy into and internalize your training, but be careful. They can easily get out of hand. Follow these steps for conducting an effective virtual discussion. These apply if you are using a virtual training package or a social networking site, such as Facebook.

Initiate the discussion by asking a thought-provoking or timely question, such as, "Why do we need to change the way we schedule appointments? Didn't everything work out well the way we've always done it"? Then summarize and reword the key points expressed by the group and note them using the electronic whiteboard feature of your virtual training or meeting software (see Figure 10-23-2).

Structure the discussion. Be sure to display or distribute an outline of the discussion, and enforce it. Clarify the theme of the discussion and the topics that you expect it to cover.

Control the flow of discussion. This step requires "ruling with an iron hand in a velvet glove." Be ready to step in quickly to redirect the discussion toward the goal. Closely manage the discussion by asking another colleague to help you monitor the activity from a content standpoint. Use the microphone, whiteboard, chat window, or e-mail tools to keep the discussion on track.

Provoke respectful controversy. Respectful controversy occurs when people may strongly disagree in a discussion, but do not take it personally and certainly do not insult each other. During virtual team training, you need to continually model, manage, and reinforce team member's respectful behavior toward their colleagues.

Help team members listen to one another. Plant ideas by asking a leading question on the electronic whiteboard or displaying it in the chat window. A leading question could be, "Do you agree with this?" "How would you handle this in our practice?" "Have you ever seen anyone do this really well?" "How did they do it?" or "What would you do in their shoes?" Provide summaries that explicitly reference team members' comments.

Bring together diverse threads into a summary. Weave together team members' comments and connect their contributions to the theme of the discussion.

Thank all team members for their contributions. State your appreciation for their being courageous and highlight that this would be a boring world without different opinions. You may also send a personal note to those team members that you feel contributed significantly to the discussion.

RULE 8: EMPLOY INTERACTIVE ACTIVITIES

Interaction is critical to any successful training experience. We are social animals, and we typically enjoy working with others. These interactions also encourage doing. Both interacting and doing provide your team members with opportunities to internalize the information in your virtual training class and make it their own. Although interacting is easy when the other parties are in the same room, it is a bit more difficult when they are not. However, we successfully interact virtually with people all the time. We send e-mails, write notes, talk on the telephone, text message, tweet, and some of us even Skype. So, in promoting interaction in virtual training, we are

10.23. Virtual Team Training

only enhancing skills that we already rely on every day. Judging from the success of Facebook and other social networking tools, this becomes truer every day.

Polling is a good first step. Enticing team members to participate in your virtual training session by including polls or typed questions and responses is a step in the right direction. Remember to frame these questions in terms of their value to the audience, not to you. Do not expect 100% participation in the polls. Give team members adequate time to respond, but do not slow down the action. It is a bit like waiting for a bag of popcorn to pop. First you hear bursts of popping, and then it just trickles down to a gradual halt. Close the poll when the responding trickles down. Some seasoned virtual trainers keep the results hidden until the end of the poll.

Imagine it and you will be there. When you are planning your virtual training session:

- Close your eyes and imagine that your audience is in front of you. What would you do if you were face to face with the audience?
- Imagine what you would do if you and the audience could not see each other. How would you use your voice, your words, prepared demonstrations, or outside materials to achieve the same effect?
- Once you have completed all this, write it down. You have just completed the high-level instructional strategy to complement the content outline of your class.

Good interactions also need to be rehearsed and fine-tuned. So, before the big day, rehearse interactive activities with friends and colleagues.

Use planted questions. Sometimes you simply need to "prime the pump" to get things started. If the virtual training session is quiet or if you ask if anyone has a question and no one answers, have a team member whom you have already colluded with ask a question that you have prepared in advance. They can ask this question using the audio or chat features. You can even make up a question and attribute it to some mythical team member. Say, "Emily from San Francisco would like to know …" Forget that there is no Emily. You may feel that this is a bit deceptive, and it is. If you do not feel comfortable with this technique, feel free not to use it.

RULE 9: END WITH A BANG

The ending of your virtual team training should be its pinnacle, not its abyss. Everything that you have done so far should lead up to a crescendo. Never end a virtual training session with a dry restatement of the agenda. Never say, "Let's summarize what we've covered." Go back to why team members are there in the first place.

You need to end your virtual training session with an inspirational finale and a call to action. Nothing is more deflating than a question-and-answer session but no directive for change.

If your virtual training session was meant to address a problem or a yearning, do not simply remind them of that fact. Get them to feel it. Creating a feeling rather than describing it is the basic difference between poetry and standard writing. Standard communication tells you that it is snowing, but poetry compels you to feel the coldness and wetness of the snow. It evokes the emotion of what it was like when you were a child, saw the pure white blanket, and felt that thrilling sense of not having to go to school. Go back to your introduction; conjure up the hopes and dreams that your team members had at the beginning of the virtual training session. Help them imagine what it will feel like when they realize those dreams.

Remember, the end is not really the end. Keep the members of your virtual class connected using social networking, to build a community of practice that keeps the ideas and skills covered in your virtual class alive and fresh.

RULE 10: PREPARE, PREPARE, AND PREPARE SOME MORE

It is just a week before your virtual training, and you want to make sure that everything goes just right. The following are some items that you want to make sure you have on your checklist. When possible, incorporate social networking tools.

Send a motivating e-mail reminder to team members before the training class. Build a Facebook page. Keeping your future team members aware of the event will help to build excitement for it. If applicable, remind team members why the virtual training session is valuable to them personally, not just to their organization. Be sure that your request highlights what would be of value to them, not to you. To further hammer home this point, you might also ask team members to note what they would like to cover and challenges they are experiencing. Include help information for technical problems that may occur before or during the virtual training class. Warn team members not to plan to call from a cell phone. Often the reception is poor, and everyone gets to hear the static. Finally, recommend that audience members participate in the virtual training session using a headset or a quiet room, so that they can concentrate and not disturb others.

Review and refine your materials. If you have conducted this virtual training class previously, take some time to refine the virtual training session based upon your prior experiences.

Inspect the room where you will be conducting the event. If possible, gain information on the rooms that the team members will use. If several team members are located in the same remote site, check that the site meets your needs in terms of the size and layout, access to computers, number of chairs, and equipment in working order. Ensure that the ventilation, temperature, lighting, noise level, and seating arrangements will not be distracting. As the trainer, you may use a conference room, a corporate office, or your home office. You just want to make sure that you have a quiet and private location to eliminate distractions.

Select your wardrobe. Lean toward the conservative side. You can always make your outfit more casual by removing your jacket, but you cannot produce a jacket out of thin air. Wear neutral, solid clothing. Avoid stripes, plaids, and floral designs. Make sure that your clothes contrast with the background colors. Try everything on beforehand to ensure that you have not gained enough weight to make for a distractingly too-tight outfit. This is the time to learn that a shirt is missing a button or that you need to take a trip to the dry cleaner, not in the middle of your virtual training session.

Create a list of team members. This will provide team members with a sense of community and you with a vehicle for referring to team members by name and knowing something about them.

Upload supporting materials. If your virtual training software supports uploading materials to a shared folder, upload everything that you intend to distribute during the session to the folder. Then you will not have to worry about whether team members will be able to access the materials easily before, during, and after your virtual training session.

Rehearse! There is no substitute for rehearsal time. Practice delivering the virtual training session aloud as if there were an audience listening. Rehearsing is the only way to work out timing, find the right words, and become comfortable with transitions and segues between talking points. When you rehearse, practice slowing down your speech. Most presenters tend to move too quickly and risk breezing by a key point. When you rehearse, do so using the computer that you will use for the virtual training session. This way, you will be able to recognize and resolve issues way ahead of time.

EXAMPLES

- Conduct virtual team training on updates to your employee handbook. Encourage all members to ask questions and discuss their concerns.

10.23. VIRTUAL TEAM TRAINING

• Use virtual team training to follow up classroom training on new protocols and services. Take this opportunity to address concerns and resolve any snags.
• Capture senior team members performing technical procedures (e.g., running cytology equipment or processing third-party payments). Make viewing these recordings an integral part of your practice's skills training program. This will allow team members to view demonstrations by senior team members who have limited availability.

10.24. INTERNET USE POLICY

BASICS

OVERVIEW

The practice should have a written policy statement in the policy manual, provided to all employees, which covers:

- Computers and Internet access are strictly for the business of the practice.
- Personal computer and Internet use are prohibited.
- No unauthorized or personal data (programs, multimedia files, screen savers, games, utilities, files) are allowed on practice-owned computers.
- No personal e-mail, discussion group access, or chat room access are allowed.
- Privacy statement.
- Illegal content defined (child pornography) and consequences stated (you are fired!).

TERMS DEFINED

Internet: Worldwide network of computer networks.
Libel: Defamation of another's character, appearing in written form.
Ransomware: Malware that encrypts the files on the computer, making them unreadable unless a ransom is paid.

ISSUES AND OPTIONS

SECURITY

- Hardware firewall between business network and the Internet (see 10.8 – Cybersecurity and Network Security)
- Wireless access point (WAP) security.
  - Media access control filtering – only computers known to the WAP are allowed access.
  - Encryption – only computers using the encryption key are allowed access, and all data are secure.
- Specified individual to perform updates and log them.
- Virus protection software with *scheduled* scans and updates.
- Operating system security updates *scheduled*.
- *Scheduled* backups of all critical data (see 10.7 – Information Security: Backing Up and Archiving Your System).
- Offsite storage of backup copies.
- *Scheduled* review of security logs (files kept by the computer listing activity) looking for hostile accesses.
- No employee media (discs, CDs, flash drives) allowed in computers.
- No surfing the Web on practice-owned computers.
- Consider disconnecting critical systems (medical records, employee records) from the network (use removable storage devices to transfer between local net and critical systems).
- Uninterruptible power supplies for critical systems.

PRIVACY

- Employers may read employee e-mail and files without their permission (state laws vary and must be stated policy):
  - if e-mail system is locally operated;
  - for the express purpose of protecting practice interests;
  - if employees have been so advised in writing at the point of hire.
- Otherwise, a court-issued search order is required (similar to employee lockers and work areas).
- Safeguard and prevent access to:
  - medical information, including client lists;
  - client financial records;
  - employee records.
- Do not transmit any confidential information in e-mail.

PURCHASING

- Buy from vendors that have a prior relationship with the practice.
- Make first transaction with a new vendor by paper correspondence.
- Purchase a small order on first transaction.
- Verify vendor's existence with Better Business Bureau (www.bbb.org) or local Chamber of Commerce (www.uschamber.com) inquiries or searches.
- Do not include credit card numbers or bank account information in e-mail or unencrypted connections.
- Realize that unbelievably low prices or "good deals" are signs of potential fraud.
- Internet fraud can be impossible to spot, so be security oriented.
- Do not be fooled by graphics, icons, or the appearance of content or e-mail. These things are easily faked.
- Obtain legal consultation on state and local tax laws covering electronic commerce.

COPYRIGHT

- Do not use graphics or information from the Web without written permission of the author.
- Hyperlinks are usually considered acceptable use.
- Assert copyright in all content served by the practice. For example:
  - Copyright © 201x All rights reserved Elsewhere Veterinary Clinic.

PUBLISHING

- Website is considered public publishing.
- Any derogatory or judgmental statement that can be considered libel automatically satisfies the publishing element (libel requires publishing a defamatory remark, intent to defame, identifying target, and actual damages).
- All statements are considered advertising and are subject to applicable regulations. Therefore, avoid any content that states, implies, or could be construed as:
  - diagnosing;
  - associating signs with a specific disease;
  - comparing practice with others, especially unfavorably;
  - proposing specific treatments;
  - possessing secret technology or treatments;
  - guaranteeing success;
  - possessing specialty training unless boarded or credentialed.
- The scope of Web publishing is worldwide.
- Do not publish telephone numbers, personal e-mail accounts, or home addresses of staff.
- Take responsibility for moderating any practice-operated discussion group, bulletin board, or chat room, and restrict libel, obscenities, and other illegal content. Prohibit flame wars (defamatory exchanges).

LIABILITY

- Software piracy. The practice is liable for the presence of stolen software.
- Copyrighted content. Storage or use of pirated data such as MP3 music files or "ripped" movies.
- Illegal content. Child pornography, hate statements, seditionist statements, threatening speech or extortion, libel, or stolen information.
- Hosting hacker or hostile activity. Some viruses conduct denial-of-service (DOS) attacks by infecting thousands of innocent computers. At a preprogrammed time, all the compromised computers transmit packets to the targeted system, which overwhelms it. The practice may be cut off by their Internet service provider if their machines are traced participating in a DOS assault.
- Supporting transfer of illegal content. Hackers may compromise a computer and use it as a drop box to exchange illegal content. The owner is responsible for data on their computers.
- Vicarious liability. The owner of the equipment is liable even if they did not know or participate in the prohibited use.
- Do not use names, likenesses, or attributed statements without the written permission of the individual.

10.24. INTERNET USE POLICY

EXAMPLES

Responses to typical questions posed by both employers and employees are provided.

- Why are these guidelines so draconian?
  - The practice invests resources in the computing systems and their function is critical to patient care and business operations. Valid business use poses few threats to the systems; it is the personal surfing of the Web or downloading a game that brings hostile content (malware) into the practice.
- Our practice wants to allow employees to send and receive e-mail and cannot see the harm in letting them check on their online auction status. How can we do that?
  - The desire to provide these employee benefits is admirable. However, do not compromise the business of the practice for a perk. Encourage employees to purchase private computers for their own use at home, perhaps through low- or no-interest loans. Consider adding a wireless access point for employee use. Restrict access to employee machines and isolate the wireless path to the Internet from the practice network.
- My technician found a really cool program that calculates dosages and prints a page for the records. How do you recommend we put this on our network?
  - First of all, determine if it is copyrighted material. It is illegal to copy or share content that is protected by copyright. If you cannot prove that the program is in the public domain, then do not put it on your network. Search for the software name on the Web, and if you find it being sold, consider it protected. If it is legal, then have your system administrator scan it for viruses with the latest updated virus scanning software. If satisfactorily virus free, you may then be able to negotiate a bulk rate from the supplier or author.

CAUTIONS

Many of the topics in this section are legal in nature. The statutes vary markedly between states and localities. Proper legal consultation is essential to safeguard the practice. Information presented here is generically accurate at the time written, but it must not be used without local validation.

MISCELLANEOUS

ABBREVIATIONS

DOS: Denial of service
WAP: Wireless access point

10.25. DIGITAL COMMUNICATION POLICIES FOR STAFF

BASICS

OVERVIEW

• In order to properly utilize social media and its benefits, your practice must have a comprehensive policy in place to avoid disputes and facilitate safe and secure use of various recommended new media applications and channels.
• In the digital communication world, it is important to incorporate digital communication policies within your human resources policies.
• These policies will help prevent misunderstandings from team members regarding appropriate utilization of digital communication within the practice.
• Social media policies help team members who will be communicating on behalf of the practice to fully understand their responsibilities.
• Appropriate policies prevent staff from breaking client and/or patient confidentiality.
• Your veterinary practice's social networking moderators should be trained regarding the terms of this policy, including their responsibilities to review content submitted for posting to ensure compliance with the policy.
• All social networking sites shall clearly indicate they are maintained by your veterinary practice and shall have your practice's contact information prominently displayed.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

DEVELOPING A SOCIAL MEDIA POLICY

• A social media policy should be used for all team members who will be communicating through social media channels on behalf of the practice (see 10.16 – Social Media).
• The social media policy will contain a "Purpose" that will outline the following:
  ◦ The organization may utilize social media and social network sites to further enhance communications with various members in our organization in support of stated goals and objectives. The organization has the ability to publish articles, facilitate discussions, and communicate information through various media related to conducting our business. Social media facilitates further discussion of appropriate issues, operations, and services by providing the opportunity to participate in many ways using the Internet.
• The social media policy will follow the organization's purpose and should outline the following details as part of the actual policy:
  ◦ The practice owner(s) will decide which social media channels the practice will create.
  ◦ Content submitted for posting that is deemed not suitable for posting by the practice owner because it is not topically related to the particular social networking site objective being commented upon, or is deemed prohibited content, will be rejected along with a description of the reason the specific content is deemed not suitable for posting, to further educate staff as to content appropriateness.
  ◦ The organization's social networking content and comments containing any of the following forms of content shall not be allowed for posting:
    ▪ comments not topically related to the particular site or blog article being commented upon;
    ▪ profane language or content;
    ▪ content that promotes, fosters, or perpetuates discrimination on the basis of race, creed, color, age, religion, gender, marital status, status with regard to public assistance, national origin, physical or mental disability, or sexual orientation;
    ▪ sexual content or links to sexual content;
    ▪ solicitations of commerce;
    ▪ conduct or encouragement of illegal activity;
    ▪ information that may tend to compromise the safety or security of the public;
    ▪ content that violates a legal ownership interest of any other party.
  ◦ The organization's social networking moderators shall be trained regarding the terms of this policy, including their responsibilities to review content submitted for posting to ensure compliance with the policy.
  ◦ All social networking sites shall clearly indicate they are maintained by the organization and shall have the organization's contact information prominently displayed.
  ◦ Where appropriate, the organization's information technology (IT) security policies shall apply to all social networking sites and articles.
  ◦ Employees or members representing the organization via social media outlets must conduct themselves at all times as representatives of the organization and in accordance with all human resource policies.
  ◦ Employees found in violation of the policy may be subject to disciplinary action, up to and including termination of employment.
• Provide definitions to avoid misunderstandings within the policy. Such definitions can be outlined as follows.
  ◦ For the purpose of this organization's social media policy, the following terms are defined:
    ▪ **Social media.** Social media is content created by individuals using accessible and scalable technologies through the Internet. Examples of social media include Facebook, blogs, Twitter, Really Simple Syndication, YouTube, Instagram, LinkedIn, SnapChat, and so on. A blog (an abridgment of the term web log) is a website with regular entries of commentary, descriptions of events, or other material, such as graphics or video.
    ▪ **The organization author.** An authorized organization employee that creates and is responsible for posted articles and information on social media sites.
    ▪ **Article.** An original posting of content to the organization's social media site by an organization author.
    ▪ **Commenter.** A veterinary practice employee and/or member of the public who submits a comment for posting in response to the content of a particular article or social media content.
    ▪ **Comment.** A response to a veterinary practice's article or social media content submitted by a commenter.
    ▪ **Organization moderator.** An authorized veterinary employee who reviews, authorizes, and allows content submitted by veterinary authors and public commentators to be posted to your veterinary practice's social media sites.
• When possible, provide guidance for the employee who will be participating in social networking initiatives for the practice.

MOBILE TELEPHONE AND TABLET USAGE POLICY

• Cell phones and tablets can become a big problem for veterinary practices.
• Proper policies should be in place to prevent cell phone usage during company time.
• Cell phone or tablet cameras should be strictly prohibited within the practice and not used on company time.
• Many employees utilize cell phone or tablet cameras to take photos of clients' pets and/or employees within the practice and can become an invasion of privacy.

10.25. DIGITAL COMMUNICATION POLICIES FOR STAFF

• Employees who take photos of patients without consent can put the practice in an at-risk situation for legal problems (see 13.5 – Privacy Policy and Confidentiality).
• Without appropriate instructions not to do so, employees could utilize images taken from their cell phone and/or tablet camera and post them online without consent.
• Develop a policy within the practice to cover inappropriate cell phone and/or tablet use. See Examples section.

INTERNET USE POLICY

• One of the biggest mistakes in computer networking is the failure to set up proper policies and procedures to protect your network.
• Regulating the use of your system is the key to keeping your data secure (see 10.24 – Internet Use Policy).
• Most practice systems today are connected to the Internet for conducting medical research, sending e-mails, transmitting laboratory results, digital radiographs, and more.
• Having your server connected to the Internet is also important for every practice to fully utilize their practice management software and integration capabilities.
• If your system is not protected properly you may encounter major problems that can ruin your system and the financial investment you have made in it.
• Proper policies and procedures must be taken to keep the system secure, reliable, and functional.

EXAMPLES

SAMPLE INTERNET USE POLICY

Internet use on company time is authorized to conduct company business only. Internet use brings the possibility of breaches to the security of confidential company information. Internet use also creates the possibility of contamination of our system with viruses or spyware. Spyware allows unauthorized people, outside the company, to gain potential access to company passwords and other confidential information.

Removing such programs from the company network requires IT staff to invest time and attention that is better devoted elsewhere. For this reason, and to assure the use of work time appropriately for work, we ask staff members to limit Internet use.

Additionally, under no circumstances may company computers or other electronic equipment be used to obtain, view, or reach any pornographic, or otherwise immoral, unethical, or nonbusiness-related Internet sites. Doing so can lead to disciplinary action up to and including termination of employment.

SAMPLE CELL PHONE AND TABLET USAGE POLICY

• **Section 1: Use of cell phones or similar devices.** Our company policy of cell phone usage is outlined as follows. Each employee is required to adhere to this policy while employed at the practice.
  ◦ **Section 1(a): General use at work.** While on company time, cell phones are not permitted for use.
  ◦ **Section 1(b): Unsafe work situations.** Requires that in unsafe work situations (e.g., restraining a pet, cleaning, moving heavy objects) cell phones must not be used (whether on company time or not).
  ◦ **Section 1(c): Use while driving.** As a company, we have an absolute ban on employee use of cell phones while driving on company-related business.
• **Section 2: No use of camera phones.** Camera phones can present risks to the company, potentially compromising customer information, patient identity, trade secrets, or the privacy of other employees. The uses of cameras of any type are completely prohibited on premises. In addition, as a company we enforce the Florida State Video Voyeurism Law, Statue 810.145. This law prohibits the recording or disseminating of images of an individual's "private areas" without consent, when the recording was made in a location that the person expected would be private. If an employee is accused of voyeurism, a company official will refer all instances to the proper local authorities.
• **Section 3: Special responsibilities of managerial staff.** As a company we emphasize the importance of management providing a good example of cell phone use, and in guarding against excessive or inappropriate use of such phones by their employees. If a member of our managerial staff is witnessed using a cell phone inappropriately, please report all instances to the company administrator or owner.

CAUTIONS

Ensure the practice develops the appropriate policies to protect client and patient confidentiality. Do not wait until it is too late.

Facility Management, Design and Construction

11.1. CONTEMPLATING PRACTICE OWNERSHIP: GETTING STARTED

BASICS

OVERVIEW

At some point in the career of most veterinarians there is contemplation over whether practice ownership might be a serious consideration. Approximately one-quarter of veterinarians practice as owners, and typically less than one-third of veterinarians seriously consider practice ownership somewhere in their future. But still, most veterinarians will at least give the matter some thought throughout their careers.

Contemplating practice ownership can be capricious, considering on a whim what it might be like to own a veterinary practice, and fantasies are acceptable at this stage of the game. However, when contemplating anything more tangible, it is important to realize that the time for daydreams is over, and serious thought needs to be devoted to strategic planning and finances. Owning a veterinary practice is much more than just financing a place to deliver veterinary medicine. It is a business and, as such, it will need to provide a return on investment (ROI) sufficient to justify risking time, effort, and money on the project.

Interestingly, you do not actually need preexisting business acumen to consider owning a veterinary practice. Many veterinarians without any inherent business skills have operated successful veterinary businesses. But you must be prepared to put together a team of professional with the skills you do need (see 1.17 – Practice Management Support Professionals) to help guide you on your desired path.

TERMS DEFINED

Benefit Stream: Any level of revenue (income), cash flow, or earnings (profit) generated by a business entity.

Brand: The idea or image of a product or service that consumers connect with, by identifying the name, logo, slogan, or design of the company. It is a differentiating feature from other businesses.

Trade Area: The geographic area around a business reflecting where most clients will originate. In most instances, it is inferred that about 80% of clients will come from this trade area. This concept is used in potential customer mapping, and also in noncompete agreements.

ISSUES AND OPTIONS

Contemplating practice ownership can be a fun pastime, but there are also some very real reasons why it is worth exploring the notion.

WHY CONSIDER BEING A PRACTICE OWNER?

- There are many reasons why veterinarians want to be practice owners, but the most convincing reason is typically related to compensation.
- Owner veterinarians likely pay themselves the same as they would employed veterinarians (associates) performing essentially the same services at the same level of expertise, but this is not the end of the compensation available.
- Owner veterinarians provide oversight for the business aspects of the practice, and for that they are entitled to management compensation, reflecting the time and expertise they devote to this process.
- Owner veterinarians are also entitled to a variety of perquisites (perks) associated with business ownership [see 7.17 – Perquisites (Perks) of Practice Ownership], including a variety of potential benefits, as well as preferred tax treatment (the ability to deduct from taxes many business-related expenses that employed veterinarians are not entitled to deduct).
- In most cases, if the practice is profitable, the majority of that profit accrues to the benefit of the owners of the business. In fact, the ROI for a profitable practice may far exceed the compensation payable based on production.
- Owner veterinarians also have the prospect of reaping the rewards of their efforts when they decide to sell the practice. This ROI can be substantial, especially if the business has a record of profitability, one of the most important components of a business's valuation (see 14.13 – Determining a Practice's Worth).
- Over the lifetime ownership of a profitable veterinary practice, owners stand to gain substantially more than those veterinarians simply employed by the practice.

WHY THINK TWICE ABOUT PRACTICE OWNERSHIP?

- Many veterinarians may think that the most attractive part of practice ownership is being able to be your own boss, but this is a double-edged sword.
- Being your own boss often means being the boss of others as well, and this is the aspect of practice ownership that tends to cause the most headaches for veterinary business owners.
- Being the boss also means taking ultimate responsibility for building the practice brand, and for ensuring the profitability of the practice so that bills can be paid with enough left over to justify the investment made. If a veterinary practice is not profitable, or poorly profitable, then the owners are assuming the risk for the venture without sufficient reward for such risk assumption.
- Veterinarians may be concerned with the debt component of contemplating a practice, but if you have put together the right team of professionals to assist, there should be a good chance that the practice will deliver on its projections.
- Still, if the idea of incurring debt keeps you up at night, there are options for working as a veterinarian that carry no such risk. However, it is this risk that allows owner veterinarians to become entitled to those benefits already discussed.
- Perhaps one of the most important things to consider when contemplating practice ownership is the illiquidity of the investment. Once you own a veterinary practice, if you decide that ownership is actually not for you, selling the business is rarely immediate. A liquid investment is typically one that can be converted to cash within three business days, and clearly this is not the case with a veterinary practice.

FIRST THINGS FIRST

- For at least some veterinarians, the consideration of owning a practice may originate from bad experiences working for another practice. In fact, there may even be a temptation to leave that practice and establish a competitive practice nearby, even in the same trade area. Fight this temptation!
- Like any major investment, decisions should be made on the basis of strategic planning and sober reasoning, and spite is rarely a good enough reason to assume the risks of practice ownership (see 14.5 – Strategic Planning and Implementation).
- Things worth pondering initially are the type of practice to be considered, a general geographic location that would be desirable, and a potential timeline for action.
- Another point worth considering early in the process is whether you want to build a practice from the ground up or buy one already in existence. Some veterinarians may like the idea of creating their own practice footprint with all the features they want, but the biggest problem with this option is that you also need to create an entirely new client base, and that is typically much harder than new owners envision. The advantage of purchasing a clinic already in existence is that it has a ready-made client base, and so it should have cash flow right from day one of ownership.

NEXT STEPS

- Once there is some serious intent behind proceeding with practice ownership, it is typically worth engaging a consultant that can help frame the other questions that need to be contemplated (see 1.17 – Practice Management Support Professionals).

11.1. CONTEMPLATING PRACTICE OWNERSHIP: GETTING STARTED

• Once you select a consultant with which you are comfortable, and they understand at least the basic aspects of what you are hoping to accomplish with practice ownership, they can help build a framework for proceeding.
• At some point early in the process, there will be a need for a business plan (see 14.10 – Business Plans) and pro forma documents about anticipated cash flow in the new venture. This will be needed by potential lenders, but will also be needed in the strategic planning process.
• This initial phase can also serve as a sanity check for potential new owners. There may be a tendency to build an extravagant hospital with all the bells and whistles, but a consultant can help keep the process realistic, so cash flows can be reasonably predicted and defensible. By using benchmarks (see 7.6 – Benchmarking), consultants can help new owners set realistic expectations for what the new practice is likely to deliver.
• An important role of a consultant can also be to help ensure that the novice owner has assembled a reasonable team to meet the coming challenge. This might include individuals with expertise in accounting, valuation, insurance, and law, and those with specific expertise in veterinary lending, demographic assessment, human resource issues, and so on.

THE LONG GAME

• Practice ownership is a long-term investment, so it should not be approached as a whim. In most cases, the time horizon is greater than 10 years between acquisition and sale.
• That being said, whenever approaching such a long-term investment, it is worth considering an exit plan from the very start (see 14.21 – Succession Planning).
• Succession planning works best when considering that exit strategy. For instance, if the concept is to demonstrate five years of revenue growth and profitability and then sell to a corporate entity, it is worthwhile to be aware of what the corporates are looking to buy (e.g., free-standing clinic? Three or more full-time-equivalent veterinarians? Revenue generation per full-time-equivalent veterinarian?). Buying priorities can change over time, but good fundamentals tend to serve most business owners well.
• When it does come time to transfer ownership of the practice, remember that one of the most important aspects of practice valuation is profitability. New buyers will want to purchase a benefit stream, and minimize any risk associated with that benefit stream. Retirement may be a time for slowing down, but the practice should ideally be sold when revenue and profitability are still growing.

EXAMPLES

N/A

CAUTIONS

• Owning a veterinary practice is an investment, and all investments come with risks. Veterinarians can and do lose money on veterinary practice investments, especially if they lose sight of the fact that a veterinary practice needs to be profitable in addition to being a place where veterinary medicine is delivered.
• Economic shocks, such as recessions, can occur and can affect many businesses, including veterinary practices.
• It is sometimes said anecdotally that veterinary medicine is recession proof, but this is a mischaracterization. Businesses that deliver valued services tend to fare well, even during recessions, and this includes veterinary practices. Businesses that provide less valued services can suffer during recessions, and this includes veterinary practices.
• It is sometimes disheartening to veterinarians that it is not necessarily the quality of medicine practiced that determines the value of a veterinary practice. While the quality of medicine practiced is important in value delivery to clients, it is the profitability of the business that is the main driver of practice value. Potential practice owners would do well to appreciate this reality.

11.2. Building, Buying, or Leasing?

BASICS

OVERVIEW

With the exception of mobile or traveling veterinarians, any veterinarian considering owning a hospital is faced with the decision of whether to buy, build, or lease the property needed to operate the business.

Understanding the costs and benefits of the three primary means of holding real estate allows the sole-practitioner veterinarian or ownership group to make an informed decision for the best option. Careful consideration of the specific circumstances of each option will lead to the best possible decision depending on the local market, the long-term interests of the owner(s), and the growth potential of the practice.

TERMS DEFINED

Base Rent: The rent charged by a landlord without any additional expenses, often expressed on a dollars per square-foot, per year basis. The base rent can vary widely, but most typically, in 2016 US dollars, is $20 to $40 per square foot ($2150 to $430 per square meter) per year.

Build-out: The interior construction necessary before a tenant is able to use the space. Some landlords are willing to provide an upfront, lump-sum cash allowance to provide for a portion of the build-out expenses, effectively incorporating the financing for build-out into the term of the lease.

Double Net Lease: A lease in which the property taxes and building insurance are the responsibility of the tenant, but the landlord covers the costs of any structural repairs or common-area maintenance. Also referred to as Net-Net.

Escalation: Automatic increases to the base rent amount that occur at set times over the term of the lease.

General Contractor: A builder that subcontracts for the majority or all of the trades associated with the construction of a freestanding building, renovation, or the build-out of a lease space. Although many contractors self-perform certain aspects of construction, their most important role is organizing and contracting with the specialty contractors needed for a construction project.

Lease Type: A general classification of a type of commercial property lease dependent upon assignment of costs to either the landlord (lessor) or to the tenant (lessee). The costs above and beyond the base rent rate often include property taxes, insurance, and building maintenance and repair.

SBA 504 Loan: A loan program administered by the Small Business Administration (SBA). These loans are guaranteed by the U.S. government and cover up to 40% of the project cost, with another 50% financed conventionally, and a low 10% down payment from the owner. Although there are restrictions, SBA loans are a good option for many small business owners to cover a portion of their construction financing.

Single Net Lease: A relatively uncommon form for a commercial lease agreement in which only the cost of property taxes is passed through to the tenant. Also referred to as Net.

Triple Net Lease: An expression describing a commercial real estate lease based on the terms that the tenant is responsible for a base rent plus the property taxes, building insurance, and building maintenance and repair costs. This type of lease is common for single-tenant, freestanding buildings. Also referred to as Net-Net-Net.

Veterinary-Specific Lender: Any of a number of banks or mortgage brokers/lenders that specialize in servicing the veterinary industry. Many large banks operate specific divisions that cater to veterinarians. Just like dentists and other professionals, veterinary practices operate in a known risk range that is often desirable to minimize a bank's exposure to bad debt.

ISSUES AND OPTIONS

A licensed architect and a contractor will be required to obtain the required permits and to build a veterinary hospital regardless of whether the plan for the hospital is to build, buy, or lease (see 11.7 – The Construction Process and Working with Architects).

- Building options include construction of a new freestanding building, tenant build-out of a generic leased space, or the renovation of and/or additions to an existing building in order to repurpose the building to house a veterinary practice. Renovations or additions can be performed either for a leased property or for a property that has been purchased.
- Options for buying real estate can range from purchasing a small commercial condominium to purchasing a large freestanding building or established veterinary practice.
- Buying the building or space needed to operate a business provides an investment opportunity to establish equity in the real estate market. In most situations, the veterinary practice pays rent to a separate business entity that is typically owned by the same individual(s) – that is, the practice owner(s); the lease terms usually dictate that the tenant covers all costs associated with the mortgage payments and the property.
- It can be much quicker to build-out a tenant space than to build a new freestanding building. Most tenant improvements can be constructed in three to six months, whereas new buildings commonly take a year to build. It often takes up to two years from the closing on a piece of land to move-in day for a new building when including time for design, city approvals, and construction.
- Buying real estate requires more commitment of capital than leasing. This can be a barrier for many veterinarians, especially those just starting out.
- Most start-up veterinary practices tend to be built in leased spaces in multitenant commercial buildings, such as strip malls. Lease terms can range from 5 to 20 years as a base time frame, with options for extensions to the lease term often built into the contract.
- One advantage of building a new, freestanding hospital is the ability to build exactly what is needed to suit a specific vision and to build it without compromise.
- Owning the real estate affords a practice owner the option of retaining ownership of the property as an income opportunity after retirement even if the practice is sold. Corporate veterinary practice consolidators often prefer not to hold real estate, allowing them to maximize their resources for buying practices. Obtaining rental property income from new practice owners can be an important part of an exit strategy plan.
- When planning to buy a piece of property on which to build a veterinary practice, first determine how much land is needed and if the specific property is zoned to allow veterinary use (see 11.8 – Zoning and Permitting). In most cases, lot size should be about four to five times the building size to allow for parking, landscaping, required setbacks, and other zoning requirements. For example, an 8,000-ft^2 (750-m^2) building would require a property that is between three-quarters of an acre and one acre. One acre (0.4 ha) equals 43,560 ft^2 (4,047 m^2). Consider a larger property if future expansion is anticipated.
- Be sure to check with the local planning and building department to verify that the use will be permitted and to see if there are any specific restrictions on the property.
- Be especially diligent if the plan includes any boarding services or a 24-hour emergency hospital. These are highly regulated uses in most places.
- As a rule of thumb, the older the building, the more difficult and expensive it will be to remodel. When planning for the build-out of a lease space in a strip mall, look for a newly built shopping center where

being the first tenant is an option. Tenant improvements in a new building are usually much easier to design and build, plus the locations tend to be near growing-population areas, which will be good for business growth.

EXAMPLES

- A new, start-up, small animal practice with one or two doctors typically needs between 1,200 and 3,000 ft^2 (110–280 m^2) of building area. In this size range, there are typically many options available for lease spaces in retail centers or small commercial buildings. For a first-time practice owner, this is often the best option.
- Established, multidoctor general practices can range in size from 5,000 to 10,000 ft^2 (465–930 m^2). In this size range, there are fewer commercial lease spaces available, and either leasing or building a dedicated, freestanding building becomes more viable.
- Large specialty referral and emergency hospitals can start at 10,000 ft^2 (930 m^2) and be as large as 30,000 ft^2 (2,790 m^2) or more. At this size there are few lease spaces available, and there are many benefits to building a new freestanding hospital specifically for this use.

CAUTIONS

- When paying for improvements to a leased property, it can be a good idea to deliberately select materials and make design decisions based on the anticipated time of the property lease. Beware of spending large sums of money to improve someone else's building and then not being able to reap the full benefit.
- Before agreeing to lease or purchase any property, be sure to have it inspected to ensure that it meets expectations and is suitable for the intended use. When planning extensive renovations to a property, it may be prudent to pay for some upfront design work or a review by an architect or builder to avoid surprises.
- Beware that certain changes in the use of an existing building can trigger requirements to make upgrades to meet current building code requirements. Some upgrades could be so prohibitive that the property simply may not be practical to use as a veterinary hospital.

11.3. ASSET OWNERSHIP

BASICS

OVERVIEW

• Many veterinarians believe that the success of their practice is measured by how big a facility they own and the latest and most expensive equipment they have.
• Although owning the real estate can be a good investment and is a good way to build equity, it is not necessary to own the building in which your practice is located if the location is right and the price is right and a whole host of other variables are right (see 11.2 – Building, Buying, or Leasing?).
• Owning equipment is good for your practice if the practice makes money as a result of the investment in the equipment. Many times, however, when making decisions about acquiring real estate and/or expensive equipment, very simple techniques are not always used to determine if the investments should be undertaken (see 7.1 – Time Value of Money).
• Because of the long period of time involved in making these types of long-range decisions, it is important to utilize more sophisticated techniques to help in the decision-making process.

TERMS DEFINED

Breakeven Point: The point at which the initial money spent is recovered through cash inflows from the property. Can be a valid decision-making tool for short-term investments not requiring a large outflow of cash.
Economic Life: The number of years over which cash is expected to be returned from an investment in property.
Future Value of Money: Amount that a given amount of invested cash will be worth at the end of a given period of time when earning a stated rate of interest. This presumes that the interest earned will be reinvested in the property and not withdrawn or spent.
Limited Liability Company (LLC): Business entity formed under the state laws of the state in which you live. Each statute is different, but generally the LLC is made up of members who actively manage the business but have no personal liability for its debt or obligations (unless signed on as personal guarantor for a mortgage, for example).
Present Value of Money: The present value of an amount of money that is expected to be received at a specified time in the future is the amount that if invested today at a specified interest rate would accumulate to that given amount.
Return on Investment: The present value of the net cash earned compared with the net investment in the property.

ISSUES AND OPTIONS

• In order to more accurately decide if money invested over the long term is a good investment for your practice, a number of variables need to be known:
  ◦ When and how much cash is invested (cash outflow)?
  ◦ When and how much cash is recovered (cash inflow)?
  ◦ What is the required rate of return or discount rate? (How much would you like to earn from the investment?)
  ◦ How long do you expect the property to be of value to your economic life?
• The important cash outflows are the incremental expenditures of money directly traceable to the item you are purchasing. This can include direct purchase of the item, shipping and handling, construction costs, installation, training special supplies, maintenance and expected repairs, property taxes, and so on – all items that need to be factored into the total cash outflows.
• The important cash inflows reflect the cash received that can be directly related to the purchase of the property or item. It does not matter what type of increase in cash is represented by the cash inflow – it could be a savings over a current way of doing something, cash received from the sale of a similar type asset that is being replaced or is no longer needed, or incremental income received as a result of owning this particular piece of equipment or property.
• The required rate of return represents the amount of money that you would like to receive as a result of owning this investment. Although there are sophisticated methods for determining the required rate of return, for your purposes you get to choose the rate. If the investment has an element of risk associated with it, such as a very new piece of equipment that carries a high price tag, the cost of the procedure is expensive, and your clients will need to be educated on the advantage of using the procedure, you might want to have a very high rate of return. If the property is a good investment with very little risk associated with it, such as good real estate in a very good location, your rate of return might be comparable to a risk-free investment, such as Treasury bonds.
• The economic life is simply how long you expect the property to be of value to you – real estate may be 25 or 30 years, but an ultrasound machine may be five years. (It may still be serviceable, but new technology could make it less desirable for use.)
• If inflation remains in the 2% range, for purposes of doing these calculations you can safely ignore any impact of inflation on your decision. With higher rates of inflation, however, using an appropriate and possibly changing discount rate to apply to the cash inflows and outflows in subsequent years will, in effect, account for the effect of inflation.

EXAMPLES

Putting this all together:
• You must have access to a present value table for doing these calculations. These can be accessed in Excel, several sites on the Internet (e.g., https://www.www.accountingcoach.com/present-value-of-a-single-amount/explanation3), or any good finance or accounting textbook (see 7.1 – Time Value of Money).
• Initial outflow of cash upon purchase of the asset is always multiplied by 1 to determine its present value. This basically represents the amount spent for the property in today's dollars. For subsequent years, going to the present value table, you will find a factor that you will multiply times the amount of inflow or outflow during that year. In our example (see Tables 11-3-1 and 11-3-2), $1,200 would be multiplied by 0.826, which represents the present value factor for a 10% return (the desired return we want to receive from our investment) to determine the present-day value of the $1,200 we will receive in year 2. The cash inflows for each subsequent year would be multiplied by the appropriate present value factor and then added together for each year to obtain the net present value of the income stream for each purchase.

Table 11-3-1. Typical analysis for determining when initial cash investment is recaptured.

Investment	Initial amount invested	Cash 1	Inflows 2	By year 3
A	$1,000		$1,200	
B	$1,000	$600	$ 400	$200
C	$1,000	$200	$ 400	$600
D	$1,000	$400	$ 400	$400

Table 11-3-2.

Investment	Cash outflow	Year 1 cash inflow	Present value factor	Year 2 cash inflow	Present value factor	Year 3 cash inflow	Present value factor total	Total
A	$1,000	$0	0	$1,200	0.826	$0	0	$ 991
B	$1,000	$600	0.909	$ 400	0.826	$200	0.751	$1,026
C	$1,000	$200	0.909	$ 400	0.826	$600	0.751	$ 962
D	$1,000	$400	0.909	$ 400	0.826	$400	0.751	$ 994

The net present value of each of these investments, assuming a desired rate of return of 10%, is as follows:

- The only investment that will meet our desired return of at least 10% is option B. If we had used the typical method of analyzing returns (the breakeven method), when can we recoup our investment? Options A and B will both return our initial investment by the end of year 2. Option A will appear to be the better investment because we get our money back a bit quicker; however, option B actually returns our money at the desired investment return of greater than 10% while investment A's return was slightly less than 10%. For larger investments over a longer period of time, calculating the present value of the inflow and outflows of cash together with a desired rate of return on the money invested is the best way to accurately evaluate the benefit of your investment.
- In the case of real estate, once the decision is made to purchase the real estate, who owns it? In most cases, the real estate is generally not owned by the practice. Even though, in some states, rent paid to the landlord is subject to sales tax (be sure to check this with the laws of your state), in most situations it is better to have the property owned by an LLC, even if the ownership of the LLC mirrors the ownership of the practice. Owning the real estate in the LLC insulates to a great extent a valuable asset, should the practice be named in a lawsuit.
- If the real estate is owned in a separate entity, it is generally easier and cleaner to monitor the actual operating results of the practice. Although this may not mean much when evaluating the day-to-day running of the practice, should you need to value the practice for purposes of admitting an associate, retiring, or simply selling the practice to move on to other challenges, this becomes much more of an issue.
- In sophisticated financial and estate planning, some financial planners suggest separate entities, frequently a Family Limited Partnership, for ownership of the equipment and then leasing it to the practice (see 14.22 – Gifting Practice Ownership). This can work; in situations where estate and tax planning are of major concern, this is a technique that can be explored. For most practices, however, this method is beyond the level of accounting time and effort that can be and is expended to make it work efficiently.
- Bottom line for most practices, if real estate is present, is that it is best owned in an LLC, and the practice would be responsible for day-to-day operation of the hospital, including owning the equipment.
- A basic saying in sales is that facts tell, emotions sell. Basically, this means that we rarely go to a conference and wander through the exhibit hall with all of these facts and calculations done ahead of time. We easily fall prey to the salesman's pitch about why this piece of shiny equipment is something you have to have. Same with real estate; falling in love with a lovely piece of property can be very seductive. That said, please, before you sign on the dotted line, talk to your accountant or practice advisor and run the numbers just to be sure that you are not biting off more than you can chew. Evaluating a purchase ahead of time can possibly alert you to additional things you may have to do to make the purchase decision a good one, such as remodeling an existing building, getting additional training, and so forth. Being forewarned is always a good thing.

11.4. FINANCING BASICS

BASICS

OVERVIEW

• Once a suitable practice has been found for purchase or the decision has been made to build a new structure and the price is right, financing it is the next important step.
• Veterinary practices are expensive undertakings, and it is important to have access to more money than just the purchase price.

TERMS DEFINED

Credit Report: Listing of all outstanding debt you have and your history of paying on that debt.
Fair Isaac Credit Organization (FICO) Score: Score calculated using a computer model that compares the information in your credit report with what is on the credit report of thousands of other customers. This assesses a number of factors, such as past payment history, amount of outstanding debt, age of the credit, types of credit, and changes in amount of outstanding credit. The score can range from a low of 300 to a high of 850. The higher the credit score, the lower the credit risk.
Niche Lender: Lender who has a particular expertise or area of interest for lending money. Factors other than availability of collateral and down payment are considered when evaluating a loan. Veterinarians are considered one of the best credit risks because, as a profession, they have a high payback history. There is a subcategory of lenders that lend only or primarily to veterinarians because of this fact.
Small Business Administration (SBA): Independent agency of the executive branch of the US Government. Through its loan program, the SBA is a major provider of funds for borrowers who fit their lending requirements. Although independent lenders or banks provide the actual funds, the lender receives, in essence, a guarantee by the government that the loan will be repaid. Therefore, when a business applies for and receives an SBA loan, they are actually applying for a commercial loan, structured according to SBA requirements, which ultimately receives a guarantee that the SBA portion of the loan will be repaid. As such, the loan must also meet the underwriting requirements of the lending institution.
Traditional Lender: Generally, banks, brokerage houses, or other sources that lend money. Collateral for the loan, down payment, and ability to service the debt from cash flow are deciding factors in willingness to loan money for a purchase.

ISSUES AND OPTIONS

FEASIBILITY STUDY

• The key to knowing if the price being considered for a practice is correct or not is to do a feasibility study based on the facts of the particular case. The purpose of the feasibility study is to determine if, using historical financial results of the practice, the asking price for the practice is workable.
• This is accomplished by taking the cash generated by the practice for the last complete tax year (this is not necessarily the same as the net income because certain items like depreciation are a paper transaction, not always a cash outflow) and evaluating whether it can cover the debt service (interest and principal payment) associated with the new loan at the anticipated interest rate over the stated length of time. The cash available will also need to cover the desired income requirements for the owner(s). Most purchasers do not take a cut in pay to become a practice owner. However, assuming that you are immediately going to have a substantially higher lifestyle is not realistic.
• The feasibility study shows you whether or not, given the past performance of the practice, the cash flow from the practice will be able to support the debt service that will need to be paid on the note being assumed to purchase the practice. It will also highlight if there will be enough cash available to pay a reasonable salary – enough to cover lifestyle expenses, including student debt.
• If the practice passes the feasibility test, the purchase decision can move forward. If the answer is no, the practice cannot support both the debt service and income needs, then it will be necessary to evaluate the asking price of the practice and income needs. The debt service is not going to be extremely flexible. If the margins are very tight, the purchase decision is probably not a good fit. If, however, your income needs are flexible, there may be some benefit to moving forward.
• If the income needs are realistic, keep looking. If the income needs are very high right now, the time may not be right for you to purchase a practice. There is a risk with purchasing a practice and taking on managing its day-to-day operation. If the margins are very tight, either keep looking for a practice that has more of a cushion, rethink your budget, or continue as an employed veterinarian (associate) until you can get all the pieces to fit.

FORECAST

• If the feasibility study, based on past performance, supports that the practice purchase is a good "fit," it will be necessary to prepare a two-year forecast based on the best estimate of what changes you will bring to the practice. With the help of a consultant skilled in preparing realistic forecasts for veterinary practices, you will need to prepare a month-by-month forecast of revenue and expenses for the first 12 months, and then a forecast of the second year's revenue and expenses.
• The forecast will become part of the loan package. This package will also include a brief description of the practice you are purchasing and how you will operate it, a short introduction of yourself, a formal request for the amount of money you will need, and a commentary on how you will pay it back. Included with the financial forecast is a brief outline of the assumptions you used to develop the numbers presented.
• Traditional banks are generally reluctant to loan money on veterinary practices unless the borrower has substantial assets available to serve as collateral. Because a substantial part of the value of a veterinary hospital consists of goodwill, an intangible asset, most traditional lenders do not consider them a good risk despite the excellent reputation veterinarians have for honoring their debts.
• Because veterinarians are known as excellent credit risks, an entire industry of niche lenders has developed who basically lend only to veterinarians. These lenders understand the veterinary profession and, as such, are generally very competitive in the proposals they make. Many of these lenders have specific lending requirements, and if you are a "fit" for them then you may be able to achieve your goal of practice ownership with very little of your own money invested in the practice.
• After the loan package is finalized, submit it to various lenders. Shopping for your loan is no different than contacting several banks when you are considering making any major purchase. In addition to the information you will be providing, the prospective lender will be researching your credit history. Your credit report will be obtained and reviewed. Also, your FICO score will be measured. Be sure you are aware of how FICO scores are calculated so that you do not do something that will have an adverse impact on your score. FICO scores are measured at a given moment in time. History counts, but so do actions taken just prior to the date being counted.
• Different lenders, even within the niche lender community, have different markets that they serve. Many use SBA financing, but not all. Some work with partial buy-ins, some only want to do deals where 100% of the practice is being purchased. Some do start-up practices, and some only do existing practice purchases. It will make your lender choice more efficient if you clarify with the lenders you are intending to use that they are interested in the type of loan you are requesting.

EXAMPLES

N/A

CAUTIONS

• There will be differences in the proposals that you get back. Be sure that you have your accountant or practice consultants help you evaluate each of the proposals to be sure you understand the pros and cons of each.
• The terms and costs of each proposal may be very different, and unless you understand what you are signing, going for the lowest rate may not be the best deal for you.
• Make sure you have a clear understanding of any fees, closing costs, legal fees, or other hidden costs that are associated with the deal you are considering. Clarify up front how much money you will be expected to bring to the closing table.

EXISTING VERSUS START-UP PRACTICES

• Although much of this discussion relates to purchasing an existing practice, much of the same information applies to starting a practice from the ground up.
• Some may think that forecasts for start-up practices are nothing more than crystal ball reading. However, people who are skilled in doing veterinary practice forecasts can generally provide you with a fairly realistic assessment of your proposed practice's potential.
• A demographic study of the area will provide beneficial information to aid in the development of the forecast (see 6.8 – Demographic Assessment). Once the forecast is prepared, a loan package will be put together and submitted to niche lenders for their consideration. At that point, it is really no different than evaluating proposals relating to the purchase of an existing practice.

SELLER FINANCING

• Seller financing used to be the way many veterinary practices changed hands. This is no longer the case, although it can be very beneficial in some circumstances. If you consider seller financing for part or all of the deal, make sure you have a competent transactional/real estate attorney draw up the paperwork involved with the deal. If the seller's attorney writes the contract, have your own attorney review it to be sure your interests are protected.
• Seller financing, if handled correctly, can be very beneficial. With some lenders, seller-financed portions of the loan count as borrower equity. This may change, for the better, the interest rate you are able to obtain. Remember, for seller financing to work well, you must treat it the same way you would treat any other third-party financing: make your payments on time, and do not avoid talking with them if your circumstances change and you do in fact need special considerations. Trips to Europe and bigger houses and new cars for you are not circumstances that would justify not honoring your payments to your seller on their note.

11.5. SELECTING A SITE

BASICS

OVERVIEW

• "Location, location, location." Although this phrase is often overused, it is still true when it comes to selecting a site for a veterinary hospital. Ease of access, visibility, and the quality of the neighborhood are all significant factors for success.
• A perfect site is one that would be simple for clients to find, provide easy access to and from major roads or highways, and be conveniently located near other stores and services. Clients should be able to step out of their cars with their pets and family and feel safe, comfortable, and protected from the elements. The front entrance should be easy to find and close to the parking area.

TERMS DEFINED

Catchment Area: Area from which a business draws its clientele. Also known as *trade area*.
Market Viability: Determination of the probable success of a business venture based on an evaluation of demand, price, and quality of goods or services.

ISSUES AND OPTIONS

MARKET VIABILITY

• Knowing the market area is critical in establishing the services and facility that will likely be successful. Rule-of-thumb assumptions:
  ◦ The area from which the practice draws clients is typically a five-mile radius or a 10-minute drive from the probable location in a suburban site (see 1.4 – Veterinary Trade Areas).
  ◦ The radius becomes three miles in urban areas and 10 miles in more rural areas.
  ◦ A population of approximately 10,000 can support one veterinarian.
• A qualified veterinary practice management consultant can supply information about the existing and potential market around the site, including the number of pets in the area and the median income of households (see 6.8 – Demographic Assessment). Useful information includes the number and size of households, the amount of disposable income, geographic boundaries to your catchment area, who your competition is, and where they are located.
• Sources for helping you determine market viability:
  ◦ The American Veterinary Medical Association publishes a *U.S. Pet Ownership and Demographics Sourcebook* every five years.[1]
  ◦ Companies that provide demographic information about any area in the country, including age, family status, income, and population (see 6.8 – Demographic Assessment).
  ◦ County highway departments have maps that show roads, natural features, and other elements that may affect your catchment area.

SITE SUITABILITY

• Every practice is unique, and facility size varies significantly based on location and services (see 11.6 – How Large Should a Clinic Be?). However, as a quick rule of thumb, you will need approximately:
  ◦ 1,500 to 2,500 ft^2 (140–230 m^2) of building per doctor for outpatient clinics and 2,500 to 3,500 ft^2 (230–325 m^2) of building per doctor for hospitals with inpatient wards;
  ◦ a site that is four to five times the size of the building.
• Many sites may look to be optimal at first glance, but after closer examination the requirements for zoning setbacks, utility and road easements, stormwater retention ponds, landscape buffers, and parking requirements may leave you with limited space for your building (Figure 11-5-1).

SITE RESTRICTIONS AND COMPLEXITY

• Sites that are steep, irregular in shape, or those with poor soils can make the design and construction of the parking lots, buildings and foundations, and handicap access more complex and almost always more expensive.
• Building on steep sites will typically require additional excavation, fill, retaining walls, stairs, handicap ramps, and more foundation than a comparable building on a flat site.
• Sites with poor soils may require complex and costly foundation systems to adequately support the building.
• High water tables below the site can cause problems with buildings and can be expensive to remedy.
• Flood zones can restrict the location or size of buildings. The Federal Emergency Management Agency typically requires that the floor level of your building be a minimum of one to two feet (30–60 cm) above the flood elevation.
• Make sure that the potential site has adequate space for stormwater retention. Water that sheds off new and impervious surfaces, such as roofs, sidewalks, and parking lots, will need to be held in a retention pond and then released offsite at historical rates.
• Beware of building setback requirements as determined by local zoning codes. Setbacks can range from 0 to 30 ft (0–9 m) or more from property lines. Building codes can have setback requirements that are in addition to zoning restrictions.

PARKING

The space necessary for parking can be two or more times the size of the building, so parking becomes a significant factor when configuring the layout of a site.
• Parking spaces should always be planned to fit within the boundaries of your site. Only on rare occasions are you allowed to fulfill your parking requirements on the street or on adjacent sites.
• The number of spaces that you want may not be the same as is required by code. In some instances, owners would prefer more building than parking spaces.
• Many locations require landscaped setbacks and buffers around parking areas.
• The daily ebb and flow of clients coming to the hospital should be considered when planning parking. Circulation should be planned around the morning and afternoon rush to avoid traffic congestion.
• To avoid traffic jams, veterinary hospitals that are combined with large boarding kennels should have some separation to allow hospital clients to park and boarding clients to drop off their pets.
• Although each municipality has a different approach to determining the number of required parking spaces, the following rules of thumb can help you estimate your parking needs:
  ◦ One on-site parking space for each 250 ft^2 (23 m^2) of building is a typical parking ratio in many communities.
  ◦ Parking spaces are typically 9 ft × 20 ft (2.7 m × 6 m) and drive aisles are typically 24 ft (7.3 m) wide.
  ◦ Each parking space, combined with the space required for drive aisles, adds up to approximately 400 ft^2 (37 m^2) per space.

BUILDING ISSUES

The types of services you offer and your practice style can affect the size and shape of your building and how it fits onto a site.
• Many owners prefer separate entries and exits. Specialty referral and emergency hospitals will frequently have multiple entrances, which can affect the building shape, parking layout, and site circulation.
• Boarding kennels need additional site space for pick up and drop off, outdoor exercise, and relief.
• Space should be planned around the perimeter of buildings for deliveries, trash storage, fire and trash truck access, mechanical equipment, and electrical transformers.

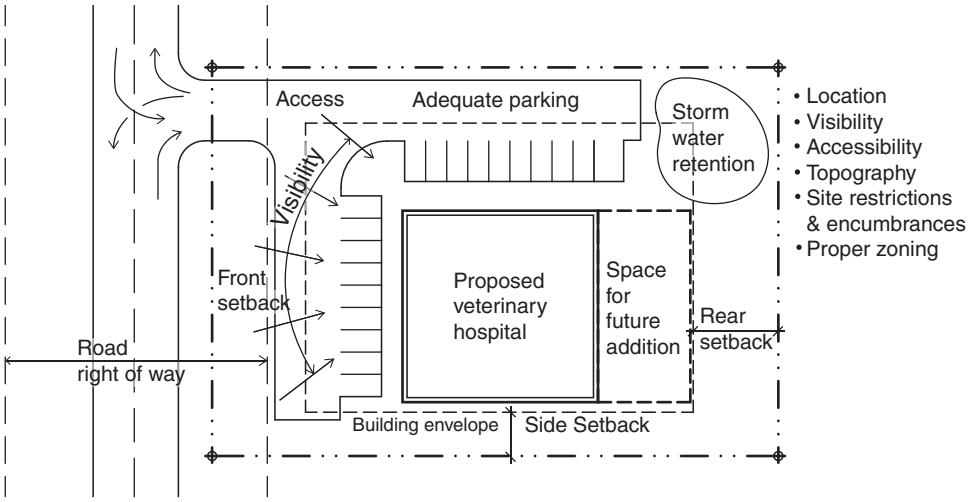

Figure 11-5-1.

Site plan.

EXAMPLES

• An average-sized, two-doctor practice would require a building that is 3,000–5,000 ft^2 (465–560 m^2). A site large enough for a facility of this size would need to be about 15,000–25,000 ft^2 (1,394–2,322 m^2). One acre equals 43,560 ft^2 (4,047 m^2) and 1 ha equals 10,000 m^2 or 2.47 acres. The site area needs to be adjusted if extra space for future expansion is being considered.
• A 4,800 ft^2 (445 m^2) building is planned. Dividing this square footage by 250 ft^2 (23 m^2) of building for each parking space equals approximately 20 parking spaces. At 400 ft^2 (37 m^2) per space, the total area for the parking lot, not including sidewalks, equals approximately 8,000 ft^2 (745 m^2).

CAUTIONS

• Think location, visibility, and access when looking for a site.
• Determine the zoning of the site before moving forward with any of the other steps in this section (see 11.8 – Zoning and Permitting). Obtaining the wrong site can translate into a lot of wasted time, money, and effort, or the inability to build your dream.
• Look for sites in areas where potential or planned growth is expected to occur. You can consult with the planning department to learn about areas of projected growth, new subdivisions, or annexations and new roads, interchanges, and future improvements to highways.
• Be aware of future road widening and/or neighborhood improvement projects that can take large swaths of land from a site.
• Look for sites that are located near established businesses and shopping centers, and take advantage of the collective draw of these businesses.
• Look for sites that will allow future expansion. Many practices are limited by their inability to grow to meet the demand for additional services.
• The soil conditions and the topography of a site can have a significant impact on the cost and complexity of construction.
• Research a prospective site for the zoning restrictions, including setbacks, encumbrances, easements, buffers, special districts, and covenants.
• Determine the type, size, capacity, and availability of services available to a site. Bringing utilities to a site, drilling wells, building septic systems, or tapping into nearby sewer, water, gas, and electrical systems is expensive.
• Request a site survey, soils investigation report, and an Environmental Protection Agency (EPA) Level One survey from the seller. To avoid inheriting the previous owner's environmental problems, you should at least obtain the EPA report prior to purchase.
• Be certain that the seller has clear title to the land and that there are no outstanding liens or other legal encumbrances on the property.
• Be aware of the extent and elevation of flood zones on your site.

11.6. How Large Should a Clinic Be?

BASICS

OVERVIEW

• When considering the construction of a new veterinary hospital or the expansion of an existing one, how large the facility needs to be to provide the services you wish to supply is one of the most important considerations. However, consider it likely that your first choice of dimensions will likely exceed the budget and/or the space available.
• To ascertain the facility size that meets your needs is a multistep process that includes input from you, your staff, and your banker, accountant, management consultant, architect, and contractor.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

VARIABLES TO CONSIDER

• Your budget.
• Your wish lists.
• Facility type. What services would you like to offer?
• Practice style. What is your approach to veterinary medicine?
• Current needs versus future growth.
• Site limitations (Figure 11-6-1).

ESTIMATING SIZE

• The following rules of thumb are approximations based on historical averages and can be swayed by many factors that can affect building size. These rules are useful for a point of departure into the initial planning phase of a project:
  ◦ Allow approximately two exam rooms per doctor and 1,000–1,200 ft^2 (93–112 m^2) of total hospital square footage (area) per exam room. This formula applies to hospitals up to about 6,000 ft^2 (557 m^2).
  ◦ Use a multiplier of approximately 1,000 ft^2 (93 m^2) per exam room when planning larger facilities that may have numerous doctors and/or exam rooms.
• The following are some factors that can affect these formulas:
  ◦ To save square footage (building area), some practice owners are willing to work in tighter quarters. They will compromise on circulation space, support spaces, and office space.
  ◦ Pet resort and retail areas are space intensive. If adding these to your hospital, calculate their space needs separate from the hospital space needs (see 11.20 – Pet Boarding and Luxury Accommodations).
  ◦ Specialized practices, such as feline practices, or practices providing a specialty, such as oncology, will vary from the rule-of-thumb averages.
  ◦ Specialty referral hospitals that can include large equipment including, computed tomography machines, magnetic resonance imaging machines, and so on are proportionately larger than general practice hospitals (see 11.19 – Referral and Emergency Facilities).
  ◦ Sites with extreme conditions or significant limitations will control the size of the hospital you can build.

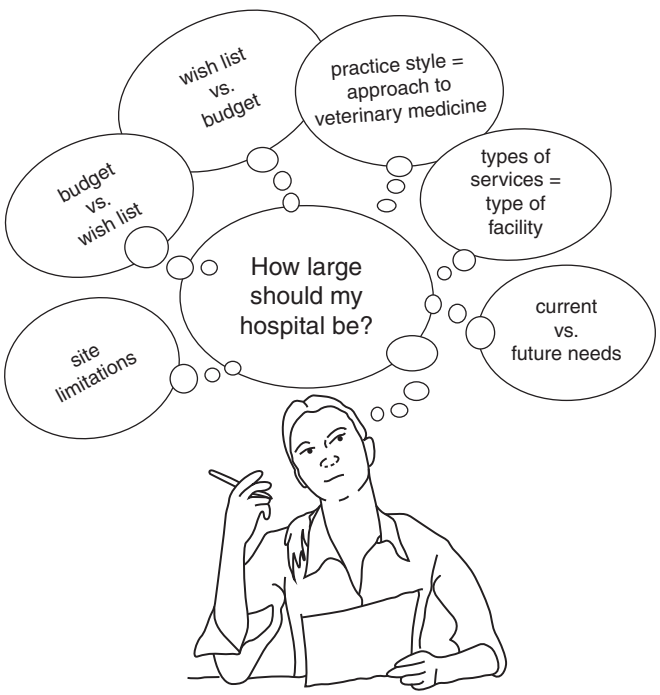

Figure 11-6-1.

Thought bubble.

BUDGET

• Your budget is probably the single most significant factor in determining the size of your hospital. When estimating your budget, you will need to determine your ability to not only pay for construction and development costs, but also for new equipment, additional staff, utilities, maintenance and upkeep, relocation costs, and advertising.
• Approximate construction costs in US dollars for veterinary facilities in 2018:
  ◦ A new freestanding hospital: $275 to $400+ per square foot ($2,989 to $4,306 per square meter).
  ◦ The build-out of a lease space: $150 to $250 per square foot ($1,614 to $$2,691per square meter).
  ◦ Remodeling an existing hospital: extremely variable, depending on the scope of construction, with $50 per square foot representing repainting and replacing finishes and greater than the cost of new construction representing complex, multiphase renovations.
• These costs can vary significantly based on location in the country, quality of construction, design features, level and durability of finishes, capacity and quality of mechanical systems, and the availability of materials and labor.
• Excluding the purchase of the site, the overall cost of the project will be approximately one and a third times the cost of constructing the building.

HOSPITAL ARRANGEMENT/ORGANIZATION

• The way you practice veterinary medicine and your traffic flow of clients, patients, and staff can greatly affect the size of your facility (see 11.13 – Client/Patient Flow).
• Certain facility types and practice styles will require a reallocation of spaces; some spaces may be used more intensively, and others may be eliminated altogether.

LARGE VERSUS SMALL FACILITIES

• Because of high construction and site development costs, some veterinarians prefer to build smaller hospitals. This approach works for some projects where there are few other options, but a new freestanding hospital should be no smaller than 2,500–3,000 ft^2 (232–279 m^2) or you will begin to see significant increases in costs per square foot (square meter).
• Advantages of small facilities. Smaller facilities generate lower overall project and construction costs, require less staff and management, and need less maintenance and upkeep than larger facilities. Also, the odds of finding a site in a desirable location are increased because of the availability of irregularly shaped or leftover sites.

• Disadvantages of small facilities. With smaller facilities, you will pay higher construction costs per square foot (square meter) compared with larger facilities, and the ability to be flexible and to expand will be limited. There are also diminishing returns on continually shrinking the footprint, because the minimum size of rooms, bathrooms, halls, and doors is restricted by building code and accessibility standards. The resulting reduction in square footage (building area) will ultimately be deducted from the medical and procedural areas of your hospital.
• Advantages of larger facilities. Larger facilities can handle more patients and can support a larger variety of services. They allow greater flexibility and have more expansion potential. Greater square footage (building area) also improves circulation and maneuvering ability.
• Disadvantages of larger facilities. With larger facilities, you will need a larger site that will require higher site development costs. The added size will also require higher start-up and operational costs, more staff, more managers, and a more efficient management style.

MULTISTORY HOSPITALS

• Building more than one story seems like a logical way to gain square footage (building area) or to minimize the size of the building footprint. However, any advantage to be gained by multiple levels is offset by the added cost and complexity of stairways, elevator purchase and installation, and mechanical systems.
• When veterinary hospitals are built with more than one story, the common approach is to locate offices and conference rooms on a second story and/or kennels and storage on a basement level.
• If the size and cost of the site will allow, the optimum layout for a veterinary hospital is to spread out horizontally and have everything on one level.
• If land cost is extremely high or the size of the site and/or the zoning requirements are very restrictive, a multistory hospital may be your best option.

ANCILLARY AND SUPPORT SPACES

• It is important to allow plenty of space for mechanical, plumbing, storage, and support spaces. Because these spaces do not directly generate revenue, it is easy to underestimate the amount of space needed for these areas or to overlook them entirely.
• All hospitals need adequate space for medical supply and food storage, boilers, water heaters and pumps, electrical panels, phone boards, housekeeping vacuum systems, and freezers.
• Space for computer equipment and other new technology should be figured with your current and future needs in mind.

EXAMPLES

• Hospitals with an outpatient focus tend to have less square footage (area) per exam room. They often will have more exam rooms, larger treatment areas, less surgical spaces, more short-term holding space for day patients, and fewer long-term wards (see 11.12 – Designing with the Patient in Mind).
• Hospitals with an inpatient focus will have larger consultation rooms and fewer exam rooms. There will be more concentration on specialty and surgical spaces, and more ward space is needed for longer term hospitalization.
• Specialty referral and emergency hospitals tend to be more departmental and have a combination of inpatient and outpatient facilities (see 11.19 – Referral and Emergency Facilities). Because exam rooms are usually shared between the various functions in these facilities, the total hospital square footage (building area) will often increase to 1,200–1,500 ft^2 (112–139 m^2) per exam room as opposed to the average of 1,000–1,200 ft^2 (93–112 m^2) per exam room.

CAUTIONS

• Regardless of your budget, remain open minded during the planning phase of your project.
• Although you need to be realistic about what you can afford, keep in mind that you will be living and working in this building for many years.
• Plan for today and for future change.
• Keep expansion needs in mind. The ability to expand and change over time is key.
• Design your facility with open and flexible interior spaces that will allow you to easily meet future needs or industry changes.
• When short on funds, build the maximum-sized shell you can afford and finish the minimum amount of interior space required to start. Continue to finish spaces as needed and as more funds are available.
• Develop a realistic master plan that will help you stay focused on your goals. It will also help to minimize haphazard changes and additions to your facility.
• Be sure to include staffing and management changes when planning your new facility.
• Seek the help of veterinary practice managers, accountants, bankers, or lenders, architects, and contractors who have experience with the planning, programming, design, and construction of veterinary medical facilities.

11.7. The Construction Process and Working with Architects

BASICS

OVERVIEW

Some of the first questions you may ask yourself when considering a construction project are "Why do I need an architect?" and "What does an architect do?"

The architect's role in the construction process is to orchestrate the project from initial concept to final completion. In simplified terms, a construction project only requires an owner, an architect, and a contractor. Understanding the responsibilities and limitations of each participant will help create a successful project.

TERMS DEFINED

American Institute of Architects (AIA): A professional organization for architects. The AIA publishes industry standard contracts and other forms that are used for construction projects.

Architect: In order to be called an architect, an individual must be registered by a specific state to practice architecture. Each state issues licenses separately. However, the examination and qualifications are roughly equivalent.

Bridging Documents: Drawings and other documents that are more developed than schematic drawings, yet still not completely engineered permit and construction drawings. Bridging documents may be prepared by a veterinary-specific architect in order to convey the important aspects of veterinary design to a builder or another architect not familiar with veterinary hospital design requirements.

Contract Administration: Also referred to as *construction administration*, this is the work performed by the architect during the construction phase of the project. During this time, the architect assists the owner to be sure the project is being built according to the plans and the owner's requirements. The architect also answers contractor questions and helps resolve any differences between the owner and contractor that may arise.

Contract Documents (CDs): The final drawings and detailed specifications that will be used to construct the building. Technically, these documents also include other items, such as the agreement between the owner and the contractor and the general conditions of the contract, which define many of the responsibilities of the parties to the contract. The key point to remember is that the drawings and specifications form a part of the contract between the owner and the contractor.

Design Team: Refers to the architect and the architect's consulting engineers.

Programming: Information-gathering process during which the design team gathers information from the owner regarding his or her needs. The product of programming may be a list of rooms and room sizes that may be referred to as the "program" or the "program plan."

Schematic Design: These drawings typically indicate the general layout and design of the building and include floor plans drawn to scale, elevations or a perspective drawing illustrating the exterior building appearance, and a site plan.

ISSUES AND OPTIONS

- Veterinary-specific design architect. Veterinary-specific design architects have the experience to quickly establish a concise yet comprehensive program, develop an efficient plan, and carry through the details of a project to create a successful veterinary facility. They offer expertise in programming and layout. They understand how a veterinary hospital works and are able to create a design with a space-efficient floor plan that flows appropriately for a hospital's needs. They have knowledge of veterinary-specific equipment, materials, and mechanical systems, and their knowledge of veterinary procedures allows them to design rooms to accommodate the required equipment. In most cases, a national design firm will contract with a local architect to assist with their services during the actual construction process.
- Local architect. A local architect may be someone you know or someone who is referred to you in your local community who has the advantage of understanding your local jurisdiction. In some places, it is indispensable to have someone help shepherd a project through the red tape. If you wish to work with someone local, you may have a veterinary-specific architect provide plan reviews on a consulting basis or provide an initial schematic design to be completed by your local architect. A local architect can more easily and frequently have access to on-site conditions; therefore, having one involved during the design and construction of remodeling projects is smart. For this same reason, a local architect is typically used for construction administration when a veterinary-specific architect has been responsible for the CDs and is located in another state.
- Design–build firm. Some firms offer design and construction services as one package. This option eliminates the checks and balances that are inherent to a traditional owner/architect/contractor-type process but may offer better cost control since there is a single party that has some latitude to make design decisions that directly impact construction cost. Design–build firms are typically led by contractors, with either in-house staff architects or architects hired as consultants by the construction company.
- Being able to communicate clearly with your architect is important. A quality relationship with your architect will ensure a satisfying experience. If you are choosing a veterinary-specific architect, the firm may be in a different state. Therefore, you may become acquainted with an architect during telephone conversations, which usually works just fine. Be sure that your architect listens to you and is willing to answer your questions with clear explanations that include as much detail as you would like to have.
- The AIA-B101, "Standard Form of Agreement Between Owner and Architect," lists in detail most of the services that an architect may offer. For small to medium-size projects, the AIA B104, "Standard Abbreviated Form of Agreement Between Owner and Architect" may be all that is needed. These contracts establish the roles and responsibilities of each of the parties to the agreement.
- As the owner, some of the responsibilities that you are typically responsible for include:
  - Establish a budget. The budget may be established with the architect's assistance during negotiation or, better yet, with the help of a contractor. It may be one of the most important pieces of information that you give your architect.
  - Provide a program for the project. To you, this means telling your architect what you need and working out the details together. Then your architect develops a more formal program for your approval.
  - Provide your architect with site survey and soils information and, in some cases, contract directly with a civil engineering firm to provide site design services.
  - The services that an architect may provide include:
    - Evaluation and planning services. Further evaluation of the owner's budget to develop a project program and initial site evaluation. Consulting services may be provided as needed.
    - Design services. This is the bulk of the architect's work. Products include the schematic design and final construction drawings and specifications.
    - Contract administration services. The architect administers the contract between the owner and the contractor by assisting the owner, answering questions from the contractor, and helping resolve any differences that may arise (see Figure 11-7-1).

11.7. THE CONSTRUCTION PROCESS AND WORKING WITH ARCHITECTS

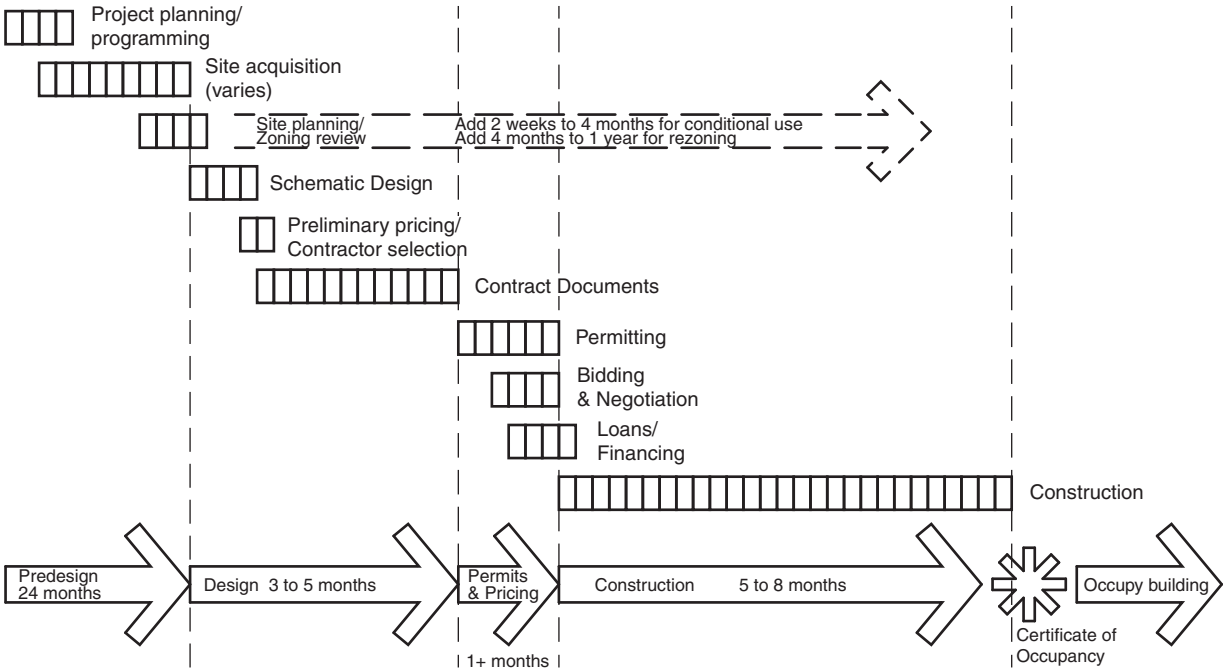

Figure 11-7-1.

Project timeline.

EXAMPLES

In the traditional construction process, the architect works with the owner to develop the design and complete the construction drawings. Then the contractor bids the work, and the owner and contractor enter into an agreement for the actual construction. During construction, the architect's role is to act as an independent third party to make interpretations of the CDs as needed and to act as an intermediary between the contractor and owner. The architect also has the responsibility to review the construction for compliance with the CDs and review the contractor's payment requests. Meanwhile, the contractor and his crew construct the building through its completion.

CAUTIONS

- You may spend significantly more time educating an architect who does not have any experience with veterinary facilities than you would with a veterinary-specific design architect. The veterinary expert can help you avoid costly mistakes and can streamline the process for you.
- Be sure to hire an architect who is a good listener. Your architect is your representative throughout the design and construction process. Having someone you can trust to make decisions in your best interests will make a successful project much easier.
- Consider negotiating with a general contractor early in the design process. A good contractor can provide reliable pricing from an architect's early drawings. Your contractor can also provide valuable input during completion of the design and help avoid any surprises at the time of bidding.
- Design–build eliminates the architect's role of independently representing your interests during the project and, for this reason, can be risky.

11.8. ZONING AND PERMITTING

BASICS

OVERVIEW

• The mission of local building departments is to preserve and maintain safe, desirable, and livable communities by controlling the physical development of the land. Originally, building officials were primarily responsible for life safety issues. More recently, their role has expanded to also include the creation, enforcement, and management of site development standards and the separation of uses such as schools and adult establishments or industrial and residential areas. Many jurisdictions now include the review of design esthetics as a means to maintain community consistency and property values.
• Each step of the process with your zoning and building departments, as you construct your building and ultimately move in, will require some form of review and approval. Although the process can be daunting and confusing, your architect, engineers, and contractor along with the planning and zoning and building officials should be able to help you through the steps.

TERMS DEFINED

Americans With Disabilities Act (ADA): Includes building requirements to ensure appropriate access for everyone, especially those with handicaps.
Conditional Use: A zoning term meaning some level of city, administrative, and/or public review, input, and approval with "conditions" is required before submitting construction drawings.
Not Allowed: Zoning term meaning specific businesses or uses are not allowed on a site as zoned.
Planning, Zoning, Building, and Permitting Departments: Municipal entities that control, enforce, and maintain the physical development of land.
Use By Right: Zoning term meaning no review process is required to proceed with the submittal of construction drawings.

ISSUES AND OPTIONS

MUNICIPAL DEPARTMENTS

• Unless you are in a very small community or rural area, most municipalities will separate planning and zoning, and building and permitting, and fire into different departments.
• Planning and zoning includes site access, building placement, parking, landscape, grading, drainage, and building type, size, and design.
• Building and permitting includes building function and occupancy, appropriate design of structural, mechanical, and electrical systems, safe exiting, fire separation, and ADA accessibility issues.
• Fire departments review compliance with fire codes, fire protection systems, access by fire trucks and fire department personnel on the project site, placement of fire extinguishers, and other criteria.
• Large municipalities may have more separations than those already described.

THE ZONING PROCESS

• Most locations assign zones that delineate specific restrictions or requirements. They are typically separated out as Use By Right, allowed as a Conditional Use, or Not Allowed (Figure 11-8-1).
• Very few of the sites available today are zoned to include veterinary facilities as a Use By Right. Most veterinary hospitals tend to fall into the Conditional Use category under the business/commercial or industrial zones and the Not Allowed category in residential areas. On rare occasions, you may be able to rezone a particular parcel, but it often requires a significant amount of time and typically proof of "hardship" to obtain a zoning change.
• Conditional Use is a common process, although it is not entirely risk free. Prior to submitting construction drawings to the building department, owners must justify that their project fits into the goals of the community and neighborhood.
• Documentation required includes a written statement describing the project and its compatibility with the site, architectural site design drawings showing building placement, exterior elevation drawings showing the design of the building, its materials, and massing, and civil engineering drawings for grading and drainage, utilities, and stormwater management. Landscape design drawings, traffic, lighting, noise studies, and the design of the signage may also be required.

Whenever there are regulations that are subject to interpretation or when there is neighborhood input, you run the risk of having your project rejected. Some of the risks include:
• The amount of time it takes to obtain approval may be excessive because of the required documentation or the need to resubmit information. Typical veterinary hospital approval can take from several weeks to several months. On rare occasions, it can take up to a year or more.
• Hiring attorneys, architects, engineers, and other consultants to create required information is expensive. It is typically an out-of-pocket expense that can be lost if the project is rejected.
• The conditions may be too restrictive for your needs. For example, some locations do not allow overnight housing of animals.

THE PROCESS

• The process of obtaining a building permit starts in the zoning department. If the site is zoned as Use By Right, or once adjustments to the zoning requirements have been approved, the next step is to

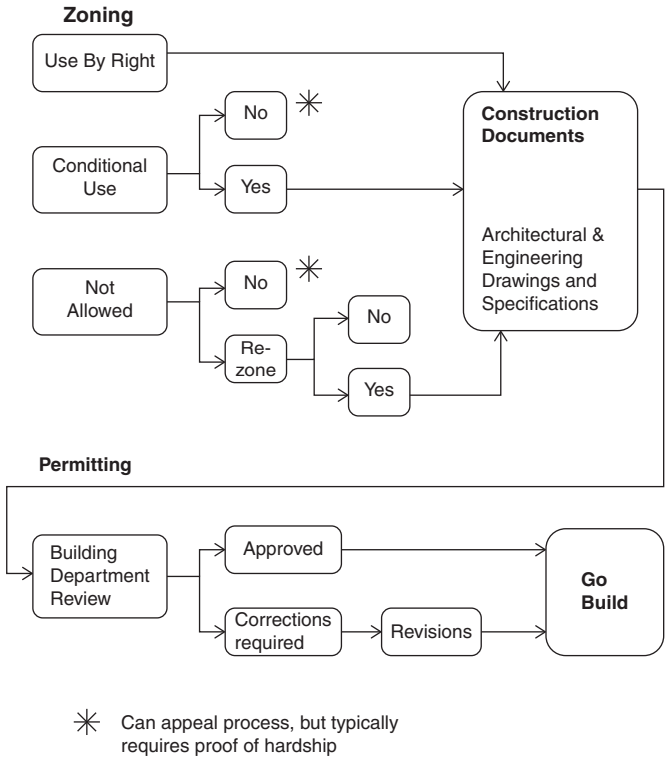

Figure 11-8-1.

Zoning permit.

move into the construction drawing phase to create the documents that will be submitted to the building department for review.
• The package of construction documents, including drawings and specifications, will be submitted to the building department for review. While there, many departments, including planning and zoning, building, fire, and others will review the information. Some locations may require the combined input of city, county, and federal agencies. This process can take three weeks to several months before a permit is released.
• Most jurisdictions have adopted an international building code that is intended to consolidate the massive amount of information contained in disparate older codes. Many states and municipalities have added or deleted certain amendments to the code to adjust for local needs. For example, California has specific earthquake and accessibility requirements, and Florida concentrates on hurricanes.
• Once you have cleared all of the regulatory hurdles, you can start into the construction phase of your project. As your building starts to take shape, there will be various inspections along the way. As your building nears completion, there will be a final inspection. After passing that last hurdle, a Certificate of Occupancy will be issued.

EXAMPLES

An owner wanted to build a veterinary hospital combined with a boarding kennel on a parcel of ground between an office park and residential areas, where veterinary hospital is a Conditional Use. After months of work and a significant amount of money invested, the owner was able to meet all the conditions and had obtained the recommendation of the city planning staff. One condition of approval of the project was that dogs would not be housed outside due to the proximity of the project to adjacent residences, so the project proceeded with indoor dog boarding components.

CAUTIONS

PLANNING AND ZONING

• Do your due diligence and verify the zoning of a particular site prior to purchase or you could end up with a site that will not allow a veterinary hospital building.
• If the site is not zoned as Use By Right, find out what the process is for Conditional Use. You should expect that any type of review process could take a considerable amount of time.
• Watch for zoning overlay districts, historic districts, and other restrictions that are applied in addition to the base zoning requirements for a particular site. Be aware that there may be regulations administered by county, state, and federal agencies that are in addition to your local jurisdiction.
• Get all the zoning information pertaining to your project in writing from the appropriate zoning official. Do not make the mistake of basing your decisions on someone's opinion.
• Residential zones adjacent to commercial zones routinely require buffers that may consume a significant amount of your site.
• If you are in a large city or other location with onerous or complex regulatory requirements, you might consider hiring an expediter to help you through the process.

BUILDING AND PERMITTING

Because the building department needs to verify that buildings are designed and built to minimum standards for life safety and durability of the building structure, they need to complete a careful review, focusing on the following:
• appropriate exiting for fire and other reasons;
• accessibility for the able and disabled to freely move into, throughout, and around the building;
• the provision of adequate facilities, including exits, corridors, and toilet fixtures;
• appropriate materials used for the building construction;
• protection of the building and structure against fire and other damage;
• appropriate sidewalks and parking;
• suitable interior environmental conditions, such as appropriate room sizes and adequate heating, ventilation, and air conditioning systems.

GENERAL

• Building codes and regulations (including the ADA) can be confusing and complex. They are also constantly revised and updated. Seek help from your architect, contractor, and building official to understand or interpret them.
• The ADA requires that buildings with certain types of occupancies, square footage, or number of occupants provide for the free and unhindered movement of those with disabilities. Building departments tend to follow the most restrictive definitions.
• Be aware that there are many development and permit fees. For example, there may be significant sewer and water tap fees in places where water is scarce, so tap size and the number of fixtures can greatly affect your cost.
• Be prepared for the building department review process to take three weeks to several months, depending on the jurisdiction. Find out how long local permits take to obtain and schedule accordingly.
• Take advantage of the services of your building department. Ask lots of questions and always get answers in writing.

11.9. MANAGING CONSTRUCTION COSTS

BASICS

OVERVIEW

• Effectively managing construction costs begins with an understanding of what kinds of costs are included in every construction project. It also requires clear communication between all parties involved, including the owner, the design team, and the builder.
• Veterinary care facilities are relatively expensive to construct when compared with typical commercial projects and are comparable to human care facilities in terms of construction cost.
• Construction cost is typically quoted in dollars per square foot (cost per square meter) of building area. When dealing with cost per square foot (square meter) numbers, it is important to first know what is included in the number. Many nonbuilding costs are usually excluded from this number, but they still must be budgeted as part of the total construction project.
• The US national average costs for construction in 2013 are approximately $250 + per square foot ($2,700 per square meter) for new freestanding buildings and $175 per square foot ($1,900 per square meter) for the build-out of a lease space. Because of its very nature, the cost of remodeling can vary significantly depending on the extent of work done. The average cost for remodeling projects is typically approximately $125 per square foot ($1,350 per square meter).
• Establishing your budget is always the first big step when considering a construction project. One rule of thumb is that the amount of money you borrow should not exceed one year's gross billing. Although this may seem aggressive, most banks are willing to lend to this level.
• One of the most successful ways to manage construction cost is to involve a contractor during the design of your facility. Contractors can offer expertise in cost estimating that takes into account local economic factors. They can also make cost-saving suggestions during design.

TERMS DEFINED

Allowance: Dollar amount assigned to a specific scope of work within a construction project to be used when the final requirements are not determined prior to bidding. For example, if the owner chooses to select carpet during construction, an allowance may be carried in a bid to cover the cost of materials. If the owner chooses carpet that is less expensive than the amount carried in an allowance, a credit will be due to the owner for the difference in cost.
Alternate: In construction, an option built into a design that may affect the cost of construction. Alternates may be included in a project as either an "add" alternate or a "deduct" alternate. When alternates can be identified early, the contractor can price them as options for the owner to choose from when the project finally bids. If the bids are below the budget, the owner may elect to add in some of the options or alternates that were previously thought to be unaffordable. Likewise, if the bid cost is higher than expected, deducting some of the alternates may allow the project to be brought into budget without going back to the drawing board.
Bid: Formal proposal from a contractor to build a defined scope of work, for a fixed price, in a fixed schedule.
Budget: Although a pro forma serves as the tool used to express the total project budget, usually the budget is directly related to building cost or the bid.
Building Cost: When building cost is quoted, it is important to understand what exactly is included. Typically, building cost does not include any soft costs, land costs, site work, or furnishings and equipment.
Change Order: Contractual change to either the time allowed by the contract for construction or a change to the cost to be paid.
Contingency: An amount of money, often a percentage of the total construction cost, which is set aside for unknown and/or unexpected costs. By carrying a construction contingency, an owner will have a special fund to accommodate unforeseen conditions (especially on remodels), design omissions, or other changes required during construction. It is also a good idea to carry a design contingency during the design phase estimate to cover items that have not yet been anticipated but will eventually be included in the final project.
Estimate: An opinion of probable construction cost prepared prior to the completion of the final pricing or bid documents. Estimates may be prepared by architects, engineers, cost-estimating consultants, or general contractors.
Hard Costs: Cost of tangible items. This typically includes land cost, building construction cost, and furnishings and equipment.
Initial Cost: Cost of materials and labor directly related to the initial construction of a project.
Life-Cycle Cost: Total cost of owning the facility, including initial costs and operating/maintenance costs.
Operating/Maintenance Costs: Ongoing costs incurred when you own a facility.
Pro Forma: Detailed analysis of the financial aspects of a project, summarizing hard costs, soft costs, financing costs, and operating expenses. A pro forma should always be prepared to determine the financial feasibility of a construction project.
Scope Creep: This is the trend of adding more and more into a design or the project's scope of work. Obviously, costs escalate as the scope grows. Establishing a budget for a fixed program and sticking to it can eliminate this situation.
Soft Costs: Cost of intangible items that may include fees to regulatory agencies, any legal fees, financing costs, design fees, insurance costs, and relocation expenses.
Total Project Cost: Combined total of soft costs and hard costs.

ISSUES AND OPTIONS

Because the majority of decisions that affect a project's cost are made prior to the start of construction, managing costs must begin at the earliest stage of design. Some of the initial issues that affect construction costs are listed here, with more detailed descriptions of their effects on construction cost.

GENERAL PROJECT LOCATION

• Regional differences in the construction industry are quite broad, and the general location of a project significantly affects the cost of construction.
• In general, construction costs in the southern states are less than they are in the northern part of the country. This is due to construction requirements such as additional insulation in colder climates as well as the cost of labor differences, especially in areas where there are trade unions.
• The latest edition of one popular construction cost-estimating guide includes location cost factors that vary from 66% to 134% of the national average. If you consider a baseline construction cost for new construction equal to $250 per square foot ($2,700 per square meter), this would equate to a range of roughly $165 to $335 per square foot ($1,775 to $3,600 per square meter). When national data suggest a range of more than 100% variance between the least expensive and the most expensive locations, it is important to understand the local economic characteristics when considering the cost of a project (Figure 11-9-1).

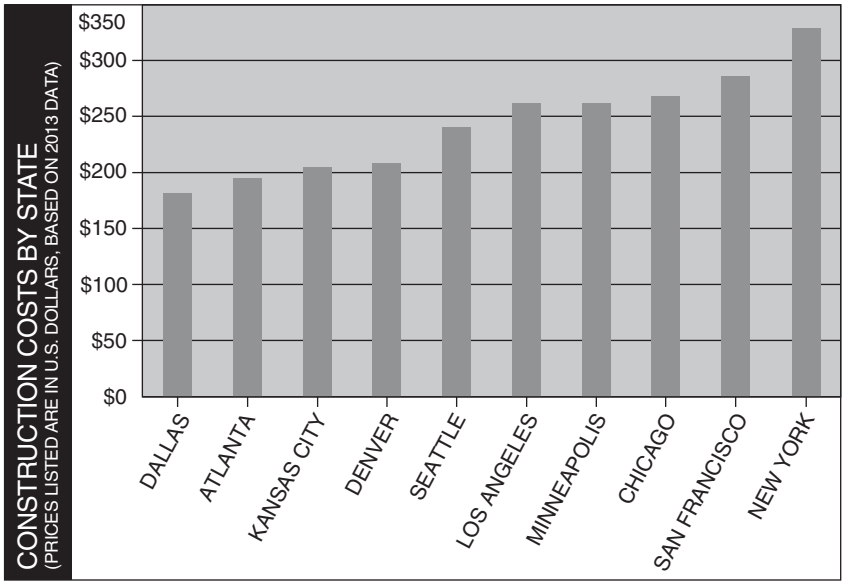

Figure 11-9-1.

Comparison of construction costs per square foot across the United States.

NEW, REMODEL, OR LEASEHOLD?

• New, freestanding buildings offer the greatest potential for meeting all your needs. A completely new facility can be extremely rewarding in terms of both professional and emotional satisfaction. It will be at the highest financial cost, however.

• Remodels have the advantage of realizing the value and maintaining the equity of an existing facility, usually with some compromises. Evaluating your needs and goals against the potential of an existing facility can fairly quickly determine the feasibility of a remodeling project.

• For smaller practices – less than about 3,000 ft^2 (280 m^2) – building out a lease space can be the best option. On freestanding projects of this size, the land and development costs usually take up too large a proportion of the total cost to make building them feasible.

CONSIDER YOUR PROFIT CENTERS

• When developing your program, carefully consider your profit centers (see 9.5 – Profit Centers). Animal boarding space is expensive to build due to the durable finishes that are required. Additionally, boarding is not as profitable as medical services (see 9.20 – Kennel Management as a Profit Center). When faced with squeezing square footage (building area) from a program, always try to first cut the spaces that will be the most expensive to build or the spaces that will generate the least revenue for your practice.

• An architect should be able to propose creative ways to make spaces flexible in order to serve multiple functions. Square footage (total building area) can be reduced if exam rooms can be used for treatment during nonpeak client hours. Recovery alcoves within the treatment area may decrease the need for separate ward space. Circulation through spaces rather than halls reduces the amount of dedicated, nonrevenue-generating circulation space.

SPECIFIC SITE SELECTION

• Government or municipal requirements can have significant impact on the cost of a project. There are many creative taxes or fees that municipalities charge on new construction projects. These may include water tap fees, sewer access fees, plan review and building construction permit fees, as well as other special assessments or taxes. Zoning requirements typically dictate how much building can be built on a particular area of land, how much parking needs to be provided, and detailed landscaping requirements. Likewise, seemingly innocuous design guidelines can have dramatic effects on the cost of a building. Some design guidelines restrict what exterior building materials may be used. For example, guidelines may require using more expensive brick rather than allowing the use of less expensive materials such as stucco or wood siding.

• Soil conditions at the specific site must be considered when designing a building. The ground must be capable of supporting the new structure with an acceptable amount of movement. Building structures can be designed to withstand almost any soil conditions; however, the costs escalate when special provisions are needed. The most common soil conditions that may require more expensive structural solutions include soil with inadequate capacity to bear the weight of the structure or soils that change volume when moisture levels change.

• In the interest of life safety, building codes require structures to withstand the forces of nature such as wind, snow, or earthquakes. Depending upon the specific project location and conditions, the impact on cost can vary from insignificant to substantial.

LEVEL OF FINISH

• For any construction project, there is a range between the high and low ends of what a facility of a given square footage (building area) can cost. The quality of the finish materials, the extent of built-in cabinetry, and the quality and number of other custom items may make a difference of $5–$10 per square foot ($55–$110 per square meter).

• One way to accurately identify these costs is to allow for "alternates." You may specify a porcelain tile floor in your lobby reception, with an alternate to be priced for stained and sealed concrete. When the project is bid, you can determine whether or not the tile is within your budget.

• Establishing a shopping list of alternates is one method of managing the project budget and construction costs.

• It is recommended that, throughout the design process, you keep in mind acceptable trade-offs in materials or finishes that can be implemented as cost-control alternatives.

CONSIDER LIFE-CYCLE COSTS

• For some items, the difference in initial costs and long-term costs can be substantial. Long-term costs can accumulate in the form of regular operating costs, scheduled maintenance, or utility costs.

11.9. MANAGING CONSTRUCTION COSTS

• Operating costs are the day-to-day costs of working in a facility. Simple examples could be the cost of automatic watering dog bowls or a commercial-grade dishwasher. Although there is a higher initial cost associated with this equipment, the long-term savings in manpower may make the initial expenditure worthwhile.
• The materials and equipment that you choose can affect costs for periodic maintenance. Weigh the cost of periodic maintenance against the higher cost for materials or equipment requiring less maintenance. For example, you will save on the initial cost for a stained concrete floor versus a porcelain tile floor, but the concrete floor will need to be periodically resealed and the porcelain tile floor will not.
• One of the biggest life-cycle costs is utility usage. In veterinary facilities, it is desirable to have a high number of air changes and to exhaust 100% of the air from animal wards. All of the energy used to heat or cool the air is wasted when it is exhausted from the building. Energy recovery mechanical units can "recycle" the heating and, to some extent, the cooling from the air and help temper the fresh air that you are supplying. Although energy recovery units have an initial cost associated with them, they usually pay for themselves in utility savings within a few years. A mechanical engineer can provide calculations of energy usage with and without energy recovery for consideration during your design process.

EXAMPLES

A breakdown of total project cost by percentage may look like this (Figure 11-9-2):
• 60% building construction cost
• 22% land cost
• 7% architectural and engineering fees
• 8% interest, insurance, and fees
• 3% contingencies.

A more comprehensive list of the costs associated with a construction project may include the following.

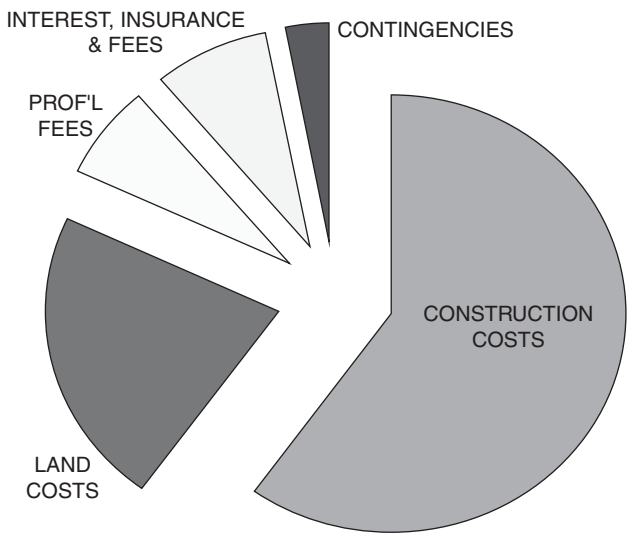

Figure 11-9-2.
Total projected costs for a building project.

• Pre-design services:
  ◦ site selection study;
  ◦ concept plan;
  ◦ legal fees (including site acquisition negotiation and contract review);
  ◦ environmental studies;
  ◦ survey (meets and bounds, improvement, topographic);
  ◦ title commitment;
  ◦ planning and zoning review and application (filing fees, consultant fees, legal fees);
  ◦ land cost;
• Financing costs:
  ◦ construction loan (processing and origination fees and interest-only payments);
  ◦ permanent loan processing and origination fees.
• Site-related costs:
  ◦ soils report;
  ◦ additional hazardous waste studies;
  ◦ improvements to right-of-way;
  ◦ development fees;
  ◦ tap and utility fees (water, gas, electric, and sewer);
  ◦ utility upgrade costs.
• Site and building costs:
  ◦ site development (including landscaping, fencing and site walls, and site clearing);
  ◦ building construction cost;
  ◦ building systems, furnishings, and equipment (emergency generator, power-wash system, central vacuum, and medical gas);
  ◦ building department application (including plan review and permit fees);
  ◦ builder's risk insurance;
  ◦ owner-required testing and inspection services;
  ◦ design fees for architectural, structural, mechanical plumbing, and heating, ventilation, and air conditioning, electrical, interiors, landscaping, and civil engineering.
• Equipment:
  ◦ veterinary built-in equipment (including exam and surgery lights, tubs and tub tables, cages and runs, and x-ray equipment; see 9.10 – Medical Equipment and Fixtures);
  ◦ veterinary medical equipment for lab, pharmacy, surgery, dental prep, and treatment;
  ◦ telephone and communications systems;
  ◦ computer systems.
• Furnishings:
  ◦ furniture;
  ◦ signage;
  ◦ educational systems;
  ◦ retail display.
• Relocation costs:
  ◦ moving cost;
  ◦ transition costs.

Table 11-9-1 shows a sample pro forma for a 6,000 ft^2 (560 m^2) veterinary hospital.

CAUTIONS

• Even though it may be tempting to try to cut corners by eliminating or reducing the work of some of the professionals involved in a construction project, it is not recommended.
• A construction project is a time-consuming proposition for an owner, even without wearing the additional hats of designer or builder.

Table 11-9-1. Sample pro forma.

Hard costs	
• land costs	$500,000.00
• building cost (6,000 $ft^2 \times \$200/ft^2$)	$1,200,000.00
Total hard costs	$1,700,000.00
Soft costs	
• architectural fees	$84,000.00
• engineering fees	$36,000.00
• regulatory and utility	$8,000.00
• financing costs	$76,250.00
• contingency	$36,000.00
Total soft costs	$245,250.00
Total project costs	$1,945,250.00
Financing	
• equity (20%)	$389,050.00
• permanent loan	$1,556,200.00
• loan payment per year (20 years, 7.5%)	$147,655.00
• return on equity per year (5%)	$19,453.00
Total annual financing costs	$167,108.00
Operating expenses per year	
• real estate taxes	$12,000.00
• insurance	$6,000.00
• utilities	$9,000.00
• maintenance	$4,500.00
Total annual operating expenses	$31,500.00
Required cash flow or "rent"	
• annual cash flow (financing and operating)	$31,500.00
• monthly cash flow/rent	$16,551.00

• Any money saved on fees will be multiplied when it comes back in the form of your own time, stress, and real costs of adding items left out.
• Beware of scope creep (see Terms Defined section). Renovation and remodel projects are especially vulnerable to scope creep since it is easy to want to update everything when making significant changes to parts of the hospital. Try to carefully prioritize the project scope for remodels. Depending on the specific needs, the most important areas to focus on may be the client areas as part of a facelift or modernization, work areas that can improve efficiency or overall capacity, or necessary maintenance items to extend the life of the hospital or minimize future operational costs. Always attempt to identify the anticipated return on the investment for the specific scope of work before including in the project.

11.10. PRACTICE RENOVATIONS

BASICS

OVERVIEW

• The primary reason veterinarians choose to renovate their facilities is to accommodate hospital growth. This growth can be due to additional staffing, new services, or the need for more treatment capacity.
• There are also a number of other factors that come into play when considering a renovation, such as the desire to rejuvenate an outdated facility, the need to attract and/or retain staff, and transition planning for retiring practice owners.
• To navigate through the remodeling process with the least anxiety and confusion, start with a clear plan and select the best team and process to carry out this plan.
• Generally, small veterinary renovations can be delivered using some variation of the design–build method, while most large and complex renovation projects are often delivered via negotiated bid or design–bid–build.

TERMS DEFINED

Design–Bid–Build: A conventional or typical project delivery method in which the owner contracts with separate entities for the design and construction of a project. A benefit of this method is that the design team is impartial and looks out for the interest of the owner. It also uses competition to improve the efficiency and quality for owners.
Design–Build: This project delivery method uses a single entity known as the design–builder or design–build contractor to retain both design and construction services. This delivery method is used to prioritize costs and timeline and thereby to minimize the risks for the project owner. A downside to this system is that the owner sacrifices control and sometimes project quality.
Negotiated Bid: In some circumstances, it is a benefit to the owner to hire the contractor early and negotiate the project scope and cost. The benefit of this method is it maintains control for the owner and yet reduces unknowns. However, this method may not yield the lowest cost, as it is less competitive than design–bid–build.

ISSUES AND OPTIONS

KEY FACTORS

There are several key factors that can initiate a hospital renovation:
• More floor space is required to accommodate growth. Most often this is manifest in the need for more examination rooms to move clients through without clogging the lobby, or additional treatment and procedural space.
• There is a perceived need to stay competitive. Sometimes the opening of a new practice nearby may trigger thoughts of renovating.
• The décor is outdated and does not equate to the high quality of medicine that is currently being practiced.
• There is a desire to increase productivity by enhancing the traffic flow of the hospital (see 11.13 – Client/Patient Flow).
• The hospital is now part of a corporation, and the company has set aside funds to remodel/renovate the practice due to any of the aforementioned reasons.
• There is a plan to either sell the practice or bring on a new associate, and renovating will make the hospital more desirable.

MAYBE A RENOVATION IS NOT THE ANSWER

If the practice is considering a very difficult renovation, sometimes it is less expensive to start fresh than it is to renovate. If an existing facility is so outdated that the expense to renovate outweighs what it would cost to build new, stop and consider the alternatives. Look at such things as existing structural members/walls that are too costly to move, site limitations relating to required parking capacities, and dilapidated heating, ventilation, and air-conditioning (HVAC) or roofing systems that would be expensive to replace.

WHERE TO START

One way to get the most from a remodel is to focus on the most positive attributes of the practice. Identify what makes the practice different and sets it apart from the rest:
• Observe the waiting area during the busiest times of day from the viewpoint of a client.
• Visit other hospitals.
• Form strategies to make positive changes and maximize inherent strengths.
• Survey staff, friends, and clients with questions about improving customer service, patient care, and work flow.

Your primary design goals will affect the overall layout of the floor plan (see 11.12 – Designing with the Patient in Mind). Combining this with the architectural style to be achieved will lead the design team down a more direct path. As an example, if your practice focuses on the client experience, your renovation may prioritize improving greeting and examination areas.
• Get finances in order by putting together a business plan or updating the current one (see 14.10 – Business Plans). There are numerous accountants and practice consultants who are experts in the veterinary industry. Generally, total debt load should not exceed gross billing per year, although this metric may vary slightly depending on the growth potential of the practice and the timeline for paying off the debt (see 14.19 – Debt Management).
• Begin to assemble a team. Selecting the right people to work with through this process is critical. The ability of the team to work with the owner and each other will lead to the best overall outcome.
  ◦ The three major delivery methods for construction projects are design–bid–build, design–build, and negotiated bid (see Terms Defined section). Understand the pros and cons of each method and select the one that is best suited for the project.
  ◦ Note that in some jurisdictions the process of going through the building department and receiving a building permit can be difficult. The right team, including architect, engineers, and contractor, can ease the process involved in navigating this road.

TYPES OF PRACTICE RENOVATIONS

For small interior facelifts consider the following.
• Enhance lighting:
  ◦ Add skylights or windows to brighten interior rooms with natural light.
  ◦ Replace old fluorescent lighting with new LED lighting for better light output and quality.
  ◦ Add task, accent, undercounter, or high-output lights in poorly lit areas.
  ◦ Install dimmer switches on your new LED lights in animal housing areas and other rooms, such as special procedures rooms, for gradual lighting transitions.
• Use or add color:
  ◦ Put color on walls where it can easily be repainted, and choose neutral colors for more permanent cabinetry.
  ◦ When repainting, repaint everything with a well-coordinated color scheme.
  ◦ Install colorful interior signage and well-selected artwork.
• Increase transparency:
  ◦ Open interior spaces with view windows or glass partitions.
  ◦ Use glass or partial-glass doors whenever possible.
  ◦ Replace solid partitions with frosted glass windows/walls where daylight can be shared but views need to be controlled.
• Interior designers or architectural firms with experience in color palette selection can be very helpful in selecting a current look and color scheme.

• Designers often work with three-dimensional models for developing the drawings. These illustrate how the space will be configured and can help you as the client visualize the space better. Three-dimensional model views can be enhanced into renderings for use as a marketing tool for staff and clients.

Large-scale remodels can include rearranging or repurposing rooms and/or adding an addition:

• If the renovation includes an addition, site expansion, site limitations, and parking capacity need to be considered.
• Order a complete analysis of the existing building systems, such as heating, air-conditioning, electrical, plumbing, and structural, to understand their limitations and capabilities.
• Have your architect review current building codes to determine the requirements for bringing the existing building up to code as required by the scope of the renovation.
• Your architect should also review accessibility standards for current compliance. Numerous regulations can affect the design of a renovation to an existing building based on the Americans with Disabilities Act.

HOW TO MINIMIZE THE IMPACT OF RENOVATION

Key steps to keep the hospital open and functioning during renovation include:

• Identify key decision-makers.
  ◦ Carefully select a few key people to make the remodeling decisions for the hospital, or for specific portions of the hospital, during renovation. Fewer decision-makers and more people maintaining the operations of the hospital will keep the process focused.
  ◦ Enlist one person or a small team to be a liaison or owner's representative to order and coordinate the delivery of new equipment and to communicate on a regular basis with the design and construction team. Depending upon the size of the project, it is not always in the best interest of the practice to select the hospital manager or an associate, as coordinating the renovation requirements may be very time consuming.
• Have a clear plan for the renovation process, including timeline for construction, phasing, parking adjustments, and desired outcome.
  ◦ Print the design and post it in the lobby and staff break room along with the timeline and upcoming action items to keep your staff on the same page and to inform your clients.
  ◦ Work with the design team regarding construction phasing and expected downtimes. Being prepared for such occurrences as power turn-offs to the building will help decrease any stress or anxiety that may occur.
• Communicate, communicate, communicate by updating the hospital team regularly on the progress of the project and what they should expect next.

EXAMPLES

N/A

CAUTIONS

• Careful planning of the infrastructure for all of the equipment while leaving enough flexibility in the design to allow for future changes in technology is a difficult but very important task.
• Finding finishes that are durable, affordable, and safe for the animals is one of the biggest hurdles in a renovation project.
• Good sound control is of key importance to client comfort, animal recovery, and the overall perception of the practice (see 11.15 – Noise and Odor Control).
• Quality design of the HVAC systems is required for patient health and odor control (see 11.16 – Heating, Ventilation, and Air Conditioning and 11.15 – Noise and Odor Control).

11.11. LEASEHOLD IMPROVEMENTS

BASICS

OVERVIEW

• Lease spaces in shopping centers have always made sense to veterinarians who are trying to establish a new practice, expand into new markets with satellite clinics, or those who are unable to invest money in a new freestanding facility. Lease spaces are even more attractive during downturns in the economy.
• Lease spaces usually make more sense when the budget or building program for a new hospital is less than 2,500–3,000 ft^2 (230–280 m^2). Site development and building shell costs can make a small, freestanding facility prohibitively expensive.
• A space leased within a shopping center will have significantly lower start-up costs, because the building shell and site are typically the responsibility of the developer and/or landlord. And, although you will pay for the maintenance and upkeep of the exterior of the building and of the site with your rent, this cost will be spread out between the various tenants, resulting in lower operational costs.
• As with anything to do with real estate and business, location is a prime factor. Ease of access, parking, visibility, and signage are important concerns. Along with location, an existing shopping center may have a proven track record and established anchor tenants to attract clients. Plus, a new shopping center is likely to be built in an area that is experiencing growth.

TERMS DEFINED

Demising Walls: Walls that separate a tenant's suite from another tenant's suite, typically in retail shopping centers and commercial buildings with multiple tenants.
Freestanding Building: An unattached building with its own site that includes parking, landscaping, and utilities. Examples would include veterinary hospitals located on individual lots or on a pad site in a development.
Noncompete Clause: In this case, it would be a contractual agreement between a landlord and a tenant to restrict a specific type of tenant from the development. For example, this type of agreement would not allow the introduction of a new PetSmart or large veterinary hospital into the same shopping center as an original, small-scale veterinary clinic.

ISSUES AND OPTIONS

ADVANTAGES OF LEASING

• The income generated versus dollars invested is often greater in lease spaces than in freestanding veterinary hospitals.
• There are significantly lower start-up costs in lease spaces than in freestanding veterinary hospitals.
• The owners of a shopping center are typically responsible for the maintenance and upkeep of the exterior of the building, thus freeing you to concentrate on the interior.
• It is usually easier to close out or relocate a practice in a lease space.
• A lease space allows you to benefit from the collective draw of a shopping center, especially when there are desirable anchor tenants.

DISADVANTAGES OF LEASING

• You will not be able to build equity in the real estate due to leasing rather than owning.
• Many of the improvements you make to the space will be left behind when you leave.
• After you leave, the improvements you have made will make it easier for another veterinarian to take over the space.
• You will have little control over the look, image, and quality of other tenants in the shopping center.
• Economic and demographic changes over time can have an effect (positive or negative) on the quality of the shopping center, tenants, and surrounding neighborhood.
• Many lease spaces are divided in a way that creates deep and narrow units, because building frontage is very valuable, and therefore more expensive. This arrangement can be less than optimal for the layout and flow of veterinary hospitals and tends to lead to dark interior spaces.
• It is more difficult for your business to be visible and recognizable in a shopping center, because most developments have strict design standards that result in spaces and signage that tend to look the same.

CONTRACT/LEASE ISSUES

• Know lease terms such as net, double net, triple net, and gross, and how they affect your costs and responsibilities. Most lease rates in the United States are expressed in terms of dollars per square foot per year.
• It is strongly recommended that you and your legal counsel thoroughly review the lease prior to signing anything.
• Try to include the following into your lease agreement:
  ◦ A tenant finish allowance to help you pay for the build-out of the space.
  ◦ A noncompete clause to keep similar types of businesses from moving into the same shopping center.
  ◦ First right of refusal for adjacent spaces to allow you to expand in the future.
  ◦ Limitation of rent increases to the same percentage as that of inflation.
• Define the ownership of built-in items. It is commonly understood that items attached to the building remain with the building when you leave. Dog runs, surgery lights, wet tables, and so on are examples of items that are typically attached to the building.
• Remember that everything is negotiable. Your negotiating power will be better when times are economically slow or in areas that are not in high demand.

LEASE SPACE SELECTION ISSUES

• Make sure the site is zoned to include veterinary hospitals. Check to see if there are additional restrictions, such as how long your patients would be allowed to stay or if boarding of animals is permitted.
• Do not assume that the landlord or leasing agent knows the zoning regulations. Find out directly from your local building/zoning department.
• Look for spaces with the most frontage to maximize your exposure and to give you the most opportunities to bring in light.
• Look for spaces that have access to the outside at the back of the building for staff, deliveries, trash, and animal removal. Some spaces only have one door in the front.
• Make certain that services such as water, sewer, and electrical are adequate for your needs.
• In shopping centers that are preleasing before construction or are under construction:
  ◦ If the space has not been constructed yet, ask that the concrete floors not be poured before you are able to install plumbing and conduit. Otherwise, you will be paying to saw-cut and patch the new floors.
  ◦ Request that the developer/landlord provide openings for additional roof penetrations. Most lease spaces typically come with only one heating, ventilation, and air-conditioning unit, and you will likely need three or more units plus exhaust fans, vents, and skylights.
• Lease space selection issues are illustrated in Figure 11-11-1.

LEASE SPACE HOSPITAL DESIGN ISSUES

• Keep the spaces as simple and as open as possible. Resist the urge to break the space into many small rooms.
• Because many lease spaces tend to be deep and narrow, try to incorporate multiuse and multipurpose spaces to keep the hospital open. Instead of long corridors, incorporate circulation space into and through such rooms as treatment. When corridors are necessary,

11.11. LEASEHOLD IMPROVEMENTS

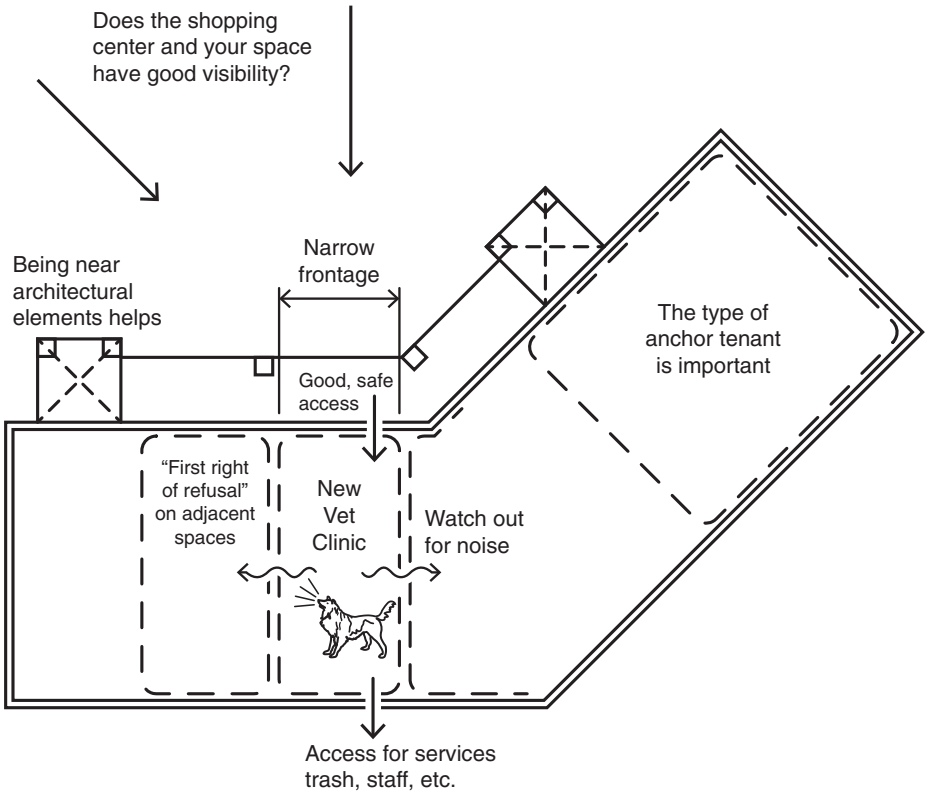

Figure 11-11-1.

Lease space.

try to combine lab, pharmacy, charting stations, and storage along each side.
- When walls are necessary, use interior windows to bring in light and give a more open feel.
- Consider installing skylights in treatment or other locations that do not have any access to exterior windows (see Fig. 11-11-1).
- Design the floor plan to minimize the noise impact to your neighbors (see 11.15 – Noise and Odor Control). It is better to locate the dog kennel on an outside wall or next to your neighbor's storeroom than on a wall adjacent to a yoga studio.
- Demising walls between tenants need to be designed and built to meet specific performance criteria to minimize the crossover of noise. Even tiny pinholes can transmit a significant amount of noise.

EXAMPLES

N/A

CAUTIONS

- When shopping for lease space, your mantra should be "location, visibility, access, frontage."
- Do your due diligence.
  - Verify that the property is zoned for a veterinary facility.
  - Know and understand the terms of the lease and have it reviewed by your attorney. Otherwise, you may end up being responsible for more than you think.
- Look for ways to stand out in a crowd.
  - Locate your hospital near unique building features or focal points, such as towers or portals.
  - Locate in a corner space.
  - If allowed, use awnings, bright colors, and unique architectural shapes that are easily seen from the exterior.
- Expect that some of your investment will be left behind when you leave.
- Look to the future for expansion needs.
  - Is your layout such that you can expand into the next space without having to change the arrangement of your existing hospital?
  - A first right of refusal agreement with your landlord on adjacent spaces will give you the opportunity to expand when the adjacent spaces become available.

11.12. DESIGNING WITH THE PATIENT IN MIND

BASICS

OVERVIEW

Animals are susceptible to anxiety and stress in hospital settings. Stress is a result of many factors, some of which can be controlled. Benefits of designing spaces that reduce stress include:

- a calmer environment;
- improved patient outcomes;
- lowered risk of secondary infections and disease;
- happier clients.

This chapter outlines strategies for designing low-stress environments for cats, dogs, and horses.

TERMS DEFINED

Air Change/Hour: The number of times the entire air volume of a room is completely removed and replaced within one hour.
Cortisol: A steroid hormone produced by the adrenal gland in animals and people in response to stress. Cortisol can be measured in the blood, so it is an indicator of stress responses in scientific studies.
Cubic Feet Per Minute/Cubic Meters Per Minute: The volume of air supplied or exhausted by the heating, ventilation, and air-conditioning system within one minute.

ISSUES AND OPTIONS

THE BIG PICTURE

Stress can be very damaging to animals. Upper respiratory infection in sheltered cats directly correlates to stress;[1] the longer a cat is housed, the more likely it is to develop an upper respiratory infection. Stress effects are not as severe in veterinary settings, because animals are housed for briefer periods and generally in less crowded conditions, but many of the same risk factors apply.

STRESS REDUCTION

It is important to acknowledge stress reduction as an overall goal in the design of a veterinary hospital. Strategies include the following.

- Reduce chaos. Animals that are housed and treated in loud and chaotic environments are stressed and often difficult to handle. Strive to create a calmer environment:
  - Design the hospital traffic flow to discourage circulation through treatment areas and animal housing areas (see 11.13 – Client/Patient Flow).
  - Recover animals from anesthesia in enclosed, quiet wards when possible.
  - In large hospitals, create treatment areas inside critical patient wards.
  - Reduce noise, including reverberant noise, and noise from air-handling equipment (see 11.15 – Noise and Odor Control).
  - Give pets as much choice as possible. For example, provide several methods for examining dogs, such as lift tables and cleanable mats for floor examinations, to eliminate forceful handling.
  - Enrich the exam and housing environments with pheromone dispensers and soft music or white noise.
- Go natural. Animals, like people, respond better to environments that are more natural (see 11.18 – Sustainable Design for Veterinary Practices).
  - Natural daylight has been proven to shorten recovery times, improve employee morale, and increase efficiency in human hospital settings.[2]
  - Use indoor/outdoor settings. Many animals and humans prefer to be in quasi-outdoor settings. This concept may be limited by your climate and other factors, but it can be incorporated in varying degrees, such as:
    - covered outdoor exam areas;
    - operable windows to allow for natural ventilation in patient wards.
- House according to species and risk. Even in the smallest hospital, it is best to separate cats from dogs and critical patients from others.

STRATEGIES FOR CATS

When cats are stressed, they tend to suppress normal behaviors, such as grooming, eating, drinking, play, and resting, rather than show abnormal behaviors.[3] It is important to recognize these subtle cues and prevent conditions that cause stress. Fortunately, cats respond well to improvements in housing configurations and designs. Some strategies that have been demonstrated to work include the following.

- Allocate enough space, especially if you plan to house cats for any length of time. Studies show that individually housed cats need at least 9 ft^2 (0.9 m^2) of space to reduce blood cortisol levels.[1]
- Enrich the space that you are providing to the level that is appropriate for the situation. In a boarding situation it is best to provide the cat with a separated litter compartment, a hiding box, and multiple levels. In a medical ward this may not be possible, but a towel placed in the cage and a screen over a portion of the door can provide the cat with some comfort and defensible space.
- Select "quiet latches" on cage doors that do not make a clattering noise when closed. Most manufacturers offer this type of latch.
- Provide a window in the back of the cage, and when possible place cats against outside walls where they can see out. Cats respond well to windows in the back of cages even when there is no view, because the cage feels less claustrophobic.
- Ventilate through cages to control odors in the space in general, cut down on overall air-handling requirements, and provide better air quality for the cats (see 11.16 – Heating, Ventilation, and Air Conditioning).

STRATEGIES FOR DOGS

Many studies have been conducted in both animal welfare and animal laboratory settings on strategies to reduce stress in housed dogs.

Stressed dogs show a variety of stereotypic behaviors, such as excessive barking. These behaviors can increase in severity depending upon the dog, the environment, and the length of time the dog is housed. Dogs, like cats, respond well to environmental enhancements, such as the following:

- Avoid housing dogs across an aisle from other dogs.
- Develop enclosures that are wider and less deep. Dogs react poorly to narrow enclosures.
- Cut down on unpleasant stimulation. A veterinary hospital that has taken this concept to its natural conclusion and has developed fully enclosed rooms for its housed dogs has reported a 95% decrease in the rate of postsurgical sedation when placing dogs in this quieter setting. Another benefit is that clients are more comfortable with the care that their pets are receiving.
- Provide natural daylight in animal ward spaces. If possible, provide windows low on the wall to let in more light and allow the dogs to look out.
- Provide enough air flow to remove odors and reduce humidity.
- Include radiant heating in the slab. Place the radiant heating in a portion of the run to provide the dog with a choice about whether to lie on a warm or cool slab.
- Use individual drains rather than trench drains to cut down on odors and cross-contamination.
- Locate wards close to exterior doors and provide convenient and sanitary exterior dog-walking areas to encourage staff to take the dogs out frequently.

STRATEGIES FOR HORSES

- The key to designing low-stress housing for horses is to develop solutions that are as much like the natural environment as possible within the limitations of the population that is being housed. Natural ventilation is appropriate in barns housing healthy horses, whereas horses that have communicable diseases must be housed in mechanically ventilated environments.
- Highly managed environments need a lot of attention to detail to protect the horses' wellbeing. If you plan to hose clean the stalls, then they must be designed with completely sealed surfaces to prevent harboring dangerous pathogens such as salmonella, which grow well in damp and porous surfaces.
- The following design guidelines apply to all equine environments:
  - In the northern hemisphere, equine wards are best oriented on an east–west axis, with the long direction facing north and south. Locate storage and prep areas on the north side and allow the horses to benefit from the southern exposure. Overhangs can be designed to allow the lower winter sun into the stall while shielding from the hot summer sun.
  - Design for the local climate, and learn from indigenous, traditional architecture. An example is the European shed row concept where the equine stall boxes are not enclosed within a barn. This works well in a mild climate and is the ultimate solution for natural ventilation.
- Allow horses to look out of their enclosures. This will help prevent stress and frustration behaviors.
- Prevent temperature extremes between inside and outside. Barns should be tempered just enough to support the recovery of the horse.
- Avoid drafty conditions. Poorly designed mechanically ventilated barns can increase physical discomfort.
- Incorporate natural daylight. Natural daylight will help create a space that feels less frightening and foreign to the horse.
- Design stalls/boxes to be the right size for the patient. In a medical setting, a typical 12 ft × 12 ft (3.6 m × 3.6 m) stall is not often sufficient. Larger stalls should be provided for larger breeds, mares and foals, neurological patients, and other special conditions. Studies have shown that horses can only have REM sleep when lying down.[5] (See 11.21 – Large Animal Facilities.)

11.13. CLIENT/PATIENT FLOW

BASICS

OVERVIEW

• The design and layout of a new hospital is key to the success of the veterinary practice.
• The size and type of hospital, the practice organization, and the types of services that are offered are critical factors in determining the layout of spaces and the circulation between them. The primary goal is to develop a solution that optimizes the organization, efficiency, and convenience for clients, patients, and staff.
• The first step in developing an efficient floor plan is to begin with a clear organizational structure that will become the basis and framework for the entire design.

TERMS DEFINED

Departmental Floor Plan: A plan with the hospital functions grouped or clustered into distinct, departmentalized areas.
Linear Floor Plan: A plan with the front, middle, and back portions of the hospital one after the other in a line.
Triangular Floor Plan: A plan with the front, middle, and back portions of the hospital in a triangular pattern.
Wayfinding: People's ability to find their way through a facility and to their selected destination.

ISSUES AND OPTIONS

ORGANIZATION AND LAYOUT

• Most veterinary facilities can be divided into three basic functional zones and numerous subzones.
• The design of mechanical systems, noise containment, and especially the movement of clients, patients, and staff are all dependent on the arrangement of these three zones.
• The zones are defined by your needs, goals, and building program, and the building program is defined by your budget, the size and shape of your space, and your imagination.

THE THREE ZONES: FRONT, MIDDLE, BACK

• The front zone is typically considered the area that will be occupied by the public (your clients). This zone commonly includes the waiting area, reception area, and exam rooms.
• The middle zone is the medical or procedural zone and typically includes the lab, pharmacy, treatment area, x-ray, surgery suite, specialty areas, and offices.
• The back zone includes the animal wards, storage, utility, and mechanical spaces.

FACILITY TYPES

The first companion animal hospitals were composed mostly of renovated houses, which worked well for one-doctor, low-volume practices. Then, as the need for additional capacity and services grew, new concepts were developed to improve efficiency.

Today's hospitals are commercial buildings, with wide circulation paths and generous room sizes. However, the organizational strategy will depend on the size of the hospital.

THE CONVENTIONAL OR LINEAR PLAN

• In small, freestanding facilities and storefront clinics of approximately 2,500 ft^2 (232 m^2) or less, the traditional front, middle, back configuration is the most efficient approach (Figure 11-13-1).
• Flow-through traffic minimizes square footage (building area) and travel distance between the front–middle and the middle–back zones.
• The conventional configuration has several drawbacks as facilities grow and increase in staff. With the through traffic passing through the middle zone, bottlenecks and traffic jams are created and become worse as the hospital grows.
• Examples of the conventional plan can be found in very small, freestanding hospitals, hospitals where the site conditions force the building to be long and narrow, and in most smaller sized lease spaces.

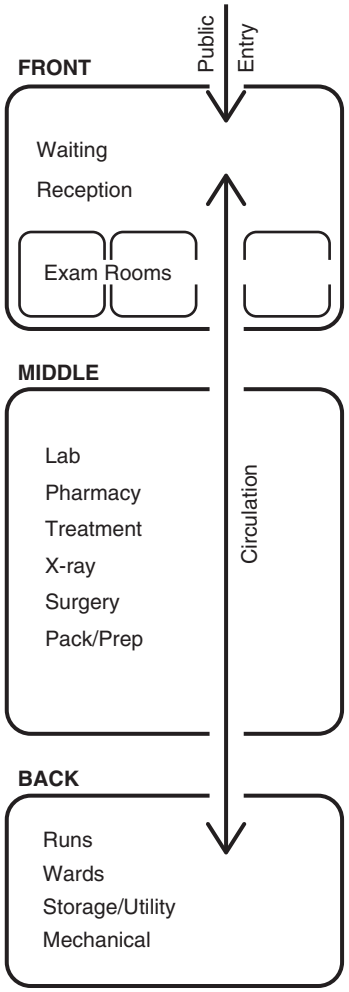

Figure 11-13-1.

Linear (front, middle, back) plan.

THE TRIANGULAR PLAN

• The triangular plan pulls the back of the clinic around to the side so that the three zones form a triangle, thus eliminating the through traffic of the conventional approach (Figure 11-13-2).
• The triangular plan allows circulation between any two zones without having to pass through the third. This scheme also shortens the distance between the front and back zones.
• Placing the workroom, lab/pharmacy, and/or a doctors' station at the center of the triangle establishes a control point for the whole hospital.
• Examples of the triangular plan include most general veterinary hospitals that are between 3,000 and 7,000 ft^2 (280–650 m^2).

THE DEPARTMENTAL PLAN

• As facilities grow or offer more diverse services, their functional requirements grow more complex. A large facility that is not well organized may feel like a maze and operate inefficiently.
• To minimize conflict, confusion, and unnecessary circulation space, it makes sense to divide large facilities into distinct areas or

11.13. CLIENT/PATIENT FLOW

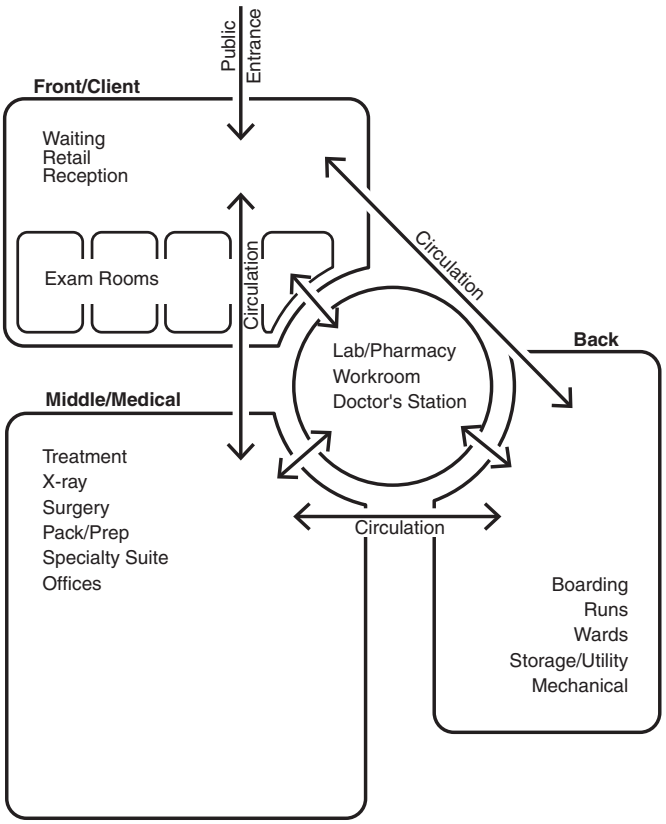

Figure 11-13-2.

Triangular plan.

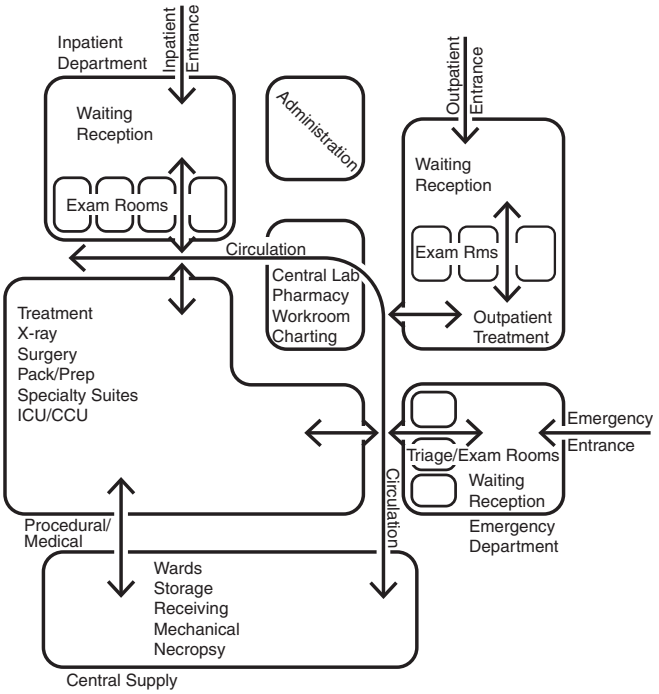

Figure 11-13-3.

Departmental plan.

departments. Spaces or functions can be clustered into groups or modules that define the various departments (Figure 11-13-3).

- Like human hospitals, the individual departments function in a semiautonomous way to help maximize staff efficiency and minimize client, patient, and staff cross-traffic.
- To operate efficiently, a large facility must have a clear circulation pattern. A racetrack type of circulation pattern will minimize complex cross-circulation and help to control traffic between and through the individual areas. It can also reduce the travel distance between departments. Another option for circulation is an oversized central spine onto which departments are connected via perpendicular hallways.
- Examples of departmental facilities include hospitals that offer separate inpatient and outpatient services, specialty referral and emergency hospitals, hospitals that are separated into species-specific departments, and large, full-service facilities.
- Veterinary hospitals offering boarding and grooming may be organized like departmental hospitals if they are operated with the hospital as a cohesive business. If the boarding and grooming services are operated separately, they may be physically separated as well.

SPACE PLANNING AND INTERIOR LAYOUT

Many of the secondary decisions made as your floor plan begins to develop can complement your overall organizational concept. These decisions will be based on your needs, practice style, design program, and budget.

WAYFINDING

Wayfinding is a term used to describe how people find their way through a space or building.

- The proper arrangement and alignment of spaces will help your clients feel oriented and help to improve the flow of people and patients.
- People often find themselves lost or disoriented in human hospitals, because the circulation paths are often arranged in and around particular functional spaces rather than the spaces being arranged around the circulation paths. The situation is made worse when the departments, rooms, corridors, and interior finishes all look the same.
- Avoid the human hospital wayfinding problem in larger veterinary hospitals with the following strategies:
  - Create easily identifiable spaces by using colors that vary by hue and intensity.
  - Create nodes (an intersection or gathering point) that are unique in color, form, and shape.
  - Vary ceiling heights or corridor widths to signal changes in circulation.
  - Avoid signage as the primary method to help people find their way.
- Because of their size and complexity, larger, full-service hospitals may function better when there are multiple points of entry and a limited amount of internal space devoted to public circulation. Although this approach requires more staff to manage, the benefit is an improvement in the flow of clients and patients, clarity of staff duties, and improved management of space. Human hospitals will have an inpatient entrance, an emergency entrance, and a separate area for diagnostics and x-ray. Outpatient services are typically provided at an offsite medical clinic. Similarly, with a full-service veterinary hospital plan, clients can freely access the public side of the various departments, but only the patients and staff are able to circulate internally.

THE RECEPTION AREA

The first experience your clients have in your practice will take place in the reception area. Overcrowding and congestion at the reception desk, combined with confusing flow patterns, can lead to undesirable pet interactions and client dissatisfaction.

11.13. Client/Patient Flow

• In a traditional model, your client walks in the front door, checks in with the receptionist, and then sits in the waiting area before being called into the exam room. Once the exam is complete, your client returns to the reception desk and is cashed out. This arrangement is space efficient and works for smaller hospitals, but it can also lead to congestion at the reception desk.
• Larger facilities can benefit from reception layouts that allow clients to move in a circular fashion through the facility. In this case, clients will enter at one location and check in at the reception desk. After they have received the necessary services, they check out at a cashier's station and exit through a different door. Even though this approach uses more space and requires more staff, it is better at reducing congestion by minimizing the number of times the clients and patients cross paths.

EXAM ROOMS

In older hospitals, the paths to and from the exam rooms are often vague, narrow, and congested. A common example is a hallway to the exam rooms that is so narrow that two large dogs can stop traffic until either one backs out of the way or steps into a side door. Strive for simple and spacious circulation to and from the exam rooms.
• Circular flow or one-way traffic is effective in reducing congestion in front of the exam rooms.
• Facilities with more than five or six exam rooms will benefit from grouping the rooms into pods of three or four.
  ◦ The pod configuration uses less space.
  ◦ Exam rooms grouped together can help with room scheduling.
  ◦ As an added benefit, a group of three exam rooms can be easily managed by a doctor, technician, and one other staff member.

TECHNOLOGY

Technology is playing an ever-increasing role in veterinary medicine and the design of veterinary facilities (see 11.14 – Integrating Technology). Computers, audio visual/information technology and network systems, and diagnostic equipment are becoming more sophisticated, affordable, and available. The following are some ways that technology can affect and improve on the way clients, patients, and staff move through buildings.
• Some hospitals have begun to check clients out in the privacy of an exam room rather than in the public setting of the reception desk. Besides reducing congestion at the reception desk, this approach allows the doctors and staff to speak confidentially with clients and discuss billing or other issues in a private setting.
• Paper files are not common anymore, and file space can be reduced or eliminated to make way for better circulation around reception desks.
• Instead of walking up to a receptionist sitting behind a large reception counter, your clients could be admitted by a greeter carrying a handheld device. The greeter could be stationed at a small desk, roam freely around the reception area, and meet clients at the front door or at the curb.
• Digital files and images can be pulled up in a variety of places around the hospital, meaning that workspaces can be reduced in size or made mobile, thereby eliminating the need for large, fixed desks and offices.
• Improved diagnostics are allowing medical equipment to become smaller, lighter, and more portable. Rather than bring the patient to the diagnostic equipment, the equipment is brought to the patient.

SPECIALTY REFERRAL AND EMERGENCY HOSPITALS

• One of the most beneficial floor plans for specialty referral and emergency practices is one that arranges the various functional spaces around a central core area such as central treatment or intensive care unit (see 11.19 – Referral and Emergency Facilities).
• Keep entrances separate and identifiable for clients who are not familiar with the layout of the building.
• Entrances to emergency facilities need to be secure and controlled for 24-hour access (see 12.5 – Security Issues for Hospital and Staff).

PET RESORT AND BOARDING FACILITIES

Clients who are boarding their pets usually drop them off early in the day and pick them up in the late afternoon or evening. These times tend to coincide with medical patients who are also dropped off and picked up at similar times. This usually leads to congestion in the parking lot, around the reception desk, in the waiting area, and at the cashier's counter.

Hospitals that are combined with boarding facilities can reduce congestion and improve circulation by separating parking, receiving, and check-in/cash out (see 11.20 – Pet Boarding and Luxury Accommodations).
• Provide additional space in the parking lot for vehicles to queue, maneuver, park, turn around, and exit.
• Consider providing a curbside concierge service to meet people at their cars during peak hours. This helps reduce the number of people who must park their vehicles and walk into the facility.
• Develop ways to make the check-in and checkout process hassle free, such as is described in the next section.
• Provide animal holding near the front for pets being dropped off or picked up. This will help reduce the number of times the receptionist or a staff member will have to run back and forth between the front and the kennels.

EXAMPLES

The following case study of a facility incorporates many of the aforementioned concepts. This full-service veterinary facility includes general medicine and is separated into inpatient and outpatient services, a separate emergency clinic, and a pet resort.
• A central entrance and reception area serves the general hospital and its separate inpatient and outpatient departments. The emergency hospital has its own easily recognized entrance, secure entry vestibule, and reception area. This layout has the dual function of allowing severe cases to bypass the people waiting for routine medical services and making it easier to secure the emergency clinic after hours.
• The staff entrance is at the back of the hospital, allowing for clear separation between the flow of staff and the flow of clients.
• The central treatment area is the hub of the medical portion of the building, and the various departments and entrances radiate out from that point. This scheme serves the clients by giving them entrances that are clear and identifiable, and circulation patterns that are simple to follow.
• The pet resort has its own entrance and check-in area and offers curbside concierge services to save clients extra steps.

CAUTIONS

• Start with a clear organizational framework to help achieve optimum efficiency.
• Start at the front of the building. Proceed step by step through the facility, looking at it from the perspective of the client, the patient, and the staff.
• Look for ways to optimize the check-in and checkout process.
• Spend extra time with your design team on the layout of the exam rooms, as this will often drive the organization of the rest of the hospital.
• Determine the best way for patients to move efficiently through your facility. Communicate with your design team about how patients should be separated (inpatient versus outpatient, by species, etc.).

• Determine the number of staff members needed to safely and efficiently operate your facility.
• Study several floor plans to see how others have solved their design problems.
• Know your needs, goals, and budget, and be realistic.
• Keep the future in mind when making your decisions. A master plan outlining future expansion options can help to keep the growth of your facility on track, particularly when you believe that an expansion could be in your future.
• Approach your project with an open mind. A rigid approach will lead to rigid solutions.
• Factor in the need for, and cost of, more staff members to manage your facility as it grows.
• When your program grows, you will need to think bigger when organizing spaces, utilizing staff, and managing your facility.
• Look at the human hospital model for examples of organization, efficiency, and future trends.

11.14. INTEGRATING TECHNOLOGY

BASICS

OVERVIEW

• Technology plays an increasing role across all industries, and veterinary practices are no exception. Current technology and future trends can impact building infrastructure with telephones, computer systems, audio/visual, diagnostic, and treatment systems, imaging equipment, and fire and security systems. Because imaging and diagnostic equipment is becoming increasingly digital in nature, images can easily be saved to a computer for input into a medical file or be transmitted across the Internet for outside consultation, revolutionizing the way veterinary medicine is practiced.
• It is now possible to combine invoicing/billing, scheduling, client information and education, medical diagnostics and protocol, practice performance monitoring, inventory management, and diagnostic laboratory capabilities into an interactive computer format. It is currently possible to digitize images and information received from the otoscope, ophthalmoscope, endoscope, ultrasound, or x-ray and import this information into a medical file or a client handout. It is also possible to transmit this same information to specialists via the Internet for consultation.
• As advanced imaging and diagnostics become increasingly accessible, it is likely to have an impact on the general nature of veterinary hospitals. Even though treatment areas serve as the hub of current veterinary practices, imaging and diagnostics could have a larger role in the hospital of the future. Miniaturization will move advanced diagnostics into the exam room and may cause the typical 8 ft × 10 ft (2.5 m × 3 m) exam room to grow slightly, whereas treatment areas correspondingly shrink.
• Until recently, veterinarians could not afford the equipment and training necessary to offer oncology services to their clients. However, through time shares, the advent of smaller magnetic resonance imaging (MRI) machines for veterinary medicine, and the growing availability of used and reconditioned computed tomography (CT) scan machines and linear accelerators, oncology is becoming one of the largest emerging fields of veterinary medicine.
• Furthermore, because veterinarians now practice oncology, there will be more and continued research for better diagnostic equipment. Even though CT scan machines and MRIs are invaluable imaging tools, human medicine is already exploring the combination of metabolic and anatomic imaging in positron emission tomography/CT machines. Although these machines are not yet affordable, they demonstrate the continual evolution of diagnostic imaging.
• Integrating this new technology into the infrastructure of a traditional veterinary practice requires some careful consideration. With ever-increasing miniaturization, flexibility is a must. For example, a particular piece of equipment that you are planning to purchase may end up being one-third its current size by the time you actually buy it.

TERMS DEFINED

Bluetooth: Short-range wireless technology used for connecting mobile devices, such as a wireless electrocardiograph.
Computer Networking: Provides basic connectivity between invoicing/billing systems, patient records, building security, building controls systems, and digital diagnostics equipment.
IEEE 802.11: Currently the most widely used standard for wireless radio-frequency (RF) data transmission.
Linear Accelerator: Device most commonly used to deliver highly focused beams of x-ray radiation in oncology treatments.
Local Area Network (LAN): Connection of computers, printers, and other network devices in a localized area, such as within a single facility.
Nomadic Computer: Portable, wireless computer system, such as a tablet- or notebook-type personal computer or personal digital assistant. Nomadic computers and wireless networks can provide flexibility in a veterinary hospital.
Tablet Computer: Any of a number of portable computers, approximately the same size as a notebook computer, in which the display screen serves as a touch-sensitive input device. The most common example is the iPad by Apple Computers.
Uninterruptible Power Supply (UPS): A battery pack used to provide temporary power to critical systems in the case of a power outage.
Wide Area Network (WAN): A computer network that spans a wider area than a LAN, usually connecting several LANs together. The Internet could be described as the largest WAN in the world. Smaller, private WANs that span large geographical areas operated by governments, universities, and large corporations serve as other examples.
Wired Equivalent Privacy: An encryption protocol defined in IEEE 802.11, which is used to provide security of data transmissions over a wireless network.

ISSUES AND OPTIONS

PLANNING FOR TECHNOLOGY SHOULD INCLUDE:

• Spatial considerations for the various types of equipment.
• The cost of training personnel and/or the hiring of people who specialize in the operation and maintenance of various systems.
• An understanding of the initial and long-term system maintenance costs. Complex and specialized systems are often more temperamental and tend to require more attention and maintenance.
• Special consideration during the early phases of design to help "future proof" your facility for the inevitable changes. Flexibility is the simplest way to keep up with technology that is ever changing (Figure 11-14-1).

INTEGRATING COMPUTER SYSTEMS

• A small LAN requires a network data server computer that is no larger than a typical desktop personal computer.
• The network server is best located in a centrally located data/communications closet. Owing to the amount of heat generated from the computer and networking equipment, the information technology closet typically requires an exhaust fan as a minimum means of keeping it cool and often needs dedicated supplemental air conditioning (see 11.16 – Heating, Ventilation, and Air Conditioning).

Figure 11-14-1.

Digital ultrasound in exam room of West Houston Veterinary Medical Associates, Houston, Texas. Photo courtesy of M3 Photographic.

Figure 11-14-2.

Computers in treatment area of Upstate Veterinary Specialists, Greenville, South Carolina. Photo courtesy of David Dietrich Photography.

• Other network equipment that should be located in the data/communications closet includes a network switch and a single UPS or more for computer network and telephone equipment.
• A 4 ft × 4 ft (1.2 m × 1.2 m) plywood panel on the wall is recommended for mounting all telephone and computer cable terminations.
• Data ports should be provided throughout the hospital for network-linked computer terminals and current or future network-capable devices.
• Connectivity may be either via cabling, wireless technology, or a combination of both. Wired networks have the advantage of better speed, consistency of signal, and security, whereas wireless systems allow the use of nomadic computers and ease of installation in renovations.
• Mobile, networked notebook or tablet computers may reduce or eliminate the need for stationary, fixed location computers (Figure 11-14-2).

INTEGRATING X-RAY EQUIPMENT

• A typical x-ray room should be approximately 9 ft × 12 ft (2.7 m × 3.7 m).
• American Animal Hospital Association Standards of Accreditation require that practice team members remain outside the room during exposure.
• A state-licensed physicist is required to prepare a shielding analysis and plan to protect other building occupants from scatter radiation.
• Digital x-ray is eliminating the need for darkrooms and film storage (see 9.8 – Digital Imaging Systems in Practice).
• Even if you do not plan to go digital right away, any new veterinary hospital should include data ports in the x-ray room.

INTEGRATING SPECIALIZED IMAGING EQUIPMENT

• **CT scanner.** A CT scanner requires shielding similar to an x-ray. Minimum space requirements for the CT scanner room will be approximately 16 ft × 18 ft (4.9 m × 5.5 m). It also requires a 6 ft × 10 ft (1.8 m × 3 m) control room and a 6 ft × 8 ft (1.8 m × 2.4 m) equipment closet. More robust "multislice" scanners require larger rooms than single-slice or dual-slice scanners. If creating a room the correct size for the installation of a dual-slice CT scanner, consider creating an oversized room instead to accommodate a future upgrade to a multislice CT.
• **MRI.** MRI requires RF shielding rather than radiation shielding. MRI is also affected by ferrous metal located within approximately 16 ft (4.8 m) of the facility. This includes the building framework, electrical fixtures, conduit, and even cars and trucks that may pass by outside. An equipment room with a raised computer room floor is needed to house all of the MRI computer equipment. The computer room should be located immediately adjacent to the scan room and requires a dedicated cooling system capable of maintaining temperature and humidity levels (Figure 11-14-3).

LINEAR ACCELERATORS

• Linear accelerators may have the most extensive and complex shielding and isolation requirements of any machine used in veterinary medicine.

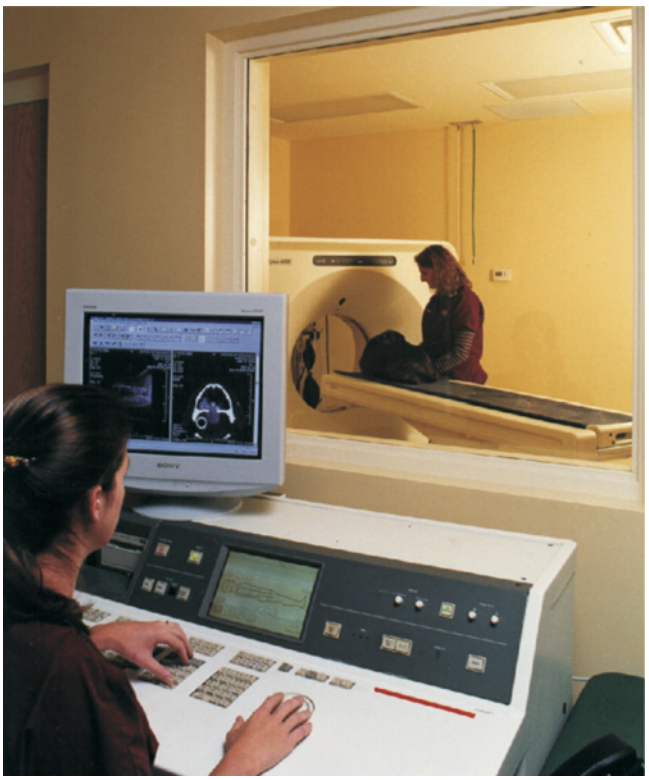

Figure 11-14-3.

CT scanner in specialty referral practice. Upstate Veterinary Specialists, Greenville, South Carolina. Photo courtesy of David Dietrich Photography.

11.14. INTEGRATING TECHNOLOGY

Figure 11-14-4.

Linear accelerator in specialty referral practice. Florida Veterinary Specialists, Tampa, Florida.

• A clear floor space of as much as 20 ft (6 m) on all sides is required. Excluding the control room, the space may be 35 ft (3.25 m) square and 16 ft (4.9 m) high.
• Shielding can consist of several feet (1 m) of concrete around and over the equipment in a vault-like assembly (Figure 11-14-4).

SECURITY SYSTEMS AND ELECTRONIC ACCESS CONTROL DEVICES

• Physical building security and information security needs are growing with all of the added technology in veterinary practices.
• With current electronic access control systems, you can program access to your hospital on an individual basis or on a per door basis (see 12.5 – Security Issues for Hospital and Staff). Either keypads or proximity card readers can be used. Computer connections to the access control devices may be either through wired or wireless connections to allow programming changes.
• Most electronic access systems include tracking capabilities.

HEATING, VENTILATION, AND AIR CONDITIONING AND ELECTRICAL ISSUES

• Much of today's increased technology and equipment can put unusual loads on your electrical and heating, ventilation, and air-conditioning (HVAC) systems (see 11.16: Heating, Ventilation, and Air Conditioning).
• It is possible that the electrical service available at your site may not be compatible with the needs of your specialized equipment, necessitating the installation of an onsite transformer. Always contact the equipment supplier to obtain detailed electrical requirements, including voltage, amperage, phase, and duration of need.
• Specialty equipment tends to create heat, thus requiring an increased cooling need in the space where it is located. Thermostatically controlled exhaust fans or additional cooling may need to be provided in computer rooms or rooms with other specialty equipment.
• Advanced lighting control systems integrated with day-lighting schemes can be an important part of energy-wise "green" buildings (see 11.18 – Sustainable Design for Veterinary Practice).
• For larger facilities, direct digital control of HVAC systems can provide direct, easy to understand feedback on how these systems are functioning and give you the capability to make adjustments as needed.

EXAMPLES

• A great way to use a computer network is as an interface to a digital camera monitoring system. Advanced computer systems now have the capability to transmit video camera imaging onto any computer monitor, including the capability to organize and display multiple, remote, live camera images. If your practice is focused on inpatient care, consider providing a website where your clients can log on and see live images of their pets. Facilities offering boarding can use this same technology to allow clients to see images of their boarded companions. Video cameras can display live or taped images, including an operating room overview, endoscopic camera views, and digital x-rays. In addition, large, flat-screen wall monitors can be located in surgery suites and public areas for staff teaching or client viewing. A surgeon could view and discuss real-time images sent from the lab, or x-ray images could be pulled up at a moment's notice. Veterinarians can now use their computers to monitor staff, provide building security, and educate their clients about procedures by providing images from surgery, treatment, endoscopy, and dentistry.
• The use of nomadic computers has the potential to completely eliminate the reception desk from the lobby of a veterinary hospital. It is possible that a greeter with a wireless tablet computer can check in clients while greeting each animal without the barrier of the reception desk. In the same way, checkout can be performed in the more private setting of the exam room rather than at a corner of the reception desk.
• Flat-panel, touch-screen nurse call systems are currently being used in human healthcare. These systems speed interaction and communication between the staff members. Coupled with an infrared locating system, it is possible to keep track of staff, patients, and equipment. It is also possible for a greeter with a wireless headphone to roam the facility and at the same time be responsible for the front greeter desk, because infrared sensors can sense when a client comes through the front door.

CAUTIONS

• It is easy to become overwhelmed by the array of new medical equipment on today's market. Some are merely tools. Others may revolutionize the way you practice medicine.
• If you are planning a renovation or are building a new hospital, you have an excellent opportunity to educate yourself and make conscious choices about which technologies you would like to integrate into your facility.
• Although there are practical limitations to how much time can be spent chasing every new or improved technology, some of these technologies can create many opportunities for veterinarians.

MISCELLANEOUS

ABBREVIATIONS

CT: Computed tomography
HVAC: Heating, ventilation, and air conditioning
LAN: Local area network
MRI: Magnetic resonance imaging
RF: Radio-frequency

UPS: Uninterruptible power supply
WAN: Wide area network

11.15. NOISE AND ODOR CONTROL

BASICS

OVERVIEW

• Clients form opinions about a veterinary hospital based on their first experiences. If the hospital smells bad and is noisy, the clients will be less likely to believe in the quality of care that their pets will receive.
• Noise and odors can also have negative effects on the hospital staff. For example, if the noise in the kennels is deafening, staff members are less likely to spend enough time cleaning kennels and caring for the animals.
• The following outlines the basics of noise and odor in veterinary settings and offers design guidelines for mitigating their negative effects.

TERMS DEFINED

Decibel (dB): A measure of the intensity of sound, based on the human ear. The lowest end of audible sound is marked by 0 dB. The sound intensity created by a jet engine is 140 dB. An increase of 10 dB represents a *perceived* doubling of the sound. For example, a sound measuring 80 dB will seem twice as loud as a sound measuring 70 dB.
Noise Reduction Coefficient (NRC): An empirically derived rating for materials or material assemblies that describes the percentage of noise absorption measured at 250, 500, 1,000, and 2,000 Hz. For example, a ceiling material that has an NRC rating of 0.55 absorbs 55% of reverberant sound waves. A material that has an NRC rating of 1.0 absorbs 100% of reverberant sound waves.
Reverberant Sound: Sound waves that bounce off surfaces.
Sound Transmission Class (STC): An empirically derived rating for materials or material assemblies that describes the number of decibels "screened" when noise passes through. For example, a wall that has an STC of 45 will screen 45 dB of sound. If the sound is 65 dB, then 20 dB will be audible on the other side of the wall. Generally, walls with greater mass screen more noise.

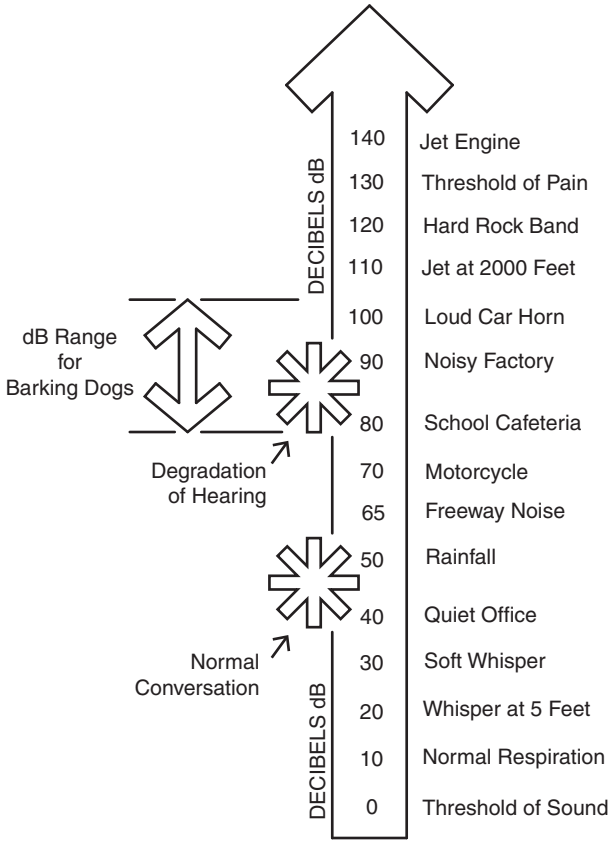

Figure 11-15-1.

Decibel range.

ISSUES AND OPTIONS

NOISE

Veterinary hospitals can be noisy. Fortunately, there are many design tools available to control noise within rooms and throughout the facility. The noisiest areas are often the dog wards and runs. The simplest first approach is to discuss what can be done to prevent excessive barking. Dogs may bark because of stress, or because people or dogs are passing their enclosures, or simply because other dogs are barking. Figure 11-15-1 shows a decibel scale with relative sound intensities.

Options

• Consider layout options that minimize the number of dogs that are housed across an aisle from one another.
• Install isolation panels or walls between runs to prevent barrier aggression.
• Add natural light through windows and skylights to create a more pleasing environment.
• Play soft music or audio books for the dogs.
• If the hospital offers boarding, provide an outdoor or indoor area for exercise.
• Minimize unnecessary artificial noise within the dog run rooms.
• Prevent placing air-handling equipment directly over animal ward spaces to prevent the rumbling noises that are created by this equipment.

After taking preventative measures, the next step is to develop ways to mitigate the effects of noise. There are five methods for reducing noise: absorption; isolation; dissipation; masking; and heating, ventilation, and air-conditioning (HVAC) design.

ABSORPTION

The first line of defense is to absorb noise near the source with materials such as sound baffles, acoustical wall panels, and acoustical panel ceilings that have high NRC ratings. However, high NRC ratings and water and bacteria resistance are opposing forces for materials. This is due to the fact that absorptive materials need to be somewhat porous, making them difficult to clean (Figure 11-15-2).

Options

• Do a thorough study of the market options to find the materials that balance sound-absorbing qualities with cleanability, durability, and water resistance. It may be necessary to get advice from an architect or contractor and from materials manufacturers.
• Hang the sound absorptive materials high on the walls and from the ceiling, where they will be out of the way and less likely to be damaged.

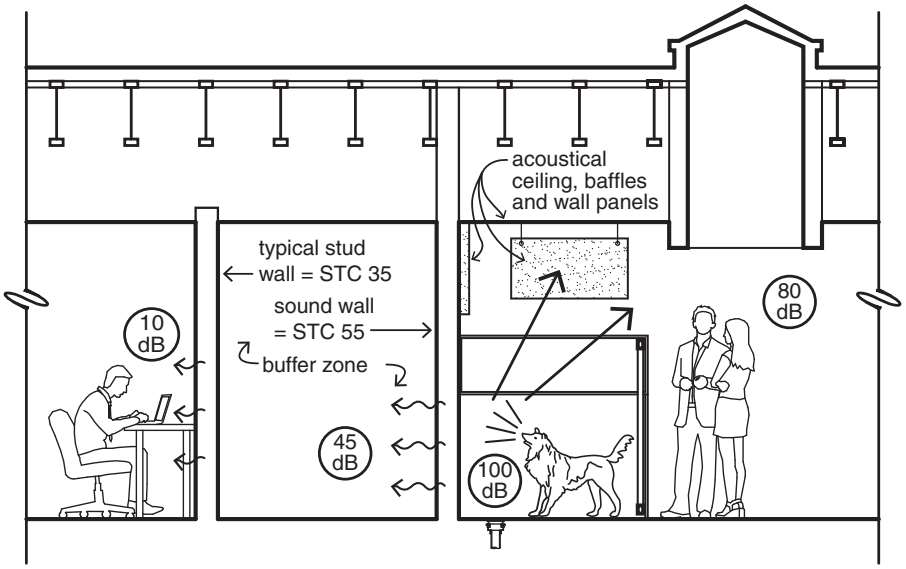

Figure 11-15-2.

Buffer zone to control noise.

• Dogs can generate 100 dB of sound in kennel areas. It is important to use some sound absorptive materials in the dog run rooms that have NRC ratings of 0.70–1.0. A good choice for ceilings is a cleanable, moisture-resistant ceiling panel that has an NRC of at least 0.70. Pair this with acoustical wall panels with NRC ratings of 0.85 to 1.0. The material used for acoustical baffles and panels can be fabric, polyvinyl chloride or nylon, Styrofoam, or perforated wood or metal. Predictably, NRC ratings drop in materials with increased cleanability.

ISOLATION

Even in the best scenario, sound absorption is limited to reverberant sound. It is not possible to absorb the noise as it is originally produced. Therefore, the next goal is to isolate the sound before it causes a problem. Sound isolation is measured with the STC rating.

Options

• Design the facility with sound walls and traps so sound does not travel freely from the original source to another room. Walls with a high STC will effectively screen much of the noise; however, they may not screen enough. For example, if the dogs generate 100 dB of sound in the kennels, the walls would need to screen 100 dB. This is not practical or even feasible. Fortunately, there are other options.
• One of the best ways to isolate noise is to use rooms such as halls and storage rooms as buffers between loud rooms and quiet rooms. For example, if the kennel is generating 100 dB and the STC rating of the first wall is 55, then 45 dB of noise will escape into the buffer zone. However, if the next wall has an STC of 35, then only 10 dB of noise will escape into the quiet rooms, which will be barely perceptible.
• Design sound walls to extend above the ceiling all the way up so they are tight to the structural or roof decking. An excellent sound wall will be completely ineffective if sound can "flank" the wall by traveling up through the ceiling and dropping into the adjacent space. Seal the sound wall completely to the structural deck.
• The following is a list of the STC of various materials and assemblies:
  ◦ 4 in. (10.16 cm) stud wall with drywall on both sides, STC of 35;
  ◦ 6 in. (15.24 cm) stud wall with staggered studs and two layers of drywall both sides, STC of 58;
  ◦ 8 in. (20.32 cm) concrete block wall with voids filled, STC of 55;
  ◦ 1/8 in. (3.175 mm) thick glass (i.e., a window), STC of 25;
  ◦ typical solid-core wood or hollow metal door, STC of 45;
  ◦ typical hollow-core wood door, STC of 35.
• A door or window can negate the acoustical isolation properties of a wall. Therefore, if it is important to isolate noise between two rooms, locate doors and windows on other walls, choose doors and window assemblies that isolate sound well, and install weather-stripping around the doors.
• A window with two layers of glass separated by a 1 in. (2.54 cm) air space has an STC of 45, which is much better than the 25 rating of a regular window.

DISSIPATION

In nature, sound dissipates very quickly, because there are few reverberant surfaces. A simple logarithm explains the relationship of decibels to distance:

$$\text{Decibels of Change} = 20 \times \log\left(\frac{\text{distance 1}}{\text{distance 2}}\right)$$

More simply, sound intensity decreases at a rate of approximately 6 dB for every doubling of distance.

Options

• Dissipation may not be a useful method for reducing noise within a room, because the distances are small. For example, raising the ceiling height in a dog run room from 8 to 12 ft (2.44 m to 3.66 m) will only result in a 3 dB reduction in the noise being reflected from the ceiling.
• Within an entire facility, dissipation can be a useful tool. For example, assume that the dog runs are located 80 ft (24.38 m) from the offices, and the noise in the kennels, 10 ft (3 m) from the dogs, is 100 dB. By the time the sound reaches the offices, it will be 18 dB

11.15. Noise and Odor Control

lower, regardless of other factors. This decrease may not be relevant by itself, but when paired with sound isolation walls and absorptive materials it may complement the overall scheme to reduce noise in certain areas of the hospital.

MASKING

Sound is not additive. If the constant level of noise in a room is 45 dB, adding a white background noise at 30 dB does not create a 75 dB cacophony. Therefore, masking with background sounds may be a good last resort method for reducing noise within a room.

Options

Some hotel lobbies have waterfalls or fountains to provide a gentle level of white noise that can mask conversations and clattering of luggage. Music also works. There is some evidence that dogs may be calmed by music or audiobooks played in kennel areas.

HVAC SYSTEM DESIGN

- HVAC ducts that cross from one sound area to another can be a source of noise leaks. Ducts that cross from room to room within a sound area can also transmit noise between rooms.
- Design the HVAC system so that ducts do not penetrate across sound walls or between sound areas (see 11.16 – Heating, Ventilation, and Air Conditioning).
- If a penetration is necessary:
  - Install a sound attenuator in the duct at the point of penetration.
  - Install acoustical lead inside ducts to contain noise within the duct.
  - Avoid duct layouts that provide a "straight shot" from one sound area to another. In mitigating a sound problem, it is often helpful to add bends in the ducts to reflect some of the sound waves back toward the source of the problem.
  - Seal carefully around duct penetrations through sound assemblies.

ODOR

Controlling odor is very important in a veterinary hospital. Strong odors can create an unpleasant environment for people and animals, and can send the wrong message to clients. Odor can also be an indication of a sanitation problem. The following are guidelines for eliminating and preventing odors.

ELIMINATE THE SOURCE OF ODORS

- Clean the runs and cage areas frequently and thoroughly.
- Remove organic material before disinfecting.
- Size and select floor drains carefully. For example, if you are scooping the runs prior to washing them, a small floor drain will suffice. If you plan to wash waste down drains, the drains must be large and smooth, with appropriate grates that will allow the waste to go through without being a hazard to dog paws. Drains should be located in the backs of enclosures.
- Clean first, then disinfect. Follow the manufacturer's guidelines for the contact time and dilution rate of the disinfectant.
- Locate hose bibs in convenient locations.

SELECT APPROPRIATE MATERIALS AND INSTALL THEM PROPERLY

- Use nonporous finishes for walls and floors.
- Cove floor materials up the walls 6 in. (15.24 cm) to eliminate the "joint" between the floor and wall. This is especially important in medical areas, restrooms, and all animal wards (see 11.17 – Flooring).
- Use seamless floor materials in all medical and ward areas.
- Invest in durable finishes, especially in animal wards. Damaged or degraded finishes will more readily trap bacteria and fungus.
- Seal every material transition carefully to prevent water and dirt from working its way behind surfaces.
- Provide exhaust fans in the following rooms to remove odors near their sources: laboratory, exam rooms, restrooms. Integrate exhaust with the air-handling system for these rooms: dental rooms, bathing and grooming, animal wards, isolation wards.
- Pressurize the air to keep odors where they belong. For example, it is recommended that the HVAC system be designed to remove more air from a dog run room than is supplied. This will give the room a negative air pressure. When the door to the room is opened, air from other areas will rush into the room to equalize the pressure. This will keep odors from flowing out of the room into other spaces. In general, all animal areas should have negative pressure. Isolation should have the most negative pressure to prevent the spread of disease. Public areas, such as reception and waiting, should have positive pressure to prevent odors flowing in from other areas of the hospital.

EXAMPLES

In a hypothetical example, a veterinary team is working with their architect to design the dog ward for their new hospital. They have used the tools available to mitigate unpleasant noise and odors. The following are some design features of the new ward, based on the results of their discussions.

- **Noise control:**
  - The run layout minimizes cross-barking.
  - The ward is located away from other commotion.
  - Natural lighting enhances the room and helps to create a pleasant environment.
  - Acoustic panels are placed on the wall above 7 ft (2.13 m) to absorb reverberant sound. The acoustical ceiling balances a moderate NRC value with cleanability.
  - The walls are designed to be sound assemblies with an STC of 55. The sound walls extend to the roof deck, and all penetrations are sealed.
  - A hall is located as a buffer zone between the ward and an adjacent office area.
- **Odor control:**
  - The ward is designed with a good, convenient cleaning system.
  - The walls and floors are finished with nonporous, durable products. Joints are minimized, and each transition between materials is sealed carefully.
  - A generous amount of air is exhausted from the ward. The ward is negatively pressured to prevent odors from escaping to other rooms.

In this example, the new ward is designed to be a pleasant space that integrates well into the overall design of the hospital. A hospital that seeks to minimize unpleasant noise and odors will be more professional, enjoyable, and comfortable.

CAUTIONS

NOISE

- When designing a sound isolation wall, it is critical to eliminate all openings that might permit leaks. A sound wall is only as good as the weakest link, and even a 2 in. (5.08 cm) square hole will completely negate the sound isolation qualities of a wall. An architect can help with a plan to route piping, electrics, and ducts to reduce penetrations

through sound walls. Where it is necessary to penetrate a sound assembly, the penetration should be completely sealed on all edges with an insulating material.

- Rule of thumb: *if light can penetrate, sound can penetrate.*
- Use caution when using dissipation as an argument to plan outdoor runs for a hospital. Although it may be true that the noise from the barking dogs will be greatly diminished over the broad spaces of the outdoors, the laws of dissipation will be thrown out of balance by many factors, such as wind speed and direction, temperature, and humidity.

ODORS

- Many veterinary hospitals use high-pressure water spray systems effectively. However, if you decide to use this type of system, be sure the finishes in the run area are tough enough to hold up to the water pressure. Some high-pressure systems can damage less-durable finishes. This damage can create an environment for bacteria to grow, thus defeating the purpose of the cleaning system. Consult with an architect to select materials that are compatible with high-pressure cleaning systems.
- It is important to solve the source of an odor problem first rather than relying on treating the symptoms. Many electronic air deodorizers and air disinfectant systems are available on today's market. These systems are expensive and, depending upon whom you ask, may not be effective. If you choose to invest in an air treatment system, do thorough research to ensure that the system has been successful in other veterinary hospitals.

MISCELLANEOUS

ABBREVIATIONS

dB: Decibel
HVAC: Heating, ventilation, and air conditioning
NRC: Noise reduction coefficient
STC: Sound transmission class

11.16. HEATING, VENTILATION, AND AIR CONDITIONING

BASICS

OVERVIEW

• Heating, ventilation, and air conditioning (HVAC) design for animal care is constantly evolving. This evolution is driven primarily by three factors: higher standards for animal housing, concerns about indoor air quality, and building code requirements for energy efficiency.
• Today's veterinary hospitals have complex and sophisticated HVAC systems. These systems require a significant initial investment. Veterinarians who are planning to build or renovate a hospital must understand the basics of HVAC design to make informed decisions.

TERMS DEFINED

Air Change/Hour: The number of times the entire air volume of a room is completely removed and replaced within one hour.
Cubic Feet/Minute (CFM), Cubic Meters/Minute (m^3/min): The volume of air supplied or exhausted by the HVAC system within one minute.
Energy Recovery Ventilator (ERV): An ERV recycles energy by "preconditioning" the air that goes into the building with the air that is exhausted. The two channels of air pass next to one another to facilitate thermal exchange, but they remain physically separate to prevent contamination.
Exhaust Air: Exhaust air is mechanically exhausted to the outside without being reused by the HVAC unit.
Fan Coil System: In a fan coil system, hot and cold water is supplied from a remote boiler and chiller to fan coil units, which are mounted in each room. Fan coil systems are not practical for most veterinary hospitals, because they are relatively expensive and may not provide sufficient exhaust for rooms such as animal wards. However, they are often used in retrofits, because they are space efficient.
Heat Pumps: A mechanical system that moves heat from one place to another. For example, in heating mode, heat is collected from the outside and moved to the inside of a building. In cooling mode, heat is collected from the inside and moved to the outside of a building. Heat pumps may derive heat from air (air source), ground (ground source), or via a commercial water source, such as a boiler and chiller system.
In-Floor Radiant Heat Systems: Some veterinary hospitals supplement their HVAC system in animal wards with in-floor radiant heat to provide therapeutic floor surfaces and decrease floor drying time.
Rooftop Unit (RTU): This is a term used to define a prepackaged HVAC unit that combines gas-powered heating, a fan unit, and cooling. RTUs are often combined with ERVs, which reduces the RTU's required capacity. RTUs are the most common solution for veterinary hospitals.

ISSUES AND OPTIONS

A good HVAC system prevents the spread of airborne disease, reduces odors, and improves the overall wellbeing of the animals and staff. Veterinary hospitals are commercial buildings, and to comply with codes they must employ a mechanically ventilated system. In older hospitals, it is common to see residential-style furnaces and separate compressors. Newer hospitals are more likely to use larger packaged air-handling equipment such as RTUs because RTUs are capable of handling much greater volumes of air than standard residential-style furnaces.

RTUs can be combined with ERVs to recover some of the energy that is lost by exhausting large volumes of air. Because of changes to energy codes and regulations, ERVs are often required in veterinary hospitals.

After the mechanical engineer chooses the system, the next step is to design each system component to create an overall healthy indoor environment that controls disease and odors:

• **HVAC zoning.** Veterinary hospitals are divided into zones that are controlled by separate HVAC units. Except for the smallest hospitals, which may only have two zones, most hospitals require a minimum of three zones to divide the following:
  ◦ The client zone. Reception, waiting, retail, exam rooms.
  ◦ The procedural zone. Treatment, surgery, laboratory, pharmacy, darkroom.
  ◦ The patient zone. Wards, runs, isolation, food prep, grooming, bathing.

  Each zone should be distinct and separate. Return air for one specific zone should not draw from an adjacent zone, which crosses odors from one zone to another (see 11.15 – Noise and Odor Control).
• **Air pressurization.** Air pressurization is very important in a veterinary hospital. In a room that is negatively pressured, more air is removed than is supplied. In a room that is positively pressured, more air is supplied than is removed. In general, the client zone should be positively pressured and the patient zone should be negatively pressured. This prevents odors and airborne diseases from wafting into public areas. Most of the procedural zone may be slightly negatively pressured or neutral, except the surgery area, which should be positively pressured to maintain an aseptic environment.
• **Exhaust air.** Air should be exhausted from:
  ◦ *Laboratory.* Install a 150 CFM (4.28 m^3/min) exhaust fan over the sink. If chemotherapy drugs are being prepared in the lab/pharmacy area, install a biological safety cabinet to meet United States Pharmacopeia standards and refer to requirements in 9.21 – Waste Management.
  ◦ *Exam room.* Install a 90 CFM (2.55 m^3/min) exhaust fan to prevent stuffy air and remove odors.
  ◦ *Bathroom.* Building codes require exhaust fans.
  ◦ *Animal wards and runs.* The best way to control disease and odors in animal rooms is to maintain negative air pressure by exhausting 110% of the air supplied to the space, via the air-handling units. This results in wasted energy, making it sensible to use energy recovery technology.
  ◦ *Isolation.* Isolation can be exhausted with a direct exhaust fan if it is only occasionally occupied, or it can be included in the overall building exhaust system with the animal wards and runs. In either case, it should be highly negatively pressured, with 120% of the supply air being removed from the space.
  ◦ *Bathing and grooming.* This room has similar exhaust requirements to an animal ward or runs.
• **Air changes/hour.** Many variables affect the number of air changes needed in a room.
  ◦ *Use.* Minimum air changes based on use:
    ▪ Animal wards and runs. Minimum 12 to 15 air changes/hour in dog wards and 20 to 25 air changes/hour for cat wards.
    ▪ Treatment and medical. Minimum eight to 10 air changes/hour.
    ▪ Client areas and staff offices. Recommended six to 10 air changes/hour, with fresh outside air making up 25–50% of returned air.
  ◦ *Number of occupants.* A cat ward with triple-stacked cages will need more air changes than the same ward with a few cats. It is helpful to compare the desired CFM, 40 CFM (1.42 m^3/min) per dog and 30 CFM (0.23 m^3/min) per cat, of air moved per animal to the overall room air changes. For example, a room that is 8 ft × 15 ft × 9 ft tall (2.5 m × 4.6 m × 2.7 m) has 1,080 ft^3 (32 m^3) of air volume. In a room of this size, 12 air changes/hour will move 12,960 ft^3 (384 m^3) of air/hour or 216 ft^3 (6.4 m^3) per minute. With five dogs in the room at 40 CFM per dog, the HVAC would

11.16. HEATING, VENTILATION, AND AIR CONDITIONING

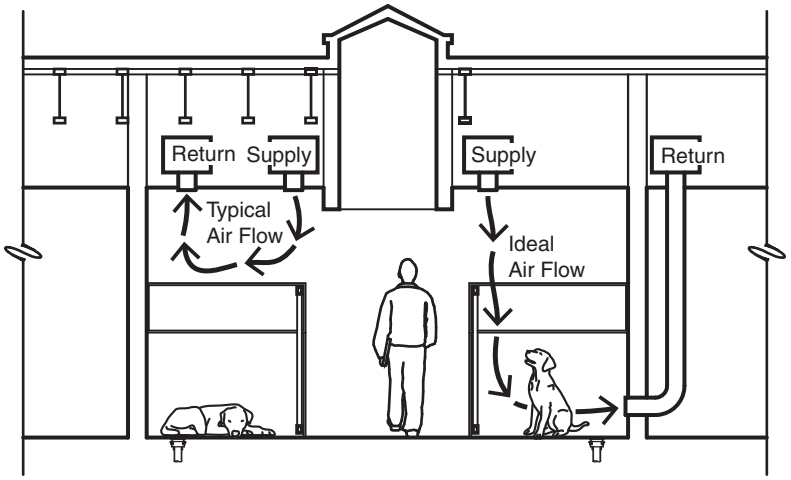

Figure 11-16-1.

Heating, ventilation, and air conditioning.

need to move 200 ft^3 (5.6 m^3) per minute. In this case, 12 air changes/hour would be adequate for proper air flow.

- **Size.** In small rooms, the HVAC system is moving a small volume of air. Increasing the number of air changes can create the same *perceived* air movement as in a larger room.
- **Equipment.** Motorized and electronic equipment creates heat. Compile an equipment list for each room so the HVAC engineer can adjust the airflow as necessary.

EXAMPLES

To take HVAC design to the next level, look beyond the numbers. *How* is the air moving? Does the air movement accomplish the goal of maximizing health and comfort? Figure 11-16-1 illustrates a simple way to improve airflow in animal areas: exhaust through the animal cages or runs.

CAUTIONS

- **Costs.** The costs of modern HVAC systems can be intimidating. Some components, such as energy recovery units, pay for themselves in lower utility bills and higher efficiency.
- **Space requirements.** Modern HVAC units are heavy and take up space, which can be problematic for small hospitals. RTUs and ERVs are too large to place in attics or closets. If the site is restrictive, the unit can be mounted on a portion of flat roof. If a sloped roof is important to the design, choose a site large enough to accommodate exterior pad-mounted units. In either case, the units will not be attractive and should be screened from view.
- **Maintenance.** It is important to keep up with recommended maintenance. A simple example is changing filters clogged by pet hair and dander, which restricts airflow.

11.17. FLOORING

BASICS

OVERVIEW

Of the myriad commercial flooring materials, only a few are truly appropriate for use in veterinary facilities. When evaluating any flooring material, the specific qualities that must be considered include durability, cost (including initial, maintenance, and replacement costs), maintenance needs, resilience under foot, slip resistance, noise absorption, and appearance.

Because the available materials that are appropriate for use in veterinary facilities exhibit all of these properties in varying levels, you need to understand what the differences are and which qualities you need from a flooring material in each area of your hospital.

TERMS DEFINED

Resilient: Capable of absorbing impact without permanent deformation. Resilient flooring materials tend to be more comfortable under foot, especially during extended periods of standing, as may be experienced in treatment or surgery areas.

Resinous: Self-leveling, or troweled-on, liquid-applied flooring materials consisting of epoxy, acrylic, or urethane resins.

ISSUES AND OPTIONS

ACID-STAINED AND SEALED CONCRETE

- Acid-stained concrete offers warmth in appearance, similar to natural stone, at a fraction of the cost.
- Stained concrete may be used effectively in lobbies or other low-maintenance areas. However, it does require periodic resealing, especially in high-traffic areas.
- If cracking occurs due to drying, shrinking, or with slight building movement, these cracks will be visible when using exposed concrete as flooring. These cracks may also impact the ability to adequately sanitize the floor.

CERAMIC TILE

Options

- Porcelain pavers
- Unglazed quarry tile
- Clay pavers
- Mosaic tile.

Issues

- Ceramic tiles used for flooring are most often unglazed for slip resistance. However, crystalline-glazed clay tiles have an uneven surface that may be used for light-duty floors.

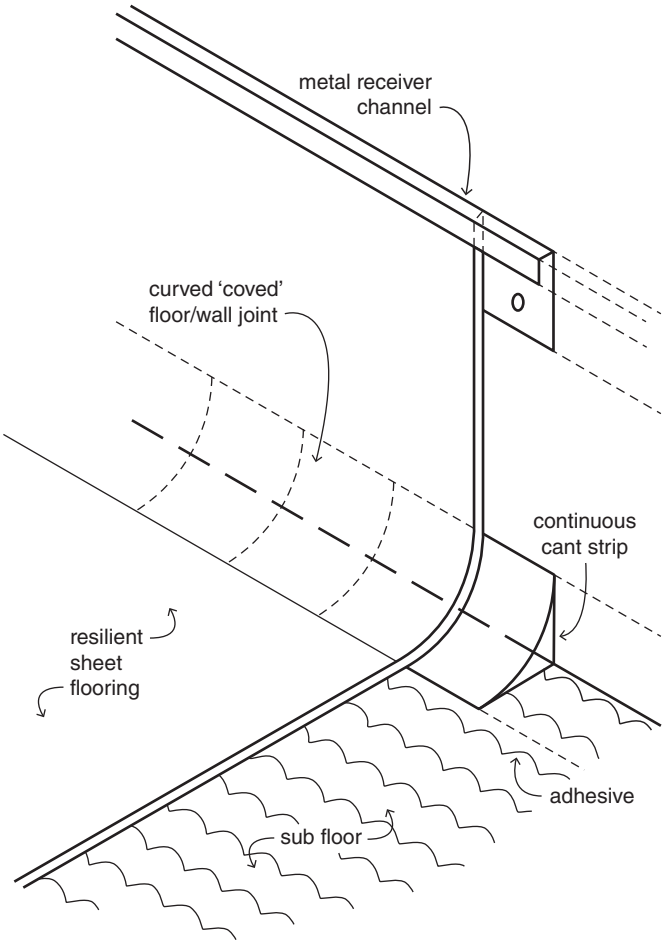

Figure 11-17-1.

Flash cove base at joint between floor and wall.

- Tiles up to 6 in.^{2} (38 cm^2) are commonly referred to as *mosaic tiles*, whereas larger tiles are referred to as *paver tiles*.
- Porcelain tiles are much harder and less permeable than clay ceramic tiles and are recommended for use in veterinary facilities. Clay ceramic tiles may be used in restrooms, break rooms, or other lower use areas.
- Epoxy grout and setting materials should be used for their higher stain resistance. Many tile installers resist working with these materials

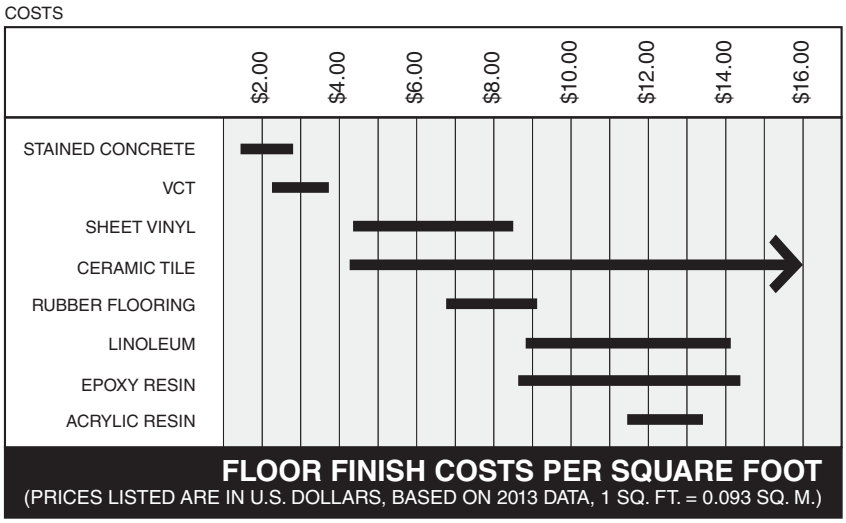

Figure 11-17-2.

Floor finish costs per square foot.

and may charge a significant premium for their use. Be assured, the additional cost is well worth it.

• Quarry tiles, like porcelain tiles, are virtually unaffected by such elements as water and chemicals, but are thicker, improving their impact resistance. Glazed quarry tiles may be slippery when wet, so only unglazed is recommended.

RESILIENT FLOORING

Options

• Sheet vinyl
• Linoleum sheet
• Vinyl composition tiles (VCTs)
• Luxury vinyl tiles (LVTs) and luxury vinyl planks (LVPs)
• Rubber tiles or rubber sheet.

Issues

• Sheet vinyl may have heat-welded seams and an integral flash cove base, which is recommended for ease of cleaning and increased sanitation, particularly when used in treatment or surgery areas. Traditionally, sheet vinyl has required stripping and waxing, but new no-wax formulations have an improved appearance with easier maintenance.

• Linoleum sheet is an environmentally friendly product, manufactured primarily from cork and linseed oil. Similar to sheet vinyl, it may be heat-welded and installed with an integral flash cove base. It may be susceptible to staining from some chemicals, so check with the manufacturer for a list of chemicals that have been tested and their adverse effects.

• When sheet flooring is used in restrooms, an integral flash cove base should always be provided to insure conformance with building code requirements for toilet room floor surfaces.

• VCTs come in 12 in. × 12 in. (30.5 cm × 30.5 cm) tiles and should only be used in areas such as offices, workrooms, and break rooms that do not require frequent cleaning. VCTs require periodic waxing to maintain an attractive appearance.

• According to most building codes, VCTs are typically not permitted to be used in restrooms due to the number of joints in the flooring that can harbor microbial growth. For the same reason, they are not recommended in locations where highly sanitary finishes are needed.

• LVTs and LVPs are increasingly popular, providing the appearance of natural materials such as stone or wood planks with the performance benefits of vinyl.

11.17. Flooring

• Rubber tiles and rubber sheet flooring are more resilient than other resilient flooring, improving comfort and somewhat decreasing noise from footfall or wheeled traffic. Rubber products are typically not as chemical resistant as VCTs or sheet vinyl, so check with the manufacturer for a list of chemicals that have been tested and their adverse effects. Seams may be heat or chemically welded for seamless installations.

RESINOUS FLOORING

Options

• Epoxy resin
• Acrylic resin (methyl methacrylate)
• Urethane
• Polymer-modified concrete toppings.

Issues

• Decorative epoxy resin flooring is typically 1/16 in. to 1/4 in. (1.5 mm × 6 mm) in thickness. A colored quartz aggregate topping provides most of the finish color. Most systems also include a urethane seal coat. The newly installed floors may be too smooth or too coarse, so samples and a mock-up should be reviewed prior to installation. A heavily textured finish provides greater slip resistance but is more difficult to keep clean.
• Acrylic resin flooring gets its appearance from colored vinyl flakes. Though more attractive than the quartz aggregate systems, it does not offer as much inherent slip resistance.
• Both epoxy and acrylic resin may present a strong odor during installation. Epoxy resin should only be installed in unoccupied, well-ventilated areas. Some acrylic resin products are available in low-odor formulations. Good ventilation should always be used when installing this type of flooring, especially when working in occupied facilities.

EXAMPLES

A scenario for a typical veterinary hospital would include the following flooring materials:
• Lobby, reception area, public restroom: porcelain paver tiles with epoxy grout or LVPs.
• Exam rooms, treatment area, isolation area, surgery suite: sheet vinyl with heat-welded seams and integral flash cove base.
• Break room, food-prep/utility rooms, back hallways: sheet vinyl with rubber wall base.
• Wards: resinous flooring with integral base.

While giving up some durability and ease of maintenance, but still an acceptable scenario, a hospital on a tighter budget may include:
• Lobby/reception area, utility/food-prep, back hallways, and wards: stained and sealed concrete.
• Restrooms, isolation, surgery suite: sheet vinyl with integral cove base.
• Exam rooms, treatment area, offices, and break room: sheet vinyl with rubber base.

CAUTIONS

• Partially due to changes made to reduce the volatile organic compounds in products, it is critical when applying flooring to concrete slabs that the concrete meet the moisture and pH limits established by the specific flooring manufacturers. In new construction, manufacturers almost always recommend vapor barriers

under slab-on-grade construction. They also recommend that moisture and pH tests be performed prior to flooring installation. If an acceptable moisture level cannot be achieved, an additional topical treatment may be needed prior to the installation. Sheet vinyl and resinous flooring materials are most sensitive to these moisture and pH levels, but manufacturers of VCTs, sheet linoleum, and most adhesives also include similar cautions. Excessive moisture, unacceptable pH levels, and improper installation can all result in failure of flooring to initially adhere or to remain adhered to the substrate.

- All hard-surface flooring materials may become slippery when wet. Therefore, special consideration is necessary when selecting flooring materials for areas that will be cleaned frequently. Obviously, highly textured floor surfaces usually provide improved slip resistance over smoother finishes. The trade-off with more highly textured flooring is more difficult cleaning. Most of the major flooring companies have test data for slip resistance, tested both wet and dry. While not necessarily helpful in quantifying any type of absolute slip resistance, the test results do provide a means of comparing the different products relative to each other.

11.18. SUSTAINABLE DESIGN FOR VETERINARY PRACTICES

BASICS

OVERVIEW

Green building has been an important trend for long enough that many sustainable technologies are required by newer building codes and regulations. However, some technologies are better than others when applied to specialty buildings such as veterinary hospitals.

Although it is important to design hospitals that use less energy, focusing on environmentally friendly methods also provides a framework for creating healthier and more inspiring environments for animals and people.

TERMS DEFINED

Biophilic Design: Design inspired by humans' inherent need to connect with the natural world.

Carbon Footprint: A measure of the global warming potential of a given project, system, or activity using carbon dioxide equivalents.

Commissioning Agent: A professional who is hired, usually as a third party, to verify that the building mechanical, electrical, and energy systems are operating correctly.

Energy Recovery Ventilator (ERV): An ERV recycles energy by "preconditioning" the air that goes into the building with the air that is exhausted. The two channels of air pass next to one another to facilitate thermal exchange, but they remain physically separate to prevent contamination.

Photovoltaic System: A solar-powered, energy-producing system used to generate electricity.

Sustainable Design: The application of design principles that use resources responsibly and reduce negative environmental impacts.

Two-Stage Evaporative Cooling: Also known as indirect/direct evaporative cooling, the first stage of cooling precools the air without adding humidity. The second stage cools and slightly humidifies the air. This system reduces the humidity of traditional evaporative cooling by 10–30% yet reduces energy use by 60–70% compared with traditional air-conditioning systems (source of statistics: American Society of Heating, Refrigerating and Air-Conditioning Engineers).

ISSUES AND OPTIONS

SITE DESIGN

Veterinary practices generally put real estate concerns first in selecting and developing a site (see 11.5 – Selecting a Site). Land is typically purchased in an area of future growth and is developed in a way that maximizes street visibility and access. Overlaying sustainable design ideas onto land purchase and development decisions may add complexity but will bring value to the project.

- Reuse an existing building. Carl Elefante said, "The greenest building is one already built." Purchasing an existing unused office building for redevelopment is a cost-effective decision. An existing building comes with infrastructure in place, and it represents a physical investment of energy and resources. Saving money on the shell of the building can allow a practice to spend more money on other aspects of the project. A good-quality commercial building shell may reduce the cost of a typical project by 20%.
- If there is a choice, select a site with favorable orientation and dimensions. A site that is long in the east–west direction will allow for a more favorable building orientation than one that is long in the north–south direction.
- Avoid building in sensitive zones such as wetlands, flood plains, prime farmland, and wildlife areas. Avoiding these areas will also save you money.
- Avoid hilly sites. These sites will require you to move a lot of soil, which is expensive in terms of money and resources.

BUILDING ORIENTATION

- Veterinary hospitals are typically designed from the inside out. They are functionally driven, for good reason. If it is possible to challenge your design team to solve the functional concerns while also considering environmental concerns, the resulting hospital will be a better place to work and will cost less money to operate.
- Strive to create thinner or open plans, oriented on an east–west axis, that have a greater connection with the outdoors. A long axis running east–west is the best orientation for maximizing passive solar design, which translates to a reduced cooling load and energy savings for conditioned space. The following rules of thumb may be adjusted slightly based on your local conditions:
  - Place treatment, waiting, and office areas on the south side and utility spaces on the north side.
  - Use overhangs on the south to keep out the summer sun and let in the winter sun.
  - Locate large openings on the south, high openings on the north, and reduce openings on the east and west.

ENERGY USE REDUCTION

Veterinary hospitals tend to use a lot of gas, water, and electricity, which translates to high utility bills. Therefore, energy use reduction is an excellent strategy for creating a greener, more cost-effective building. Some of the methods described in the following require an initial investment, but they are the most effective over the lifetime of the building. A hospital that incorporates a broad range of energy-saving features may use 25–35% less energy than the industry baseline.

- Invest in an energy-efficient heating, ventilation, and air-conditioning (HVAC) system (see 11.16 – Heating, Ventilation, and Air Conditioning):
  - If appropriate for your location and your project, consider alternative HVAC technologies, such as ground-source heat pumps. A skilled mechanical engineer with sustainable design experience can evaluate the potential viability of alternate approaches.
  - If using traditional rooftop air handling, incorporate ERVs, even when not strictly required by code, to precondition incoming air and cut down on heating and cooling costs.
  - In dry climates, use two-stage evaporative cooling instead of traditional air conditioning.
  - Allow some temperature fluctuations in animal areas to cut down on energy usage and peak load demands. Typical ranges may be from 65 to 80 °F (18.3–26.7 °C).
  - Consider the possibility of using properly designed natural ventilation in select areas of the building during favorable days and seasons.
  - Have the building systems fine-tuned by a commissioning agent after completion of construction and prior to occupancy. This saves about 13% in energy costs in new buildings and more in high-tech buildings such as veterinary hospitals.[1]
- Reduce lighting needs, which account for the largest use of energy in commercial buildings. The best way to do this is to incorporate natural daylighting. Sunlight provides approximately 140 lumens of light for each watt of heat energy produced, making it far more efficient than artificial lighting systems.
  - Tie the artificial lighting systems into the daylight systems so the artificial lights can be dimmed and even shut off selectively when daylighting systems provide sufficient illumination.
  - Incorporate daylight into employee work areas to improve efficiency and boost morale. Daylighting has been demonstrated to shorten patient recovery times in human medical facilities.
- Use high-efficiency LED lighting fixtures.
- Reduce water use in the facility with the following strategies:
  - Plant low-maintenance, native plants in the landscape that tend to use very little water once established.

11.18. SUSTAINABLE DESIGN FOR VETERINARY PRACTICES

- Install water-saving fixtures in restrooms, break rooms, and other places where water pressure is not critical.

• Clean with cold water in kennels. Disinfectants are available that sanitize in cold water. This saves money initially, because copper piping can be reduced, and using cold water also saves money and energy over time.

RESPONSIBLE RESOURCES AND TECHNOLOGIES

There are dozens of green technologies and thousands of products, so the options can be overwhelming. Here are some helpful rules of thumb.

• When considering alternative systems such as a photovoltaic system, ask a reliable local vendor to provide a cost/payback analysis. Some systems are cost effective in some regions, but this depends on many factors, such as local incentives and subsidies, climatic and site considerations, and the availability of manufacturers and installers.
• Be aware that shipping and transportation is one of the largest contributors toward a project's carbon footprint, so select green products and systems that are manufactured within the United States and ideally within a 500-mile (800-km) radius of your project.
• Use greener versions of tried and true materials. Veterinary hospitals are used harder than most building types. It is not wise to experiment with a new product until it has been used successfully in other veterinary hospitals. Fortunately, many manufacturers of durable materials, such as porcelain tiles, are diversifying and offering greener options. It is possible to select high-recycled-content tiles that are manufactured locally.

REGIONALISM

Today's high-performance buildings respond to the local environment, incorporate local materials and technologies, and are designed with some reference to local building customs. The return of regionalism is an opportunity to design an inspiring and comfortable place to work. The following are some examples of regional concepts.

• If your locale has big daily temperature swings, use thermal mass to your advantage by building with masonry or concrete. These materials are cool in the morning, absorb heat during the day, and release heat at night, thereby moderating the indoor environment. Heavy-mass materials work in extremely hot climates as well.
• Except in high latitudes, use light-colored or reflective roofing to avoid excessive heat gain. Traditions, such as reflective metal roofs in Texas, have persisted because they are so effective.
• Design deep porches in hot climates and incorporate breezeways to funnel moving air. Porches also make effective transition zones between inside and outside environments and help shield buildings from solar heat gain.
• Collect rainwater, if legal in your area, and use it to water landscaping.
• Consider incorporating photovoltaic panels in the roof design in sunny climates. If your building already faces south, it is ideally set up for sunlight harvesting.

BIOPHILIC DESIGN

As the world becomes increasingly urban, people become more disconnected from nature. The goal of biophilic design is to appeal to peoples' inherent need to connect to nature and the outdoors. A large window looking into a garden may not be a luxury if it is inspiring, energy boosting, and creates a sense of belonging. Veterinary hospitals can incorporate biophilic design in many ways. Examples could include:

• Providing a relaxing, attractive, fenced garden off an exam room to be used as an alternate exam or euthanasia space.
• Creating a view to an outside space, simply for the purpose of connection. Even a small or narrow window can bring daylight in and relax everyone who is working in the space.
• Going above and beyond with daylighting to create spaces flooded with ever-changing natural light.
• Using materials such as sustainably harvested wood to create a more natural feel.

FOLLOWING THROUGH WITH OPERATIONS

Veterinary hospitals must necessarily consume resources to operate properly and practice good medicine, including critical life-saving procedures. Beyond these necessities, there are ancillary programs that can be put in place to achieve a greener work place, including:

• Providing financial encouragement to employees to carpool, use the bus, or bike to work.
• Starting a recycling program, and even a composting program, if offered by your local municipality.
• Purchasing recycled materials for any bulk-use item, such as paper towels and office paper.
• Developing an effective waste management plan.
• Going mercury free. Mercury-free initiatives are common in human healthcare.

11.19. REFERRAL AND EMERGENCY FACILITIES

BASICS

OVERVIEW

• As clients seek specialty care for their pets, the number of referral and emergency hospitals is on the rise.
• Specialty referral and emergency practices have their own specific design requirements, and these requirements can be complex in hospitals that combine the two practices. However, combined practices can profit from sharing spaces and by providing one-stop resources and services.
• To plan a combined specialty referral and emergency hospital, begin by reviewing the requirements of each practice, then create a plan that minimizes duplication and maximizes efficiency.

Building flexibility into the design and room for expansion will allow the practice to keep up with ever-changing services, and practice growth.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

Specialty referral and emergency hospitals share many features. The following are characteristics common to both types of practices.

THE SITE

• A central location is important, because clients come from a wide area.
• The site must be accessible and easy to find from major roads and highways.

THE BUILDING

Clients visiting referral or emergency practices may be coming for the first time. They will feel more confident about the care their pets will receive if the building makes a good first impression.

• The hospital should appear professional yet inviting.
• A modern, professional look reflects a similar practice philosophy.
• Durable and cleanable materials are especially important.
• An efficient floor plan is critical to patient care and customer satisfaction.

THE CLIENT

Referral and emergency hospitals are places where clients may come with their families. Emergency hospital clients may not be able to leave their children at home, and referral hospital clients may have traveled a long distance to discuss or implement a specialty procedure or treatment plan. Therefore, the hospital should be able to accommodate family groups and children.
• Provide oversized examination rooms to accommodate larger groups.
• Provide a client service area where clients can get refreshments.
• Provide a comfortable long-term area for people who may stay for an entire day in the building.

SPECIAL CONSIDERATIONS FOR EMERGENCY PRACTICES

Security

Because emergency practices are open all night, security is important (see 12.5 – Security Issues for Hospital and Staff).
• Choose a site in a secure area where clients and staff feel safe after dark.
• Install bright lighting in the parking lot and on the exterior of the building.
• Design a definitive entrance so the clients do not lose any time trying to locate the main emergency entrance and so the staff can help keep an eye on clients and patients upon entering the property.
• Provide an entrance with as much transparency as possible to better facilitate the visibility and thus readiness of the staff for an arriving critical patient.
• Consider installing additional security measures to better control access into the facility when the staff has a skeleton crew at night. These could include electronic access control for interior doors to keep medical areas and staff secure, and video and electronic door locks in the main entry vestibule. A video monitor in the intensive care unit

(ICU) or treatment area to view what is going on outside the building and in other locations of the hospital can be an added security measure.
• Providing two ways out of an emergency exam room will help facilitate direct access to the back of the facility for critical patients, and it will enhance exam room safety.

Traffic Flow

Emergency hospitals need to operate efficiently with a small number of staff and many critical patients (see 11.13 – Client/Patient Flow).
• Provide a straight path from waiting to treatment/emergency room (ER) triage.
• Exam rooms can open directly into treatment/ER triage, but a small sound barrier created by a buffer such as a hallway may be warranted to help shield noise from upsetting an already worried client.
• Surgery and radiology should be immediately accessible from treatment/ER triage.
• Step-down wards need to be adjacent or close to ICU/critical care unit (CCU) to allow the skeleton crew the ability to watch over critical and noncritical patients.

Client Comfort

Clients often must wait for long periods of time in emergency hospitals. A comfortable waiting area will lessen their anxiety and will make their experience more positive.
• Dedicate a spacious, clean, cheerful area for clients to wait out of the traffic flow.
• Provide TV and/or free Wi-Fi to help pass the time and comfortable chairs for lounging.
• Add a special feature such as an aquarium, water feature, or exterior landscaped area to entertain and calm anxious families and provide them with an area of refuge.

SPECIAL CONSIDERATIONS FOR SPECIALTY REFERRAL PRACTICES

The Specialist

Referral hospitals should be carefully designed around the needs of each specialty service. The following are some examples:
• **Orthopedics.** The orthopedist will need a dedicated surgery room to maintain an aseptic environment. Rehabilitation spaces can correlate to this service.
• **Dermatology.** Most dermatology is outpatient, but the dermatologist will need an exam room with good lighting, a secured area for medications, and flexibility for examining patients on a table or the floor. Small "mini-labs" can be considered for this service and would help this service to be more efficient.
• **Ophthalmology.** The ophthalmologist needs an exam room with no windows or the ability to completely darken the room as well as control the lighting (e.g., dimming capabilities). Special consideration should be given for service-specific equipment that must be stored in both the exam/procedure room and the surgery room.
• **Oncology.** In some specialty hospitals, oncology procedures and equipment such as computed tomography scan machines and linear accelerators can command a large amount of space. Feline I-131 wards should be separate from other wards and need their own exhaust and waste disposal along with radiation shielding built into the walls. Chemotherapy requires a vented biological safety cabinet that meets United States Pharmacopeia <797> requirements, and the layout of the room(s) must comply with current regulations for handling, storage, and administration of medications (see 9.21 – Waste Management).
• **Internal medicine.** Internists need a room for endoscopic procedures and proximity to the animals that they are treating. Ultrasound is important to internal medicine as well and is typically contained within its own room.
• **Neurology.** Neurology depends on access to both a magnetic resonance imaging (MRI) machine for diagnostics and a surgery room. MRI machines may be incorporated into the facility, or the practice can consider using an MRI trailer, which is less permanent, but also less expensive.

FUTURE EXPANSION

Specialty referral hospitals serve clients who are looking for the latest in technological innovations and medical procedures. They can also be magnets for attracting new and/or expert specialists into the practice. Therefore, it is necessary for specialty referral hospitals to build, change, and grow as new technologies are integrated and the demand for these services increases.
• Choose a site that is large enough to accommodate future expansion and parking (see 11.5 – Selecting a Site).

11.19. REFERRAL AND EMERGENCY FACILITIES

• Design the floor plan with an expansion plan and direction.
• Provide additional electrical panel capacity.
• Organize the building systems, such as electrical, heating, ventilation, and air conditioning, plumbing, and computer cabling, to be easily accessible and "stubbed out" in the direction of future expansion.
• Provide generous space above the ceiling for future cabling and ducts.

CLIENT COMFORT

As described earlier for an emergency practice, a specialty practice should also prioritize client comfort. Clients may visit regularly for their pets to receive a specialized service, and they appreciate a comfortable place to wait.

COMBINED PRACTICES

Some combined specialty referral and emergency hospitals are operated by a single management team. Others integrate multiple practices under one roof. One of the greatest challenges in designing a combined hospital is to decide which areas can be shared and which must remain separate.

• Examples of shared areas:
  ◦ exam rooms;
  ◦ treatment area;
  ◦ pack/prep;
  ◦ surgery prep;
  ◦ surgery rooms (except orthopedic and neurology);
  ◦ wards and surgery recovery areas;
  ◦ staff lounge, conference room, and library.
• Examples of separate areas:
  ◦ specialized procedure areas;
  ◦ dedicated storage areas:
    ▪ drug storage to control inventory;
    ▪ equipment storage to prevent unauthorized use.

TRAFFIC FLOW

Specialty referral and emergency hospitals must function effectively at both peak hours and during reduced staff capacity timeframes (see 11.13 – Client/Patient Flow).

• Map separate traffic patterns for the emergency and referral functions.
• Create specialty zones within the overall organization.
• Provide separate reception, waiting, and entrance vestibules for referral and emergency patients.
• Design the emergency practice as a compact "mini-hospital" within the larger facility.

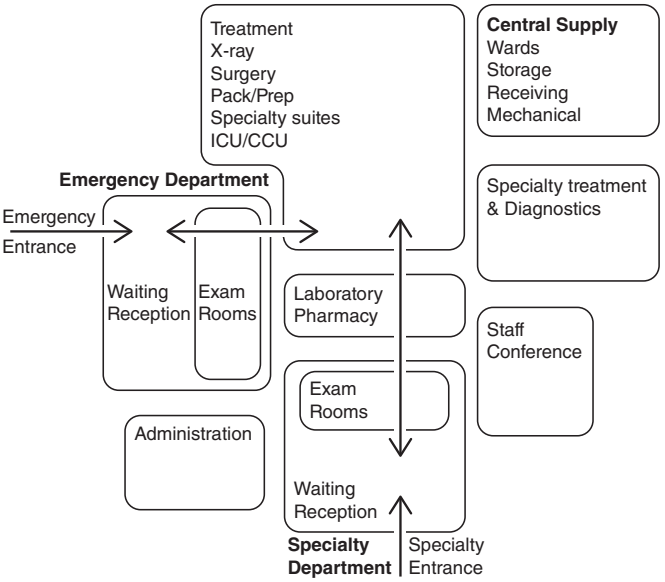

Figure 11-19-1.

Organization and traffic flow diagram.

EXAMPLES

The following is a hypothetical example of a combination specialty referral and emergency hospital. After compiling the needs of each specialist, the project team has mapped a simple organization and traffic flow diagram (see Figure 11-19-1).

FEATURES OF THE DIAGRAM

• Traffic flow for referral and emergency is separated.
• Central areas are shared.
• Specialists have zones.
• Emergency functions are compact and efficient.

11.19. REFERRAL AND EMERGENCY FACILITIES

By beginning with a simple, overall organizational concept, it is much easier to work through the details to create an environment that helps each team member practice most efficiently.

CAUTIONS

- It can be a challenge to design a specialty referral and emergency hospital that addresses the needs of each specialist while still maintaining a sense of unity. The best way to achieve this goal is to foster an open feeling throughout the hospital and to create common areas where different team members can interact.
- Use glass generously throughout to provide visual connections from room to room.
- Keep your floor plan as simple as possible and work to create opportunities for the staff to be in constant communication with one another.

11.20. PET BOARDING AND LUXURY ACCOMMODATIONS

BASICS

OVERVIEW

Remarkably, the pet industry has continued to grow each year, despite economic ups and downs, due to the fact that most Americans consider their pets to be an important part of the family. One of the outgrowths of this societal trend is the rise in the number and quality of facilities for boarding pets. Some boarding facilities are independent, some are franchised, and others are associated with veterinary practices.

Boarding animals offers many benefits for veterinary practices, including:

- Providing an additional profit center (see 9.20 – Kennel Management as a Profit Center).
- Providing income during times when veterinary service revenues drop, such as during summer vacation.
- Reinforcing the veterinary practice by offering specialized care for boarded dogs and cats and thus providing services that veterinary clients need and value.

On the other hand, the business of boarding requires capital expenditure, expertise, and finesse to ensure profitability. This chapter provides general guidelines for veterinary practices that are considering offering pet boarding.

TERMS DEFINED

Doggy Daycare: A service for dogs to play together in supervised group settings. This may be a drop-off day service, or it may be offered as an enhancement to overnight boarding.

ISSUES AND OPTIONS

ECONOMIC CONSIDERATIONS

- It is important to have a good picture of investment versus return before committing to opening a boarding business. The first questions that a veterinary practice may ask are "How many animals can be boarded?" and "What are the capital costs?"
- For calculating the size of the housing and support areas of a boarding facility, use the ratios of 100 ft^2 (9.3 m^2) per dog and 75 ft^2 (7 m^2) per cat. Then add the desired square footage of large spaces, such as dog playrooms.
- Luxury boarding facilities cost approximately as much to construct as veterinary spaces. This is because of the mechanical, plumbing, and finish requirements, as well as the significant expense of animal caging and run equipment. In 2018 US dollars, the cost of building a luxury boarding facility was approximately $350 per square foot ($3,770 per square meter). Therefore, a facility housing 100 dogs could be at least 10,000 ft^2 (929 m^2) in size and could cost approximately $3.5 million to build.
- Some questions that a veterinary practice considering a boarding facility must consider include:
  - Are there adequate funds to build a facility that is profitable on its own? Case studies indicate that boarding facilities should have a capacity of around 100 animals to be profitable on their own.
  - If the answer to the previous question is no, then will the boarding bring other support to the practice, such as client loyalty, growth in services, and community presence?

ANIMAL HOUSING

Many veterinary practices that successfully incorporate boarding are offering luxury accommodations and a high-service approach (Figure 11-20-1). Providing good-quality animal housing is generally part of the objective. Within that overall objective, successful boarding businesses offer different options and price ranges to sell to a broader market. For dogs, these options may include:

Figure 11-20-1.

The Grand Pet Resort in Fort Worth, Texas. Photo courtesy of Dr. Steve Hotchkiss.

- Fully enclosed luxury suites that should be a minimum of 5 ft × 6 ft (1.5 m × 1.8 m) for small dogs and 6 ft × 7 ft (1.8 m × 2.1 m) for large dogs or pairs.
- Luxury runs with a minimum size of 4 ft × 6 ft (1.2 m × 1.8 m).
- Smaller basic runs with a minimum size of 3 ft × 5 ft (0.91 m × 1.5 m).
- Typical cages for the smallest dogs.

Considerations for planning dog boarding facilities:

- Provide high-quality spaces designed to support the psychological and physiological wellbeing of dogs.
- Avoid housing dogs across an aisle from each other unless absolutely required for maximizing the facility square footage. When dogs are housed across from one another, provide view blocks for overstimulated dogs.
- Use caging that is wide and less deep instead of narrow enclosures.
- Incorporate a lot of noise control into the space (see 11.15 – Noise and Odor Control).
- Provide natural daylight with views to the outdoors if possible.
- Provide adequate air flow.
- Include radiant heat in a portion of the floor for a choice of warm or cool space if possible within your budget.
- Provide plenty of outdoor time with staff members.

Cats can become stressed in boarding situations. The following are some special considerations for boarding cats:

- Allow enough space (at least 9 ft^2 or 0.9 m^2)[1] for cats to fully stretch and have a separated litter compartment, a hiding box, and multiple levels.
- Provide housing in a quiet area away from noise and commotion, and select caging that utilizes quiet latches.
- Select cages with a window in the back and provide a view to the outside if possible, but a view to the inside is also acceptable.
- Provide natural light.
- Provide ventilated cages for odor control and for the health benefit of fresh, uncontaminated air if possible within your budget. Clients are less likely to board their cats than their dogs, so in a veterinary hospital setting do not make the mistake of creating cat boarding areas that are larger than needed. Except in the largest facilities, or in cat-only practices, a few well-designed, quiet enclosures will serve the demand. By designing the cat areas to be expandable, the popularity of this service can be gauged before investing a lot of money (see

11.20. PET BOARDING AND LUXURY ACCOMMODATIONS

11.15 – Noise and Odor Control and 11.12 – Designing with the Patient in Mind.)

HEATING, VENTILATION, AND AIR CONDITIONING

A properly designed heating, ventilation, and air conditioning (HVAC) system should be installed in any pet boarding facility to prevent the spread of airborne disease, to reduce odors, and to promote the overall wellbeing of the animals and staff. This is typically a specialized, forced-air heating and cooling system (see 11.16 – Heating, Ventilation, and Air Conditioning).

ANCILLARY SERVICES

Even the most luxurious boarding facilities are limited in terms of what can be charged for an overnight stay. Many boarding businesses make most of their money on ancillary services. Therefore, offering ancillary services is a key to success. Some ancillary services, such as acupuncture, directly relate to veterinary practice, although each service should be evaluated separately based on market demand and the veterinary practice's capabilities. The following are typical ancillary services that boarding businesses within a veterinary hospital can offer:

- walks and playtime;
- swimming;
- special diets;
- grooming;
- holistic wellness services, such as acupuncture, massage, and reiki;
- special care, such as the administration of medications.
- rehabilitation services;
- retail.

DOGGY DAYCARE

Doggy daycare is a common ancillary service for boarding facilities, although there are many doggy daycare businesses that operate independently and without boarding. Unlike boarding, a doggy daycare business can open without a lot of capital expenditure. At the most basic level, doggy daycare requires:

- A large, open, dividable play space that can be cleaned and sanitized.
- Time-out areas. These can be as simple as dog crates in a separate room.
- Minimal office and evaluation areas.
- Competent staff.

If your practice is in an urban area that can support a drop-in daycare, then adding this service can be very profitable.

OPERATIONAL CONCERNS

Boarding is a Service-Based Business

Regardless of the quality of the building, a boarding business cannot be successful without well-trained staff and outstanding customer service. An effective operational plan will include:

- Safety for animals and staff. Provide a behavior assessment area and an examination area to assess the temperament and health of animals that are coming in to be boarded or to play in a daycare program. Vaccination records should be verified, and animals should be vaccinated against preventable communicable diseases such as *Bordetella*.
- Develop protocols for training staff to prevent and respond to incidents of aggression and injury. Separate dogs into manageable-sized groups, based on specific dog-to-staff ratios.
- Connect with your clients. Because pets are valued family members, clients expect them to be treated as such by boarding businesses. Reach out to clients by:
  - providing webcams so clients can login remotely and see their pets;
  - equipping rooms with furniture, interesting decor, and television monitors so the environment is more appealing and less sterile;
  - providing regular, personalized status updates for clients;
  - developing a concierge relationship with clients by anticipating their needs and arranging desired services.

11.21. LARGE ANIMAL FACILITIES

BASICS

OVERVIEW

• Planning for large animal hospitals starts on the project site. Large animal facilities should be built around a good master plan that anticipates future growth and ensures good traffic and work flow as additional buildings and services are added.
• Large animal veterinary facilities are different in scale from small animal hospitals. While human spaces such as offices may be the same, spaces for handling animals are overscaled compared with their small animal equivalents. Exam, diagnostic, and treatment spaces are much larger, as are surgery rooms. Housing spaces and circulation areas, such as barn aisles, are sized for moving large animals efficiently and safely.

TERMS DEFINED

Ambulatory Services: Services provided by a veterinarian at an owner's farm, away from the clinic.
Scintigraphy: Imaging utilizing radioactive isotopes for contrast.

ISSUES AND OPTIONS

DEFINING THE CURRENT PROJECT WHILE PLANNING THE FUTURE

• Large animal facilities can vary dramatically in scope, from a simple haul-in clinic to large hospital campuses with multiple buildings. A haul-in large animal clinic may be half as expensive per square foot as a small animal hospital because it can be constructed of prefabricated buildings with low-cost finishes and systems. However, a complex, multi-building large animal hospital may cost as much as a small animal hospital because it must be built to similar healthcare standards.
• Given the complexity of budgeting large animal projects, and greater economic unpredictability of the market, large animal facilities work best when they are master planned and built out over time as the practice grows.
• Future-proof your large animal practice by developing a strategic business model. Examples include:
  ◦ Combining resources with a small animal practice in the same building. While mixed animal hospitals are not as common as they used to be, they continue to be popular in parts of the rural United States and Canada, where human populations are small and large and small animal hospitals are difficult to support on their own.
  ◦ Starting a separate small animal practice on the same site or a different site as the large animal practice. In this model, the large animal practice is still standalone, but the diversification of services helps with long-term business stability.
  ◦ Focusing on a specific, predictable market of clients. An example is equine sports medicine, which can be a very viable business in some areas of the country.
  ◦ Being the only game in town. Since the market is already smaller, it makes more sense for a large animal practice to avoid locating close to its competition.

MASTER PLANNING THE SITE

• Consider the flow of large animals, people, and vehicles and create paths for all three. Map circulation paths so you can identify and resolve conflicts.
  ◦ If designing a facility to handle cattle, the entrance, unloading, and reloading areas must be planned in the earliest stages as these are difficult and space consuming.
• Plan for the required turning radii for trailers, delivery vehicles, emergency access vehicles, and trash trucks. Create circular paths, so no one must back up large vehicles.
• Plan the location of current and future buildings so they work with short- and long-term circulation paths, placements of infrastructure, and so on.
• In temperate and southern climates, plan buildings with the long direction on an east–west axis to minimize east and west solar radiation. In cold climates, reverse this orientation to gain more solar radiation.
• Locate septic fields and be sure there is room to expand them. If the site is on a well, locate the well uphill from septic fields and at least 150 ft away.
• Develop a service area for trash, recycling, and soiled manure storage. This should be away from the front doors of buildings and out of client traffic flow.
• Identify low spots on your site. These can be used for stormwater detention or for open space. Pastures, arenas, and paddocks should be located on high, well-draining ground.

SIZING ROOMS FOR LARGE ANIMAL FACILITIES

Stalls

The normal standard is 12 ft × 12 ft stalls (3.7 m × 3.7 m). However, this module is too small for large-breed horses (drafts and warmbloods), for mare and foal, and for intensive care unit or neurological stalls. Use 14 ft × 14 ft (4.3 m × 4.3 m) modules for specialized medical stalls and large breeds, and use 12 ft × 18 ft or 14 ft × 18 ft (3.7 m × 5.5 m or 4.3 m × 5.5 m) minimum stalls for foaling or mare and foal.

Barn Aisles

Twelve-feet wide is the width that works best for cross-tied horses. For medical barns, 14 ft (4.3 m) minimum is better as it prevents accidental disease transmission, although separate cross-tie areas should be provided.

Equine Examination Spaces

The minimum size for an equine examination space is 16 ft × 16 ft clear. In busy hospitals, it may be necessary to accommodate more than one horse in the same examination space. Each examination area will need its 16 ft × 16 ft (4.9 m × 4.9 m) module and 8 ft (2.4 m) of additional clear circulation space to prevent interference between horses that are being walked through. For example, a room that contains three examination spaces would likely be (16 ft + 8 ft) × (3 × 16 ft) or 24 ft × 48 ft (7.3 m × 14.6 m) in size to be used comfortably for three horses simultaneously.

Cattle Treatment Areas

Cattle treatment areas are sized based on the equipment needed to handle and treat cattle efficiently and safely. Start with the design of the handling equipment and size the space accordingly. Place unloading alleys and crowding tubs outside under cover, and use inside space for alleys leading to chutes. Plan the size of chutes, as well as the necessary working space around them.

Equine Examination/Treatment Space with Stocks

The minimal size for a treatment space that includes stocks is 18 ft × 24 ft (5.5 m × 7.3 m), assuming the horse can be walked straight through the room via a separate entry and exit. If the room is planned with only one exit, enlarge the room to 24 ft × 24 ft (7.3 m × 7.3 m) or 24 ft × 30 ft (7.3 m × 9.1 m).

Induction and Recovery Stalls

For horses recovering unassisted, the stall should be a standard 12 ft × 12 ft (3.7 m × 3.7 m) module (padding will slightly reduce the room size) to prevent the horse from crashing around while recovering. However, if the veterinarian prefers assisted induction with a squeeze gate or assisted recovery with ropes, the stall may need to be enlarged to 14 ft × 14 ft (4.3 m × 4.3 m) or 12 ft × 16 ft (3.7 m × 4.9 m).

11.21. LARGE ANIMAL FACILITIES

Surgery Rooms

An efficient general surgery room is 20 ft × 25 ft (6.0 m × 7.6 m) from wall to wall, with the table placed in the center parallel to the long dimension. For a more generously sized general surgery room, enlarge the room to 20 ft × 30 ft (6.0 m × 9.1 m). Orthopedic and other specialty surgery rooms need even more space. For example, 25 ft × 30 ft (7.6 m × 9.1 m) is common in larger hospitals and 30 ft × 30 ft (9.1 m × 9.1 m) in referral and teaching settings, where more people may be present in addition to tools and carts and anesthesia equipment.

Specialty Imaging

Do not proceed with designing specialty equipment rooms without aligning the exact sizing of the room with the equipment to be installed. For example, scintigraphy and overhead x-ray typically have gantries supported by steel structures that are specific to the equipment.

Central Supply and Pharmacy

When sizing the pharmacy and central supply areas, consider the items you need to store and estimate their spatial requirements in terms of "linear feet of shelving." It is typical for a full-service hospital to need at least 12 ft × 16 ft (3.6 m × 4.9 m) for stocked materials. Central supply rooms get larger if planned for ambulatory service trucks to pull in for stocking. For example, 15 ft in width in each bay and 30 ft in depth (4.6 m × 9.1 m) will allow for shelving on both sides of the truck.

Laboratory

Laboratory space planning is nothing more than an equipment coordination exercise. Make a list of all the lab equipment that your lab needs and work with your designer to provide the counter space to accommodate the equipment along with some seating stations.

Client Spaces

Because large animal clients tend to be reluctant to spend time in lobbies, client areas are smaller. A sitting area sized to accommodate a few comfortable chairs, a television, and a coffee station is sufficient for small and medium-sized hospitals. Large hospitals may need or want more generous client areas for gathering groups or to accommodate a greater flow of clients.

EXAMPLES

The equine surgery room (see Figure 11-21-1) illustrates how the size of a large animal, the need to move it in and out of a space, and the need to work around the equipment can necessitate that spaces be quite large. This room is 25 ft square (7.6 m square) in size.

Figure 11-21-1.

Tryon Equine Hospital in Columbus, North Carolina. Photo credit: Tim Murphy/Foto Imagery.

11.21. LARGE ANIMAL FACILITIES

CAUTIONS

When master planning a large animal facility, add inflation costs at 4 percent per year for anything that you plan to build in the future.

In addition to planning larger and well laid out spaces, spend some time planning building materials for durability. Large animals are extremely hard on building materials and finishes. For example, induction stalls are typically constructed of fully-grouted concrete block.

Section 12

Practice Safety

12.1. BASICS OF MEETING PRACTICE SAFETY REQUIREMENTS

BASICS

OVERVIEW

Veterinary practice is a relatively sparsely regulated environment, compared with our human counterparts. Still, there are regulatory obligations for veterinary hospitals, including safety concerns. In the United States, practice safety falls under the jurisdiction of the Occupational Safety and Health Administration (OSHA).[1] In Canada, a similar function is fulfilled by the Canadian Centre for Occupational Health and Safety,[2] and in Europe by the European Agency for Safety and Health at Work.

TERMS DEFINED

Carcinogen: Substance or agent that is known to cause cancer.

ISSUES AND OPTIONS

COMPLIANCE

It is the responsibility of every veterinary practice to remain in compliance with safety regulations at the federal, state, and municipal level, including developing a hazard communication standard for your hospital. In the United States, this means being in compliance with OSHA's Hazard Communication, Regulation 29 CFR 1910.1200. There are excellent resources for accomplishing this (see References and Recommended Reading sections), but for most practices that do not yet have a safety program in effect, hiring a consultant can save a lot of time and research (see 12.7 – Hospital Safety Manual).

EMERGENCIES

A plan needs to be in effect as to how staff will be notified in cases of emergency, and the preferred response of employees to the emergency. This includes emergency telephone numbers at ready access (9-1-1 in many parts of the United States and Canada; 9-9-9 in the United Kingdom; 1-1-2 in much of Europe, etc.), as well as text/Short Message Service messaging, and where staff should assemble in case of evacuation. Staff require specific training if any of the following are expected:

- use of a fire extinguisher;
- rendering first aid to injured humans;
- evacuating animals;
- handling human tissues (including blood).

See also 12.11 – Emergency Plans. During employee orientation, new employees should be introduced to the hospital safety officer, given a tour of the facility, and should appreciate the following important areas of the hospital:

- emergency exits;
- location of surgical gases;
- location of fire extinguishers (not less than 75 ft/23 m apart);
- radiographic filming and developing areas;
- bulletin boards where safety notices are posted;
- location of safety manuals and material safety data sheets files;
- location and use of personal protective equipment;
- surgical areas;
- hospitalization/boarding areas, especially if sound levels are excessive and require protective equipment.

HAZARD COMMUNICATION: RIGHT TO KNOW

The hazard communication standard requires that all employees who come in contact with hazards in the workplace be aware of those hazards and are instructed on how to protect themselves from such hazards. This even applies to common agents in a veterinary hospital, such as isopropyl alcohol, formalin, and all pesticides other than those sold prepackaged for consumers. The hospital safety officer should maintain a current list of all hazardous chemicals in the hospital and use this list to ensure compliance in hazard communication. Common household products, such as detergents and cleansers, are exempt if they are used in the same manner and concentration in the practice that they are used at home.

To properly comply with the law, all practices need to be able to provide the following documentation for the purposes of employee safety:

- The name of the safety officer, or the individual who trains employees and verifies safety conditions in the practice.

12.1. BASICS OF MEETING PRACTICE SAFETY REQUIREMENTS

• A list of all hazardous chemicals used in the practice. This needs to include all injectable pharmaceuticals, pesticides, antiseptics/disinfectants, laboratory reagents, radiographic chemicals and supplies, and compressed gases. Pharmaceutical tablets do not need to be included in the hazard list.
• The filing system for material safety data sheets (MSDSs) so that employees can easily access the hazard information on individual compounds in the practice.
• Description of the labeling system used when compounds are transferred from their original containers to secondary containers, and assurance that all hazardous chemicals in the hospital are properly labeled.
• What to do in case of emergency, and the steps to take in case of an evacuation.
• A training program in place so that employees learn the proper methods of handling hazardous materials, report hazardous conditions in the practice, how to handle spills, and use the proper equipment and monitoring devices to work safely in the clinic, for themselves and others. This is mandatory in practices with 11 or more employees, and highly recommended for all practices. A periodic review should be conducted to ensure that the MSDS library is current and complete and that all product labels are inspected for presence and condition.

HAZARDOUS MATERIALS LIST

An inventory list must be compiled of all the hazardous chemicals included in the practice, including:
• injectable medications;
• pesticides;
• antiseptics, disinfectants, and sanitizers;
• laboratory reagents;
• radiographic chemicals and supplies;
• disinfectants and hospital sanitizers (including bleach, but not routine household cleansers);
• compressed gases.

MATERIAL SAFETY DATA SHEETS

An MSDS is a fact sheet for chemicals and provides important information related to hazard communications, including:
• identity of the chemical;
• physical and chemical characteristics;
• health hazards;
• permissible exposure limits;
• whether it is a carcinogen;
• emergency first-aid procedures;
• specific hazards (fire, health, reactivity, special hazard, protective equipment).

Practices must maintain an MSDS sheet for every hazardous chemical on the premises, and they should be current to within three years. MSDSs are available from manufacturers of the products, and often from distributors. All employees must have ready access to MSDSs, whether they are in paper form or available electronically.

ACCIDENT INVESTIGATION

The practice should have an established method for reporting and investigating accidents and injuries, including ergonomic injuries such as carpal tunnel syndrome. All injuries must be reported to a supervisor, who will help the employee to get appropriate medical care and then record the injury and investigate the incident. In practices with 11 or more employees, the details must be recorded on an OSHA 300 Log.

ZOONOTIC DISEASE HAZARDS

Veterinary staff frequently come into contact with patients with potentially zoonotic diseases and must know how to adequately protect themselves. Similarly, owners may infer that animals that have visited a veterinary practice and have been clinically evaluated should not pose a zoonotic risk at home. Because this involves some liability of behalf of the practice, it is important to note in the record that there was no evidence of zoonotic conditions at the time of the visit. Using a parasite control protocol is also advocated.

Just a few of the potentially zoonotic conditions of small animals include:
• rabies;
• internal parasites (including roundworms, hookworms, cryptosporidiosis, and some tapeworms);
• external parasites (including sarcoptic mange mites, cheyletiellosis, etc.);
• microbes (including dermatophytosis, toxoplasmosis, tuberculosis, salmonellosis, methicillin-resistant staphylococci, etc.).

12.1. Basics of Meeting Practice Safety Requirements

Clients should not assist with procedures in a veterinary hospital to avoid injuries such as bites and scratches and the potential for zoonotic contagion. Having trained staff do the work, with appropriate protective techniques and equipment, is less likely to result in injury.

COMMON SENSE

Many OSHA inspections are triggered by complaints lodged from present or previous employees. It is important that everyone in the practice appreciates that workplace safety is important to everyone and to celebrate excellence in practice safety. Some of the simple ways of keeping everyone safe include:

- Make sure that staff do not store meals in hospital refrigerators (those that might reasonably contain vaccines, drugs, or laboratory samples or supplies).
- Provide staff with a safe place to relax and eat, such as an employee lounge. Staff should not store food, make coffee, eat, or drink on counters or tables in any hospital area.
- Share the workload. It is important in larger hospitals that the same staff members not do all the radiography or all the insecticidal dips, so that the exposure is not concentrated repeatedly in the same individuals even if they are taking proper safety precautions.
- Frequent handwashing is one of the most important safety measures for employees. Make sure that staff wash their hands with an antiseptic soap after every procedure and after handling each animal.
- Make sure that staff know how to safely handle needles, and to properly dispose of needles and scalpel blades in an appropriate sharps container.
- Make sure that staff know the meaning of labels used as part of the safety program. For example, the National Fire Protection Association (NFPA) uses colored diamonds to indicate risks associated with health, fire, reactivity, and special hazards. These diamonds are to be located on each entry point, to identify the hazards inside. This is also important for emergency personnel, to quickly determine what hazards they may be facing on entering the area. The same NFPA diamond system is used to label products transferred from their original containers to secondary containers.
- Make sure that all staff are aware of the personal protective equipment (PPE) available, and the proper use of such equipment.
- Do not overload electrical receptacles and extension cords.
- Establish a waste anesthetic gas management program, allowing only trained individuals to handle anesthetic gases. With today's safe anesthetic gases, the main risk is for individuals adding liquid anesthetic to the vaporizer, and for systems that are not properly scavenged.
- Do not allow emergency exits to be blocked. These are not storage areas.
- Appoint a workplace safety administrator/officer and make the position more than ceremonial. Invest in appropriate training and recognize that safety is an important consideration of everyone working in the practice.

DOCUMENTATION

Practices need to compile documentation for hazardous communications and training, hazardous inventory lists, a workplace safety manual, annual summary of job-related injuries and illnesses (posted on the employee bulletin board during the entire month of February), and MSDS files.

It is not enough to just train employees. Practices must maintain documentation of the programs offered and attendance. Training programs might include the following:

- working with hazardous chemicals
- MSDS files
- PPE
- proper lifting techniques
- animal restraint
- bite injuries
- needle sticks
- radiation safety
- handling spills.

Also, even if a disposal service is used for hazardous chemicals, including radiographic chemicals, request a manifest from the service as proof that the chemicals have been properly disposed. Removal from the veterinary practice is not a sufficient safeguard.

12.1. BASICS OF MEETING PRACTICE SAFETY REQUIREMENTS

CAUTIONS

This information should serve as a guide regarding various safety issues and documentation in a veterinary hospital only. It is not intended to relay all pertinent information regarding regulatory requirements for full and proper compliance. It is the responsibility of all veterinarians and practices to ensure that their activities comply with all bylaws and regulations of federal, state, and municipal authorities.

12.2. PRACTICE SAFETY NEEDS

BASICS

OVERVIEW

• All veterinary hospitals have some similar basic safety needs. For example, all facilities need to have an emergency evacuation plan.
• In addition to these general needs, individual facilities will each have specific requirements. For example, a facility that makes use of nuclear medicine would need to have certain rules and training for dealing with radioactive materials.
• The Occupational Safety and Health Administration (OSHA) is the governmental organization that enacts and enforces safety rules for the American workplace; there are similar agencies in most other countries, including Canada and the United Kingdom. All states must abide by federal OSHA standards, and some states have additional regulations. It is important to check for rules in your state.
• There are four elements to a facility's OSHA compliance and safety program: administrative tasks, evaluation and control of facility or procedural hazards, the use of personal protective equipment (PPE), and staff training.

TERMS DEFINED

Hazard Assessment: A physical exam of the facility and procedures of the practice looking for risks or potentially harmful procedures.
Hospital Safety Manual (HSM): A collection of all the safety rules, and policies of the facility. It should contain the set training schedule for the staff, a written safety plan, safety data sheet library, and evacuation plans for emergencies. It must be stored in an easily accessible location and be available to staff during their normal work shift.
Personal Protective Equipment (PPE): Item(s) that are worn to protect the individual from direct or indirect contact with hazardous substances. Must be provided at no cost to staff members.
Safety Data Sheet: A document prepared by the manufacturer of a product that contains detailed technical and safety information about the product.
Safety Director: Individual responsible for overseeing the safety plan for the entire facility.

ISSUES AND OPTIONS

ADMINISTRATIVE TASKS

• Post signs and informative posters. A job safety and health protection poster must be prominently displayed in all facilities, and paths to exit doors should be well marked with signs and arrows.
• Keep accurate records of all accidents, injuries, and illnesses. Businesses with more than 10 employees are required to keep additional logs and post year-end summaries.
• Detailed floor plans of the facility, with well-marked locations of potential hazards and safety equipment, should be made and displayed throughout the facility. Examples of notable items include fire extinguishers, circuit breakers, compressed gas, alarm controls, and exit doors.
• Create a detailed HSM, which must be kept in an easily accessible location (see 12.7 – Hospital Safety Manual). Avoid keeping them in administrators' offices, as this discourages employees from reading them; instead, the employee break room would be an ideal location.
• Keep detailed records of all safety training, noting the date, topic, instructor, and participants. Consider using short tests or required demonstrations to ensure understanding of the material.

EVALUATING THE FACILITY AND PROCEDURES

• Conduct a hazard assessment to identify all potential hazards relating both to the building and to the procedures that take place in the facility.
• All exit doors should be kept unlocked from the inside but locked from the outside, at all times. Deadbolt-style locks are only allowed on exit doors if they can be opened from the inside without the need for a key or special device.
• Every facility should have adequate emergency lighting, which should turn on automatically whenever there is a power outage. Lights should be placed strategically to illuminate the exit way and in areas where critical operations may be ongoing in a power failure (treatment room, surgery).
• Good ventilation is essential. In addition to regular ventilating units, it is advisable to also have fans in areas where odors or vapors might accumulate.
• Walking surfaces, stairs, and hallways must be free from tripping hazards, protrusions, or holes. Stairs must have sufficient hand rails. Pay particular attention to the location of floor scales.
• Electricity is a necessary but dangerous utility. Extension cords and power strips are not a substitute for permanent wiring and should only be used on low-amperage devices in a temporary nature. Access to circuit breaker or fuse box connections cannot be restricted to less than 3 ft clearance.
• Furniture (chairs, desks) and fixtures (cabinets and shelves) must be sturdy and in good repair. Fixtures should be anchored to the wall to prevent tipping, especially in earthquake-prone areas.
• Housekeeping and sanitation are important safety issues. The facility must be maintained in a sanitary condition with trash and excessive clutter removed regularly.
• Since chemicals are used in the facility, a permanent eyewash device must be available in near proximity (within about 10 seconds). Hand-held bottles of wash solution are not a suitable substitute for a permanent device.

PERSONAL PROTECTIVE EQUIPMENT

• Train all staff members in the use and limitations of the PPE.
• Under OSHA guidelines, the use of PPE is mandatory for all workers and must be provided by the practice at no cost to the employee.
• Eye protection is necessary in any area where there is a possibility that foreign material could enter an eye.
• Hearing protection is necessary in noisy areas like kennels, mechanical rooms, and grooming/bathing areas with noisy fans. Hearing protection should have at least a 20 dB noise reduction rating.
• The practice's dress code should include safety considerations. When working around animals, closed-toed shoes with slip-resistant soles that cover the entire foot are expected When working with large animals, such as horses or cattle, steel-toed shoes are suggested. Excessive or "pendulous" jewelry should be discouraged.

STAFF TRAINING

• Having a safety plan is important, but it is worthless without educating the staff. All staff, both full and part time, must receive regular training on all safety issues (see 12.6 – Developing and Implementing a Safety Plan). It is not enough to just write the items down and discuss them; the safety director is responsible for making sure that all staff members can also demonstrate their understanding of the material.
• Training sessions should be recorded for two reasons. First, it provides proof that the staff received training, which is important should there be a complaint filed against the practice by an angry employee. Second, when new staff members are hired, they can watch these videos and gain important information quickly.
• There are numerous styles of training, so select a style based on the message – some topics lend themselves to written instructions, while

other tasks require more hands-on instruction. Use videos to illustrate and instruct, but they are not a replacement for one-on-one instruction or evaluation.

SPECIFIC ISSUES

- Sharps injuries are a real concern in the veterinary practice. Although the disease transmission factor is not as serious as in human medicine, it is still a concern. Likewise, exposure to the chemical (drug) contents of the syringe/needle is a major concern. Recapping should be discouraged, as should needle cutting, which increases the possibility of aerosol contamination. Needles should not be removed from syringes for separate disposal, but the entire needle/syringe combination should be placed in an appropriate sharps container immediately after use.
- The animals themselves can present a hazard. All staff members should be trained in handling and restraint. Recently, there has been an increase in the number of staff members who are allergic to latex. Reactions might range from mild skin irritations to asthma. Staff education is the best way to combat this problem. Although most such reactions will be cutaneous, all staff need to understand how to recognize these allergies and what to do if they occur.
- Bathing areas have many possible hazards: lifting animals, noise, bathing chemicals, animal danger due to improper restraints, and slipping. In addition to waterproof aprons, mats that decrease slippage, ramps that allow animals to walk to the bathing compartment, and protective goggles and gloves are essential tools in the bathing area.
- Protective aprons, thyroid collars, and gloves *must* be used each and every time a staff member takes a radiograph and must remain in the room during the exposure. Each staff member must have and use their own individual exposure monitoring badge.
- Anesthetic machines must be pressure checked daily, with an annual preventive maintenance service by a qualified repair technician. It is also important to have a quality scavenger system. Masking and tank inductions should be the exception rather than the rule as they are nearly impossible to scavenge properly. Annual testing of the staff's exposure to waste anesthetic gases is easily accomplished using badge-style monitors. When changing the absorbent in anesthetic machines, protective gloves and goggles should be worn.
- Chemotherapy, nuclear medicine, and advanced imaging processes create new and more dangerous environments for veterinary workers. Consult the protocols that are provided by companies selling these products for advice.
- Three chemicals that require additional, specific precautions are formalin, nitrous oxide, and ethylene oxide.
- Sometimes the simplest actions can be the best preventions. Washing one's hands after handling drugs, animals, or laboratory equipment will decrease the danger of contamination.
- The storage, preparation, or consumption of food or beverages is not allowed in any room where hazardous chemicals are present or where unsanitary conditions exist (biological hazards) nor in any restroom.

12.3. Client Safety

BASICS

OVERVIEW

• Clients can be harmed in a variety of ways while just being on the property of a veterinary facility. A commercial property landowner or possessor is usually required by law (1) to maintain the property in a reasonably safe manner and (2) to warn others of potential hazards on the property.
• Veterinarians who own or possess property, through lease or other rental arrangement, have a legal duty to maintain those premises in a safe condition and to warn the people entering into or upon those premises of any hazards that are known or, with ordinary care, should be known to the owner.
• A veterinarian business owner's failure to maintain the premises or to warn of hazards could expose the veterinarian to liability for negligence.
• "Premises liability" is a legal term in which property owners are held responsible for any type of personal injury caused by some type of unsafe or defective condition, such as, but not limited to, icy walkways, large holes in the ground, broken handrail on a stairway, a pool without protective fencing, or even the presence of potentially dangerous animals.

TERMS DEFINED

Invitee: Anyone who enters the premises by invitation and whose entry is connected with or may in some way enhance the business of the owner.
Licensee: Someone who enters the premises but does so for his or her own purposes rather than for the benefit of the business owner.
Trespasser: A person who goes on the premises without an express or implied invitation from the possessor.

ISSUES AND OPTIONS

Premises liability laws generally classify those who enter onto a business premises as "invitees," "licensees," or "trespassers" – including different levels of protection afforded to each by the landowner/property possessor.

INVITEE

• An invitee is anyone who enters the premises by invitation and whose entry is connected with or may in some way enhance the business of the owner.
• The invitation may be express, implied, or inferred from previous conduct.
• The premises possessor owes the highest duty of protection to its invitees.
• The most common invitee is a client coming into a veterinary practice for an appointment or to purchase goods. However, not all clients are invitees – such as when a veterinarian goes to a client's property/home to deliver services or if a client has been notified that his or her presence will no longer be tolerated/welcome on the business property.

LICENSEE

• A licensee is someone who enters the premises but does so for his or her own purposes rather than for the benefit of the business owner.
• The premise possessor owes the licensee a duty of "reasonable care."
• Social guests or public-utility repair personnel (such as water/sewer/street lighting repair) would be examples of licensees.

TRESPASSER

• A trespasser is a person who is on the premises without an express or implied invitation from the landowner/possessor.
• Although there is generally no legal duty to protect a trespasser from harm, if a landowner/premises possessor knows or might reasonably believe that a trespasser could be on the premises, the owner might have to exercise ordinary care for the safety of the trespasser – such as maintaining a fence along property boundaries, posting "no trespassing" signs or warnings of "Dangerous animals – Will bite" in areas throughout the premises.
• A premises possessor cannot prepare pitfalls, snares, or other traps for the trespasser and cannot willfully or wantonly injure the trespasser.

GENERAL

• There is a general legal trend towards a common doctrine for property owners being required to provide reasonable care of property maintenance and warning of risks to all persons regardless of their status or technical classification.
• The mere fact that a person is injured on the premises does not mean that the property owner is liable. Although visitors are not expected to look for hidden hazards, they have the duty to exercise reasonable care in moving about the premises and must be alert to "obvious and apparent" dangers.
• There are also some additional precautionary measures that veterinarian property owner/possessors should be aware of:
  ◦ **Children.** In general, children/minors are considered not to have the same degree of rational judgment as adults, and therefore they are not held to the same standard of conduct as an adult. Veterinarians should take extra precautions to ensure the public areas of their premises are "child-proofed" (such as closed doors to kennel/herd areas and no sharp glass tables in lobby area) and advising clients to closely supervise their children at all times while on the property.
  ◦ **"Attractive nuisance doctrine."** Under this legal theory, a premises possessor who has or creates a condition that may be reasonably seen as "attractive" yet is a source of danger – especially to a child – has a special duty to take reasonable precautions to prevent injury to children who may be attracted to the danger. For example, animals can attract the attention of many children. Accordingly, this doctrine could apply to veterinary facilities with open kennel areas, to mobile veterinary practices, or to those whose employees walk animals in public areas – all activities that might attract the attention of children yet can prove to be quite dangerous.
  ◦ **Criminal activity.** Some courts have held property owners/possessors are liable for failing to take reasonable actions to warn others against potentially foreseeable or recurring criminal activity on their land. If a premises possessor/owner has knowledge of or reason to foresee potential criminal activity on the premises, the owner has a duty to warn others and to take reasonable measures to deter, prevent, or guard against the dangers of such activity – for example, by maintaining lighting on property, use of locked fencing surrounding property during closed business hours, or prominently visible warning signs of possible dangers.
  ◦ **Product liability.** Many veterinarians dispense medications and other products to their clients. Many of these products can be hazardous if not used for the intended purposes. Although this is a very complex area of law well beyond the space available here, veterinarians should be aware that they may face liability for injuries arising from the products they dispense, especially if the products have been altered in any way. Place warning labels on all medications, such as "for animal use only as prescribed" and "keep out of children's reach."
  ◦ **Nonowned/shared property.** Traditionally, landowners have no duty to maintain property not managed, possessed, or controlled by them, nor have a duty to warn others of dangers that exist on the property of others. However, in many states, commercial property owners have been found liable if they have received a commercial benefit from the property and did have some control over it. This applies most often to shared parking lots or walkways in large commercial facilities. Depending on the facts and circumstances,

premises' possessors can be liable to members of the public who are injured on a shared icy sidewalk – even if the injured person is not a client.

EXAMPLES

• **Obey the codes.** A possessor of commercial premises has a duty to provide a safe environment for his or her visitors. There are local, state, and federal laws, codes, and regulations that control general safety. At a workplace, clients are also protected under general safety standards (i.e., Occupational Safety and Health Administration). Veterinary premise possessors should take all necessary steps to ensure they are in compliance with all local health and safety codes.

• **Perform frequent inspections.** Generally, the premises owner/possessor has a legal duty to periodically inspect the premises for hazards. All personnel, including the veterinarians, should be instructed how to report (or correct) potentially dangerous conditions – whether a loose animal running around the premises or broken furniture/equipment. Many insurance companies offer consultations, educational materials, or even training in this area. Inspections should include all areas of the building and grounds, on a regular basis. Commonly encountered hazards would include slippery, rough, or uneven floors; improperly placed weight scales; confusing floor patterns and other trip hazards; bad lighting; exposed or loose wires, plugs, or sockets; improperly stocked merchandise; and dangerous equipment. Veterinarians and their staff should be especially alert for open containers, exposed drugs, syringes, and needles. Maintaining workplace safety at all times should be a paramount concern to all employees.

• **Repair or warn immediately.** Once a hazardous situation has been identified, it should be repaired or removed as soon as possible. Whenever a hazardous condition cannot be immediately corrected, the premises possessor should take all reasonable steps to identify the hazard and protect visitors and employees from injury by posting highly visible and easily understandable warning signs.

• **Limit animal handling.** Animal-related injuries can occur to clients in a lobby area while holding their own animal or when restraining their own pet during a veterinarian or technician examination procedure. Veterinary staff should carefully handle all animals undergoing any procedure, no matter how small or insignificant. Veterinarians should also take precautions to ensure that clients are far enough away from "the danger zone" of a procedure to preclude their injury. All veterinary staff should be regularly and properly trained in safe animal handling as well as the recognition and resolution of dangerous situations. Owing to the potential for injury, veterinarians can refuse to serve clients – especially those who will not accept safeguards of muzzling, sedating, or having trained staff to hold their animals.

• **Insurance.** In efforts for a veterinary premises owner or possessor to protect their business interests, property insurance coverage should include protection for incidents related to premises liability. Premises liability insurance and professional malpractice insurance are completely different, yet, oftentimes, they are frequently intermingled during the claims process. This is especially true when an owner is injured while holding an animal or helping with a procedure. Clients' injury claims are often handled as professional malpractice or negligence claims; accordingly, owners or possessors of veterinary premises should carry property and general liability insurance as well as professional malpractice insurance, preferably with the same company. Veterinary premise owners are advised to consult with a qualified insurance agent about these products prior to purchase.

CAUTIONS

It is important to remember that the legal responsibilities of being a premises/property possessor cannot be delegated. The property owner may contract with others to do landscape, parking lot, or building maintenance, but the possessor of the property (whether the owner or another party) remains liable for any dangerous conditions and for any resultant injuries.

Constant and active attention to the details of premises inspection and maintenance may not prevent an accident and injury, but it should go a long way toward protecting the property's/premises possessor from liability.

12.4. Animal-Related Injuries at the Workplace

BASICS

OVERVIEW

There are almost an unlimited number of circumstances by which domesticated animals, livestock, and wildlife can inflict injury or harm on humans, on other animals, or on property. As human–animal interactions continue to escalate within our society (mainly due to physical expansion of communities/businesses as well as increased attempts towards domestication of animals), reports of animal-related injuries have also increased. For example, daily news reports include injuries related to venomous snake bites, alligator attacks, dog bites/killing, and the potentially fatal illnesses transmitted by insects. Those who work at a veterinary facility are at an increased risk of exposure to animal injuries – and, accordingly, are considered to assume those associated risks. Yet, employers should take proactive measures to comply with applicable laws and enact safety protocols to minimize the potential for animal injuries in the workplace.

TERMS DEFINED

Scienter: A legal term implying that the offender had knowledge of wrongdoing before the act was committed.

ISSUES AND OPTIONS

As a general rule, when an animal causes injury or damages, legal responsibility (referred to as "liability") can be directed towards the owner, the keeper/possessor of the animal (who might not necessarily be the owner), the occupier/owner of the land upon which the injury resulted, or a combination of these parties. Imposing liability upon a party for an animal-related injury is dependent upon two important components: (1) the facts and circumstances surrounding the incident (including what or whom was injured/damaged) and (2) the jurisdiction in which the injury or damage occurred.

With certain exceptions, liability might not attach to an animal's owner or possessor for animal-inflicted injuries or damages if:

- another person/entity assumed legal responsibility and control over the animal;
- the animal was provoked or unnecessarily placed in surroundings where it could become frightened or agitated;
- the injured person was a trespasser or "was doing an unlawful act" when injured by the animal (depending upon the jurisdiction, this will not apply for children nor if an "attractive nuisance");
- contributory or comparative negligence exists (not applicable in all states); or
- there was an assumption of the risks by the injured victim(s).

Veterinarian's potential liability as "possessor" of animal. With many exceptions, when a veterinary clinic assumes control of a client's pet, a potential shift in the transfer of legal liability could cross over from the client to the veterinarian-practice owner and/or the clinic's property owner (if different from the owner of the practice) for the animal and its actions. However, depending upon the jurisdiction, and circumstances, many exceptions could relieve clinic owners of liability. For example, the liability of an animal's owner does not necessarily transfer over to the veterinary clinic in circumstances where he or she had prior knowledge of the animal's propensity to cause injury but failed to communicate the potential danger to others.

Laws for liability of animal-related injuries vary significantly from jurisdiction to jurisdiction. In some states/jurisdictions (not necessarily in others), courts have held that:

- In keeping with common law principles, only if the owner/possessor of a domesticated animal knows, or had reason to know, that their animal was particularly dangerous/vicious or had bitten a human or other animal, the owner (or possessor) has a duty to exercise reasonable care to keep their animal(s) under control and is subject to liability for harm caused by the animal. This knowledge requirement is sometimes referred to as "common law scienter." [*Note.* Some states have held that no scienter requirement is necessary for holding owners/possessors responsible for injury or damages caused by their animals if they are in violation of a local ordinance (such as a dog running at-large without a leash), whereby a possessor of an animal who is not exercising due care or control of the animal can be held strictly liable for the damages inflicted by the pet.]
- With a few exceptions, dog owners are strictly liable to victims who are bitten or attacked by their dog while in a public place, under the respective state's "dog-bite statute" or "responsible dog owner" laws.
- It is the *act* of the animal, not its intent, that implicates the owner/possessor. Even injuries or damages inflicted by a "playful" or "mischievous" pet can create liability issues for the owner.

12.4. Animal-Related Injuries at the Workplace

• Liability for animal-inflicted injuries does not necessarily apply to all types of domestic animals equally. Many states have enacted statutes limiting the liability of horse owners and equestrian facilities for injuries resulting from inherent risks of equine activities. Some states have expanded similar protections to "llama activities," whereas other states have enacted broader laws relating to risks associated with injuries from animals under "recreational activity" liability laws.
• Generally, when referring to injuries caused by domestic animals, whoever had control of the animal at the time of the incident is usually legally responsible. Accordingly, a veterinary clinic owner who knowingly permits employee's pets or the clinic's "pet mascot" to wander unrestrained in the workplace could potentially be held liable for direct or indirect injuries occurring to clients, their pets, or to vendors/repairmen as a result of the animal's actions or presence.

Courts also take into consideration the following when determining awards for damages or injuries inflicted by animals:

• **Injury to humans versus injury to animals or property.** In most circumstances, if an animal seriously injures or kills another animal or causes damage to property, the law in most jurisdictions has traditionally been interpreted to limit the victim's recovery to the property's/pet's fair market or intrinsic value. However, if an animal injures or kills a human, the possessor of the animal could possibly be held strictly liable for the victim's resulting injuries and damages, potentially having to provide compensation to the victim for medical fees/repair of damages/loss of employment income and "emotional pain and suffering," as well as facing possible felony conviction and, depending on the circumstances, incarceration.
• **Injury/damages to people at the workplace ("premises liability") versus off the workplace property.** Injuries from animals can be inflicted either directly (i.e., physical attacks, bites, scratches, kicks) or indirectly (i.e., allergen sensitivities, zoonotic disease transmission, or actions causing a chain reaction of damaging events). Generally, courts consider various factors and circumstances when determining liability issues pertaining to workplace injuries:
  ◦ What relationship does the property owner have with the injured party?
  ◦ Was the risk known or anticipated?
  ◦ Was the party warned about the risk of injury?
  ◦ How did the person who was injured arrive on the property?
• A practice owner's (or employer's) liability, if any, for animal-related injuries might depend upon whether the incident occurred at, or away from, the workplace as well as whether harm occurred to a client, an employee, or a nonemployee. Also keep in mind that the effect of the injury might not exhibit or show until after the victim has left the workplace property (such as zoonotic diseases).
• **Injured client.** A veterinary practice owner could potentially be liable for animal-related injuries that occur either at, or away from, the clinic (see 12.3 – Client Safety). For example, a veterinarian who, after examining and releasing a client's pet that had been previously bitten by a wild animal, fails to warn about potential risks associated with zoonotic disease transmissions could potentially be implicated if the client later acquired a zoonotic disease from the pet. Possible defenses for an owner/possessor of a workplace against liability for client injuries generally can include assumption of risk (such as clients who demand to hold/restrain their animal during veterinary examinations and refuse assistance from staff), reasonable care taken to limit animal's access to others (animals secured through separate entrances, barrier seating in lobbies, requirements of leash/carrier), or unnecessary provocation of animal (usually caused by humans taunting sick or frightened animals).
• **Injured employee.** Generally, if an animal-related injury occurs to an employee at a veterinary clinic, employers/practice owners are not necessarily held legally responsible for damages or injuries. Generally, injured employees working at American veterinary facilities are oftentimes limited (and entitled) to receiving compensation through their state's workers' compensation (WC) system, without imposing blame or fault, as long as the injury "arises out of and in the course of employment." [*Note.* Even though almost all states require every employer to provide WC for all employees, not all WC laws are the same. Some states might exclude employers with less than three employees from requiring coverage, whereas many states exclude certain types of workers (e.g., casual employees or agricultural workers). A few states require employers to purchase insurance coverage through a state-sponsored fund, whereas other states might require employers to purchase WC coverage through private insurance carriers. As with most insurance coverage, an employer's premiums will reflect the frequency and amount of claims made by your employees. Contact your state's WC agency to learn what options are available for your clinical operations.]

Legal responsibility and duties owed by business or property owners/occupiers to those entering upon their land/workplace will differ, depending upon circumstances, the type of person injured (trespasser, invitee, or licensee), and the jurisdiction in which the incident occurred.

12.4. Animal-Related Injuries at the Workplace

RECOMMENDATIONS

Maintain a safe working environment. Good business practices, in addition to being the legal duty and responsibility of the veterinary practice owner, include having a safe working environment for employees (see 12.1 – Basics of Meeting Practice Safety Requirements). The Occupational Safety and Health Administration (OSHA) imposes strict safety regulations on American workplaces. Although OSHA does not address animal-related injuries directly, veterinary employers are responsible for workplace safety under OSHA's "General Duty Clause."[1] The broadly written clause requires an employer to provide a place of employment "free from recognized hazards that are causing or are likely to cause death or serious physical harm to employees"; as such, veterinary employers should take proactive measures to maintain a safe working environment.

1. **Provide staff training on a regular basis.** Implement, train, and enforce safety protocols with each workforce member (including volunteers and independent contractors) on how to properly approach, restrain, handle, treat, and care for animals.
2. **Provide personal protective equipment (PPE) as well as a safety manual to all personnel** (see 12.7 – Hospital Safety Manual), including written policies on:
   i. *Warning of dangerous conditions and restricted areas.* Warning signs should be posted in common areas requiring that all animals should be restrained and/or under the owner's/possessor's control; warn of restricted areas such as where radiation is present or where only trained personnel can enter (such as surgical/kennel/grooming areas); and place warning notices on each medical record and each cage regarding an animal's abnormal or dangerous behavioral propensities (such as "Fractious" or "Will Bite").
   ii. *Taking precautionary measures when using sharps, scalpels, or other sharp objects near animals.* Train personnel on proper disposal of sharps, syringes, and other medical waste into appropriate, clearly labeled containers.
   iii. *Keeping all doors, cages, and fences securely closed* to prevent the potential escape of animals. This could also prevent potential future injury to the animals, injury to others, or property damage.
3. **Prevent potential for cross-contamination.**
   i. Wash hands thoroughly after handling each animal, after cleaning cages and equipment, and before eating or drinking.
   ii. Establish and maintain a "quarantine" area where possible infectious diseases cannot be spread – either to humans or to other animals in the facility.
   iii. Keep human food/beverages out of animal-occupied or pharmaceutical refrigerated/frozen-storage areas.
   iv. Provide, and enforce use of, PPE. PPE, including restraint equipment, should be made available to all personnel in efforts to reduce the potential for harm to an employee or animal.
4. **Advise clients about keeping their children safe.** Request clients' children remain with their parents at all times – and not to approach other clients' pets or animals' cages. If space allows, consider a "Children Only Zone" where toys, books, television, and other activities are available to keep children entertained – instead of interacting with possibly sick or frightened animals.
5. **Design or arrange common areas to reduce possibility of animal-to-animal (or animal-to-child/client) interactions**, such as using barriers/walls surrounding seating areas or having separate entrances for client-intake and checkout.

EXAMPLES

N/A

CAUTIONS

General disclaimer. The unique facts and circumstances surrounding each incident of animal-related injuries/property damage significantly affects the legal outcome. Legal liability is also dependent upon the

jurisdiction in which the injury/damage occurs. As a practice owner, *always consult with your insurance company and/or your attorney when an animal-related injury occurs at your workplace*. The information provided here does not serve as legal advice nor is applicable to every situation.

12.5. Security Issues for Hospital and Staff

BASICS

OVERVIEW

Veterinary hospitals face the same security issues that most small businesses face with some additional unique factors that are specific to veterinary medicine. Basic security systems and policies should be developed in order to avoid theft or fraud and to provide for the safety of the staff.

It is easy to recognize how a basic security system can provide safety against burglary, but more broad security issues should also be considered, including fraud or internal theft, protection from fire or flood, computer security, and risk of frivolous claims from staff or the public.

TERMS DEFINED

Firewall: Any number of software-based or hardware-based programs installed in a computer to keep a network secure from outside threats.
Flow Monitor or "Flow Switch": A device installed in the fire sprinkler piping that monitors any flow of water in the pipe, indicating that an automatic fire sprinkler has been activated. Automatic fire sprinkler systems with 100 or more sprinkler heads require flow monitors to be installed by code, with a notification system to alert the fire department in the event of fire sprinkler activation.
Intrusion Detector: A security-system device installed in a building to detect unauthorized access to the building. The most common types of detectors include door-ajar sensors and glass-break detectors.
Monitored Security System: An electronic building security system consisting of any combination of motion detectors, intrusion detectors, or other monitoring devices that is capable of relaying information to an off-premises company in order to alert the business owner or emergency personnel in case of a security breach. Security systems may also include panic buttons for manual notification by staff to the security company and/or police in case of emergency or fire.
Phishing: Attempting to acquire such information as passwords, user names, and credit card details though electronic communication by posing as a trustworthy entity.

ISSUES AND OPTIONS

BUILDING AND STAFF SECURITY PROVISIONS

• Excellent exterior lighting, especially around building entrances and windows, along with a monitored security system provides the best defense.
• If operating a 24-hour emergency hospital, it is best to have a protocol that allows keeping the entry doors locked yet, at the same time, permits quick identification of people wanting to enter the practice. This can be accomplished either by simple visual connection from the reception area to the front door or via a video security monitor and the ability for the entry door to be remotely locked and unlocked.
• Consider installing electronic access control systems or other programmable door locks. These systems minimize the need for rekeying locks and replacing keys whenever there are staff changes or keys are lost. Additionally, sophisticated access control systems are able to monitor when specific staff members access the hospital or specific controlled areas.
• Video surveillance can be installed not only to create a means of tracking down criminal activity, but also as a deterrent to crime in the first place. Areas to consider can include the front reception area and anywhere money is handled, the pharmacy, storage areas, all exterior doors, and the parking lot. Having a video surveillance monitor in plain view of both staff and clients advertises the importance of the safety and security of the practice. Records from video surveillance systems can also help defend against frivolous claims from clients or staff.
• Consult with an architect or a building security expert to develop a plan for controlling access through your building. There are many different functions for locks that can be used as part of an overall building security strategy. When locking doors are used, careful consideration needs to be given so emergency egress from any point in the building is not compromised.
• Make it a policy to not allow building access to staff outside of normal business hours. Additionally, always have two people open and close the hospital. Not only does this provide safety for the staff, it decreases the chance of inventory walking out the door when no one is around.
• When designing a new facility, it is important to understand the traffic flow of public areas versus secure staff areas of the hospital. When planning a 24-hour facility, consider where doors can be provided to separate the back of the hospital from the public areas in the front during overnight hours. Limit the number of exam rooms that are used after hours and use locks to restrict access to the other areas of the hospital.
• Some interior lights should remain on all night. Ideally, a small number of lights in all areas should be circuited to a separate night-light circuit that always remains on. If separate night lights are not an option, determine which lights should be left on and make it a policy to leave them on when closed.
• Limit the number of keys to the hospital and make sure that all copies are stamped Do Not Duplicate. Always be sure to collect keys from employees when their employment is terminated.
• Any facility that provides overnight boarding of animals, either medical or nonmedical, should include an automatic fire sprinkler system. Fire sprinkler systems may be required by building codes; if not, building owners can elect to install them to help minimize property loss from fire.
• Be sure to post emergency telephone numbers at the reception desk.
• Identify a specific room or multiple rooms that can serve as safe rooms in case a client or staff member becomes violent. Doors to safe rooms should swing outward, be solidly constructed, and lock from the inside. Safe rooms should have telephones to alert the police when needed.
• Install peepholes or windows in any exterior doors where there are no windows so staff can check outside before opening the door.
• Eliminate significant landscaping or other large items near exterior doors that can create places where people could hide.

COMPUTER SECURITY

• Retain the services of a qualified computer consultant to set up appropriate networking and protocols to ensure the security of the hospital systems (see 10.8 – Cybersecurity and Network Security).
• Update all software regularly, including basic operating system and application software, and especially antivirus software.
• If using wireless computer networking, be sure to use a secured wireless system with a strong password. Communications over open, unsecured wireless networks can be accessed by people outside the hospital and can pose a serious security risk.
• Require each staff member to use a unique computer log in and enforce strong password requirements. Immediately disable computer accounts of terminated employees.
• Private computer networks connected to the Internet should include some sort of firewall to prevent intrusions from the outside and to restrict access to unauthorized or dangerous Internet sites. Firewalls may be hardware devices, but often just consist of software programs or systems that control and/or limit access.
• A high percentage of Internet computer fraud is the result of "phishing" scams. In this type of fraud, unsuspecting users are duped

into entering account information, passwords, or other private information into a website that has been created to appear legitimate. Most good firewalls or network access providers can be configured to block access to phishing websites. However, users should avoid activities that could subject them to phishing scams. For example, avoid clicking on links in e-mails to access a website and secure account information even if the e-mail appears to be from a familiar company or bank. Instead, access the company's website directly and enter log-in information in the approved way. Secure websites will always display "https://" as the first part of the web address. If this does not appear it is not a secure site, and user names, account numbers, and password should not be entered.

MONETARY SECURITY

- Utilize a single cash drawer for all client transactions in order to simplify reconciliation and minimize opportunities for unauthorized access. Lock the cash drawer in a safe at night.
- Count the day's receipts in the back of the hospital, away from the front desk and out of public view.
- Post signs about limited cash on hand.
- Reconcile accounts monthly and consider having all bank statements, including credit card statements, sent to the practice owner's home for review before providing to the bookkeeper or practice manager for reconciliation.
- Keep blank checks in a secure, locked location.
- Require the business owner to sign all checks.
- Obtain criminal background checks on key personnel, including the bookkeeper and anyone who will handle cash.
- Always check references from past employers for all new hires, regardless of the position.
- Order a credit report for your business at least once per year to check for any unauthorized credit accounts.

MEDICAL DRUG AND INVENTORY SECURITY

Perform regular weekly or monthly inventory counts of all high-value items, including prescription medications, prescription food, and controlled drugs.

The American Animal Hospital Association recommends in their standards for accreditation that pharmacies should be in a separate room with controlled, restricted access to only authorized individuals. A hard ceiling installed in a separate pharmacy room can prevent access to the room from over walls and above the ceiling.

Provide additional security for controlled drugs (see 12.12 – Controlled Substances). Drug safes may be located in secured closets or cabinets in order to provide additional security. A separate, secondary drug safe in treatment areas may help minimize the quantity of controlled substances that can be readily accessed at any given time.

Post signs indicating that all drugs/controlled substances are secured in drug safes.

Large hospitals may consider the use of automated pharmacy cabinets. In addition to inventory control, these systems can integrate with practice management software to improve billing compliance for all dispensed medications.

Central storerooms should be locked with access only to specific personnel. Separate locked cabinets or a means of securing high-value items should be provided within the central storeroom.

12.6. DEVELOPING AND IMPLEMENTING A SAFETY PLAN

BASICS

OVERVIEW

• Having a functional safety plan shows that the practice is concerned about staff safety in the workplace.
• Not only will it reduce financial liability and save time and money, but also having a safety plan is the right thing to do and a legal requirement.

TERMS DEFINED

Hazard Assessment: A physical exam of the facility and procedures of the practice looking for risks or potentially harmful procedures.
Personal Protective Equipment: Various pieces of equipment that need to be purchased and brought into the facility for the safety and protection of the staff. Examples include eyewash stations, safety goggles, and lead aprons for radiology.
Safety Data Sheets: Detailed explanations about each drug or chemical providing all-important information regarding use of the substance.
Safety Director: Person in charge of defining and implementing the safety plans.
Safety Manual: Written collection of safety-related information in the practice into one resource. May be printed on paper or may be electronic and maintained on the practice computer.

ISSUES AND OPTIONS

Implementing a safety plan is time consuming, but important. Do not expect that everyone will instinctively know what to do in a given situation or that they will recognize a problem without instruction.

STEP 1

Decide if you want to do it yourself or you want to hire someone to do it for you.
• Although a dedicated safety staff member is not necessary, there will be a significant time commitment.
• Outsourcing will buy you *time* by getting plans, documents and training completed without other practice distractions.
• Do not overestimate what a consultant will do for you. They will *not* relieve you of your obligations or responsibilities for any part of your safety program.

STEP 2

Educate yourself of the requirements.
• Actual copies of every Occupational Safety and Health Administration (OSHA) standard, directive, or interpretation can be found on OSHA's website (www.osha.gov).
• A veterinary-specific compliance kit or newsletter will "decipher" the regulations into terms and procedures the average practice can understand and implement.
• Compliance kits are simply an interpretation of the rules by the author. OSHA does not "approve" or "certify" any person or publication in this regard.

STEP 3

Do a "physical exam."
• In safety terminology, this physical exam is known as the hazard assessment and it is the first thing that a manager or safety director must accomplish.
• Start at one end of the facility and go room to room with a checklist to evaluate the physical facility.
• The hazard assessment does not have to be complicated. Watch people do their tasks and write down any step that appears to present a risk of injury above what would be expected for a person just observing the process.
• Take note of any protective equipment that is used and recommendations for any that is needed.

STEP 4

Make an implementation plan.
• Take the time to write out a list of changes or procedures that need attention. This is called an implementation plan. Organize the plan by topic instead of by geography or area.
• Prioritize the issues from most important to least critical. It is OK to make adjustments and even rearrange the order of events on the plan when the need arises.

STEP 5

Share the duties.
• It is tempting to give the "OSHA program" to a single, trusted employee and expect they will personally do the things that need to get done. But that is not realistic in most practices.
• Designate a safety director to oversee the program, but involve many people in the various things that need to be done (checking fire extinguishers, replacing worn or missing container labels, etc.).
• Create a monthly checklist with the names of folks who are responsible for accomplishing key tasks in the safety program.

STEP 6

Create a safety manual.
• Compile all of the safety-related information in the practice into one resource. This gives the impression of a comprehensive program instead of a "hit-or-miss" one (see 12.7 – Hospital Safety Manual).
• It is perfectly acceptable, and often more practical, to put the safety manual on the hospital's computer system. As long as employees have reasonable access to the computer during their work shift and are competent to operate the computer to get to it, the safety center is ideally suited for the hospital's intranet.
• Keep a printed safety manual in a convenient location in the practice – usually in a "neutral" area like the break room, treatment area, or lab. Avoid keeping it in the doctor's or manager's office because there may be some "situational intimidation" that would prevent a new or concerned worker from reviewing it.

STEP 7

Fix one problem at a time – generally!
• Start with the most hazardous jobs (according to your implementation plan) and establish a procedure that must be followed when exposure to the hazard can occur.
• Pay particular attention to the safety equipment that is required. Make sure that your equipment is appropriate for protecting the user and that it fits properly.
• Immediately correct any situation where someone is likely to suffer a serious injury because of an improper procedure or lacking safeguard. But when it comes to the "little things," take it at a moderate pace and let folks become accustomed to one new thing before you spring another on them.

STEP 8

Train, train, train. Then train some more.
• An effective training plan begins with simply setting aside some time on a regular basis for the staff to review information relevant to their jobs.
• Informal instructional meetings can be just a few minutes a day at the start of the shift to go over the plan for the day.
• For more complex issues, schedule a guest speaker to really make the topic useful as well as mandatory! (Fire department or police officer.)
• Spread the topics out over a time, when you can. Having a marathon safety meeting that lasts hours is sometimes necessary for operational reasons, but it is by far the least desirable.

12.6. DEVELOPING AND IMPLEMENTING A SAFETY PLAN

STEP 9

Reevaluate and adjust.

- Do not be afraid to make changes. Nothing ever works out exactly as planned, and you have to be flexible.
- Ask the staff for input during the development phase of the plan; you may find that they have concerns that you never realized.

STEP 10

Enforce the rules.

- When an employee violates the rules (safety or otherwise) the leadership must take immediate corrective action, or else the rule or procedure really does not mean much.
- Corrective actions should be tailored to the *reason* for the failure. If the problem is lack of understanding, then it is a training or competency issue, but if the staff member knows the rules and still disregards them, you have a discipline problem.
- You must correct discipline problems with appropriate enforcement actions. You will *never* solve a discipline problem with more training.

12.7. Hospital Safety Manual

BASICS

OVERVIEW

The hospital safety manual (HSM) is a communication tool for the practice manager. It contains all the safety policies of the practice assembled in a single location. The safety manual is the leadership's directions to the staff on issues related to safety and should be constructed and enforced in the same manner as an employee policy manual.

The HSM can be printed on paper or maintained electronically on the practice's intranet. No matter what format is used, the leadership must make sure every staff member is aware of and has access to the HSM in a reasonable amount of time and that the HSM accurately reflects the operations of the hospital.

TERMS DEFINED

Bloodborne Pathogens: Generally refers to disease-causing organisms present in blood, but could refer to any organism capable of infecting a human from blood or body fluid contact.

Chemotherapy: The introduction of drugs into the body primarily used to treat cancers. Chemotherapy drugs are carcinogenic in long-term exposures outside of therapeutic treatments. Chemotherapy drugs are often referred to as cytotoxic drugs because they are toxic at the cellular level.

Ergonomics: The study of injuries or disorders related to the musculoskeletal system. In the small animal veterinary profession, back injuries are the most common ergonomic injury. In the equine and food animal areas, muscle strains and "twisting" injuries are more common.

Hazard Assessment: A review and analysis of the facility and the procedures of a practice with the goal of identifying potential hazards to the staff. Often referred to as a "physical exam" of the practice.

Hazardous Chemical: Any chemical product that can cause physical harm to a person or to the environment, including seemingly mild products that can be irritating to the eyes or cause skin reactions.

Occupational Safety and Health Administration (OSHA): The OSHA is a division of the US Department of Labor. Twenty-five states and territories of the United States have state-level OSHA agencies.

Personal Protective Equipment (PPE): Any clothing or device worn by a person to place a barrier between them and a hazard.

Scavenger: A mechanical, physical, or chemical device that captures the waste anesthetic gases from the anesthesia machine and discharges them to a safe area or absorbs them into a filter.

Waste Anesthetic Gas: Inhalation anesthetic gas that is not metabolized by the patient and subsequently exhausted from the machine or from the animal, preferably into a scavenging system.

Zoonotic Disease: A disease that is common to both animals and humans. In the context of veterinary hospital safety, the greatest concern is for those diseases easily transmittable from animals to humans.

ISSUES AND OPTIONS

In order to prepare an HSM, one must first understand the risks associated with the facility and the operations of the hospital. To this extent, a hazard assessment must be performed prior to deciding on the contents of the HSM (see 12.2 – Practice Safety Needs).

In most veterinary practices, the list includes the following topics, but there will be cases where additional topics are warranted. If a topic is not applicable to a practice, it should still be included in the HSM to show that the topic was considered and that staff members are not likely to be exposed to that hazard.

ANESTHESIA

- Annual machine servicing.
- Daily user testing.
- Scavenger system integrity and use.
- Masked or tanked induction as the exception.
- Exposure-level testing of staff is available.

ACCIDENT PREVENTION AND RESPONSE

- Requirement for employees to report accidents or work-related injuries to a specific person.
- Identify nearby hospitals or physicians for treatment.
- First aid policy and location of supplies.

ANIMAL HANDLING

- Training requirement to identify aggressive animals.
- No loose animals in the hospital.
- Ergonomic principles when lifting or restraining.

BLOODBORNE PATHOGENS/INFECTION CONTROL

Although most provisions of OSHA's bloodborne pathogens standard do not apply to veterinary practices, the general duty requirements of protecting employees from zoonotic diseases still applies.

- Safe needle handling and disposal.
- Isolation protocols.
- Personal hygiene standards.
- Laboratory sanitation and hygiene.
- Eating and drinking in hazardous areas prohibited.

CHEMICALS

- Hazard communication plan
- Safety data sheet library location and organization.
- Secondary-container labeling plan.
- Keeping lids or caps on chemical containers.
- Location of spill kit.
- Use of PPE in requisite situations.
- Special considerations for formaldehyde, ethylene oxide, and glutaraldehyde.
- Use of exhaust fans to remove fumes.

CHEMOTHERAPY

- Restricted access area for chemotherapy procedures.
- All staff involved in the procedure or husbandry of patients trained.
- PPE required for mixing, administration, and clean-up.
- Only use water for clean-up, never disinfectant chemicals.
- Store chemotherapy drugs separately and in a safe location.
- Biological safety cabinets are required for mixing or drawing up chemotherapeutic drugs on site.
- All waste and trash (including patient waste) must be treated as hazardous chemical waste (not biological waste).

DRIVING/OPERATING MACHINERY AND EQUIPMENT

- Must have a valid driver's license in good standing to operate a motor vehicle for the practice, even a privately owned vehicle on an errand.
- Vehicles used for any practice task must meet minimum safety rules (lights, seatbelts, brakes, etc.).
- Person identified to conduct regular checks of practice-owned vehicles.
- Emphasize the requirement for obeying all motor vehicle rules, especially speed.
- Special training required to operate forklifts or similar industrial or agricultural vehicles for the practice.

DENTISTRY

- Use of eye protection, surgical mask, and protective gloves as minimum equipment.
- Address posture (see Ergonomics section).
- Be aware of anesthetic gas issues (see Anesthesia section).

12.7. Hospital Safety Manual

ELECTRICITY
• Clear access (3 ft, 1 m) to circuit breaker or fuse box panels.
• Never use extension cords as substitute for permanent wiring.
• Use power strips or surge suppressors *only* for low-amperage computer electronics.
• Damaged equipment repaired or taken out of service.

ERGONOMICS
• Reinforce safe lifting techniques (lift with legs and keep back straight). No real "safe" weight limits, but individual specific.
• Use of lifting devices/tables when possible.
• Frequently modifying posture when working on extended procedures, such as surgery or dentistry.

FIRE
• Fire extinguishers every 75 ft (22 m) throughout the building.
• Smoke or heat alarms in any room with a heating device or where someone is allowed to sleep.
• No storage within 3 ft (1 m) of a heating device/appliance.
• Emergency exits identified and free of obstructions.
• Automatic emergency lights available to light the way to the exit or to allow staff to terminate critical procedure in a power failure.
• Establish an outside assembly area for evacuations.
• Train staff on duties in an evacuation (strongly suggested that rescue duties be left to the professional first responders and staff concentrate on establishing triage and animal care locations in the assembly area).

LASERS
• Must designate a laser safety officer.
• Some states require the registration of laser devices.
• Only approved devices used for procedures.
• Area restricted and signage installed.
• Proper PPE (laser-specific glasses or goggles) used by everyone in the room.
• Smoke from surgical lasers captures using high-efficiency particulate air filter or evacuation system to outside.

MEALS, SNACKS, AND BREAKS
• No storage, preparation, or consumption of food or drinks in areas with hazards (chemical or biological). This generally means no food or beverages in medical exam, treatment rooms, or storage areas, nor in kennels or restrooms.
• Must keep designated break area free from hazards such as animal housing/husbandry, including practice mascot, and storage of hazardous materials.
• Emphasize good personal hygiene and area sanitation.

NATURAL DISASTERS/HAZARDOUS WEATHER
• National Oceanic and Atmospheric Administration weather radio available with hospital-specific warning system.
• Designated safe areas for severe weather.
• Plans for staff members who travel (see 12.10 – Emergency Preparedness for Veterinary Professionals).

NOISE HAZARDS
• Posted signs identifying high-noise-level areas, including kennels and aviaries.
• Mandatory use of hearing protection for extended exposure in high-noise areas (see 11.15 – Noise and Odor Control).

RADIATION
• Usually required to appoint a radiation safety officer by state regulations.
• Goal to keep exposure as low as reasonably achievable.
• Machine registration and inspection required in most states.
• Gloves and apron are *required* PPE for restraint.
• Holding of the receptor plate/cassette or the generating tube not allowed.
• Digital radiology still requires the same protections (see 12.8 – Radiation Safety).
• Dental radiology is still a radiation source and usually requires the same protections.
• Restricted use area – only people necessary for the exposure allowed in the room.
• Mobile operations require same protections.
• Individual dosimetry badges required.

SAFETY TRAINING
• Initial orientation for new staff.
• Periodic and regular in-service or continuing education/continuing professional development for existing staff.
• Remedial training for staff who demonstrate a lack of understanding or who ask for additional assistance.
• Designate individual staff members as "mentors" for specific topics.

SECURITY AND VIOLENCE PREVENTION
• Keep nonclient doors locked at all times.
• Use of a safe to lock money (change fund and deposits) when closed.
• Drop safe or location available when cash accumulates in the drawer.
• Good lighting around the perimeter of the building and in the parking lot (see 12.5 – Security Issues for Hospital and Staff).
• Lockers (with locks) available for staff to store personal belongings
• Recordable security cameras for high-risk areas such as front desk and animal exercise area.
• Monitor for cameras visible in treatment room so the staff knows what is happening in other areas of the building or outside.

12.8. RADIATION SAFETY

BASICS

OVERVIEW

• It is the responsibility of the veterinary practice to provide training relative to radiation safety.
• Radiation safety guidelines are set at national and state levels. It is the responsibility of the veterinary practice to adhere to regulations as they apply to their particular state.
• It is the responsibility of the veterinary practice to ensure guidelines relative to radiation safety are available, and adhered to, for the safety of staff and patients.

TERMS DEFINED

As-Low-As-Reasonably-Achievable (ALARA): Making every reasonable effort to maintain exposures to ionizing radiation as far below the dose limits as practical.
Ionizing Radiation: Energy that causes ionization when it interacts with tissues. Ionization within tissues has been linked to free-radical formation, nucleic acid mutations, cell death, and cancer. There is no "safe" level of ionizing radiation. Thus, regulators, the Nuclear Regulatory Commission, set maximum permissible dose (MPD) for occupational exposure (50 mSv/year).
Occupational Exposure: Dose received by an individual during the course of employment.
Occupational Workers: Workers who are expected to come in regular contact with radiation-producing sources. In the veterinary field, veterinarians and paraprofessional staff are typically considered occupational workers. Occupational workers must be at least 18 years of age.
Primary Beam Radiation: Ionizing radiation as it leaves the radiographic tube and collimator. This should never strike veterinary staff.
Radiation Dose: Measured in millisieverts (mSv) or rems (Roentgen equivalent man).
Scatter Radiation: Ionizing radiation that scatters from the patient, table, equipment, and so on, after interaction with the primary beam, and which may travel directly toward veterinary staff. This radiation should be the focus of radiation safety in the veterinary practice.

ISSUES AND OPTIONS

• Sources of ionizing radiation in a typical veterinary practice will focus around the radiology suite, though they may extend to nuclear medicine or computed tomography, where available.
• Where possible, the radiation source should be housed in an appropriately shielded room (controlled area) reserved for its exclusive use. Where the radiation source is in a treatment area, the entire room must be considered a controlled area for radiation safety.
• The radiography equipment (tube, table, console) must be maintained appropriately and regularly to ensure safety.
• The primary beam should strike only the patient or receiving device (cassette, plate, etc.); staff should never be exposed to the primary beam.
• The goal of the practice should be to minimize radiation exposure to staff and patients to a level ALARA.
• Methods to decrease exposure focus on minimizing time, increasing distance, and maximizing shielding.
• Techniques to minimize time and maximize distance and shielding can be found in Table 12-8-1.
• Protective equipment (lead gowns, gloves, thyroid shields, lead walls/barriers) must be provided and maintained by the veterinary practice.
• Lead protective equipment is designed to protect from scattered radiation; it is *never* intended to protect from the primary beam.
• Appropriate training on radiation safety should be provided annually, and staff should sign-off on attendance and understanding of radiation safety techniques and regulations.
• Patient compliance, size, or condition should never be used as excuses for laxity in radiation safety, or exposure to the primary beam.
• Where appropriate, occupationally exposed staff should be provided with monitoring devices (dosimeters) to evaluate occupational exposure. Most states require workers with potential to receive 1/10th of the annual MPD to wear a monitoring device. However, this level can be difficult to determine, and a more conservative approach is to provide any worker who makes radiographic exposures with a monitoring device.

Table 12-8-1. Techniques to minimize exposure time, maximize distance, and maximize shielding.

Time	
Minimize staff exposed	Provide and use appropriate restraint devices and sedation
	Set hospital policies for maximum patient size to be manually restrained (e.g., 15 cm body part thickness, 18 kg/40 lb dog)
Minimize retake exposures	Follow technique chart
	Use appropriate restraint devices and sedation
Minimize staff exposure	Rotate through staff members so one member does not receive the bulk of exposure
Distance	
Maximize distance from exposure source	Have staff stand behind wall or leave room
	Stand as far from patient as is reasonable. Radiation exposure decreases by the square of the distance from the source
Shielding	
Room shielding	The x-ray suite and control area should be appropriately shielded according to state regulations
	This should be taken into account during design and construction of new facilities
Minimize scatter	Use appropriate technique from technique chart
Minimize scatter	Employ appropriate collimation techniques
Protective equipment use	Set policies for staff to always wear appropriate lead gown, gloves, thyroid shield
	Audit regularly to ensure compliance
Protective equipment maintenance	Schedule annual evaluation of lead for wear (holes, cracks, etc.)
Protective equipment availability	Ensure protective equipment is available and accessible by staff

• Badges are available for monitoring from numerous sources, with convenient online monitoring and limit-warning triggers that will automatically notify the worker if they are approaching set limits.
• State and national regulations must be closely adhered to. These may include maximum permissible dose limitations, inspection and licensing of radiation-producing equipment, labeling (posting) of radiation-producing equipment, recordkeeping on dose and exposure, and radiation safety training.
• Once a pregnant worker declares their pregnancy (in writing) to their employer, increased radiation safety practices must be employed. Where practical, reassignment should be considered. Some states do not allow a declared pregnant worker to restrain an animal being radiographed. An additional monitor should be obtained and worn (according to manufacturers' instructions) by the pregnant worker, typically at the waist under the lead apron. The fetal dose limits (as a member of the general public) are 5 mSv for the entire nine-month gestation period and monthly dose not in excess of 0.5 mSv.

EXAMPLES

• A 30 kg (66 lb) Labrador retriever requires abdominal radiographs. Appropriate positioning devices (sand-bags, foam wedges, troughs) should be used to position patient. Ensure appropriate collimation is employed. Staff should not be in the room for exposure (behind leaded wall is appropriate).
• A 7 kg (15 lb) minimally dyspneic feline requires radiographs. If possible, use positioning devices and have staff leave room. If patient is intolerant of positioning devices, a single staff member, wearing a lead gown, gloves, and thyroid shield may hold the patient and still maintain ALARA (as this level of restraint would be considered reasonable to obtain the radiographic exposure). Use appropriate collimation and technique chart. The staff member must never be exposed (even when shielded with lead) to the primary beam.
• A 5 kg (11 lb) dachshund requires stifle radiographs prior to surgery. The patient should be sedated and radiographs obtained without staff in the room. Preoperative nonsedated radiographs are often of inferior quality, and will break the tenets of ALARA if staff members are exposed during the original or follow-up examinations.

CAUTIONS

• A common misconception is that lead equipment (gown, gloves) will protect the staff member from the primary beam. These are only intended to protect from scatter radiation. The staff member must avoid the primary beam, even when wearing this protective equipment.
• Laxity in the radiography suite is common in practice. Regular radiation safety meetings can help remind regular staff, and teach new staff, appropriate techniques to minimize exposure and adhere to ALARA.
• Pressure upon staff to obtain radiographs on fractious, intractable, or unstable patients such that radiation safety protocols may be broken must be avoided. Hospital administration should ensure other staff or veterinarians are not creating an environment where laxity of radiation protocols is tolerated.
• Diagnostic radiographs can rarely be obtained without sedation in patients in pain, those requiring presurgery orthopedic radiographs or spinal or skull radiographs, and juvenile patients. To minimize exposure of staff, sedation should be strongly considered as a first-line option in these patients rather than taking a "try it once or twice" approach.
• There is a common misconception that digital radiography decreases radiation dose in veterinary practice. To decrease "noise" in digital radiographs, there is a tendency to increase the radiographic technique (peak kilovolts or milliamps). This is analogous to increasing light to obtain a higher quality digital photograph. However, increasing technique causes increased dose to the patient and any staff in the radiography suite. A technique chart should be developed and followed to ensure that dose does not "creep."
• Digital radiography also allows for easy (and instant) retake radiographs. This often leads to an increase in unnecessary retake radiographs. As with traditional radiography, proper patient position and radiographic technique, with appropriate restraint, should be employed to minimize retake radiographs. A diagnostic-quality radiograph should not be repeated simply to obtain a "better-looking" image. It must be emphasized that *every* retake radiograph doubles radiation dose to the patient and staff.

12.9. WORK-RELATED ACCIDENTS AND WORKERS' COMPENSATION

BASICS

OVERVIEW

• In any workplace, there is an inherent risk of injury. However, potential risks in the veterinary profession are plentiful – especially injuries inflicted by animals, medical-related injuries (such as improper handling of sharps or scalpels), potential exposure to hazardous chemicals and radiological exposure, as well as slips, trips, and falls. In addition, the veterinary profession poses an increased risk of injury through zoonotic disease transmission. Safety for the animals, the clients, and for all workplace members should be one of the foremost daily business concerns at a veterinary workplace.

• A workers' compensation (WC) insurance program provides coverage for loss of income and medical care payments for employees who suffer on-the-job or work-related injury, illness, or death. In general, the purposes of WC are to offset losses to employees that might occur resulting from work-related injuries and to expedite the return-to-work process.

• State statutes and court decisions govern most aspects of WC systems, including the handling of claims, evaluation of impairment, settlement of disputes, and determination of benefit entitlement. Depending on the state in which the veterinary practice is located, WC insurance can be obtained from a private insurance carrier, a self-insured group, or through a state fund.

TERMS DEFINED

Workers' Compensation (WC): A system for payment of benefits to injured workers and their families, primarily for lost wages and medical expenses incurred as a result of work-related injuries, sickness, disability and death, usually without regard to negligence or fault.

Work-Related Injury: Generally, any injury or illness arising from an event or exposure in the work environment that either caused or contributed to the resulting condition (or significantly aggravated a preexisting injury or illness) in the course of employment. Courts have the ultimate decision-making authority as to what constitutes "work-related" and can vary depending on the jurisdiction.

ISSUES AND OPTIONS

• **WC requirements vary from state to state.** Generally, WC insurance, compulsory for most American employers in the United States, covers the cost of lost wages, medical care, and rehabilitation for workers injured on the job. In most cases, it compensates and provides for disability and death benefits for dependents if an employee is rendered totally or partially incapacitated or killed in a work-related accident. Each state has its own WC laws and regulations – differing as to eligibility (such as minimum number of employees in the workplace), coverage (some include costs of therapy, rehabilitation or retraining for other duties if no longer able to perform prior duties), and the type of insurance required (such as state-funded program or self-insured program or through a private insurer). Each state's WC program also governs the standards by which insurance will be applied. For example, some states require that the employee's injury must have occurred "by accident," and if injury occurred due to the employee's or some other person's intentional act then no WC benefits will apply.

• **Common factors.** In most jurisdictions, there are a few key common elements of WC programs:

  ◦ As a general rule, employees cannot waive their rights to WC (unless specifically permitted to do so by statute), nor can employers "opt out" of the WC system.

  ◦ Benefits are available only where the employee's illness/injury "arises out of and in the course of employment." For example, WC benefits will not apply to any illness/injury that occurs to an employee during the employee's vacation.

  ◦ Employee must notify employer immediately of a work-related illness or injury.

  ◦ WC benefits usually begin on the first day of employment without any waiting period.

  ◦ Independent contractors are not covered by, nor receive benefits of, WC.

  ◦ Generally, when applicable, light duty must be offered to employee as an alternative before restoring him or her to prior job duties.

  ◦ WC programs rely on safety protocols being a top workplace priority – maintaining a safe work environment is also the law. The Occupational Safety and Health Administration (OSHA) requires that safety protocol notices are posted in areas where employees frequently gather.

  ◦ WC is the exclusive remedy in most states for work-related injury, illness, or death. WC laws authorize that, except in limited circumstances, an injured employee (or employee's family) cannot file a lawsuit in order to receive more compensation than afforded by the WC insurance benefits.

• **Minimizing WC claims.** Not all work-related accidents are preventable. However, reasonable steps can be taken, in addition to safety measures required by applicable laws (i.e., OSHA), such as the following:

  ◦ *Draft safety protocols for each work area and post in prominent, highly visible location.* Preferably, your workplace safety standards should be more stringent than those required by federal and state laws. Ensure supervisors/managers maintain compliance with the safety protocols and standards.

  ◦ *Make sure that notices of dangerous conditions are posted – wherever necessary and until no further potential risk of danger is present.* Whether placing a "Will Bite" notice on animal's pen/cage, a "Caution: Wet Floor" sign to avoid slips/falls, or a "Radiation Hazard" sign on a door, alerting the public should be a constant, immediate, requirement of potentially dangerous conditions.

  ◦ *Provide ongoing, regular training and monitoring of employees* with respect to the following:

    ▪ Provide training and demonstrations *on proper handling of animals* – including proper restraint techniques – for avoiding injury to the animal and the employee.

    ▪ Provide easy access to *personal protective equipment* (PPE) for all employees – such as muzzles, catch poles, blankets, gloves, and eye protection – especially when handling animals that might have tendency to bite, scratch, kick, or cause bodily harm. Also require protective apparel during use of radioactive equipment (including requirement for monitoring levels of exposure by wearing body badges for each employee).

    ▪ Provide ongoing instructions regarding *proper bending and lifting techniques*, as well as requiring employees to request assistance with any heavy item or animal. *Use of ladders* – not furniture or boxes – to reach objects beyond arm's length.

    ▪ Random testing of employees for illegal drug use or alcohol intoxication (unless otherwise prohibited by law).

    ▪ Safe working environment includes ensuring that all high-traffic areas – such as hallways, lobby, and kennel area – are *free from objects or conditions that might cause a person to slip, trip or fall.* Place large, highly visible, safety and cautionary signs where needed.

    ▪ Ongoing training and monitoring for proper handling and proper disposing of *sharps*; use/labeling/storage/disposal of *hazardous chemicals*; use/storage/recordkeeping/disposal of *controlled substances*; *regular testing of fire/CO_2 alarms*; *performing inventory of pharmaceuticals* (especially avoiding unwanted access to drugs by animals); and *regular maintenance of lab/medical equipment*.

12.9. Work-Related Accidents and Workers' Compensation

• **Recommendations.** There are intrinsic and unavoidable occupational hazards in a veterinary workplace; however, the following might minimize potential WC claims and, accordingly, the related insurance premiums:

◦ *Insist upon reporting of all workplace injuries immediately after occurrence.* Even a "minor" injury, such as a small cut or scratch, can have serious consequences when working with animals. Zoonotic diseases, such as brucellosis or rabies, can be transmitted through barely visible cuts/punctures on the skin and, in many cases, be asymptomatic for weeks or months after the injury (yet further cross-contamination in the interim is possible).

◦ *Maintain records of injuries and ensure recordkeeping compliance with laws.* In most states, employers are required to keep records of all workplace accidents – especially under OSHA laws. Generally, accidents must be reported to the state WC board and to the employer's insurer within a specified number of days. Be aware of the reporting period.

◦ *Inquire into possible "discount" programs offered by insurer carrier.* In some jurisdictions, employers are eligible for WC discounts provided they meet certain criteria at the workplace (such as written policy, testing, resources for assistance/addiction issues, supervisor training, and employee education).

◦ *Maintain adequate insurance coverage.* A prime consideration for adequate coverage must be made in accordance with size and activities of the business practice. Insufficient insurance coverage or limitations of coverage could prove financially perilous for a small business in the event of a lawsuit.

◦ *Provide light-duty jobs* at the workplace for employees who are either recovering from prior injuries or are temporarily disabled. Following an injury, most people prefer to return to productive employment as soon as possible. To facilitate the return-to-work process, employers should investigate possibilities for accommodating the employee, and maintain open lines of communication between client and his or her treating healthcare professional (obtaining a "consent for return to work" by employee's healthcare provider might be required before allowing employee to resume his or her job duties).

EXAMPLES

N/A

CAUTIONS

• **Not all workplace injuries are necessarily eligible for WC coverage.** Generally, WC laws do not provide benefits for an injury or accident resulting from an employee's willful misconduct (i.e., taunting animals or running/throwing objects in workplace); injury due to alcohol intoxication or due to use of illegal drugs; employee injured resulting from own criminal act; the willful failure or refusal to use PPE when required or available (such as refusing protective apparel when taking radiographs or administering care to an animal with a zoonotic contagious disease); or injury resulting from a "non-work-related" incident (such as being involved in car accident coming to/going home from work).

• **Be aware of WC's interplay with other laws.** Employers must ensure strict compliance with all applicable state and federal laws that affect or pertain to WC.

◦ An absence from work may be necessary due to a work-related illness or injury; however, the maximum leave permitted is based on other applicable laws, such as the Family and Medical Leave Act and the Americans with Disabilities Act.

◦ Termination of employment of an employee while on leave due to a work-related injury could potentially lead to a claim of unlawful discrimination or retaliation (claiming that termination due to employee's use of WC) even if the termination was based upon legitimate, business-necessity reasons. Consult with legal counsel when considering an employee's employment termination during, or shortly after, an injury-related or disability-related leave of absence.

• **Potential investigations.** In certain circumstances, depending on applicable facts, the employer's insurance carrier or claims administrator (as well as an OSHA representative) may investigate the workplace to determine how an injury occurred, whether safety protocols were being followed, if the injury is compensable, and to ensure ways to prevent similar injuries from happening again.

• **Laws are constantly changing – seek legal counsel in your area for assistance**. The information in this chapter is a generic overview for educational purposes only and is not intended to provide legal advice. Employment laws vary depending upon jurisdiction/location of the veterinary practice and the applicable set of facts and circumstances. *The recommendations made in this chapter might not be applicable to all workplace situations.* Consult with an employment lawyer in your area for advice and consultation about your business needs regarding this subject matter.

12.10. EMERGENCY PREPAREDNESS

BASICS

OVERVIEW

Veterinary professionals play an important role as community resources in the management of animal health and public health issues in local emergencies or large-scale disasters.

An emergency event affecting a large number of people also will affect a large number of animals. The emergency management system in the United States and in many other countries offers an established mechanism for addressing all emergency issues at the local, tribal, state, and national levels. Agricultural agencies and animal professionals, including veterinary professionals, must learn to work within that system to deal effectively with animal concerns during emergencies.

TERMS DEFINED

Biosecurity: Procedures used to reduce the risk of the introduction or internal spread of infectious organisms in a facility or operation. Cleaning, disinfection, quarantine, limiting access by unauthorized personnel, and limiting the introduction of potentially contaminated materials are essential practices.

Bioterrorism: A premeditated attack on people, animals, or plants using infectious biological agents as a weapon.

Disaster and Emergency: These terms are often used interchangeably when departments, agencies, or private entities are unexpectedly torn from their standard operating procedures or are required to obtain resources outside their normal authority. In some cases, government declarations give official status to an emergency or disaster that may result in the release of additional resources for response and recovery.

Disaster Declaration: An official designation of an event as a disaster by local, tribal, state, or federal authorities. An official declaration may often trigger economic or resource assistance.

Emerging Disease: A new disease or new strain of known disease that may impact human, animal, or plant health.

Foreign Animal Disease: A disease of great concern that is currently not endemic to the country. This may also be referred to as a transboundary disease.

Terrorism: The unlawful use of force or violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof in furtherance of political or social objectives.[1]

Zoonotic Disease: A disease agent that can be transmitted from animals to humans.

ISSUES AND OPTIONS

SIX REASONS WHY ANIMAL ISSUES ARE IMPORTANT

1. The bond between animals and humans can be very strong and may cause people to act recklessly to protect their animals. This bond may exist between human owners and their pets or livestock (see 1.19 – Importance of the Human–Animal Bond).
2. The United States and many other countries have large numbers of animals. In the United States, for example, there are 76.8 million dogs,[2] 58.4 million cats,[2] 4.9 million horses,[2] 103 million cattle,[3] and 75.5 million swine.[4] An emergency affecting a large number of people is also likely to affect a large number of animals.
3. Natural disasters or livestock disease outbreaks can have dramatic effects on agricultural communities. Critical concerns include livestock losses, the cost of disease eradication, damage to export markets, public health issues, and the threat to food supplies. A foreign animal disease outbreak could potentially result in billions of dollars in direct costs and up to hundreds of billions of dollars in indirect impacts.
4. Zoonoses are diseases that can be transmitted from animals to humans. Many potential bioterrorism agents are zoonotic, creating the need for a coordinated response by public health and animal health officials.
5. Wildlife may be affected by natural or man-made disasters, including disease outbreaks.
6. Society places a significant value on protecting animals from needless suffering or death.

EMERGENCY MANAGEMENT PRINCIPLES

- Priorities in emergencies:
  - Public safety – protect human lives.
  - Protection of property.
  - Protection of the environment.
  - Animal protection in emergencies may be the highest priority for many people after the protection of human life.
  - Preservation of evidence for criminal prosecution may be critical in some events.
- Four phases of emergency management:
  - *Mitigation*. Actions taken to reduce the probability or potential impact of a threat.
  - *Preparation.* Planning and training actions that develop the capacity to respond to threats.
  - *Response*. Actions taken in the face of an emergency event.
  - *Recovery.* Process of returning toward normal after an emergency event. This process may take an extended period of time (see 14.20 – Business Contingency Planning).
- Common elements of disasters:
  - Injured or dead people (or the potential).
  - Injured or dead animals (or the potential).
  - Property damage and destruction.
  - Loss of communications, utilities, and other services.
  - Economic, environmental, and psychological injury.
- National Incident Management System:
  - Mandates the use of the Incident Command System (ICS), a standardized system for management of emergency response, across all levels of government: federal, state, county, and local.
  - Provides a unified command structure that works to ensure that all resources working in an event are under a single command hierarchy, improving communication, performance, and safety.
  - All agencies and individuals responding in an emergency must be able to function within this system, including veterinary personnel.

12.10. Emergency Preparedness

- ICS – basic structure:
  - Incident commander – in charge of the overall event.
  - Command staff:
    - liaison officer – contact point for representatives of support agencies;
    - safety officer – works to ensure that conditions during a response remain safe for all response personnel;
    - public information officer – unified contact point for all media releases regarding incident events.
  - General staff:
    - operations section – directs all resources providing field response to the event
    - planning section – creates incident action plan, documents actions, and projects future needs;
    - logistics section – responsible for supplies, equipment, transportation, and supporting services (meals, medical, housing, etc.);
    - finance and administration – manages overall event costs.
- Emergency operations plan (EOP): a comprehensive plan addressing planning, preparedness, response, and mitigation based on a risk assessment and using an all-hazards approach to managing incidents. Animal emergency plans are generally found in an annex or appendix to the state or community EOP.

The local emergency manager works to develop plans, resources, and response capacity in the community. In addition, the emergency manager supervises the local emergency operations center (EOC).

- The EOC serves as a coordination and communications center for jurisdictional resources. EOC representatives include government agencies (law enforcement, fire, health, public works, administration, etc.) and nongovernmental organizations (Red Cross, Salvation Army, and other volunteer organizations active in disasters entities). Animal resources may be connected to the local EOC through County Animal Response Teams (CARTs) or equivalent entities.
- A comprehensive emergency management system employs the same generic processes and resources to address most kinds of emergencies. It is flexible, adaptable, and much more cost effective than standalone systems. Animal response resources need to be incorporated into comprehensive emergency management models.
- Risk analysis equation: Hazards + Vulnerabilities = Risk.
- Hazards:
  - natural hazards, including flood, drought, tornado, hurricane, blizzard, earthquake, volcanic eruption, landslide, wildfire, some disease outbreaks;
  - Man-made unintended hazards, including radiologic or chemical hazardous materials incidents, infrastructure failure, transportation accidents;
  - intentional threats, including terrorism, bioterrorism, criminal events including biological, chemical, radiological, explosive, and mass casualty events.
- Vulnerability: population or resource potentially threatened by a hazard.
- Risk: level of danger to a community based on an analysis of threat versus vulnerability.

ANIMAL EMERGENCY-RESPONSE ORGANIZATIONS

- Many states have or are forming State Animal (or Agricultural) Response Teams (SARTs), Veterinary Medical Reserve Corps (VMRC), or equivalent organizations. These statewide organizations work with state emergency management and help connect various governmental and nongovernmental organizations and volunteers to address a wide variety of animal emergency issues. A SART's main mission is to develop and support CARTs or equivalent organizations. CART programs should carry an all-hazards mission and address both companion animal and livestock issues. CART programs or similar programs should seek involvement from community resources, including:
  - emergency management;
  - animal control;
  - animal shelters;
  - brand inspectors (many western states);
  - companion animal associations/clubs;
  - county mapping;
  - cooperative extension agents;
  - equestrian organizations;
  - fairgrounds;
  - fire, emergency medical services, and search and rescue resources;
  - kennels and pet service providers;
  - law enforcement;
  - livestock associations;
  - livestock producers;
  - public health;
  - veterinary professionals;
  - youth agricultural organizations (Future Farmers of America, 4-H);
  - wildlife agencies, zoos, wildlife preserves;
  - community businesses related to animals (retail/wholesale/manufacturing).
- Concerned citizens.
  - In addition to SARTs and CARTs, the following organizations provide opportunities for veterinarians interested in emergency response:
    - state veterinary response corps (SART, VMRC);
    - national veterinary response teams (National Disaster Medical System, US Department of Health and Human Services);
    - National Animal Health Emergency Response Corps (NAHERC), United States Department of Agriculture (USDA), Animal Plant Health Inspection Service.

COMMUNITY-BASED EMERGENCY TASKS RELATED TO ANIMALS

- Communities must develop and maintain effective networks of animal resources to work under the supervision of local emergency management. The local emergency response plan should contain an animal emergency response annex. To assure a coordinated animal emergency response, local emergency management must be able to effectively communicate during the response with all community animal resources.

12.10. Emergency Preparedness

• Assist residents with evacuation of livestock and companion animals. When allowed, safely retrieve stranded animals from areas under evacuation orders.
• Search a disaster scene and recover animals to a safe location.
• Utilize technical rescue skills to safely extract animals from situations when necessary.
• Shelter evacuated animals.
• Protect the public from zoonotic diseases and foodborne hazards that may pose a threat to people and animals during a disaster.
• Provide veterinary medical care for animals affected by disasters.
• Respond to animal issues in emergencies involving biological threats (livestock diseases or zoonoses), chemical and radiological hazards, including natural, accidental, terrorist, or criminal events, providing trained resources through appropriate incident command channels.
• Support local law enforcement authorities in caring for animals in large-scale cases of cruelty, neglect, or animal hoarding.
• Collaborate with state and federal wildlife authorities to address wildlife issues during disasters.
• Address community cultural and mental health needs related to the human–animal bond, animal loss, anxiety over animal safety, and other animal-related concerns.
• Ensure the dissemination of accurate and timely information concerning animal issues to the public through appropriate incident command channels during emergencies.
• Manage community resources and any requested resources mobilized from outside the community, including donations, personnel, supplies, and equipment.
• Track the full costs of response for all resources mobilized for animal response, including supplies, equipment, paid personnel, volunteers, and in-kind donations.
• Address animal-related issues in the community long-term recovery plan.
• Train community responders to provide them the knowledge, skills, and abilities to meet the aforementioned objectives.
• Provide information to the public and local businesses concerning:
  ◦ individual preparedness (including companion animals and livestock in personal plans);
  ◦ continuity of operations planning for animal-related businesses;
  ◦ biosecurity practices and emergency preparedness for agricultural producers;
  ◦ zoonoses and animal issues related to public health.

GENERAL RESPONSIBILITIES OF VETERINARY PROFESSIONALS IN COMMUNITY EMERGENCY MANAGEMENT

• Veterinarians are first responders in the world of animal health and safety and have expertise in public health issues. As citizens, they have a responsibility to apply these skills to protect their communities.
• Unless veterinary professionals are involved in local emergency planning and training processes, they and their practices may not be utilized or may be underutilized.

AGRICULTURAL EMERGENCIES

• Agriculture is a "soft" target for terrorism, in that it is difficult to defend against an intentional attack. Constant surveillance by veterinary and regulatory veterinary personnel in the community and the implementation of biosecurity procedures by livestock producers is essential. Emergency management systems must provide the capacity for rapid large-scale response.
• Veterinary professionals must implement and adhere to appropriate biosecurity protocols for themselves and their practices to ensure they do not contribute to the spread of infectious agents.
• *The potentially massive scope of a major foreign animal disease outbreak may necessitate the involvement of many veterinary professionals from outside food animal practice.* Veterinary professionals should become involved in local, state, and national programs for disaster management, including CARTs, SARTs, and USDA's NAHERC (www. naherc.aphis.usda.gov).

PUBLIC HEALTH EMERGENCIES AND VETERINARY MEDICINE

• Examples of zoonotic disease outbreaks include the outbreak of Ebola virus in West Africa in 2014, with several cases detected in the United States and Europe, Severe Acute Respiratory Syndrome virus in 2003, was first reported in Asia and spread to countries in North and South America, Europe, and Asia; the arrival of West Nile virus in North America; and reported outbreaks of H3N2v influenza among fair attendees with a history of close contact with pigs from 2012 to present.[5] As international trade and travel continue to increase, so does the risk of spreading new diseases between nations and regions. The impact of an emerging disease on people and economies can range from mild to catastrophic. The veterinary community must be vigilant for atypical syndromes that may appear in animals to ensure rapid identification of emerging disease agents.
• Influenza is a zoonotic disease of great concern. Influenza viruses are found in poultry and mammals. These viruses can change rapidly by mutating or exchanging genes with other influenza strains, creating the potential for the development of new and dangerous strains that can be transmitted from animals to people. Worldwide influenza outbreaks, called pandemics, have the potential to cause disasters.
  ◦ In 1918–1919, an influenza pandemic infected 20–40% of the world's human population and an estimated 50 million people died. The United States recorded nearly 675,000 influenza-related deaths during that period.[6]
  ◦ In 2009, an outbreak of H1N1 influenza first identified in California spread across the world and reached pandemic proportions.
  ◦ During 2012, approximately 300 people in the United States were diagnosed with H3N2v influenza. Additional outbreaks have been detected since then. Most cases appear to be associated with extended exposure to swine at agricultural fairs.[5]

PERSONAL PREPAREDNESS

• **Planning.** Create a personal emergency plan for yourself, family, pets and livestock. Learn about the risks to your community and develop a

plan to address those risks. During an emergency *be prepared to care for your family and animals for up to 72 hours* whether evacuating or sheltering at home.

- **Preparation.** Involve all family members or employees in practicing your plan. Gather all the supplies you will need during an emergency. Create prioritized lists of needed actions. Seek training from community organizations such as the Red Cross, Community Emergency Response Team programs, and CARTs.
- **Communication.** Agree upon a meeting place and an out-of-area contact through which you can communicate if separated. Make sure you have a backup source for telephone numbers other than the contact list in your cell phone. **Remember:** Text messages may go through when cell phone calls do not. Make sure you have a charger or spare battery for your phone.
- **Cooperation.** Work with neighbors and friends in the community to help ensure that assistance with evacuation and other matters is available for people and animals. Know those with special needs in the community and work as a neighborhood to ensure their needs are met during an emergency.
- **Mitigation.** If you live in an area at risk for wildfires, work with your local fire department to evaluate and prepare your property to provide *defensible space*. If you live in an area subject to flooding or earthquakes, make sure you have the appropriate insurance coverage.
- Tips for families with animals:
  - *Identification.* Identify each animal using tags, tattoos, microchips, photos, or other means. Store photos and copies of brand inspection and registration papers away from home.
  - *Evacuation.* If you are evacuated, you may not be allowed to return for an extended period of time. Be prepared to evacuate people and animals quickly and in one trip (if possible). *DO NOT LEAVE ANIMALS BEHIND*. Be prepared to assist neighbors.
  - *Post information.* Post contact information and information about animals (pets and livestock) on the premises to assist neighbors and emergency responders in safely evacuating animals if you are not able. For example, place information in a sheet protector and post near the door or in the barn.
  - *Supplies*. Gather supplies needed for pets and livestock for evacuation or sheltering in place at your home. Supplies include collars, leashes, bowls, blankets, pet carriers, halters, lead ropes, prescription medications, health records, food, and water. Create a "go kit" for people and animals.
  - *Preventative healthcare.* Maintain current records of vaccinations, heartworm testing, and deworming. Take these records with you if you need to evacuate.
  - *Temporary housing.* Know where you can take your pets or livestock in an emergency. Locations may include animal shelters, kennels, hotels, fairgrounds, or a friend's or relative's home.
- Tips for livestock owners:
  - *Biosecurity.* Implement effective biosecurity (disease prevention and disinfection) practices to help protect animals and the nation from accidental or intentional disease outbreaks.
  - *Transportation*. Make a plan to move your livestock to a safe area. *Teach horses to load quickly and safely into trailers.* Failure to properly train horses puts people and the animals in danger. Work with neighbors and friends to share trailers and help each other evacuate livestock.
  - *Prepare for severe weather, including blizzards, hurricanes, tornadoes, and thunderstorms.* Electricity and other utilities could be disrupted for many days following a disaster. Keep at least 10–14 days of feed on hand. Make sure there is a source of drinking water available for animals, even if it means melting ice or snow. Keep horse blankets and a first aid kit for livestock on hand. Make sure your personal storm or winter gear is adequate.

EXAMPLES

WEYAUYWEGA, WISCONSIN, 1996

In March 1996, a train containing hazardous cargo, including liquefied petroleum gas, propane, and sodium hydroxide, derailed, caught fire, and burned for more than two weeks near Weyauwega, Wisconsin. People were ordered to evacuate quickly and were not instructed to take pets. Animal owners illegally entered the evacuation zone to remove or care for pets and livestock. On the fourth day of the evacuation, the National Guard was dispatched to the evacuation zone to conduct a pet rescue operation.

HURRICANE FLOYD, 1999

This hurricane hit North Carolina and several other states, resulting in the deaths of thousands of animals. The response to this disaster highlighted the need for a more coordinated animal response and helped lead to the formation of the North Carolina SART. Since then, the SART model has been adopted by many states.

HURRICANE KATRINA, 2005

In September 2005, Hurricane Katrina came ashore in the Gulf Coast, causing extensive damage and loss of life. Many people refused to evacuate because they could not take their animals with them. In addition, countless animals were left behind when their owners evacuated. Following Katrina, the Pets Evacuation and Standards Act (PETS Act) was enacted to amend the Stafford Act, creating a mandate to state and local governments to include plans for pets in their disaster plans.

HIGHLY PATHOGENIC AVIAN INFLUENZA, 2014–2015

In 2014–2015, the United States experienced its most significant animal health event in history. Highly pathogenic avian influenza was detected in poultry in 21 states, affecting over 50 million birds. The response involved over 3,400 personnel and cost $850 million.[7]

HURRICANES HARVEY, IRMA, AND MARIA, 2017

A series of devastating hurricanes in the fall of 2017 affected millions of people and animals in Texas, Florida, Puerto Rico, and the Virgin Islands. People and animals were evacuated and sheltered. Local, state,

12.10. EMERGENCY PREPAREDNESS

federal, and nongovernmental organizations assisted with evacuating, sheltering, and rescuing people and animals.

CAUTIONS

- Do not self-deploy to the disaster. Only respond to a disaster as part of an organized response team with authorized access.
- Rules of thumb for emergency responders:
  - do not become a victim;
  - expect the unexpected;
  - communication is the critical link;
  - plans always fail, but planning is essential (paraphrased from President Dwight Eisenhower).

12.11. EMERGENCY PLANS

BASICS

OVERVIEW

Planning for emergencies is not difficult; it is nothing more than a game of "what if." Granted, figuring out the details of each of those scenarios is a little harder, but most veterinary practice managers know that any event takes planning, even the unexpected ones. By definition, an unplanned emergency leaves little time to figure things out quickly, so prior planning and practice are essential to minimizing the impact of the emergency.[1]

TERMS DEFINED

Alarm: A loud verbal or electronic sound possibly combined with a visual stimulant (strobe-type light) that is used to alert people of an emergency situation of which they may not be aware. In small facilities, the alarm may just be yelling, "Fire, fire, fire!"
Emergency: An unplanned event that is likely to cause significant harm to people or animals or property damage. Some emergencies require immediate action (such as a fire), whereas others provide warnings and possible reaction time (such as a wildfire or hurricane).
Emergency Action Plan (EAP): A specific written plan on how the practice will respond to a given emergency situation.
Natural Disaster: A tornado, hurricane, blizzard, earthquake, wildfire, or even severe weather such as lightning storms.
Personal Protective Equipment (PPE): Any clothing or device worn by a person to place a barrier between them and a hazard.
Workplace Violence: Physical harm or intimidation of a person or people by another person with or without the use of a weapon.

ISSUES AND OPTIONS

Start with a list of "what if" scenarios and then brainstorm how the practice should respond to such an event. A good perspective for an EAP is to assume the owner or boss is not immediately available. The plan should be detailed enough that mid-level managers can start the process until the owner or boss can be located and arrive on scene.

The following is a list of emergency scenarios to get started, but also be sure to solicit ideas from the staff and discuss issues with local experts such as the fire department or the county/city emergency coordinator's office.

- Fire (small contained fire as well as a catastrophic one).
- Natural disaster.
- Robbery or workplace violence.
- Loose vicious animal.
- Severe chemical spill, such as a large quantity of formaldehyde.
- Medical emergency for humans.
- Explosion or release of hazardous materials from a nearby business or factory.
- Train derailment with hazardous materials if the facility is within a mile of train tracks.

Workplace safety rules in most countries, including the United States, require employers of all sizes to develop emergency action plans for scenarios likely to happen in their industry. Sometimes the rules allow businesses with small numbers of employers (less than 10 employees) to use a "verbal" emergency action plan, but that is not a good idea for a number of reasons. In order for a plan to be useful, it has to be in writing and include *details*!

In an emergency, lighting will certainly be diminished and people may have lost their eye glasses, so EAPs should be printed in large, clear type (14 point or larger) on white paper for best visibility. EAPs should include the following:

- The name and contact information of the person in charge of executing or keeping the plan current should be clearly spelled out at the top of the plan.
- Contact information must be included for key people in the plan, including staff and local community resources and even insurance company representatives. Because e-mail addresses will not usually work in an emergency, be sure to include telephone numbers for reaching that person after hours if necessary.
- The "trigger" for activating the plan should be clearly defined when appropriate. Some events warrant activation of an EAP without prior approval, such as a fire or tornado, but other situations may require advance authorization from others, such as an impending hurricane or blizzard.

• A one-page checklist at the beginning of the plan highlighting the sequence of steps that must be taken and the person responsible for making it happen will give a great overview of the plan. Details of each action are explained later in the plan.
• Development of a specific workplace alarm system. An alarm system must be:
  ◦ loud enough to be appreciated as an alarm above surrounding noise conditions;
  ◦ distinctive enough to result in immediate action by staff members; and
  ◦ tested periodically for reliability if the alarm system is electronic or electrical.
• In very small practices, a verbal alarm may be sufficient, but in most practices, an electronic alarm is usually warranted.
• Specific, clearly defined duties identified by job position or person's name to be taken as part of the EAP is the basis of the plan, so do not skimp on this part. Some people have difficulty thinking clearly or remembering everyday things in an emergency, like passwords or combinations, so there can never be enough detail to EAPs. Do not assume someone will remember simple things – write them down! Also remember that any staff member assigned to a task in such an emergency must be given appropriate training and opportunities to practice the tasks.
• Use diagrams and pictures when appropriate. A staff member may have the facility layout memorized, but a diagram can be given to first responders and save a lot of time in locating key facility details, such as gas shut-off valves. Pictures can explain something in a few seconds that would take minutes or longer to comprehend through the written word. For example, a picture showing what a gas valve looks like in the *off* position will help someone who is not mechanically inclined understand the task quicker.
• In a scenario that requires evacuation of the facility, the plan should identify the primary location where evacuees will meet and the method that will be used to account for everyone (see Figure 12-11-1). An

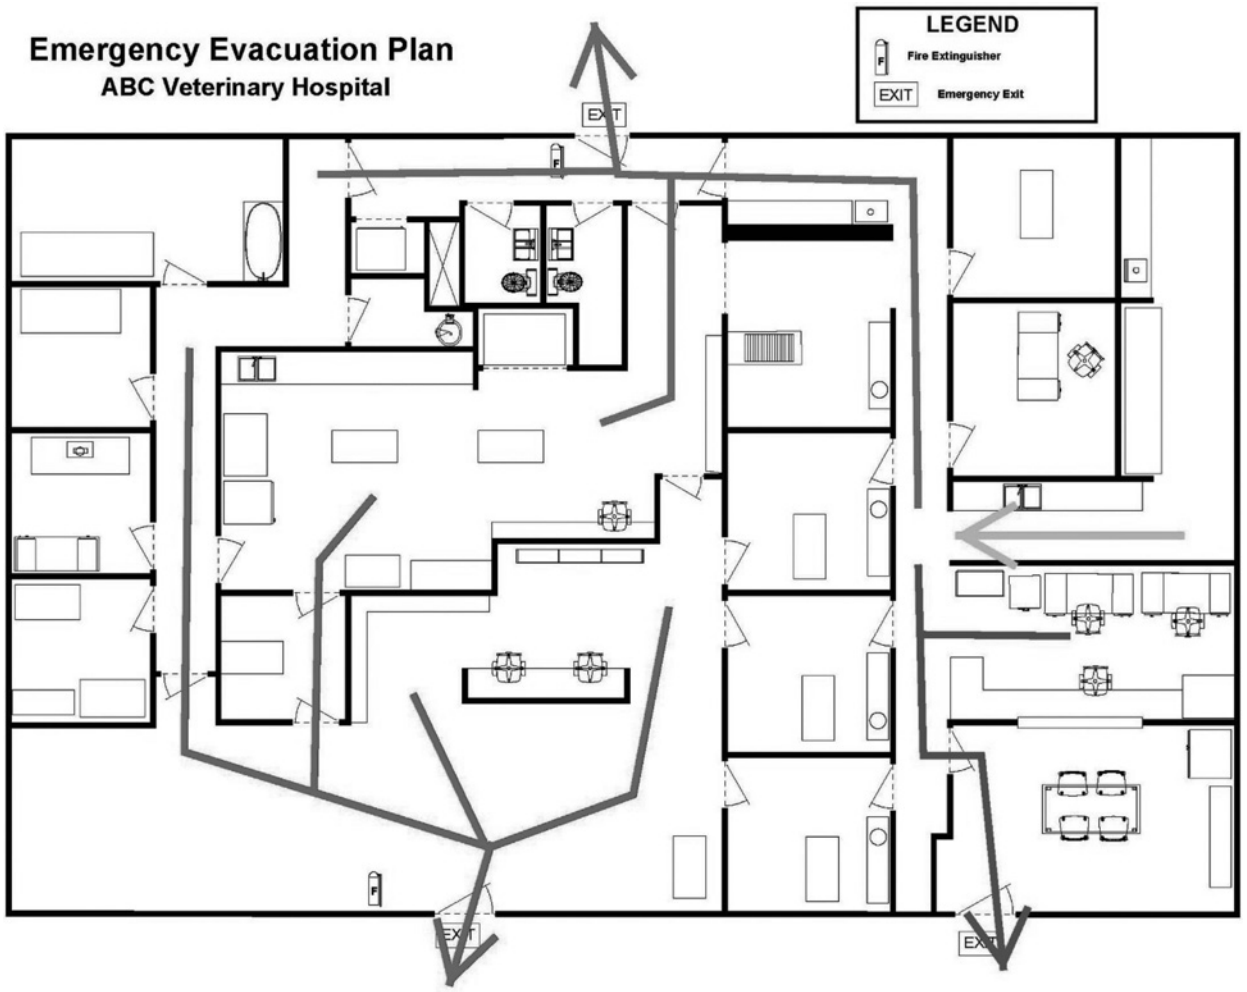

Figure 12-11-1.

Emergency evacuation plan.

12.11. Emergency Plans

alternate location should also be identified in case the primary location is unusable. The meeting places should be close enough to be convenient, but far enough away from the building to remove staff members from the immediate risk. Because it is not practical for most practices to use a "sign-in and sign-out" board, this task will often fall to relying on the memory of those present, so including a complete staff roster with extra blank spaces at the end for guests will make this part more useful.

- Placement and maintenance of emergency equipment, such as portable fire extinguishers and automatic emergency lights used to illuminate an exit or exit-way. Include the name of an individual responsible for regular testing and maintenance of the devices.
- Location and type of first aid supplies or PPE that may be necessary for responding to the emergency. Be sure to include instructions for anything more complicated than putting on a pair of gloves. And be sure to include the procedure for making sure those first aid supplies are regularly inventoried and replaced when missing or expired.

EAPs can be kept as part of the hospital safety manual (see 12.7 – Hospital Safety Manual) or in a separate binder or location, but they have to be current and easy to get. Computer files are great for most business plans, but EAPs should also be printed and collected in a binder or folder so they are easy to "grab and go." Additionally, backup copies should be maintained offsite, such as at the owner's or manager's home, so that they are available when responding to an emergency from offsite. Likewise, offer a copy of the completed plans to the local fire department or emergency management agency for them to have on file in case their response is needed.

Be sure every staff member knows where the EAP is located and is familiar with their part in the plan, even if that is just "get out and go to the assembly area."

And because one can never get really good at something unless they practice, emergency drills should be part of the normal training program in any veterinary facility. Schedule some practice drills during a very slow time of the day, and be sure to schedule at least one drill throughout the year for a busy time; fires and disasters do not follow the same schedule as your appointment book! At a minimum, an annual test of the EAP should be conducted.

12.12. Controlled Substances

BASICS

OVERVIEW

Controlled substances that veterinarians use and dispense are regulated by the Drug Enforcement Administration (DEA). The DEA is the lead federal law enforcement agency responsible for enforcing the Controlled Substances Act (CSA). Established in 1973, the DEA was the product of a merger of five federal agencies that were related to drug enforcement. In carrying out its mission, the DEA cooperates with other federal agencies; state, local, and foreign governments; private industry; professional groups; and other organizations.

Controlled substances are the drugs and chemicals that must be handled and stored within the closed system as described by the DEA. The closed system generally means there are several requirements that the practitioner and his or her agents, including employees, must abide by to be in compliance with the law, so that all acquisitions, storage, and dispensing of any of the drugs or chemicals on the schedules must be highly controlled, tracked, and accountable subject to audit and/or inspection by the DEA as requested. If these procedures are not followed, one can lose the right to be a registrant, which would limit one's right to order, store, and use the controlled substances, some of which are essential to the operation of a veterinary hospital.

This section covers most of the significant issues, from the different definitions of the schedules of the drugs to security requirements and minimum standards for handling employee screening or premise inspections, with an enforcement warrant or by a broad consent grant by the owner, operator, or agent in charge of the controlled premises.

DEA registrants must be especially cautious in the specific areas of recordkeeping and controlled substance access by any agents and/or employees if there is any knowledge of any of those persons having a history that would lead one to suspect or know of a potential risk of misuse of the controlled substances.

DEA registrants also embody an employee reporting requirement that states they must report any drug diversion from the employer by a fellow employee to a responsible security official of the employer (Title 21 C.F.R., Section 1301.91).

Between 1914 and 1970, Congress enacted more than 50 pieces of legislation relating to the control and diversion of drugs. Most of these diverse laws were gathered in the one piece of legislation, the CSA, which became effective May 11, 1971.

A key element of this law is to improve control over the manufacture, distribution, and dispensing of controlled substances by providing a "closed" system for legitimate handlers of these drugs. Such a closed system deters the diversion of these drugs out of legitimate channels into illicit markets.

The information further presented should acquaint veterinarians with security requirements set up under the CSA, the Diversion Control Amendments of the Comprehensive Crime Control Act of 1984, and the Code of Federal Regulations.

The drugs and drug products (controlled substances) that come under the jurisdiction of the CSA are divided into five schedules – lists of included controlled substances. Owing to their length, it is recommended the reader find them under DEA on the World Wide Web.

TERMS DEFINED

Controlled Premises (including veterinary practice facilities): Places where original or other records or documents required under the CSA are kept or required to be kept. Places, including factories, warehouse, or other establishments and conveyances, where persons registered under the act or exempted from registration under the act, or regulated persons may lawfully hold, manufacture, or distribute, dispense, administer, or otherwise dispose of controlled substances or listed chemicals or where records relating to those activities are maintained.[1]

Controlled Substances Act (CSA): The CSA (84 Stat. 1242; 21 U.S.C. 801) and/or the Controlled Substances Import and Export Act (84 Stat. 1285; 21 U.S.C. 951).[1]

ISSUES AND OPTIONS

DEA SCHEDULES

Before a particular drug can be placed on one of the five DEA schedules of drugs, the following findings are required for each of these schedules.

- Schedule I:
  - ◦ The drug or other substance has a high potential for abuse.
  - ◦ The drug or other substance has no currently accepted medical use for treatment in the United States.
  - ◦ There is a lack of accepted safety for use of the drug or other substance under medical supervision.
- Schedule II:
  - ◦ The drug or other substance has a high potential for abuse.
  - ◦ The drug or other substance has a currently accepted medical use in treatment in the United States or a currently accepted medical use with severe restrictions.
  - ◦ Abuse of the drug or other substances may lead to severe psychological or physical dependence.
- Schedule III:
  - ◦ The drug or other substance has a potential for abuse less than the drugs or other substances in Schedules I and II.
  - ◦ The drug or other substance has a currently accepted medical use in treatment in the United States.
  - ◦ Abuse of the drug or other substance may lead to moderate or low physical dependence or high psychological dependence.
- Schedule IV:
  - ◦ The drug or other substance has a low potential for abuse relative to the drugs or other substances in Schedule III.
  - ◦ The drug or other substance has a currently accepted medical use in treatment in the United States.
  - ◦ Abuse of the drug or other substance may lead to limited physical dependence or psychological dependence relative to the drugs or other substances in Schedule III.
- Schedule V:
  - ◦ The drug or other substance has a low potential for abuse relative to the drugs or other substances in Schedule IV.
  - ◦ The drug or other substance has a currently accepted medical use in treatment in the United States.
  - ◦ Abuse of the drug or other substance may lead to limited physical dependence or psychological dependence relative to the drugs or other substances in Schedule IV.

Drugs by name in particular schedules can be found by looking under the DEA on the World Wide Web site.

Veterinarian DEA compliance requires individual veterinary registration. According to Section 822 of Title 21 of the U.S. Code (USC) CSA, registration is required for the following persons:

1. Every person who manufactures or distributes any controlled substance or List I chemical, or who proposes to engage in the manufacture or distribution of any controlled substance or List I chemical, shall obtain annually a registration issued by the Attorney General in accordance with the rules and regulations promulgated by him.
2. Every person who dispenses or proposes to dispense any controlled substance shall obtain from the Attorney General a registration issued in accordance with the rules and regulations promulgated by him. The Attorney General shall, by regulation, determine the period of such registrations. In no event, however, shall such registrations be issued for less than one year nor for more than three years.

12.12. Controlled Substances

There are some exceptions to the requirement for registration under Section 822 – the following persons shall not be required to register and may lawfully possess any controlled substance or List I chemical under this subchapter:
1. An agent or employee of any registered manufacturer, distributor, or dispenser of any controlled substance or List I chemical, if such agent or employee is acting in the usual course of his business or employment.
2. A common or contract carrier or warehouseman, or an employee thereof, whose possession of the controlled substance or List I chemical is in the usual course of his business or employment.
3. An ultimate user who possesses such substance for a purpose specified in Section 802(25) of this title.

Also, some individuals may be required to have more than one registration if they operate out of several locations. Section 822(e) states that a separate registration shall be required at each principal place of business or professional practice where the applicant manufactures, distributes, or dispenses controlled substances or List I chemicals.

SECURITY REQUIREMENTS FOR PRACTITIONERS

Practitioners include physicians, dentists, veterinarians, researchers, hospitals, pharmacies, or other persons registered to do research, to dispense, or to use in teaching or chemical analysis a controlled substance in the course of professional practice.

Minimum security standards for practitioners are set forth in the regulations (Title 21 C.F.R. 1300 to end), and are to be used in evaluating security.

MINIMUM STANDARDS FOR PRACTITIONERS' SECURITY FOR HANDLING OF CONTROLLED SUBSTANCES

Controlled substances must be stored in a securely locked cabinet of substantial construction. Even though federal regulations do not specifically define locked cabinet construction, the intent of the law is that controlled substances must be adequately safeguarded. Therefore, depending upon other security measures, a wooden cabinet may or may not be considered adequate. In an area with a high crime rate, a strong metal cabinet or safe may be required.

Some of the factors considered when evaluating a practitioner's controlled substances security include:
- The number of employees, customers, and/or patients who have access to the controlled substances.
- The location of the registrant (high or low crime area).
- Use of an effective alarm system.
- Quantity of controlled substances to be kept on hand.
- Prior history of theft or diversion.

OTHER SECURITY CONTROLS FOR PRACTITIONERS

In order to minimize opportunities for theft or diversion of controlled substances, practitioners have an obligation not only to provide effective physical security, but also to initiate additional procedures to reduce access by unauthorized persons and to provide alarm systems where necessary.

EMPLOYEE PROHIBITION REQUIRED

A practitioner must not employ an agent or individual who has had his or her application for registration with the DEA denied or revoked at any time and who, as a result of his employment, will have access to controlled substances.

EMPLOYEE RESPONSIBILITY TO REPORT DRUG DIVERSION

A practitioner must limit an employee's right to work in the drug security area if they do not report any known diversions as described as follows, taken from Section 1301.91 of Title 21 of the C.F.R.

Reports of drug diversion by fellow employees are not only a necessary part of an overall employee security program, but they also serve the public interest at large. It is, therefore, the position of the DEA that an employee who has knowledge of drug diversion from his employer by a fellow employee has an obligation to report such information to a responsible security official of the employer. The employer shall treat such information as confidential and shall take all reasonable steps to protect the confidentiality of the information and the identity of the employee furnishing information. A failure to report information of drug diversion will be considered in determining the feasibility of continuing to allow an employee to work in a drug security area. The employer shall inform all employees about this policy.

ILLICIT ACTIVITIES BY EMPLOYEES (TITLE 21 C.F.R., SECTION 1301.92)

It is the position of the DEA that employees who possess, sell, use, or divert controlled substances will subject themselves not only to state or federal prosecution for illicit activity, but shall also immediately become the subject of independent action regarding their continued employment. The employer will assess the seriousness of the employee's violation, the position of responsibility held by the employee, past record of employment, and so on, in determining whether to suspend, transfer, terminate, or take other action against the employee.

LOSS OR THEFT

A practitioner shall notify the nearest DEA field office of the theft or significant loss of any controlled substance upon discovery of such loss or theft. The practitioner shall promptly complete and submit DEA Form 106 regarding the theft or loss.

BLANK PRESCRIPTIONS AND DEA ORDER FORMS

A practitioner should keep blank prescription forms in secure locations that would preclude patients or casual visitors from stealing the forms for the purpose of falsification. Unused DEA Order Forms should also be kept in a secure location for the same reason.

DEA AUTHORITY TO MAKE INSPECTIONS

In Section 1316.03 of the Code of Federal Regulations (C.F.R.), the Administrator, through his inspectors, is authorized in accordance with Sections 510 and 1015 of the act (21 U.S.C. 880 and 965) to enter controlled premises, and conduct administrative inspections thereof, for the purpose of inspecting, copying, and verifying the correctness of records, reports, or other documents required to be kept or made under the act and regulations promulgated under the act. These inspections are mostly for the inventory, including records, files, papers, processes, controls, and facilities.

EXCLUSIONS FROM INSPECTIONS

Under Section 1316.04 of the C.F.R., unless the owner, operator, or agent in charge of the controlled premises so consents in writing, no inspection authorized by these regulations shall extend to:
- financial data;
- sales data other than shipping data;
- pricing data.

INSPECTION PROTOCOLS

Inspections have certain protocols that must be followed. In order to allow entry to your facilities under Section 1316.05 C.F.R., any inspector upon (a) stating his purpose, (b) presenting to the owner, operator, or agent in charge of the premises to be inspected appropriate credentials and written notice of his inspection authority under Section 1316.06 of this chapter, and (c) receiving informed consent under Section 1316.08 or through the use of administrative warrant, shall have the right to enter such premises and conduct inspections at reasonable times and in a reasonable manner.

12.12. Controlled Substances

INSPECTION WRITTEN NOTICE

A written notice required for the inspection shall include the following under Section 1316.06 C.F.R.:

- Form 82, which shall contain the name and title of the owner, operator, or agent in charge of the controlled premises;
- the name of the controlled premises;
- the address of the controlled premises to be inspected;
- the date and time of the inspection;
- a statement that a notice of inspection is given pursuant to Section 510 of the act (21 U.S.C. 880);
- a reproduction of the pertinent parts of Section 510 of the act;
- the signature of the inspector.

PREMISES OWNER CONSENT

Premises inspections commonly require consent of the owner, operator, or agent in charge of the controlled premises, as set forth in Section 1316.08 C.F.R. —In all cases where an inspection is contemplated, an administrative inspection warrant is required pursuant to Section 510 of the act (21 U.S.C. 880), except that such warrant shall not be required for establishments applying for initial registration under the act, for the inspection of books and records pursuant to an administrative subpoena issued in accordance with Section 506 of the act (21 U.S.C. 876), nor for entries in administrative inspections (including seizures of property):

- with the consent of the owner, operator, or agent in charge of the controlled premises as set forth in Section 1316.08;
- in situations presenting imminent danger to health or safety;
- in situations involving inspection of conveyances where there is reasonable cause to obtain a warrant;
- in any other exceptional or emergency circumstance or time or opportunity to apply for a warrant is lacking;
- in any other situations where a warrant is not constitutionally required.

OWNER INSPECTION CONSENT — MANY REQUIREMENTS

An administrative inspection warrant shall not be required if informed consent is obtained from the owner, operator, or agent in charge of the controlled premises to be inspected, as previously stated. However, the consent has several requirements that are very important to practitioners. Section 1316.08(b), the informed consent, shall consist of a written statement signed by the owner, operator, or agent in charge of the premises to be inspected and witnessed by two persons. The written consent shall contain the following information:

- That he (the owner, operator, or agent in charge of the premises) has been informed of his constitutional right not to have an administrative inspection made without an administrative inspection warrant.
- That he has the right to refuse to consent to such an inspection.
- That anything of an incriminating nature which may be found may be seized and used against him in a criminal prosecution.
- That he has been presented with a notice of inspection as set forth in Section 1316.06.
- That the consent given by him is voluntary and without threats of any kind.
- That he may withdraw his consent at any time during the course of inspection.

The written consent shall be produced in duplicate and be distributed as follows:

- the original will be retained by the inspector;
- the duplicate will be given to the person inspected.

PRE-EMPLOYMENT QUESTIONS ALLOWED FOR EMPLOYEES

Employees working in a controlled substances environment may be screened and rejected for reasons as described by the DEA. According to Section 1301.90 of the C.F.R., it is permissible to ask the following questions as part of an employer's comprehensive employee screening program:

- Within the past five years, have you been convicted of a felony, or within the past two years, of any misdemeanor, or are you presently formally charged with committing a criminal offense? (Do not include any traffic violations, juvenile offenses, or military convictions, except by general court-martial.) If the answer is yes, furnish details of conviction, offense, location, date, and sentence.
- In the past three years, have you ever knowingly used any narcotics, amphetamines, or barbiturates, other than those prescribed to you by a physician? If the answer is yes, furnish details.

CHECKING INFORMATION ON EMPLOYEES

An employer will have to have an authorization in writing that allows inquiries to be made of courts and law enforcement agencies for possible pending charges or convictions. This authorization must be executed by a person who is allowed to work in an area where access to controlled substances clearly exists. That person must be advised that any false information or omission of information will jeopardize his or her position with respect to employment. The application for employment should inform a person that information furnished or recovered as a result of any inquiry will not necessarily preclude employment, but it will be considered as part of an overall evaluation of the person's qualifications. The maintaining of fair employment practices, the protection of the person's right of privacy, and the assurance that the results of such inquiries will be treated by the employer in confidence will be explained to the employee.

Under Section 1301.93, the DEA recommends that inquiries concerning employees' criminal records be made as follows:

- **Local inquiries.** Inquiries should be made by name, date, and place of birth, and other identifying information, to local courts and law enforcement agencies for records of pending charges and convictions. Local practice may require such inquiries to be made in person, rather than by mail, and a copy of an authorization from the employee may be required by certain law enforcement agencies.
- **DEA inquiries.** Inquiries supplying identifying information should also be furnished to the DEA field division office along with written consent from the concerned individual for a check of the DEA files for records of convictions. The regional check will result in a national check being made by the field division office.

RECORDS AND REPORTS OF REGISTRANTS

Under Section 827 of the Title 21 United States Code (USC), every registrant manufacturing, distributing, or dispensing a controlled substance or substances shall maintain, on a current basis, a complete and accurate record of each such substance manufactured, received,

sold, delivered, or otherwise disposed of by him, except that this paragraph shall not require the maintenance of a perpetual inventory.

Otherwise, the inventory records must be kept as soon as a registrant first engages in the manufacture, distribution, or dispensing of controlled substances, and every second year thereafter make a complete and accurate record of all stocks thereof on hand, except that the regulations prescribed under this section shall permit each such biennial inventory (following the initial inventory required by this paragraph) to be prepared on such registrant's regular general physical inventory date (if any) which is nearest to and does not vary by more than six months from the biennial date that would otherwise apply.

12.13. ADVERSE DRUG EVENT REPORTING AND PHARMACOVIGILANCE

BASICS

OVERVIEW

Adverse drugs events (ADEs) are undesirable and unintended reactions to any veterinary product, including drugs, vaccines, medical devices, foods, or pesticides applied to animals that can occur during or after the use of a product or device. Even though the adverse event occurs in association with use of one of these veterinary products, the reaction may not be caused by that product. Pharmacovigilance is the science and activities relating to the detection, assessment, understanding and prevention of adverse effects or any other drug-related problem.[1] Most manufacturers of veterinary drugs have a group in professionals that record, maintain and provide records of ADE reports, in accordance with regulatory requirements.

Documentation of the safety and efficacy of a veterinary drug, vaccine, or topical pesticide is required prior to approval. Multiple studies are conducted, during which common ADEs associated are identified. However, the entire safety profile of a veterinary product may not be fully understood until it is administered to the general target population, is used in other species, or used for other purposes than the approved indications (see 13.13 – Extralabel Drug Use). Additionally, rare ADEs may not be identified until the drug has been administered to thousands or millions of patients. ADE reporting along with pharmacovigilance provides an ongoing surveillance program that can identify: (1) unexpected problems, not previously identified in the pre-approval process; (2) unsafe use of products, including extralabel use; (3) product defect, contamination, or issues that could adversely affect the safety of a product early. This allows manufacturers and agencies to communicate this information to those that prescribe and administer these products.

Reporting of ADEs by veterinarians and pet owners is voluntary. Manufacturers or sponsors of veterinary products are required to record and maintain all ADEs that they receive. However, requirements on when and how the manufacture reports ADEs is different based on the federal agency that oversees and laws that govern the specific veterinary product.

- The Food and Drug Administration (FDA) regulates all animal pharmaceuticals, medical devices, and medicated feeds and foods. Manufacturers of animal pharmaceutical and medicated feeds are required to record and routinely report all adverse drug reports that they receive.
- The United States Department of Agriculture (USDA) Animal and Plant Health Inspection Service (APHIS) Center of Veterinary Biologicals (CVB) regulates veterinary vaccines. Vaccine manufactures are required to record but are not required to routinely report ADEs.
- The Environmental Protection Agency (EPA) regulates topical pesticides used to treat ticks and fleas. These include shampoos, collars, dust or powder, sprays, spot-on products.[1] Manufacturers of these products are not required to routinely report ADEs.

TERMS DEFINED

Adverse Drug Event (ADE): Any adverse event associated with the use of an animal drug, whether or not considered to be drug related, and whether or not the drug was used in accordance with the approved indication, species, or dosage. An ADE can also include lack of expected efficacy, product defect, or human exposure to the product either directly or due to residue violations and exposure in food.[2]

Animal Drug: Any article intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease in animals other than humans.[3]

Environmental Protection Agency (EPA): Government agency, established on December 2, 1970, to consolidate in one agency a variety of federal research, monitoring, standard-setting, and enforcement activities to ensure environmental protection.[4] The EPA regulates products used topically for the control of ectoparasites and insects on animals under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Food and Drug Administration (FDA): The FDA is an agency within the US Department of Health and Human Services that is responsible for protecting the public health by regulating the manufacturing, marketing, and distribution to ensure the safety, efficacy, and security of human biological products, human and veterinary drugs and medical devices, cosmetics, and products that emit radiation.[5]

Food and Drug (FDA) Center for Veterinary Medicine (CVM): The FDA-CVM is a branch of the FDA dedicated to ensure the safety and efficacy of animal drugs, devices, medicated feed for companion and food producing animals, and safety of food products made from treated animals. In addition, the FDA-CVM monitors the safety and effectiveness of animal drugs on the market, ensures the safety of pet foods and food additives.[6]

Generally Recognized as Safe (GRAS): GRAS substances are substances added to food that are *g*enerally recognized as safe by qualified experts. These do not need to be reviewed and approved by FDA before being marketed.[7]

Generic Drug: A copy of an approved new animal drug for which patents or other periods of exclusivity are near expiration.

National Animal Supplement Council (NASC): The NASC is a nonprofit industry that provides guidelines for product quality assurance, adverse event reporting, and labeling standards for animal supplements.[8]

Pesticides: Any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest. Generally speaking, pesticides must be registered with EPA prior to distribution or sale, unless they are otherwise excluded or exempted from regulations.[9]

Pharmacovigilance: The science and activities relating to the detection, assessment, understanding, and prevention of adverse effects or any other drug-related problem.[2]

Pioneer drug: The brand-name or patented version of a drug, later copied to make generic drugs after the patent expires.

Serious Adverse Event: A serious adverse event is any adverse event that results in death, is life-threatening, or results in persistent or significant disability/incapacity, or a congenital anomaly or birth defect.[11]

United States Department of Agriculture (USDA): Government agency that regulates animal vaccines and biologics under the Federal Virus, Serum, and Toxin Act.

United States Pharmacopeia (USP): Established in 1820, the USP is a nongovernmental organization that sets quality standards for medicines, food ingredients, and dietary supplements for the United States and other countries.[11]

ISSUES AND OPTIONS

ADE REPORTING FOR FDA-CVM-APPROVED PRODUCTS

The Reporting Process

Although voluntary, the FDA encourages veterinarians and animal owners to report adverse drug experiences and product defects associated with animal drugs or animal devices.[12] Adverse drug experiences can include side effects, lack of effects or product defects (e.g. broken product seals, broken tablet, or leaking bottles).

There are three ways to report and ADEs:

1. Call the drug company. The name of the company and contact information (phone number, email) for reporting is typically found on

12.13. Adverse Drug Event Reporting and Pharmacovigilance

the product package insert. When calling the company, you should speak with one of the company's veterinarians to discuss the adverse. You should be prepared to answer questions about the patient(s), all medications that the patient received, any clinical signs and diagnostic abnormalities, what treatments were implemented and the outcome of the case. You may be asked to provide medical records. In the case where the animal's owner is calling in the report, they may be ask for permission to contact their veterinarian for more information.
2. Download Form FDA 1932a, "Veterinary Adverse Experience, Lack of Effectiveness or Product Defect Report" from the FDA website[13] and email the completed form to CVM1932a@fda.hhs.gov
3. Contact the FDA CVM by email at AskCVM@fda.hhs.gov, by phone at 1-888-FDA-VETS (1-888-332-8387), or mail Center for Veterinary Medicine, Food and Drug Administration, HFV-1, 7519 Standish Place, Rockville, MD 20855.

Manufacturer's Requirements

An ADE report is generated when four critical pieces of information are provided: (1) an identifiable reporter; (2) an identifiable animal(s) or human(s); (3) an identifiable drug; and (4) one or more clinical signs.[10]

The Federal Food, Drug, and Cosmetic Act requires drug manufacturers (pioneer and generic) to establish and maintain records of all ADEs and product defects reports and all data or information received or obtained with these reports. Manufactures are also required to report ADEs and product and manufacturing defects within specific timelines, dependent upon the type of report. Product defects must be reported within three days, and serious ADEs within 15 days. All other reports are submitted every six months for the first year after approval and then annually, on the anniversary of the approval date. This continuous monitoring of approved drugs is the primary means by which FDA-CVM obtains information on potential safety and efficacy problems of marketed approved animal drugs as well as potential product/manufacturing problems.

There is no mandatory reporting requirement for manufacturers of unapproved drugs, including compounded drugs or drugs approved for human use that are prescribed for veterinary patients in an extralabel manner. Because manufactures do not report ADEs, veterinarians should reports ADEs of unapproved drugs to the FDA-CVM, which will allow for the collection, monitoring, and detection of safety or efficacy issues with these drugs. For information on extralabel drug use, see 13.13 – Extralabel Drug Use and 9.14 – Medication Dispensing, Compounding, and Prescribing: Legal Considerations.

Medication Errors

Medication errors are preventable events that may cause or lead to inappropriate medication use or harm in a patient, either by the veterinary professional or veterinary client.[14] Typical causes of medication errors include illegible labels leading to confusion of drugs with similar names, confusing directions for administration, dosing, and so on. Medication errors may also originate in human pharmacies due to unfamiliarity with veterinary terms, products, and species differences in pharmacokinetics or pharmacodynamics.

The FDA-CVM is responsible for monitoring and addressing veterinary medication errors. Medication errors involving animals may result in human exposure because of error in administration to the animal or food residues. Manufacturers are required to report all medication errors to the FDA, and the FDA encourages veterinarians to report all medication errors.

Animal Dietary Supplements

On October 25, 1994, the Dietary Supplement Health and Education Act (DSHEA) was signed as an amendment to the Federal Food, Drug, and Cosmetic Act. The DSHEA created new regulations for dietary supplements, which were defined as a product, other than tobacco, intended to supplement the diet that contains at least one or more of the following: a vitamin, mineral, herb or other botanical, amino acid, and so on. Although the DSHEA provided strict guidelines for the labeling and marketing of dietary supplements for humans, in 1996 the FDA determined that the DSHEA did not apply to animal supplements.[15]

Therefore, animal dietary supplements are regulated by the FDA-CVM. As such, these supplements, which include nutraceuticals, are considered unapproved drugs and do not undergo regulatory approval nor have requirements for reporting ADEs. The FDA has designated oversight to dietary supplements and nutraceuticals to two industry groups: the Association of American Feed Control Officials and NASC. If the supplement manufacturer is a member of the NASC there is an industry-sponsored adverse event reporting system and the data are made available to the FDA-CVM.[16] Complaints concerning dietary supplements should be made to the manufacturer and or FDA-CVM.

Animal Medical Devices

A medical device is an instrument, apparatus, implement, machine, contrivance, implant, in-vitro reagent, or other similar article that is intended for the diagnosis of disease or other conditions, or to cure, mitigate, treat, prevent disease, or affect the structure or any function of the body of humans or other animals and that does not achieve its primary intended purposes through chemical action or metabolism.[17] Needles, syringes, surgical instruments, prosthetic devices, x-ray equipment, certain diagnostic test kits, and dental appliances are considered medical devices.

Pre-market approval is not required for medical devices used in veterinary medicine, and, except for radiation-emitting devices (register with the Center for Devices Radiological Health), companies who exclusively manufacture or distribute veterinary devices are not required to register their establishments, list their veterinary devices, nor are they required to report ADEs.

The FDA does, however, have regulatory oversight over veterinary devices and can take appropriate regulatory action if a veterinary device is misbranded or adulterated. The FDA recommends that manufacturers and/or distributors of veterinary medical devices request a review of their product labeling and promotional literature to ensure that it complies with federal regulations. This includes devices marketed in another country and offered for importation into the United States.[18]

Report a Pet Food Complaint

Similar to dietary supplements, some food products may affect the structure or function of the body. The FDA considers these products to be food, not drugs, if they exert their effect by providing nutrition, taste, or aroma.[19] However, if a food affects the structure or function of the body apart from its nutritive value, such as by improving joint function in an arthritic dog, the FDA may consider it a drug. Similarly, a food marketed with a claim that it improves or increases production and performance or is intended to treat or prevent a disease may be a drug. Food manufacturers are not required to routinely report adverse events, but they are required to maintain these records and make them available to the FDA upon request.

Veterinarians and pet owners can report complaints about a pet food or pet treats to the manufacturer, directly to the FDA through the Safety Reporting Portal,[20] or to a state FDA Consumer Complaint Coordinator. Include as much information as possible when submitting the complaints, such as exact product name, product description, container type, lot number, product dating, Universal Product Code, purchase date and location, description of the problem; and information about the affected pet(s) and how they became sick or injured as a result of consuming a pet food product.

Animal Biologics: Vaccines, Bacterins, and Diagnostic Kits

USDA-APHIS CVB regulates animal biologics (vaccines, bacterins, antisera, and other products of biological origin) and diagnostic kits. The CVB is regulated by the Virus, Serum, and Toxin Act and defines

12.13. ADVERSE DRUG EVENT REPORTING AND PHARMACOVIGILANCE

an adverse event as any undesirable occurrence after the use of an immunobiological product, including illness or reaction, whether or not the event was caused by the product. For products intended to diagnose disease, adverse events refer to anything that hinders discovery of the correct diagnosis. As such, the adverse event reports are assessed for the possibility of a product deficiency.[21]

The USDA recommends reporting any adverse event to the manufacturer. Reports can also be submitted to the CVB; once an adverse event has been reported to the manufacturer, the CVB may be contacted online using the Adverse Event Electronic Report Worksheet.[22] Forms can also be submitted by fax or (515) 337-6120 or by mail to Center for Veterinary Biologics, 1920 Dayton Avenue, P.O. Box 844, Ames, Iowa 50010. Additionally, adverse events may also be reported by calling the CVB at (800) 752-6255.[22]

Pesticides: Topically Applied Parasiticides

The EPA regulates topically applied pesticides under FIFRA, which requires pesticide registrants to report information concerning unreasonable adverse effects of their products to the EPA. EPA-registered pesticide products to treat dogs and cats for fleas and ticks include shampoos, collars, dust or powder, sprays, and spot-on products, excluding topical parasiticides that have been approved by the FDA. The EPA is responsible for ensuring that all pesticides sold in the United States do not cause unreasonable risks when they are used according to label directions and precautions. FIFRA requires pesticide registrants to report information concerning unreasonable adverse effects of their products to the EPA.

Veterinarians can report pesticide-related incidents involving domestic pets through a reporting page developed by the National Pesticide Information Center (NPIC) and the EPA.[23] This reporting site is for veterinarians only. Nonveterinarians wishing to report an incident involving a pet can contact the NPIC.[24]

ACTIONS RESULTING FROM ADE REPORTS

Veterinarians and pet owners reporting an ADE to the drug manufacturer will speak with trained veterinarians, who will take all of the information and enter this information into a database. That information is evaluated and assessed by pharmacovigilance specialists to determine any trends or signals that might arise from the data and submit these to authorities according to regulation. If a trend or signal is detected, appropriate action will be recommended.

The regulatory authorities will independently review ADE information to determine trend or signals. Each agency has a different method on how they evaluate the data. Possible trends or signals may include identifying an ADE not previously seen or a specific subgroup of patients that maybe at risk. In some situations, a lack of clarity in the label may result in misadministration. As a result, labels might be changed to include the newly identified ADEs, or contraindication, warnings, or precautions sections might be updated to better define the appropriate patient population to receive the drug. Administration instructions may be modified to increase clarity. These changes are implemented so that veterinarians can make informed decisions on patient selection or improve instructions for administration. In rare situations, a defective lot might be recalled, or a drug may be removed from the market.

WHY REPORT ADES

Ongoing surveillance of the efficacy and safety of any veterinary product is dependent upon adverse event reporting. It has been estimated that at least 30,000 people need to be treated with a drug to detect at least one patient with an adverse drug reaction (ADR) which has an incidence of 1 in 10,000 exposed individuals.[25]

Although similar calculations have not been made for veterinary drugs, reporting ADRs is the responsibility of all veterinarians to identify rare, but sometimes very serious ADRs and ensure appropriate use of these products.

EXAMPLES

N/A

CAUTIONS

The FDA-CVM maintains a database of all ADRs. The Cumulative Adverse Drug Event (ADE) Summaries Report listed on the website contains ADE data from reports received on paper between 1987 and April 30, 2013. CVM has transitioned to electronic reporting and is currently working to include ADE data from the electronically received reports, but are not included in the data on the website.[26]

The primary purpose for maintaining the CVM ADE database is to identify adverse effects not detected during the approval process and to monitor the performance of drugs not approved for use in animals. When reviewing the Cumulative ADE Summaries Report it is important to understand that the numbers reported are not incidence or prevalence but simply the number of times a particular sign has been reported for a drug.[26] These data also do not reflect the number of animals affected, as often times multiple signs will be reported for one animal. Additionally, for any given ADE report, there is no certainty that there is a causal relationship between the drug and the adverse event. Underlying disease, concurrently administered medications, or other non-drug-related causes are not reported on this website and may have influenced the outcome of the case. Other points to consider are:

1. The accuracy of information regarding the ADE is dependent on the quality of information received from the veterinarian or animal owner.
2. There is no accurate way to determine how many animals were given the drug; therefore, these data should not be used to compare the safety of one drug with another. For example, if a drug is marketed for several years before another drug in the same class, there may be more ADEs for this drug but this does not mean that the first drug was more unsafe than the second.
3. Information on how the drugs were used (for indications on the product label or in an extralabel manner) is not provided.
4. Adverse experiences are listed by the active ingredient of each drug in the ADE report. One of the active ingredients in the list may represent more than one brand name.

12.14. SUICIDE IN THE VETERINARY PROFESSION

BASICS

OVERVIEW

• Veterinary professionals have legitimate concerns when it comes to seeking professional psychological help, such as: fear of losing their license, judgement and ridicule from peers, being labeled as mentally ill, and other social stigmas.
• Suicide is an uncomfortable topic and is not often talked about, thus adding to the stigma. Normalization of the term must be a primary goal.
• Education in veterinary school is lacking regarding issues veterinarians will face in the field.
• Constantly increasing student loans, along with other personal stressors, are huge triggers.
• The rate of mental illness/psychiatric disorders in the veterinary industry is two times the national average, for both men and women.
• The American Veterinary Medical Association Committee on Wellness estimates that 11–13% of veterinarians are substance abusers.[1] Substance abuse and depression are the top two indicators for suicidal feelings.
• The rate for suicidal thoughts/plans is three times higher than the national average for veterinary professionals.
• There are stressors unique to the veterinary industry that must be acknowledged and managed: euthanasia, compassion fatigue (CF), increasing debt, income, and ethical dilemmas.
• Depression has an 80–90% treatment success rate when someone seeks help.[2]

TERMS DEFINED

Burnout: Overall decreased job satisfaction. Can occur in any industry, unlike CF.
Compassion Fatigue (CF): "The cost of caring" – Charles Figley. The impact of providing a high level of compassion on a daily basis, causing emotional and physical symptoms. The result of two things being present: (1) a caregiving relationship; (2) an empathetic capability.
Compassion-Fatigue-Induced Burnout: Burnout as a result of unidentified, and unmanaged CF.
Post-Traumatic Stress Disorder: The impact of experiencing a traumatic event first-hand.
Secondary Traumatic Stress (STS): The impact of experiencing someone else's first-hand trauma.
Trigger: Anything that exacerbates or causes symptoms to occur.

ISSUES AND OPTIONS

EDUCATION

• Education on suicide awareness needs to begin in veterinary school and technician programs. This alone could increase suicide awareness and provide valuable tools and resources needed to navigate the challenges of veterinary medicine.
• Additionally, veterinarians need to be trained on realistic expense management, due to the increasing debt load (see 1.7 – Today's Veterinary Students). Within the last 30 years the debt-to-income ratio has gone from 1 : 1, to 2 : 1.[3] This means that the debt load is double the income, on average.
• Within the practice, staff should be trained, and retrained, as they would for Occupational Safety and Health Administration-related safety issues. Regular training and discussion will reinforce the importance of this issue and keep it at the forefront of staff's minds.
• The return on investment for practices that invest resources into continuing education is increased staff happiness, which ultimately leads to lower attrition rates and higher productivity.
• Leadership within a practice must acknowledge the need and value of education before the staff does.
• Staff must understand the difference between CF and burnout (see 2.8 – Compassion Fatigue and Burnout).
• Myths/misinformation:
  ◦ There is still a mindset with some professionals (who are sometimes leaders in the practice) that there is no such thing as CF. This can come as a result of that person not being educated on the symptoms of CF.
  ◦ A common misperception is that asking someone if they are contemplating suicide will increase the chances that they will act on their thoughts. This is false. If someone is *not* considering suicide this question will not encourage suicidal thoughts. And if the person *is* contemplating suicide, then they may actually ask for help when someone shows they care.
  ◦ "There are always warning signs." This is untrue. Not everyone displays warning signs. If you do observe warning signs then someone may be reaching out for help.
  ◦ "Suicide is a selfish decision." This is a false judgment. The Canadian Mental Health Association states that the suicidal state of mind has been described as a sense of self-hatred, rejection, and hopelessness. Often, a person feels as if they are a burden to their friends and family.
• By placing an emphasis on team education on this topic, awareness will increase, and depression, CF, and suicide may become more acceptable to talk about.

NORMALIZATION

• Within a practice it is vital that the management and ownership team not make staff feel like they cannot ask for help. This generally boils down to a level of trust and culture within the hospital. "If I ask for help, will I be judged?" "If I ask for help, will it be kept confidential?" In order to normalize a topic such as CF or suicide, leadership needs to be a part of the discussions. This often requires a level of vulnerability on the leadership team's part, to increase staff's comfort with sharing their own stories.
• The main goal is to encourage people to ask for help when they need it. As mentioned in the Overview section, there is an 80–90% success rate when help for depression is sought.
• Not being able to express how the practice workflow affects team members can sometimes drive compartmentalization. It is not uncommon to go from a euthanasia appointment to a new puppy exam within minutes. This forces veterinary professionals to compartmentalize their feelings on the impact of euthanasia and encourages the suppression of emotion. This ultimately leads to burnout, which is exacerbated by personal stressors.

SUPPORT

• Communication platforms should be provided so staff members can share, process, and normalize what they are feeling. This can be done through staff meetings, or individual meetings organized by the staff. During the holidays, the number of euthanasias significantly increases, which is a time when staff needs the most support.
• Resources need to be provided to staff so that they know where to go when they need help. According to a Veterinary Hospital Management Association Insight survey, only 35 out of the 209 participating practices offered an employee assistance program (EAP). An EAP is a benefits program that provides counseling or resources to assist employees with personal problems and/or work-related problems that may impact their job performance, health, and mental and emotional wellbeing. These are very cost-effective benefit plans (less than $2 per employee/month) that allows staff to confidentially seek help when needed.

12.14. Suicide in the Veterinary Profession

• Personal and professional connections are the most important factor for a happy and fulfilling life, according to a 75-year-long Harvard study. The more connected someone feels to others, the more likely they are to ask for help and feel valued as a person. Within a practice, the leadership team should implement things that allow for personal connections to be built. This can be in the form of team-building activities or appreciation events. Asking staff how they would like to approach this will increase the level of connection. Practices with poor organizational cultures will have the hardest time creating this connection. At a minimum, staff should be encouraged to have an accountability partner. This is someone both parties can speak freely with about work-related concerns. It should be someone they have a good connection with, and conversations should be judgment free.
• Encourage staff not to assume that someone *else* will help a person in need (bystander effect), or that they are not qualified to help another person (diffusion of responsibility). At a minimum, a connection needs to occur, and the person should be guided to someone who can help. Just because someone initiates concern does not mean they have to personally be the solution.

EXAMPLES

A veterinary practice decided that they wanted to increase awareness in their practice when it came to suicide and CF. To begin, they had to start introducing these ideas to their staff. They started taking 10–15 minutes at each staff meeting to discuss each topic, symptoms, and tools to anticipate and manage them. For topics that they were uncomfortable tackling, they reached out to industry professionals, or distributor/manufacturer connections. After a general education level was established, they began doing activities with the staff to build connection and trust.

They soon noticed the staff found comfort in talking about difficult cases and clients that they interacted with. To share their stories of STS, the staff was encouraged to have quarterly meetings, outside of the practice, to connect with each other. They also began to invite other practices to join them, since these issues are experienced by every practice. Through this education and support the team began to have a higher level of connection, and their feelings were normalized through hearing that others experience the same things.

The practice made a commitment to provide formal education to their teams on an annual basis. They also created a one-page resource paper that was placed in the break room. This contained information on a suicide hotline, the employee assistance plan, and other available resources. This allowed staff to confidentially access the information from the break room, and not have to ask for help if they did not feel comfortable. By following the steps of educating, normalizing, and supporting, the practice leadership team created a more positive culture. This ultimately increased job satisfaction and diminished attrition rates. One way they were able to measure job satisfaction increase was through annual confidential employee workplace satisfaction surveys. This provided a platform for honest feedback and allowed the practice to have a way to measure changes in happiness and culture.

CAUTIONS

• Do not assume that "suicide is not an issue at my practice." This is something heard often and is not a topic we want to be reactive about. Being proactive is the best approach, as it is not a problem until it is.
• Not all staff will want to participate in making connections. Depending on personality types, they may not feel comfortable with this. Do not get discouraged. The goal is to create a support system and resources with access for everyone, but individuals cannot be forced to get involved.

MISCELLANEOUS

ABBREVIATIONS

CF: Compassion fatigue
EAP: Employee assistance program
STS: Secondary traumatic stress

Section 13

Legal Issues

13.1. VETERINARY PRACTICE LEGAL NEEDS AND DEALING WITH ATTORNEYS

BASICS

OVERVIEW

Every business needs a team of professional advisors. That advisory team should include at least a lawyer, along with an accountant, banker, insurance provider, and a management consultant.

- All veterinary practices need legal assistance for help in many more areas than defense of malpractice, especially if liability prevention is the plan.
- Legal help is needed to represent veterinarians before license boards.
- Legal review should be used before a business is open to assist in drafting operation documents and in negotiations (if more than one owner) of the corporate bylaws, the limited liability company (LLC) operating agreement or partnership agreements, and even for proprietorship legal liability risk assessments.
- Practices need legal assistance in the review of employee manuals, employee contracts, and employee policy manuals (see 3.21 – Employee Manuals).
- Legal advice should be used to develop forms for recording client admittance, authorization, and release forms.
- If the practice is multi-owner, attorneys must be sought for operating agreements, whether for shareholder agreements, partnership agreements (see 13.8 – Partnership Agreements), buy/sell agreements (see 13.9 – Buy/Sell Agreements), or simply management agreements.
- Dealing with attorneys should be an ongoing relationship in which the client is the director of the actions of the hired professional attorney.
- Clients should not be intimidated by attorneys.
- Clients should demand explanations of the plan of action and the risk assessments (likelihood of winning or losing an adversarial relationship), and the client should expect a continual update of estimated costs and legal fees.

TERMS DEFINED

Attorney: A lawyer who is licensed to practice law in a given jurisdiction. Some lawyers study the law but do not take and/or pass the bar exam to be licensed to provide legal services. Unlicensed attorneys should not be used for providing legal documentation.

Buy/Sell Agreements: Agreements between shareholders or LLC members, or agreements in partnership documents that explain and provide for the methodology of allowing owners to exit, how the practice will be priced, and how payments will be made upon that exit. They should provide for rights and methods of surviving shareholders to purchase an exiting shareholder's stock.

Corporate Bylaws: The written terms of agreement of the shareholders of a corporation that explains voting rights and management rights, which may also include some reference to successor ownership and procedural determinations for executive officers. The bylaws do not include all the terms needed in a buy/sell agreement.

Dual-Degree Attorney: These are attorneys that have at least two concurrent degrees. Commonly, they include degrees in veterinary medicine and/or business administration. Dual-degree attorneys should theoretically be better qualified to advise businesses on operations while understanding the needs of legal liability protection.

Employee Manuals: Written manuals running from a few pages to many pages explaining the terms and conditions employees must operate under while working for a given business.

Employee Policy Book: The policy book should be separate from the employee manual, in that it can include many operating policies giving more detail on the day-to-day operations than an employee manual can. The employee manual primarily directs behavior, attendance, and/or absences.

Fee Agreement: Clients of attorneys should have a signed fee agreement explaining the terms of the relationship and the expected cost to the client.

Lawyer: One learned in law.

Legal Liability Risk Assessments: This is a form of practice audit where an attorney or lawyer can visit and review a practice to be sure there is coverage for the risk of malpractice and the risk of client lawsuits based on client injury.

Malpractice Defense Attorney: An attorney or licensed lawyer who is able to defend a client in a court of law in a given jurisdiction in a suit based on the veterinarian's possible deficient veterinary care, in which the patient treatment may not have achieved acceptable medical standards.

Operating Agreements: Agreements that are the very essence of an LLC or can also be agreements used as part of a partnership agreement to explain the management terms and exit strategies for one or more of the owners.

Partnership Agreements: An agreement between partners, whether a general partnership or a limited partnership, that explains the terms of management and exit strategy.

Shareholder Agreement: Agreements between corporate shareholders that can and should include buy/sell agreement terms allowing one or more shareholders to exit the company having pre-committed buyers for the shares.

ISSUES AND OPTIONS

The legal issues to be resolved for a veterinary practitioner should be planned to include an ongoing relationship with an attorney. This allows for the legal work to not just be incidental or "fire engine" or crisis oriented, but rather preventive in nature to include practice risk analysis, including operation document reviews.

- Minimizing practice liability exposure. Practices need multiple categories of standard operating forms.
- Standard operating forms should include various medical forms, including informed consent authorization forms and client waiver forms.
- Client waiver forms must be used for clients who refuse to allow practitioners to proceed with their medical recommendations that meet standards of care of the profession.
- Clients must sign informed consent forms when they agree to follow the practitioner's advice. This form would confirm that the client has been adequately apprised of risk and possible outcomes of any given procedure.
- Veterinarians should be seeking legal advice at least two to three times a year just for practice risk audits and review of practice forms.
- Employee relations and employee management arenas are a whole separate department that attorneys should be involved in for reviewing the employee manuals and policy booklets.
- Legal advice must be sought to draft and revise veterinary associate contracts or, at a minimum, veterinary associate letters of intent, explaining the terms of employment.
- Ownership of a practice should never be undertaken without seeking legal advice.
- Legal advice regarding practice ownership must include providing for exit and possible sale of stock before any stock is ever purchased.
- Every multi-ownership practice has issues about the amounts of investment per shareholder, the amount of time and money required for purchasing another's stock, and for the allocations for returns on investment and/or dividend or asset distributions.
- Allocations for investment and distributions of profits are not required to be pro rata to the percentage of ownership. Some laws

13.1. VETERINARY PRACTICE LEGAL NEEDS AND DEALING WITH ATTORNEYS

require without a separate agreement that distributions of any kind are to be equal, regardless of the initial investment.
• Variations in state partnership and corporate law make practice investment and distribution allocation a mandatory discussion before any purchase of shares or equity should happen.

EXAMPLES

• A veterinarian is taken before the veterinary licensing board based on a client complaint explaining that the quality of medical service was below standards because the scar of the surgery site was too large. In fact, the client was complaining because she really thought the bill was too high. The veterinarian had to defend the case because the veterinarian did not have signed statements confirming adequate informed consent that could have dismissed the case. The signed informed consent forms could have prevented the client from complaining that she was not aware of a certain size scar following surgery.
• Legal advice must be sought annually to update forms to prevent a new associate's buy-in from being held up because the shareholder agreements, including the buy/sell terms, are so outdated that the valuation provided for is so inadequate and unfair that the new associate is not willing to purchase equity.
• In another case, a lawsuit followed a minority shareholder's exit from the practice because the shareholder agreement was outdated by several years, not providing for the updated veterinary practice valuation methodology. This resulted in the exiting associate demanding exorbitant share values that were no longer accepted in the profession.

CAUTIONS

• Client forms can prevent lawsuits or veterinary board complaints if they are properly drafted, relieving veterinarians of liability when clients disagree with recommendations.
• Employee lawsuits can be prevented by having adequate employee manuals that explain at will employment (if allowed in your state) and the terms of training required before employees can achieve certain levels of responsibility in a given practice.
• Shareholder agreements, whether writing separately or combined in other forms, are absolutely mandatory to provide for the exiting owner's ability to sell stock.
• Terms of voting structure, or lack of the same, must be provided for to allow prior majority owners to maintain control at least until a new minority shareholder has paid for their stock.

MISCELLANEOUS

• Attorneys are licensed to practice in the given jurisdiction. Lawyers are not. Attorneys can represent you before licensing boards and in a court of law. You can check their standing with the appropriate bar association.
• Practice risk assessment or liability prevention can be properly handled by having at least annual or more often reviews of your documentation for dealing with clients and employees.
• Prevent attorney intimidation of clients by requesting and receiving the attorney's plan of action for your case along with regular communications, updates, and an estimate of fees and costs of hiring the attorney.

13.2. INFORMED CONSENT

BASICS

OVERVIEW

• The doctrine of informed consent arose centuries ago to require practitioners of the "learned professions" to provide information to their clients adequate to allow those clients to make informed decisions in their dealings with professionals.
• Today, the doctrine is most often applied to physicians in obtaining consent from their patients for surgery and medical treatments.
• Historically, courts have applied legal principles established in human medicine to controversies in veterinary medicine; some courts have already applied the doctrine of informed consent regarding the physician–patient relationship to veterinary malpractice cases, and this trend is expected to continue.

TERMS DEFINED

Informed Consent: Person's agreement to allow something to happen, such as a medical diagnostic or surgical procedure, that is based on full disclosure of the facts necessary to make an intelligent decision.

ISSUES AND OPTIONS

THREE STANDARDS OF DUTY TO INFORM

• Courts in different jurisdictions have applied three separate but distinct standards regarding the information that a doctor must provide to the patient in order for the patient to exercise true *informed* consent:
  ◦ *Reasonable practitioner standard.* Requires a practitioner to disclose facts that the individual practitioner believes would be material to a particular client.
  ◦ *Reasonable patient/client standard.* Requires a practitioner to disclose all risks that would be material to a reasonable, prudent person in the client's position.
  ◦ *Individual client/patient standard.* Requires a practitioner to determine what risks are material to a particular client he or she is dealing with and to disclose those risks.

Most jurisdictions today apply the reasonable patient/client standard. The reasonable practitioner standard is generally considered to be too paternalistic in modern times when clients insist on a more "hands-on" approach to decision-making regarding medical treatment for themselves and their animals. They are reluctant to allow the practitioner to determine what is best for them or their animal. Application of the individual client/patient standard, however, is usually viewed as too demanding on the practitioner, who is forced to somehow determine what information is important to that particular client.

WHO MAY GIVE INFORMED CONSENT?

• Competency of a person to give informed consent is rarely a problem, but there are certain situations in which the practitioner should exercise care:
  ◦ Level of competency required to give informed consent is generally the same as the level of competency required to enter into a contractual relationship.
  ◦ Mental competency is measured at the time of consent. If competency is in question, it should be confirmed by a credible witness.
  ◦ In most jurisdictions, competency is assumed and the burden is on the plaintiff to prove incompetence.
• Problems generally arise in two situations. The first involves obtaining consent from a minor. Consent should rarely be accepted from a minor who is simply delivering the animal to the practitioner for an adult owner. If the minor is truly the owner and caregiver of the animal, care should be taken to assure that the minor clearly understands the risks, alternative treatments, and costs involved. The second situation involves the competency of the person at the time of consent. Care should be exercised to determine that a normally competent person is not under the influence of a substance that renders them temporarily mentally incompetent. Conversely, the fact that a person may have intermittent episodes of dementia does not mean that they cannot give informed consent if they are determined to be competent at the time of giving the informed consent.

INFORMATION THAT MUST BE DISCLOSED

If consent from the veterinary client is to be truly informed, the veterinarian must disclose the following information to the person providing the consent. It is best if the information is given in person, but it may be given by written materials if the practitioner is sure the client has read the written materials *before* the consent is given. Simply giving the client a handout describing the procedure and telling them to call if they have any questions is not sufficient.

THE DIAGNOSIS OR NATURE OF THE PATIENT'S AILMENT

• The general nature of the proposed treatment and the purpose or reason for the treatment:
  ◦ risks or dangers involved;
  ◦ the probability or prospect of success;
  ◦ all alternative treatments or procedures, along with the risks and probabilities of success for each alternative treatment;
  ◦ the prognosis or risk of no treatment;
  ◦ cost of each alternative treatment.
• A practitioner should never rely on a statement by a client to "do whatever you think is best" as giving informed consent. Such a statement is consent, but it is not informed consent. The average client has very limited knowledge of the risks and costs involved in various diagnostic and treatment procedures, and therefore has no basis for giving informed consent. Until the client has been apprised of the information previously listed regarding risks, alternative procedures, and costs, they may give consent, but it is not informed consent. This is why most consent forms signed by the client are of little value in litigation. Members of a jury will quickly identify with a plaintiff who claims they were simply told what procedure needed to be done, and then signed the consent form without reading it.
• The common recommendation of practice management speakers and writers to recommend the highest level of treatment for the patient's condition and ask for consent to perform that treatment is not consistent with the principles of informed consent. Unless the client is informed of all possible alternative treatments along with the risks and probability of success for each alternative treatment as well as the alternative of no treatment, then there may be consent but it is not informed consent.
• Information presented to the client should be in terms that the client can understand. This must be tailored to the understanding of each client, taking into consideration educational level, experience with pet ownership, past dealings with veterinarians, and so on. Information should be given in common and accurate terms. If there is a chance the pet may die during the procedure, the client should be told that the animal might die, not that there might be an "adverse outcome." If the animal is to receive a general anesthetic, that term should be used rather than telling the client that the animal will be "sedated."

WHEN NONDISCLOSURE IS PERMITTED

• Under very limited circumstances disclosure of the facts previously listed is not necessary. However, the practitioner should very careful when deciding that nondisclosure is permissible. Nondisclosure may be permitted in the following circumstances:
  ◦ Stabilization of life-threatening injuries.

- If the client specifically requests nondisclosure. However, when risks of treatment are significant, the practitioner should insist on disclosing those risks.
- When consent is implied by actions. This might apply if a client brings an animal for a specific surgery or treatment after they have previously brought another animal for the same treatment or procedure.

FACTS NOT REQUIRING DISCLOSURE

- When disclosure is required, there are some facts that do not require disclosure, including:
  - risks so remote that they are not material;
  - risks that are obvious or within common knowledge;
  - risks already known to the client;
  - risks which, if disclosed to the client, might be harmful to the client's wellbeing.
- A practitioner should be very reluctant to decide that facts should not be disclosed to the client. Although such nondisclosure may be perfectly acceptable when dealing with a long-time client, caution should be exercised when talking with a new client. The fact that a client has another dog that has been neutered does not mean that the client is informed of the risks involved in the procedure. The other procedure may have been done by another veterinarian that did not inform the client of the risks, or the client's spouse may have been the person to give consent to the earlier procedure.
- Particular care should be exercised when deciding that disclosing information might be harmful to the wellbeing of the client. If informing the client that a particular procedure could be fatal to their animal is likely to upset the client to the extent that it would affect their wellbeing, there may be a question whether that person is of sufficient mental stability to even give informed consent. In such situations, the best practice might be to try to consult with a family member or caregiver of the client, either to obtain consent from the other person or to determine how best to approach the situation.

WHO SHOULD OBTAIN CONSENT?

Whenever possible, the practitioner should be the person who obtains consent from the client. The practitioner is usually the only person who can adequately explain the procedure and fully answer the client's questions. In limited circumstances it may be permissible for a staff member who is very familiar with a routine procedure to obtain consent for that procedure; however, the staff member should always ask if the client wishes to speak with the doctor. In order to ensure that there are no misunderstandings, the person obtaining consent should always continue to ask, "Do you have any questions?" until the client says, "No."

USE OF A CONSENT FORM

- Although a written consent form is always advisable for any procedure that involves substantial risk, the signature of a client on a form does not in itself protect a practitioner if a client complains during litigation that they were not properly informed of the risks of a procedure. The signed consent form is *some* evidence of informed consent, not absolute proof. The following types of consent forms are viewed with disfavor by the courts:
  - A form signed by a person not competent to give consent, such as a minor, a person who is mentally incompetent, or a person under the influence of drugs or alcohol.
  - A blanket consent form authorizing the practitioner to undertake any and all procedures he or she deems necessary.
  - A consent form signed at the onset of the veterinary–client–patient relationship that purports to grant unending consent to any and all future and unspecified procedures.
  - A form signed without being read by the client because the staff member tells the client, "We need you to sign this so we can do the surgery on your pet."
- Many consent forms are available for use by practitioners, and no particular form is required. Most such forms contain statements that the client has been told the nature of the procedure to be performed, that they have been informed of the risks involved, that they have read the form, that they authorize treatment, and so forth. The most desirable form will have blanks beside each of these statements that are to be initialed by the client and the person obtaining consent. These are an indication that the form was discussed with the client and that the client did not just sign the form without reading it.

CONCLUSION

The key to informed consent is information more than consent. Proper information, clearly and accurately conveyed, will do far more to protect a veterinary practitioner from liability than any signed consent form, no matter how carefully crafted.

13.3. MALPRACTICE

BASICS

OVERVIEW

Legal actions against veterinarians are almost always based on negligence. Although actions can be brought under theories of breach of contract, breach of warranty, defamation, and so forth, the vast majority is based on negligence regarding the medical treatment of an animal, or negligence that leads to harm of a person in the clinic.

TERMS DEFINED

Burden of Proof: Level of proof that must be provided by the plaintiff in order to prevail in a legal action. In negligence actions, the plaintiff must usually prove that the probability of negligence and harm is "more likely than not." The legal term often applied to this burden of proof is "by a preponderance of the evidence," a much lower burden than the "beyond a reasonable doubt" required in criminal cases.
Negligence: Doing an act that a person of ordinary prudence would not have done under similar circumstances, or the failure to do what a person of ordinary prudence would have done under the same or similar circumstances.
Standard of Care: Duty to exercise the care and diligence that is ordinarily exercised by a reasonably competent veterinarian under similar circumstances.

ISSUES AND OPTIONS

ELEMENTS OF A NEGLIGENCE CAUSE OF ACTION

Veterinary malpractice is classified legally as a tort that requires proof of four essential elements. If any element cannot be proved by a preponderance of the evidence, the cause of action fails:
• **Duty.** The duty to practice within the standard of care is usually established at the time the veterinarian–client–patient relationship (VCPR) is established. This element is rarely of great importance in a veterinary malpractice action, unless the existence of a VCPR is questioned by one of the parties to the action.
• **Breach of duty.** Failure of the practitioner to act in accordance with the standard of care. This breach may result from failure to perform an act that should have been performed or by performing an act that should not have been performed.
• **Proximate cause.** The connection between the negligent act of the practitioner and the harm to the patient or client caused by that act. If the patient was harmed by a nonnegligent act (such as unavoidable lameness resulting from a necessary surgical procedure), there is no cause of action for malpractice even if it is proved that the practitioner was guilty of negligence which resulted in no harm to the patient (such as giving an incorrect dose of medication that did not result in symptoms).
• **Damages.** Harm incurred by the patient or client as a direct result of a negligent act by the practitioner.

STANDARD OF CARE

• The standard of care in a veterinary malpractice action is established by expert testimony. The standard of care is essentially what an expert says it is. In reality, the standard of care articulated by the plaintiff 's expert is usually much different than the standard articulated by the defendant's expert. It is the province of the jury to decide which is the proper standard or whether the proper standard is somewhere between those articulated by the experts. The standard of care also changes with time as knowledge increases (see 9.3 – Standards of Care and Care Pathways).
• The standard of care is generally higher for specialists than it is for generalists. This applies to board-certified specialists, but may also apply to practitioners who hold themselves out as having special expertise in certain areas or who accept referrals of patients with certain conditions. Practitioners who perform difficult procedures when specialists are readily available to perform those procedures may be held to the standard of care of a specialist.
• The standard of care used to be defined in relation to the care rendered by practitioners in a limited geographic area and was referred to as a "local" standard of care. Under this standard, a practitioner was only required to practice at the same level of competency as those practitioners in his or her geographic area. For instance, if none of the practitioners in a certain area recommended heartworm preventative medication for dogs, then a practitioner who did not make such recommendations could not be found guilty of negligence for such failure to recommend that medication. Such a "local" standard of care probably no longer applies. With modern means of communication and continuing education requirements, practitioners will probably be held to a national standard of care determined by what the standard is for practitioners nationwide.

DUTY TO TREAT

• No duty to treat until a valid VCPR is established, not even in emergency situations.
• Once a VCPR is established, treatment must be continued until: (1) the animal recovers from the disease or injury; (2) the practitioner has completed all the treatment agreed upon; (3) the animal dies; (4) the client terminates the VCPR; or (5) responsibility for treatment is transferred to another practitioner with the consent of the client.
• Although refusal to treat an animal, whether an emergency or not, may result in anger by the person presenting the animal, moral indignation by the community, and bad public relations, a practitioner has no legal duty to render emergency treatment to an animal and may refuse to treat any animal for any reason, including the inability of the person presenting the animal to pay for treatment.
• Once treatment of an animal is undertaken, it is very difficult for a practitioner to terminate treatment of that animal, if such termination would result in harm to the animal, without the consent of the client even if the client is unable to pay for continuing treatment. Termination of treatment for inability to pay may be acceptable if the client clearly agreed to such termination before treatment began. When treatment of an animal that needs further treatment is terminated for any reason, the current treating practitioner should make a good-faith effort to assist the client in finding another practitioner to continue the treatment.

LEGAL DEFENSES

• **Contributory negligence.** The defendant in a malpractice action may be able to show that the client was also negligent in their care of the animal. This would include failure to confine a large dog after surgery, or failure to give prescribed medications, for example. In jurisdictions that recognize the doctrine of contributory negligence, proof of any degree of negligence by the client may serve as a complete bar to recovery by the client.
• **Comparative negligence.** As in contributory negligence, this theory of defense depends upon proving that the client also was negligent in their care of the animal. The difference is that in jurisdictions that recognize comparative negligence, the client's recovery is reduced by the degree of negligence attributed to the client. If the jury finds that the client was 25% negligent and the veterinarian was 75% negligent, the client will recover only 75% of the total damages awarded by the jury. In most jurisdictions the client cannot recover any damages if more than 50% of the negligence is attributed to the client.
• **Assumption of risk.** This defense theory is often applied in cases involving animal bites to clients, veterinarians, or veterinary staff members. The defendant in the action will claim that the plaintiff "assumed the risk" of getting bit and therefore cannot recover damages.

• **Statute of limitations.** Lawsuits for veterinary malpractice must be filed within a certain period of time following the alleged act of negligence. If the defendant can show that the action was not filed within the allowed time period, the court will grant a motion for summary judgment and the action will be dismissed.

MEASURE OF DAMAGES

The owner of an animal that is the victim of negligent acts of a veterinary practitioner can recover the following damages:

• The reasonable cost of veterinary care to correct the harm caused by the negligent practitioner.
• Costs incurred in transporting the animal to another veterinarian for treatment (such as to a school of veterinary medicine or a specialty clinic in another town).
• Wages lost in procuring veterinary care necessary because of the negligence.
• The fair market value of the animal if the animal dies.
• Costs of bringing a replacement animal to the same condition as an animal that died, including vaccinations, specialty training, and so on.
• Loss of income that would have been derived from an animal that died, such as sale of puppies and stud fees.
• Currently, most jurisdictions still consider pets to be property, and recovery for damages is based on that holding. As a result, courts generally do not allow for recovery of emotional damages of mental anguish or pain and suffering experienced by the owner or family members. However, some governmental entities and many individuals are working diligently to have courts hold that animals are not property or are a special kind of property. Such a change in the characterization of animals will most likely allow for the recovery of noneconomic (pain and suffering) damages for owners of animals harmed by the negligence of a veterinarian. There have even been recent legislative proposals to allow animals themselves to recover damages for their own pain and suffering. Such changes will most likely greatly increase the amount of damage awards in veterinary malpractice cases and the number of cases filed. The limited damages currently available in medical malpractice cases does not allow for sufficient monetary recovery for an attorney working on a contingency basis to recover sufficient funds to compensate him or her for the time and expenses involved in a veterinary malpractice case. Because most clients are unable or unwilling to pay attorney fees on an hourly basis, such cases are rarely filed.

AVOIDING MALPRACTICE SUITS

There is nothing that a veterinarian can do to assure that he or she will never be the subject of a malpractice suit. However, there are many things the veterinarian can do to decrease the likelihood of such a lawsuit:

• **Continuing education.** As the base of knowledge in veterinary medicine grows, veterinarians must continue to stay up to date with current knowledge (see 3.6 – Continuing Education Benefits). It will be difficult for a veterinarian to prevail in a malpractice action if the plaintiff can show that the veterinarian was unaware of facts that a reasonable practitioner would consider common knowledge.
• **Medical records.** Medical records are the most important evidence in a malpractice case (see 9.1 – Medical Records and Patient Documentation). Even if the veterinarian can recall details of the treatment of a particular animal, the attorney for the plaintiff will claim that, "if it is not in the records, it did not happen."
• **Informed consent.** Sufficient information must be given to clients to allow them to make informed decisions regarding their pets. The doctrine of informed consent is discussed in more detail elsewhere in this book (see 13.2 – Informed Consent).
• **Staff training.** Staff members must be adequately trained in medical knowledge and techniques as well as in proper communication procedures with clients (see 3.10 – Staff Training).
• **Referrals.** With the proliferation of specialists and specialty practices, general practitioners should be careful to make clients aware if such specialists can offer a higher level of care than the general practitioner and offer to refer the animal to a specialist if requested to do so by the client (see 13.12 – Legal Duty to Refer).

13.4. UNPROFESSIONAL CONDUCT

BASICS

OVERVIEW

• Usually, a finding of unprofessional conduct is made by a state veterinary licensing board. However, it may also be a breach of the principles of veterinary medical ethics as defined by the American Veterinary Medical Association in the 2005 revision of that code of ethics. This breach usually would have less consequence than a finding by a state veterinary licensing board.
• Before a finding is made by a licensing board, a person must file a complaint to the licensing board and, after an investigation, the licensing board must affirm the validity of the complaint of unprofessional conduct. Unprofessional conduct is by the doctor, whether inside the practice environment or in personal life.
• Malpractice will usually be included as one form of unprofessional conduct (see 13.3 – Malpractice).
• Clients may be the recipients of a veterinarian's unprofessional conduct, but it is not a requirement.
• Most commonly, a veterinarian's unprofessional conduct is related to office and business environment, whether with clients or staff, but it is not required.
• Unprofessional conduct as related to staff could be regarding improper supervision or allowing them to do actions with patients that is beyond their ability or license entitlement.
• Some practice acts may also refer to unprofessional conduct as dishonorable conduct.
• Because unprofessional conduct may be a result of improper personal behavior, it can include traffic law violations, at least if that violation should rise to a gross misdemeanor or felony level.
• Unprofessional conduct includes moral turpitude issues.
• Fraud, especially in the use or issuance of animal health documents or certificates, will result in a finding of unprofessional conduct.
• This conduct includes gross ignorance, which may be inclusive of or greater than a malpractice act.
• Gross ignorance requires comparison with a larger pool of standard-setting colleagues. This means that, in looking for a breach of standard of care to determine gross ignorance, the board not only looks to the local similarly situated practitioners, but also to the teaching hospitals, veterinary medical journals, and reasonable experimentation processes in the furtherance of veterinary medical acts or treatments.
• It is easier to be found guilty of gross ignorance in some technical areas than it is to be found guilty of malpractice due to this broadening of the scope of finding a standard of care (see 9.3 – Standards of Care and Care Pathways); however, the behavior for gross ignorance is more than just a negligent act.

TERMS DEFINED

Dishonorable Conduct: This term is referred to by some state practice acts to be the same as unprofessional conduct.
Fraud: An intentional misrepresentation of the truth to mislead another to bargain or act in reliance upon the misrepresentation.
Gross Ignorance: An act or omission that reaches a level of incompetence or error much greater than that of a more common negligent or mistaken action or omission.
Malpractice: A more limiting term specifically describing a professional's failure to practice the quality of medicine set by the similarly situated veterinarians in a given geographical area, if the accused is a general practitioner. If the accused is a specialist, then the standards of care are compared with a broader area than for a general practitioner.
Moral Turpitude: The act of baseness, vileness, or the depravity in private and social duties which humans owe to their fellow humans or society in general, contrary to accepted and customary rules of right and duty to others. It also includes acts or behaviors that gravely violate moral sentiment or accepted moral standards of a community.
Negligence: This is a finding in a malpractice case where the actor or defendant did not act as a reasonable veterinarian in a similar situation.
Unprofessional Conduct: The finding of a state veterinary license board where the behavior of a veterinarian is below the standards of behavior set for a licensee. This behavioral violation may be related to actions within the practice scope or related purely to personal life situations, including but not limited to alcohol and/or drug-related behavior. Most every complaint before license boards, if not dismissed, has a finding of unprofessional conduct.

ISSUES AND OPTIONS

MORE SPECIFICS OF UNPROFESSIONAL ACTS

• An action involving moral turpitude, dishonesty, or corruption relating to the practice of the person's profession, whether the act constitutes a crime or not.
• All advertising that is false, fraudulent, or misleading.
• Incompetence, negligence, or malpractice that results in injury to a patient or that creates an unreasonable risk that a patient may be harmed.
• Suspension. Revocation or restriction of the individual's license to practice any healthcare profession by competent authority in any state, federal, or foreign jurisdiction.
• The possession, use, prescription for use, or distribution of controlled substances or legend drugs in any way other than for legitimate or therapeutic purposes, diversion of controlled substances or legend drugs, the violation of any drug law, or prescribing controlled substances for oneself.
• Violation of any state or federal statute or administrative rule regulating the profession.
• Failure to cooperate with a disciplinary authority.
• Failure to comply with orders issued by a disciplinary authority.
• Aiding or abetting unlicensed persons to practice.
• Violation of rules established by health agencies.
• Practice beyond the scope of practice as defined by law or rule.
• Misrepresentation or fraud in any aspect of the conduct of the business or profession.
• Failure to adequately supervise auxiliary staff to the extent the client's or patient's health or safety is at risk.
• Promotion for a personal gain of any unnecessary or inefficacious drug device, procedure, or service.
• Conviction of any gross misdemeanor or felony relating to the practice of a person's profession.
• Misuse of alcohol, controlled substances, or legend drugs.
• Fraudulent use or misuse of health certificates, shipping certificates, brand inspection certificate, or other blank forms used in practice.
• Perpetuating dilatory methods, including willful neglect or misrepresentation in the inspection of meat.
• Misrepresentation of services rendered.
• Failure to report any reportable diseases.
• Dispensing or giving to anyone live culture or attenuated live virus vaccine to be administered by a layman without providing instruction as to its administration and use and without prior written authorization by law or state veterinarian.
• Conviction of a charge of cruelty to animals.
• Failure to keep one's premises and equipment in a clean and sanitary condition.

13.4. UNPROFESSIONAL CONDUCT

EXAMPLES

• A practitioner must reapply for the veterinary renewal licensure, usually annually. In this case, the veterinarian was cited for a traffic violation that could have been a gross misdemeanor or a felony and was therefore concerned whether he will get his veterinary license renewed or not, even though there was not a third-party complaint to the licensing board. If the veterinarian had denied the driving citation, then he would have been guilty of misrepresentation in the application. If he admits the citation and it was a gross misdemeanor or a felony, then in some states he would not have been able to obtain a license renewal, at least without a special hearing before the license board.
• A client complains about the excessive surgery scar on the face of his poodle, even though it appears from the facts of the case to the licensing board that probably the complaint was precipitated from the client's surprise at the bill for lack of an estimate. Unprofessional conduct is claimed to get even with the veterinarian. The license board investigates and finds that the surgery and scar are within the standards of care; hence, unprofessional conduct was not found.
• A veterinarian does surgery late in the afternoon. The intestinal surgery for a foreign body turns out to be very complicated, with 27 intestinal perforations from swallowing dental floss. This resulted in four hours of surgery and a late recovery. The doctor believes the owner does not have any funds to take the pet to emergency care or to pay extra for an emergency technician to provide care in the hospital. The client was not given the opportunity to take the patient home or for euthanasia. The veterinarian is found guilty of unprofessional conduct and given a fine, plus required continuing education courses.

CAUTIONS

• Most cases brought before licensing boards that are not summarily dismissed will often include a finding of unprofessional conduct. This finding is what a licensing board finds in lieu of malpractice, when the behavior or omission by the veterinarian is within the practice arena.
• Malpractice is left to the civil courts for a client to sue for damages (see 13.3 – Malpractice).
• Unprofessional conduct is the catch-all finding for the behavior and/or malpractice of a veterinarian in the licensing board practice act or administrative code violations by a veterinarian.

MISCELLANEOUS

• Because nearly every nondismissed case before a licensing board results in a finding of unprofessional conduct for a breach of the practice act or administrative code in a given state, veterinarians must do a better job of communicating the case's prognosis, diagnosis, and risk, and to obtain informed consent from the client before proceeding with a case.
• Likewise, prevention of unprofessional conduct findings requires veterinarians to give adequate information, including financial estimates, to allow clients to adequately make an informed consent.
• Clients should not be surprised by successes or failures of treatment if adequate information was given to allow them to know the risk involved before beginning treatment.
• The documentation of all preventive measures taken must be recorded and maintained in the client's records.

13.5. Privacy Policy and Confidentiality

BASICS

OVERVIEW

Veterinarians and veterinary practices have an ethical and moral obligation to maintain client–patient confidentiality and privacy.[1,2] Additionally, veterinarians in 47 states are required by law to obtain client authorization before releasing their medical records.[3] Exceptions generally include disclosure due to a subpoena, court order, or during a disease outbreak.

Two distinct areas of confidentiality emerge:

1. the confidentiality of medical records, which contain diagnostic information, the diagnosis or presumptive diagnosis, and treatment information; and
2. the confidentiality of communications with the client.

Instances where unauthorized disclosure of client–patient information could occur include sharing records with other veterinary practices or laypersons such as groomers or boarding facilities, oral disclosure when working with another client or in private conversations, or during legal proceedings such as depositions, disclosure, or during trial.

TERMS DEFINED

Client Communications: Information shared between the client, the client's agents, and the veterinarian and veterinarian's agents in pursuit of a diagnosis, treatment, or prognosis. This information may be protected under state evidentiary privilege laws from disclosure during a legal proceeding.

Confidentiality: The duty of keeping secret or private information pertaining to a patient's health that was obtained during the formation of a diagnosis, treatment, or prognosis of the animal.

Health Information Portability and Protection Act of 1996 (HIPPA): A federal law that governs medical privacy and contains provisions for safeguarding medical information. HIPPA specifically defines protected health information as being geared towards individuals and, therefore, does not apply to veterinary medical information.

Privacy Policy: A written or legal statement that discloses how a practice uses or intends to use a client or customer's data. Generally pertains to nonmedical information such as name and demographic data, but may also include purchasing data, credit card information, data gathered online, and other potentially sensitive information.

ISSUES AND OPTIONS

PRIVILEGE

Disclosures during legal proceedings are governed by the concept of privilege. The law recognizes several distinct forms of privilege, including attorney–client privilege, physician–patient privilege, and marital privilege. Privilege in this sense means that the person testifying cannot reveal information that was communicated to them by the "holder" of the privilege. Generally, the "holder" of the information is the attorney's client, the physician's patient, or the other spouse in a marriage. Privilege ensures that information given to a person of trust cannot be used against them and encourages complete disclosure without fear of admission of the information in a legal proceeding.

A few states recognize veterinary–client privilege, including California, Colorado, Florida, Georgia, Illinois, Indiana, Kansas, Kentucky, Mississippi, Missouri, Nebraska, Oklahoma, and Texas.

Veterinary client–patient confidentiality exists to increase client candor and truthfulness when exchanging health information with a veterinarian. When a client knows that their information is protected and confidential they will more likely be open and transparent with information that is pertinent to the case. Secondly, the veterinarian may hold knowledge that could be very damaging to the client in terms of reputation or financial value of the patient or other animals owned by the client. The most telling examples of the financial implications are on farms, breeding facilities, and for other clients where the financial value of the animal is driven by health and disease-free status.

Despite the clear legal and ethical requirements, it is common practice for veterinary practices to exchange medical records, including medical history, diagnoses, treatment, and prognosis to other practices, laypersons, and other clients.

In most states, veterinary medical records are owned by the practice, not the client or veterinarian creating the medical record (see 9.1 – Medical Records and Patient Documentation). However, many states have a law or administrative rule that requires release subject to the client's request. Although the veterinary practice owns the medical record, the client's sensitive information contained within the record is protected. This dichotomy is confusing to many veterinarians and veterinary practice teams.

A veterinary practice should adopt a written policy regarding the importance of maintaining confidentiality for client and patient information. The policy should detail when and how medical records can be shared via fax, email, or orally.

The practice's state law concerning privacy and confidentiality of records should be consulted to determine whether written or verbal client consent should be obtained before sharing veterinary medical records.

In states requiring written consent, a consent form should be presented to the client, signed by them, and kept on record in compliance with state record retention laws.

Team members should be trained on when to obtain consent to release medical records and how to obtain the consent during sensitive situations.

Veterinarians and veterinary team members working with patients of value or breeding potential should be particularly sensitive to holding confidential information regarding health status, genetic issues, ability to perform, and infectious disease.

Social Media and Potential

The widespread use of social media presents additional challenges for veterinary practices. Photographs of patients, clients, and cases are regularly shared as part of marketing materials in veterinary practices (see 10.16 – Social Media). Practices should only share and disseminate photographs and other revealing information after express written consent from the client. Furthermore, even after written consent, care should be taken to keep confidential potentially damaging information about diagnosis, prognosis, and treatment.

Data and Internet Privacy

Data breaches of company customer information maintained in digital databases have become more prevalent, despite increased security and protection (see 10.8 – Cybersecurity and Network Security). Veterinary practices generally maintain databases of client names, addresses, and phone numbers, and potentially credit card, social security card, and date-of-birth information. Data hackers prey on small to medium-sized businesses, which include veterinary practices. Many veterinary practices do not maintain adequate security protection over digital databases, hardware, and other sensitive client, customer, employee, and practice information. A complete veterinary practice confidentially plan would include regular and robust audits of online and database security.

Web-based Privacy Policy

When consumers access a veterinary practice's website and other digital marketing platforms, data is invariably collected (see 10.13 – Websites). This data is subject to the posted privacy policy and terms and conditions of the practice's website. Privacy Policies should be

drafted in coordination with the actual use of the data collected by the practice. Terms and conditions should be paired with actual use of the website. For example, if a third-party vendor operates an online pharmacy via a portal in the practice's website, clients should be made aware that protecting information such as credit card numbers and shipping addresses is that of the third party. If the practice operates its own online store and assumes the responsibly and liability of confidentiality, then the privacy policy should reflect the actual usage.

In the event of a data breach, these policies and how they were presented to the consumer become very relevant in determining liability.

Prescription Drug Monitoring Databases

Forty-nine states currently operate a prescription drug monitoring program that applies to the practice of veterinary medicine, many of which gather opioid and other controlled-drug dispensing information. Other providers can then access the information to aid in determining an individual's propensity to abuse controlled substances and whether to dispense or prescribe further controlled drugs. Some states allow veterinarians and their staff to access the prescribing information of human clients before dispensing or prescribing. Human health information that contains controlled drug prescribing or dispensing information is protected health information and is governed under HIPPA. Before accessing or allowing a staff member to access the information, a veterinary practice should be trained on how to protect and keep protected health information confidential. Additionally, the information should not be accessed unless the practice is fully aware of the liabilities involved with mishandling protected health information.

EXAMPLES

Specific issues where client confidentially and privacy arise include:

- knowledge of a disease that is endemic to a herd;
- information that heritable traits are present or not present in breeding animals;
- knowledge of diagnosis, prognosis, or treatment in an individual animal;
- cases involving high-profile animals or clients;
- information about treatment during client divorce, separation, and custody proceedings;
- ownership information in cruelty, abuse, or negligence cases;
- evidentiary information in criminal cases involving animals;
- human health information, such as adverse condition or diagnosis that a client has not given express consent to disclose.

CAUTIONS

A veterinary practice should have written and distinct policies regarding:

- disclosure of medical records;
- confidentiality of client communications;
- confidentiality of patient–client information;
- data security and breach policy;
- website privacy policy, terms, and conditions;
- policy concerning human health information.

13.6. IDENTITY THEFT PREVENTION PROGRAMS

BASICS

OVERVIEW

With a worldwide increase of every-waking-moment use, unlimited trust, and in some cases total reliance upon technological advances in computers and electronics, identity theft has been reported to be the fastest growing crime in the world. There are constant, daily news reports in which millions of people and businesses (including major corporations such as Equifax, a multinational credit reporting agency) have been victimized – without very little, if any, legal recourse. Unknown thieves, for their own financial gain/profit, are stealing all types of private, uniquely identifiable information belonging to individuals and businesses. Bank and brokerage accounts have been emptied, life savings gone, credit scores plummeted, and in many cases tax return refunds are being mailed to/cashed by unknown third parties. Funds never get refunded, the theft never gets resolved, and the perpetrators are not held accountable for their crimes. So, in order to avoid being victimized, prevention from attack is the only solution.

As veterinary businesses increasingly depend upon electronic data and computer networks to conduct their daily operations, there is an increased potential, liability, and risk associated with privacy violations and stolen information – especially when data are improperly diverted, stolen, downloaded, or hacked, whether by an employee or by a stranger.

Veterinary practices, like other businesses, are generally required by law to take precautionary measures to secure and maintain confidentiality of various types of information – such as but not limited to employees' medical, health, and tax information – without providing access to (or by) the public and unauthorized individuals. Many states have enacted laws that require confidentiality of veterinary medical records in efforts to prevent release of an animal's owner's personal information being released to the general public.

Employers must be vigilant about use of security measures in order to avoid theft or fraudulent use of personally identifiable or confidential business information. Failure to do so could potentially result in a number of different problems for the business owner/employer, such as (1) significant financial losses, (2) theft of animals, (3) loss of drugs/controlled substances/inventory, or (4) inadvertently providing client's/employee's residential information which results in criminal acts committed by the thief/perpetrator.

TERMS DEFINED

Identify Theft: A third party's fraudulent taking and use of another person's or business's uniquely identifiable information (social security/employer identification number, copied signatures, credit card numbers and holder's name) for the third party's financial gain.

Malware: Any malicious software that enters your entire computer system – as easily as someone clicking on an e-mail link. The malicious software/virus has the ability to freeze up your networked-computer system, to erase all your data, to potentially infect the networked-computer system with a slow-acting "virus" that can systemically cause your entire computer network (both old and new computers) to malfunction or simply to copy all data being entered into your computer network operation.

Phishing: A phone and e-mail technique used by identity thieves attempting to gain victims' personal information by calling or sending fraudulent e-mail messages that seem to come from legitimate businesses.

Ransomware: A type of malware that blocks all access to computerized data until the business owner pays a substantial fee, upon demand, to the perpetrator. Unfortunately, no guarantee exists the data will be fully restored even if payment is made or that future malware attacks will not occur.

Red Flag Rules: A set of federal regulations that require certain businesses and organizations to develop and implement plans to keep client information secure in efforts to discourage identify theft.

ISSUES AND OPTIONS

ISSUES

- One person, in a matter of minutes, can assume the identities of several people or businesses anywhere in the world simply by obtaining a name, address, birthdate, tax identification, or only the credit card number of multiple victims. Identity thieves use this information, without the victim's permission or knowledge, to commit additional crimes, such as purchasing consumer goods, obtaining medical care and drugs, gaining access to bank accounts, filing fake tax returns for misdirected large refund checks, or committing employment fraud.
- Identity thieves are almost impossible to prosecute because they do not necessarily act within any particular country, and, as reported in

13.6. IDENTITY THEFT PREVENTION PROGRAMS

many cases, their own identities are usually hidden by fake names or behind an "electronic cloud" of false data. According to the Federal Trade Commission, which is known as America's consumer protection agency, every day some type of identity theft occurs to millions of people and businesses worldwide.

• Identity theft is a multiple-victim crime. Unfortunately, neither the victim nor the target (i.e., business, financial company, vendors) becomes aware of the theft until after the damage has occurred.

• Business identity theft is on the rise. Generally, individuals are not the only targets or perpetrators of identity theft. Businesses, as entities of their own, are at risk for loss of income due to identity theft. Business identity theft (also known as "corporate or commercial identity theft") is a relatively new development. A criminal will electronically hijack a business's identity and use that identity to establish lines of credit with banks or retailers. With these lines of credit, the identity thieves can purchase their own inventory of products for resale, such as commercial electronics, medical equipment, gift cards, and other items that can be bought and exchanged for cash or sold with quick, relative ease.

OPTIONS

Use sound practice management plans for reducing identity theft and minimizing the potential for any type of identity theft – through the drafting of clear policies for the workplace, with regular training of employees, and requiring constant vigilance by all employees, such as:

Detection of Red Flags

Make a list identifying the various warning signals that might trigger identity theft at your practice. For example, "red flags" might include the following:

• Someone who has "just moved to the neighborhood" and is unable to provide a government-issued photo identification (ID) or any ID with a current address, phone number, or other verifiable information).

• Someone who neither resembles his or her photo ID nor provides personal information that matches prior information collected (such as differing birthdates).

• Someone who usually pays in cash only, and then issues a check for a large purchase (surgery, drugs, food, etc.).

• Someone who provides a handwritten credit card number or number over the phone instead of the actual card. These are the most common ways that veterinary practices "lose money" for services rendered – fake identities of clients. No chance or little possibility of catching the thief/thieves.

Deter Identity Thieves

Businesses can take simple measures to safeguard and prevent the potential for disclosure of employees' and clients' personal information. Examples include:

• Discrete intake of information. Refrain from using "sign in" sheets showing listing of patient–client's names and/or other personal information. Turn computer monitors away from clients' viewing range or use privacy screens.

• Locked/password-protected/secure storage. Provide computer security measures that, at the very least, require constantly changing complex password reentry by limited individuals to access when computers are turned on. Always perform ongoing backup of data systems to an offsite location – preferably, the information should be encrypted. Ensure all employees' personal information and clients' paper files are kept in locked cabinets or locked storage area. Provide a secure area (i.e., keyed storage lockers) for employees' personal belongings.

• Limited keyed access with video surveillance system of the building, files, computers, and other areas containing personally identifiable information to deter criminals is advisable. Use changing complex security codes, made available only to certain employees, whenever possible.

• Have a clearly drafted policy prohibiting (or limited restrictions for) employees reading personal e-mail on business computers – or, at the very least, prohibit employees from clicking on any links within e-mail messages and opening email from unknown senders (two of the primary ways that hackers or malware gain access to internal databases).

Mandatory Security Training of Employees

Regularly train and update your employees on clinical security procedure protocols (see 10.8 – Cybersecurity and Network Security). Teach employees what information can, and cannot, be discussed over the phone or expressed on the Internet or sent by e-mail/fax to third parties. For example, train employees not to publicly display or give out telephone numbers of staff members "to contact in an emergency" nor leave clients' paper files unattended at the front desk (for someone to take a photo of a page with identifiable information) or by posting computer access codes in easily viewable location.

• Disposal of information. Instead of placing documents into the trash or getting rid of old computers by placing in outside bins or third-party electronics company, make sure to cross-cut shred all documents and physically remove/destroy the hard disk from old computers.

13.6. Identity Theft Prevention Programs

• Avoid accepting a client's credit card number for payment over the phone and avoid using stored credit card numbers for processing clients' medical service payments. Without the client's signature on a purchase receipt, the charges can always be disputed (even by good clients!) and left unpaid without much legal recourse (if any) by your business.
• Require government-issued photo ID with current address for credit card and check payments. Do not rely solely on credit cards with stamped photos on front of card or company ID cards – be wary of checks with different addresses than photo ID card.
• Consider using third-party check payment services (such as *VeriCheck* or *TeleCheck*), which provide immediate check payment processing – similar to credit cards – for your business operations.
• Use secure, encrypted and password-protected portals for transacting online business.
• Do not provide business tax number or business banking information to any caller, visitor, or online request (unless you have initiated the contact and have confirmed the requesting business or the person's identity through alternate means, such as telephone call to corporate headquarters/regional bank director/place of employment).

Defend Against Identity Theft

Communicate with clients about your clinic's payment procedures *prior to* providing veterinary services. Post notices at the front desk, tell new clients, or clearly print the policy upon intake forms. This enables the client an opportunity to inform staff about any potential concerns (such as not having any form of photo ID with them) *before* services are rendered. Various examples of notices might include the following:
• "Major credit cards accepted with government-issued photo ID in cardholder's name only."
• "We accept local banks' debit cards and checks only with photo ID (Sorry, no out-of-state bank checks or debit cards accepted)."
• "Cash or pre-printed addressed checks only. No credit cards accepted."

Phishing is a phone and e-mail technique used by identity thieves attempting to gain victims' personal information by calling or sending fraudulent e-mail messages that seem to come from legitimate businesses. The victim-recipient is informed by phone or through e-mail from the fake "phishing" organization that money orders, lottery winnings, or other items belonging to the victim are being held in efforts to trick the victim into giving up personal information such as address, bank account numbers, social security number/individual taxpayer identification number, birthdates, or passwords.

Warning. Some phishing e-mails include more than fraudulent information – they can also carry viruses, malware, or "Trojan horses." If you identify that an e-mail is "phishy," do not open it and definitely do not click on any links in the e-mail. Immediately and permanently delete the e-mail. Train employees not to use business computers for personal use – and not to click on any links from communications that are unsecured transmissions.

If identity theft is suspected. Immediately contact law enforcement and/or the client–victim as soon as possible to inform them of the suspicious activity. File reports with the police, the credit bureaus, your bank, and the applicable businesses or governmental agencies, as soon as possible, describing the identify theft red flags/warning signs.

By having an identity theft prevention program in place, your clients and employees can feel assured that you are taking steps to protect their personal information from being hacked, stolen, or misused for criminal purposes.

13.6. IDENTITY THEFT PREVENTION PROGRAMS

EXAMPLES

N/A

CAUTIONS

General disclaimer. The following is a generic overview of the subject matter for educational purposes only and not intended as legal advice. The following recommendations might not be applicable to all workplace situations. Consult with an employment lawyer in your area for advice and consultation about your business needs regarding this subject matter.

Small businesses are just as exposed to hacking as large corporation operations. Small businesses are more at risk of "losing everything" due to lower budgets to cover losses. Consider contacting insurance companies to see who provides the best protection/least cost for losses due to computer hacking or malware attacks.

Tip. If possible, perform daily backups of your computer system – and make sure backup data is not physically connected to the business computer's network (such as using one computer to back up all data; see 10.7 – Information Security: Backing up and Archiving Your System). Obtain an up-to-date virus protection program for your network – and update your system regularly (oftentimes, with "patches").

13.7. EMPLOYMENT CONTRACTS

BASICS

OVERVIEW

• When veterinarians are working for an employer such as an educational institution, corporate practice, or private practice, they are an employee because they had the offer of a job, they accepted it, and they were promised consideration or pay as a benefit for working there. These actions meet the requirements of a contract.
• In that situation, there is an employment agreement or contract, whether the employee is aware of the existence of a written document or not.
• Contract law principles determine whether it is an express or implied employment contract, whether an oral contract or a written contract, and the enforceability of either. The initial bullet point included the three traditional elements of contract formation: offer, acceptance, and consideration.

TERMS DEFINED

Acceptance of Employment Offer: Acceptance of an offer may be manifested by a promise or by performance. The promise to become an employee can be verbal, leading to an implied contract, or by performance, that of beginning work, or of course by signing the agreement of acceptance in an employment contract.
At-Will Employment: At-will employment means that the employee is serving the employer at the will of both parties. This allows an employer to terminate its employees with or without cause, without incurring liability for the resulting terminations. Likewise, the employee can terminate without cause or any fixed duration of time to stay on the job. Generally, employment contracts for a definite period of time are the most commonly recognized exception to an at-will employment rule. With an employment agreement for a definite term in effect, in writing for clarification, or because it goes longer than a year, then an employer can only terminate an employee for "good cause" or for "just cause," without costs unless the agreement specifies an "at-will agreement."
Consideration: In contract law, consideration is generally expressed in terms of a benefit to the promisor or a detriment to the promisee. In our most common scenario, a written employment contract, or at least a letter of intent similar to an employment contract, is where the employer provides the promise of consideration or monetary payment to the employee for the work performed. Then there is adequate consideration for enforcement of other terms of the contract.
Offer of Employment: An offer is "a manifestation of willingness to enter into a bargain, so made as to justify another person an understanding, his assent to that bargain is invited, and so he will conclude it." As stated, the existence of an offer is presumed where the employment agreement is expressed. Where an employment agreement is implied, the offer may be oral or derived from writing, such as a hiring letter or policy statement. The two main requirements for an offer to be enforceable are that it must be definite and it must be certain.

ISSUES AND OPTIONS

• The main issues employees face, when under an employment agreement, usually have to do with the terms of employment, the consideration offered and paid or not, and the duration of employment, along with a commonly included noncompete agreement that is covered elsewhere in this book (see 13.11 – Noncompetition).
• The terms of employment may be misunderstood, especially where an agreement is implied. An implied employment agreement may be oral or derived from writing, such as a hiring letter or a policy statement. The offer for the employment must be definite and certain. In that offer there should be many terms that are clarified by the parties and agreed upon before signing. That offer should identify the parties, plus include many of the following terms:
  ◦ A statement of mutuality indicating an agreement on the part of employer to employee and an agreement by the employee to perform the services.
  ◦ A duties clause defining the employee's duties and responsibilities.
  ◦ A statement of consideration, including the salary, fringe benefits, and other compensations.
  ◦ A term or duration clause.
  ◦ A provision defining events and contingencies, such as employer's disability that might trigger termination aside from the expiration of the contract.
  ◦ A statement defining the employment relationship as terminable "at will," or alternatively limiting the employer's right to terminate the employee for cause.
• Employees may have to rely on terms of a "letter of intent," where official contracts are not signed by both parties, which is particularly more common in large organizations.
• There should be statements explaining ownership of employee inventions and other valuable intellectual property generated by the employee, in the scope of employment.
• Restrictive covenants prohibiting an employee's right to compete with the employer for a specified period of time, following the termination or limiting the employee's rights to divulge or use employer's trade secrets or other confidential business information.
• Restrictions against the solicitation of employer's work force or customers after an employee is terminated.
• Mandatory mediation or arbitration or a combination of both as a vehicle for dispute resolution.
• The law or venue governing interpretations and enforcement.
• Circumstances and notice of any amendment or modification.
• Remedies available for breach, which may include an obligation to pay attorneys' fees.

MORE SPECIFIC DETAILS

In the duties clause previously mentioned, there should definitely be a definition of the employee's duties and responsibilities while allowing the company to change those duties and responsibilities as required. The duties clause may also limit the employee's ability to work in other jobs outside the scope of the primary employment; if some outside employment is allowed, there may be a requirement to avoid conflicts of interest.

TERM OR DURATION CLAUSE

When an employee has a specific term in the contract, most courts interpret that to mean that the contract may not be terminated without "good cause" or "just cause," unless the agreement provides otherwise. Of course, the contract would then enumerate many, even if not all, examples of good cause or just cause for that particular contract. When the term of the contract or employment agreement exceeds one year, the agreement must be in writing to satisfy the Statute of Frauds. Even though this is the standard rule that a contract greater than a year, or that cannot be completed within a year, is unenforceable due to the Statute of Frauds, many courts will enforce them depending on the facts of the case.

It is very important in the term of duration section of the contract that there should be a detail as to whether the contract is renewable automatically at the expiration of the contract term and, if so, the terms of any renewal, whether it is another year or it is month to

month. If this is not specified, the courts may interpret it to be a repeat of another same duration term with the same details as the original contract. If these continuation terms are not specified, the agreement may alternatively have a renewal option and the procedure to exercise that option.

"AT-WILL" EMPLOYMENT PROVISIONS

As previously mentioned, employment contracts that do not speak to this provision are usually interpreted to mean the employee is not an "at-will" employee. Therefore, they can only be terminated with cause, whether "good cause" or "just cause," depending on the definitions of the agreement. Therefore, it is imperative, when an agreement is made for a specified term to avoid implication of a "for cause" termination, it must be stated which way this agreement is to be interpreted.

EXAMPLES

The following are a few examples of termination for cause, irrespective of whether we should define them as "good cause" or "just cause":

- Unsatisfactory job performance.
- Gross negligence or malfeasance in the performance of duties.
- Material breaches of the agreement.
- Breaches of the executive's duty of loyalty.
- Conviction of a felony or of a lesser crime involving an act of dishonesty.
- Acts of fraud, misrepresentation, theft, or embezzlement, or the misappropriation of corporate assets.
- Cessation of employer's business due to unprofitability, casualty loss, or other specified reasons.
- Changes in business ownership, including sale of the business, merger or consolidation, or a work force reduction based on reorganization.
- The death or disability of the executive.

If these termination provisions are listed, there should also be a statement that says, when these cause terminations to happen, the employer's obligations under the agreement end immediately, including payment of salary and benefits, but it does not extinguish the employee's obligation under any restrictive covenants contained in the agreement.

CAUTIONS

- It may seem like a minor issue, but with more employees being in different jurisdictions than the employers, it is very important that the agreement includes a choice of law designation stating the jurisdiction where disputes might be settled.
- Also, there should be an arbitration or, from the author's perspective, preferably a mediation clause that then could move to arbitration if the dispute is not settled by mediation.
- There should be an attorney's fees statement that clarifies that, when disputes arise, the prevailing party shall be allowed to obtain attorney's fees from the nonprevailing party.
- There should be a statement allowing for revisions or amendments, but requiring that they must be in writing to be enforceable.
- There should be a severability clause. This allows for parts of the contract to be thrown out by a judge without voiding the whole contract in a dispute situation.
- There is always a statement explaining that the terms of this written agreement are the entire agreement, which then can avoid presumptions of other factors in determining the terms of this employment relationship.

13.8. Partnership Agreements

BASICS

OVERVIEW

- A partnership is a legal relationship created by a contract among individual owners of a business.
- Partnership agreements are essential to define the relationship among two or more veterinarians associating to practice together as a partnership, and between the partners and the partnership.
- Disputes between partners in a veterinary practice result from misunderstanding of the relationship with each other and with the partnership.
- Numerous areas of the relationship, from compensation to expectations, should be agreed to in writing as the basis for a successful partnership.
- Determination of triggering events and agreement for the purchase and sale of partnership interests are critical for a smooth transition of exiting and entering partners based upon certain future events.
- The Uniform Partnership Act (1997; last amended 2013)[1] governs the relations among the partners and between the partners and the partnership in most states to the extent the relationship is not covered by the partnership agreement.

TERMS DEFINED

Partner: A person who has joined together with one or more persons to carry on a partnership.
Partnership: An association of two or more persons to carry on as co-owners of a business for profit.
Partnership Agreement: The agreement, whether written, oral, or implied, among the partners concerning the partnership, including amendments to the partnership agreement.
Partnership-at-Will: Partnership in which the partners have not agreed to remain partners until the expiration of a definite term or the completion of a particular undertaking; in other words, to practice as partners for an indefinite term until one or all of the partners elect to leave or dissolve the partnership.
Partnership Interest: All of a partner's interest in the partnership, including the partner's transferable interest and all management and other rights.
Property: All property owned and used in the operation of the partnership, including real estate, personal property, and tangible and/or intangible property.

ISSUES AND OPTIONS

PREPARATION OF THE PARTNERSHIP AGREEMENT

- An oral partnership agreement will rely primarily on the memory and good faith of each partner. The risk of problems developing among the partners and/or between a partner and the partnership is high.
- Partnership agreements should be in writing and should be prepared by an attorney after consultation with all of the prospective partners. The attorney should be chosen to represent the partnership, not any individual partner's interests.
- The partnership agreement should be completed and signed by all partners in advance of the partnership commencing operation of the veterinary practice. Once the veterinary practice begins, one or more of the partners may be less motivated to complete the agreement.

TERMS OF A PARTNERSHIP AGREEMENT

- The identity of each veterinarian partner.
- Name of the veterinary partnership and location of the veterinary practice.
- The purpose of the partnership should be described.
- The term of the partnership needs to be set forth, whether it is for a specific period of time or will be a partnership-at-will.
- The nature and amount of the contributions (cash or property) to the partnership by each partner should be set forth, including initial contributions as well as how future contributions will be made.
- The interest of each partner and the profits, losses, and liabilities of the partnership should be defined, as well as how distributions of profit will be made to the partners.
- The ownership of property to be used in the veterinary practice should be identified.
- Financial issues, including who will maintain the books and records of the partnership and where they will be kept, a determination of the tax year of the partnership, and what bank accounts the partnership will need.
- The acquisition and maintenance of insurance for the partnership to cover general liability and property damage as well as professional negligence should be agreed upon, including the source and manner of payment of premiums.
- Management of the veterinary partnership will be one of the most critical points contained in the agreement. Duties of each partner need to be set forth, as well as the designation of which partner or partners will assume the management responsibilities and how those partners will be selected. The authority and responsibility need to be clear, particularly regarding any restrictions on the authority of the individual partners and the managing partners.
- Partners must agree on the manner in which the partnership can act, as well as the frequency and conduct of partnership meetings. It is important to determine how and when action can be taken without a meeting.
- It would be wise to set forth in the partnership agreement the rights of each partner and the partnership in the event a partner is called to active military service.
- Triggering events for transfer of partnership interests must be defined, such as death, disability, and voluntary withdrawal or expulsion of a partner.
- Provisions should be made for maintenance of past veterinary medical files created by a withdrawing partner while a partner in the veterinary practice.
- A withdrawing partner should be given rights to have access to and copy veterinary medical files in the event of a veterinary medical negligence claim against the withdrawn partner.
- A withdrawing partner should be obligated to cooperate with the other partners and the partnership regarding any claims or issues involving the partnership during the period of time the withdrawn partner practiced veterinary medicine in the partnership.
- How the partnership will deal with a breach of the partnership agreement by a partner must be detailed.
- Restrictions on the transfer of the partnership interests is important to ensure any new partner is qualified and compatible with the other partners.
- Consent of the remaining partners should be required before the transfer of a partnership interest.
- The goodwill and client base of the veterinary practice should be protected through a covenant not to compete in the partnership agreement.
- Do not get "greedy" and overreach by including unreasonable limitations on the ability to practice in a covenant not to compete.
- The restriction on competition must be reasonable as to the length of time as well as the geographical area of practice.
- A larger area may be restricted with a rural practice, but in a metropolitan area, the area of noncompetition may be measured in city blocks rather than miles.
- A partner may be restricted from competing with the veterinary practice for up to three to five years (see 13.11 – Noncompetition).

• The more reasonable the restriction on the withdrawing partner competing, the more likely a court will uphold the restriction.
• An agreement as to how the value of a partnership interest will be determined is necessary. The procedure for selection of appraisers, the method of calculation of value, and the terms of purchase of a partnership interest are essential parts of the partnership agreement.
• The partnership agreement should be amended only by a written amendment signed by all partners. Any new partner joining the partnership after the initial partnership agreement is signed should sign the agreement with clear language to indicate an intent to be bound by all provisions of the original partnership agreement.
• Future events that would cause the partnership to be terminated and dissolved should be identified and the procedure set forth to accomplish termination and dissolution.
• The manner and method of notice to each partner should be set forth.
• Identification of which state's law controls the construction of the partnership agreement in the event of any dispute.
• If not preempted by the express language of the partnership agreement, the Uniform Partnership Act (1997; last amended 2013)[1] will control the relationship among the partners and the conduct of the partnership.

EXAMPLES

N/A

CAUTIONS

• Most states do not allow a veterinarian to limit his or her professional liability; therefore, insurance protecting the partnership against professional negligence is an absolute must.
• Veterinarians can limit their exposure to other third-party liabilities if they practice in a corporation or a limited liability company.
• A general partnership provides no limitation of liability to the individual partners to third parties.
• A strong written partnership agreement can enhance the probability of success of the partnership veterinary practice, but it can never replace the good faith and fair dealing, which must be expected of all the partners.

MISCELLANEOUS

• Individual veterinarians should select partners carefully and should choose other veterinarians as partners who have similar work ethics and business philosophy.
• Before deciding to engage in the practice of veterinary medicine as a general partnership, the prospective partners should consult with an attorney well versed in the selection and creation of business entities, a certified public accountant, and an insurance broker to determine which form of business entity would be most appropriate for these particular veterinarians and the type and location of the practice.
• All profits and losses of partners in a general partnership are passed through to each partner in direct proportion to their partnership interest, which is then reported on the individual partner's personal income tax return. This generally is a favorable method of taxation, which can also be similarly advantageous through practicing in a limited liability company or a corporation by electing Subchapter S status.
• General partnerships are becoming less common as a veterinary practice entity than professional corporations and limited liability companies.

13.9. Buy/Sell Agreements

BASICS

OVERVIEW

Every business affiliation between owners must always provide for the escape or for one's getting out, as an issue that is equal to or more important than getting in. The document that plans for that is the buy/sell agreement. This document may be incorporated into other organizational agreements, but most commonly stands alone. The key is not what it is called or where it is located, but rather that the terms have been negotiated to agreement by all stakeholders.

This agreement should be a requirement in any form of business ownership, but it is more commonly included in corporation or limited liability company (LLC) arrangements.

- It is a separate document for the corporation.
- It may be a separate document in an LLC, or its terms may be included in the operating agreement.
- It is a binding contract for shareholders.
- It is vital to perpetual survival of a closely held corporation or LLC.
- Its purpose is to spell out definitively the shift of shareholder ownership upon the happening of certain stated events.
- Likewise, the family of a deceased shareholder has a built-in market for the stock of the decedent.
- If owners agree that nonemployed persons should not be shareholders, then this agreement provides for retirement income to exiting shareholders.
- A buy/sell agreement is also known as a cross-purchase agreement if it provides for other shareholders to purchase the stock.
- A buy/sell agreement is also known as a redemption agreement if the business entity is to be the stock purchaser.

TERMS DEFINED

Binding Contract: Document binding on all shareholders or owners of a given business, even though it may seem there is not separate consideration for this document. The consideration for signing this agreement is the mutual benefit that all parties get when they become the one party that wants to exit ownership.

Built-in Market: Because of this agreement, the family of a decedent is able to sell the share of the decedent, even if the shares are a minority interest, without having to go to the public to find an interested minority buyer.

Business Affiliation Escape: Provisions of a buy/sell agreement between associated business owners allowing for one or more shareholders to leave ownership for various reasons, including death.

Buy/Sell Agreement: Agreement between stockholders explaining methods for valuing the shares and methods for selling and buying shares by other stakeholders.

Business Ownership: Act of a person having an equity or capitalized interest in the goodwill and tangible assets of a business. It does not include associate employees.

Cross-Purchase Agreement: Another name for a buy/sell agreement where other shareholders individually buy out an exiting shareholder of the business.

Option to Purchase: The rights given to surviving or remaining shareholders allowing them the chance to purchase available shares before they can be sold to any other third party.

Perpetual Survival: Businesses, if successful and profitable, need perpetual or uninterrupted existence, whether one or more shareholders desire to leave or not.

Redemption Agreement: Another name for the buy/sell agreement where the business entity or corporation is buying the shares of an exiting owner.

Right of First Refusal: The rights given to surviving or remaining shareholders allowing them to meet or match a third party's offer to purchase available shares of a business, within a prescribed specific amount of time.

Separate Document: The buy/sell agreement in a closely held corporation is usually a standalone document and should not be part of the bylaws of the corporation. The buy/sell agreement may be called a shareholder agreement or incorporated into a shareholder agreement.

Shareholder Agreement: Another name for a separate document that may include the terms of the buy/sell agreement that details the ability of one of the owners to buy more, or sell some, of the shares of ownership of a business. It also may include many other items about the business operations and/or shareholder working agreements and schedules.

Stakeholder: Person holding some amount of ownership interest in a business, or at least this person is a representative of a shareholder.

ISSUES AND OPTIONS

Other than the specific terms to follow, of happenings or circumstance changes in the life of a shareholder that trigger this agreement, the major issue is how the buyout purchase price will be determined and how the payments will be made. Also, the priority of surviving ownership rights must be included.

- There must be definitiveness on whether a purchase should be mandatory or optional for the remaining shareholders.
- This agreement includes the terms of payments and the method of funding the future obligation of the organization or the remaining shareholders. This may include that certain buyouts may be covered by insurance purchased by the business.
- The agreement must include (at minimum) the seven following life events, of which any one can be a trigger for this agreement to be used. The seven triggering events include an owner's death, disability, retirement, bankruptcy (of any party or the business), marriage, divorce, or simply a shareholder desiring to get out whether a friendly or an adversarial relationship exists.
- There must be a decision on the kind of restrictions, if any, on transferability of shares. These restrictions vary from a requirement that only the business can purchase an exiting shareholding interest to alternately only giving surviving shareholders an option to purchase available shares or to only allow surviving shareholders the right of first refusal to purchase available shares.
- There must be a clear explanation of whether the buyout is to be by way of a cross-purchase agreement or by way of a stock redemption event.
- There is risk in a stock redemption buyout in that the purchase may be deemed a dividend distribution to the seller, thus creating the risk of loss of a capital gains tax basis.
- There must be a fixing of the value of the stock through the stock purchase agreement, or at least there must be a complete explanation of the methodology of business valuation to fix the estate tax value of the stock.

CALCULATIONS

Using the pre-agreed valuation formula or methodology decided by the shareholders in the buy/sell agreement to value the stock, the business valuation must be implemented at the time of the departure or exit or death of one shareholder. The calculations must provide for meeting the agreement's methods, and it must be determined if there is a requirement by other shareholders to give consent for the sale or redemption along with the payment methods and terms after the price has been determined.

- In calculating the payments, if made by installments, there is an issue as to whether the stock of the estate and/or of the surviving owners shall be pledged as security.

• Other security may also be given for the unpaid portion of the purchase price paid by surviving shareholders. Along with security, voting rights must be decided for stock held as collateral.
• If the parties agree that nonemployees of the corporation cannot be shareholders, then while the time payment buyout is happening, there may be voting restrictions placed on the decedent's estate or on the shares to be obtained by the surviving shareholder time purchasers.
• The agreement should declare whether the purchase price includes the value of goodwill, or do the shareholders agree to allow the stock to be transferred based on tangible assets or book value only.
• An important consideration is whether or not the surviving shareholders are required to purchase or whether they should just have the first right of refusal to purchase an exiting shareholder's stock. This decreases the pressure, especially on a young or new shareholder with less profit from the business, when there is an early exiting shareholder.
• If surviving shareholders only have the right of first refusal, then the burden to sell is placed on the seller to find the third-party offer to purchase, rather than on the surviving shareholders to immediately come up with a cash offer.

EXAMPLES

• Two shareholders own a veterinary practice. One is a local resident and the other is a relatively young practitioner from out of town, buying in. The young practitioner's parents become drastically ill across the country, and the young practitioner must go back home, out of the area, and can no longer work in the practice. The agreement will allow for the departing shareholder to at least get a commitment to be paid by the surviving shareholder or the corporation upon the unexpected, sudden departure.
• If the senior practice owner decides to sell a minority interest to more junior veterinarians, and the junior veterinarians are buying the stock on time, then agreements can be made in the buy/sell document to use stock as security, but to limit the voting rights so that the primary senior shareholder remains in control until the newer shareholders have finished paying for their stock.
• When there is an owner veterinarian who dies unexpectedly and the veterinarian's family and spouse now have an estate, including the ownership interest, but the shareholder buy/sell agreement specifies that there would not be stock ownership without employment, or even if the state law also prohibits nonveterinary owners, then the estate has hereby a fixed methodology for stock valuation and a planned methodology of payment receipts, either from the corporation or the surviving shareholders as they pay the estate.

CAUTIONS

N/A

MISCELLANEOUS

• Buy/sell agreements, whether cross-purchase agreements or redemption agreements, are mandatory for any multiple-owner veterinary hospital.
• Every buy/sell agreement must include provisions for stock sale on the death of a shareholder, the disability of a shareholder, the retirement of a shareholder (at least on the following conditions of a shareholder: bankruptcy, marriage, divorce, or simply the want-out, get-out, buy-out individual).
• Buy/sell agreements, as previously described, are discussed from a corporate perspective. They can and should apply to every form of multi-owner entity, including partnership, but the terms may be incorporated into the partnership agreement rather than having a separate document.
• Similarly, the terms required for this important document may be included in the operating agreement of an LLC.
• The most important point of this whole topic is that there should never be multiple owners in a business without a plan to allow exit from ownership by one or more owners without the event resulting in an adversarial relationship.

13.10. EMPLOYEES VERSUS INDEPENDENT CONTRACTORS

BASICS

OVERVIEW

Classifying an employee is a complex issue that involves laws, rules, court cases, and state and federal regulations.

Businesses must pay payroll taxes and provide worker's compensation insurance coverage for employees. Businesses are not required to withhold and pay these taxes on workers that are independent contractors. Taxes and insurances can account for over 30% of a business's total labor costs. Additionally, liability from negligence actions and labor laws is increased if workers are employees, but not independent contractors. Therefore, a large incentive exists for practices to classify workers as independent contractors and not as employees.

The quintessential contractor is temporarily hired for a job or task, uses their own tools and equipment, determines their own schedule, takes their own investment and risks, and has complete control over how the task is completed. An example would be a construction worker hired to build an addition to the practice. Stated another way, contractors own their own businesses, which are independent of the practice.

In a classic employer–employee relationship, the employer sets the schedule, gives instructions and training, provides tools and equipment, provides the investment, and takes the risks associated with the work. An example would be a veterinary technician/nurse that works defined shifts in an urgent care practice using all of the practice's equipment. Stated another way, the employee is part of the business of the employer in terms of control and economic unit.

In reality, a continuum exists from these two extremes of classic contractor to classic employee, with much gray area for each individual situation.

Both parties to independent contractor relationships should seek the advice of labor attorneys or accountants who are knowledgeable about federal and state laws and agency rules.

Form SS-8 can be submitted to the Internal Revenue Service (IRS) for formal determination of worker status for purposes of federal employment taxes and income tax withholding, but employers may use the form as a "self-audit" to avoid misclassification.[1] None of the factors are fully dispositive of classification, but collectively influence the determination, and each factor should be considered when classifying workers in practices.

TERMS DEFINED

1099-MISC Form: The form a company issues to its independent contractors, citing all monies paid to the individual on an untaxed basis. It is then the responsibility of the independent contractor to file and pay all appropriate federal, state, and local taxes. Practices that pay independent contractors $600 or more in a year must file a 1099-MISC with the IRS and provide a copy to the recipient of the payment.

Employees: Workers hired by practice owners to perform specified job tasks during delineated time periods, subject to the authority and control of their employers.

Independent Contractors: Workers who are contracted by veterinary practice owners to perform certain jobs for the practice.

Payroll Taxes: Taxes that are paid by employees and employers. During payroll periods, the employer pays one half of the taxes and withholds the employee's one half and submits payments to the state and federal government. These taxes are comprised of social security and Medicare taxes, which are mandated by the Federal Insurance Contributions Act and unemployment taxes, which are mandated by the Federal Unemployment Tax Act and state counterparts.

ISSUES AND OPTIONS

THE INDEPENDENT CONTRACTOR

- True independent contractors have flexibility when practicing veterinary medicine or serving as relief veterinary technicians, because they are in control of their behavior and finances.
- They establish the fees for their time and maintain their own work schedules.
- They can deduct ordinary and necessary business expenses, such as home office expenses, travel, licensure, continuing education, Internet service, and phone plans.
- They can establish and maintain retirement plans and choose the types and numbers of practices for which they work.
- Contractors may lose money because they bear financial risk. Also, their income may vary from job to job, month to month, and year to year.
- They must pay business taxes, expenses, and their own benefits.
- To provide for vacations and sick leave, cover the costs of health insurance and continuing education, and pay association dues, liability insurance, and licensing fees, contractors need to add another 10–12% to the daily amount they receive for their efforts.
- To compare net income with employees, independent contractors must charge fees that are 25–32% higher than the salaries received by similarly positioned employees due to taxes and benefits.

THE VETERINARY PRACTICE

- Veterinary practices can benefit financially by using independent contractors because practices do not pay any federal or state income, payroll taxes, or worker's compensation on money paid to independent contractors.
- They simply generate an IRS 1099 form at the end of the tax year and submit to the independent contractor.
- Practices are able to contract with independent contractors for short time periods with minimal tax filing requirements.
- Except in unusual circumstances, practice owners are not liable for damages to third parties caused by the actions of independent contractors.
- Mistakenly classifying employees as independent contractors can result in disciplinary actions taken against employers by taxing agencies, including forced payment of back taxes plus interest and penalties.
- Veterinary practices cannot direct, supervise, or instruct independent contractors as to how they are to complete their work.
- They can establish standard fees for their veterinary practices; however, they cannot require that their independent contractors comply with such fee schedules.

THE IRS'S FACTORS FOR MAKING THE DETERMINATION BETWEEN INDEPENDENT CONTRACTOR OR EMPLOYEE

The three major groups of factors that will be examined in an audit are, behavioral control, financial control, and the type of relationship.

Behavioral Control

The more restrictions that the practice puts on the worker for time, assignment of tasks, and how to complete the tasks, the more likely the worker will be classified as an employee. The behavioral control test is the most important of the areas of factors.

- To determine behavioral control, questions will be asked such as:
  - What specific training and/or instructions is the worker given?
  - Who determines the methods, orders, or sequence by which the assignments are given?
  - At what location does the worker perform the services?

- Is the worker required to perform the work personally, or could they subcontract the work?
- Who hires and pays helpers or substitutes?

Financial Control

The more risk of loss that the worker carries, the more likely they will be classified as having their own business as an independent contractor. If the worker is paid hourly or by salary, they are more likely to be an employee. If they are paid by the job or project, an independent contractor classification is more likely.

- To determine behavioral control, questions will be asked such as:
  - What supplies, equipment, materials, and property are provided by each party?
  - What expenses are incurred by the worker in the performance of services for the firm?
  - How is the worker paid? By salary, hourly, commission, by project, or lump sum?
  - Who does the customer pay?
  - Can the worker realize a profit or loss?

Type of Relationship

The way that the practice and the worker intend their relationship has some bearing on the classification, but a simple title cannot overcome the function of the relationship.

- Questions that will be asked to determine the perceived relationship include:
  - Are benefits such as paid vacations, sick pay, paid holidays, pensions, insurance, or bonuses available to the worker?
  - Is the worker exclusive to the practice or do they work for other businesses?
  - Is the relationship permanent or indefinite, or is it period or project based?
  - Are the services performed a key aspect of the business, or are they peripheral to the core service offerings?
- If the parties can show that they have a "reasonable basis" for classifying a worker that later is found to be an incorrect classification, they can limit fines, taxes, and penalties. To pass the reasonable basis test, they must show a good-faith effort to comply with the law.

INDEPENDENT CONTRACTOR CONTRACTS

Independent contractor contracts evince the intent of both parties to create an independent contractor relationship.

An independent contractor contract should provide clear understanding of responsibilities, control, financial, liability, and risks to be borne by both parties.

EXAMPLES

COMMON SCENARIOS IN VETERINARY MEDICINE THAT WOULD LIKELY FAIL THE INDEPENDENT CONTRACTOR CLASSIFICATION

- General practitioners who work the same hours or days of the week and use the staff, fee schedules, and billing procedures of the practice owners, even if they work for more than one practice.
- General practitioners or veterinary technicians who work specified shifts at emergency clinics on a part-time but consistent basis over a period of several months or more.
- General practitioners or technicians who work as employees in one practice and fill in occasionally for a few days at a time at only one other practice.

VETERINARIANS AND TECHNICIANS WHO PROBABLY CAN MEET THE INDEPENDENT CONTRACTOR CRITERIA

- Specialists who work as mobile surgeons, ultrasonographers, endoscopists, internists, general practitioners, and consultants for practices, who complete specific procedures, consultations, or limited engagements and transfer the post-visit care to the veterinary practice.
- Veterinarians who work short periods of time at multiple veterinary practices as "relief veterinarians."
- Technicians that perform similar specialist or short-term relief services.

CAUTIONS

LIABILITY FOR ACTIONS OF INDEPENDENT CONTRACTORS VERSUS EMPLOYEES

- Employers are liable to third parties or their animal patients injured by the negligent acts of their employees.
- Veterinary practices generally are not liable for injuries suffered by third parties injured as a result of the negligence of their independent contractors. This is one of the risks inherent in providing services as an independent contractor and why such parties must have good insurance.
- Contractors can become liable for injuries caused or incurred by their actions under the extensive list of circumstances set forth in chapter 10 of Wilson et al.[2]
- If misclassified independent contractors fail to file their own income taxes, employers who have not filed payroll taxes on them may have to pay all past-due employment taxes plus interest and penalty charges.
- Veterinary practices and independent contractors should periodically reevaluate their working relationships to ensure that they in compliance with federal and state laws.
- Misclassification of employees as independent contractors, without a reasonable basis, can result in significant tax liability, fines, and jail time.[3]

13.11. NONCOMPETITION

BASICS

OVERVIEW

• Noncompetition, in the form of noncompete clauses in employment agreements, or a covenant not to compete (CNC), or restrictive covenants, refers to specific legal terms used in contract law.
• Typical noncompete clauses attempt to prevent employees of the practice from participating in competitive businesses within a given distance of the practice and for a defined period of time after leaving the practice.
• Ordinary business competition is to be encouraged, and noncompetition is likely to only be enforced to prohibit activities that unfairly take business from a practice.
• Most US states recognize and enforce noncompete agreements, with a few notable exceptions. In most other countries, CNCs are allowable if the employer can document a reasonable business interest.
• Noncompetition clauses are just the most common types of restrictive covenants, but there are many others, including those in which employees agree not to solicit or accept business from the employer's existing customers, not to solicit or hire the employer's existing customers or staff, and agreements not to disclose confidential information.

TERMS DEFINED

Consideration: A legal term in which something of value is exchanged for a tangible benefit, such as a potential employee willingly signing a noncompete agreement in exchange for employment, compensation, and perhaps even additional remuneration.
Noncompetition: A noncompete agreement is a promise by an employee not to compete with his or her employer for a specified time and within a specified geographic region.
Restrictive Covenant: Any type of agreement that requires an individual to take or abstain from a specific action.
Trade Area: Also known as a catchment area, this is the geographic area around a business wherein you are most likely to acquire the majority of customers. The *majority* of customers are generally defined as 80% of the total customer base.

ISSUES AND OPTIONS

• The issue of noncompetition is most commonly encountered in employment contracts (see 13.7 – Employment Contracts), partnership agreements (see 13.8 – Partnership Agreements), and buy/sell agreements (see 13.9 – Buy/Sell Agreements). An agreement not to compete may be one of many covenants in an employment contract or a partnership or shareholder buy/sell agreement, or it may be written as a separate document as part of a purchase agreement for the sale of a practice.[1]
• Noncompete clauses are common in today's employment contracts, and may be present in about 90% of such contracts.[2]
• The purpose of the clause or covenant is to protect the practice after an employee has resigned or been terminated, and serves to stop that employee from competing unfairly against the practice with knowledge of certain confidential information, such as client lists, marketing plans, business contacts, or business practices.
• For most CNCs there is a contractual agreement that the employee will not compete against the practice after leaving, in a defined geographic area and for a defined period of time.
• As a contract provision, the noncompete clause is bound by regular contract requirements, which include the consideration doctrine – the agreement that the right to compete is being surrendered in exchange for a benefit (such as the offer of employment and compensation).
• The appropriate area and duration will vary depending on the type of practice and the setting. In most urban and suburban areas, there might be a CNC in the practice's predetermined trade area, the region from which it draws most of its clients (see 1.4 – Veterinary Trade Areas).
• CNCs are unlikely to be enforced by courts if the area is deemed unreasonable (e.g., within 120 miles/200 km) for a primary-care practice, or for an unreasonable time period (e.g., five years).
• A covenant that restricts the veterinarian from practicing in areas where the practice did not derive clients is likely to be regarded as an unfair restraint of trade because it negatively impacts the employee from practicing in an area from which the original practice did not have a significant presence.
• If a departing veterinarian violates a CNC, court action can be sought to enforce the covenant and order the veterinarian to stop the prohibited practice and pay for the damages she or he has wrongly caused.[1] However, such actions are not a foregone conclusion just because a CNC is in place, and courts may not choose to enforce such a covenant if they believe that it is restricting an individual's ability to work, and if there is public benefit associated with such competition. Individual jurisdictions may ultimately determine whether they will enforce such covenants.
• In deciding whether to enforce a CNC, courts are likely to evaluate the reasonableness of the covenant, including the actual activities prohibited, the geographic extent of the limitation, the time for which competition is prohibited, and the consideration given as part of the original agreement and covenant.
• Typically, the employer has the burden of proof regarding any CNC.
• Despite the issues involved in securing an enforceable CNC, the benefits outweigh the burdens because, without a CNC, a departing veterinarian, whether employee or seller, is free to engage in a competing practice.[1]
• Even without a CNC, employees are not allowed to take trade secrets, including client lists, but the extent of the impropriety may still need to be settled in court.

NONCOMPETITION CLAUSES IN EMPLOYMENT CONTRACTS

• Not all states enforce a CNC in an employment contract.[1] Still, without a covenant in place, there is little protection for the employer should an employee choose to leave and directly compete with that practice.
• Given all the concerns about the enforceability of noncompete agreements, one might wonder why they are included in so many contracts. Their inclusion seems to suggest a legitimate purpose when fairly negotiated.
• Noncompete clauses can be fairly negotiated. Employees are hired and compensated, and it should be expected that in exchange for these considerations that they should not harm the practice by directly competing with it by breaking covenants that were fairly negotiated prior to employment.
• Noncompete clauses, and the contracts in which they are contained, can be covered in plain language and really do not need to be obscured by "legalese" or require an attorney to decipher them. Both parties benefit if the intent is clearly communicated and accepted.
• To be considered fair and reasonable, noncompete clauses are best negotiated as part of initial contract discussions, in which the restricted time frame is not excessive (six months to two years is common), and the restricted area is defensible (the practice's existing trade/catchment area). The scope of activity restricted is typically that of the duties for which the veterinarian was hired for the practice; it would be unreasonable to restrict the individual from unrelated duties. For most primary-care veterinary practices, the trade area, the area from which most clients are derived, is typically a 10-minute drive time; for

specialty practices, that might be a 45-minute drive time (see 1.4 – Veterinary Trade Areas). If necessary, the trade area can be documented by creating a graphical representation of the existing client base, which can substantiate the legitimacy of the trade area claimed.
- It is more likely that courts will enforce noncompetition agreements (if they are allowed in the jurisdiction) if the employer can prove a legitimate business interest to protect, the restriction to the employee's right to compete is not excessive, and that the employee received adequate value in exchange for the restriction.
- In general, the CNC should be supported by appropriate consideration, which is the benefit to the veterinarian whose future options will be restricted. In some cases, in addition to the offer of employment, a separate amount of money is offered in exchange for agreeing not to compete. In buy/sell agreements, for the seller not to directly compete with the buyer, the sale typically includes the goodwill of the business and the seller should receive sufficient consideration for agreeing not to compete; often, a portion of the purchase price is allocated for this purpose.[1]

EXAMPLES

N/A

CAUTIONS

- Even if noncompetition clauses are ultimately unenforceable in a specific jurisdiction, if they are fairly negotiated then there are compelling ethical reasons to honor them.
- Breaching noncompete clauses may not always have immediate consequences in all cases, but it can raise concerns for future opportunities in which individuals are asked if they have ever acted in violation of prior employment contracts.
  - CNCs are best negotiated before employment has started, when the consideration aspect might be covered by the job offer and compensation. Asking existing employees to sign restrictive covenants after they are already working in the practice might require additional consideration in exchange for the restriction.
  - Both parties to the agreement should consult lawyers so that they have adequate representation in reaching a fair negotiated arrangement.

In most cases, noncompetition clauses are a feature of employment agreements. As such, noncompetition clauses are not typically included in agreements with independent contractors (see 13.10 – Employees versus Independent Contractors) and are not likely to be enforceable if written into agreements where the individual/entity truly is an independent contractor.

13.12. LEGAL DUTY TO REFER

BASICS

OVERVIEW

Our society imposes different types of duties – ethical, moral, and legal – on licensed professionals. Each type of duty carries with it differing sets of obligations and considerations. Typically, moral and ethical duties are defined by the profession's governing association's conduct guidelines as well as the practitioner's personal "moral compass." Yet, legal duties are imposed by federal laws, state statutes, and administrative agency regulations as determined by a third party's/legislator's (objective) standards. Unlike ethical/moral deviations, a practitioner's noncompliance with applicable laws and regulations can carry significant potential problems and penalties.

Regardless of the specific type of duty owed, a veterinarian has a legal/moral/ethical obligation not to cause harm or injury to either self, animals, clients/owners, or other persons.

Veterinarians do not have a legal duty to provide treatment to all injured animals.

However, in general, once a veterinarian begins to provide care or treatment to an animal, the duty to act or not act in a certain manner becomes critically important. In accordance with the veterinary profession's principles and guidelines established by the American Veterinary Medical Association (AVMA) and the American Animal Hospital Association (AAHA), there is an ethical duty of referral created when a veterinarian has already "assumed the responsibility" for making "clinical judgments regarding the health of the patient," the client has "agreed to follow the veterinarians' instructions" and that the veterinarian is either "readily available for follow-up evaluation *or* has arranged for the following: veterinary emergency coverage, and continuing care and treatment."

Aside from ethical or moral considerations, at the point when the veterinarian agrees to provide services to a patient/animal, he or she also becomes legally responsible ("liable") with regard to the treatment and care being rendered. Such treatment and care must be in accordance with (1) the standards of the profession, as defined by various regulatory administrative agencies, including the jurisdiction's Board of Veterinary Medicine, (2) all applicable federal, state, and local laws, and (3) the animal's owner's/client's needs or requests under the veterinarian–client–patient relationship (VCPR).

Generally, legal liability can potentially attach to a veterinarian's actions or inactions especially if, as a result, the animal suffers harm, injuries, or death that was potentially curable or preventable had the animal been referred to, or treated by, another veterinarian, a veterinary specialist/expert, or at a specialized (i.e., emergency) facility.

An exception where legal liability does not attach to a veterinarian's actions applies in jurisdictions with "Good Samaritan"-type laws. In those jurisdictions, veterinarians who provide on-site medical treatment or care to an animal at the scene of an accident or emergency, at no cost to the owner, are generally protected from legal liability – especially against allegations of malpractice or negligence in case of further injury/death that might occur to the animal.

TERMS DEFINED

Legal Duty: Any duty that is defined or regulated by laws in the jurisdiction where the veterinarian is licensed to practice.

Reasonableness: The subjective standard by which the actions of a veterinarian with similar qualifications, skills, and knowledge is determined.

Standard of Care: A standard of care typically means the degree of care that a prudent, reasonable, and similarly skilled/educated/licensed veterinary colleague would act, under similar circumstances, to prevent further injury, harm, or damages (including death) from occurring to the animal being treated.

ISSUES AND OPTIONS

PARSING "DUTY" VERSUS "LEGAL DUTY"

In general, a veterinarian's duty focuses upon the conduct and manner in which care is provided for the continuation of animals' good health and, in so doing, strive towards improving public health as well – especially through diagnosing, treating, and researching medical health conditions and diseases of animals. Generally, the duty is reflective of the standard of care imposed by (1) the obligations under the applicable state and federal laws, (2) local regulations, and (3) canons of professional ethics.

In exercising professional duties, the standards of care for veterinary medical treatment of an animal can vary significantly, depending upon the individual facts and circumstances presented.

Legal duty means any duty that is defined or regulated by laws in the jurisdiction where the veterinarian is licensed to practice. Legal duty can also be imputed upon a veterinarian in accordance with precedent established by case law, regulations, or standards applied to other legal claims (such as avoiding potential for fraudulent business practices).

- A variety of legal duties apply to the practice of veterinary medicine, such as the use/storage/recordkeeping/dispensing of controlled substances, maintaining a safe work environment, employment-related issues, licensure compliance, building codes and business permits, and in some jurisdictions there is a legal duty to refer patients under certain specific conditions/circumstances.
- A veterinarian's duty to meet the applicable "standards of care" becomes crucially important - especially for potentially triggering a legal duty to refer the patient to another practitioner.

"REASONABLENESS"

Referring patients to another practitioner is usually based upon the premise that, given similar facts and circumstances, would any other veterinarian with similar qualifications, skills, and knowledge have *reasonably* sent the patient/animal to another doctor with a more specialized level of expertise/knowledge or to a better-equipped facility in order to minimize further potential risk of harm or injury to the animal? If the answer is "yes" then there is the strong likelihood that the treating doctor would have a duty to refer his or her patient to another veterinarian. Yet, this is not necessarily a *legal* duty.

Depending upon the particular facts and circumstances, the failure or refusal of a treating veterinarian to refer a patient/animal elsewhere for continuing medical care and treatment might not rise to the level of a "legal duty violation," but it could trigger the creation of other legal claims, such as negligence, malpractice, fraudulent business practices, conversion, or breach of contract against the veterinarian.

Legal Duty to Refer versus Legal Liability for not Referring

Depending on the jurisdiction, a legal duty to refer typically occurs in one of two contexts: either specifically (by law or regulation) or indirectly (by triggering other laws/regulations that were violated as a result of veterinarian's failure to refer).

Depending upon the particular facts and circumstances at issue, if no specific law for referral applies when a VCPR is established, a legal duty to refer could potentially be created under one or more of the following circumstances:

- the client specifically requests referral to another practitioner, or
- the treating veterinarian's business is closed, or no veterinarian is present (due to nonbusiness hours, illness, or vacation), or
- required diagnostic medical equipment is nonfunctioning or not available, or
- the treating veterinarian has lack of experience or knowledge regarding the animal's particular condition (standard of care cannot be met by the treating veterinarian under the circumstances/facts of the situation), or

• lack of staff/personnel to assist veterinarian in providing necessary care to the animal.

An implied duty to refer becomes dependent upon several factors, such as:

• the degree of urgency of the situation;
• the limitations of the practitioner's training, skills or knowledge;
• the consent of the owner/guardian of the animal after being fully informed of alternatives (benefits, risks and estimated costs of each alternative); and
• the limitations of the particular location (rural versus metropolitan) and related ease of access to equipment, medications/drugs, specialists, assistants.

Yet, none of the above factors, considered independently, is determinative on its own of imposing any legal duty to refer a patient elsewhere.

POTENTIAL DEFENSES AGAINST CLIENT'S CLAIMS OF FAILURE TO REFER

• **Client rejected the referral.** The legal duty to refer a patient to another veterinarian does not necessarily mean that the client must agree to the referral. Keep in mind, this is not a definitive defense. Even if client rejects or fails to follow through on the veterinarian's recommended referral of the animal to another practitioner/facility, legal claims can still be potentially raised against the treating veterinarian for other reasons.
• **Contributory negligence of the client/complaining party.** In certain jurisdictions where the claim of contributory negligence can be made as a defense, the treating veterinarian should be able to show that the animal's owner (or caregiver) was partially to blame for the animal's post-treatment injuries or harm.
• Client's failure to provide expert testimony for allegations made in a lawsuit claiming that a referral of the patient would have produced different results or outcome.
• Failure to prove all of the required elements for legal duty to refer, especially in allegations of negligence or malpractice.
• Statute of limitations has passed.
• Evidentiary proof that prior treatment of animals with same condition had been successfully resolved.
• Evidentiary proof showing that no harm, injury, or damages were incurred as a result of veterinarian's treatment.

EXAMPLES

N/A

CAUTIONS

Review your local regulations and "Veterinary Practice Act" laws to determine which, if any, types of referrals are required ("legal duty") in your jurisdiction.

Clearly communicate with owner regarding referral or treatment and document the communications. Provide sufficient information for a reasonable person to understand the benefits and risks of *each* alternative treatment for the animal – including risks of nonreferral, risk of treatment being withheld, or potential euthanasia (if applicable). Inform the client/owner of the most common or serious complications, including follow-up care (medicine is an inexact science – be realistic). Document the communications.

Always use written consent and written waiver forms. When possible, have client sign refusal of treatment or refusal of referral, whichever is applicable, after the treating veterinarian has informed the client of the various medical alternatives (if any).

Takeaway message. Acknowledging one's own limitations can be difficult. Veterinarians who accept and acknowledge that the referral of an animal–patient for specialized treatment, including the ability of the owner to consult with specialty practitioners on a specific case – even if it is not a legal duty to do so – could potentially save that animal's life. At the very least, by personally seeking the advice of another veterinary practitioner specialist regarding possible treatment options, many veterinarians can potentially avoid losing money (on fees of defense attorneys or court-ordered fines/penalties) and avoid many stressful time-consuming moments with upset clients or lawyers alleging claims such as professional misconduct, fraud, negligence, or malpractice.

Disclaimer. *The following is a generic overview of the subject matter for educational purposes only and not intended as legal advice. Employment laws vary depending upon jurisdiction/location of the veterinary practice and the applicable set of facts and circumstances. Consult with an employment lawyer in your area for advice and consultation about your business needs regarding this subject matter.*

MISCELLANEOUS

ETHICS AND REFERRALS

In the United States, a veterinarian's ethical duties are established through the veterinary profession's guidelines and principles, such as those proffered by the AVMA and the AAHA. The AVMA has published a comprehensive set of ethical conduct guidelines known as the *Principles of Veterinary Medical Ethics* by which "all veterinarians are expected to adhere." The AAHA has established referral guidelines for "companion animal practices addressing all matters of communication between those veterinarians referring and those receiving patients." Both organizations emphasize the importance of collaboration with colleagues and clients in efforts to provide the highest quality of care for patients.

13.13. EXTRALABEL DRUG USE

BASICS

OVERVIEW

Although every year more drugs are approved specifically for use in animals, there still remain a number of conditions, diseases, and situations where veterinarians are required to use approved veterinary or human drugs to treat their patients in an extralabel manner. Extralabel use refers to the use of an approved drug in a manner that is not in accordance with the approved label directions and can include differences in:

- indication – treatment, prevention, or control for a condition or disease;
- species;
- signalment – age, sex, weight, breeding, lactating, pregnant;
- dosing regimen – dosage, route of administration, dosing interval;
- formulation – changing formulation for a specific use (e.g., injectable formulation used oral transmucosally).

The US Food and Drug Administration (FDA) recognizes the professional judgment of veterinarians, and legally allows use of approved human and animal drugs in an extralabel manner (within certain restrictions) under The Animal Medicinal Drug Use Clarification Act of 1994 (AMDUCA).[1] AMDUCA applies only to drugs approved by the FDA. Vaccines, bacterins, other biologics, and diagnostics are regulated by the United States Department of Agriculture, Animal and Plant Health Inspection Service, Center for Veterinary Biologics.[2] Veterinarians are allowed discretionary use of vaccines; state regulations should be referred to in order to determine if use of vaccines in animal species not listed on the label is allowed. Topical pesticides used to treat ticks and fleas (shampoos, collars, dust or powder, sprays, spot-on products) are regulated by the Environmental Protection Agency (EPA), which does not acknowledge veterinary discretion regarding use of these products. Under the Federal Insecticide, Fungicide, and Rodenticide Act, all extralabel uses of EPA veterinary products are illegal.[2]

TERMS DEFINED

Extralabel Use: Actual use or intended use of a drug in an animal in a manner that is not in accordance with the approved labeling. This includes, but is not limited to, use in species not listed in the labeling, use for indications (disease and other conditions) not listed in the labeling, use at dosage levels, frequencies, or routes of administration other than those stated in the labeling, and deviation from labeled withdrawal time based on these different uses.[1]

Veterinarian–Client–Patient Relationship (VCPR): A valid VCPR requires that the veterinarian: (1) assumes responsibility for and recommends management of the health of the patient, which the client has agreed to follow; (2) is personally acquainted with and has sufficient knowledge of the patient to diagnose the patient's medical condition; (3) is readily available for or has arraigned for follow-up and continuing care and treatment; (4) provides oversight of treatment, compliance, and outcome; and (5) maintains the patient's records.[3]

ISSUES AND OPTIONS

Prior to prescribing drugs in an extralabel manner, veterinarians should ensure that the diagnosis is confirmed and that there is no approved drug labeled, or if there is an approved drug that it has been determined to be ineffective for the intended use. In non-food-producing animals, a drug labeled for use in humans can be administered even if an animal-label drug for that species and medical condition exists. AMDUCA does not allow unrestricted extralabel use. Specific limitations of this law are as follows:[1]

- extralabel use is limited to circumstances when the health of an animal is threatened, or suffering or death may result from failure to treat;
- extralabel use of drugs may only take place within the scope of a valid VCPR;
- extralabel use of drugs in animal feed is prohibited;
- extralabel use cannot include list of drugs prohibited from extralabel use as specified and listed in 21 Code of Federal Regulations (CFR) 530.41.[1]

Because extralabel use of drugs in food-producing animals can pose a hazard for human health due to drug residues, additional restrictions apply to extralabel use of drugs in food-producing animals. A full description of the extralabel use of drugs in food animals is beyond the scope of this chapter but can be found in 21 CFR 530.[1] The rest of this chapter will focus on the extralabel use of FDA-approved drugs in non-food-producing animals.

LABELING OF DRUGS PRESCRIBED FOR EXTRALABEL USE

Extralabel use of approved drugs[4] can be dispensed either by the veterinarian or by a pharmacist on the order of a veterinarian. In order to ensure that the prescription contains information adequate to ensure the safe and proper use of the drug, the following are required:

1. Name and address of the prescribing veterinarian. When the drug is dispensed by a pharmacy, the labeling shall include, in addition to the veterinarian's information, the name and address of the dispensing pharmacy.
2. Established name of the drug (active ingredient) or drugs of each ingredient included in the formulation.
3. Directions for use specified by the veterinarian, including species or identification of the animal(s) being treated; dosage, frequency, and route of administration; and the duration of therapy.
4. Any cautionary statements.

ADDITIONAL CONSIDERATIONS

When deciding to use an approved drug in an extralabel manner, consider if there is a drug that is approved for that species and indication. Under AMDUCA, veterinarians are allowed to use drugs approved for use in humans even if an animal-label drug for that species and medical condition exists.[2] However, realize that the data generated for approval of these drugs relied on the pharmacokinetics, pharmacodynamics, clinical safety, and efficacy in humans. The decision to use a drug in an extralabel manner should be based on the evidence that supports the efficacy and safety of that drug for the intended use. There is a hierarchy to the level of evidence that evaluates the type and quality of published studies and other information. Systematic reviews and randomized controlled studies are considered the highest level of evidence. Single case reports, opinions and editorials, and in vitro studies are considered to be the lowest level of evidence. When prescribing drugs in an extralabel manner, the veterinarian must keep records of prescription/treatment and should report any adverse drug reactions associated with the extralabel use to the FDA-CVM (see 12.13 – Adverse Drug Event Reporting and Pharmacovigilance).

CLIENT CONSENT

Veterinarians should always discuss the available treatment options with their clients, especially when extralabel use of a drug is indicated. It is important for clients to understand that their pets are being treated with a drug in an extralabel manner and the limit of safety and efficacy information on the use of these drugs. Various states have implemented legislation that requires that client consent be obtained for extralabel use. Veterinarians should check with their local laws on requirements for a signed consent form.[2] Client consent forms should

include the intended use for the drug that is used in an extralabel manner as well as statements that (a) identify the drug is not approved by the FDA for the intended use, (b) reveal there is limited knowledge on the safety of the drug for the intended use, and (c) indicate the client is giving written consent for the drug to be used in the manner stated in the consent form.

COMPOUNDING UNDER AMDUCA

The FDA defines compounding as a practice in which a licensed pharmacist, a licensed physician, or, in the case of an outsourcing facility, a person under the supervision of a licensed pharmacist combines, mixes, or alters ingredients of a drug to create a medication tailored to the needs of an individual patient.[5] Under AMDUCA,[2] compounding is considered extralabel drug use and must be made from an approved, finished dosage form of human or animal drugs only. AMDUCA does not permit veterinarians, pharmacists, or outsourcing facilities to compound preparations from bulk (i.e., raw active ingredient) drugs. Compounding is allowed if the following criteria are followed.

1. The veterinarian follows AMDUCA regulations.
2. There is not an approved animal or human drug in the available dosage form and concentration that will adequately treat the diagnosed condition.
3. Compounding is performed by a licensed pharmacist upon the order of a veterinarian or by a veterinarian within the scope of their professional practice with proper compounding practices to ensure the preparation is safe and effective.
4. Only the amount needed for treating an individual patient adequately should be compounded at a specific time.
5. All relevant state laws relating to the compounding of drugs for use in animals are followed.

EXAMPLES

N/A

CAUTIONS

LIABILITY FOR THE VETERINARIAN WHEN PRESCRIBING DRUGS IN AN EXTRALABEL MANNER

Veterinarians can minimize their risk for liability regarding any adverse drugs event that occurs in association with the extralabel use of a drug by following the criteria set forth in AMDUCA and local regulations that govern extralabel use of drugs. Failure to follow these regulations could potentially make a veterinarian liable if an adverse event occurs and increase their risk of actions by the FDA, including warning letters, regulatory meetings, product seizures, injunctions, or prosecution. Veterinarians may also face disciplinary action by their state's veterinary medical board. Veterinarians are advised to check with their liability insurance carrier for terms of coverage and liability risk associated with specific extralabel uses of drugs.[2]

13.14. DISABILITY LAW

BASICS

OVERVIEW

Disability law refers to those issues that may be covered under the Americans with Disabilities Act of 1990 (ADA), now revised. The law was originally enacted on July 26, 1990, and became effective for employers with 25 of more employees on July 26, 1992. This was revised downward, however, to 15 or more employees on July 26, 1994.

The ADA's employment discrimination provisions are defined in one seemingly simple sentence that has gone on for 14 years of revision through the courts. The provisions that impose restraints upon employers are as follows: "No covered entity shall discriminate against a qualified individual with a disability because of the disability of such individual in regard to job application procedures, the hiring, advancement, or discharge of employees, employee compensation, job training, and other terms, conditions, and privileges of employment." The outcome of employers trying to abide by the definition of this statute is that employers get imposed an affirmative obligation to make "reasonable accommodations."

TERMS DEFINED

Covered Entities: The entities covered under this act include employers, unions, and joint labor–management committees.

Disability: As defined in the ADA: (1) a physical or mental impairment that substantially eliminates one or more of the major life activities of such individual; (2) a record of such impairment; or (3) being regarded as having such impairment.[1]

Employer: As defined in the ADA, a person engaged in an industry affecting commerce that, as of July 26, 1994, employs 15 or more employees. This definition also includes an employer as a person acting as the agent of an employer, also being an employer.

Equal Employment Opportunity Commission (EEOC): This is the commission at either the federal or state level that is responsible for implementing the regulations to enforce the ADA statutes, whether state or federal.

Person: As defined in the ADA, "person" includes one or more individuals, governments, governmental agencies, political subdivisions, labor unions, partnerships, associations, corporations, or legal representatives. Thus, from this definition, it can be seen that employers include the private sector and state and local governments employing 15 or more employees. The federal government, however, is expressly excluded.

ISSUES AND OPTIONS

DISCRIMINATION

Discrimination against the individual might include any of the following:

- Limiting, segregating, or classifying a job applicant or employee in a way that adversely affects the opportunities or status of the applicant or employee because of his disability.
- Entering into an arrangement such as with an employment or referral agency or a leasing organization that subjects an applicant or employee to discrimination.
- Using standards, criteria, or administrative procedures that either discriminate or "perpetuate the discrimination of others who are subject to common administrative control."
- Discriminating against a qualified individual because of the known disability of an individual with whom the qualified individual is known to have a relationship or association.
- Not making a reasonable accommodation to the known physical or mental limitations of an otherwise qualified applicant or employee with a disability, unless the accommodation would impose an undue hardship on the business operation.
- Denying employment opportunities to an applicant or employee who is an otherwise qualified individual with a disability, if the denial is based on the need of the business to make reasonable accommodations.
- Using qualification standards, employment tests, or other selection criteria that screen out an individual or class of individuals with disabilities, unless the selection criteria used by the employer are job related and consistent with business necessities.
- Failing to administer tests concerning employment in the most effective manner to ensure that, when the tests are administered to an applicant or employee who has disability that impairs sensory, manual, or speaking skills, the test results accurately measure the skills, aptitude, or other factors the test purports to measure.[2]

IMPAIRMENTS

The EEOC recognizes physical, mental, and lifestyle impairments, as well as exclusions from these categories.

Physical Impairments

- Physiological disorder or condition.
- Cosmetic disfigurement.
- Anatomical loss affecting one or more of the following body systems:
  - neurological
  - muscle skeleton
  - special sense organs
  - respiratory (including speech organs)
  - cardiovascular
  - reproductive
  - digestive
  - genitourinary
  - hemic and lymphatic
  - skin
  - endocrine.[3]

Mental Impairments

Mental or psychological disorder, such as mental retardation, organic brain syndrome, emotional or mental illness, and specific learning disabilities.[4]

Nonimpairments

The following are exclusions from impairments, according to the ADA:

- homosexuality;
- bisexuality;
- transvestitism;
- transsexualism;
- pedophilia;
- exhibitionism;
- voyeurism;
- gender identify disorders not resulting from physical impairment;
- other sexual behavior disorders;
- compulsive gambling;
- kleptomania;
- pyromania;
- psychoactive substance use disorders resulting from current illegal use of drugs.[5]

Major Life Activities

The following are the major life activities that, when limited, can be an impairment:

- caring for oneself;
- performing manual tasks;
- sitting, standing, lifting, reaching, and walking;
- seeing, hearing, speaking, breathing, learning, and working.[6]

13.14. DISABILITY LAW

DISABILITIES AND THE ADA

The major issues for any employer regarding the ADA are whether or not an individual is protected by the ADA and whether or not the employer has to provide some form of reasonable accommodation to enable the employee to perform the essential functions of the job.

A "qualified individual with a disability" is defined as an individual with a disability who, with or without a reasonable accommodation, can perform the essential functions of the employment position that such an individual holds or desires. The ADA provides that "consideration shall be given to the employer's judgment as to what functions of the job are essential."[7] Evidence of the essential functions of a job may be determined by the written job description, assuming the job description was written prior to advertising or interviewing for the job. The regulations define "essential functions" to mean the fundamental job duties of an employment position and to exclude marginal functions.[8] Regulations provide that a job function may be considered essential for any of several reasons, including the following:

- The reason the position exists is to perform the function.
- There are a limited number of employees available among whom the performance of the function could be distributed.
- The function is so highly specialized that the position's incumbent is hired because of his or her expertise or ability to perform the function.[9]

The other major issue in trying to maintain compliance with the ADA is whether or not the employer is able to reach reasonable accommodation. The term "reasonable accommodation" is defined in the ADA as follows:

- The term "reasonable accommodation" may include making existing facilities used by employees readily accessible to and usable by individuals with disabilities.
- Job restructuring, part-time or modified work schedules, reassignment to a vacant position, acquisition, or medication of equipment or devices, appropriate adjustment or medications of examinations, training materials, or policies, the provision of qualified readers or interpreters, and other similar accommodations for individuals with disabilities.[10]

The last major issue for an employer to be concerned about in meeting compliance with the ADA is that, in the requirement to provide reasonable accommodation, there is a limiting factor called undue hardship. Under the undue hardship definitions for the ADA, it provides that an employer has no obligation to extend an accommodation if an employer is able to demonstrate that the accommodation would impose an undue hardship on the operation of the employer's business.[11] The determination of what constitutes an undue hardship is not complex and is based on all relevant facts. An undue hardship is defined as "an action requiring significant difficulty or expense when considered in light of factors set forth in the following paragraph."[12] The factors to be considered in determining whether a particular accommodation would be an undue hardship for covered entity include:

- The nature and cost of the accommodation.
- The overall financial resources of the facility or facilities involved in the provision of the accommodation.
- Number of persons employed at the facility.
- Effect on expenses and resources, or the impact otherwise of such accommodation upon the facility's operation.
- Overall financial resources of the covered entity.
- Number of employees of the covered entity.
- Number, type, and location of covered entity facilities.
- Type of operation of the covered entity, including the composition, structure, and functions of the covered entity.
- Geographical separateness, administrative or fiscal relationship with the facility or facilities in question to the covered entity.[13]

Undue hardship refers to any accommodation that would be unduly costly, extensive, substantial, or disruptive, or that would fundamentally alter the nature or operation of the business.[14]

EXAMPLES

As defined under the ADA, a disability is any physical or mental impairment limiting one or more major life activities. The courts point out that the duration, extent, and impact of the impairment must be taken into account to determine if a temporary impairment is covered under the ADA. For example, a broken leg that heals normally would not be considered a disability. But if a broken leg took significantly longer than normal to heal and during that period the individual could not walk, the person would be considered disabled.

Stress or depression could be considered an impairment; however, it would have to be documented as a physiological or mental disorder. A person suffering from "general stress" because of a job or personal pressures could not claim ADA protection.

CAUTIONS

A person who has a contagious disease is considered to have an impairment. You do not have to hire or retain anyone, however, whose contagious disease poses a direct threat to the health or safety of your clients, patients, or other employees if no reasonable accommodation could reduce or eliminate the threat. Please note the aforementioned list of exclusions from ADA impairment or disabilities.

MISCELLANEOUS

Accommodation request. Before an employee can obtain protection under the ADA, he or she must inform management of his or her qualifying condition. An organization that is unaware of an employee's disability is not required to accommodate it.

13.15. WORKPLACE HARASSMENT

BASICS

OVERVIEW

- Within the United States, Title VII of the Civil Rights Act of 1967, as amended, prohibits a covered employer from discriminating against any employee on the basis of any protected status as defined by that law or certain other federal laws.
- Title VII finds illegal discrimination to include harassment of any employee on the basis of any protected status.
- Title VII is enforced by the Equal Employment Opportunity Commission.
- Protected statuses include:
  - sex
  - race
  - color
  - national origin
  - religion
  - age
  - disability
  - veteran status
  - pregnancy
  - alienage or citizenship
  - marital status
  - creed
  - genetic predisposition or carrier status
  - sexual orientation.
- Workplace harassment is much more than just sexual harassment.
- Individuals or classes of employees can sue their employers to recover compensation and punitive damages as well as attorney's fees for violations of Title VII.
- Workplace respite can take two forms: hostile work environment and quid pro quo.
- Employers are strictly liable for quid pro quo harassment.
- Employers may be strictly liable for harassment based on a hostile work environment, unless the employer can demonstrate that it had a written, disseminated, affective policy prohibiting harassment; that the policy provided a suitable mechanism for complaining about harassment; and that the complaining employee failed to follow that policy.
- Supervisors are not individually liable under Title VII, but their actions are imputed to the employer.
- Harassment policies apply in the workplace and in any work-related setting outside of the workplace, such as during business trips, continuing education events, business meetings, and business-related social events.

TERMS DEFINED

Direct Harassment: Occurs when one person is targeted for harassing, intimidating, or offensive behavior because that individual is a member of a protected group.

Hostile Work Environment: Exists when conduct based on protected status, by anyone in the workplace, has the purpose or effect of creating a hostile, intimidating, or offensive work environment. The conduct can be verbal, nonverbal, or physical. Harassing conduct includes, but is not limited to: epithets, slurs, or negative stereotyping; threatening, intimidating, or hostile acts; denigrating jokes and display or circulation in the workplace of written or graphic material that denigrates or shows hostility or aversion toward an individual or group (including through e-mail or other Internet communication sites).

Quid Pro Quo Sexual Harassment: Occurs when a supervisor conditions the granting of employment benefits upon the receipt of sexual favors from a subordinate, or when a supervisor punishes the subordinate for refusing to submit to his or her request for sexual favors.

Sexual Harassment: Exists when there are unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature; for example: submission to such conduct is made either explicitly or implicitly a term or condition of an individual's employment; submission to or rejection of such conduct by an individual is used as the basis for employment decisions affecting such individual; or, such conduct has the purpose or effect of unreasonably interfering with an individual's work performance or creating an intimidating, hostile, or offensive working environment.

ISSUES AND OPTIONS

- Title VII requires employers to maintain a work environment free from unlawful discrimination and harassment.
- Employers with 15 or more employees are covered by Title VII.
- Many states have laws preventing harassment for smaller employers.
- Many states have laws defining protected statuses that are much broader than those covered by federal laws; in those states, state law supersedes federal.
- In recognition that consensual flirting, dating, and romance are often difficult to discern from illegal sexual harassment, an employee who seeks to claim sexual harassment must demonstrate that the complaint of conduct was unwelcome.
- Quid pro quo sexual harassment creates strict liability for an employer if it occurs. In these situations, a supervisor must condition terms of employment on the employee's submission to sexual advances, and the employee must also suffer some adverse employment action.
- Sexual harassment based on a hostile work environment creates liability for an employer who knew or should have known of the hostile conduct and failed to intervene.
- Sexual harassment may include a range of subtle and not so subtle behaviors and may involve individuals of the same or different gender. Depending on the circumstances, these behaviors may include, but are not limited to: unwanted sexual advances or requests for sexual favors; sexual jokes and innuendo; verbal abuse of a sexual nature; commentary about an individual's body, sexual prowess, or sexual deficiencies; leering, catcalls, or touching; insulting or obscene comments or gestures; display or circulation in the workplace of sexually suggestive objects or pictures (including through e-mail); and other physical, verbal, or visual conduct of a sexual nature. Sex-based harassment – that is, harassment not involving sexual activity or language (e.g., male manager yells only at female employees and not males) – may also constitute discrimination if it is severe or pervasive and directed at employees because of their gender.
- Employers are deemed to know about prohibited harassment even if the only one who knew was a low-level supervisor. Any supervisor knowledge is implied to the employer.
- Employers are also liable for harassment by clients, vendors, and or sales representatives who have access to employees.
- Employers should have written policies regarding harassment; they should also train supervisors and employees about how to use the policy and how to follow policy.
- Supervisors must take action to stop it as soon as it comes to their attention, even if the person being harassed does not want to raise a complaint. The obligation of an employer who learns of alleged traffic is to do as follows:
  - Complete an internal investigation, talk to all parties and witnesses involved, before coming to a conclusion.
  - If necessary, separate parties involved pending an investigation. This may include transferring one party or another.
  - All parties should be told that they must cooperate fully with the inquiry, and any harassment, intimidation, retaliation, or interference of the investigation is grounds for discipline.

- After all facts have been collected, decide whether prohibited harassment has occurred.
- If harassment has occurred, determine the proper response – which could be as little as a verbal warning or as serious as immediate termination.
- All records and documents should be kept regarding the investigation, but not in the individual parties' personnel files, unless it has been deemed that the complaining employee complained in bad faith. In addition, the information should not be stored in the personnel file of the alleged harasser if it was deemed unfounded.
- Regular training of veterinary team members should include what kind of conduct is prohibited, as well as what to do if prohibited activity is discovered.
- The written harassment policy should be clearly defined in the employment manual and disseminated to new employees.

REPORTING PROCEDURE

- When creating a workplace harassment entry in an employee's employment file, create a reporting procedure for employees to follow, including informing the immediate supervisor, the practice manager, and the owner of the business.
- Ensure that all complaints are investigated promptly, and maintain confidentiality to the fullest extent possible.
- Retaliating or discriminating against an employee for complaining of harassment or for participating in the investigation of harassment is prohibited.

EXAMPLES

N/A

CAUTIONS

When creating a workplace harassment entry into the employee file, have an attorney review the statement, insuring it is in compliance with both state and federal regulations.

13.16. FAIR LABOR STANDARDS ACT

BASICS

OVERVIEW

- The Fair Labor Standards Act (FLSA) is a federal law regulating the way in which most employers pay their employees.
- The FLSA sets standards for minimum wage, overtime compensation, equal pay, payroll recordkeeping, and child labor.
- The FLSA does not regulate:
  - vacation, holiday, severance, or sick pay;
  - meal or rest periods, holidays off, or vacations;
  - premium pay for weekend or holiday work;
  - pay raises or fringe benefits; or
  - a discharge notice, reason for discharge, or immediate payment of final wages to terminated employees.
- The FLSA does not provide wage payment or collection procedures for an employee's usual or promised wages or commissions in excess of those required by the FLSA. However, some states do have laws under which such claims (including fringe benefits) can be filed.
- The FLSA does not:
  - limit the total number of hours an employee can work per day or per week;
  - manage how frequently an employee must be paid;
  - require an employer to observe any particular meal or break schedule or policy.

These subjects are governed by state laws, which vary widely from state to state.

- Any state may adopt more rigorous standards than the federal.
- The US Department of Labor enforces the FLSA and has authority to audit employer payrolls, compel payment of back wages, issue civil penalties, and/or to bring criminal charges against employers for violations.
- Compliance with the FLSA recordkeeping requirement is critical to avoid liability under FLSA.
- Ensure the practice is compliant with fringe benefit reporting.
- When hiring independent contractors, ensure they are true contractors versus employees (see 13.10 – Employees versus Independent Contractors).

TERMS DEFINED

Compensatory Time: Time off given to the employee to compensate for extra time worked in a single workweek.

Exempt Employees: Professionals, executives, certain administrators, and computer workers are exempt from the minimum wage and overtime compensation present provision of the FLSA if they meet specific regulatory tests.

Fringe Benefits: Any benefit provided in excess of compensation that is not excluded according to law. Pet care discounts is an example of a fringe benefit.

Minimum Wage: There is a federal minimum wage; however, many states, cities, or locales have higher minimum wages than the federal minimum wage. Ensure you are in compliance with the highest paid wage required in your location.

Overtime: All time worked in excess of 40 hours per workweek.

Overtime Compensation: One and a half times the regular rate of pay.

Regular Rate: The regular rate is an hourly rate equal to the amount an employee receives per hour for all time worked during any workweek, without regard to the manner and means by which employees' pay is earned.

Remuneration: All monies received for time worked in a pay period, whether deemed wages, commissions, nondiscretionary bonuses, tips, or any other form of compensation for services rendered.

Time Worked: All time during which an employee is at work and not free to leave, including in most cases waiting time. Time worked does not include paid time off, such as sick leave, vacation days, or paid holidays, even if an employee is paid by the hour for that time.

Workweek: Any period of seven consecutive 24-hour periods, as determined by employer. Once the workweek has been defined, it cannot be changed without notice.

ISSUES AND OPTIONS

- Covered employers must pay nonexempt employees at least the federal or state minimum wage (whichever is higher) for all time worked during any workweek.
- Covered employers must pay nonexempt employees at least one and a half times the regular rate for all time worked in excess of 40 hours in one workweek.
- Covered employers must pay men and women equal wages in an equivalent workweek.
- Covered employers must not employ children under the age of 14, and children under the age of 16 can only work limited hours.
- Employers must keep payroll records and time sheets for nonexempt employees. Record retention varies by state.
- Employers must keep pay records and schedules for exempt employees. Record retention varies by state.
- The wage garnishment law limits the amount of an individual's income that may be legally garnished and prohibits firing an employee whose pay is garnished for payment of a single debt.

MINIMUM WAGE RULES

- Time worked includes all time that the employee is ready and available to work, including waiting time.
- Even if not scheduled, if an employee works late or comes in early, this time counts as working time.
- Lunch periods and breaks can count as working time if the employee is expected to remain on the work premises and/or is expected to perform tasks during those periods. Some states mandate lunch and break periods, in which the employee is not to perform work-related tasks. Ensure you are in compliance with your state regulations.
- Sick days, vacation days, or holidays, even if paid, do not count toward working time.
- Deductions made from wages for such items as cash or merchandise shortages, employer-required uniforms, and tools of the trade are not legal to the extent that they reduce the wages of employees below the minimum rate required by the FLSA or reduce the amount of overtime pay due under the FLSA.
- To calculate the actual wage paid to an employee, divide the gross weekly pay (including all wages, commissions, and bonuses) by the actual number of hours worked. This yields the regular rate that must equal or exceed the minimum wage.

OVERTIME RULES

- Employers must calculate overtime compensation due for each workweek, even if the employee is paid less frequently than that (i.e., bi-weekly, semi-monthly, etc.).
- Overtime is calculated as one and a half times of the regular rate.
- All time worked over 40 hours per workweek by a nonexempt employee must be compensated at the overtime rate, even if the employee was not authorized to work extra time.
- Compensatory time must be taken in the same workweek as the extra time for which it compensates. However, in the private sector, it is unlawful to bank, defer, or carry over compensatory time to any subsequent pay period in lieu of overtime compensation.

RECORDKEEPING REQUIREMENTS

- Employers must display an official poster outlining the provisions of the FLSA, which is available at no cost from local Department of Labor offices.

13.16. FAIR LABOR STANDARDS ACT

• Every covered employer must keep certain records for each nonexempt worker. The FLSA requires no particular form for the records but does require that the records include certain identifying information about the employee and data about the hours worked and the wages earned. The law requires this information to be accurate. The following is a listing of the basic records that an employer must maintain:
  ◦ employee's full name and social security number;
  ◦ address, including zip code;
  ◦ birthdate, if younger than 19;
  ◦ sex and occupation;
  ◦ time and day of week when employee's workweek begins;
  ◦ hours worked each day;
  ◦ total hours worked each workweek;
  ◦ basis on which employee's wages are paid (e.g., "$9 per hour", "$440 a week", "piecework");
  ◦ regular hourly pay rate;
  ◦ total daily or weekly straight-time earnings;
  ◦ total overtime earnings for the workweek;
  ◦ all additions to or deductions from the employee's wages;
  ◦ total wages paid each pay period;
  ◦ date of payment and the pay period covered by the payment.
• Each employer shall preserve payroll records, collective bargaining agreements, and sales and purchase records for at least three years (or as determined by state regulation; whichever period is longer).
• Records on which wage computations are based should be retained for two years – that is, time cards and piecework tickets, wage rate tables, work and time schedules, and records of additions to or deductions from wages – (or as determined by state regulation; whichever period is longer).
• These records must be open for inspection by the division's representatives, who may ask the employer to make extensions, computations, or transcriptions. The records may be kept at the place of employment or in a central records office.
• Employers may use any timekeeping method they choose. For example, they may use a time clock, have a timekeeper keep track of employee's work hours, or tell their workers to write their own times on the records. Any timekeeping plan is acceptable as long as it is complete and accurate.
• Employees on fixed schedules. Employees may work on a fixed schedule from which they seldom vary. The employer may keep a record showing the exact schedule of daily and weekly hours and merely indicate that the worker did follow the schedule. When a worker is on a job for a longer or shorter period of time than the schedule shows, the employer must record the number of hours the worker actually worked, on an exception basis.

EXECUTIVE EXEMPTION

To qualify for the executive employee exemption, all of the following tests must be met:
• the employee must be compensated on a salary basis (as defined in the regulations) at a rate not less than a specified amount per week;
• the employee's primary duty must be managing the enterprise, or managing a customarily recognized department or subdivision of the enterprise;
• the employee must customarily and regularly direct the work of at least two or more other full-time employees or their equivalent; and
• the employee must have the authority to hire or fire other employees, or the employee's suggestions and recommendations as to the hiring, firing, advancement, promotion or any other change of status of other employees must be given particular weight.

This definition can apply to practice administrators.

ADMINISTRATIVE EXEMPTIONS

To qualify for the administrative employee exemption, currently all of the following tests must be met:
• The employee must be compensated on a salary or fee basis (as defined in the regulations) at a rate not less than a specified amount per week.
• The employee's primary duty must be the performance of office or non-manual work directly related to the management or general business operations of the employer or the employer's customers.
• The employee's primary duty includes the exercise of discretion and independent judgment with respect to matters of significance.
• This definition can apply to practice managers (not veterinary technicians).

PROFESSIONAL EXEMPTION

• To qualify for the *learned professional* employee exemption, all of the following tests must be met:
  ◦ The employee must be compensated on a salary or fee basis (as defined in the regulations) at a rate not less than a specified amount per week.
  ◦ The employee's primary duty must be the performance of work requiring advanced knowledge, defined as work which is predominantly intellectual in character and which includes work requiring the consistent exercise of discretion and judgment.
  ◦ The advanced knowledge must be in a field of science or learning.
  ◦ The advanced knowledge must be customarily acquired by a prolonged course of specialized intellectual instruction.
  ◦ This definition applies to veterinarians only (not veterinary technicians).
• To qualify for the *creative professional* employee exemption, all of the following tests must be met:
  ◦ The employee must be compensated on a salary or fee basis (as defined in the regulations) at a rate not less than a specified amount per week.
  ◦ The employee's primary duty must be the performance of work requiring invention, imagination, originality, or talent in a recognized field of artistic or creative endeavor.

COMPUTER EMPLOYEE EXEMPTION

To qualify for the computer employee exemption, the following tests must be met:
• The employee must be compensated *either* on a salary or fee basis (as defined in the regulations) at a rate not less than a specified amount per week *or*, if compensated on an hourly basis, at a rate not less than a specified amount per hour.
• The employee must be employed as a computer systems analyst, computer programmer, software engineer, or other similarly skilled worker in the computer field performing the duties described in the following.
• The employee's primary duty must consist of:
  ◦ The application of systems analysis techniques and procedures, including consulting with users, to determine hardware, software, or system functional specifications.
  ◦ The design, development, documentation, analysis, creation, testing, or modification of computer systems or programs, including prototypes, based on and related to user or system design specifications.
  ◦ The design, documentation, testing, creation, or modification of computer programs related to machine operating systems.
  ◦ A combination of the aforementioned duties, the performance of which requires the same level of skills.

13.16. Fair Labor Standards Act

HIGHLY COMPENSATED EMPLOYEES

Highly compensated employees performing office or non-manual work and paid total annual compensation of a specified amount or more (which must include at least a specified amount per week paid on a salary or fee basis) are exempt from the FLSA if they customarily and regularly perform at least one of the duties of an exempt executive, administrative or professional employee identified in the standard tests for exemption.

NURSING MOTHERS

- The Patient Protection and Affordable Care Act, signed into law on March 23, 2010 (P.L. 111-148), amended Section 7 of the FLSA, to provide a break time requirement for nursing mothers.
- Employers are required to provide reasonable break time for an employee to express breast milk for her nursing child for one year after the child's birth each time such employee has need to express the milk. Employers are also required to provide a place, other than a bathroom, that is shielded from view and free from intrusion from coworkers and the public, which may be used by an employee to express breast milk. State regulations may require greater employee protections. Ensure the practice is compliant with the more stringent regulation.
- Employers are not required under the FLSA to compensate nursing mothers for breaks taken for the purpose of expressing milk. However, where employers already provide compensated breaks, an employee who uses that break time to express milk must be compensated in the same way that other employees are compensated for break time. In addition, the FLSA's general requirement is that the employee must be completely relieved from duty or else the time must be compensated as work time applies.

INDEPENDENT CONTRACTORS

- The veterinary profession often hires independent contractors to carry on business. Often, employees are misclassified as independent contractors. It is prudent to understand the difference between the classifications to avoid penalty by the Internal Revenue Service (IRS; see 13.10 – Employees versus Independent Contractors).
- Workers who are economically dependent on the business of the employer, regardless of skill level, are considered to be employees, and most workers are employees. On the other hand, independent contractors are workers with economic independence who are in business for themselves.
- The Supreme Court has indicated that there is no single rule or test for determining whether an individual is an employee or independent contractor for purposes of the FLSA. The court has held that the totality of the working relationship is determinative, meaning that all facts relevant to the relationship between the worker and the employer must be considered.
- While the factors considered can vary, and while no one set of factors is exclusive, the following factors are generally considered when determining whether an employment relationship exists under the FLSA (i.e., whether a worker is an employee, as opposed to an independent contractor):
  - *The extent to which the work performed is an integral part of the employer's business.* If the work performed by a worker is integral to the employer's business, it is more likely that the worker is economically dependent on the employer and less likely that the worker is in business for himself or herself. For example, work is integral to the employer's business if it is a part of its production process or if it is a service that the employer is in business to provide.
  - *Whether the worker's managerial skills affect his or her opportunity for profit and loss.* Managerial skill may be indicated by the hiring and supervision of workers or by investment in equipment. Analysis of this factor should focus on whether the worker exercises managerial skills and, if so, whether those skills affect that worker's opportunity for both profit and loss.
  - *The relative investments in facilities and equipment by the worker and the employer.* The worker must make some investment compared with the employer's investment (and bear some risk for a loss) in order for there to be an indication that he or she is an independent contractor in business for himself or herself. A worker's investment in tools and equipment to perform the work does not necessarily indicate independent contractor status, because such tools and equipment may simply be required to perform the work for the employer. If a worker's business investment compares favorably enough to the employer's that they appear to be sharing risk of loss, this factor indicates that the worker may be an independent contractor.
  - *The worker's skill and initiative.* Both employees and independent contractors may be skilled workers. To indicate possible independent contractor status, the worker's skills should demonstrate that he or she exercises independent business judgment. Further, the fact that a worker is in open market competition with others would suggest independent contractor status. For example, specialized skills possessed by carpenters, construction workers, and electricians are not themselves indicative of independent contractor status; rather, it is whether these workers take initiative to operate as independent businesses, as opposed to being economically dependent, that suggests independent contractor status.
  - *The permanency of the worker's relationship with the employer.* Permanency or indefiniteness in the worker's relationship with the employer suggests that the worker is an employee, as opposed to an independent contractor. However, a worker's lack of a permanent relationship with the employer does not necessarily suggest independent contractor status because the impermanent relationship may be due to industry-specific factors, or the fact that an employer routinely uses staffing agencies.
  - *The nature and degree of control by the employer.* Analysis of this factor includes who sets pay amounts and work hours and who determines how the work is performed, as well as whether the worker is free to work for others and hire helpers. An independent contractor generally works free from control by the employer (or anyone else, including the employer's clients). This is a complex factor that warrants careful review, because both employees and independent contractors can have work situations that include minimal control by the employer. However, this factor does not hold any greater weight than the other factors. For example, a worker's control of his or her own work hours is not necessarily indicative of independent contractor status; instead, the worker must control meaningful aspects of the working relationship. Further, the mere fact that a worker works from home or offsite is not indicative of independent contractor status because the employer may exercise substantial control over the working relationship even if it exercises less day-to-day control over the employee's work at the remote worksite.

FRINGE BENEFITS

- Any fringe benefit you provide is taxable and must be included in the recipient's pay unless the law specifically excludes it.
- Fringe benefits can be reported with payroll in each pay period, monthly or quarterly.
- Fines and penalties are applied to both the employer and employee should an audit reveal lack of reporting.
- Examples of fringe benefits often seen in veterinary practices include:
  - Pet care benefits.
    - Any discount on services provided to the employee greater than a 20% discount of the cost charged to clients (see Examples section).
  - Athletic club membership (unless the club facility is located on practice property).
  - Employer-furnished facilities (reasonable cost or fair value of board, lodging, or other facilities furnished by the employer for the employee's benefit).

13.16. FAIR LABOR STANDARDS ACT

EXAMPLES

If a practice provides free services as an employee benefit, 80% of the value charged to clients must be reported. IRS guidelines allow 20% of the fair market value to be provided as an employee benefit.

CAUTIONS

- Regulatory agencies can complete a random audit at any time. Be sure to have all records available for audits.
- New regulations regarding the FLSA are pending at the time of publication. Be sure to review the most current regulations at www.dol.gov.
- Review the section covering independent contractors, to ensure that relief veterinarians, groomers, or any other "partial" employees are classified correctly.
- Penalties for violating the FLSA are extremely steep, and cases are hard to defend. Keep scrupulous records and carefully analyze the status of their exempt employees.
- Employees who have filed complaints or provided information cannot be discriminated against or discharged because of such activity. If adverse action is taken against an employee for engaging in protected activity, the affected employee or the Secretary of Labor may file suit for relief, including reinstatement to his or her job, payment of lost wages, and damages.

13.17. EMPLOYMENT LEGALITIES: BIAS

BASICS

OVERVIEW

All human beings differ from one another. Unfortunately, acts of discrimination, harassment, and violence occur throughout human societies, sometimes based solely upon those pervasive differences. These acts and behaviors are usually based on pre-judgmental beliefs or judgments made without regard to, or consideration of, the actual facts about a person's life, talents, skills, or abilities. Oftentimes, this bias, both conscious and unconscious, also appears in our workplaces.

Unconscious bias is something that innately exists in all of us and which, if not managed appropriately, can give rise to unlawful, overt discriminatory actions and behavior. Any type of discrimination can adversely impact the overall sense of "team" in the workplace – causing problems such as bullying, low morale/high turnover of employees, verbal or physical sexual harassment, and oftentimes a "toxic" work environment.

Employment bias occurs in workplaces when a decision, treatment, or consideration is made against (or in favor of) a person based upon his or her perceived class, grouping, category, or physical attributes rather than on actual capabilities and talents, usually in a way that is considered to be unfair. This perceived unfairness by others in the workplace will often result in claims of discrimination, harassment, or retaliation.

Reports of employment discrimination and harassment are spotlighted almost daily in media headlines. Significant social and cultural attitudes are changing, and still evolving, regarding our perception and tolerance of others. Efforts to reduce the potential for illegal biases to infiltrate any business operation will require an active, daily effort by the employer – through enforcement of legally compliant personnel policies, training of supervisors and employees about those policies, and, where warranted, consistently applied discipline in the event of policy violations.

TERMS DEFINED

Disability: According to the Americans with Disabilities Act, a physical or mental impairment that substantially limits a major activity (of which the person *has a record* of having such physical or mental impairment or *is regarded as having* such an impairment).

ISSUES AND OPTIONS

Numerous laws prohibit discrimination in the workplace. The most notable federal law for protecting people against discrimination in the United States is the Civil Rights Act. Originally, the Civil Rights Act of 1866 (42 U.S.C. section 1981) prohibited all private employers from discriminating on the basis of race or ethnicity. In 1964, the Civil Rights Act was expanded, under its Title VII, making it illegal for any covered employer to refuse to hire, terminate employment, or otherwise to discriminate against any employee regarding any terms or conditions of employment (including, but not limited to, hiring, training, evaluation, job assignments, pay, benefits, promotion, layoff, and termination) because of an employee's race, color, religion, sex, or national origin.

Some other federal laws prohibiting discrimination in the workplace include the following:

- Age Discrimination in Employment Act
- Americans with Disabilities Act
- Equal Pay Act
- Executive Order 11246 (applies to federal employers/contractors)
- Fair Labor Standards Act
- Genetic Information Nondiscrimination Act
- Immigration Reform and Control Act
- Migrant and Seasonal Agricultural Worker Protection Act
- The Rehabilitation Act (applies to federally funded employers)
- Uniformed Services Employment and Reemployment Rights Act
- Vietnam Era Veterans Readjustment Assistant Act.

Not all businesses or workplaces are necessarily covered by these federal laws. Yet, individual state's laws or a city's ordinances (where the particular veterinary practice is located) might prohibit employers within that jurisdiction from discriminatory or retaliatory actions against protected groups of people or protected traits.

For example, some states and various cities have laws that include employment-related protections against discrimination or harassment pertaining to:

- sexual orientation or preference
- smokers
- welfare recipients
- persons who are morbidly obese, or
- persons with prior arrests/convictions.

By contrast, other states and local jurisdictions do not provide employment-related protections for such traits or characteristics.

The current "hot topics of employment bias" include race, gender, disability, harassment, age, religion, and criminal history.

RACE AND GENDER

The most controversial targets of bias – both historically and currently, in and out of workplaces – involve race and gender.

Race

Absolute prohibition against racial discrimination at any level – potential damages include significant fines and penalties as well as possible incarceration and unending negative business reputation stigma. There should be zero tolerance for racial discrimination at the workplace.

Gender/Sex

Despite gender/sexual discrimination being prohibited in the workplace – there are legal debates concerning the definition of "gender" (or "sex") within the Civil Rights Act. Namely, whether "sexual orientation" and "gender transitioning" are protectable interests – as being inclusive within the term "gender" or not. There are currently no federal laws prohibiting discrimination on the basis of sexual orientation or gender transitioning. Yet, there are a few state and city laws that prohibit discriminatory actions based on a person's gender transitions or sexual orientation – regardless of whether an employer, employee, client, or a vendor is involved.

DISABILITY

Generally, job applicants and employees with qualified disabilities (or those whom employers regard as having a disability) are to be treated as any other applicant or employee. For example, when hiring, an employer should select someone who is able to perform the essential functions of a job – with or without reasonable accommodations.

HARASSMENT

Basically, harassment is a subtype of employment discrimination – usually expressed through unwelcome verbal or physical behavior that is based on race, color, religion, sex (including pregnancy), gender/gender identity, nationality, age (40 or older), physical or mental disability, or genetic information.

Harassment can occur between people of the same gender, between manager and employee, and even during the interview process.

Employers must take steps to to draft well-written policies that prohibit and penalize acts of harassment in the workplace, including the prohibition for "social media bullying" by maliciously targeting/victimizing work colleagues.

AGE

Under federal and state laws, employers cannot discriminate against an applicant or employee (including firing an employee) who is of a certain age, usually 40 years or older, unless it can be shown that they are not qualified physically, mentally, or by training or experience to satisfactorily perform the essential functions of the job.

RELIGION

Basically, the same principles apply with other antidiscrimination situations; namely, that a religious practice of "sincerely held belief" should be accommodated unless an employer can show that (a) the employee's religious observances are unable to be reasonably accommodated, (b) it causes the employee not to be able to perform the duties for which hired, or (c) accommodation would create an undue hardship on the business.

Be wary of drafting policies that could potentially restrict an employee's ability to comply with religious traditions (such as dress code policies for hair/clothing or break periods for prayer).

CRIMINAL HISTORY

Generally, for business necessity reasons, an employment decision can be based upon an applicant's or employee's criminal record. However, in many states there are strict procedures that must be followed when employers want to obtain criminal history information. Familiarize yourself with state laws before asking a job applicant to volunteer information about their criminal convictions – it might prove to be illegal.

PRACTICE TIPS

In efforts to minimize potential for bias at the workplace, especially while making employment-related decisions:

- Treat all job applicants and employees fairly, equally, and consistently – especially for promotions, training, and discipline.
- Provide equal pay for equal jobs and skill levels. If variations exist, be able to show business-related differences that are not based on (nor perceived to be based on) gender, race, age, religion, or national origin.
- Strive to create and maintain a workplace culture of respect. Provide effective and ongoing training of management/supervisors and to employees – especially regarding the adverse impact of unconscious bias, the negative impact of stereotyping others, and the positive impact of promoting tolerance among employees (both inside and outside of the workplace).
- Post notices and enact policies – especially those required by state and federal laws – informing employees of their rights as well as the company's procedures for filing complaints. Handbook policies and procedures should reflect current laws and include antidiscrimination, antiharassment and antiretaliation clauses as well as providing employees the ability to communicate with employer (or management) regarding complaints of discriminatory or harassing behavior at the workplace. Notices of employees' rights must be posted in highly visible areas within the workplace (usually in a break room or employee locker area).
- Handle all complaints of alleged discrimination or harassment seriously, and investigate immediately and thoroughly, no matter how slight the claim or claims might seem to the employer or manager. Treat the complainer with respect, avoid blaming or retaliating against the complainer, interview all people involved, and keep investigations as confidential as possible.

EXAMPLES

N/A

CAUTIONS

Employers can be sued for discrimination by someone who never worked for them. Discrimination can be claimed at the job advertisement or interview phase. These cases usually arise as a result of employers who exclude potentially qualified applicants in job advertisements, illegal interviewing practices, or discriminatory hiring (most often resulting from an interviewer's biases against an applicant).

Takeaway message. In general, the focused goal of employers' decisions when hiring should be based on the applicant's abilities – and when firing should be based either on employee's failure to perform the duties for which hired or having committed an illegal act.

Neither hiring nor firing should be based upon generic factors such as appearance, ethnicity, or disability. Screening of job applicants and termination actions (including other disciplinary measures) must be job related and consistent with business necessity.

Disclaimer. *This particular area of law is, and has been, a "hot topic" in our society for generations – and is still undergoing constant changes. This is a brief, noninclusive, generic overview of some employment laws affecting – or applicable to – current discriminatory behaviors in the workplace. This overview is intended for educational purposes only – not as legal advice. The information contained in this chapter might not be definitive of the laws in your particular jurisdiction nor applicable to future laws. Consult with an employment or civil rights attorney in your area for up-to-date information that is relative to your specific workplace needs and goals.*

13.18. ACCOMMODATING EMPLOYEES WITH DISABILITIES

BASICS

OVERVIEW

Dealing with problematic employees in the workplace can be extremely challenging – especially when trying work within, and be compliant with, the multitude of employment laws affecting workplaces. However, if an employee's alleged "problematic" behavior arises as a result of, or is due to, or is claimed to be the result of, a disability then this scenario can present its own distinct set of challenges, especially when an employer either ignores or is not aware of federal and state laws related to the Americans with Disabilities Act (ADA – or referred to as the ADAAA for ADA, as amended).

One of the challenges facing many employers who become aware of a job applicant's or employee's disability is understanding how to balance legitimate business interests and workplace accommodations – even though not all disabilities are physical or obvious. For example, some not-so-obvious disabilities can appear as short-term, intermittent (such as seizures or migraines), or psychological impairments (such as post-traumatic stress or bipolar disorders). Yet, regardless of the type of disability that an employee or job applicant might have, employers are responsible – and can be held liable – for failing to follow applicable state and federal laws, in a consistent manner, with all employees/applicants, for the particular set of circumstances presented.

The Equal Employment Opportunity Commission (EEOC) is the primary agency in America that enforces and investigates claims of federal law violations related to illegal discrimination based on a person's race, color, religion, sex (can include pregnancy, gender identity, and sexual orientation), national origin, age (40 or older) and genetic information – including job applicants and employees who have, or are regarded as having, disabilities of any kind. If a job applicant or employee has a disability – whether known or unknown to an employer, regardless if the disability is physical or psychological, and regardless if temporary or long-term – employers must adhere to applicable state and federal laws before taking any adverse actions, such as not hiring, demotions, disciplinary actions, or terminations. An employer's failure to act within the confines of the law could potentially result in legal action, fines, punitive damages, and other penalties imposed against the employer by either the affected individual or by an administrative agency (such as the EEOC or Department of Labor).

Discrimination against a qualified individual with a disability is prohibited in every part of the employment process – including, but not limited to, advertising, job application procedures, testing, job descriptions, leaves of absence/sick leave, fringe benefits, social media policies, disciplinary proceedings, and termination. The ADA and its amendments (ADAAA) encompass the primary law in the United States that applies to, and provides protections for, disabled persons in the workplace. The ADA applies to workplaces with more than 15 employees, yet there are also individual state's laws that apply to businesses with less than 15 employees and protect disabled persons from discrimination, harassment, or retaliation in the workplace.

Under the ADA, a person with a disability is someone who has "a physical or mental impairment that substantially limits one or more major life activities," has "a history" of physical or mental impairment, or is "regarded as having" such an impairment. Major life activities include, but are not limited to, performing manual tasks, seeing, hearing, eating, sleeping, walking, standing, lifting, bending, speaking, breathing, reading, concentrating, communicating, and working.

Under the ADA, an employer may not discriminate against (treat any differently than another employee or applicant) a "qualified individual on the basis of disability" in any of the employment's terms, conditions, or benefits. A "qualified individual" under the ADA is anyone who can perform the essential functions of a job, with or without having reasonable accommodations. State laws vary between states – some laws may include smokers, alcoholics, or morbidly obese as being "disabled" – and therefore employers should be aware of their particular state's laws.

Running afoul of your state's laws or the federal laws with respect to treatment of disabled persons in the workplace could prove extremely expensive, stressful, time consuming, causing negative morale in workplace, and damaging to a business's reputation.

TERMS DEFINED

Disability: Any impairment, physical or psychological, that substantially affects a person's activities. Applicable federal or state laws can define the term "disability" differently.

ISSUES AND OPTIONS

The two key considerations in administering a workplace's disciplinary and accommodation policies are (1) consistency and (2) reasonableness. By developing disciplinary policies and programs that are specifically tailored to an individual workplace, employers can address various types of problematic behavior in almost any situation. Disciplinary proceedings (up to and including termination) should be administered in a consistent manner, for the same/similar set of circumstances involving any employee – regardless if disabled, regarded as disabled, or not disabled – otherwise a perception of unfair/disparate treatment could result in the potential filing of claims for discrimination or retaliation by other employees who were treated differently under the same/similar set of circumstances.

Detailed job descriptions can help minimize misunderstandings, avoid litigation, and promote workplace efficiency. An employer's written requirements should accurately describe the necessary functions ("essential functions") for performing the duties of the specific job for which the applicant/employee is hired, such as, but not limited to, physical requirements (bending, lifting, standing, use of both arms, squatting, stretching/reaching, and more), educational/licensed professional status (if any), defined level of mental wellbeing if applicable (such as ability to communicate effectively and be alert at all times while working with animals) as well as physical presence at the workplace. A well-written job description, applied consistently to all prior and present employees for each specific workplace position, can serve as a valuable defense against allegations of discrimination by anyone unable to perform their duties, with or without accommodation.

Avoid using job descriptions that are generic, too broadly written, or do not apply to the particular duties for which the person being hired is to perform at your workplace.

A job function considered to be "essential" is usually evaluated on a case-by-case basis. Generally, essential functions of any job do not include the functions that are marginally performed for that particular position. When lawsuits or grievances arise, determining whether a task is an "essential" function, relevant evidence usually includes (1) the employer's opinion of what is considered essential for the job, (2) the written job description, (3) the amount of time spent performing the function as part of the job for which hired, (4) the experience of past employees in the same position performing that particular function, (5) the experience of current employees performing that function in similar job positions, and, if applicable, (6) a collective bargaining agreement's terms produced by a workplace union.

REASONABLE ACCOMMODATION

Under the ADA, employers must provide reasonable accommodations in response to a qualified job applicant's/employee's request – unless such accommodation causes undue hardship to the business. "Reasonable accommodation" and "undue hardship" depend upon the specific facts and circumstances at issue.

13.18. ACCOMMODATING EMPLOYEES WITH DISABILITIES

• "Reasonable accommodation" is one that enables the employee to perform the essential functions of the job in the present or immediate future – without the employer incurring significant expenses or significant changes or causing the business/workplace to suffer as a result of the accommodation provided. Examples of reasonable accommodation include, but are not limited to, granting leave of absences, reducing to part-time hours, or light duty/job restructuring (does not necessarily include elimination of essential functions) – provided that these changes do not create a hardship for the particular business.
• The employer and employee should engage in an interactive discussion to determine if a reasonable accommodation can be made – including the precise nature of the problem, how the disability is prompting a need for an accommodation, and what accommodations might be effective.
• Not all requests for accommodations might be reasonable nor must be fulfilled. For example, the ADA does not require an employer to:
  ◦ create or fund a new position as an accommodation;
  ◦ hire new employees (to replace disabled employee during absence);
  ◦ purchase equipment or personal use items (wheelchair, glasses, hearing aids, etc.) for disabled individual;
  ◦ eliminate essential functions of the job;
  ◦ lower the production standard of the workplace;
  ◦ physically alter the workplace;
  ◦ meet the demands of an employee for the exact accommodation(s) requested.
• **"Undue hardship"** generally means that an accommodation would be substantially costly, disruptive, or would fundamentally alter the nature or operation of the business. Among the factors to be considered in determining whether an accommodation is an "undue hardship" are (1) the type and cost of the accommodation, (2) the employer's size and financial resources, and (3) the nature and structure of the business operation.

Regardless of disability status, an employer might be able to terminate employment of a physically or mentally impaired applicant or employee if the burden of proof is satisfied for showing that the person (1) is unable to perform the essential duties of the job for which he or she applied/was hired, even with accommodation, or (2) creates "a direct threat of harm," by causing an imminently dangerous/significantly unsafe workplace situation or perpetrates a criminal act.

EXAMPLES

N/A

CAUTIONS

Not all impairments are obvious or constant. Employers should provide ongoing training and clear policies for supervisors/managers to include the following:
• Recognizing and avoiding acts that may be perceived as discriminatory or retaliatory (learn to treat all employees in same/similar manner).
• Knowing how to respond promptly and to effectively/immediately investigate complaints about discrimination or bullying or harassment.
• Providing interactive communications in response to accommodation requests from an applicant or employee who has a claimed disability/impairment.
• Avoiding sharing or exposing any person's medical information with third parties (except for those in workplace management who are required to know). Maintain confidentiality of all employees' health records and information.

Avoid the mistaken belief that employees can automatically be terminated due to tardiness or absences from the workplace. Unless a legitimate business necessity reason exists, termination or other adverse actions due to absenteeism/tardiness of a disabled person can oftentimes prove legally problematic.

Both federal and state laws afford protections against adverse actions being taken by qualifying business employers on eligible employees who must be absent from the workplace – even for intermittent absences – due to military services, a "serious health condition," or as a result of a work injury, or due to a disability, or a family-/service-member's care, or "qualifying exigencies."

Be wary of the potential of overlap among various laws – such as the ADA, Family and Medical Leave Act (FMLA), and workers' compensation laws – especially when a leave of absence is provided as reasonable accommodation for an employee's disability. For example, the "maximum" 12 weeks of absence afforded by the FMLA can be extended beyond 12 weeks to unlimited absences for a "qualified individual" under the ADA or under workers' compensation laws, or under military-related laws – provided that the absences do not create an undue hardship for the employer's business.

Seek legal consultation prior to terminating any employee for a workplace policy violation – especially if the employee is known to have a disability, is out on a protected leave of absence, belongs to a legally protected status, or if he or she recently filed a complaint related to workplace conditions. When deciding not to hire an applicant, refrain from citing any ground that does not relate to the person's ability (or inability) to perform the duties of the job. If in doubt, contact a local human resources (HR) specialist or employment attorney.

Disclaimer. *This brief, not all-inclusive, generic overview is intended for educational purposes only – not as legal advice. The information contained in this chapter might not be definitive of the laws in your particular jurisdiction nor applicable to future laws. The recommendations might not be applicable to all workplace situations. Always consult with an employment lawyer in your area for up-to-date information that is relative to your specific workplace needs and goals.*

MISCELLANEOUS

There are many fact- and circumstance-specific workplace scenarios that cannot be covered here. Employers ought to consider contacting legal counsel or an HR expert for advice prior to taking adverse action (especially termination of employment) or retaliating in any manner against a job applicant or employee who might have a disability.

13.19. OWNERSHIP VERSUS GUARDIANSHIP

BASICS

OVERVIEW

Animals continue to have an increased presence and favorable relationship with humans in our society. Societal views regarding animals as companions continue to shift to a more inclusive and developed human–animal bond (see 1.19 – Importance of the Human–Animal Bond).

However, for over 2,000 years the law in multiple countries and societies has regarded animals as property, capable of being bought and sold at the discretion of the owner. US society is still undergoing a shift from an agrarian society where animals held utilitarian and economic value to an urban and suburban society where animals are more likely to be used for companionship and emotional value. Generally, the law slowly evolves, lagging behind the ethical and moral views of society at large as regulatory bodies pass legislation that aligns with its constituents.

Reviewing the history of domesticated animals can help to understand the development of the law using the animals as property model.

Canines were first domesticated long before the development of written law or history. Prehistoric people that kept domestic dogs were more proficient hunters, had warning of approaching aggressors, and additional protection. Later, in modern times, before the invention of many advanced technologies, dogs were used in roles of transportation, herding, tracking, hunting, warfare, as guards, for fighting, and security. These roles and jobs filled a need within society, and those people that had dogs that could perform these roles owned a valuable asset. If that asset was lost or damaged by another person, the law found ways to compensate the owner. In today's society, these roles and responsibilities have been replaced with other mechanical assets, such as security systems, a mechanized food supply chain, cars and snow machines, and other weapons for fighting and warfare.

Cats have long held a mutualistic or commensal relationship with humans. Ancient Egyptians revered cats as gods but also helped Egyptian culture to flourish because of their ability to control rodent populations in grain storage. Cats also fought, killed, and repelled venomous snakes and other vermin. Egyptian law held severe punishment for those harming cats. Other societies formed commensal relationships with cats to reduce rodent populations, and thereby disease and mortality. Cats were viewed as an asset to keep and protect, and thus our laws evolved alongside our relationship with domestic cats.

However, in the last 50–100 years, humans have developed technologies that replace the need for dogs and cats to cohabitate in our homes. Many still keep pets in our homes for the want of companionship, and emotional and sentimental value. This shift from need-based property to want-based companions has created tension in our legal and court system and is why some advocate resolving that tension by creating legal guardianship and further rights for animals within the legal system.

Beginning with Boulder, Colorado, in 2000, some municipalities began replacing the term "owner" with "guardian" in their municipal code. The legislature of Rhode Island amended its animal cruelty statutes in 2001, stating that the terms "owner" and "guardian" are to be used "interchangeably." In five years following 2001, over 20 cities changed the terminology in their ordinances from "owner" to "guardian."

Veterinary professional associations, such as the American Veterinary Medical Association and state veterinary medical associations, as well as lay organizations, such as the American Kennel Club and the Cat Fanciers Association, have adopted position statements to recommend that "guardian" not replace "owner" even if just semantically.[1,2]

By shifting terminology from owner to guardian, the implication is that ownership is removed, and the guardian does not own, but merely cares for the animal. Some commentators have advocated that animals fall into different classification of property, such as "sentient" property or "living" property.

Uncertainty exists as to whether a shift to guardianship terminology will lead to increased duties, liabilities, and costs to veterinary service providers.

Legally, the term "guardian" invokes the counterpart term "ward." Under human guardianship laws, wards have legal rights, and complex laws, duties, and case law have formed around the protection of those rights.

TERMS DEFINED

Adoption: A legal action that permanently alters the relationship with the child's biological or previous parents. After adoption, the biological parents give up all parental rights and obligation. As contrasted with guardianship, which is a legal relationship between guardian and ward coexisting with the biological or adopted parents.

Fiduciary Duty/Relationship: A fiduciary duty is the highest standard of responsibility to another. A person who has a fiduciary duty is called the fiduciary, and owes the duty of good faith, trust confidence, and candor.

Guardian: One who has legal authority and duty to care for another's person (ward) or property because of the other's infancy, incapacity, or disability.

Guardian Ad Litem: A guardian, appointed to the court to appear in a lawsuit on behalf of an incompetent or minor party.

Guardianship: The fiduciary relationship between a guardian and a ward, whereby the guardian assumes the role of owner to make decisions about the ward's person or property; guardianship is almost always an involuntary procedure imposed by the state on the ward. Guardianship implies a fiduciary duty in the relationship.

Owner: One who has the right to possess, use, and convey something.

Ownership: The bundle of rights allowing one to use, manage, and enjoy property, including the right to convey to others.

Standing: The legal requirement for a party to prove that they can participate in a lawsuit. Simply put, standing is the legal right and ability to sue and be sued. The party must show that they have an actual harm, that there is causation between the behavior of the other party and the actual harm, and the action of the court can actually correct the issue.

Ward: A person, usually a minor or incompetent, who cannot properly take care of themselves.

13.19. OWNERSHIP VERSUS GUARDIANSHIP

ISSUES AND OPTIONS

GUARDIANSHIP GENERALLY

• Guardianship is generally used in a legal guardian situation where a person cannot properly care for himself or herself.
• Typically, guardianship is used in one of three categories: an incapacitated senior; a minor that has not reached the age of majority and a natural guardian (usually parent) is not available; and developmentally disabled adults.
• Guardians are typically appointed and overseen by a court. Typically, two distinctions are made in a guardianship relationship: (1) a "guardian of the person" is an individual with authority and fiduciary responsibilities for the actual person, and (2) the "conservator" or "guardian of the property" oversees money or significant property that belongs to the ward.

Advocates of guardianship for animals do not generally promote the traditional legal implications of guardianship be transferred to animals. Typically, pro-animal guardianship associations reject the notions of ownership itself and support a stance that animals are more than "mere property."[3] Some write that the word "owner" does not accurately reflect the true bond that develops between people and animals, and that "guardian" more adequately describes the high level or responsibility, care, and respect that people show the animals.[4] Furthermore, commentators often negatively describe the notion that the law treats animals as inferior to humans and that the law is behind the norms and views of society.[5] Lastly, animal guardianship advocates often suggest that guardianship would relieve animal cruelty and suffering.

VETERINARY MEDICINE AFFECTED

• The role of veterinarians and veterinary practices in a guardianship scenario remain unclear. Currently, veterinarians have an ethical obligation to concurrently serve the interests of the animal, the owner, and public safety.[1,2]
• Most guardianship advocates contemplate guardianship for companion animals, including canine and feline species, but there are large issues regarding members of those species kept for working or financial reasons. For example, law enforcement dogs and military working dogs would not fit the guardianship model well.
• Furthermore, some livestock and food animals may be included in a definition of companion animals. Currently, a clean line of ownership and human guardianship exists between nonhuman and human animals. Including guardianship of nonhuman species may create more fair outcomes for certain individuals, but without precise drafting and complex rules the application could become very tedious.

NONECONOMIC DAMAGES

• In civil lawsuits related to the tort of negligence there are several classifications of damages. Damages are the compensation that a court will award to the plaintiff for the losses that they have endured because of the actions of the defendant. In most jurisdictions there are compensatory damages and punitive damages.
• Punitive damages are rare and are designed as punishment to defray the defendant or other defendants from engaging in the behavior again.
• Compensatory damages can be further divided into economic (special) damages and noneconomic (general) damages.
• Economic damages are losses that the plaintiff can quantifiably verify, such as medical expenses, loss of past or future earnings, replacement costs of property, loss of use of property, or cost of repair of property. These damages are permissible when a plaintiff's property is damaged by the negligence of the defendant. Commonly, these damages are sought in car accident cases, medical malpractice cases, and other personal injury lawsuits. In the law of veterinary malpractice, economic damages would include the cost of veterinary care to repair the loss, the cost of replacement of the animal and other losses to income or lost wages.
• Noneconomic (general) damages are losses that are nonverifiable or quantitative but still exist. Courts have awarded damages for physical and emotional pain, suffering, loss of companionship, loss of consortium, loss of reputation, disfigurement, loss of enjoyment of life, emotional distress, and other factors. The law of damages and recovery in most jurisdictions limits the plaintiffs who can recover noneconomic damages to close family members, such as the parents, children, and spouses of the injured or killed. Very few jurisdictions will extend noneconomic damages for loss or injury of an animal. By limiting the recovery of damages to only verifiable money loss, actions in negligence toward animals, including veterinary malpractice, are greatly reduced.
• Presumably, animal guardianship would increase claims and the possibility of noneconomic damages for negligence involving companion animals.

> Use of terms in popular culture that help create a pro-guardianship view by society: Furbaby, pet parent, four-legged family, dog mom, kiddos, children Adoption, rescue

Rights that Animal Owners Currently Hold

• Ability to buy, sell, trade, lease, and breed their animal.
• Ability to make decisions concerning the health and wellbeing of their animal, including whether to pursue veterinary care and options regarding veterinary care.
• Ability to make end-of-life decisions, including the option of humane euthanasia.
• Ability to make reproductive decisions, including breeding, spaying, and neutering.
• Control over the confidentiality of veterinary information and control of medical records.
• Ability to insure under property/causality insurance.
• Ability to make financial decisions regarding their animal(s).

Duties that Animal Owners Have

• Must refrain from animal cruelty, negligence, bestiality, and animal hoarding under federal state and local laws.
• Must provide adequate food, water, shelter, and, in some states, veterinary care.

13.19. OWNERSHIP VERSUS GUARDIANSHIP

• Must carry liability insurance for certain animals and in some jurisdictions.
• Must keep their animal(s) from causing injury or damages to other people, animals, or property.

Rights that Guardians of Wards Traditionally Hold

• Ability to sue in court on behalf of the ward.

Duties that Guardians of Wards Traditionally Have

• Must provide food, water, shelter, education, and medical care.
• Must conduct financial decision-making with the utmost of care.
• Held to highest possible standard under the law; must place the interest of the ward before their interests.
• Must report to the court, generally at least annually, on the status of the ward and financial relationship.

Duties of the Guardian in an Animal Guardianship Scenario

• Enhanced requirements for food, water, shelter, and veterinary care.
• Increased penalties for cruelty, abuse, and negligence.

FIFTH AMENDMENT TAKING

The Fifth Amendment to the US Constitution states "nor shall private property be taken for public use, without just compensation." An issue is created when animals are classified as private property and a law proclaims the property as owned by the government and cared for by former owner. In its legal sense, this is a Fifth Amendment taking and requires "just compensation" by the government.

STANDING

Currently, animals do not have standing in court to sue on their own behalf, and a person is unlikely to have standing to sue on behalf of an animal, because standing is usually limited to "persons." Some statues do grant standing to nonpersons and property. Because animals will not be able to hire an attorney or argue in court, standing for animals would always require a third party to file the lawsuit. Guardians of persons regularly file lawsuits on behalf of an incapacitated person or minor. Extensive case law exists describing standing for guardians of the person, guardians of property, and guardian ad litem. Conceivably, under animal guardianship, even semantically, standing would be more achievable. Cities and states wishing to add guardianship language, even symbolically, should carefully draft and give court guidance as to the legal ability and right to sue for animals.

IDENTIFICATION

In most minor child custody cases, where the courts struggle with guardianship, the birth certificate system identifies and verifies the existence of the child through a permanent system and creates a record of the child's family ties. A true animal guardianship system would need a uniformly implemented protocol for the proof of existence of the animal, positive identification of the animal, and the ties to the guardian. Some have advocated for the use of a microchip system as the permanent system, but due to the varying manufacturers, databases, and technology, an extensive overhaul and implementation would be needed for that to transfer into a guardianship model.

ANIMAL CRUELTY AND NEGLIGENCE STATUTES

• Every state and most cities have laws and ordinances that prohibit animal cruelty and negligence and prescribe a minimum standard care for animal owners and others (see 13.22 – Animal Cruelty). Other laws prohibit animal hoarding, bestiality, puppy mills, and overworking of farm animals. In essence, animal owners do not have unlimited rights as to the treatment and care of their property. Two forms of animal cruelty statutes exist: (1) prohibits act of commission, meaning a positive act such as beating, kicking, torturing, maiming, dragging, and overworking; and (2) prohibits act of omission, or an absence of an action, such as negligence in feeding, watering, providing shelter, or veterinary care.
• Generally, acts of omission are misdemeanors and acts of commission that result in severe injury or death are felonies. These statutes have long existed in animal law and are constantly being updated with more severe penalties. However, in reality, these statutes are selectively enforced and at times difficult to prove.
• Advocates of animal guardianship will often cite a reduction in animal cruelty, abuse, and negligence as a need for pursuing animal guardianship, without evidence of how or why it will achieve the desired outcome.

EXAMPLES

• Cities that have passed guardianship language:
  ◦ Boulder, Colorado
  ◦ Sherwood, Arkansas
  ◦ West Hollywood, California
  ◦ Berkeley, California
  ◦ Amherst, Massachusetts
  ◦ Menomonee Falls, Wisconsin
  ◦ Woodstock, New York
  ◦ San Francisco, California
  ◦ Sebastopol, California
  ◦ Wanaque, New Jersey
  ◦ Windsor, Ontario Canada
  ◦ Albandy, California
  ◦ St. Louis, Missouri
  ◦ Bloomington, Indiana
  ◦ Imperial Beach, California
  ◦ San Jose, California
  ◦ Parma, Ohio
  ◦ Richmond, California.
• Counties:
  ◦ Marin County, California
  ◦ Santa Clara County, California.
• State:
  ◦ Rhode Island.

13.19. OWNERSHIP VERSUS GUARDIANSHIP

CAUTIONS

- Use of the words "guardian" and "guardianship," even semantically or symbolically, can confuse clients, legislative bodies, lawyers, and even courts.
- Proper enforcement of current animal cruelty, abuse, and negligence laws is needed.
- Nearly two decades since the first guardianship terminology ordinances were passed, many of the projected issues regarding court involvement, noneconomic damages, and animal standing have not been fulfilled.
- However, veterinarians should understand the legal implications of animal guardianship and animal rights.

13.20. Pet Trusts and Wills

BASICS

OVERVIEW

• As pets are treated more and more like family members, it is only natural that pet owners will want to plan for the eventuality when they may no longer be able to provide the care needed. This is not only the case for long-lived animals, or even for seniors, but anyone can find themselves in a situation (accident, infirmity, debilitating illness, natural disaster, terrorist event, etc.) when they are unable to properly care for their pets and need assistance in this regard, either while still alive or following death.
• Despite the aging of the US population, the recognition of the human–animal bond as an important connection between people and their pets (see 1.19 – Importance of the Human–Animal Bond), and a continuous trend for increased spending on our pets, most pet owners do not consider what might happen to their pets if they die or become even partially disabled. In perhaps too many instances these pets do not receive the continued care their owners would have wanted, and the pets may end up relinquished to a shelter or even euthanized.
• Even if there are individuals willing to care for a decedent's pet(s), if there is not a will or trust that mentions the pet and the owner's intentions for its care then there may be legal quandaries over who is allowed to take the animal and how to deal with pet-related expenses.
• Wills and trusts are methods for individuals to make their wishes known regarding their pets. However, pets cannot directly be left property, including money, following their owner's death, so a human intermediary is required.
• A will can transfer assets following a death, but it cannot dictate ongoing supervision. A trust, on the other hand, can outline the continued care of pets, name new caregivers, provide funding for pet care, and empower the trustee, who has a legal duty of carrying out the wishes of the settlor. Accordingly, most attorneys recommend trusts for pets rather than just including a pet in a will.
• An additional estate instrument that is sometimes used for similar purposes is known as a pet protection agreement. This is actually a laypersons' document that can be used to help ensure the wellbeing of pets after a pet owner's death or disability. It does not have the legal weight of a trust or a will, but it is a low-cost alternative that can be completed without the assistance of an attorney.

TERMS DEFINED

Beneficiary: The individual who benefits from a trust agreement.
Decedent: A person who has died.
Executor: A person or entity appointed by a testator to carry out the terms of their will.
Grantor: An individual who transfers or conveys ownership.
Probate: The court process by which a will is proved valid or invalid.
Responsibility: The duty to perform or complete an assigned task.
Settlor: A person who has created a trust. Also known as a trustor or grantor.
Testator: A person who has made a will.
Trust: A relationship whereby property is held by one individual for the benefit of another.
Trustee: The individual or organization who receives the settlor's property for the benefit of the beneficiaries.
Will: Also known as a testament, the legal declaration by which a person names one or more persons to manage aspects of the estate after the testator's death.

ISSUES AND OPTIONS

WILLS

• A will is a legal declaration by a testator in which an individual or individuals are named to manage an estate and transfer property after death.
• In the strictest historical sense, wills refer to real estate property, whereas testaments refer to personal property, but today everything is included under the so-called last will and testament.
• Pet owners can include their pets as provisions in their wills, but there are several reasons why this might not be the optimal solution. Wills can take weeks or months to be executed, might have to go through probate, and can be contested by others. When pets are transferred in a will, they are conveyed as any other type of property and the testator can specify what they hope for in terms of pet care, and even provide support in the form of monetary assets for this purpose, but the beneficiary is under no obligation to act as the grantor intended.
• Although a will may allow a pet to be transferred to someone else following the owner's death, it is important to realize that this may not be helpful if the owner remains alive but is unable to provide adequate care and would just benefit from some assistance in caring for their pet(s). The will is strictly an instrument for transferring property after the testator's death.
• It is for this reason, and many others, that trusts are often considered better options for pet owners; but if that is not possible, the will does offer the prospect for the pet owner to make their wishes known regarding the transfer of ownership of any pets.

TRUSTS

• A trust is a legal agreement that provides for the care of a pet in the event of an owner's disability or death. The owner does not need to be incapacitated for the trust to take effect, as long as the pet owner is deemed unable to manage their pet's care.
• With the adoption of a new provision for the Uniform Trust Act of 2000, many states allowed laws that permitted the creation of pet trusts.
• Although not universally available in all states, pet trust laws have been enacted in almost all states and the District of Columbia.[1]
• Pet trust laws do vary on a state-by-state basis, so pet owners should enlist an attorney skilled in estate planning in their state of residence. Because there are some states in which a pet trust is not valid, and others where enforcement is discretionary, trusts need to be reviewed whenever moving to another state.
• Some states allow a trust to provide for an animal for its entire life, whereas others may be limited to 21 years, so it is important to know the law in any particular state of residence. The trust can also be written to cover offspring of the pet beneficiary.
• Typically, the trust is written for the trustee to hold property (including money) "in trust" for the settlor's pet(s), and it can take effect during their lifetime or after their death. The trustee can then make payments to a designated caregiver, as provided in the trust. Trust funds are not subject to probate, the terms of the trust are not part of the public record, and there are no funding delays once the trust has been triggered by a specified situation.

• The instructions in a pet trust can be very specific, so pet owners can feel confident that the trust is likely enforceable by law and that their wishes regarding their pets will be respected. Such instructions might include the frequency of veterinary visits, favorite foods to be fed, grooming requirements, and even the mode of burial or cremation after the pet's death. The pet's anticipated standard of living should be well documented within the trust.
• Pet owners should not be secretive with friends and family members about their intentions for their pets. They should especially discuss such arrangements with anticipated caregivers to ensure that such individuals are willing and prepared for the task proposed. Without this agreement, it will likely be left up to the trustee to find an appropriate individual or organization to provide such services.
• When the pet dies and there is still money left in the trust, the assets are distributed to a second beneficiary, such as an individual, a charitable foundation, or a corporation.
• In preparing a trust, it is important to select trustees who will be responsible for following the directions specified, and the caregivers who will ultimately be providing the day-to-day care requested. Because both trustees and caregivers are susceptible to the same fates as the rest of us, thought should be given also to successor trustees and caregivers who would be next in line should first choices no longer be able to provide the services requested. Secondary beneficiaries are also named, in the event that assets remain in the trust after the beneficiary pets have died.

EXAMPLES

N/A

CAUTIONS

• Because pets cannot legally hold title to property in the United States, they also cannot be direct beneficiaries of a will or trust. Therefore, individuals or other legal entities must fulfill the intermediary role, with pets being the eventual beneficiaries of the instrument.
• There are significant differences between states in pet trust laws, including how long they can remain in effect, how much can be left for a pet beneficiary, and how enforceable a pet trust might be, so trusts should only be created after consultation with an experienced estate attorney, with expertise in the likely state of residence of the pet and caregiver.
• It is possible to create a trust for each individual pet to be cared for, but an alternative is to create one trust meant to serve all pets that would be owned during a pet owner's lifetime.
• Situations change, including moving to a state with different pet trust laws or enforcement, changes in relationships with would-be trustees and caregivers, and changes in number or types of pets that might alter the circumstances in a pet trust. Whenever such changes occur, it is important to revisit the trust and consider whether amendments are warranted.

MISCELLANEOUS

• Veterinarians can assist pet owners in the creation of a pet trust by providing them with a personalized pet profile for lifelong care (see 5.12 – Discussing Pet-Specific Care and 4.10 – Personalized Pet Profiles) that would enable them to estimate the costs of medical care over the pet's anticipated lifespan. To that end, they would also need to add reasonable costs for feeding, grooming, and miscellaneous other expenses that would be relevant to a particular pet. It is also important for the pet owner to consider the assets necessary to adequately cover the administration of the trust, including trustee fees, attorney consultation, and other such expenses.
• Whenever money is involved, fraud can also exist, so care should be taken to ensure that the pet can be accurately identified. Suitable permanent forms of identification include microchipping and archived DNA samples from which identification can be confirmed. Photos and veterinary documentation of identifiable markings also help with identifying pet beneficiaries.
• If pet owners do not create a trust or will, they should consider what will likely happen to their pets in the case of death or disability. Other options exist, including life trusts, pet protection agreements, or private arrangements with friends, family members, or charitable pet-related organizations or shelters. Not having any plan can create a hardship not only for any pets involved, but also for those that are ultimately going to be left with making decisions related to those pets.

13.21. ANIMAL ABANDONMENT

BASICS

OVERVIEW

Veterinary hospitals operate under a paradoxical paradigm. On the one hand, the ethical considerations and professional arts engender a holistic respect to avoid harm and maximize wellbeing by treating their clients' nonhuman animals as "patients" with independent lives. On the other hand, business pressures dictate that bills be promptly paid, forcing some to recharacterize the animal as "mere chattel," more like a broken radiator or crashed computer, to be detained pursuant to a retention lien until the client pays all amounts owing. The same considerations apply to nonhuman animal corpses.

May a veterinary hospital refuse to return a companion animal or her remains until the bill has been paid in full, or even in part, deeming the animal "abandoned" for invoice arrearage?

Unrelated to paying invoices, one encounters the separate question of how to care for animals relinquished to the sole custody of the veterinarian. So long as the law continues to regard nonhuman animals as mere personalty and does not extend guardianship law principles to nonhumans, animal care practitioners have been known to invoke the statutory protections of the abandonment statute, other statutory liens such as the generic chattel lien and specific veterinary lien, and, in the right circumstance, agister lien. Others rely on consensual liens at time of service per written contract. The common law also defines abandonment of personalty.

TERMS DEFINED

Abandonment: The relinquishing of a right or interest with the intention of never again claiming it.
Agister Lien: A lien on the animals under an agister's care, to secure payment of the agister's fee. An agister is one who takes and pastures grazing animals for a fee, a type of bailee for hire.
Chattel Lien: A statutory lien that secures payment for labor or materials supplied in improving, repairing, or maintaining personal property, such as an automobile.
Common Law: A product of judicial evolution, a sort of gap-filling or gloss established over generations by judges; compare with "statutory or code law," which is set forth by legislative ordinance.
Foreclosure: A legal proceeding to terminate a debtor's interest in property, instituted by the creditor either to gain title or to force a sale in order to satisfy the unpaid debt secured by the property.
Personalty: Personal property; compare "realty," which is real property.
Possessory Lien: A lien allowing the creditor to keep possession of the encumbered property until the debt is satisfied. A power of sale may or may not be combined with this right of possession.

ISSUES AND OPTIONS

VETERINARY LIEN

• More than half of the US states have codified veterinary liens. Some limit their scope to livestock or large animals.
• Others expire once the veterinarian loses possession (called "possessory liens," in contrast to those that continue despite dispossession, called "nonpossessory liens").

ABANDONMENT

• Many states have animal abandonment statutes aimed at providing a clear framework for disposing of deserted animals. Some extend beyond veterinarians to boarding kennel owners or any person who treats, boards, or cares for a nonhuman animal.
• Some statutes "deem abandoned" an animal that has been placed in the custody of a veterinarian for a specific period of time but has not been removed at the end of that period; alternatively, if left for an indeterminate period, the law requires that some notice be given to the animal owner–guardian prior to being "deemed abandoned." And, of course, failing to pay agreed upon or reasonable treatment charges may also give rise to an abandonment claim.
• Important, however, is the distinction between the right to reimbursement and the right to retain possession of and lien the animal until a bill is paid. And where the right to retain possession exists, a second distinction arises between using the proceeds from sale of the animal to satisfy the debt versus having lawful authority only to deliver the animal to the sheriff for auction or to the humane society for euthanasia or adoption. Obviously, the practical effect of threatening to deliver one's pet to a third party works to ensure prompt payment.
• If your state or locality did not enact a statute governing animal abandonment, then one may consider the common law definition. Abandonment must be proved by clear, unequivocal, and decisive evidence.
• Critical to the determination of this claim is an actual intent to relinquish or part with the right or rights claimed to be abandoned. "Abandoned property" is property to which the "owner has relinquished all right, title, claim, and possession, *with intention* of not reclaiming it *or resuming* its ownership, possession or enjoyment."[1] (Emphasis added.)
• The burden will be on the veterinarian to *clearly, unequivocally, and decisively* prove the client's actual intent to relinquish ownership of the companion animal. In the absence of any express evidence to support this claim, and where alternative, less equivocal intentions may be reasonably inferred, abandonment cannot lie. Hence, the veterinarian should take steps to confirm intent to relinquish, preferably in writing and in the presence of witnesses, to discredit all plausible excuses that might later be raised by the client after you have relocated the animal patient.
• Ideally, one should release the animal upon demand but then exhaustively pursue collections. To detain a loved one's companion animal or animal's cremated remains pending payment of a debt is not only impolitic but amounts to emotional blackmail. If a mother left her child with a pediatrician, could the doctor hold the adolescent hostage until she paid the bill for services rendered? The application to beloved nonhuman animals does not seriously require further exposition. Particularly where most businesses, including human healthcare providers, bill on net-30 or even net-90 terms, a demand for payment coupled with a refusal to return the pet's body may result in a lawsuit or bad press.
• Although sensible to presume that the daily boarding costs should accrue toward the balance, one can readily see the risk it poses for creating a further impasse in negotiations, for as each day passes, the total due and owing increases such that the boarding fee alone may dwarf the disputed sum.

CHATTEL LIEN

• Chattel liens grant the artisan or mechanic a retention lien over any personal property "repaired" through "labor" performed or "material" furnished at the request of its owner. Thus, an animal guardian who surrenders her dog to a veterinarian for a routine neuter may face a chattel lien plus daily boarding costs if she does not promptly pay the veterinarian's full bill. But leaving a cat with a veterinarian for private cremation, although typically outsourced, should not trigger a chattel lien, because the "property" may not have been repaired as contemplated by statute.
• Be mindful that you could lose your lien by bad faith overcharging (i.e., extorting more than the contract debt through withholding possession). If the client makes an unconditional tender of the true amount due, you must surrender the animal.

AGISTER LIEN

Finally, most agister liens apply only to farmers, ranchers, herders of cattle, livery and boarding stable keepers, vets, and other persons to whom horses, mules, cattle, or sheep are entrusted for feeding, herding, pasturing, training, caring for, or ranching. It provides a possessory lien that attaches at the time amounts are due until paid a period after attachment. Read the statute closely, as the class of animals covered often limits to traditional livestock species.

EXAMPLES

If your ability to evaluate the client's ability to pay has gone haywire, and you find yourself out thousands of dollars incurred through hours of legitimate care and hospital resources, you may either comply strictly with the specific statutory lien that applies in your jurisdiction, if it exists, or choose to deem the client's animal abandoned. Make sure to read the relevant state or local law governing these transactions. If the statute offers sparse guidance, err on the side of professionalism and compassion by considering the following:

- Mail first-class and certified, return receipt requested, a clear notice indicating that you will deem the animal abandoned by a certain date (at least 15 days is sensible) if the bill is not paid. If you know that the animal is owned jointly by, for instance, a breeder or spouse or domestic partner, then send the notice to the co-owner(s) as well.
- State in no uncertain terms that this is the "last opportunity to retrieve" the animal. Make this and the date conspicuous (that means bolded, offset, larger font, different color).
- Include a copy of the relevant laws, in full.
- On the day the animal is deemed abandoned, send a second notice, both first-class and certified, return receipt requested, to the last known address stating precisely where the animal has been sent, including the name, address, and phone number of the agency or shelter. Mail this notice the day before delivery to the shelter or agency, but no later than the day of transfer. Inform the client of the minimum number of days the animal is likely to be held at that agency before being euthanized or adopted out (confirm with the shelter). You can even include a copy of the relevant impoundment law, which can be obtained from the shelter.
- Inform the shelter, sheriff, or agency that the animal has been "deemed abandoned" under the pertinent statute. Provide the shelter with the last known contact information for the owner–guardian(s).

CAUTIONS

Although some states permit veterinarians to foreclose on their possessory lien by selling the client's companion animal, such as California Civil Code § 3051, others subject veterinarians to discipline, such as 256 Massachusetts Code of Regulations § 7.01(4). Regardless, prudence and due regard for the best interest of the animal should guide the veterinarian.

13.22. ANIMAL CRUELTY

BASICS

OVERVIEW

In the Antebellum South, legislators appeared to condone cruelty to slaves more than barbarism against animals. The Louisiana Black Code of 1808 merely fined those who maimed or killed slaves $200 to $500, whereas those who "wantonly or maliciously killed any horse, mare, gelding, mule, or jack-ass" were fined $200 or imprisoned for six months.[1]

Over the centuries, times have changed. With slavery banned by Emancipation Proclamation and Jim Crow days ended, all races began to enjoy equal treatment under the law. Meanwhile, nonhuman animals that previously enjoyed a higher status than slaves were left with the same stale protections of yore. Not until the late twentieth century did states begin passing felony animal cruelty laws, with minimum penalties of one year in state prison, larger fines, and the standard disenfranchisements associated with a felony conviction.

Currently, only the American Samoa and Northern Marianas do not felonize animal cruelty. Still, not all laws are created equally. For instance, Idaho passed its first felony animal cruelty law in 2012, but felony provisions only apply on the third conviction. As civic sensitivity increases to the plight, new responsibilities and limitations on veterinary practice emerge.

TERMS DEFINED

Abuse: Traditionally reserved for positive acts causing unnecessary injury or death to an animal, such as overworking, torturing, traumatizing, or mutilating.

Animal: Varies by jurisdiction. Common omissions include noncaptive wildlife, invertebrates, insects, fish, amphibians, or reptiles.

Criminal Negligence: Unlike intent, knowledge, or recklessness, criminal neglect *does not* involve a state of awareness. A person acts negligently when he or she inadvertently creates a substantial and unjustifiable risk of which he or she ought to be aware. His or her fault is *inattentiveness.*

Expungeability: After a prescribed period of time of good behavior, the ability of a convicted defendant to cleanse the criminal conviction from their record.

Intentionally: The actor's conscious object is to perform an action of that nature or to cause such a result. The action is *purposive.*

Knowingly: The actor is simply aware that their conduct is of the required nature or that the prohibited result is practically certain to follow from their conduct. A man who wills that a particular act or result takes place *has intent*, whereas another who is merely willing that it should take place *has knowledge.*

Malice: The intentional and wrongful doing of an act without lawful justification and with evil motivation.

Mandated Reporter: Those individuals required by law to notify law enforcement of penal code violations. Good faith immunity from civil and criminal prosecution often protects those upon whom the duty to report is imposed.

Neglect: Often relegated to negative acts causing unnecessary injury or death to an animal, such as deprivation of medical attention, ventilation, shelter, space, and sustenance.

Recklessly: The actor is consciously creating a risk that injury might result with a probability less than substantial certainty (if they know that injury is *certain* to result, they act *knowingly.*) It is an unjustified, substantial risk known by the actor and consciously disregarded by the actor. Their fault is *indifference.*

ISSUES AND OPTIONS

NEGLIGENCE

A person who accidentally (i.e., without knowledge) creates an unjustified, substantial risk that an illegal result will occur *is criminally negligent*; a person who knowingly creates an unjustified, substantial risk that an illegal result will occur *is reckless*; where the probability of the risk is substantially or virtually certain (i.e., no longer a risk but, rather, necessarily or will very likely cause a particular result), the person *has knowledge*; where the person desires that the outcome occur, there lies *intent.*

CRUELTY STATUTES

The standard cruelty statutes prohibit the unnecessary and unlawful infliction of substantial pain, physical injury, or death by a means causing undue suffering. Traditionally, circuses, rodeos, institutions performing animal experimentation, ranchers, packers, and farmers engaging in accepted animal husbandry practices, and veterinarians employing accepted professional techniques may find safe harbor from cruelty laws. Of course, some municipalities ban degrees of ear cropping, tail docking, foot soring, and declawing, regarding the procedures as illegal forms of animal mutilation. In some states, the veterinary practice acts subject practitioners to discipline for engaging in acts of animal cruelty, even with exoneration after a criminal trial.

Important distinctions among jurisdictions include the class of animals protected (some exclude insects, fish, and game animals), the class of acts excepted from prosecution, the mental states criminalized (i.e., neglect, recklessness, knowledge, intent, malice), the conditions imposed upon conviction (e.g., forfeiture of animals, injunction against future ownership of animals, psychological treatment, civil penalty, fine and imprisonment, cost of care), the conviction's expungeability, the crime's classification (i.e., misdemeanor or felony) and felony ranking (e.g., some laws declare animal cruelty an "unranked" felony, resulting in identical jail time for a defendant with no priors and a defendant with a lengthy rap sheet), and the need for an expert to prove undue pain or suffering. Oregon obviates the need for expert veterinary testimony by presuming cruelty upon proof of objective physical manifestations, such as pierces, cuts, punctures, bruises, or burns.[2] This legislative move avoided requiring judicial interpretation of the type that occurred in the Washington State case *State v. Zawistowski.*

Vern and Katonya Zawistowski faced six counts of second-degree animal cruelty charging them with neglect in causing unnecessary pain to Silver and Princess Tarzana (horses) from underfeeding, poor dentition, and malnutrition. The Pierce County Superior Court threw out the district court jury convictions, and the state appealed in September 2003. Division II reinstated the convictions. This

published decision clarified the threshold for proving nonhuman animal pain sufficient to obtain a second-degree animal cruelty conviction. The second-degree animal cruelty law, RCW 16.52.207, did not define "pain" or "unnecessary," and no Washington court had determined whether such factors as amount, frequency, or duration apply differently, if at all, between nonhuman animals and humans. The *Zawistowski* court solidified the nexus between starving an animal and causing unnecessary pain in adopting the dictionary definitions: "pain" as "a state of physical or mental lack of well-being or physical or mental uneasiness that ranges from mild discomfort or dull distress to acute often unbearable agony" and "hunger" as "[t]he discomfort, weakness, or pain caused by a lack of food."[3]

The *Zawistowski* court did not define "substantial pain" for first-degree, felony animal cruelty. It also did not address the variable sensitivities of certain animals to experience pain; for instance, insects, fish, and invertebrates such as butterflies, salmon, lobster, and octopi are not protected by most cruelty statutes even though zoologists and other scientists have raised research-grounded doubts. By adopting the dictionary definition, the *Zawistowski* decision could serve to protect nonhuman animals against psychic pain as well as physical discomfort sustained by underfeeding and malnutrition. Traditionally, however, psychological injury without physical manifestations will not trigger a cruelty or neglect violation.

Because veterinarians, like human medical doctors, teachers, and social workers who tend to see with greatest frequency injuries most consistent with criminally abusive acts, are often the first responders early in the cycle of animal abuse, some states have mandated animal cruelty reporting by veterinarians to law enforcement. For instance, Minnesota requires reporting known or suspected cases of abuse, cruelty, or neglect.[4] Naturally, veterinarians fear foremost the loss of business should word spread that they work with police to nab "innocent," well-meaning clientele. More significantly, they may risk courting a civil lawsuit for breach of confidentiality or a disciplinary complaint, or even criminal recourse in the form of false reporting. That said, many jurisdictions have enacted anti-SLAPP laws (SLAPP means "Strategic Lawsuit Against Public Participation") that immunize those who report matters to government agencies, even in bad faith, on matters relevant to that agency, and sport civil penalties and recovery of attorney fee provisions to the prevailing defendant. Those states that impose duties of confidentiality, such as California, Illinois, Texas, Kansas, and Georgia, may explicitly or implicitly exempt reporting suspected animal cruelty to law enforcement.

EXAMPLES

Take the rare case of a man maliciously kicking a pregnant dog in the abdomen, causing her to miscarry and with obvious trauma to the in-utero puppies. Under most cruelty statutes, the prosecutor could charge one count of cruelty to the mother for unnecessarily causing physical injury to a nonhuman animal. But what of the puppies? Virtually no cruelty statute explicitly defines "animal" to include the unborn, and technically a canine embryo or fetus is no less classifiable as an animal than a whelped pup. Even if applicable to the unborn puppies, most prosecutors would still need to prove death by means causing undue suffering or substantial pain, issues that remarkably portend the tremendous conflict over homocentric disputes such as abortion. For if the cruelty statutes protect pre-nonhumans, on what basis may one not similarly protect pre-humans under one of the numerous proposed fetus protection statutes? Others may even argue that a human fetus is a "nonhuman mammal" for purposes of the animal cruelty statute precisely because it has not attained viability outside the womb. There is also the question of whether the puppies' gestational affixation to the mother renders them indistinguishable from her, such that only one count of cruelty is appropriate. In much of civil animal law, unborn animals are considered accessions to personal property (i.e., a part of the whole that increases the value of the latter).

A green belt in karate was demonstrating her skill to her friends. She made as if to strike her parakeet with her foot; however, her kick broke the bird's neck and killed him. Assuming the cruelty statute protects avians, and that the pain or suffering can be proved, whether she is charged with criminal negligence or recklessness depends upon whether she took a risk that was both substantial and unjustifiable, which may turn on whether she took steps to mitigate the risk of death to the bird.

What if an individual wanted to humanely kill his sickly, suffering dog by using a revolver? He believed he was quite the marksman and thought he knew how to kill his dog instantly. Unfortunately, he did not fire properly. It took some time and a few more rounds to put his dog to rest. There is no doubt that during this time, the dog unduly suffered. There is clearly an *intent* to kill, but not an intent to kill with undue suffering. There *is knowledge* that the dog would die from being shot, especially improperly, but no apparent knowledge the dog would suffer as a result of his firing the first bullet. In this sense, there was only a *risk* of misfiring. Clearly, the man took a *risk* that he would not instantly kill the dog, and that the dog might needlessly suffer by euthanizing in this fashion. But was the risk *substantial*? Based on his experience as a sharpshooter? Based on his reliance on perhaps incorrect instructions on bullet placement? Was it *unjustified*? This may depend on the circumstances surrounding the fading health of the dog and the proximity to the vet. If substantial and unjustified, did he consciously create the risk (i.e., fail to take precautions to minimize or eliminate the risk and thereby show indifference to the outcome)? If so, he may be *reckless*. If there were a substantial risk that he did not consciously create (i.e., inadvertently), then he may be *criminally negligent*.

CAUTIONS

Though not routine, it is conceivable a veterinarian could find himself or herself facing extortion charges should he or she withhold possession of the animal pending the suspected abuser's signature on an owner surrender form; in short, threatening to call the cops if the victimized animal is not turned over to his or her care. In most states, threatening criminal prosecution in order to obtain property or money amounts to extortion in some lesser degree. On the other hand, one may defend against extortion if the threatened criminal charge is reasonably believed to be true and the sole purpose of making the threat is to compel the person threatened to right the wrong.

Mental state	*Likelihood of result/injury*	*Awareness*
Intent	Certainty	Aware and desirous of result
Knowledge	Certainty	Aware of conduct and result
Reckless	Substantial, unjustifiable risk	Aware but conscious disregard
Criminally negligent	Substantial, unjustifiable risk	Failure to be aware

Section 14

Planning and Decision Making

14.1. CAREER PLANNING

BASICS

OVERVIEW

Career planning is an integral component of career success. Regardless of talent, skill level, or experience, failure to appropriately plan can lead to the failure to reach one's full potential. The employment landscape has evolved during the last several years. As a result, professionals, especially those who are part of the Millennial Generation, are changing jobs more frequently than in the past, sometimes as often as every 18 months to two years. At the very least, the average professional should expect to change jobs four times by the time they're 32 years old.[1] This evolution underscores the need for career planning to an even greater degree, as an acceleration in workplace dynamics requires more forethought in order to take full advantage of premium employment opportunities.

Successful career planning requires the identification, integration, and management of several key factors. These factors include professional considerations such as passion, talent and abilities, skills assessment, and needs analysis. These factors also include personal considerations such as family, work-life balance, relocation, and personality/mindset. Successful career planning also requires the setting of both long-term and short-term goals, a corresponding plan of action that addresses both sets of goals, and accountability measures to ensure progress.

TERMS DEFINED

Career Planning: The continuous process by which an individual assesses the current state of their career, sets specific objectives for advancement and/or growth, and takes action designed to meet those objectives.

Hard Skills: These are teachable skills and quantifiable skills. This means they produce quantifiable results and you can be graded and/or evaluated for your ability.

Soft Skills: These are skills that involve the way a person interacts with other people, specifically their boss and coworkers within the workplace setting.

ISSUES AND OPTIONS

PROFESSIONAL CONSIDERATIONS

Passion

What a person is passionate about plays a central role in career planning, especially in terms of satisfaction. Any plan should include how passion can be continually pursued, and any course of action undertaken should reflect this pursuit.

Talent and Abilities

Natural talent and raw abilities often serve as the cornerstone of a career planning initiative, especially if that talent and those abilities line up with the person's passion. If an individual is good at something and they are also passionate about it, that combination serves as the driving catalyst for the creation of a career plan.

Skills Assessment

Talent and abilities translate into specific skills, which is important because those skills translate into the value that employers crave in the workplace. The more and better skills that an individual possesses, the more valuable they are viewed by their employer (and potential employers).

Needs Analysis

What a person wants professionally is a key factor in that person's career plan. This includes the type of work they want to do, the type of organizations and/or veterinary practices for which they want to work, and their clearly defined parameters for what they consider to be career success.

PERSONAL CONSIDERATIONS

Family

Career planning absolutely must include family considerations. This is especially the case if an individual is married and has children. Their plan should be created with the inclusion of whatever family dynamics apply to their situation.

Work-life balance

How much and how long a person is willing to work affects their career plan in more ways than one. First, it can affect the direction of the plan. Second, it can affect the pace of the plan. This personal consideration often goes hand in hand with the personal consideration of family.

Relocation

A person's ability and/or willingness to relocate directly influences the scope of their career planning. Once again, family is also a part of this consideration. A career plan often entails pursuing another employment opportunity and changing employers. In such a situation, it is important to determine priorities by asking the following questions:[2]

- Is this position more beneficial for my family in regard to income and benefits?
- Will our children be able to adjust to the move?
- Will this part of the country that we are relocating to benefit my family?
- Will my spouse be able to find a job?
- Will this position be essential for furthering my career? Or not?
- What will we gain or lose by relocating?

Personality/Mindset

A person's personality and their mindset or attitude regarding their career also affects their planning efforts. Some people take their careers more seriously than others. What is a priority for one person is not necessarily a priority for somebody else. Within this consideration, it is key for the individual to identify their priorities and apply them strategically to their plan.

SETTING OF GOALS

Long-Term Goals

Any career plan must have the end in mind. In other words, any plan must have an ultimate objective. This objective sets the direction of the plan, as well as the scope and the trajectory. After all, the overriding goal of a career plan is to reach the ultimate objective (or objectives, if there are more than one).

Short-Term Goals

These types of goals are critical for individuals pursuing their ultimate objective (or objectives). They serve as a "bridge" of sorts, connecting the individual with where they are in the present to where they want to be in the future. Short-term goals should be based upon the same professional and personal considerations that the long-term goals are based upon.

ACTION STEPS

There are two main ways for an individual to grow their career. They can grow their career with their current employer, or they can grow their career by seeking out and finding an employment opportunity with another organization. These two paths could include the following paths:

- A job change within their current employer, including through a promotion.
- A job change and a career change within the same industry.
- A job change and a career change to an entirely different industry.

The path that an individual takes and the corresponding short-term and long-term goals that are associated with that path dictate the appropriate course of action. For example, the following steps could comprise one or more courses of action:

- Engaging in continuing education programs, either within the current employer or outside of it
- Adding additional skills, either hard skills, soft skills, or both.
- Creating or developing a résumé or curriculum vitae (CV).
- Launching a job search for the purpose of identifying suitable employment opportunities
- Creating a cover letter to accompany the résumé or CV.

The action steps required for the achievement of both long-term and short-term goals with the career plan should be sequential, logical, and spelled out in no uncertain terms. Specifics are recommended and generalities should be avoided. Too much in the way of "gray areas" can derail a well-intentioned plan.

ACCOUNTABILITY MEASURES

A career plan with corresponding action steps for the achievement of short-term and long-term goals is only useful if the plan is effective. That is why a system of accountability, combined with analysis regarding the plan's execution, is paramount (see 2.6 – Accountability). While an individual could hold themselves accountable for the success of their plan, accountability with the help of a third party is the preferred method. That third party can take the form of one or more of the following:

- family member
- colleague
- career counselor
- career coach
- search consultant/recruiter.

Keep in mind that career counselors, career coaches, and search consultants can also help with a person's career planning efforts. Their knowledge and experience can be applied to nearly every step of the process, and their expertise can be instrumental in helping to determine important decisions. In the final analysis, the quality of decisions made ultimately dictates how successful a career plan really is.

EXAMPLES

N/A

CAUTIONS

It is dangerous during any career planning endeavor to not be open to at least considering opportunities, either those that a person uncovers on their own or those that are presented to them. Not being open to opportunity, for whatever reason, can be a career-limiting move. In addition, an aversion and/or fear of taking risks can also thwart even the most carefully constructed career plan. Remember: a plan is only as good as the extent to which it is successfully executed. Everything looks good on paper, but a person's career (and life) do not exist solely on paper.

MISCELLANEOUS

- Successful career planning (and execution) requires a proactive mindset, as opposed to a reactive one. This means taking proactive steps regarding one's career, including within the realm of networking, which is an essential ingredient in plan execution. When an individual is proactive, they are working from a position of strength, as opposed to a position of weakness. In addition, they create more options and opportunities for themselves, which results in better decisions. Good decisions ultimately form the cornerstone of effective career planning.
- As an extension of the proactive versus reactive mindset, the best time to search for a job is when you already have a job. (Remember that there are two main ways for an individual to grow their career. They can grow their career with their current employer, or they can grow their career by seeking out and finding an employment opportunity with another organization.) While this might seem counterintuitive, searching for a job when you already have one is the perfect illustration of moving from a position of strength as opposed to a position of weakness. When you operate from a position of strength, you have more options. When you operate from a position of weakness, you have fewer options.

14.2. Professional Development Plans

BASICS

OVERVIEW

Professional development plans are important for veterinary practices and other organizations. That is because they serve more than one purpose, and each of those purposes is crucial for long-term health and viability. There are three main aspects of a professional development plan. They can be classified as (1) onboarding/training, (2) skills development, and (3) career advancement and enhancement.

As far as the multiple purposes that a professional development plan serves, it helps a practice to maximize the productivity of new employees, infuse employees with more skills so they provide more value to the organization, and increase its retention rate of those employees overall. This promotes more continuity, more production, and ultimately more profit.

TERMS DEFINED

Hard Skills: These are teachable skills and quantifiable skills. This means they produce quantifiable results, and a person can be graded and/or evaluated for their ability.

Professional Development Plan: A plan assembled by an organization's management for the purpose of enriching its employee's skills and enhancing their careers, and at the same time aligning the employees' motives with the organization's business needs and goals.

Soft Skills: These are skills that involve the way a person interacts with other people, specifically their boss and coworkers within the workplace setting.

Transferrable Soft Skills: These are skills that involve the way a person interacts with other people that can be transferred between positions and even between industries.

ISSUES AND OPTIONS

Professional development plans are essential for all employees, but even more so for top-performing employees. There are two main reasons why this is the case. First, a veterinary practice or organization can least afford to lose its top-performing employees. Second, top-performing employees are the ones most likely to leave due to the fact that the organization does not offer a career development plan for its employees.

It is important to note that professional development initiatives can be conducted on both an individual basis and within a group and that professional development plans are a continuous process at all levels (see 3.14 – Staff Development).

ONBOARDING/TRAINING

Onboarding

Onboarding is the first and most important step in a professional development plan – see 3.9 – Staff Orientation (Onboarding and Integration). That is because if the employee is not onboarded properly, then they are at greater risk for leaving the practice. There are two phases of the onboarding process:

- **Phase 1: acceptance to employment.** During this two-week period, management must assure the new employee that they have made the correct decision. This helps prevent the person from accepting a counteroffer.
- **Phase 2: start of employment.** During this phase, management provides all of the paperwork, housekeeping details, and hardware and software tools to the employee.

Note that there is a degree of overlap between the second phase of the onboarding process and the start of training.

Training

All training within this aspect of professional development is related to either the employee's job, to the veterinary practice or organization at large, or both. This training includes, but is not limited to, the following:

- Job duties and responsibilities, both individually and in collaboration with others.
- Company policies as contained in the employee handbook.
- Company culture communicated either orally, in written format, or both.
- Training regarding updates to hardware and/or software.
- New products or services prior to or following release.

Other aspects to consider are those of method and setting, specifically how the training will be administered and where it will be administered. That depends, as one might expect, on the type of training involved.

For example, a training session regarding a new company policy would require a lecture format in a large group setting. Method and setting are at the discretion of the manager associated with the training.

In addition, evaluation measures must be undertaken to ensure training proficiency and skills acquisition. This often includes periodic performance evaluations, sometimes as often as twice per calendar year.

SKILLS DEVELOPMENT

This training involves skills and abilities that do not necessarily pertain to the employee's job or the veterinary practice or company at large. However, the organization stands to benefit tremendously from its employees continuing to hone and grow their skill sets. The following are some of the ways that it can benefit:

- Employees with more and different skills provide more overall value to the organization.
- These employees are better able to apply their skills and abilities to solve more problems.
- These employees can assume additional duties and responsibilities not part of their original job description.

Whereas the skills involved with onboarding/training are primarily hard skills, those involved here are primarily soft skills (although hard skills are not excluded). Specifically, they are classified as transferable soft skills, meaning that they can be applied within an employment setting, regardless of the industry or position. The following is a list of some of the more important transferrable soft skills:

- communication (both written and verbal);
- time management;
- sales (or put another way, the art of persuasion);
- emotional intelligence;
- leadership.

Of these, leadership is the most valuable to an organization's professional development efforts (see 2.12 – Leadership). That is because employees with leadership skills are candidates for promotion and management.

Skills development training within a professional development plan takes many different forms, depending upon the type of training involved. These forms of training are either formal or informal in nature, and they can be individual, one on one, or within a group. The following are examples.

- **On-the-job experience (informal).** During the course of employment, an employee is invariably confronted with unforeseen challenges. They could include additional duties or responsibilities, inclusion on a special project, or a critical assignment involving another department. All of these situations could result in the acquisition and development of important skills.
- **Employer-initiated training (formal).** This can take the form of special classes, online training, or trade shows and conventions. Some employers even have a tuition reimbursement program. Formal mentorship arrangements also fall into this category, which are beneficial for cross-training and succession planning.

• **Employer-initiated training (informal).** This example represents other opportunities that the employer offers to its employees, such as a training library of books and videos or DVDs or informal mentorship arrangements.
• **Employee-initiated training (formal).** An employee who decides to go back to school to further their education is an example of this type of training. In short, this also includes any type of formal training that their employer does not initiate.
• **Employee-initiated training (informal).** This includes anything that the employee does on their own to improve their skills and does not constitute a formal training situation. An example is reading books of their own accord.

If the veterinary practice or organization plans and pays for the training, it is employer initiated. If the employee plans and pays for it, it is employee initiated. Evaluation measures depend upon the type of training, the method, the parties involved, and the setting.

CAREER ADVANCEMENT AND ENHANCEMENT

In regard to top employees, this is the most important part of a veterinary practice's professional development plan. That is because top employees are most interested in growing their career, and there are two ways they can do so. They can either grow their career with their current employer, or they can do so by seeking an employment opportunity with another employer. There are two main areas of focus here:
1. **Advancement** – employees want to "climb the career ladder" through promotions.
2. **Enhancement** – employees want to enjoy the benefits and perks that are associated with advancement.

Consequently, a veterinary practice or organization must create a plan for employees, especially top employees, to advance and enhance their career within the organization. If it does not, then those employees are at risk for leaving.

As a result, the veterinary practice or organization should discuss career issues with its employees. Specifically, they should discuss the professional considerations of passion, talent and abilities, skills assessment, and needs analysis and the personal considerations of family, work-life balance, relocation, and personality/mindset (see 14.1 – Career Planning).

THE BOTTOM LINE

The bottom line in terms of professional development plans is just that: the bottom line. Employers that create, implement, track, and measure their plans benefits from the following:
• **More productive new employees.** Less ramp-up time means that new employees are completing tasks and solving problems more quickly.
• **More valuable employees.** Not only are employees more productive in a shorter amount of time, but they also acquire more and different skills, steadily increasing their value in many different ways over time.
• **Increased retention rate.** Employees who are part of a professional development plan feel more engaged with their employer and are less likely to leave for another employment opportunity.
• **Better workforce management strategy.** With greater retention comes more promoting from within and less need to hire from the outside. This saves time, money, and energy, not to mention the fact that employees who stay and grow with the company perform at increasingly higher levels.

EXAMPLES

N/A

CAUTIONS

An effective professional development plan can require a substantial amount of time, energy, and effort. However, if done properly, this investment can yield a tremendous return in terms of increased production, profitability, and retention. In addition, this plan is a continuous endeavor, evolving over time to meet the demands of the employees and the organization. As a result, veterinary practices and organizations should approach their professional development plans studiously and execute and measure them thoroughly.

14.3. RÉSUMÉ AND COVER LETTER

BASICS

OVERVIEW

A person's résumé and cover letter are more than just a compilation of dates, timelines, skills, and experience. They should work together to tell a story about how that person has provided value to their employers and how they can provide value to potential employers by solving whatever problems that employer is seeking to solve.

TERMS DEFINED

Hard Skills: These are teachable skills and quantifiable skills. This means they produce quantifiable results and a person can be graded and/or evaluated for their ability.

Résumé: A brief summary of personal, educational, and professional qualifications and experience, typically used as part of a job application.

Soft Skills: These are skills that involve the way a person interacts with other people, specifically their boss and coworkers within the workplace setting.

Transferrable Soft Skills: These are skills that involve the way a person interacts with other people that can be transferred between positions and even between industries.

ISSUES AND OPTIONS

RÉSUMÉ

The importance of the résumé lies in the purpose that it serves. It is a major component of both a job search and the hiring process:

- A résumé helps a job seeker get a telephone interview.
- A telephone interview helps a job seeker get a face-to-face interview.
- The face-to-face interview brings the job seeker closer to an offer of employment.

So, without a résumé, an offer of employment is nearly impossible. This underscores the importance of the résumé and the information that it should convey.

First, make sure that you title your document appropriately. Do *not* name it something generic, such as "My Resume" or "Document 12." Instead, give your résumé an accurate, descriptive, eye-catching title. Examples include "John Smith for Technical Services Veterinarian" or "Feline Veterinarian Janet Jones."

Physical appearance

- Avoid bright color paper, as that can distract from the contents of the résumé.
- Use a common font, such as Times New Roman or Arial. A font size of 12 is best, but a size of 11 or 10 is acceptable in some cases.
- Layout and spacing can vary in accordance with the template used.
- The résumé should be no longer than two pages.
- Do not include a photograph of yourself or a cartoon or funny graphic on your résumé. Employers use what are called applicant tracking systems (ATSs) for screening résumés. An ATS may not properly import your résumé if it contains any of these elements.
- If sending the résumé electronically, do so in a Word Document format. If you send a PDF version, the ATS may not import it properly.

Contents

Format

You can use more than one format for your résumé. However, the one that is recommended is the traditional format. There are three different types of traditional résumés:[1]

- **Historical/chronological.** This type is set up in reverse chronological order, most recent first. This style is best suited for those with significant experience in their field.
- **Functional.** This format uses titles (or job functions) as headings and may ignore historical format. Recent college graduates typically use this style.
- **Analytical.** This format uses skill fields as headings and also ignores historical sequence. If you have diverse experience or are trying to change careers, use this style.

No matter the traditional format that you use, make the work history as relevant as you can to your job search and tailor the résumé to the specific job for which you are applying. This entails more work on your part, but it also increases your chances for success.

Contact information

- Put your name at the top of the résumé. Do not simply write the word "Résumé" at the top. Use regular caps and not all caps, though you can use a bold face to make your name stand out.
- You do not necessarily have to provide a full mailing address, but at least include a city and state. This is needed in case relocation is an issue.
- List your cell phone number. Even if you have a home telephone number, include your cell number instead. Hiring managers know that you are more likely to answer your cell phone. Not only that, but some hiring managers text candidates, as well.
- Be sure that your voicemail message is professional. You do not want a potential employer to get the wrong impression from an unprofessional message or greeting.
- You should also include your e-mail address, since e-mail correspondence is common during the hiring process. However, include a professional-sounding e-mail address. If you are using an outdated e-mail service such as AOL or Hotmail, sign up for a Gmail account. They're free and easy to use.

Executive summary/professional summary

- Do not include a mission statement or an objective statement on your résumé. Instead, use an executive summary or a professional summary. If you state your mission or objective, then it might not line up perfectly with the organization's mission and current opening. But if you list an executive summary, then it might more closely align with the company's expectations.
- If you know exactly what you want, why not say it? It may be best to take a broad approach. For example, instead of writing a sentence like, "Seeking a career opportunity in industry," try including a simple title after your contact information, such as "Veterinarian."
- Include your title and years of experience first, then list special skills. Next, talk about your character traits or work style. Remember that this is a summary. Do not go over three sentences.
  - *Example.* Small Animal Veterinarian with more than 10 years of experience with two veterinary hospitals. More than three years of experience directing a hospital. Customer service oriented.
- Like every part of the résumé, you should strive to convey the potential value that you could bring to an organization.

14.3. RÉSUMÉ AND COVER LETTER

Qualifications
• Provide a few short statements that help to summarize your skills, abilities, and experience in a way that illustrates your value.
• This is a prime place to list things that do not fall under work history and experience, especially if it is a unique qualification.
Education
• Use reverse chronological order for the education section. List the names of the academic institutions and their locations.
• List the degrees that you have earned, including majors, minors, and dates.
• It is typically not necessary to include your high school in this section.
Professional experience (work history)
• Once again, it is important that this is listed in reverse chronological order and not chronological order. This can be confusing and misleading, especially if the person looking at the résumé does not look at it for very long. So, start with the job that you currently have.
• Then list each position held in reverse chronological order, going back at least 10 years. If you held multiple positions with the same employer, be sure to list all of them to show how you have progressed.
• List the name of the employer, its location, your job title, the dates that you held that job title, and a description of your job duties.
• Create your statements to be short, but impactful.
• Choose your words carefully and efficiently. Every word should convey and denote the value you possess as a worker and potential employee.
• You should describe your responsibilities and your accomplishments. The body of the position description has two parts: a description of your responsibilities and your accomplishments.

When detailing your accomplishments, remember to tie those accomplishments to tangible value. The following are 12 accomplishments that are of the most interest to employers:[2]
1. Increased revenues
2. Saved money
3. Increased efficiencies
4. Cut overhead
5. Increased sales
6. Improved workplace safety
7. Purchasing accomplishments
8. New products and/or new lines
9. Improved record keeping process
10. Increased productivity
11. Successful advertising campaign
12. Effective budgeting.

In addition, highlight hard skills, soft skills, and transferrable soft skills throughout your professional experience. The following is a list of some of the more important transferrable soft skills:
• communication (both written and verbal);
• time management;
• sales (or put another way, the art of persuasion);
• emotional intelligence;
• leadership.

When applicable, highlight these skills within the work history section (see 14.2 – Professional Development Plans). While hard skills are required, soft skills (and especially transferrable soft skills) are highly valued by veterinary practice owners and employers.

Formats for professional experience
There are two basic formats for organizing the professional experience section. They are feature–accomplishment–benefit (FAB) and situation–solution–outcome (SSO) formats.[3]
• **FAB.** Use the FAB format to organize your skills and sell your accomplishments:
  ◦ *Feature:* The actual responsibilities.
  ◦ *Accomplishment:* The performing of responsibilities.
  ◦ *Benefit:* How your performance affected your employer.
  ◦ *Example:* Small animal veterinarian.
  ◦ *Feature:* Turned around clinic.
  ◦ *Accomplishment:* Increased clientele base by 30% in one year.
  ◦ *Benefit:* Increased annual revenue by more than 45% in one year.
  ◦ *Statement:* Turned around clinic by increasing clientele base by 30%, which led to increased revenues of more than 45% last year.
• **SSO.** The SSO format might be used to demonstrate your problem-solving capabilities:
  ◦ *Situation:* What situation was your company facing?
  ◦ *Solution:* What did you do to solve the problem?
  ◦ *Outcome:* What was the outcome?
  ◦ *Example:* Vice president of sales.
  ◦ *Situation:* Company wanted to grow nongovernment business.
  ◦ *Solution:* Created and implemented commercial market penetration strategy.
  ◦ *Outcome:* Increased revenues over $50 million.
  ◦ *Statement:* Company wanted to grow nongovernment business. Developed business that resulted in the capture of commercial sales with increased revenues of over $50 million.

If you have had a gap in your work experience, fill that gap with something that adds value to your résumé. For example, it could be related to volunteering or charity work. However, do not make it appear as if you "disappeared" during that time.
Other relevant experience
• These are experiences that support the central theme and focus of the résumé. As such, they should be relevant and also convey value.
• List the experiences in reverse chronological order, including names, locations, position titles (if applicable), dates, and descriptions of the experience and any associated duties.
• This section can include voluntary work, especially if it falls with the parameters of the veterinary profession or serves as evidence of transferrable soft skills.
Honors/awards
• List the name of the honor or award and the date you received it and provide a brief description of it.
• Honors and awards earned at education institutions can also be included here.
Certifications/memberships
The veterinary profession requires and offers numerous certifications, some of which are prerequisites for certain jobs and some of which are supplementary in nature. However, they all support your value and should be included, starting with the most recent ones first.
Clubs/hobbies
• Clubs that pertain to the veterinary industry should be given preference, especially if membership in these clubs helps to further illustrate your value as a potential employee.

14.3. Résumé and Cover Letter

• List the full names of the clubs of which you are or have been a member, and also list the dates of membership for each.
• Hobbies are not 100% necessary on a résumé, but they can represent interests outside of work and may speak to how well-rounded you are as a person.
• If your hobbies can also convey your value, that is a bonus. Example: being fluent in more than one language and having a desire to become fluent in more languages.

References

• Do not write "References available upon request" on your résumé. This is an outdated statement that was common practice 20 years ago, but not today.
• Choose between three and five people to serve as references who can speak at length about your skills and your experience.
• Request permission from the people you choose to serve as references. Do not assume that they will be willing to do so.
• List references on a separate sheet of paper and not as part of your résumé. Include their full name, telephone number, e-mail address, and mailing address. Once again, be sure that you have permission to provide all this information.
• If a list of references is required at the time you apply for the position, then submit your references then. However, still take multiple copies of your references with you to your interview.

COVER LETTER

• A cover letter serves as the precursor to your résumé. It should introduce you and also entice the reader to investigate your résumé.
• As a result, your cover letter should not contain the same information that is contained in your résumé.
• A cover letter is not used in every situation, but it is advisable to have one ready. For example, you typically would not take one to a face-to-face interview, although you should have your list of references with you (as noted earlier).
• Use a professional grade of paper. Ideally, use the same type of paper that you used for your résumé for consistency's sake.
• The cover letter should be one page in length.
• Include the date at the top, followed by the addressee's full name and address.
• Single space the lines, and put a line between the paragraphs. You can left justify or align the paragraphs, depending upon your personal preference.
• Like the résumé, use a common font, such as Times New Roman or Arial. Also like the résumé, a font size of 12 is best, but a size of 11 or 10 is acceptable. (It is more acceptable than a two-page cover letter.)

Introduction

• If you know the name of the person who will be reading your cover letter, present a formal greeting, such as "Dear," "Mr.," or "Mrs." Do not use the person's first name. If you do not know the name of the person, then do your best to find out beforehand.
• Do not use "To Whom It May Concern." Like "References available upon request," this is an outdated practice.
• The two most common instances involving a cover letter include when you are applying for a specific job (in response to an advertisement or otherwise) or you are simply presenting your candidacy.

Applying for a specific job

• Reference where you saw the job advertisement.
• Explain what about the advertisement piqued your interest in the position.
• Mention briefly how your interests, background, and experience tie you to the position in a way that will compel the reader to read your résumé.

Presenting your candidacy

• Explain how you know about their organization, providing only relevant details.
• Explain why you are contacting them.

Note: if you have met or spoken with the person before, be sure to reference that prior contact. Be as detailed as possible so that you "jog their memory." Prior contact is a useful icebreaker and helps to engage the reader more easily.

Value Proposition

• Everything in the employment marketplace revolves around value. After the introductory paragraph is where you should describe the value that you could bring as an employee (see 9.6 – Value-Added Analysis).
• Convey your value in terms of both your experience and your skills.
• Remember that in terms of skills, value is defined by hard skills, soft skills, and transferrable soft skills.
• Tie your experience, your hard skills, your soft skills, and your transferrable soft skills first to the position for which you are applying (if you are applying for a position) or frame them in a way that conveys the value that you could bring to a potential new employer.
• If you have conducted research about the veterinary practice or organization (and you should have), this is the time to reference the results of that research, in as much as it relates to the position and/or your candidacy. This is especially the case if you are presenting your candidacy and are not applying for a specific position. This shows both interest and initiative.

Closing

• This is the section where you should include one or more calls to action (CTAs). Ideally, you want the person who is reading your cover letter to also read your résumé (one CTA). Then, you want them to contact you, either over the telephone or via e-mail (another CTA).
• Not only can you ask for action on their part, but you can also express the fact that you plan to take action. Indicate that you will follow up with them, once again either by telephone or e-mail or both, at a time in the future. You can either designate a time or leave it open ended.
• If you indicate that you plan to take action, then you must be prepared to follow through. Doing what you say you are going to do is the number one way to brand yourself as dependable and reliable, which also illustrates your value.
• However, do not "stalk" the person. If you have attempted to follow up and have not been able to initiate contact, repeatedly attempting to do so can ultimately work against you.
• Use a common closing, such as "Sincerely" or "Cordially." Do not get too creative with your closing. What you see as creative another person might see as unprofessional.
• Type your full name with your title and/or degree after it, with the appropriate number of spaces left above for your signature.
• You can either include contact information following your name, or you can use a letterhead that includes your contact information at the top of the page.

14.3. RÉSUMÉ AND COVER LETTER

EXAMPLES

See 15.2 – Sample Résumé and Cover Letter.

CAUTIONS

• Your LinkedIn profile is *not* the same thing as your résumé. Unfortunately, job seekers and candidates have been attempting to treat them as interchangeable during the past few years. However, they are not interchangeable and should not be treated as such.
• If a hiring manager or a recruiter asks you to send your résumé, you should send it to them as an attachment in an e-mail.
• Though your LinkedIn profile is not your résumé, it is advisable that you update your LinkedIn profile at the same time that you update your résumé.
• It is recommended that you update both your résumé and your LinkedIn profile at least once per quarter, or more frequently if that is warranted.

What *not* to include on your résumé:

• Do not include personal information on your résumé. This includes your ethnicity, your religion, and your children.
• Do not disclose your marital status.
• Do not disclose your current salary information.
• Do not include your social security number.

Above all, be truthful when constructing your résumé. One of the things that job seekers lie about the most is job experience. If you lie to get the job, you will almost certainly be found out. It is extremely difficult to fake experience. Not only will you be fired, but your reputation will also be tarnished within the industry.

Speaking of which, the veterinary industry is a small one. People within it travel in the same circles. This increases the chances that any lies you propagate with your résumé will eventually be discovered and you will be dealt with accordingly.

MISCELLANEOUS

ABBREVIATIONS

ATS: Applicant Tracking System
CTA: Call to action
FAB: Feature–accomplishment–benefit
SSO: Situation–solution–outcome

14.4. CURRICULUM VITAE

BASICS

OVERVIEW

A curriculum vitae or vita (CV) is a special type of résumé used extensively in countries outside of the United States. Within the United States, a CV is typically used only within the academic and/or medical communities, including the veterinary profession. A CV differs from a résumé in many ways, starting with the fact that it is exceptionally detailed and is not held to length restrictions. As such, a CV includes numerous sections and subsections containing information such as degrees earned, teaching experience, publications, presentations, and any research that has been conducted, among other things.

TERMS DEFINED

Curriculum Vitae (CV): An ongoing account of an individual's education, qualifications, and experience.

ISSUES AND OPTIONS

FORMAT

- Use standard-sized letter paper, which might be 8.5 in. × 11 in. (215.9 mm × 279.4 mm) in North America, but could be A4 elsewhere (210 mm × 297 mm or 8.26 in. × 11.69 in.).
- Like the résumé (see 14.3 – Résumé and Cover Letter), use a traditional font like Times New Roman or Arial. In terms of font size, 12 point is preferable, although you can use 11.
- Also, like the résumé, use reverse chronological order throughout, meaning that the most recent information is listed first.
- Since there are no length restrictions, it is important to number the pages of the CV. You may also list your name in the footer section of each page, depending upon your preferences.

CONTACT INFORMATION

- Put your full name at the top of the CV.
- List your cell phone number and your home telephone number if you have one.
- List your full address. Although just the city and state are needed for résumés, the CV requires more information.
- List the e-mail address at which you would like to receive correspondence, but make sure that the address sounds professional and does not tarnish your CV.

EXECUTIVE SUMMARY/PROFESSIONAL SUMMARY

- Like the résumé, do not include a mission statement or an objective statement on your résumé. Instead, use an executive summary or a professional summary.
- The overall goal is to convey the value that you could bring. If possible, tie your summary and your CV as closely to the value that the organization is seeking as you can.
- Include your current title in your summary, as well as years of experience and any special skills. Do not go over three sentences.

EDUCATION

- Once again, list all information in reverse chronological format.
- Start with academic institutions that you have attended, including dates and locations.
- List the degrees you earned while at these institutions, spelling out the name of each degree.
- Include majors and minors, and in the case of graduate programs the title of your thesis.
- This section can also include academic honors, as well as internships and residencies.

PROFESSIONAL EXPERIENCE (WORK HISTORY)

- Once again, use reverse chronological order.
- List the name of the employer, its location, your job title, the dates that you held that job title, and a description of your job duties.
- If you held multiple positions with the same employer, be sure to list all of them to show how you have progressed.
- You can include internships (paid or otherwise) and unpaid positions.
- You can include specialized skills within this section, or you can include them in a separate section. Noteworthy skills could be those associated with using specific pieces of lab equipment, being familiar with technology tools and computer software, and the ability to speak and/or read a foreign language.
- Unpaid consulting experience can also be listed here. If applicable, include the name of the organization and the dates of your consultation.

OTHER RELEVANT EXPERIENCE

- Any experience deemed relevant to the CV and not included in another section can be included in this section.
- List the experiences in reverse chronological order, including names, locations, position titles (if applicable), dates, and descriptions of the experience and any associated duties.

TEACHING EXPERIENCE

- Once again, use reverse chronological order.
- Include the institution's name and location.
- Also include the course title, the course number, and the semester that you taught the course.

CERTIFICATIONS

- These can also be listed in reverse chronological order, so that the most recent certification is listed first.
- Include the name of the certification, the name of the organization or institution that issued it, and the date that it was issued.

HONORS AND AWARDS

- Use reverse chronological order.
- List the name of the honor or award and the date you received it and provide a brief description of it.
- You can categorize the awards within this section, if this is applicable. Those categories would be academic, professional, and community.

RESEARCH-RELATED ACTIVITIES

- There are many ways in which to segment the information in this section. However, there are two main categories: presentations and publications.
- In the presentations category, include speaking engagements, providing information such as date, venue, title of presentation, and format of presentation (paper, poster, etc.).
- Publications encompass anything falling within the realm of the written word. This includes the traditional medium, such as journal articles, magazine articles, and books, and the technology-driven medium, such as blogs and e-zines.
- Once again, include the name of the publication, the title of your work, and the date that it was published.

GRANTS

- Include the standard information under this section, which includes the name of the grant, the source, the amount funded, and the dates.
- An attractive ratio of grant writing to grant funding is a boost to any CV, as funding is unsurprisingly the bottom line in this section.

SERVICE ORGANIZATIONS

- As always, use the reverse chronological format.
- Once again, you can divide the memberships into the categories of academic, professional, and community.
- Include the name of the organization involved with the service and the dates of the service.

• Leadership positions are often highlighted here, so it is acceptable to also include accomplishments or achievements associated with the service.
• Volunteer work can also be listed here.

MEMBERSHIPS

• As always, use the reverse chronological format.
• Similar to the service section, you can divide the memberships into the categories of academic, professional, and community.
• List the full names of the organizations of which you are or have been a member, and also list the dates of membership for each.

PROFESSIONAL DEVELOPMENT EFFORTS

• It is imperative on a CV to illustrate the fact that you are continuing to improve your skills and increase your knowledge. Anything that serves that purpose should be listed here.
• You can divide your efforts into two categories: professional and academic. However, since there might be crossover between the two, such a division is not necessary.
• Include conferences and conventions, as well as workshops and webinars.

REFERENCES

• Choose between three and five people to serve as references who can speak at length about your skills and your experience.
• Request permission from the people you choose to serve as references. Do not assume that they will be willing to do so.
• Include their full name, telephone number, e-mail address, and mailing address. Once again, be sure that you have permission to provide all of this information.
• If a list of references is required at the time you apply for the position, submit your references then. However, still take multiple copies of your references with you to your interview.

ADDITIONAL COMMENTS

• Like a résumé, update your CV frequently. In fact, considering all of the information that it contains, you should probably update it more often than you would your résumé.
• Your CV can serve as the pool from which you draw to create and fine-tune your résumé. Since the CV serves as the complete record of your academic and professional career, you can pick and choose which elements to also include in your résumé.
• You may wish to maintain different versions of your CV in terms of content. These versions could emphasize different aspects of your academic career, so that you can use whichever version best suits a particular situation.
• A CV can be beneficial for those working in the animal health industry, especially those working in research and development. There is much in the way of course work, lab work, and animal handling associated with these vocations. By creating and updating a CV early in your career, you can better position yourself for success by creating an edge over other professionals in the employment marketplace.

EXAMPLES

See 15.3 – Sample Curriculum Vitae.

CAUTIONS

• Do not mix up the terms CV and résumé. In other words, do not submit a CV when a résumé is required and do not submit a résumé when a CV is required. When in doubt, inquire about what exactly is needed.
• Like a résumé, it might be necessary to tailor your CV to the position for which you are applying. Using the same CV in every situation will not serve to optimize your efforts, and in fact it could end up ultimately hampering those efforts.

14.5. STRATEGIC PLANNING AND IMPLEMENTATION

BASICS

OVERVIEW

Creating an organizational plan for a practice to experience significant financial improvement requires forward-thinking strategic initiatives. Improving existing operations will likely lead to improved circumstances, but substantial improvement (normally greater than 25%) typically requires changes in hospital processes themselves. Whereas examination of financial reports can tell a practice what it has done over the recent and distant past, it cannot provide a "roadmap" for substantial improvement going forward. This is the job of strategic planning.

TERMS DEFINED

Business Assessment Report Kard (BARK™): Strategic planning process designed to evaluate veterinary practices.

Microwave Thinking: The mistaken perception that if changes are made then results will be quickly evident. Most changes made will yield gradual improvement, which can be difficult to appreciate in times when instant gratification is expected.

Nonlinearity: A relationship between *x* and *y*, wherein a unit change in *x* will not always bring about an equal unit change in *y*. The graphic representation of this relationship is a curve rather than a straight line.

Strategy: A plan or action to achieve a specific end, typically within a long time frame (usually greater than a year). Often, strategies are achieved by utilizing various tactics to achieve specific aspects of the overall strategy.

Tactic: A plan or action to achieve a specific end, typically within a short time frame (usually less than a year, but occasionally spanning a few years).

Value Proposition: Description of the value that a product, service or process will provide to the pet owner, hospital, and staff.

ISSUES AND OPTIONS

THE STRATEGIC PLANNING PROCESS

• Numerous studies have documented what veterinary practitioners and consultants have known for years: that veterinary practices are inherently costly to operate and many provide an insufficient margin of profit to adequately compensate owners and staff for their contributions and as a return on investment. However, this information alone is insufficient to suggest ways to remedy the situation.

• Similarly, the availability of benchmarking data (see 7.6 – Benchmarking) and even evaluating financial statements (see 7.2 – Financial Statements) for a practice provide valuable insights into the revenues and expenses of veterinary practices, but do not provide useful information as to how to change things so that future financials are more profitable for a practice.

• This problem with using past financials as a predictor of future success is not unique to the veterinary profession. Today's news reports are filled with stories of companies with high stock prices in past years that have not maintained their value in the marketplace, sometimes declaring bankruptcy. Past success, it turns out, is not a very good predictor of continued or future success.

• Future success is better defined by incorporating staff and business process changes that are likely to be responsive to client needs, and to do so on relatively short notice. It is also important to avoid so-called "microwave thinking," the mistaken belief that results will occur quickly rather than gradually, which is most likely. One of the best ways to encourage this process is to use established strategic planning tools. There have been several such approaches used in industry. The Business Assessment Report Kard (BARK™) was developed by Dr. Lowell Ackerman as a strategic planning model specifically designed for veterinary practices.

BUSINESS ASSESSMENT REPORT KARD (BARK)

The fundamental design of a strategic planning initiative is to deliver exceptional medical care and client service in a team-based fashion, pay staff appropriately for the value they deliver, pay employed veterinarians (associates) appropriately for value delivered, provide practice owners a fair return on investment, and then charge clients appropriately for the value they receive. In some cases, this might mean adding services, in others it might mean changing the way services are delivered, and in other cases it might suggest discontinuing services that cannot be delivered profitably (see 9.6 – Value-Added Analysis).

In a well-designed strategic plan, there is a division of duty between the management team (trained practice management consultant, owners, and hospital manager/administrator) and the hospital staff who will be implementing the changes; however, the strategy and execution must be considered simultaneously, and should be shared with all stakeholders (see 14.10 – Business Plans). The duties of the management team are to:

• Explore strategic opportunities, such that good medicine is practiced, appropriate fees are established, and profit will naturally follow from implementation of the opportunity.

• Create actionable objectives that will be able to be implemented by the staff. This is critical, because many mission statements are vague and without specific direction (e.g., to practice the highest quality of medicine possible). Once the objectives are determined, then strategies should be developed that will be aligned with those objectives. From these strategies, tactics will be developed with the staff, who will effectively implement them (see Figure 14-5-1). The tactics on their own might be diagnostic at first (e.g., compliance audit), but the next step will involve specific actions to fulfill the strategies, which in turn will deliver results aligned with the practice goals.

• Assess the value proposition, the value that will be delivered to all stakeholders by the implementation of the process. This is important, because if management sees the value but the staff does not, implementation will be problematic.

Once a core group of actionable objectives has been created, the value of which is evident to all stakeholders, then specific plans (tactics) for implementation should involve staff. In many cases, teams are the most effective way to ensure the success of the process. This is more like acting as captain of a ship rather than dictator of a small empire. Management determines the destination for the voyage and the best route to get there, and the staff explores options for ensuring smooth sailing, acting tactically on smaller pieces of the strategy. Staff should work together on the following steps:

• Setting specific target goals that serve as markers along the path of strategic accomplishments. All goals must be measurable, and teams must agree on the goals and the time to accomplish them.

• The team needs to improve capabilities within the practice to allow the goals to be realized. For example, if one of the goals is to increase the number of dental procedures, there may be a need to buy equipment, train staff, develop and print client educational materials, design a marketing campaign, and increase scheduling time slots for dental procedures.

• All progress must be measured by a yardstick agreed in advance by staff. For example, on a pathway that leads from 20% of senior pets getting age-appropriate assessments to a goal of 80% compliance, the team may plan on getting to 30% compliance by the end of the first three months of the initiative. In the BARK format, grades are given in progress reports so that it is immediately apparent to all concerned whether the strategic initiative is still on target, proceeding as anticipated, and delivering the outcomes intended.

14.5. STRATEGIC PLANNING AND IMPLEMENTATION

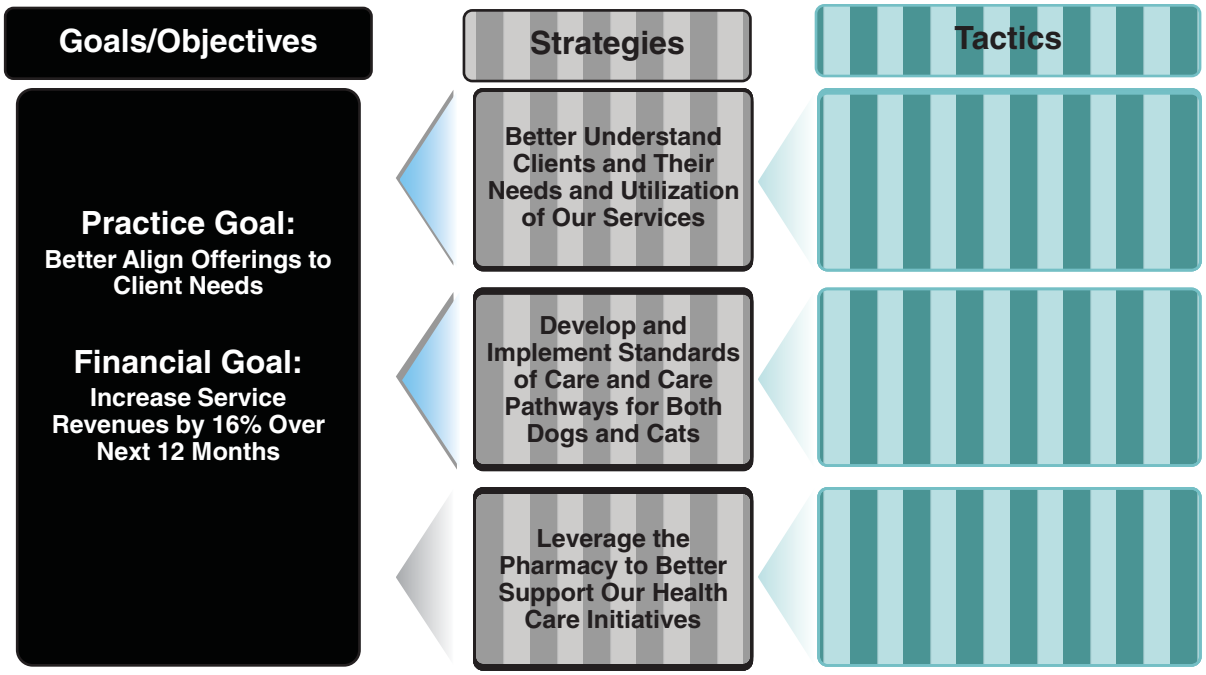

Figure 14-5-1.

To ensure alignment, practices should create specific strategies that support their goals, and then work with staff on specific tactics and actions that will fulfill those strategies.

• The final step is continuous quality improvement, in which new goals are set and the process continued. For example, once 80% compliance on senior testing is achieved, the team may elect to try for ongoing 85% compliance and examine the hospital processes that would need to be improved to allow this to reasonably happen.

IMPLEMENTATION

Strategic planning is a valuable exercise, but many veterinary practices have excellent business plans and never manage to achieve their goals. The answer for hospitals is not in the plan itself, but in the discipline needed to implement it. It is important not to underestimate the challenges involved in overcoming inertia and actually putting plans into action.

Implementation takes more than just providing the strategy to staff – it takes leadership (see 2.12 – Leadership). It is the hospital leadership that appreciates the "big picture" of the goals to be obtained; that is sometimes lost in the tactics that the staff are asked to implement.

It is also important to overcome the natural tendencies of employees to be suspicious of change and how it might affect them (see 2.7 – Change Management). Along with those suspicions, it is also critical to manage the inefficiencies that are bound to occur while implementing change. For example, leadership may identify that new practice management software may be needed to support new initiatives, including pricing model changes, creation of personalized pet profiles, supporting customer relationship management, and integrating new technology that would need to be scalable and cannot be easily accommodated with the current software. Although most employees complain about aspects of practice management software, and from time to time might actually suggest that it be replaced, they tend to be protective once the decision has been made and they realize that they are going to have to master a new system and that the features they are used to may not be conserved in the new system. Accordingly, there is going to be a documented drop in productivity following implementation, until a certain degree of competency has been achieved, and this productivity drop must be anticipated and actively managed to keep staff on task (see Figure 14-5-2). In fact, prior to implementation, the staff might be asked to identify steps in the implementation progress where productivity might suffer and to develop tactics to help mitigate those circumstances.

When strategic planning leads to big changes happening, it is critical to ensure staff alignment and to actually assign tasks and monitor accountability of individuals on the hospital team (see 2.6 – Accountability). This is best accomplished with an implementation plan (see Figure 14-5-3). Each employee should fully understand their role in accomplishing the hospital goals and any deliverables expected, and the timeline for completion, which is compatible with the overall timeline to achieve strategic targets. For major projects, each employee should have their own implementation plan, for which they are held accountable; for smaller goals, there can be one implementation plan but one in which individual assignments are clearly evident. These plans should be shared so everyone understands and appreciates the role each colleague plays in accomplishing the overall goal. This not only makes it easy for staff members to understand their personal

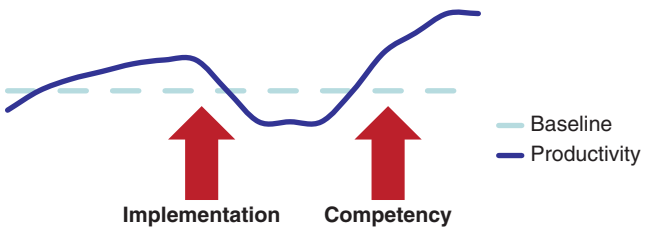

Figure 14-5-2.

It is important to appreciate that with any major change implemented there will be a temporary drop in productivity until a certain degree of competency is achieved. This must be effectively managed.

14.5. STRATEGIC PLANNING AND IMPLEMENTATION

Tactic	Action/Outcome	Target Completion Date	
		Start	Finish
Parasite Prevention	• Compliance audit of active canine (30) and feline (30) patients to determine baseline compliance for parasite prevention and vaccination		
	• Develop marketing materials for integrated parasite control for both cats & dogs		
	• Monthly reporting of trend data showing progress toward goal		
Pharmacy Management	• Compile list of current human medications dispensed and any veterinary-labeled alternatives		
	• Compile list of products that would improve convenience and compliance for owners (e.g., injectables and medications easy for clients to use at home)		
	• Develop formulary that eliminates 25% of existing inventory while better aligning with our standards of care		
	• Compile comparison list of our charges with those of retail and online competitors		
Client Needs	• Conduct customer service survey and set specific targets for improvement based on customer feedback		
	• Perform demographic assessment to help determine future opportunities		
	• Determine percentage of our clients coming to us because of referrals from friends and family, versus coming from our marketing efforts; set target for improvement		

Figure 14-5-3.

Implementation plans help ensure that everyone appreciates their personal responsibilities in achieving overall goals for the hospital.

responsibilities in project management, but also makes it impossible to hide from tasks not completed on schedule. To accomplish goals on schedule, it is imperative that a sense of urgency be conveyed and accountability established, so staff can fully appreciate the prioritization of the strategic plan. It is not critical that every task be listed in an implementation plan – it is important to concentrate on the high-value targets needed to guarantee the success of the overall project, realizing that there are likely many other component parts that will need to be addressed to achieve those high-value targets.

EXAMPLES

The ABC Veterinary Hospital management team decides to take a more strategic look at its processes and hires a consultant to BARK the practice and guide them through the process. In a strategy session, the team decides that they will implement and measure six core initiatives. One of those initiatives is for genetic screening, which currently is not being done in any deliberate fashion within the practice. The management team determines that if screening is accomplished as planned, then not only will an important medical service be delivered, but also a significant profit margin (that was specified) could be achieved by better managing pets across their entire lifetime, based on preliminary budget estimates.

The management team created an initiative on implementing a genetic screening program in the hospital, with only some basic information: that there were at least several dozen genetic tests available for specific conditions (including von Willebrand disease, several forms of progressive retinal atrophy, and many others), that early diagnosis and management were important, and that the practice was not currently meeting the needs of pet owners in this regard.

A team of staff members, including an associate (employee veterinarian), nurse, and receptionist, agreed to take on the project and help correct the situation. After a preliminary research session of their own, they reported back to the entire hospital staff that there were actually hundreds of genetic tests that the clinic was not currently utilizing, that it was possible to run many in a single cost-effective profile, and that there were opportunities for screening both dogs and cats, and purebreds as well as mixed-breed animals. The team evaluated laboratories to determine which could provide resources for staff training and implementation in addition to results, set a strategy to validate their plans and to create care pathways (see 9.3 – Standards of Care and Care Pathways), and established guidelines of how to monitor and treat pets on the basis of such tests, and to suggest when referral of screened animals might be indicated.

They proposed a budget that would include staff training of at least one veterinarian and one nurse in the practice, resources on heritable diseases and genetic testing, production of client education materials, and some changes to the computer software that would facilitate the process. The receptionist provided valuable information about how clients could be informed about the protocol when they were making appointments and suggested that it might be worthwhile to actually send the clients a link for them to complete questionnaires prior to the visit, so the staff would have this information to discuss with the client during the visit. There was also discussion of how to schedule these

sessions and whether it would be worthwhile to add a "genetic screen" as an option to any pet coming in for puppy or kitten visits. The nonveterinary staff would drive the initiative to pet owners, and if the training and other processes could be done in a timely fashion then the initiative could be implemented in earnest within three months. The hospital staff and management team both agreed that their preliminary goal should be genetic screening for the purposes of prevention and early detection, to fulfill one of their other core goals of delivering pet-specific care (see 4.8 – Pet-Specific Care). It was determined that advanced diagnostics was not a feature of this current strategy, and those cases would still be referred to a specialist for confirmation and further scrutiny.

CAUTIONS

Although management and staff need to work together, there are advantages to splitting duties in the creation of a strategic plan. In creating strategies, the hospital is concerned with the practice of veterinary medicine as well as being able to operate a profitable business. Accordingly, the management team creates a plan that, if implemented correctly, will meet both the medical and financial goals of the practice. Staff, on the other hand, must be clear of purpose that they are providing a useful medical service; the profitability from the hospital perspective should not be a major objective for the staff. Their goal is the provision of excellent medical and client services. It can be very detrimental for practices if staff believe that healthcare initiatives are profit driven rather than a consequence of excellent healthcare delivery propositions. Similarly, staff should not be rewarded on the basis of revenue enhancement for a practice; they can, however, be rewarded for excellence in client service.

In the process of strategic planning, it is important to realize that the obvious choice is not always the best choice, and it may not even be the correct choice. Bias exists in many of our assumptions, and often leads to results that do not match expectations. For example, profit is a reflection of cost, volume, and price, and all are interrelated. If our costs go up, we would need to increase either price or volume to maintain profit. If we decide to cut our prices to be competitive, we would need to be able to either cut costs or increase volume to maintain profit. However, one might be surprised to learn that this relationship is not linear. Accordingly, you might find that discounts given are much costlier than first imagined (see 8.17 – Discounting). This nonlinearity is prevalent in many strategic considerations, such as making strategic plans to improve the clinic's website ranking for veterinary hospitals in a geographic area. If the primary goal is to increase website traffic, then most can appreciate that it requires significantly more effort to raise the rank two places, from four to two, than it does to raise it four places, from eight to four. It is important to take nonlinearity into consideration during strategic planning efforts, as it occurs more commonly than most planners appreciate. To attain success with strategic planning, it is important to focus on outcomes over crude metrics, especially when there is not a linear relationship between the two.

MISCELLANEOUS

In any strategic action plan, it is important to regularly determine whether the plan is still on target, whether the stakeholders are all happy with the program, and whether the target is still desirable. Strategic plans are fluid and flexible, and some plans may not be able to be successfully implemented. The most important aspect is to be responsive to the needs of clients and to alter programs accordingly.

14.6. IDENTIFYING AND SOLVING PRACTICE PROBLEMS

BASICS

OVERVIEW

- To make any problem-solving system work one needs to have developed and implemented a process or system.
- There are multiple types of concerns, issues, or problems that may arise in a veterinary practice:
  - financial
  - human resources
  - managerial
  - inventory.
- Each type of problem has its own set factors to be considered.
- Every practice needs to establish an organizational chart to aid in identifying how or where a decision can or should be addressed (see 2.2 – Organizational Charts).
- Organizational charts provide the framework of decision-makers.
- Every practice needs to have both a vision and a mission statement that gives the practice the tools to assist in making decisions (see 14.9 – Mission and Vision Statements)
- What are the core values of the practice?
  - Core values give the groundwork of how decisions in the practice can be made.
  - Core values are basic tools for decision-making.
  - They can consist of being ethical, how we treat our patients, clients, and our fellow team members.
- The development of measurable goals to manage your practice.
- The establishment of either industry- or company-specific benchmarks to measure yourself against.
  - Industry averages are a great starting point, but company specific is better to track trends.
  - Average is a starting point. Strive to be exceptional.

TERMS DEFINED

Benchmarks: Numbers, percentages, dollars, or some type of measurable quantity for a given period of time that are industry standards.
Budget: Quantitative expression of a financial plan of action for the practice.
Core Values: Belief system of the practice – the cultural values that give team members the tools to make decisions for the practice.
Culture: Personality of the practice. It tells the history and beliefs of the practice and sets the tone for giving the practice the competitive advantage.
Mission Statement: Statement that clarifies the way the organization plans to achieve its goals.
Organizational Chart: Overview of who reports to whom within an organization.
Self-Directed Teams: Self-managed group of employees who work together to produce a product or service. The process by which empowerment of team members at the local level is made to effectively make "operational" decisions without deferring to a supervisor or other manager for their area. These individual groups define and train for the process needed to achieve the goals of the practice.
Standard Operating Procedures (SOPs): Preferred methods of doing a procedure or protocol in the practice.
Systems: Methods to create positive repeatable outcomes for the patient, the client, and the practice. Each area of the practice (client service, technical services, doctors' procedures, inventory, etc.) need job descriptions or SOPs.
Vision Statement: Statement that defines and clarifies the direction in which an organization needs to move.

ISSUES AND OPTIONS

TOOLS

- The SOPs contain a wealth of protocols or processes for the practice to operate more efficiently and effectively (see 9.3 – Standards of Care and Care Pathways).
  - Contains protocols or procedures for a multitude of jobs in the practice.
  - Can be developed for all departments in the practice as well as for management duties.
- Self-directed teams allow groups (client service, technical services) to make decisions at a local level.
  - Each group is their own operating team and contributor to the success of the practice.
- The budget is the primary financial management tool to control costs in the practice (see 8.21 – Controlling Cash Flow: Budgeting).

14.6. IDENTIFYING AND SOLVING PRACTICE PROBLEMS

- A budget provides a written financial expression of the policies and plans of the practice for the upcoming year.
- It provides a basis for the evaluation of financial performance of the plans and policies.
- It provides a very useful tool for the controlling of costs if you review it and use it on a regular basis. A good budget is flexible and not set in stone.

• National benchmarks and practice trends are a very important element to financial management of today's veterinary practices (see 7.6 – Benchmarking).

- Benchmarks are the initial standard to achieve.
  - Example: an exclusive small animal practice will expense 15–18% on drugs and medical supplies.
  - Example: the average number of new clients seen by a full-time employed veterinarian is 25–30 per month.
  - Example: the average medical revenue generated per veterinarian in practice is $582,000 per year.
- Achieving a national benchmark is great, but improving on those benchmarks is even better.

• The employee handbook (or manual) communicates the practice's policies, protocols, and operations to each employee (see 3.21 – Employee Manuals).

- The manual gives employees important information related to their employment with the practice.
- It should be reviewed annually. If there are any changes or amendments to be made then correct them as soon as possible.
- Make sure all employees read and understand any changes in the handbook and have them sign off on these changes.

• Nearly all of the problems in a veterinary practice can be identified by any of the "tools" previously described.

- All policies, benchmarks, trends, protocols, and budgets should not be static in nature. They need to be dynamic, and the practice should be constantly striving to improve on their benchmarks.

• A practice needs to perform a yearly strengths, weaknesses, opportunities, and threats (SWOT) analysis (see 6.7 – Basic Tools of Marketing):

- S is for the strengths of the practice. What do you do well?
  - An example would be a well-trained staff.
- W is for the weaknesses of the practice. What is the practice doing poorly?
  - An example would be an old building needing remodeling.
- O is for opportunities. What opportunities (e.g., ultrasound) can the practice develop into a new profit center?
  - An example could be adding advanced dental procedures.
- T is for threats. These are areas or issues outside of the control of the practice (i.e., a new road being built through the facility).
  - An example could be maintaining an accurate drug log in case you are inspected by the Drug Enforcement Agency.

BENCHMARK ISSUES

• There are several sources available for acquiring benchmarks to build your budget and monitor the actual percentages (see 7.6 – Benchmarking):

- The American Veterinary Medical Association annually publishes specific revenue and expense percentages for all types of small, large, mixed, and equine practices.
- The American Animal Hospital Association publishes several books (e.g., *Financial and Productivity Pulsepoints*[1]) with national and regional benchmarks.
- The American Association of Equine Practitioners has developed some benchmarks for the equine practitioner.
- The *Well-Managed Practice* series that Denise Tumblin, CPA, publishes annually.

• Benchmarks do not accurately reflect the individuality of a practice, but they set the stage for making needed changes.

EMPLOYEE MANUAL ISSUES

• The employee manual (EM) gives valuable information to employees and allows for consistent management instructions (see 3.21 – Employee Manuals).

• The EM can allow for quick resolution of employee complaints before they become serious.

• The EM needs to be reviewed by the practice attorney to ensure that the contents (when indicated) follow the laws or statutes of your state.

• A practice has a contractual agreement when it publishes its EM. If it is not upheld by management and makes it into a court of law, a court may consider the practice as violating its own contract.

• The practice needs to evaluate and update its manual on a regular basis (yearly) to ensure it is compliant with the laws of the state and federal government.

SOPS ISSUES

• When the practice has a unified and defined vision, mission statement, and clear goals, the protocols should be written by the employees who are performing the tasks.

- Example: how the phone should be answered.

• By allowing the team members involved with the process to develop and evaluate their own SOPs gives the employees ownership and accountability for their positions.

14.6. IDENTIFYING AND SOLVING PRACTICE PROBLEMS

• Creating self-directed teams to develop the SOPs allows more operational decisions to be made at the local level without the need to seek a higher authority as defined by the organizational chart.

EXAMPLES

• It is the end of the first quarter of the year and the practice recognizes that the number of new client visits is down by 20% from the previous year's benchmark, and the weather has been mild, and the general economy is stable.
  ◦ As a gentle reminder, before making a decision on a situation, every product, service, and policy in a practice needs to create a benefit for the patient, client, and the hospital. Evaluate any situation by addressing the benefits for each stakeholder. If benefits (for all) cannot be found, either they need to be fixed to show a benefit or they need to be discarded.
  ◦ The trend is down, and there is one item in the tool kit to directly address this situation: SWOT analysis.
    ▪ Check to see if there is a weakness that is affecting how clients feel about the practice.
    ▪ Is there a new threat that is not allowing clients to get to the hospital?
  ◦ Have the office manager perform a new SWOT analysis and compare it with the previous one. Has anything changed?
  ◦ Has a new threat occurred that could influence potential clients (i.e., bad press about the hospital and/or an employee, or a negative online review that has not been addressed)?
  ◦ Have the office manager direct the client service team to revisit its SOPs to ensure that client satisfaction remains the practice's primary goal.
  ◦ When possible causes have been identified, the solution is to create an action plan for its implementation. This will contain new SOPs, training, timeline, and measurability.
• The office manager has brought to your attention that drugs and medical supplies are now 5% above the budgeted level for the previous quarter. The gross revenue of the practice is slightly above that budgeted for this time of the year.
  ◦ You have identified the problem because of the budget and benchmarks standards.
  ◦ To help solve the problem, look for clues from the inventory team, bookkeeper, pricing issues, missed charges, theft, and the inventory management system.
  ◦ Check specific revenue centers (i.e., heartworm preventives, flea/tick products) against their corresponding expense category to determine if the problem is product specific.
  ◦ Once a sufficient amount of evidence has been gathered, have the inventory team and the office manager determine appropriate solutions to the problem.
  ◦ If it means rewriting the SOP, creating a secure drug storage room, or better control of preventing missed charges, have the appropriate people institute the change along with new training for the other healthcare teams.
• Your best technician is one hour late for her shift without letting the office manager know, and her absence is disturbing the workflow of the day.
  ◦ The problem is very visible to the entire healthcare team.
  ◦ The solution is found in the EM, which has procedures on how to handle this situation.
  ◦ It is extremely important for legal reasons to follow the protocol set up in the EM, and to demonstrate that the policies of the practice will be followed to the letter.
• In some situations, the problem is obvious, such as creating a new service (e.g., boarding) for the practice. The practice needs to develop a method (an SOP) to evaluate if the service warrants being added to the product mix.
  ◦ In marketing they discuss the four "Ps": product, place, price, and promotion (see 6.7 – Basic Tools of Marketing).
  ◦ The product is the new service, but is it what the clients want? Develop a survey to help build client wishes. In the survey, ask if they would use the new service, how often, what they would be willing to pay for it, hours of operation, and any other pertinent information.
  ◦ What will the new service cost in equipment, remodeling, staff hours, and any other additional administrative expenses?
  ◦ What rate of return does the practice desire on any new service? This may be equal to the profit of the practice.
  ◦ From the results of the survey, you can develop a pro forma budget.
  ◦ The accountant can do a few financial calculations to determine if the net present value will equal your required rate of return (see 7.1 – Time Value of Money).
  ◦ Promotion is both training the staff to the new service and determining how to promote the service to the client.
  ◦ Create your benchmarks of how many transactions for this service you should anticipate to better manage the service.

14.7. TIME MANAGEMENT

BASICS

OVERVIEW

- Time management is the process of organizing and planning how to divide time between specific activities and tasks.
- Time management is critical regardless of an individual's role in the veterinary practice.
- Time management is actually a misnomer. Time cannot be managed; however, the events and/or tasks that occur – that take up time – can be managed.
- How time is used can depend on planning, self-discipline, and self-control.
- Learning to delegate is critical to time management.
- People who manage time efficiently:
  - are more productive;
  - have more energy;
  - are less stressed;
  - are able to complete tasks on schedule;
  - have a more positive attitude;
  - have a better professional reputation.
- Poor time management results in:
  - inferior work quality;
  - inefficient work flow;
  - fatigue;
  - moodiness;
  - high stress levels;
  - increased risk of frequent illness.
- Practices should take advantage of all available technology to increase efficiency.

TERMS DEFINED

Time Management: The process of organizing and planning how to divide time between specific activities and tasks.

ISSUES AND OPTIONS

GET ORGANIZED

A lack of organization results in poor time management. Clear the clutter.

STOP BEING A MICROMANAGER

- Micromanagers insist on controlling or doing all of the work themselves (they do not trust someone else to do it correctly).
- Micromanagers lack personal leadership and tend to:
  - resist delegating work;
  - immerse themselves in the work assigned to others;
  - focus on insignificant details and miss the big picture;
  - discourage others from making independent decisions;
  - get involved in the work of others without permission;
  - monitor what is least important and expect regular reports on miscellany;
  - push aside the experience and knowledge of colleagues;
  - do not foster loyalty and commitment;
  - focus on the wrong priorities;
  - have a demotivated team.

STOP PROCRASTINGATING

- We often procrastinate when tasks are difficult to complete or do not offer a challenge. Perhaps these tasks could be delegated to another team member or members that could divide and conquer the task.
- If the task(s) cannot be delegated, create a work schedule and firm deadline.
- Give yourself a reward for completing the task on time.

LIMIT MULTITASKING

- Evidence suggests that we cannot *effectively focus* on more than one thing at a time, so while multitasking is usually required in the veterinary profession, *limiting* the tasks to be completed within the same block of time is vital.
- Plan the day in blocks if possible when high-priority items need to be completed.

SCHEDULE YOUR TIME APPROPRIATELY

- The busiest people find time to do what they feel is important by effectively managing their time.
- Create a schedule and work plan for your day allowing for some flexibility, while also prioritizing the absolute necessary items. The less critical tasks may need to be pushed to the next day, but the priority tasks will get done.
- Proactive time management allows a sensible work-life balance.

TAKE BREAKS

- Taking breaks refreshes the mind and allows us to return to task completion with focus.
- Working straight through without breaks may log more work time but is statistically less productive.
- Stick to allotted break times so that everyone on the team has time for his or her breaks as well.

STAY HEALTHY

- Self-care is very important for productivity and efficiency. If we do not care for ourselves it becomes difficult to care for others.
- Maintain a healthy work-life balance, allowing time to relax, do nothing, see friends, or work on hobbies, and so on, which helps you rejuvenate both physically and mentally.

LEARN HOW TO SAY NO

- Time is limited. Identify what is urgent, important, and what can be delegated.
- Be able to say no to nonurgent or nonimportant requests.

START EACH DAY WITH A CLEAR FOCUS

- Determine what needs to be accomplished by the end day (before checking e-mail, etc.).
- Resist the temptation to start with smaller, unimportant items first. Start with the most important.

KNOW HOW YOU SPEND YOUR TIME

Keep a log for one week; identify which tasks require the most time and determine the time of day that is most efficient. By identifying which tasks are most time consuming, you can create a plan of action and help identify what could be delegated to others.

Rank tasks from highest to lowest, based on time usage, importance, and risk assessment.

- **Time.** How long does it take to complete the task?
- **Importance.** How important is this task in the ranking? Must it get done every day/week/month? Can the business function if the task does not get done?
- **Risk assessment.** How confidential is the information/task to the owner/business, and so on? If the information 'leaks' out, is it detrimental to the business?

Determine tasks that can be delegated based on this assessment.

THE ART OF DELEGATION

- Delegation can be a tough skill to learn, especially when failure has occurred in the past.
- Most heard excuses:
  - "I don't have people to delegate to."
  - "It is just easier and quicker if I do it myself."
  - "I'll end up doing it again, the right way."
- Most often, a delegated failure is due to the poor communication of the delegator, not the person receiving the delegation.

• Determine inherent strengths of team members, and delegate tasks based on strengths.
• Give permission for the person accepting delegated tasks to make mistakes. People learn problem-solving skills from making mistakes.
• There are multiple ways to achieve the completion of tasks. Keep an open mind.
• Use a "SMART" chart and write out information, ensuring clarity and understanding between both parties.
  ◦ S = specific. Write down the specific task being delegated.
  ◦ M = measurable. Determine how this task is going to be measured for completion or success.
  ◦ A = attainable. Is the task attainable by the person accepting the task? Ask the person. Do not assume.
  ◦ R = resources. What tools/education does the person receiving the task need in order to be successful? Ask the person. Do not assume.
  ◦ T = time-bound. What is the due date/completion date? Schedule check-ins to prevent the perception of micromanagement, and to address any questions that may arise.
• Some people need more guidance than others. However, it is the responsibility of the owner/manager to develop the staff potential within the practice. Take the time to do it right the first time instead of taking the task back.

COMMUNICATION

• Maintaining communication in the veterinary practice can be time consuming, difficult, and many times does not occur between leadership/management and the veterinary team. In fact, when multiple work shifts exist in a hospital, a lack of communication is common (but unacceptable).
• When communication stops, client service and patient care suffer.
• Solutions:
  ◦ Host weekly meetings.
    ▪ Depending on the size of the practice, this may be the entire staff.
    ▪ In larger practices, host weekly meetings with team leaders, who disseminate communications to team members.
  ◦ Utilize technology.
    ▪ Practice intranet – post meeting notes/messages on server.
    ▪ Use smart phone apps, such as Slack. Messaging appears immediately on team member phones.
• Without communication, the team is unclear of responsibilities and their roles in carrying out duties to achieve goals.

LISTS

• Prioritize items to be completed each day. Distinguish between what is important, and what is urgent. Complete the most urgent first.
• Develop an ongoing list of tasks to be completed. Cross off items as they are completed each day and roll incomplete items to the next day. Keep in mind that your goal is not to mark off the most items; but rather to complete the highest priority items.
• Identify tasks on the list that can be delegated to team members. Even if team members are just contributing smaller pieces of the puzzle, the team is working together to accomplish the task.
• A dynamic list would include both short-term and long-term tasks (long-term tasks are usually attached to strategic goals; short-term tasks lead to long-term goals).
• Do not keep multiple lists.

LEVERAGING

• Veterinarians can improve time management by leveraging staff members.
  ◦ Veterinarians have three main roles as stated by the veterinary practice act: diagnose, prescribe, and complete surgical procedures.
  ◦ Appropriate tasks that involve high-level patient care should be delegated to credentialed veterinary technicians.
  ◦ When credentialed veterinary technicians are leveraged appropriately, the practice revenue can increase nearly $100,000.[1]
  ◦ Tasks that do not require professional or paraprofessional credentials should be delegated to veterinary assistants and receptionists.
• For every task that is not leveraged appropriately, the veterinarian misses an opportunity to see another patient, catch up on medical records, or complete other veterinarian-specific tasks that often keep veterinarians at the practice long after hours.
• Leveraging team members appropriately improves job satisfaction, contributes to whole-team health, and decreases employee turnover.

REVIEW THE DAY

Before leaving the practice each day, review tasks that were completed and create a list for the next day. This will provide the ability to start fresh each day with a clear mind.

14.8. KEEPING UP WITH THE PACE OF CHANGE

BASICS

OVERVIEW

Change is inevitable – it is the only constant in our ever-changing world. So why do most people have such a hard time with it? Those who are reluctant to change or that wait until they *have* to change will never reach their potential. Those who embrace – and even champion – change are the ones who tend to be leaders and the most successful at their craft. Keeping up with change, however, is much easier said than done.

TERMS DEFINED

Change: To make or become different.
Evolution: The gradual development of something, especially from a simple to a more complex form.
Need: Require (something) because it is essential or very important.
Want: Have a desire to possess or do (something); wish for.

ISSUES AND OPTIONS

Most veterinary practice owners feel overwhelmed with the day-to-day responsibilities of caring for patients at their clinic. Add in payroll, staffing, operations, finance, recruitment, inventory management, marketing, and training, and you can see why so many feel inadequate, guilty, anxious, or worse. Successfully managing a veterinary business – or any business – is not for the faint of heart. Seeming to always be chaotic, it is no wonder that the typical practice owner thinks they can never catch up, let alone be proactive.

So, what does it mean to keep up with the pace of change? From the big-picture perspective, it means to know what it is that your clients want (sometimes even before they do) and to be able to serve their evolving needs in ever-better ways (see 2.7 – Change Management). This requires the ability to identify trends and learning enough to be an early adopter so that when a new tool/technology/service becomes mainstream, you already have the experience and can do so masterfully.

Keeping up with the rapid pace of change means you must:

- **Relinquish control.** Top-down, centralized management is a recipe for low or no growth and a constant turnover of the staff. People who control too much are failing or about to fail because there is simply too much coming in too fast. No one can do it all, and delegation is necessary. Without any real responsibility or autonomy, job satisfaction will be lacking, and the fear of making a mistake will be the overriding emotion for the team. That is why if you want to keep up with the flow you need to let go of some control (see 3.15 – Engaging Staff).

Build teams who have a variety of skills. Stay open minded to new ideas from anyone (see 2.1 – Workplace Management). Ask more questions, and spend more time listening. Look at what is working for other practices, and talk to employees, colleagues, and other industry leaders. This will help you see what is missing or what you could be doing to stay on trend.

- **Teach your core.** Just as failure comes from overcontrolling, it also comes from attacking everything without a strategy (see 14.5 – Strategic Planning and Implementation). Before letting go, make sure the team understands your vision for the practice. This ensures that everyone is focused on creating a consistently positive customer experience.

Identifying your practice differentiators and knowing your target market(s) and key messages help keep your team on track (see 6.15 – Practice Differentiation). Everyone on your staff should know how to communicate with customer segments – especially these days, when it is easier for customers to access your managers and other employees directly through e-mail or social media.

- **Know your numbers.** With the timely and seemingly infinite amount of data available, owners must be more analytical than ever before. Consider all of your customer touchpoints and the initiatives you are running now. Honing your quantitative and analytical skills will help you turn the sea of data into relevant insights that keep your team focused (see 7.7 – Data You Should Be Reviewing Regularly). For added support, you can hire consulting specialists to assist you in understanding what the numbers mean and, consequently, what specific actions should be taken.
- **Build a tactical team.** As owners or managers, your main job is turning data into insights and then executing on them. It is critical that your leaders know how to work at the strategic and executional levels – and carve out enough time to do it extremely well. Otherwise, you risk reacting to fads or the wrong audience rather than focusing on what makes a favorable impact.
- **Embrace the sense of urgency.** Pay attention to behavior – of your team and your customers. They are telling you what you need to know through surveys, social media, and review sites. You must listen, be willing to hear what they are telling you, and act expeditiously when necessary. Others are watching, so your actions or inactions have far-reaching implications.
- **Diversify your team.** It is more important than ever to hire a diverse workforce (see 2.1 – Workplace Management). Younger generations, like Millennials, who grew up using digital technology, know how to reach and tap into the largest group of pet owners – and they are leading the changes. Practices also benefit from having employees of differing opinions, cultures, and backgrounds. In fact, a recent McKinsey & Company report found that companies with more racially and ethnically diverse workforces are 35% more likely to see higher financial returns, and gender-diverse companies increase performance by 15% over the average. Accordingly, the more diverse your team, the better they can listen to what might be needed in varying markets.

EXAMPLES

As a service business, building, nurturing, and growing your client base is the ultimate goal when looking to have a profitable practice. But successful businesses, including veterinary practices, understand there are multiple components that must be attended to with expertise and nimbleness for each to contribute optimally to the whole. If you look at the general "buckets" that make up a business, you can see that only one focuses on the patient directly: clinical care. The remaining areas are all necessary to support the delivery of veterinary care (see Figure 14-8-1).

Changes exist both internal and external to the practice, and both are important. All segments of the chart need to be overseen in a manner that will allow them to make the greatest impact on patient care and the practice in general.

On the inside, multiple generations among team members have created the need for changes in communication, with each other as well as clients (see 1.13 – Generational Differences). The burden is on the human resources, operations, and information technology functions to create processes and policies that can be uniformly implemented across all departments, ensuring information flows in a timely and effective manner. Years ago, many practices had a mailbox for each team member that they checked for memos or other announcements on the way in each morning. Today, simply providing each team member a company email address @yourpracticename.com gives everyone a central repository to receive or disseminate information. Having a clearly defined organizational chart that indicates communication channels, reporting structure, and career paths also gives team members a road map to funnel issues and ideas to the appropriate individuals and can provide the motivation to take

14.8. KEEPING UP WITH THE PACE OF CHANGE

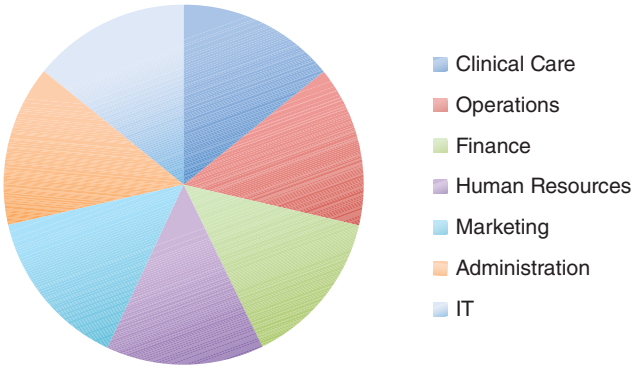

Figure 14-8-1.

The different categories or "buckets" of practice management.

initiative to accept more responsibility (see 2.2 – Organizational Charts). Continuing the pursuit of greater efficiency for communicating and sharing knowledge should be the responsibility of all team members, but the accountability falls on the leadership team to identify the right tools for the team and to implement them for the benefit of the practice (see 2.6 – Accountability).

Externally, the most obvious area that practices need to keep pace with is continuing education (CE). The speed at which medical advances are taking place can be mind-boggling. Budgeting for CE is a must, and selecting how to bring new information into the clinic regularly will keep the team engaged and each team member feeling confident in their ability to do the best for each patient (see 3.6 – Continuing Education Benefits).

What keeps people from accepting change is typically two things: fear and ignorance. A commitment to invest in yourself, as a practice owner, and in your team will not only keep you informed but also keep you enjoying your profession, and it will give you the exposure to learn about trends, interesting publications, and key opinion leaders and experts to help you prioritize and navigate the "how" – to keep up with change. Knowledge really is the answer. It reduces risk, lowers fear, and gives you more confidence.

CAUTIONS

Do not change something without a strategy and plan. Define the purpose of the change. How will it impact the team and the practice? Who will need to be involved? What resources will be needed? How will the change be communicated? And what is the expected result of the change? All of this must be shared with and understood by all stakeholders if it is to produce the desired outcome.

14.9. MISSION AND VISION STATEMENTS

BASICS

OVERVIEW

• The most important aspect of mission and vision statements is the *process* of developing them.
• Most veterinary practices do not have current, written mission and vision statements because owner(s) do not see the benefit of them, nor do they want to invest their time and energy to develop them.
• Most veterinary practices do not have current, written mission and vision statements because owner(s) do not want to commit their dreams and philosophies to paper, and thereby expose them to staff and clients.
• Mission and vision statements, however, are the central theme of how you plan to run your practice. They summarize your philosophies and general goals for your practice.
• Mission and vision statements can be a few sentences or several pages long, but usually the shorter the better.
• Mission and vision statements are a useful "yardstick" to measure all your strategies and keep you focused on the major goals of the practice. (Do your employees know the major goals of your practice?) This is especially useful as new business opportunities arise during your career.
• Mission and vision statements convey your management philosophy to your employees.
• Mission and vision statements are useful for handing out to your clients. Clients do not know what your philosophies are unless you tell them. This can be used as a powerful promotional tool in your marketing literature.
• Mission and vision statements should be reviewed every couple of years. As your practice grows and evolves, so should your mission and vision statements.
• Continual reevaluation and instilling the mission and vision statements in your employees gives you a virtual link between what you want to accomplish in your practice and your everyday activities.

TERMS DEFINED

Mission Statement: Statement of the role, or purpose, by which a practice intends to serve its stakeholders.
Vision Statement: Statement that identifies where the organization intends to be in the future or where it should be to best meet the needs of its stakeholders.

ISSUES AND OPTIONS

STRUCTURE

Though there is no set structure to what mission and vision statements must include, here are some guidelines:
• Vision statements are formulated prior to creating a mission statement; the mission statement actually flows from the vision for the practice.
• The vision statement is typically three to five sentences long; it is clear and easy to understand.
• Most mission statements are no more than 10 sentences in length. A mission statement is a reflection of the objectives of a practice – it should be easily comprehended by a 12-year-old child and staff should be able to recite it from memory, even under stress.
• Animals are the heart of the veterinary business, and the statement must outline the quality of care they receive. Is this not why you went into practice anyway? Include the types of animals (large animal, small animal, exotic pets, etc.).
• Clients. Remember, you cannot practice veterinary medicine if the clients do not bring in their pets. Another important consideration is what pet owners are willing to pay to take care of their pets. It does no good to possess the experience and equipment to diagnose and treat a pet if the client is not willing to pay for those treatments. Have you ever seen a pet with a checkbook?
• Staff and owners. A mission and vision statement should discuss the role and expectations of the staff and owners. This includes the attitude and aptitude expected to perform the level of client service desired by the owners. It is from the mission and vision statements that employee goals and job descriptions can evolve.
• Business. Making money is one of the goals of a practice. If you are practicing veterinary medicine and not making any money, then this is not a career, it is a hobby. Whether we like it or not, a practice is a business. If we do not make a profit, then everyone suffers. The pet suffers because the practice will not have the equipment and people to properly diagnose and treat the animal. The clients suffer because they will not receive the best service level possible for the pet. Any client worth having wants you to stay in business. The staff (including employed veterinarians) will suffer because there will not be money in the practice available to pay adequate compensation and benefits to make their job positions a long-term career. The owners will suffer because they will not be financially rewarded for the risk they took to start or buy the practice in the first place.
• Community. What is the philosophy of the hospital toward the community that supports the practice? What community activities do the practice support? How is the practice going to be involved in the community?
• Any other goals or philosophies at the core of your practice should be included.

APPLICATIONS

• Single owner. Mission and vision statements will force the owner to define his or her goals and directions. A practice without goals and directions is like a boat without a rudder – the practice will just drift aimlessly in the waters of commerce, ultimately crashing on the rocks of bankruptcy. Most of the time, this is to the detriment of the practice, the clients, and ultimately the pets, and nullifies the reason you became a veterinarian in the first place.
• Multiple owners. One of the hardest elements with multiple owners is getting everyone on the same page. Taking a group of individuals and making them a team requires time, effort, and expertise in the area. Most owners are not willing to invest the time and money to do this; thus, most practices do not have current, revised mission and vision statements. Mission and vision statements force owners to express, evaluate, and define the overall philosophies of a practice. Once defined and evaluated, this makes decision-making much more uniform regardless of what owner makes the decision because each owner agrees to the overall philosophy of the practice.
• By having specific mission and vision statements, owners will find common ground on which to build a practice instead of differences that can tear a partnership apart. (Partnerships are the least likely legal form of business to survive because of that reason.)
• Team building. A mission and vision statement can be a great team-building tool. To help staff members take ownership of your practice mission and vision statement, post a draft and let them edit and rewrite it until it is concise and satisfactory to everyone (especially the owners). This will form a team with a united vision that will propel the practice to increased employee satisfaction and will, in turn, show up in increased client satisfaction and increased practice profits.
• Management decisions. Once you have agreed upon the mission and vision statements, use them to answer management questions that arise, and also use them to evaluate new business opportunities. Your mission and vision statements then provide the final evaluation of all management decisions and give consistency so that any owner or staff faced with a decision should decide congruent to the philosophy of the practice. That way, all staff and owners are aligned for the same outcome. This synergism is essential if the owner or owners expect the

practice to continue to grow. (This is especially true as a practice becomes bigger. As you add staff and owners, having consistent, congruent decisions epitomizes a well-run, profitable veterinary practice.)
• Marketing. Sharing your mission and vision statements with your clients acts like bait. It will attract the kind of clients you want and who want the types of products and services you wish to practice. In many cases, it is a self-fulfilling prophecy. Display your mission and vision statements in every room of the practice, especially the exam rooms and the waiting room where the clients will see them.

EXAMPLES

REPRESENTATIVE VISION STATEMENTS

• "It is our goal to provide animals with the best possible medicine consistent with the owner's desires, in a manner that is both enjoyable and financially rewarding for the staff and owners of our veterinary hospital."
• "Our practice offers the finest veterinary care available. We and our staff unconditionally commit to excellence and quality in everything we do. We commit to the best service at a fair price so our practice can grow and prosper, thereby satisfying all current and future needs of our clients."
• "Our practice exists solely for the convenience of our clients. Without them and their pets, we are in economic ruin."
• "We shall provide the best veterinary medicine in our city. We shall price our services to reflect the true costs of retaining outstanding staff, providing outstanding medicine by our veterinarians, and rewarding the practice owners for their economic risks."

REPRESENTATIVE MISSION STATEMENTS

• Quality care provided with compassion.
• We love pets… and it shows!
• Rely on us for outstanding veterinary care.

14.10. Business Plans

BASICS

OVERVIEW

Business plans are important for any project that involves commitment of time and resources, not just those that require outside financing. A business plan helps to organize a project and look at it critically from a number of important perspectives.

TERMS DEFINED

Business Plan: Written document that details a proposed or existing venture. It seeks to define the objective, vision, current status, expected needs, strategies, defined markets, and projected results of the business.
Overcapacity: Situation in which there is capacity available to perform services, but inadequate demand to perform those services at capacity.
Pro Forma: Projection or estimate of what may result in the future, given current assumptions and predictions. This is the financial estimate of how the business will do if certain assumptions are achieved.

ISSUES AND OPTIONS

BUSINESS PLANNING

Although it is possible to start a project without a business plan and without a budget, this is typically not a recipe for success. The smaller the project, and the less risk it carries, the more likely that lack of planning will not have major adverse consequences. However, there is some sense in the old adage that *if you fail to plan, you plan to fail*. Business plans are valuable because:

- They force entrepreneurs to actually commit to a plan of action.
- They require a realistic assessment of the resources (time and money) that will be required to make the project work.
- They establish an orderly sequence as to the steps that need to happen for the project to be successful.
- They clearly map the milestones to be achieved, as a measure that the project is working according to schedule.
- They provide a solid framework of the concept that can be evaluated by others, including consultants and financiers.

Business plans also serve as communication tools, allowing planners to share their vision with others inside and outside the organization. For internal stakeholders, this might facilitate buy-in for the venture, but for all concerned it provides a roadmap that can be discussed, debated, used to elicit feedback, and, finally, to chart a path forward.

INFORMATION NEEDED

- Most would-be entrepreneurs are comfortable with vision and mission statements (see 14.9 – Mission and Vision Statements), but a business plan is more than that. It requires solid numbers on which to base an investment, so it is worth doing some research to appreciate reasonable numbers within the industry, and it is important not to rely on a banker's approval of a plan as an endorsement of the validity of that plan. Veterinary projects get financed relatively easily, not because veterinary projects are so profitable or the plans so well written, but because veterinarians rarely default on their loans. This is not the same as having a business plan with an excellent return on investment.
- If the business plan is for a new veterinary hospital, a demographic assessment is critical to ensure that there is sufficient caseload to support another hospital in a given area (see 6.7 – Basic Tools of Marketing and 6.8 – Demographic Assessment). The pet population is not growing appreciably, and yet veterinarians are continuing to open new practices in areas already well served by other practices. All this serves to do is to cut the "pie" of available pet owners thinner, putting increased pressure on all practices in the area. Because most practices are high-overhead facilities with surgeries, hospitalization, treatment rooms, and radiography, this often leads to issues of overcapacity, in which all practices in the area are incompletely utilizing their facilities and staffs. In many cases, consolidation of hospitals into regional powerhouse practices makes more sense than establishing many small practices (all with high overhead and duplication of services), and this is likely to become more popular as there is increased pressure on small practices (see 1.1 – Models of Veterinary Practice). The exception is emergency and specialty clinics, which often do best in areas with high densities of primary-care veterinary practices.
- One of the most difficult estimates to make, but often the most critical, is how quickly clients will start using the new service. Veterinarians are often overly optimistic, believing that clients will beat a path to their door as soon as it is opened. If pet owners' needs are already being met, even by a facility that is considered inferior, there is still often a delay, sometimes a significant delay, before a switch is contemplated. Veterinarians command much loyalty from their clients, and there is typically a lot of inertia to overcome before a new practice is visited.
- The financial information in a business plan may be the most intimidating to veterinarians, but it is actually the easiest to compile and the most likely to be accurate. Estimates from qualified architects with experience in veterinary buildings, although not necessarily binding, are typically good estimates if changes are not repeatedly made to the plans (see 11.9 – Managing Construction Costs). Similarly, the costs of equipment, computers and software, and start-up supplies are available from vendors.

VALUE PROPOSITION

Vision and mission statements are great, and necessary for practices, but the value proposition takes a more basic look at the value being delivered by the practice (see 9.6 – Value-Added Analysis). The value proposition asks the following questions:

- Why would clients select this practice over others that are available?
- Why would the best staff available want to work in this practice?
- Why would I want to invest my money, time, and commitment in this practice? What will I achieve here that I could not achieve elsewhere?

The value proposition can be difficult for veterinarians to answer, and it is sometimes best posed by an impartial third party, such as a consultant. It is natural to assume that clients will want to come because the new veterinarians in the practice are excellent. But how will clients know this, and what will overcome the inertia of their loyalty to their current practice? Similarly, great paraprofessional staff are in short supply and high demand. They can be attracted with excellent salary, benefits, and working conditions, but the will likely stay only if it is a great place to work and to grow as a paraprofessional.

Along with the standard features of value proposition, creating a business plan also sometimes allows for reframing of objectives and considering other alternatives. As client numbers increase, for example, it is reasonable to consider building a larger facility, or enlarging the current one, but there are likely other, sometimes unexpected solutions that might accomplish the same goal. Sometimes just changing perception of what the problem is can be instrumental in allowing the consideration of other possibilities.

For any venture being considered, it is important to balance strategy with execution. There is sometimes a misguided belief that strategy is the purview of top management and consultants, and execution is the job of rank-and-file employees, but this is rarely a recipe for success. Employees can certainly accommodate the decisions and rules made by management, but if the goal is to fulfill strategic objectives, then it is better to involve those on the front lines in the planning process (see 14.5 – Strategic Planning and Implementation). Whether it is building a new clinic, redesigning the front-office space, or purchasing new practice management software, involving the people who will be asked

to make the new venture functional should be part of the business planning process.

The toughest question is the one that veterinarians must ask themselves about starting a new venture. There are many advantages to being your own boss, but many risks and liabilities as well. It is important to face these questions realistically, and a business plan is a good way to formalize the process.

CASH FLOW

One of the biggest problems with any new venture is the start-up itself, covering all the expenses before the revenues start to flow consistently (see 7.13 – Breakeven Analysis). The business plan helps to focus attention on this important topic, and it can be very useful in financing if the predictions are realistic. In many instances, however, the predictions are not realistic, and this leads to cash shortfalls before the breakeven point is reached. For instance, a practice may predict a sustainable cash balance by 18 months, based on seeing 15 patients a day at an average client transaction of $136, by 12 months. However, if the start-up was slower than anticipated and the practice is actually seeing 11 patients a day at an average transaction of $112 at 12 months, then a cash flow imbalance may result. In this example, based on the amount borrowed, the reconciled budget shows that, in three months, there will be inadequate cash to pay the bills of the practice, including payroll and accounts payable. In all likelihood, this will cause significant stress among management, and another round of financing will need to be considered (and possibly not at the same attractive rate as the first round).

This is a common problem in veterinary practices. It is better to plan pessimistically and finance the project accordingly than to hit a shortfall in the cash balance. It is sometimes useful in this regard to consider three different scenarios:

- What will happen with the most optimistic projections?
- What will happen with a projection that is relatively easy to achieve?
- What will happen with the most pessimistic projection?

Although veterinarians may not like planning around a less than optimal outcome, it is much preferred to have the cash available but not use it than to not have the cash available when needed.

EXAMPLES

See 15.4 – Sample Business Plan.

CAUTIONS

Business plans rely on assumptions, and it is important that those assumptions be realistic if the business plan goals are to be achieved. Especially in the case of new practices, veterinarians are often overly optimistic about how much business will be conducted once the doors to the practice open. This can cause problems when financing is based on optimistic assumptions, and the practice hits a cash flow problem when revenues are less than predicted. Going back for additional financing is never as easy as planning appropriately in the first place. Hiring a consultant to help with the process will help ensure that the numbers used are realistic, and that the objective is attainable.

When setting objectives, it is good to rely on "SMART" goals; that is, they should be **S**pecific, **M**easurable, **A**chievable, **R**elevant, and **T**ime-bound (see 6.7 – Basic Tools of Marketing). Business plans help to formalize the process.

MISCELLANEOUS

There are many different ways to create business plans, and there are several useful software programs to guide novices through the process, including Business Plan Pro (www.BusinessPlanPro.com), LivePlan (www.liveplan.com), and Bplans (www.bplans.com). Any of these programs, however, require the user to provide meaningful information, as they are only capable of utilizing the data they are provided.

14.11. BUSINESS ENTITY STRUCTURES

BASICS

OVERVIEW

There is no one "best" entity choice for small businesses. Veterinary practice owners or potential owners should consider many variables when evaluating separate legal entities for their practices. Consulting with a qualified attorney and/or accountant for assistance regarding specific legal and financial questions is highly recommended. The five main types of legal entities to choose from are:

- sole proprietorship
- partnership
- C corporation
- S corporation
- limited liability company (LLC).

Initial focus should be on the following entity selection issues:

- entity complexity;
- tax issues;
- risk management (liability) issues;
- cost of maintenance of the entity;
- local, state, or federal government regulatory issues.

TERMS DEFINED

De Minimis: A Latin term meaning minor, or lacking significance.
Pass-Through of Losses: The net income or loss of a pass-through entity is passed through and taken into account by the owners in proportion to their ownership. Thus, an S corporation shareholder or LLC member may use his or her pro rata share of losses to offset other income, subject to loss and basis limitations.
"Piercing the Corporate Veil": Courts are often asked to issue a judicial order stating that the corporate owners are liable for the corporation's unpaid debts. If courts agree to issue the order, this is known as "piercing the corporate veil." Courts look at certain actions by business owners and management to determine if the order is warranted, such as whether owners failed to observe corporate formalities (keeping minute books, passing resolutions, holding board meetings, etc.) and if they treated the corporation as a separate entity or just as a continuation of themselves.

ISSUES AND OPTIONS

In making a selection of entity decision, a choice should initially be made based on whether a pass-though is desired. If a pass-through entity is not desired, the C corporation should be the entity of choice. If pass-through treatment is desired and liability limitation is important, the choice is narrowed to either an LLC or an S corporation.

SOLE PROPRIETORSHIPS

- A sole proprietorship is a one-person for-profit venture that is not registered with the state as any particular type of business.
- The owner creates a sole proprietorship just by engaging in business activities. No documentation is needed to organize a sole proprietorship and no special recordkeeping or corporate formality is necessary.
- A sole proprietorship is inseparable from its owner, as they are one and the same. Owners report business income and losses on their personal tax return and are personally liable for any business-related obligations, such as debts or court judgments.
- Sole proprietorships end upon the death of the owner, and the property is disposed of according to the terms of the owner's will.
- A sole proprietorship may be the preferred entity choice where the owner contemplates no complex financing, no co-owner relationships, and no risk management issues. However, veterinarians planning to have a practice of any sophistication should avoid this entity.

PARTNERSHIPS

- A partnership is a venture consisting of two or more people who have not registered with the state as a particular type of business.
- Partners do not file paperwork to form a partnership. The partnership starts as soon as the partners engage in business.
- In a partnership, there is the potential for conflict between partners. Partnerships typically generate more discord than other entity types due to the lack of a decisive initial partnership agreement clearly outlining the rights and responsibilities of each partner. It is preferred to have a qualified attorney draw up a written agreement (rather than relying on oral agreements), if only to prevent future disagreements over present intentions of the parties.
- The major drawback of operating as a partnership is that each partner carries unlimited personal liability for the obligations of the partnership. If one partner acts negligently or fraudulently and the partnership is sued and loses, each partner's personal assets can be seized to pay the court judgment. Each partner has equal power to incur obligations on behalf of a partnership, and each partner has unlimited liability for partnership debts, regardless of which of the partners may have been responsible for accumulating those debts. General liability insurance may help protect both personal and partnership assets of each partner.
- Partners pay taxes on their shares of the partnership income and report it on their personal tax returns at personal income tax rates. Profits and losses generated by a partnership "pass through" directly to the partners without incurring a "double" tax liability, as is the case with a corporate profit distribution in the form of dividends.
- A partnership lacks the advantage of continuity as it is automatically terminated upon the death of any partner. A final accounting and division of assets (and liabilities) is necessary unless specific methods under which the partnership may be continued have been outlined in the partnership agreement.
- General partnerships are not typically recommended except for real estate ventures or with close, trusted family members.

LIMITED LIABILITY COMPANIES

- An LLC is organized under state law by filing a certificate of organization with the Secretary of State, and is usually governed by a written operating agreement. The cost of establishing an LLC is similar to that of a corporation or partnership. Accounting and legal costs are similar.
- LLCs offer useful flexibility as to crafting the economic arrangement among the owners and permit the double benefit of favorable taxation and liability protection without ownership restrictions. LLCs can have disparate levels of membership interest, control, and equity benefits designated by the members.
- LLC equity owners are called members rather than shareholders.

• An LLC can opt to allow via the operating agreement certain people called "managers" to control the LLC. LLC managers possess the same scope of powers as a general partner would have in a standard general partnership. They can sign contracts, sell assets, and make other essential business decisions. But managers are not required for an LLC, as members may simply retain managerial authority or grant limited powers to certain members as managers.
• The LLC's greatest advantage over a general partnership is that LLC members do not assume any personal liability for the obligations of the LLC. LLC members are only liable for LLC debts to the extent of their LLC ownership interest.
• LLCs are generally pass-through entities for tax purposes. That means that a single member LLC (allowed in most states) is treated as a schedule C sole proprietorship for tax purposes. A multimember LLC is treated as a partnership for tax purposes. An LLC can also elect to have tax treatment as a corporation if it so chooses.
• LLC members are treated as partners for tax purposes and obtain additional basis in their LLC membership interest for their allocated share of LLC debts. This could result in increased deductions for LLC members compared with S corporation members.
• An LLC has perpetual existence if the members so elect. LLCs can admit new members and modify membership and investment structures, a key attribute when transferring business ownership from family members to succeeding generations. Older generations can retain control while slowly passing LLC interests to the younger generation. As the older generation members of the LLC retire, control can be passed to the next generation while beneficial ownership can be retained by the older generation, allowing a step-up in basis for estate tax purposes.
• A 2% or more LLC member is treated like a partner of a partnership for purposes of qualifying for tax-free employee fringe benefits. As a result, they may not exclude from income the value of LLC-provided health and accident insurance, disability insurance, group term life insurance, cafeteria plan benefits, or the value of meals and lodging furnished for the convenience of the employer. Accident and health insurance premiums paid for the benefit of a 2% member are deductible by the LLC under Internal Revenue Code (IRC) Section 162 and includable in the member's gross income under IRC Section 61.
• Upon a sale of an LLC equity interest, some of the gain will be taxed at ordinary income rates (that are attributable to inventory and accounts receivable), whereas the sale of S corporation stock is generally treated as capital gain.

HIGHLIGHTS OF A C CORPORATION

• A C corporation is an independent legal and tax entity, separate from the people who own, control, and manage it. Because of this separate status, owners of a C Corporation do not report business profits on their personal tax return. The C corporation itself files tax returns and pays any resulting taxes. Owners pay personal income tax only on money they draw from the corporation in the form of salaries, bonuses, and other compensation.
• The C corporation's two-tiered structure of taxation can be a benefit to some businesses, especially established ones. Not only do owners of a C corporation avoid paying personal income taxes on profits they do not receive, but because federal corporate income tax rates on the first $75,000 of corporate income are lower than the federal individual income tax rates on that same amount of personal income, a corporation and its owners may actually pay lower overall taxes than owners of unincorporated businesses such as sole proprietorships, LLCs, and partnerships.
• There are no limits on who can own stock in a C corporation, and its owners are protected from the debts and obligations of the business. The main drawback of C corporations is that (under current law) they are subject to two levels of tax: one at the entity level and one at the shareholder level.
• C corporations may adopt a tax year without regard to the tax year of the shareholders.
• The main disadvantage of a corporation is that the profits of a corporation, when distributed to the shareholders in the form of dividends, are subject to being taxed twice. The first tax comes at the corporate level. The distribution of any corporate profits to the investors in the form of dividends is not a deductible business expense for the corporation. Thus, any dividends that are distributed to shareholders have already been subject to corporate income tax. The second level of tax is imposed at the personal level.
• Unlike owners of businesses operated as partnerships, S corporations, and LLCs that have elected partnership tax treatment, C corporation shareholders are not taxed on the undistributed income of the corporation.
• Losses of a C corporation do not pass through to shareholders, but are allowable as net operating loss deductions only against some past and future taxable income of the C corporation.
• A C corporation will be the entity of choice for employee-owners who desire to obtain tax-free and tax-deductible fringe benefits available to employees as a result of statutory exclusions from gross income. Professional service corporations may elect to be taxed as a C corporation (rather than as an S corporation, a partnership, or an LLC) for this reason.
• Small businesses may benefit from the lower marginal tax rates on C corporation income (15% up to $50,000 and 25% from $50,000 to $75,000 under 2017 tax laws in effect). The effect of taxation at both the corporate and the shareholder level must be closely monitored.

HIGHLIGHTS OF AN S CORPORATION

• An S corporation is a hybrid entity with characteristics of both partnerships and C corporations.
• S corporations are incorporated in the same manner as a C corporation. The primary advantage of operating as an S corporation is that corporate income is only subject to one level of taxation.
• Only individuals (other than nonresident aliens), estates, certain trusts, and tax-exempt organizations and qualified retirement plans are permitted to be shareholders, and only US citizens and US tax residents may own stock. S corporations may not have more than one class of stock (preferred stock classes not allowed). There also can be no more than 100 shareholders.
• The S corporation must make a timely election of S corporation status. The election is made by filing Internal Revenue Service (IRS) Form 2553 within 75 days of the incorporation date in order for the election to take effect that year. Late filing relief may be requested from the IRS under Revenue Procedure 2013-30 up to 3 years and 75 days from the date the election was intended to be effective.
• Under Subchapter S, earnings are generally taxed only at the shareholder level, and not at the corporation level. All income and losses of an S corporation are attributed and pass through pro rata to the owners. The Subchapter S election effectively eliminates the impact

14.11. Business Entity Structures

of double taxation, subject to certain exceptions such as the built-in gains tax (for a five-year period after the conversion) and the excess passive income tax. The election makes the S corporation a tax-reporting, rather than a tax-paying, entity.
• Owners of an S corporation are protected from the debts and obligations of the corporation, and the owners are only taxed once on the corporation's income.
• States often require corporations to pay franchise fees or other taxes annually.
• S corporation shareholders can deduct losses only to the extent of their basis in stock plus the amount of any debt for shareholder loans made to the S corporation under IRC Section 1366. Even if the S corporation shareholder personally guarantees the corporation's debt, losses cannot be deducted on that debt.
• The conversion of an existing C corporation to an S corporation involves less tax cost and is less of an administrative burden than a conversion of a C corporation to an LLC. The conversion of a C corporation to an S corporation generally is not a taxable event.

WHAT ENTITY SHOULD YOU CHOOSE AND WHY?

Corporations and LLCs

Corporations and LLCs limit an owner's personal liability for business debts and court judgments against the business. Corporations and LLCs make sense for practice owners who:
• are engaged in a potentially litigious profession (veterinary medicine);
• have incurred large business debts to finance operations or expansion;
• own significant assets personally they want to shield from business creditors.

Advantages of an LLC versus an S Corporation

• LLC members can allocate profits and losses, allowing flexibility in designing owners' economic compensation. Special allocations in an S corporation stock convert the S corporation back to a C corporation.
• LLCs have no ownership restrictions, whereas violating S corporation ownership restrictions results in the S corporation becoming a C corporation. LLC members do not have to worry about losing the pass-through nature of their entity when new owners are added or additional stock is issued.
• New and existing LLC members can put appreciated assets into the company in exchange for an equity interest after formation without triggering taxable gain (this cannot be done with a corporation unless the transferor(s) owns 80% or more of the corporation after the transfer).
• LLC members can generally distribute appreciated property from the LLC without tax consequences, whereas shareholders cannot remove assets from the corporation without triggering taxable gain if the asset's value exceeds the tax basis.
• Sale of an LLC interest at a premium permits the tax basis of the LLC's assets to be stepped up to reflect the purchase price premium paid, permitting future tax deductions. This tax basis step-up may present an opportunity to negotiate a higher purchase price. Corporate share sales generally do not increase the tax basis for corporate-owned assets.
• Issuing equity to future employees can be accomplished through LLC profit interests, which offer flexible structuring alternatives. Profit interests provide a benefit to employees because, if they are sold after a one-year period after exercise and a two-year holding period, gains may be treated as long-term capital gains.
• When an LLC membership interest is purchased, purchasers can step up their tax basis of unappreciated LLC assets to reflect the purchase price pursuant to IRC Section 754. There is no similar favorable adjustment provision available for purchasers of S or C corporate stock.

Disadvantages of an LLC versus an S Corporation

• An LLC cannot engage in tax-free exchanges with corporations, whereas corporations can combine on a tax-free basis. If an exit strategy includes a tax-free acquisition of your business, an S corporation may be a better entity choice.
• Entity profits (after deducting a reasonable salary) paid to S corporation owners are generally not subject to the self-employment tax, whereas entity profits of an LLC are usually all subject to the self-employment tax. Self-employment tax is a substitute for social security for the self-employed and consists of a Medicare tax component (2.9% of salary without limitation), and a Federal Insurance Contributions Act tax component (12.4% of annual wages up to $132,900 of compensation during 2019). Employees of an S corporation must be paid a reasonable salary, which will be subject to social security taxes. Low salaries paid to the corporation's owners are subject to challenge by the IRS and could be recharacterized as wages subject to the social security tax.
• An LLC or a partnership will be deemed to be terminated for tax purposes if 50% or more of the interests in capital and profits of the entity are sold or exchanged within a 12-month period. A similar rule does not exist for S corporations.

Self-Employment Tax Considerations

In some cases, it may be preferable for an S corporation to pay lower salaries and permit the distribution of earnings in order to avoid self-employment tax on the additional distributions. Dividends (or S corporation distributions) are excluded from the definition of net earnings from self-employment.

There is still some uncertainty as to how LLC members should be treated for self-employment tax purposes. Generally, an LLC member is treated as a limited partner and not subject to self-employment tax unless he or she:
• is personally liable for debts of or claims against the partnership by being a partner;
• maintains authority to contract on behalf of the partnership;
• participated in the LLC's trade or business exceeding 500 hours during any tax year.

EXAMPLES

• Shareholders enjoy limited liability. For example, if each shareholder invests $25,000 into the corporation and it eventually fails, they have lost no more than the amount invested ($25,000). Furthermore, under the IRC, they may deduct up to $3,000 per year in stock losses on their personal tax returns, with the balance carried over to future years for further deductibility.
• Because an LLC is treated as a partnership, special tax allocations regarding income, gain, loss, deductions, or credits may be made among the LLC members pursuant to IRC Section 704. For example, one member may receive 65% of the operating profit yet only 25% of the gain on the sale of the business by the LLC.
• A C corporation with two 50% shareholders earns $100,000 during the year. The C corporation pays tax at a marginal tax rate of about 22.3% to the US Treasury of $22,250. When the remaining $77,750 is paid as a dividend to the two shareholders, each shareholder pays tax on $38,875 at their own individual marginal tax rate.

CAUTIONS

- Do not try to create a corporation or LLC without first consulting with an attorney and/or accountant who is experienced in the area of entity selection and taxation.
- A C corporation might be inclined to increase compensation payments to its shareholders and/or management in order to reduce taxable income. The IRS is interested in whether the compensation is reasonable under the circumstances. This is a critical issue, because the IRS can reclassify a portion of any salary or compensation that is considered to be excessive as a nondeductible dividend.
- Unlike the C corporation, where increased compensation levels tend to benefit the parties, the opposite can be true in the case of an S corporation. The IRS will be most interested in situations in which compensation is unjustifiably low and tax-free distributions are unjustifiably high.
- Even a *de minimis* member of an LLC (a small ownership position) will no longer be an "employee" and will face the prospect of making estimated tax payments in lieu of wage withholding and the loss of certain employee fringe benefits under the same rules that apply to general partners.

14.12. FRACTIONAL PRACTICE OWNERSHIP

BASICS

OVERVIEW

There are many ways to become a business owner, from starting a business from scratch to buying a piece of the business, to buying 100% of the business. For veterinarians and veterinary managers, the most common way to become a practice owner is through buying a portion of the practice where they work. Being a fractional owner in a veterinary hospital offers many benefits that people who remain employees throughout their careers never receive. The benefits come with some disadvantages, which largely can be overcome through strong agreements with the other owners of the business.

TERMS DEFINED

Cash Flow: The cash received by the business minus cash expenditures. Cash flow demonstrates a company's ability to meet its financial obligations, such as payroll, accounts payable, and business loans.

Fractional Owner: An owner who owns less than 100% of a business.

Majority Owner: An owner who controls more than 50% of the organization and has significant influence or can control the direction of the business.

Minority Owner: An owner who does not have sufficient ownership to control business operations on their own.

ISSUES AND OPTIONS

Practice ownership provides many advantages over being an employee, but those advantages come with increased responsibility and risk. The first and most obvious benefit is money available to pay the owners for taking the risk of owning the business.

• **Increased compensation.** As an employee, your compensation is limited to paying for the work you do in the hospital. When you become a fractional owner in a successful business, your compensation as an owner should be greater than your compensation as a nonowner. Veterinarian owners should receive compensation for their clinical production, compensation for any management responsibilities they assume, and a percentage of the business's profit. Manager owners would continue to be paid to manage the business and would receive a profit allocation as well. When first buying in, the money fractional owners receive as profit will be used to pay for the buy-in loan. Then, as the business grows, profits will increase and the profit available to owners will exceed the amount necessary to service the debt. From that point forward, the minority owner has more money to use as they wish.

There is a financial disadvantage of owning a business. During times when cash flow is tight, the owners may need to reduce their pay, or take no compensation at all, until cash flow is restored. Before buying into the business, find out if there are months of the year when the owner is not paid. This is a warning sign that the practice may be poorly managed. There may also be times when much of the profit must be reinvested in the practice, to pay for equipment upgrades or invest in facility improvements.

In addition to greater compensation, owners frequently receive *additional benefits* not available to employees. Examples include personal cell phones for owners and their families, greater continuing education (CE) allowances to include destination CE, vehicles or vehicle allowances to name a few; see 7.17 – Perquisites (Perks) of Practice Ownership. Owners will also have life insurance policies where the practice is the beneficiary. These policies provide the proceeds to buy the deceased owner's percentage of the practice from the surviving spouse.

• **Long-term job security.** As an employee, you have no guarantee that the job you have today will be yours next month. In contrast, owners cannot be fired, short of some serious misconduct. A legal document such as an owners' agreement will dictate how owners can be removed, usually due to loss of veterinary license, conviction of a felony, or egregious misconduct.

The other side of this is that, as an owner, it can be difficult to quit. The owners' agreement will specify the steps necessary to end your relationship with the practice. The partners will control who can buy the fraction you own, and often have the first choice of buying the available ownership. You will not be able to make a clean break by cursing at your business partner and slamming the door on your way out.

Because it is time consuming to exit practice ownership, conduct due diligence to ensure you understand the practice fully prior to becoming an owner. Get to know the other owners and understand if they make decisions collaboratively. You must have a good professional relationship and trust that they make decisions in the best interest of the practice and its mission.

• **Authority to direct the business.** While many businesses include employees in decision-making, the hospital owners set the direction of the practice, and establish the guiding principles. Owners decide what equipment and instrumentation is in place, what services are offered, how and where to market the practice and to whom, which employees receive raises, what products to carry, CE allowances, telephone and Internet providers, what employment policies are in place, and what employee conduct is acceptable. Every aspect of the practice is under the control of the owners.

The disadvantage is that every aspect of the practice is under the control of the owners. Regardless of how empowered the employees are to handle problems, the owners are ultimately responsible. When the security alarm goes off in the middle of the night on Christmas Eve, an owner may need to go to the practice and speak with the police. If an employee physically threatens a client or vendor, the practice owners must handle the fallout. By owning a fractional interest, this responsibility is shared with others who also have the practice's best interests at heart.

• **Build personal wealth.** When you acquire an interest in the hospital, you buy an asset you can later sell. This is one of the best ways to reward a long career in the profession, by making a good living doing something you love, then having an asset, your ownership interest in the practice, to sell. The sale of the practice may not fully fund your retirement, but the proceeds would provide additional financial security. An employee has no asset to sell.

EXAMPLES

Acquiring a fractional ownership in a practice is different from buying 100% of the business. While many lenders provide loans for purchasing the entire practice, they are averse to financing partial interests unless the buyer has significant personal assets to use as collateral. Unless the other owners are willing to allow the hospital's assets to be encumbered in this way, and this is rarely the case, securing a bank loan may be impossible. Instead, one or more of the other owners will hold the loan.

Fractional ownership can be a perfect opportunity to be mentored into practice ownership. Fractional owners may not see a significant increase in pay (at least right away), but they will build financial equity in the business and build "knowledge equity" as they gradually learn more and more about practice ownership. Fractional owners can acquire knowledge equity without the burden of having the success of the practice resting solely on their shoulders.

Because the current owners will finance the buy-in loan, it is in their best interest to keep the practice profitable enough that distributions are sufficient to meet the debt requirement. The financial rewards are not as high as being a majority owner or a single owner, but the financial risks are not as high. Fractional owners do not have the same level of control over business operations as a solo owner would have, but, in many cases, control over specific areas can be designated in the owners' agreement.

A **50 : 50 ownership** is a fractional ownership where two owners have an equal share in the control and the financial rewards of the organization. This is not usually a mentorship level of ownership, but it is more common between equally qualified owners. Since neither owner possesses a majority share, all decisions must be unanimous. This requires a shared vision for the practice as well as good communications between the owners to get things done and move the practice forward. In such a situation, the owners must determine in advance how a decision will be made if a stalemate is reached.

Many potential buyers, particularly employed (associate) veterinarians, believe that practice ownership is not attainable given the high educational debt they carry. The reality is that, if a practice is valued appropriately, ownership is a very attainable financial goal, even with a high student loan burden. In fact, the profit distributions practice owners receive may allow faster repayment of student loans. Money should not be the deciding factor!

Becoming a practice owner offers the possibility of many benefits, from increased financial return to increased work flexibility to guiding the philosophies of the practice. Fractional ownership is appealing for many reasons, not the least of which is having partners to mentor you as you develop your leadership style and learn the skills needed to maintain and grow a successful practice. Through buying a fractional interest, you can assume new responsibilities gradually, which reduces the relative risk of becoming a business owner.

CAUTIONS

Nothing in this chapter should be construed as legal advice. Always consult with an attorney before signing any legal document. The hospital's attorney cannot provide advice to an individual owner or prospective owner.

There are income tax consequences to becoming a business owner, and those consequences may be significant. Always consult with a tax professional prior to buying, and understand the impact business ownership will have on your personal tax situation.

14.13. DETERMINING A PRACTICE'S WORTH

BASICS

OVERVIEW

- The value of a practice is based upon the expected future financial returns from a practice and the risks associated with receiving these returns:
  - the higher the expected return and the lower the risk of receiving these returns, the higher the value of the practice;
  - the lower the expected financial return from the practice and the higher the risk associated with the return, the lower the value of the practice.
- Many factors must be analyzed to determine the future financial return expected and the risks associated with the return.
- An assessment of these factors requires the skills of a qualified business valuator. The information provided here will promote a greater understanding of the process and methodologies used to develop a valuation conclusion.
- Although valuations are frequently associated with buy/sell transactions, they can be effectively used in partnership agreements, as a proactive management tool, or a succession planning tool, for example.

TERMS DEFINED

Book Value: Dollar amount at which assets and liabilities are recorded in financial statements. This amount generally is not reflective of the fair market value of a business or its assets. Net book value is the difference between assets and liabilities as recorded in the financial statements.

Capitalization Rate: Any divisor (usually expressed as a percentage) used to convert anticipated economic benefits of a single period into value.

Capital Reinvestment: Periodic capital outlay required to maintain operations at existing levels; also referred to as sustaining capital reinvestment.

Discount Rate: A rate of return used to convert a future monetary sum into present value.

Excess Earnings: The amount of earnings expected over and above the return on tangible assets; includes earnings as a result of intangible assets such as goodwill.

Fair Market Value: The amount (cash or cash equivalent) at which the property would change hands between a willing buyer and a willing seller, where neither is under any compulsion to act, both parties have reasonable knowledge of relevant facts, and the property was exposed on the open market for a reasonable period of time. In Canada, fair market value is defined by the highest price available and includes special-interest purchasers.

Going Concern Assumption: Assumption that the business will remain in operation for the foreseeable future (as opposed to a liquidation assumption).

Goodwill: An intangible asset resulting from a business's reputation, name, location, products, services, customer base, and so on.

Goodwill Value: Value attributable to goodwill, whether personal (related to a specific owner) or enterprise (related to the business as a whole).

Intangible Assets: Nonphysical assets such as goodwill, contracts (noncompete covenants), trademarks, patents, copyrights, and so on, which provide value to a business.

Liquidity: The ability to quickly convert assets to cash or to pay a liability.

Nonoperating Assets: Assets not related to ongoing operations of the business enterprise; if the assets were eliminated from the business, the resulting earnings would be unchanged. An example is a vehicle owned by the hospital but used exclusively by the business owner for personal transportation. Also referred to as *redundant assets*.

Rule of Thumb: Commonly used, easily calculated criteria to arrive at a business value. Criteria are usually specific to a particular industry. Changing economic conditions and the inability to compare similar practices in veterinary medicine make the rule-of-thumb approach an unreliable method of valuing veterinary practices.

Tangible Assets: Physical assets such as cash, accounts receivable, inventory, property, facility, and equipment.

Valuation Approach: An overall theoretical way of approaching the valuation of a business – the three general ways used to determine value for a going concern are the asset-based, earnings-based, and market-based approaches.

Valuation Method: Specific techniques or methodologies within the three general valuation approaches to determine value. For example, the excess earnings method is usually considered an asset-based approach, whereas the single-period capitalization method is an income approach.

Working Capital: Current assets minus current liabilities.

ISSUES AND OPTIONS

WHY VALUE YOUR PRACTICE?

There are many reasons why a practice is valued. The most obvious reason is to transfer ownership of a practice in whole or in part. Other situations that give rise to a valuation include the following.

- Structuring partnership and shareholder agreements – buy/sell agreements should contain an updated practice value or a methodology for obtaining it when needed.
- Business planning – valuation analysis can assist owners in developing strategies to improve the profitability and value of their businesses. This is especially important if the owners wish to fund part of their retirement from the sale of their businesses.
- Estate planning, succession planning, and tax planning.
- To obtain financing.
- Converting a C corporation to an S corporation.
- Merging two organizations or dividing a practice into two or more parts.
- Partnership and shareholder disputes, litigation issues, insurance claims, or breaches of contract.
- Marital dissolution (divorce) – there is a trend toward both parties jointly appointing a single independent valuator (appraiser) to establish a valuation conclusion, as opposed to each party engaging their own expert. In many cases, this can save significant time, money, and stress for the individuals involved.

CHOOSING A VALUATION EXPERT

In recent years, the veterinary healthcare industry has become more sophisticated with specialization of veterinarians in orthopedic surgery, oncology, neurology, and so on. Similarly, the business valuation industry has become more sophisticated. There are several organizations in North America that provide continuing education and certification processes for valuation experts. Each organization establishes prerequisites, continuing education, and experience requirements for their members. The designations and organizations in North America are:

- ASA/AM: Accredited Senior Appraiser/Accredited Member designations awarded by the American Society of Appraisers.
- CVA: Certified Valuation Analyst designation awarded by the National Association of Certified Valuators and Analysts.
- ABV: Accredited in Business Valuation designation awarded by the American Institute of Certified Public Accountants.

• CBV: Chartered Business Valuator designation awarded by the Canadian Institute of Chartered Business Valuators.

Considering the specialized knowledge base required to conduct business valuations and the litigious nature of our society, the significance of engaging experts with the aforementioned designations will become even more important in the future.

In addition to valuation methodology, a valuation expert must be familiar with the latest developments and trends in the veterinary industry. For example, the valuator must be familiar with the differences among the transferability of goodwill, marketability, and valuation of a single-doctor equine practice, a mixed-animal practice, and a large multidoctor companion animal practice. They must be familiar with key success factors in the industry, such as revenues resulting from reliance on medical and surgical services versus product sales. They must also familiarize themselves with key indicators of operating performance that are specific to the industry, including average transaction charges, revenue per doctor, client retention figures, and so on. It is critical that the appraiser of the practice have experience in valuing veterinary practices or be willing to obtain the necessary information. Although many broad appraisal principles apply to all types of businesses equally, there are some distinct differences. For example, not all professional practices include goodwill in the estimate of value, whereas this is almost always a given in veterinary medicine. A valuation performed by a nonqualified individual will waste money, delay the appraisal process, and create unnecessary friction between a buyer, seller, or other parties with an interest in the matter. If you choose to engage a local accountant with business valuation expertise to conduct your valuation, the individual will need to familiarize him or herself with industry trends, developments, and industry-specific benchmarks. There are many trade publications, websites, and associations that can assist valuators in this area. Some local accountants may decline to do a valuation due to a possible conflict of interest if they also prepare the hospital's financial statements and tax returns.

Ask a potential valuator about their experience doing business valuations *and* veterinary practice valuations specifically. If they lack experience themselves, ask if there will be a more experienced individual supervising the valuation process or report.

The cost of valuations varies greatly. This should be of no surprise to veterinarians, given, for example, that there is more than one way to spay a cat, with potential outcomes including a cat that is not 100% spayed. Ask the valuator the process he or she will use to get the end result. A sample report is ideal, but a table of contents also assists in evaluating the thoroughness of the process.

Although higher priced valuations are not a guarantee of higher accuracy, they are generally associated with a more thorough and professional valuation report and conclusion. Choosing a bargain basement valuation may save you money in the short term, but it may cost you thousands more in the longer term. Do your bargain shopping while in the discount store, not when shopping around for a valuator for the business you have spent years building.

BUSINESS ANALYSIS

To determine practice value, a valuator performs a detailed analysis of the following three main areas:

- the economic environment;
- the veterinary industry;
- the specific practice.

This analysis will be both quantitative and qualitative and will lead to appropriate estimates for the variables needed to arrive at valuation conclusions. The variables required will be based on the method or methods of valuation chosen. Variables include projected cash flows, sustainable earnings/cash flow levels, and the risks associated with these anticipated monetary benefits as measured by the discount rate and capitalization rate.

The Economic Environment

Consideration should be given to the following:

- Past and future economic conditions, bank prime rates, mortgage rates, unemployment rates, taxation, stock market performance, investment interest rates, and so on.
- Past economic conditions compared with the veterinary industry and the practice's past performance, and predictions on how the industry and practice will respond to forecasted economic conditions.

The Industry

Evaluate opportunities and threats to the veterinary industry, including:

- Market demand and trends for services and products, substitutions (Internet pharmacies, groomers), complementary products, and recent developments.
- Technology effects on the industry (Internet pharmacies, high-tech client communication, telemedicine, and education technology).
- Key success factors in the industry (service quality).
- Government policies and regulation of the industry (greater market for practices in states where nonveterinarians can own practices).
- Growth potential or decline for market segments (declining number of mixed animal practices).
- Pet population trends and demographics of pet owners.
- Past, current, and potential competitive environment – strengths and weaknesses of competition, geographic location, estimated market share, and product and service offerings.
- Presence of corporate consolidators
- Stage of industry lifecycle – growing or mature.
- Entry barriers to establishing a practice.
- Industry-specific variables for veterinary practices compared with industry data (see analysis of The Specific Practice section).

The Specific Practice

An internal analysis of the practice serves to evaluate the strengths and weaknesses of the individual business and should cover the following areas.

- General business review:
  - history of the business
  - asset sale or share (equity) sale;
  - location, facility, lease terms, technology employed;
  - organizational structure – management, leadership, key employees;
  - business plans, strategic plans, and marketing plans – measures of their effectiveness, markets served, demand for services/products and so forth;
  - potential buyers, including whether the practice would attract corporate consolidators;
  - operations – capacity utilization, quality control procedures, capital investment requirements;
  - transferability of goodwill (single doctor mobile versus multidoctor companion animal practice);
  - if there are multiple locations, each location will require the same analysis.
- Financial analysis:
  - historical and current financial data;
  - capital structure of the business (debt compared to equity);
  - working capital requirements, identification of working capital surpluses or deficiencies;
  - capital asset additions – past and future requirements to meet operating results;
  - unusual or nonrecurring items;
  - transactions conducted at rates that are not market rates, such as would occur between two related or affiliated parties (non-arm's-length transactions);
  - forecasts – accuracy of historical forecasts;
  - sales by product/service;

14.13. DETERMINING A PRACTICE'S WORTH

- ratio analysis (liquidity, profitability, efficiency, leverage); ratios should be compared with industry values;
- industry-specific ratios and financial data compared with industry values – examples include revenue per doctor, ratio of product sales to medical/surgical services, and reliance on product sales versus veterinary services, client retention rate, number of new clients, average client transaction charge;
- trends in sales, operating margins;
- common-size financial statements facilitate comparisons of the data from year to year and with other practices (each account group, the total cost of goods sold for example, is expressed as a percentage of sales);
- nonoperating assets (redundant assets).

VALUATION METHODOLOGIES

There are three main approaches to the valuation of a business as a going concern. However, within the main approaches are several valuation methods that represent specific techniques used to determine a business value. The three main approaches to valuation are:

- earnings/cash flow based;
- asset based;
- market based.

The business analysis performed by the valuator assists in the determination of the value approach to be used for a specific practice, although most valuators rely on more than one method to arrive at a valuation conclusion.

Earnings/Cash Flow Based

This method is also referred to as the income method. The value conclusion is based on anticipated future income streams, and it includes risks associated with the possibility that the future income streams will not materialize as expected. There are three basic valuation methods in this category:

- capitalization of earnings/cash flow technique;
- discounted cash flow;
- dual capitalization of earnings/cash flow (also known as excess earnings).

Capitalization of Earnings/Cash Flow Technique

Appropriate for a mature business with relatively consistent earnings and/or where reliable earnings and/or cash flow forecasts are unavailable.

- Actual historic results of the company are used as an indicator of future results.
- Involves establishing a maintainable earnings level or a maintainable cash flow amount and applying a capitalization rate specific to the practice being valued.
- A capitalization rate, which measures the risk of the investment, is used as a divisor of the maintainable earnings or cash flow.
- The mathematical inverse of the capitalization rate can also be used to multiply the earnings or cash flow number to arrive at a practice value.
- Nonoperating or redundant assets, if present, are added to determine an overall going-concern value. In a sale situation, these assets are added only if they will remain with the practice.
- In Canada, the cash flow technique takes into consideration sustainable capital reinvestments required to maintain earnings and their associated tax shields.

Discounted Cash Flow Technique

- Appropriate for a business with a finite lifespan or businesses whose forecasted earnings are expected to change for a period of years before a longer term sustainable cash flow level is achieved.
- Example: start-up practices, or practices going through a period of rapid growth due to expanded services or decline because of competition.
- Technique is essentially a present-value calculation using an appropriate discount rate that is specific to the business entity; the discount rate is used as a measure of risk associated with the anticipated financial returns.
- The present value of forecasted cash flows for each year where cash flow is expected to change is added to a terminal present-value calculation for the practice.
- Nonoperating or redundant assets are considered.
- In Canada, the discounted cash flow technique also considers capital reinvestments and their associated tax shields.

Dual Capitalization of Earnings or Excess Earnings

- Although this approach is often used as a primary method of valuation, many business valuators feel its primary purpose is to test valuation conclusions using other methodologies.
- The business is divided into tangible components and intangible components. Each component is valued separately and then added together to create a value for the entire entity.
- The tangible component is represented by net tangible assets; an expected return (percent) is applied to the tangible assets and reflects the risks associated therein; the risk for receiving a return on tangible assets is usually lower than the risk associated with intangible assets.
- Because this method includes a tangible asset component, having a formal equipment appraisal is critical.
- The intangible component is represented by excess earnings; a capitalization rate specific to the intangible component is chosen and usually reflects a higher risk associated with a return on the intangible assets. This capitalization rate will be higher than the rates used in the capitalization of earnings method.
- Also classified as an asset-based approach.

Asset Based

There are two closely related techniques that are based solely on the net assets of a business:

- Liquidation value.
  - Liquidation value is used when a business is no longer considered a viable concern. It is the net amount of money left to owners if the business is terminated and the remaining assets are sold individually for cash.
  - There are few circumstances in veterinary practice where liquidation value is used.
- Adjusted net book value.
  - Adjusted net book value is used to value the net assets of a viable (profitable) ongoing business where there is no expectation of a return from intangible assets or commercially transferable goodwill.
  - Adjusted net book value is used frequently to value investments and real estate holding companies.
  - An example where adjusted net book value would be used as a primary valuation method would be a practice that is made up entirely of personal goodwill (nontransferable goodwill); however, most practices have a component of goodwill that is commercially transferable, and adjusted net book value calculations are included to back up valuations conclusions using more appropriate methods.
- Net assets are valued at their current fair market values.

Market Approach

- This approach involves a comparison of actual transactions and public market data with the business being valued. Under some circumstances the market approach can be superior to other valuation methodologies because it is based on actual transactions.
- Because most veterinary practice sales are between private companies, it can be difficult to find enough comparable sales data to accurately use the market approach as a primary method of valuation. However, Simmons and Associates Inc., in partnership with the VetPartners™ Valuation Council is actively gathering data in this area.
- The main problem with the market-based approach is that it is difficult to find businesses that are truly similar in all characteristics. Most business valuators will use a combination of these techniques to arrive at a valuation conclusion.

NORMALIZATION OF THE FINANCIAL STATEMENTS

The financial statements and tax returns of the practice are the starting point for determination of a practice's earnings (see 7.2 – Financial Statements). However, adjustments to these figures are usually required to accurately reflect what a purchaser of the practice would expect as earnings in the future. The business analysis outlined earlier assists valuators with this process. Financial statements and results are examined thoroughly to determine if they can reasonably be expected to continue under new ownership.

Adjustments may involve:

- Salary adjustments. Owner compensation adjustments to properly reflect compensation for medical and management duties.
- Rent adjustments reflective of fair market value.
- Nonrecurring revenue and expenses – large one-time product sale, malpractice legal defense, or practice owner perks including automobiles, cell phones, and so on.
- Impact of a dropped service or added service.
- Impact of an equipment purchase on labor costs and revenue.
- Changing tax rates, interest rates, or accounting practices (cash versus accrual, inventory management method).

As can been seen from these necessary adjustments, determining a maintainable earnings level for a practice involves more than taking an average or weighted average of past years' performance.

Normalizing financial statements and earnings facilitates comparisons with year-to-year data, and it assists with more accurate predictions of maintaining earnings and forecasted cash flows.

CAPITALIZATION RATE AND DISCOUNT RATE

The capitalization rate and discount rate are important variables in the determination of value using the earnings/cash flow method of valuation.

- The discount and capitalization rates measure the risk associated with achieving the projected income or cash flow.
- The capitalization rate is utilized when determining the value of a business using the capitalization of earnings or capitalization of cash flow technique; normalized earnings or cash flows are divided by the capitalization rate to arrive at a value for a business.
- Capitalization rates are usually expressed as a percentage, such as 20%.
- The inverse of the capitalization rate (1/20% = 5) is referred to as the multiplier.
- A discount rate is the rate of return used to determine the present value of a stream of future income when applying the discounted cash flow method of valuation.
- The capitalization rate is related to the discount rate with one main exception: the capitalization rate does not include a growth component. The capitalization rate equals the discount rate minus a growth factor usually representative of the national long-term rate of inflation and real growth.
- In determining an appropriate discount rate and or capitalization rate, the valuator must assess the risk of achieving the normalized earnings/cash flow. The business analysis previously described assists the valuator in deciding an appropriate level of risk.

CAUTIONS

This material is for general information only and should not be used as a substitute for professional advice regarding any legal, financial, or tax issues. It does not constitute the rendering of any legal, financial, or tax advice or service. You should consult the appropriate legal, financial, or tax professional for these services.

MISCELLANEOUS

In general, Canadian valuations are conducted on an after-tax basis and include appropriate tax shield considerations. In the United States, veterinary practice valuations are usually prepared on a before-tax basis.

14.14. The Valuation Process

BASICS

OVERVIEW

At any given point in time, a business may have several different values, depending on what is being valued and why. The purpose of the valuation has an impact on the methodology used and will affect the result. This underscores the need for the client and the valuation analyst to determine many facts at the onset of the valuation engagement.

Many consultants who establish selling prices for their clients use the term "valuation." Some consultants act as advocates for the practice owner and arrive at a price that emphasizes their clients' best interests. Those consultants use the term "valuation" incorrectly. By definition, a business valuation must be an unbiased, professional determination of business value. The valuator may not act as an advocate for any side of a potential transaction and must verify there are no conflicts of interest before accepting the valuation engagement. The professional fees paid for a valuation may not influence the value in any way. This position will be specifically stated in a valuation report.

TERMS DEFINED

Assets: Things of value, such as cash, equipment, inventory, or buildings.
Capitalization Rate: Also referred to as a "cap" rate. It reflects the risk of average adjusted earnings continuing at current levels in the future.
Control: The power to direct the management and policies of a business.
Earnings: The profit remaining to the owners of a business after all normal business expenses have been paid.
Equity: The portion of the practice's assets that belong to the owner or owners, not the creditors.
Estimate of Value: A range of values when, in the sole professional judgment of the valuation analyst, an opinion of value cannot be stated.
Fair Market Value: The price at which the property would change hands between a willing buyer and a willing seller, when neither is under any compulsion to buy or to sell, and both having reasonable knowledge of relevant facts.
Going Concern: The premise that business is expected to continue to operate into the future.
Investment Value: The value to a specific buyer based on their unique requirements and expectations.
Liquidation: The cash that would be received under the premise that the business would be terminated and the assets sold piecemeal.
Normalizing Adjustments: Adjustments made to financial data so that they conform to industry accounting principles and to eliminate nonrecurring, extraordinary, and excess items
Opinion of Value: The most unambiguous expression of value, expressed as a single value.
Valuation Date: The specific point in time on which the business value is determined, frequently a calendar or fiscal year end.

ISSUES AND OPTIONS

PURPOSE OF EVALUATION

The purpose of the valuation drives the result. When contacted regarding a valuation engagement, the valuator will ask two questions that may seem intrusive but are germane to the assignment. Those questions are:

- *Why* is a valuation necessary?
- *What* is being valued?

There are many different reasons *why* a valuation may be needed. These include:

- sale or purchase of all or a portion of the business;
- mergers;
- update to buy/sell agreements or life insurance policies;
- tax planning, including estate and gift tax;
- litigation – most commonly divorce or partner disputes.

What, or the legal interest to be appraised, must be identified at the outset of the engagement. The valuator must understand exactly what will be appraised before they can determine the documentation required and how to proceed.

For veterinary hospitals, the *what* can be broken further into the following.

- **Assets.** Generally used when 100% of the business will be sold. In this situation, the practice is sold "cash free" and "debt free," meaning that the buyer is not buying the cash in the seller's bank accounts and will not assume any existing liabilities, including equipment leases.
- **Partial interests.** Generally selected when a specific portion of the practice will be valued. Examples include valuing the large animal portion of a mixed animal practice or valuing individual specialties in a referral practice. Unless there has been strict separation of historical income and expenses, valuing partial interests may require the services of a forensic accountant.
- **Equity.** Generally applies when less than 100% of the business will be sold. This is the most common interest sold in an associate buy-in or any similar transaction when less than 100% of the business will be sold. In an equity valuation, consideration also is given to whether the interest being sold is a controlling or noncontrolling interest. If a *controlling interest* is valued, the potential buyer would have the ability to change virtually anything about the practice, from its fee schedule to the products and services offered, as well as the compensation of owners, doctors, and staff. An owner of a controlling interest may be able to force the sale of the business itself.

Before the valuator can begin a valuation, many decisions must be made, generally in discussions with the practice owners or the persons ordering the valuation. These include:

- **Valuation date.** The date upon which the valuation is effective. In valuations done for matrimonial dissolution, the business may be valued on two separate dates: the date of the marriage and the date the divorce papers were filed. This is done to determine the change in value of the business during the marriage. Just as the balance in a bank account may change from day to day, the value of a business fluctuates.
- **Applicable standard of value.** The purpose of the valuation also dictates the standard of value used. The standard of value reflects the type of valuation needed and for whom. These are:
  - *Fair market value (FMV).* The Internal Revenue Service defines the FMV as "the price at which the property would change hands between a willing buyer and a willing seller, when neither is under any compulsion to buy or to sell, and both having reasonable knowledge of relevant facts." Under the FMV standard, the value is based on a typical buyer or a typical seller in the market, rather than the investment needs of any particular buyer or seller. FMV is used most commonly when 100% of the business will be sold.
  - *Investment value.* The primary difference between the FMV standard and the investment value standard is that the valuation reflects the needs of a specific buyer or seller. If either the buyer or seller were motivated to act based on criteria unique to them, the appropriate value would be investment value. For example, if the seller was moving out of state in 60 days, there might be urgency on their part to sell, and a lower price might be acceptable if the timeline could be met. In another example, a buyer may be willing to pay more for a specific practice if it is in an area where the buyer would like to live and has been searching for a practice to buy for an extended period.

- *Fair value.* Fair value is a statutory standard of value that varies from state to state. It is most commonly used in situations that will be litigated, particularly for dissenting shareholders. For these reasons, fair value is not commonly used in veterinary practice valuation.

• **Premise of value.** The premise of value used in the appraisal is based on expectations for the future. The two most common premises of value are:

- *Going concern.* Most veterinary practices are valued under the premise that the business will continue to operate into the future. Under this premise, some of the intangibles included in the value are the staff, equipment, systems, and inventory in place.
- *Liquidation.* Here, the expectation is that the business will be closed and all assets sold in an orderly fashion. In this case, only the tangible assets (e.g., medical and computer equipment) are sold. No value is placed on intangible assets.

THE VALUATION ENGAGEMENT

Another determination that must be made at the outset is whether the valuator will provide a *conclusion of value* or a *calculation of value*. For a calculation of value, the valuator and the client must agree on certain facts in advance of the engagement. The National Association of Certified Valuators and Analysts (NACVA) standard for a calculation engagement states:[1] "A Calculation Engagement occurs when the client and the member [valuator] agree to specific valuation approaches, methods, and the extent of selected procedures and results in a Calculated Value." Calculation engagements require the client to have detailed knowledge regarding valuation methodology.

In contrast, for *conclusion of value* engagements, also known simply as "valuation engagements", the NACVA standard states:[1] "A Valuation Engagement requires that a member apply valuation approaches or methods deemed in the member's professional judgment to be appropriate under the circumstances and results in a Conclusion of Value." Conclusions of value, therefore, rely on the valuator's professional judgment, rather than requiring that the client also be well informed regarding valuation theory.

THE VALUATION REPORT

Just as there are many decisions to make regarding the assumptions and methods used in a valuation, the valuation report itself comes in many forms, from formal written reports to informal verbal reports. The type of report to be issued must be discussed in advance to ensure the client receives the information and the document appropriate to the purpose of the valuation. Calculations of value result in a "calculation report," whereas conclusions of value are provided in either a "summary report" or a "detailed report." The valuation analyst's professional standards may dictate the specific content of the report. In some cases, an oral report may be provided.

The type of report issued has an impact on the total fees for the valuation, as there is a great deal more time required for an analyst to prepare a written report than it does to prepare for an oral report.

SITE VISITS

Many times, a site visit will be conducted at some point during the valuation. This is an opportunity for the valuator to meet the principals involved in the business, have a tour of the facility, and conduct interviews with owners, managers, and a select number of employees. The visit may occur at any point during the valuation. The analyst's goal is to gain a broad perspective of the business and gain answers to questions that arise during the analysis. If the analyst is not in the local area, additional fees will apply for the site visit.

Working with an analyst with extensive experience valuing veterinary practices may negate the need for an onsite visit, particularly given information sharing advances in technology. Instead of going on site, the analyst may ask for detailed lists of equipment, photographs, a video tour, and other information that will provide a comprehensive picture of the business. Interviews with owners and managers may take place via web conference, over the phone, or in written format.

Once the valuation date, the purpose of the valuation, the standard and premise of value, and the type of report to be issued are determined, the valuator will provide the client with an engagement letter (which includes the items listed in the previous sentence, plus the fees for the valuation) and a list of the information they wish to review. This list will be extensive, and will include legal and financial documents, personnel listings, salary and wages reports, production reports from the practice management software, inventory listings, details related to the facility, the equipment owned and leased, the presence of competitors, and other details to help the valuation analyst understand the practice and the environment in which it operates. Typically, three to five years of historical documents are requested.

VALUATION ANALYSIS

The valuation analyst must develop an understanding of the business and the interest being valued. This understanding should include the key employees in the business and their backgrounds, large customers, suppliers, and the business environment in which the practice operates. The analyst should understand the history of the practice, how it was started and by whom, all previous ownership sales, and any planned ownership changes. Although the most recent history will be the basis for the financial analysis, the valuator must understand the full practice history to determine what is relevant.

Once the analysis is underway, the valuator will determine the approach or approaches to value that are most appropriate (see 14.13 – Determining a Practice's Worth). For a conclusion-of-value engagement, many appraisers use more than one approach and compare the results to determine the value for a given business. In a calculation-of-value engagement, the client and the valuator agree in advance to use one specific method. This is one way to tell the difference between the two types of reports.

The three approaches to value are:

• *Asset approach*, where the value of each physical asset is determined and summed. Because it does not consider intangible assets such as goodwill, the asset approach is rarely used as the primary approach for veterinary practices.

• *Market approach*, where sales of similar businesses are compared and used to develop a value for the practice being valued.

• *Income approach*, where the profit or earnings available to the buyer are quantified and capitalized (divided by a percentage that represents ownership risk). This is the most common approach used for businesses that make most of their money from professional services.

When the asset approach is the only method utilized, the valuation assessment is complete once the assets have been individually appraised. Under the income and market approaches, the valuator determines the most likely earnings available to a buyer.

EARNINGS

From a valuation perspective, all income and expenses that are not strictly related to the business must be removed from the financial statements so that the value reflects the most likely ongoing business activity. A large part of the valuation analysis is done through review and adjustments to financial statements. Accounting standards allow accountants some discretion in how income and expenses are stated in order to minimize their clients' income tax liabilities. As a result, the business's expenses may fluctuate considerably from year to year. The valuator will analyze income and expenses across several years to identify anything that seems unusual and, depending on the reason for the variance, will modify, or "adjust," the number to represent a more normal level of business activity.

Some business owners maintain a very strict line between personal and business expenses, whereas others will blend the two occasionally. Also, some tax accountants are more aggressive than others about claiming certain personal expenses like vehicles or computers as business expenses. It is important for the client to provide complete, honest information to the valuator. If the business pays for season

14.14. The Valuation Process

tickets to the hometown team and the owner's family uses those tickets exclusively, the cost of the tickets would be adjusted out of the financial statements, assuming the purchase would not be continued under a new owner.

There are two types of financial adjustments: normalizing adjustments and control adjustments. *Normalizing adjustments* are made to remove nonrecurring income and expenses from the financial statements and adjust other items to remove fluctuation and allow better comparisons with industry benchmarks, where available. An example relates to acquiring new equipment.

Annual reinvestment in equipment and the facility are necessary to replace old or broken equipment, maintain or increase the quality of medicine, and to keep the facility up to date. Even when a replacement schedule is in place, there are many reasons why spending in these categories may fluctuate greatly from year to year. To normalize the impact of this spending and remove the fluctuation, the valuator will adjust spending to an average level, or an industry-specific level, based on their experience valuing other veterinary practices

Control adjustments are made when a controlling interest in the business will be sold, or when the owner or owners who have control agree to a future change. Two common examples in veterinary practice valuations are facility rent and owner compensation. When the real estate and buildings are owned by one or more of the practice owners, the facility rent paid by the practice may or may not reflect fair market rent. Usually, facility rent levels are determined by the owners with advice from their tax accountants. If the rent paid is higher than fair market rent, the business value will be artificially low. To receive a higher value, the controlling owner would need to agree to charge lower rent in the future.

In the case of owner compensation, business owners may compensate themselves in any manner and at any level they wish. In a situation where the controlling owner is paid more than what a nonowner with similar responsibilities would be paid, a control adjustment would be made only if the controlling owner agreed to reduce their compensation.

The result of making normalizing and control adjustments is an "adjusted earnings" number for each of the years analyzed. The valuator then determines which year or years represent the most likely stream of earnings that an owner of the business can expect to receive. An average of adjusted earnings is calculated and then converted to value through division by a *capitalization rate*. The capitalization rate reflects the risk of those earnings continuing in the future. More about this in a moment.

RISK OF OWNERSHIP

According to the income approach, a person who is buying a business is buying the stream of future earnings the business will generate. Those earnings will pay for the acquisition loan for the business itself and provide a return to the owners beyond fair compensation for the work they perform in the business. However, these earnings cannot be guaranteed.

Investors must consider the potential return on their financial investments. Astute investors will require a higher potential rate of return for a risky investment than they would require for a safer investment. Similarly, a buyer of a veterinary hospital will be willing to pay a higher price for a stable business with less risk than they would be willing to pay for an unstable business with more risk. This assessment of financial risk is captured in the "capitalization rate" or "multiple" that is used to convert the adjusted earnings to a practice value.

Though the assessment of risk is more subjective than the adjustment of earnings, there has been extensive research in the veterinary market to help guide valuators when establishing capitalization rates. These guidelines are based on a variety of risk factors including, but not limited to:

- trends in gross income;
- volatility of adjusted earnings;
- quality of doctors and staff, including advanced training and certifications, as well as turnover;
- equipment and instrumentation in the hospital, and its current condition;
- area demographics such as population and household income and the number and quality of competing veterinary hospitals;
- national and local economic factors such as unemployment and whether a major employer is entering or leaving the area.

The valuator will use these and other factors to determine the risk level of the subject practice compared with the level of risk for an "average" veterinary practice. This risk level will then be converted to a capitalization rate based on the valuators knowledge of the historical market rates of return for practices with similar levels of risk.

CAPITALIZATION RATES AND "MULTIPLES"

As mentioned earlier, the capitalization rate represents the risk of the investment. Capitalization rates or "cap rates" are expressed as percentages, with higher percentages indicating higher risk investments, and lower percentages representing lower levels of risk. To calculate the value of a business, using the income approach, the average adjusted earnings are divided by the capitalization rate. The "multiple" is simply the inverse of the capitalization rate. A 25% cap rate is equal to a multiple of four (1/25%).

VALUING ASSETS VERSUS VALUING EQUITY

If the purpose of the valuation is to determine an *asset value* for a sale of 100% of the practice assets, the value calculation is complete. If the purpose of the valuation is to determine an *equity value* for a buy-in, the valuation analyst must convert the asset value to an equity value by adding in the cash in business bank accounts, plus any prepaid expenses and subtracting all practice liabilities, such as balances in accounts payable, equipment loans, capital leases, and so on. Because the buyer gets an ownership stake in everything, he or she would own a portion of the cash and owe a percentage of all the debt if the practice closed suddenly.

SUMMARY

Business valuation is complex, and the best result can be determined only through diligence on the part of the valuator. The purpose of the appraisal is critical to determine at the outset as it has a large impact on the way in which the analysis is performed as well as the resulting value of the business. If the appraisal is done for the purposes of establishing a value for an associate buy-in, where the associate will have little to no control over compensation, benefits, the fee schedule, or facility rent, the resulting value will be much different from the value to a buyer of a controlling interest who can make any changes they wish. Different purposes require the use of different methods and approaches, as well as different assumptions.

EXAMPLES

N/A

CAUTIONS

The information presented is not intended to replace the services of a professional valuator.

The term "valuation" is used in different ways by business consultants. Many business consultants offer services they represent as "valuations" that do not follow the valuation definition of being unbiased. When reading a valuation report, watch for adjustments that eliminate normal business expenses, such as licenses, dues, or

continuing education. These reports may have been prepared by an advocate for the seller, not as an unbiased business valuation.

It is a mistake to use a valuation prepared for one purpose for any other purpose. This is because the assumptions used for the original purpose may not apply to a different situation. For example, if the original valuation was done for a minority buy-in but was used instead for a 100% sale, the seller will not receive a fair price.

14.15. Practice Value Rules of Thumb

BASICS

OVERVIEW

The *International Glossary of Business Valuation Terms* defines a "rule of thumb" as "a mathematical formula developed from the relationship between price and certain variables based on experience, observation, hearsay, or a combination of these; usually industry specific."[1] In the veterinary industry, a rule of thumb is derived from actual practices sales, along with a healthy dose of hearsay, an average of one or more variables, and then comparing that average with the sales price. In other words, a rule of thumb would apply to an "average" practice.

TERMS DEFINED

Asset Approach: A business valuation approach generally selected when 100% of the business will be sold. The practice is valued "cash free" and "debt free," meaning that the seller retains all the cash in the business and pays all liabilities, including equipment leases.

Earnings before interest, taxes, depreciation, and amortization (EBITDA): EBITDA represents a business's net income with certain accounting expenses, namely depreciation, amortization, plus income taxes and interest added back in. EBITDA is used to gauge a business's profitability as well as its ability to repay debt.

Equity Sale: A business valuation approach used when less than 100% of the business will be sold; for example, when an associate buys into the practice as a partial owner.

Fair Market Value: The price at which the property would change hands between a willing buyer and a willing seller, when neither is under any compulsion to buy or to sell, and both having reasonable knowledge of relevant facts.

Rule of Thumb: A rough approximation that is not intended to be strictly accurate or reliable for every situation.

ISSUES AND OPTIONS

Rules of thumb are often expressed as a multiple of a financial figure like gross revenue, profit, or earnings. The most common rules of thumb heard in the veterinary industry are that practices are worth some percentage of the gross revenues from the previous year, or a multiple of earnings.

There are a number of problems with rules of thumb, particularly in a profession where most practice sales are private, meaning access to data regarding those sales is difficult to obtain. Instead, many people rely on values recounted "through the grapevine" to develop these rules. The inability to compare similar practices in veterinary medicine makes the rule-of-thumb approach an unreliable method of valuing veterinary practices.

In addition, if the rule of thumb relies on a multiple of earnings, there is no consensus regarding how earnings are quantified, what they include and do not include, or even whether owner compensation is subtracted from earnings, or is added back into them. This is a significant difference! If we rely on a rule of thumb based on earnings, it is critical to ascertain whether each practice was priced using the same definitions.

If a valuation expert is asked to provide an applicable rule of thumb for veterinary practice value, that expert is likely to offer a host of reasons why a rule of thumb is difficult to determine, let alone apply, in this industry. The value of any business is based on the specific characteristics of that business. In the valuation world, rules of thumb are sometimes used as sanity checks, but never as a primary valuation method. The tremendous changes in veterinary medicine over the past 15–20 years must not be overlooked. Old formulas and multipliers of revenue are no longer reliable methods of determining price. These widespread rules are inaccurate at best, and dangerous at worst.

ADVANTAGES AND DISADVANTAGES

Sometimes, veterinary practice owners wish to avoid the expense, time, and effort involved in a formal business valuation and would like to use a rule of thumb to come up with values for their practices. Rules of thumb have their advantages. First, they are free of charge, which can be a huge plus in comparison with a formal business valuation, which will cost several thousand dollars. Second, they are easy to apply. Anyone with access to financial information about the hospital can apply a multiplier to a gross revenue figure or EBITDA to come up with a business value. Finally, rules of thumb provide immediate results, where a valuation will take a minimum of several weeks to complete.

The disadvantages of relying on a rule of thumb valuation are many. The most serious concerns relate to establishing a selling price that is much lower than the true fair market value of the practice. There are instances of sellers losing tens of thousands of dollars in sales price because they or their advisors did not take the time to get a formal appraisal. On the other side of the transaction, if a buyer overpays for a practice, it could result in a situation where the buyer cannot afford to make the payments. If the seller is financing all or part of the sale and the buyer defaults on the loan, that seller may never receive full payment. In a worse scenario, the retired owner may be forced to take back the practice, which may be generating a fraction of the original pre-sale revenue. Finally, no rule of thumb can encompass the wide variation of practices, modalities, facilities, specialties, geographic locations, economic situations, equipment availability and condition, staff training, and all the other intricacies of veterinary medicine.

EXAMPLES

Rules of thumb are observational statistics that report on averages of sales transactions that have already occurred. They are not predictors of future sales. Consider this: according to the Centers for Disease Control and Prevention, the average height for an American man is 5′9½″ (177 cm). The rule of thumb, then, is that the average American man is 5′9″ (177 cm) tall. It does not mean that a specific man is 5′9½″ (177 cm) tall, only that, on average, American men are 5′9½″ (177 cm) tall. In fact, a man's height is determined by many factors, including genetics, childhood health, and nutrition. Though some American men are 5′9½″ (177 cm), most men are not.

Now apply this concept to veterinary practices. Consider two veterinary practices, each grossing $1.5 million in revenue. If using a rule of thumb, both practices would have the same value. But as we know, every veterinary practice is unique and operates under unique economic conditions. Practice #1 is in a thriving neighborhood with abundant housing and economic stability. The practice has made significant investments in equipment and employee education, and it has grown more than 10% compared with the previous year. The practice facility was built in the last five years and is situated on a lot with space to expand.

Compare Practice #1 with Practice #2, which is a mature practice located in a low-income neighborhood. The owner has been ready to retire for two years and has not reinvested in the practice. Gross fees have fallen 7% compared with the prior year. The décor is dated, the equipment has not been maintained, and the staff receives no continuing education allowance.

With these facts in mind, an informed buyer would likely pay a higher price for Practice #1, particularly if indicators point to continued growth in the future. Practice #1 appears to be more valuable than Practice #2, though it is impossible to quantify how much more valuable using these facts alone.

Business value is affected by many different variables unrelated to revenue or EBITDA, including financing terms, whether it is an asset sale or an equity sale, how long the seller will remain with the practice and how they will be compensated. Other factors that influence practice value are whether payment contracts with laboratory and imaging equipment will be assumed by the buyer, facility lease terms, staff turnover, and many other factors too numerous to mention.

Determining a business's true value is complex and time consuming. The process can be overwhelming, but relying on a rule of thumb to avoid due diligence is dangerous. For veterinarians, buying a practice may be the biggest financial transaction of their lives. Although rules of thumb are easy to apply, they should not be relied on for such a significant investment.

CAUTIONS

Using a rule of thumb to value a veterinary practice is an oversimplification of a complex process. Rules of thumb never should be used as a primary method of valuation. Because of the imprecise nature, use of rules of thumb should be limited to reasonableness checks.

14.16. FROM ASSOCIATE TO OWNER: BEYOND THE MONEY

BASICS

OVERVIEW

The process of purchasing a practice – the nuts and bolts, financials, loans, and so forth – is easy when compared with the process of running a truly successful practice.

The desire to be a business owner may weigh on the minds of veterinarians even before they get into veterinary school. Because most veterinarians entered the profession for the clinical and technical aspects, gaining the necessary business acumen was rarely on the radar screen during the professional education period. The ability to take the "technical" veterinarian and add the management, leadership, and entrepreneurship skills necessary requires additional work for those seeking to be successful business owners.

Upon graduation from veterinary school or completion of an internship, the typical veterinarian will work for an experienced veterinarian business owner/clinician or in a corporate practice environment with an experienced clinician. If a veterinarian has *any* inkling that they might want to own a practice, this formative period *must* be used to not only develop the medical and surgical skills required to be a top-level physician but also the communication skills, business skills, management skills, and leadership/entrepreneurial skills needed to run a successful business. And now, more than ever, being a practice owner gives you a much better chance to pay down any student debt and get out from under that burden. Although this may be a scary concept, practice owners earn significantly more than associates (employed veterinarians). So, developing the skills needed to be successful is more important than ever.

TERMS DEFINED

N/A

ISSUES AND OPTIONS

Before addressing the skills needed, an evaluation of the pros and cons of being a business owner needs to be conducted.

COMMUNICATION SKILLS

Interpersonal communication can be the difference-maker in a successful practice. There are many levels of communication, including owner–associate doctor, owner–manager, owner–staff, owner–client, and owner–other business that support the hospital. This area can be learned or improved with courses but is best learned and improved with experience and feedback.

Seek advice from those around you about your communication skills. Observe the people around you that seem to get the most work done or who seem to have the most people surrounding them. They are probably those that have learned to use their communication skills to build a team to support them. Observe closely those people around you that others tend to shy away from. This is truly reflective of an inability to engage people in conversation and frequently indicates poorly developed interpersonal communication skills. This talent must be developed more than any other to ensure success. In many cases, you can hire others to manage, lead, run the business, and so on. However, you cannot hire somebody to communicate for you. You will always have to communicate with somebody.

Under the discussion of communication is the area of written communication. From medical records to letters of recommendation, your ability to put your thoughts on paper is also a skill that you can and must develop to be truly successful.

Finally, public speaking is a communication skill that is one of the most common phobias. However, it is also a measure of success in business. The ability to speak to a group of staff members or a chamber of commerce can truly enhance the respect you receive as a business owner.

BUSINESS SKILLS

You do not need a Master's in Business Administration or even an undergraduate business degree to run a veterinary hospital – although these days it would not hurt. Understanding business laws, human resource laws, the regulatory (e.g., Occupational Safety and Health Administration, Drug Enforcement Agency) expectations, in addition to maintaining your medical knowledge, can be quite daunting. Add into this an understanding of marketing, advertising, public relations, budgeting, financial planning, inventory control, and the other business skills needed to have a profitable business and the decision to own your practice requires a thoughtful and introspective process.

The good news about business skills is that in many cases they can be successfully delegated to a skilled manager to handle the tasks that are outside of your comfort zone. However, from an ownership standpoint, you cannot abdicate responsibility, and thus an understanding of the business skills still is a must. From an internal controls standpoint, you must always be aware of how these business skills are being handled to mitigate the risk of embezzlement or sabotage, or worse. The Veterinary Hospital Managers Association (www.vhma.org) is a great resource to find the skills that a great manager should have, education programs to improve yourself in areas that you are weakest, and job listings for managers looking for jobs.

To learn the necessary business tools for success, find a mentor or, more important, build a team of practice management support professionals to support you (see 1.17 – Practice Management Support Professionals). A team of attorneys, accountants, financial planners, and consultants should be budgeted for to assist you and keep your business on a forward-looking path. To find resources of this nature you can visit www.vetpartners.org. Surround yourself with experts who make you look good with their skills.

MANAGEMENT SKILLS

Getting the job done correctly is the role of management. A manager's skills focus on accomplishing the goals of the business in the most effective, efficient, and profitable fashion. This means having the right people on your team and in the appropriate positions.

Encouraging people to perform to the best of their abilities for the benefit of somebody or something else is a skill that is not possessed by every veterinarian. There are some great clinical veterinarians that can manage or motivate people to support them in their practice (see 2.5 – Motivating the Healthcare Team). On the other hand, there are some mediocre clinical veterinarians whose support team ensures that they are moving forward and doing so with their full support.

Management skills take the business skills, communication skills, and some leadership and entrepreneurship skills and meld them together into one individual who focuses on the vision and mission and standards and goals of the practice. This can be a veterinarian who has learned how to multitask or it can be a hired manager or administrator who has been empowered to manage the team. Being a good veterinarian *does not* guarantee that you will be a good manager. However, a great clinical practice without the management foundation will fail. You can learn to manage from books, mentors, and colleagues. However, there is nothing like managing people and processes on your own to determine if you can be the manager that will lead your practice to its optimal outcome. As noted, the Veterinary Hospital Managers Association is a great resource to help out here.

LEADERSHIP/ENTREPRENEURIAL SKILLS

Owning and managing a practice will get you to one level of success. However, to truly succeed you have to have a vision of what you see the practice developing into and the path to get there (see 14.5 – Strategic Planning and Implementation). Leadership and entrepreneurial skills take you from just getting through each day

14.16. FROM ASSOCIATE TO OWNER: BEYOND THE MONEY

Table 14-16-1. Pros and cons of business ownership.

Pros of business ownership	*Cons of business ownership*
Job security	Responsible for other people's job security
Own a tangible asset that can be sold at some point to return a profit on the original investment	Have responsibility for the employees, the patients, and the eventual success of the practice
The opportunity to earn a greater income based upon the earnings as both a veterinarian (salary) and business owner (profits) and business manager (management fee) and, in some cases, land owner (rent/mortgage)	The bills have to be paid before you get paid
You build equity that can be used down the road	There is a risk that the value of the business will not grow
You control your own destiny	You are responsible to a number of governmental agencies, regulations, and taxes
You can control your work-life balance	It can take time to find that balance
You choose the people to work with	You do not always make the right choice
You can follow your passion	You can get swallowed up by everything needed to follow that passion
Pride of ownership	Despair of ownership

successfully (management) to having each day taking you closer to the ultimately successful practice that you visualized when you decided to be a business owner (see 2.12 – Leadership).

A business owner without leadership skills is happy to get through each day. A business owner with leadership skills has a team that is looking for long-term success and is constantly looking forward in the direction that they are heading versus backward at where they were. The desire to grow your business, add new technology, constantly improve the business skills, management skills, and communication skills requires a "big picture" capability that is *not* present in every business owner. As a veterinarian, you can survive with outstanding technical skills and maybe some good management skills. To be a successful business owner you *must* have leadership and entrepreneurial skills to take your business to new levels. You can tell those practices with no vision as those that look the same today as they did 20 years ago. The practices that are looking down the road are never comfortable and constantly upgrading and changing to address the needs of the marketplace around them.

A good doctor does not make a good leader, and being an owner does not guarantee that you will be a good leader. Leadership skills are both nature and nurture; they require work, practice, and experience.

A CHECKLIST OF SUCCESSFUL BUSINESS OWNERSHIP INTANGIBLES

Whether you are starting a business or buying an existing business, the following should be developed:

- organizational skills;
- time management skills;
- public speaking skills;
- problem-solving or resolution skills;
- interviewing skills;
- motivational skills;
- mentoring;
- negotiation skills;
- ability to project a professional image.

A great resource to help you understand all of the requirements for practice management success is VetPartners' *Veterinary Practice Management Essentials*.[1]

EXAMPLES

N/A

CAUTIONS

One great piece of advice is to "Hire Your Weaknesses." Moving from associate to owner means moving from a technical focus to a business focus… and being able to balance the two foci. The technical skills come from veterinary school and continuing professional development. As a veterinarian, your technical focus is what you do well: diagnose, prescribe, set up treatment plans, do surgery, and so on. However, as a veterinarian business owner, unless you outsource all of the business-related activities (which comes with inherent risk), you must go outside your comfort zone, and frequently your education zone if you want to be successful. You will have to learn to trust people, communicate with people, conduct business with people, hire people, fire people, market to people, educate people, and the list goes on. As you take the road from associate to owner, keep in mind that being a successful veterinarian business owner requires knowledge, skills, and attributes that were not part of the veterinary curriculum. There is no better time to learn about these than during your first few jobs out of school. Enter these jobs with a thirst for veterinary knowledge to supplement what you learned in veterinary school. More important, identify successful and balanced practices and model the communication, business, management, leadership, and entrepreneurial skills to give you the foundation to make your practice even more successful.

14.17. MANAGERS AS PRACTICE OWNERS

BASICS

OVERVIEW

Veterinarians are often encouraged to become hospital owners, not only because they receive great satisfaction from creating a practice in their own vision, but also because buying a successful hospital is an excellent financial investment. Practice owners receive the stream of profits generated by the hospital and build long-term equity in the business, too. Through many years of practice ownership, veterinarians own an asset that, when sold, can help fund their retirement.

Veterinarians cannot create successful practices and run them on their own. They need help from every hospital employee to ensure quality of patient care, excellence in client service, and cleanliness of the facility and grounds. In many cases, practice managers work long hours beside the owner veterinarians to maintain employee morale, increase the profitability of the business, and improve owner returns. Despite their hard work, most managers do not share in practice profits because they are not owners. In fact, managers may have limited growth potential unless they leave for a bigger practice or a multispecialty referral center. Yet this group of employees is very loyal and knows as much about the business, or more, than the veterinarians who own it. For managers who wish to make a long-term career out of veterinary practice management, practice ownership could be an option to consider.

TERMS DEFINED

Cash Flow: The amount of money available to the owners of a business to use for purposes such as debt repayment, equipment replacement, or to withdraw for personal use.

Certified Veterinary Practice Manager (CVPM): A designation available since 1989 through the Veterinary Hospital Managers Association (VHMA, vhma.org) to recognize the professional development of veterinary managers.

Small Business Association (SBA) Lender: A US Government lender partnership that lowers lenders' risk though guarantying a percentage of each loan.

ISSUES AND OPTIONS

Every year the veterinary profession loses some of its best and brightest employees to other industries. Reasons vary, but high on the list are compassion fatigue, general burn out, and the financial reality that many people can make significantly more money doing something else. Business managers are in high demand, and many of the skills learned in a veterinary practice, such as employee, facility, and inventory management are readily applicable in other industries.

A good business manager makes the owner veterinarian's life much easier, allowing the owner to focus on the clinical aspects of practice while the manager runs the business side of the hospital. A good manager acts as the owner's partner to ensure policies and protocols are in place, and that core values are reflected in every form. Many owners report that having a manager reduces the owner's stress and frustration and may allow the owner to spend more free time away from the hospital.

EARNINGS POTENTIAL

The realities of veterinary practice profitability put constraints on salaries available to pay practice managers. Because managers do not directly generate money for the practice, it is difficult to compensate them directly for their efforts. Hospital owners receive clinical and sometimes management compensation as well as a portion of the annual profits. Practice managers frequently contribute substantially to the profitability of the business but do not benefit from an improved bottom line.

As an employee, a manager's earning potential is limited to salary, benefits, and bonuses. As an owner, a manager would continue to receive all three, and they would receive a portion of the profits from the business. This provides more incentive as well as recognition for the manager's role in the hospital.

Financial compensation is only one factor that leads to job satisfaction. In survey after survey, the opportunity for advancement ranks very high on employees' lists of motivators. The 2016 *Employee Job Satisfaction and Engagement* report published by the Society for Human Resource Management states that "nearly one-half (47%) of employees reported that career advancement opportunities within their organization were very important to job satisfaction."[1] In addition, since 2008 "the percentage of employees considering career advancement opportunities as very important to their job satisfaction has risen by almost 20 percentage points."[1] What opportunities for advancement do practice managers have? Once they have learned to successfully manage all the systems in the hospital, few growth opportunities remain. For exceptional managers, an ownership stake in a hospital may be the best answer to both job satisfaction as well as continued enthusiasm for veterinary management.

The VHMA recognizes the need for managers to be well prepared to meet many different challenges and improve the business practices of veterinary medicine. Since 1989, the VHMA has offered a credential, the Certified Veterinary Practice Manager (CVPM), to those individuals seeking to demonstrate "the knowledge and experience necessary to successfully manage the ever-changing business management of today's veterinary practice." The CVPM designation requires several years of management experience, college coursework, and a proctored exam that tests candidates on myriad topics from Occupational Safety and Health Administration to mission statements, from employee law to Drug Enforcement Administration compliance. Ambitious managers reach the top of their careers through achieving this certification.

MANAGERS AS OWNERS

At the time of publication of this edition, few states allowed managers to be the sole owners of veterinary hospitals. Since the advent of corporate consolidators, businesses owned and managed by a group of investors rather than one or more private veterinarians or managers, there have been widespread concerns over nonveterinarians owning veterinary hospitals. These concerns are primarily related to patient welfare and ensuring that decisions regarding appropriate treatments are not driven by a profit motive. Each state's veterinary medical board has different regulations for veterinary practice ownership, and it is important to understand the requirements.

Veterinary transactional attorneys are familiar with these statutes and understand the rationale behind them. This knowledge allows attorneys to find legal methods to involve managers in ownership while still adhering to the state regulations. One way to do this is through creation of a management service organization, where the manager owns and manages the practice assets, such as equipment and inventory, as well as payroll for all nonveterinary employees. This option provides the ability for managers to be fractional practice owners and, in some cases, 100% owners of the business.

One of the biggest draws to selling a hospital to corporate consolidators is the opportunity for the veterinarian owner to return to being "just a veterinarian," relieved of the occasionally onerous responsibility of managing the business. The biggest management headaches often involve staffing and addressing client complaints, neither of which are covered extensively in veterinary school curricula. As the business of veterinary medicine becomes ever more complex, the intellectual reward garnered from practicing medicine can be overshadowed by the stress of staying abreast of technological

advancements, changing employment laws, and increasing competition.

A reasonable alternative to a sale to a corporate consolidator is selling to a qualified manager. Practice ownership by a nonveterinarian manager with a history of working in the hospital may be more palatable to some sellers than ownership by an equity fund or private investors with no background in the industry at all and more significant requirements for financial return.

FINANCING A MANAGER'S PURCHASE

There are several options for financing a practice acquisition when a manager partners with a veterinarian and the veterinarian is the majority owner with more than 50% of the business. But when a manager will be the sole owner, the financing can be harder to find. For a traditional lender such as a bank, there are risks to lending to managers of professional practices because the manager is not a revenue generator. If a doctor is ill, on vacation, or quits without warning, the practice's means of making money are diminished. When the owner of the business cannot generate revenue personally, the loan scenario exceeds the risk tolerance of many conventional lenders. Many manager purchases, therefore, are seller financed.

A Small Business Administration (SBA) lender may be a good option for a manager acquisition provided the practice's projected cash flow meets certain requirements. Because SBA loans are government backed, the risk to the lender is minimized. If one or more veterinarians are employed in the practice, it is not necessary for the owner to be a veterinarian, too. Submission of a formal business plan (see 14.10 – Business Plans) is frequently a loan requirement, and while it is time consuming to prepare one, a business plan is an excellent management tool for new owners. SBA loans tend to have higher interest rates and loan fees when compared with a conventional lender.

Selling a veterinary hospital in part or in whole to a manager is becoming more of an option across the country. Professional veterinary managers take pride in being part of businesses that are financially healthy and provide much needed services to the communities that support them. Now, with the right legal structure and necessary funding, managers may also have pride of ownership.

EXAMPLES

N/A

CAUTIONS

Hospital buyers and sellers must ensure strict compliance with all applicable state and federal laws. Nothing in this article should be considered legal advice about mechanisms appropriate for managers to become hospital owners.

14.18. Risk Management Issues

BASICS

OVERVIEW

Under the law, people and companies are recognized legal entities. Risk is the potential for realization of unwanted, adverse consequences to human or animal life, health, property, or the environment. An estimation of risk is based on the expected value of the conditional probability of an untoward event occurring times the consequence of the event once it has occurred. Given that definition, every veterinarian and veterinary entity may be exposed to litigation (the filing of a lawsuit) claiming bodily injury or property damage. To counter this exposure, there are several ways to deal with risk in the veterinary setting.

TERMS DEFINED

Control Risk: There are some risks you cannot prevent, such as storms, natural disasters, power failures, or accidents. There are processes, however, to minimize either the likelihood such an event will occur or the impact it will have on your business after it occurs.
Finance Risk: One approach to risk management involves purchasing enough insurance to transfer responsibility for losses to your insurer. Insurance is an essential aspect of risk management.
Transfer Risk: Where appropriate, practice owners may want to shift the responsibility for risk to practice lessors, vendors, subcontractors, competitors, and even pet owners.

ISSUES AND OPTIONS

Ideally, the practice owner's attorney will structure the practice entity to limit liability and then execute strategies to avoid day-to-day risks inherent in operating a veterinary practice (see 14.11 – Business Entity Structures). As a result, it is hoped that claims will not be made or, if claims do occur, the plaintiffs will be unable to satisfy their claims from the practice owner's personal or business assets. Occasionally, however, claims will be made, and some of these claims may penetrate the multiple layers of protection set up by the practice owner. If this occurs, insurance coverage should be the final layer of protection against liability claims.

There are two basic types of insurance coverage (see 2.27 – Practice Insurance Needs):

- Liability insurance covers damages that the insured veterinarian causes to *other* persons or pets, both personal injuries and property damage. Thus, a liability insurance policy will have separate provisions, including separate limits, for personal injury and property damage caused to other persons.
- Property insurance covers damages to the insured's own property. Thus, property coverage should not be confused with liability coverage for property damage that the veterinarian causes to another person's property. Hazard insurance (fire insurance) covers losses caused by acts of nature or accidents. Typically, a single comprehensive policy is issued offering both liability and property protection. Property protection in a hazard insurance policy covering a building will apply to the real property (i.e., the building) and to the personal property associated with the real property (i.e., contents of the building). The real property and personal property coverage will be subject to separate limits and exclusions.

Each basic type of insurance is subdivided into specific types of liability and property insurance policies. The small business owner should have a comprehensive liability and property insurance policy, and *specialized* forms of liability (i.e., errors and omissions/malpractice) and property coverage, which will cover the risks inherent in the veterinary practice.

Veterinarians have recently become subject to state malpractice claims (see 13.3 – Malpractice). More claims are expected as the value of animals increases from the traditional "market value" approach to settlements structured as human life settlements, which may include a punitive and/or emotional loss settlement.

Several factors need be proven under traditional malpractice claims to recover damages for injury to an animal under a veterinarian's care:

- First, the defendant must be under a duty of care toward the subject animal. The veterinarian must have accepted responsibility to treat the animal that the owner brought to his or her office.
- Second, the veterinarian did not act commensurate with professional standards of care (reasonable skill, diligence, and attention) as would ordinarily be expected of other similar veterinarians (see 9.3 – Standards of Care and Care Pathways).
- Third, deviation from this standard of care must have been the proximate cause of the animal's injury (the plaintiff must show that the veterinarian's action, or lack of action, injured the animal).
- Fourth, injury or harm resulted in damages to the plaintiff, not just to the animal in question. This stems from the fact the animal injured is not a party to the lawsuit. The owner must show that he or she suffered monetary or emotional loss.

Veterinarians may have several legal defenses to claims of malpractice:

- One of the most important procedural defenses is that of the statute of limitations. A statute of limitation enforces a limit on the amount of time a plaintiff has to file a lawsuit, usually from the time the injury occurred or when he or she discovered the injury. Statutes vary from state to state and upon the type of action initiated. With veterinary injury cases, the applicable statute of limitation may be based on claims for injury to personal property, as domestic animals are considered personal property of the owner (usually a two- to three-year statute).
- The manner in which a plaintiff asserts his or her claim (claims for negligence or malpractice) may dictate the statute of limitations. A claim may be barred if the veterinarian raises this defense.
- A veterinarian may also claim the defense of "Good Samaritan" (similar to when people assist in performing cardiopulmonary resuscitation in an implied consent situation), in which veterinarians render care in an emergency and are only held liable for gross negligence.

Negligence or malpractice may result in the revocation of one's license to practice veterinary medicine. Veterinarians are responsible for the maintenance of certain standards in order to have their licenses renewed. Improper actions, such as a failure to communicate with the pets' owners, the failure to inform the owners of their pets' deaths, or the failure to properly administer treatment, may result in suspension or revocation of a veterinary license.

A practice owner may also want to consider purchasing an umbrella policy (*comprehensive* secondary coverage), which provides coverage after primary insurance is exhausted. This type of policy is designed to provide *supplemental* comprehensive liability and property coverage subject to exclusions. An umbrella policy is always purchased as an adjunct to the coverage offered under standard policies. It pays off on a covered matter only *after* the primary insurance is exhausted. Premiums typically are affordable due to the existence of the primary insurance. An insurance agent should ensure there is a seamless coordination of coverage between any basic insurance policy and an umbrella plan so that no gaps in coverage exist.

EXAMPLES

There are many ways to minimize the risk of loss:

- Practice real estate, such as veterinary practice building(s), kennels, and apartment units located on practice properties, should be maintained as legal entities separate and distinct from the veterinary medicine practice.
- If your policy has "blanket" coverage for a number of different properties, make sure that all properties that should be insured are actually listed on the property policy. Even with blanket coverage, property not listed on the policy may not be covered.
- Business equipment preferably should be leased rather than purchased. Depending on the leasing arrangement, your property and liability risks may be assumed by the lessor.
- Practices should use "just in time" delivery of practice products (pharmaceuticals, etc.) or have suppliers drop-ship their merchandise directly to your customers. Veterinary supply companies employ this approach for pharmaceutical orders.
- Practices should investigate any entity or individual being considered for a subcontractor. Employing knowledgeable, properly insured subcontractors can reduce your workers' compensation risks and minimize high-risk exposures. Practice owners should request "certificates of insurance" to verify that any subcontractors you engage have adequate insurance.
- Periodic safety audits and regularly scheduled preventative maintenance of your equipment and facilities should be performed and documented.
- If you have a practice vehicle, verify the criminal backgrounds and driving records of potential employees. Monitor employee driving records and ensure that practice drivers are properly trained.
- Improvements or modifications to your facility should be reflected in your insurance coverage. Schedule periodic reviews with your risk management professional and update your property values and coverage accordingly.
- Secure employment practices liability insurance to protect your practice should you be sued for sexual harassment, wrongful termination, or any form of discrimination.
- A universal exclusion from property coverage involves losses (to the building and its contents) due to flooding. To obtain property coverage for flood loss, a separate specialized flood insurance policy underwritten by the federal government must be purchased.
- With the emergence of electronic communications, Internet fraud, and white-collar crime, many insurance companies are now offering coverage for release of personal information, e-mail confidentiality, and virus release.
- Veterinary practices typically depend upon the talents or abilities of a few key people who, if not in place, will cause the business to fail. Key person insurance is a way for businesses to insure against this kind of loss and provide surviving partners or owners the money to buy the deceased partner's (or shareholder's) stake from the deceased veterinarian's estate, spouse, or other heirs.
- Business interruption insurance is utilized when disasters such as earthquakes, fires, floods, and severe weather can cause a practice to close temporarily (see 14.20 – Business Contingency Planning). If your practice cannot perform its basic functions to generate revenue, business interruption insurance can help a practice avoid disaster at such times.

CAUTIONS

If you are a veterinarian, you may want animal bailee coverage added to your insurance program. This coverage is specifically designed to protect you and your practice if you are sued because animals in your care, custody, or control are accidentally killed or injured. When property (a pet) is turned over to the possession and control of a bailee (the veterinarian or practice staff), a bailment is established. As noted in the case *Piazza v. Best Friends Resorts & Salon* (NJ),[1] where a dog was turned over to a veterinary industry provider and later died, "when a bailment has mutual benefits for the bailor and bailee, the bailee has a duty to 'exercise reasonable care for the safekeeping of the chattel bailee.' [A]n animal is considered personal property, and thus the boarding of that animal or the transfer of possession and control of that animal to another for consideration constitutes a bailment."

14.19. DEBT MANAGEMENT

BASICS

OVERVIEW

Being in debt has become a fact of life today. Very few of us can get our veterinary degree, buy a home, and/or start a practice without going into debt. The trick is to know how and when to incur appropriate (good) debt and then, once in debt, knowing how to manage that debt so that the payments are something that can be handled even in challenging times.

TERMS DEFINED

Collateral: Item(s) of value pledged as security for repayment of a loan.
Current Ratio: Key financial performance indicator. Indicates how much you have in assets, cash, or items of value versus how much you owe on those assets, credit card debt, one year's principal payments, and so on.
Debt to Equity: Another key financial indicator. Reflects how much you owe in total as a ratio to how much you own free and clear of any debt.
Equity Loan: Money that you are able to borrow because an asset, generally real estate, but maybe value in your practice, is worth more than any outstanding debt against it.
FICO Score: FICO stands for Fair, Isaac and Company, the company that developed the number lenders used to help them decide if a person will pay them back any money that is given to them to buy a house, a car or on their credit card. Your FICO score is a snapshot of your credit risk at a particular point in time.
Lien: Claim against real or personal property until the debt associated with the property has been paid off.
Mortgage: Debt that is associated with the purchase of real property.
Note/Loan: Promise to pay a debt. Debt secured by property used as collateral against which a lien has been filed is a secured note. If there is no collateral, the note/loan is unsecured and is the equivalent of a "handshake" loan.
Prime Rate: Based on the Federal Funds Rate set by the Federal Reserve, the Prime Rate is the interest rate used by banks in lending to their best clients
Student Loan: Debt associated with post-secondary education. Graduating with little or no student loans is the rare exception today.

ISSUES AND OPTIONS

• Debt is an obligation and needs to be repaid on an accepted schedule.
• Borrowing for defensible business or personal reasons makes sense.
• Adequate analysis of ability to repay is a major part of a borrowing decision.
• If you are sitting on significant growth that has not happened because of a lack of people, facility, or equipment, good debt can help.
• Analyze your true needs to avoid borrowing more than prudent management warrants. Needing a new operating room or new ultrasound are all good reasons to borrow. Buying a new ultrasound without investing in training and appropriate use of the instrument is suspect regardless of whether or not you can make the payment.
• "Underborrowing" is a risk that is easily overlooked. Out of fear of making the payments or of what the future may hold, borrowing the smallest amount of money that will "almost make it work" is many times worse than sticking with the status quo or overborrowing. Borrowing for sensible expansion projects is abundantly sensible. Evaluate your needs, finance your loan properly, and go about making the money to repay the debt.
• Personal guarantees for any meaningful debt incurred are almost a certainty. No third-party lender will loan you money without you guaranteeing the debt. In the absence of a personal guarantee, you could take the money, pay yourself a huge bonus, and tell the lender you are broke.
• If there are several principals (i.e., partners/owners in the practice) you may be able to negotiate out of a personal guarantee. However, a digital radiographic unit is generally not of much real value to a bank. Be prepared to guarantee the loan. Even if the practice is named as the guarantor, because you are the practice owner(s), you are essentially guaranteeing the loan in most cases.
• The more collateral and the more universal the collateral, the more you may be able to negotiate out of a personal guarantee. Borrowing on real estate that could be used for general business purposes in a practice with several owners is much more attractive and could not require personal guarantees.
• Guard your FICO score religiously. Pay your bills in a very timely fashion. Limit your outstanding debt to "good debt." That means avoiding the temptation to reach for credit cards every time the urge strikes to satisfy some immediate want. The better your credit score, the more favorable agreement you can generally negotiate. Student debt is not necessarily a negative on your credit score.
• Have you evaluated the impact on your practice of the growth or expansion that you are trying to finance? In determining your appropriate borrowing level, a component in the equation is to assess what stress the larger building, new equipment, and new service is going to place on your current team. Undermanagement can be as big a problem as overcapitalization. One of the more common business mistakes is too rapid growth, which can ironically be a product of borrowing. If you are going to double your facility (employees, whatever), your management needs to be equal to your growth.
• When you enter into a loan, read the debt instrument (the paperwork). Ask questions if you do not understand something, and make sure you do understand before you sign. The paperwork governs when it comes to loans, so if there is a problem with the fine print and you did not read it or understand it, the provisions still apply.
• The interest rate stated in the loan document can be fixed or variable. A fixed rate of interest means that whatever the stated interest rate is, that is what you are going to be paying for the life of the loan. Variable rate means that the interest rate will change, generally with the prime rate. Interest rates can go up! Make sure you understand, if there are interest rate caps, as to how high the rate can go, how often the rate can change, and if there is a penalty if you decide you want out of the loan before it matures (i.e., when it is paid off).
• Being able to afford the payments on your debt is great as long as your practice is doing well or your paycheck is coming in regularly each payday. What provisions have you made in case your income stream is compromised? Basically, do you have an emergency fund that includes these payments?
• Being able to make the payments on all your debt is one consideration when deciding to make a purchase for which you cannot pay cash. However, the total debt you have is also important. In practice, your current ratio (i.e., how much "stuff" you have, in cash, inventory, and good accounts receivable, versus how much you owe during the next 12 months, on credit card debt, one year's loan, or note payments). This is a key indicator of how well your revenues can cover your expenses. The lower that number and the closer that ratio is to 1 : 1, the more difficult it will be to keep up with your payments.
• How much debt you owe in relation to how much equity you have in your practice, personal possessions, and so on is also a key indicator of how well you are doing. In your practice, depending upon whether you are a start-up practice or a mature practice, having a ratio in excess of 10 : 1 is generally not a good sign. You may need to work with a good practice consultant or accountant to determine what ratio is best for

your personal situation. If the numbers do not work, they can help you get them more where they should be.

- What kind of relationship do you have with your banker? Many practice owners find their bankers of great help, not just because they lend money or give dog bones out in the drive-through, but because they are truly interested in their customers' businesses. Others are not so lucky. If you are in the unlucky group, go find a banker that will work with you.
- Bankers/lenders are not mind readers, and very few of them own crystal balls. If you do not talk with them about what is going on in your business or personal financial life, they can easily either jump to wrong conclusions or jump to no conclusions at all. They do not know what your needs are until you tell them. Talking to them in a language they more or less understand (i.e., balance sheets that balance and financial statements that are prepared in a timely manner) increases your chances of getting favorable responses to your requests for additional money or whatever your current borrowing needs might be.

14.20. BUSINESS CONTINGENCY PLANNING

BASICS

OVERVIEW

Veterinary practices are at risk from multiple threats that could compromise their ability to continue or resume normal business operations in the face of an emergency. Every practice must assess its threats and vulnerabilities and prepare a business contingency plan to maximize its ability to withstand and recover from an emergency event and resume normal business operations (see 12.10 – Emergency Preparedness for Veterinary Professionals). The key in business continuity for veterinary practices is having a well-conceived, fully communicated business contingency plan that addresses mitigation, preparation, response, and recovery.

TERMS DEFINED

Business Contingency (Continuity) Planning: Process of developing, communicating, practicing, and evaluating a comprehensive emergency plan to keep a business operating in the face of adverse conditions and to recover quickly from a disaster.

Disaster and Emergency: These terms are often used interchangeably when departments, agencies, or private entities are unexpectedly torn from their standard operating procedures or are required to obtain resources outside their normal authority. In some cases, governments may make official disaster or emergency declarations, making additional resources available for response and recovery.

Hazard: Any threat that could impact a nation, region, community, facility, or individual household. Hazards may be natural, man-made, accidental, intentional, low impact, high impact, low probability, high probability, local, or regional.

Risk: The level of danger to an individual, business, or community based on an analysis of threat versus vulnerability.

Vulnerability: A population or resource threatened by a hazard.

Zoonoses: Diseases that can be spread from animals to humans.

ISSUES AND OPTIONS

HAZARDS, VULNERABILITIES, AND RISKS

Community or Regional Hazards

- Natural hazards:
  - flooding (most common hazard in the United States) – over 20% of national flood insurance claims are submitted from areas outside the high-risk zone;[1]
  - drought;
  - severe weather (hurricane, tornado, wind, blizzard);
  - geologic hazards (earthquake, tsunami, volcanic eruption);
  - landslide or mudslide;
  - wildfire (may not always be a natural event);
  - some disease outbreaks (human, animal, or zoonotic).
- Man-made hazards:
  - chemical, radiological hazardous material accidents;
  - infrastructure failure (utilities, dams, roads, bridges, communication);
  - transportation accidents;
  - some wildfires and major urban fires;
  - some disease events (human, animal, or zoonotic).
- Intentional threats (terrorism/criminal events):
  - biological (human, animal, crops, or zoonotic);
  - chemical;
  - radiological (contamination, nuclear blast, nuclear facility attack);
  - cyber attack (see 10.8 – Cybersecurity and Network Security);
  - explosive or conventional attack.
- Focal hazards may affect individual facilities and may include:
  - structure fire;
  - structural failure or system malfunction (plumbing, sewer, electrical, walls, roof, heating, ventilation);
  - criminal acts (burglary, theft, vandalism, computer hackers, employee theft/dishonesty, workplace violence);
  - regulatory compliance failure (Drug Enforcement Administration, Occupational Health and Safety Administration, building/fire codes);
  - biosecurity hazards, including zoonotic threats and contamination of facility with biological agents (salmonella, plague, anthrax, influenza).

Secondary Impacts (Even If Your Facility Is Not Directly Affected, You Could Experience)

- Loss of clientele/work.
- Local, regional, or national economic damage.
- Loss of product availability or supply channels.
- Major animal disease emergencies may significantly impact:
  - local agricultural and veterinary operations;
  - local, regional, or national economies;
  - availability of veterinary personnel locally, regionally, or nationally.

Risk Assessment Process for Small Businesses

- Risk assessment is the first step to creating a business contingency plan.
- Risk analysis equation: Hazards + Vulnerabilities = Risk

14.20. BUSINESS CONTINGENCY PLANNING

• By identifying key risks, priority can be given to the most cost-effective risks to mitigate.
• Through creation of a comprehensive general contingency plan, a practice builds the capacity to respond efficiently to many events, even if those risks cannot be effectively mitigated.

PRIORITIES IN GENERAL EMERGENCY MANAGEMENT

1. Mitigation: actions taken to reduce the likelihood or potential impact of a threat.
2. Preparation: planning and training actions that develop capacity to respond to threats.
3. Response: actions taken in the face of an emergency event.
4. Recovery: the process of returning to normal after an emergency event. This process may take an extended period of time.

Mitigation

• Insurance considerations. Insurance is a key part of mitigation. Selection of insurance coverage and the amount of coverage should be tailored to the needs of the individual practice. Types of coverage include:
  ◦ Comprehensive business liability and property coverage.
  ◦ Business interruption – continuing expenses. Ask when the coverage starts and ends and what triggers the end.
    ▪ Loss of income.
    ▪ Relocation.
    ▪ Employee salary and selected expenses.
  ◦ Extra expense – payment of overtime pay and relocation expenses.
  ◦ Professional extension – covers the loss, injury or death of animals in the practice's care, custody, and control.
  ◦ Mobile loss of income – (mobile or equine practitioners) coverage in the event a vehicle or piece of equipment cannot be used.
  ◦ Personal property – for personal items at the practice (replacement value).
  ◦ Automatic inflation.
  ◦ Fire damage – not typically included in business packages.
  ◦ Water damage – not typically covered in business packages.
  ◦ Flood and/or earthquake coverage – these policies are usually purchased separately from other coverage. The National Flood Insurance Program[1] provides flood insurance to homeowners, renters, and business owners if their community participates in the program.
  ◦ Debris removal/cleanup.
  ◦ Civil ordinance coverage – coverage in the event practice is unable to function due to an act of government.
  ◦ Comprehensive building and structure replacement.
  ◦ Coverage of leased and rented equipment.
  ◦ Interruption of power, heating/air, and sewer.
  ◦ Workers' compensation coverage.
  ◦ General and professional liability.
• Periodically review the practice's insurance coverage to ensure that it has acceptable types and levels of coverage (see 2.27 – Practice Insurance Needs).
• Maintain an updated list of practice equipment and inventory:
  ◦ store copies of equipment and inventory records off-site;
  ◦ periodically photograph or video record practice inventories and equipment.
• Other mitigation efforts:
  ◦ Maintain building safety and structural soundness (see 12.1 – Basics of Meeting Practice Safety Requirements)
    ▪ Ensure the facility meets or exceeds all local fire codes. Smoke alarms and fire suppression equipment are valuable investments. Check with local fire department about having facility inspected.
    ▪ If wildfires are a risk, prepare defensible space according to fire department recommendations.
    ▪ Build or improve buildings and roofs so they can withstand high winds and storms.
    ▪ Trim trees to reduce the likelihood of damage from falling limbs or trees.
    ▪ Maintain plumbing and sewer infrastructure.
    ▪ Have electrical systems professionally maintained and quickly address any electrical problems.
    ▪ Install lightning protection systems for critical devices or the entire building.
    ▪ Use landscaping and other measures to reduce the likelihood of local flooding.
    ▪ Request a security assessment through local law enforcement or a private consultant.
    ▪ Use a security system appropriate for your community to reduce the risk of break-ins.
    ▪ Implement appropriate cash handling and accounting procedures to reduce opportunities for employee dishonesty.
    ▪ Assess computers and other electronics for vulnerability to hacking or cyberattacks and make sure software updates are installed (see 10.8 – Cybersecurity and Network Security).

Preparation

If resources permit, consult a professional business continuity planner.
• Planning to protect people and animals.
  ◦ Evacuation.
    ▪ Move people outside to a safe location as quickly as possible. Assign specific responsibilities to employees.
    ▪ Evacuate animals whenever possible, but do not allow people to reenter a potentially hazardous situation to rescue animals. Discuss the need with your local fire department to determine appropriate policies.
    ▪ Maintain client contact information offsite and ask clients to provide a 24-hour contact number and an alternate contact.

14.20. Business Contingency Planning

- ◦ Communication.
  - ▪ Management must be able to communicate with staff during a disaster.
  - ▪ Staff must be able to communicate with one another.
  - ▪ Communications resources include:
    - practice telephone directory distributed to all staff – include cellular numbers;
    - a telephone tree to quickly contact all staff and relay messages;
    - maintain an out-of-area common contact for staff members, such as a practice in another area, a state veterinary association office, or other location;
    - text messaging may work when cellular telephone calls do not;
    - two-way radios or agreements with local amateur radio operators.
- ◦ Patient care considerations.
  - ▪ Develop mutual aid agreements with other practices or associations, so your clients can receive care for their animals if you cannot provide services.
  - ▪ Ensure the availability of backup veterinary records.
  - ▪ If possible, engage staff in providing care through other facilities.
- Operational infrastructure (building, equipment, inventory, utilities).
  - ◦ Develop a plan to remove or protect mobile resources when possible.
  - ◦ Secure the facility if damaged to prevent theft, looting, or further damage from the elements.
  - ◦ Consider a generator as a backup source of power; consult an electrician or other expert regarding size, installation, and operating instructions. Maintain an adequate supply of fuel for the generator.
  - ◦ Maintain emergency food and water supplies for staff and animals.
- Critical business information systems (client records, accounting records, regulatory compliance records, inventory records, etc.).
  - ◦ Establish daily data backup procedures (see 10.7 – Information Security: Backing Up and Archiving Your System)
  - ◦ Store backups offsite or use high-speed Internet backup systems.
  - ◦ Convert critical business documents, radiographs, and other critical patient materials into a digital format and store offsite.
  - ◦ Ensure all staff understand data storage and backup policies.
- Partnerships:
  - ◦ insurance;
  - ◦ local fire department;
  - ◦ clients;
  - ◦ suppliers and creditors;
  - ◦ professional business contingency planners;
  - ◦ university cooperative extension;
  - ◦ local emergency management;
  - ◦ county animal response teams or equivalent;
  - ◦ other practices and veterinary medical associations (local, state, national).
- Management *must* commit to the process and provide the management time, staff time, and funding needed to develop an effective plan.
- Plans should be written; seek input from all staff/departments. Plans must be communicated to all personnel and periodically tested through exercises.

Response

- Respond as you train, and train as you intend to respond!
- Steps in validating your plan:
  - ◦ communicate the plan to *all* practice personnel;
  - ◦ practice the plan (exercises);
  - ◦ review and revise the plan;
  - ◦ repeat this process at least annually.
- Assign response tasks to individual staff members, and assign backup personnel.
- If outside response resources are needed, unaffected local veterinary practices, local/state veterinary associations, and county animal response programs should be able to provide assistance.

Recovery

- The recovery process can be long: months to years
- Recovery starts with a damage assessment.
- The recovery team should include ownership, all staff, insurance, government emergency management resources.

14.21. SUCCESSION PLANNING

BASICS

OVERVIEW

Having an exit strategy is important because:

- Selling a practice is probably the largest financial transaction made during one's lifetime.
- It involves much more than just setting a price.
- Advance planning is needed to:
  - provide for the continuity of practice operations;
  - prepare the facility for sale;
  - maximize the practice's value.
- Time spent considering life after practice and understanding the emotions associated with selling a practice will also help facilitate the transition.

TERMS DEFINED

Succession: The legal transfer of real estate and/or business entities to another individual/entity.

ISSUES AND OPTIONS

Practice owners may find it increasingly difficult to sell their practices. Some anecdotal reasons include:

- There appear to be fewer associates interested in the responsibilities and time demands of ownership. However, the ones that are called to ownership tend to be better prepared and educated for the purchase process.
- There will be an increase in the supply of practices coming on the market. Large numbers of Baby Boomers are coming to an age where they will be considering the sale of their practices and are starting to make preparations.
- The potential buyers seem to place location as the key driver for practices they will consider for purchase. This may cause problems for practice owners who are not located in the "desirable location" based on where the buyers want to be.

The owners who prepare well will probably be in a more opportune position to sell their practices when the time comes. Developing a well-crafted, planned exit strategy can pay major dividends for the owner. There is an old adage: *Successful business owners usually find they must work the hardest during the first five years to get their business off the ground, and the last five years to get their business ready to sell.*

STEP 1: THREE TO FIVE YEARS BEFORE PUTTING YOUR PRACTICE ON THE MARKET, DEVELOP A STRATEGIC PLAN OF ACTION

1. Identify and assemble your team of consultants and advisors:
   i. your significant other(s);
   ii. accountant;
   iii. financial planner;
   iv. attorney;
   v. veterinary practice appraiser/broker;
   vi. veterinary practice management consultant.
2. Establish your baseline personal worth. This provides a starting point to measure change. *You can't get "there" if you don't know where you are when you start.*
   i. Identify your assets and establish a baseline value for each.
   ii. Have major assets appraised: the practice, the practice real estate, other real estate, and other large assets (see 14.13 – Determining a Practice's Worth).
   iii. The practice appraisal is the most important part of the strategic plan (see 14.14 – The Valuation Process). A properly performed appraisal is a thorough examination of the practice's financial health. If your practice is not financially healthy (and thus has a low value) then there is an opportunity to improve the practice and increase its value.
   iv. Identify liabilities: long-term, business, and personal.
   v. Discuss and record your initial thoughts and dreams for life after selling the practice.
3. Identify the practice and personal goals:
   i. Practice – to maximize the value of the assets that will be sold as a part of the exit strategy.
   ii. Practice – to identify areas within the practice that can be improved or changed to influence the value, stability, and/or transferability of the
   a. practice;
   b. practice real estate;
   c. practice financial issues;
   d. practice administration.
   iii. Practice – brainstorm possibilities and options for how your exit from ownership can occur:
   a. A partial sale to an associate (see 7.24 – Buying into a Practice as a Partner)?
   b. A full sale to an associate?
   c. A full sale to an unknown buyer?
   d. A full sale to a corporation or veterinary practice consolidator? (See 7.27 – Selling to a Corporate Entity.)

e. A merger with a nearby practice?
f. Close the door and go home?

iv. Personal – to examine life after practicing. Look at tough issues often put off until too late, such as healthcare, where you live, what you do with yourself when no longer practicing, how to fund life after practice, and so forth.

4. Consider hiring a practice management consultant to help identify practice goals and improvements (see 1.17 – Practice Management Support Professionals). To find the right consultant:

i. Ask your colleagues what their experiences have been and who they recommend.

ii. Ask a practice broker or other veterinary consultant for their referrals.

iii. Contact a member of the consultants' association VetPartners and/or visit their website (www.vetpartners.org) – they can help you find potential consultants to help you reach your goals.

Before you hire a consultant or advisor, interview them. You are paying for their experience and opinions, so you will want to find a good match.

5. Put the plan in *writing*:

i. Specifically identify the goals/improvements, the person responsible for attaining them, and a target timeline for when it will be done.

ii. Include thoughts and comments from item 3(iii).

iii. Have a consultant/advisor/colleague review the plan for possible improvements.

6. Begin implementing the plan:

i. Act to make the changes and improvements.

ii. Periodically measure your progress.

iii. Note: this process is by generic by nature. This is because every practice, every individual's needs, ambitions, hopes, and desires are all different. It necessarily follows that there is no basic plan that is applicable to all situations.

7. Example of targets/goals/actions:

i. Manage the practice for revenue and earnings growth.

ii. Begin identifying potential practice buyers and/or a broker to help with your exit.

iii. Take an active role in the practice and, where appropriate, begin delegating management responsibilities to key staff. This can make for an easier transition for the new owner.

iv. Concentrate on enjoying practice and avoid burnout.

v. If there is not a nearby emergency center, consider setting up emergency rotations with area practices or referral clinics (most buyers do not want to take after-hour calls).

vi. Make sure there are no environmental concerns (buried gas tanks, x-ray chemicals, etc.) or other real estate issues that could impede the sale of the real estate.

vii. Resolve any real estate zoning compliance issues that might impact transfer.

viii. Take care of any deferred maintenance issues.

ix. If the practice is not using practice management software, discuss this with your broker/advisor.

STEP 2: ANNUAL EXIT PLAN MAINTENANCE

1. For any strategic plan to succeed, it requires periodic reassessment to:

i. assess the success of achieving the established goals;

ii. reevaluate the current situation on the path toward the final goals;

iii. establish new short-term and possibly long-term goals, measures, and time frames.

2. At least annually, a major periodic reassessment with the team of advisers should be scheduled. During these major reassessment times, the consultants will help to provide additional perspectives and feedback.

3. A key measurement in any practice exit strategy is the change in practice value. Annual valuation updates can provide an accurate means of assessing the success of the changes being made.

STEP 3: THE YEAR BEFORE

The final year before putting your practice on the market:

• Clean the facility thoroughly, repair cosmetic damages, paint, landscape. Have a building inspection done so any identified issues can be addressed *before* the buyer has their inspection done.

• Upgrade practice to current standards (imaging, computer management system, etc.), but not with a lease or relationship lease such as where the reference laboratory makes the payments. While these are often transferable, many buyers will not accept them, which can create an issue in the transaction.

• Secure assignable, employment contracts and noncompete agreements with associates (see 13.11 – Noncompetition).

• Ensure any facility lease has a life of at least five years, is renewable, and is transferable or that the landlord will sign a new lease with the buyer under similar terms.

• Check equipment leases for prepayment penalties (usually, they are paid off at closing).

• The owner should examine their own financial needs and tax implications of the sale. This involves meeting with a tax accountant and possibly a financial planner.

14.21. Succession Planning

• If a commercial real estate appraisal has not been done recently, consider ordering one.
• Begin preparing the practice records for a buyer's review: financials, contracts, employee records, and so forth. For the list of documents a buyer may request, see 7.23 – Buying a Practice.
• Compile inventory and equipment lists of what will transfer in the sale and a list of what will not transfer to the new owner.

TIME FRAME

• There is no easy answer as to how long it will take to sell a veterinary practice.
• It could take one to nine months, or longer, to find a buyer. It will depend on many factors, especially the location. Other variables include the type of practice, profitability, location, the affordability of the purchase price, and so forth.
• Once an offer is accepted, the timing will depend on how the negotiations proceed and how the financing comes together for the practice and the real estate. It could take two months or it could take six months, and in some cases even longer.

A COMMENT ON PRACTICE VALUE

Because of the significance of this transaction, a practice should be valued correctly by a veterinary practice appraiser who uses sound methodology and reality checks (see 14.13 – Determining a Practice's Worth). Unfortunately, there are still practitioners and some accountants that will try to sell on a percentage of gross revenues. The main driver of practice value, though, is the profitability after *all* expenses have been paid, including a fair market rent and fair compensation for the owner's efforts as a practitioner.

However, there are other factors that can directly influence value:
• The practice's growth history. Two practices with the revenues and profitability in a given year will have different values if one is growing at 10% per year and the other is declining at 10% per year.
• The transferability of the income/goodwill to the new owner. If client or staff loyalty is tied to an individual instead of to the practice, the value could be negatively impacted compared with a practice in which the owner is less significant, such as in a multidoctor practice.
• Geographic location. Is it going to be difficult to attract someone who wants to live where the practice is located? If so, it might take longer to find the right buyer and/or the price may have to be adjusted to attract a buyer.
• Other factors include the facility appearance, the condition and "up-to-date-ness" of equipment, quality of remaining employees, and the owner's transition period.

A COMMENT ON CORPORATE CONSOLIDATORS

For practices with high enough revenues and/or are in target locations, selling to a corporate buyer may be an option (see 7.27 – Selling to a Corporate Entity). There are many differences between the over 30 corporate buyers that are seeking practices regionally and nationally. As a part of your exit planning, if a corporate transaction is an option, there are many details to consider, including the following:
• Though individual buyers are limited to fair market value, many corporate buyers will pay significantly more. The premium over a fair market value price depends on the negotiations and which potential buyers you are working with.
• What post-sale employment is required?
• What are the purchase terms? Is it cash or is seller financing required? Is equity in the parent organization an option for you or your associate(s)?
• Will the consolidator buy the real estate?
• How much will they change in your practice?

On the surface, a corporate offer may appear to be a good fit. However, explore all the details to make sure the outcome is the right decision for your goals. *And work with your advisors.*

14.22. GIFTING PRACTICE OWNERSHIP

BASICS

OVERVIEW

Years of hard work are necessary to build an efficient and profitable veterinary practice. Practice owners may decide to either sell or transfer a veterinary practice in order to retire or engage in other interests, with unexpected illness necessitating decision-changing plans. Practice owners typically have two goals with a practice succession plan:

- to obtain regular payments, which guarantee them financial security and comfort;
- to ensure that the veterinary practice will continue so that practice employees remain employed and the practice thrives.

One component of a well-defined succession plan (see 14.21 – Succession Planning) is a gifting program that achieves the goal of transferring a minority ownership stake in a closely held practice to employees or to a combination of employees and family members. With that ownership, the minority owners cannot make major practice decisions. If a buyout offer comes along, then the minority owners would receive a ratable share of the proceeds. Even if your heirs are not interested in learning the practice and are not likely to succeed you as managers, they may hold minority shares (if the practice is located in one of the progressive states that allow nonveterinarian practice owners).

The primary reason for gifting is to gradually reduce your taxable estate. By gifting, while practice values are lower, you not only remove today's value of gifted assets from your taxable estate, but future appreciation as well. In general, though, transfers or sales to employees are usually more successful than gifts of a practice to the next generation. However, the process may still work with strict guidelines and foresight.

Children and/or employees should be required to buy the practice, as practice ownership received by gift might not be as highly valued. The transfer of practice ownership can be accomplished as follows:

- complete sale for cash;
- a portion of practice value for a cash deposit and the balance in a note;
- a deal with structured earn-outs.

Practice owners may also structure the practice sale so that the buy-out occurs over a period of years, with appropriate forgiveness of a portion of the note payments. The debt forgiveness solution makes best use of both practice transfer via a sale and subsequent gifting provisions.

Some facts about gifting (knowing that taxes are in constant change):

- Each individual may make annual gifts of up to $15,000 in 2019 to as many people as they wish without triggering the gift tax.
- A married couple filing jointly can give up to $30,000 in 2019 to an unlimited number of individuals each year, even if the gift comes from only one of the spouse's funds.
- If you have a child who is married, current gift-tax rules state that you and your spouse may transfer up to $60,000 in assets to your child and spouse each year, free of gift tax. Such gifts reduce your taxable estate and potential estate tax at death.
- Even if gifts are made in excess of the $15,000-per-person limit, typically gift tax would not be due on that transaction. Each individual maintains during tax year 2019 an $11.4 million lifetime gift tax exemption. The gift value over $15,000 is applied against that $11.4 million lifetime limit. You may gift a practice valued at $11.4 million to anyone without incurring a gift tax liability, unless you previously utilized a portion of the $11.4 million lifetime exemption.

Veterinary practice value can be transferred in the same way, provided that:

- the value of your practice has been determined by an independent third-party appraiser well versed in veterinary practice appraisal;
- the valuation (and associated discounts) will be able to withstand an Internal Revenue Service (IRS) examination.

TERMS DEFINED

Family Limited Partnerships (FLPs): An FLP is a partnership created by two or more family members in accordance with state law consisting of two classes of partners: limited partners (LPs) and general partners (GPs). An FLP is created when owners of a veterinary practice, and perhaps other assets, want to consolidate and centralize management of assets while reducing estate transfer costs. Both current value and future increases in value are transferred to heirs. The FLP is a pass-through taxpayer, so tax attributes flow to individuals holding FLP interests.

General Partners (GPs): GPs (you and/or a spouse) design the partnership to gift FLP shares to family members. GPs control the operations of the FLP and make day-to-day investment decisions.

Limited Liability Corporations (LLCs): An LLC is an entity formed by family members in accordance with state law that has characteristics of both a partnership and a corporation. Family members with LLC ownership interests are termed "members" and are not personally liable for LLC activities. Legal rights and responsibilities of a member's ownership interest are controlled by the written operating agreement. Members can share equal rights in the management and operation of the LLC, or a manager specified in the LLC agreement may manage and operate the LLC.

Limited Partners (LPs): LPs (your heirs) have an ownership interest in the FLP, but they have very limited control. They share in the income generated by the FLP, depending upon how many shares of the FLP they own, with little or no management rights.

Valuation Discounts: Generally, property is taxed for federal gift and estate tax purposes at its fair market value. The degree of control enjoyed by the interest being valued (minority discount), and the degree of its marketability (market discount), can significantly affect what an informed buyer will pay for that interest. Utilizing valuation discounts enables FLP interests to be transferred at lower tax cost by using gift tax annual exclusions to shelter gifts or using reduced applicable credit amounts. Valuation discounts are typically highly scrutinized by the IRS in large-format gifting programs.

ISSUES AND OPTIONS

The choice of whether to use an FLP or an LLC for estate-planning (namely gifting) purposes will depend upon which state the entity resides in. Either entity can be used to accomplish a client's estate-planning objectives, but this chapter will entertain FLP issues only.

The steps that should be taken in establishing a successful FLP include the following:

- Set up the FLP while the practice owner is healthy.
- Limit practice owner controls over partnership assets.
- Have the practice owner, when able, relinquish any interest in the FLP prior to death.
- Leave the practice owner with adequate assets to cover personal living expenses.

In an IRS audit, a transfer of veterinary practices to an FLP would probably be determined as valid as long as taxpayers can document:

- a bona fide business purpose;
- that the "arm's length" transfer occurred with full and adequate consideration;
- transfers were motivated by practice and investment management concerns;
- practice owners do not retain a controlling right or interest;

• practice owners conduct legitimate negotiations between themselves and their heirs in FLP funding and operations;
• that pro rata distributions be made according to ownership interest.

ADVANTAGES OF AN FLP

The advantages of an FLP include:
• Ease in transferring assets through gifting or transfer at death.
• Pooling of partnership assets to lower operating costs and increases diversification.
• Some asset protection against potential creditors. A creditor should not be able to attach partnership assets, force dissolution of the FLP, force a distribution of partnership property, replace the partner, or vote on behalf of any GP. Creditors generally receive a charging order that entitles them to income distributions only after the GP votes to make FLP distributions. The creditor is required to report "phantom income" on their tax return without actually receiving any cash distributions.
• Protection for a child in the midst of a divorce. The FLP agreement can give the other partners the preemptive right to purchase the partnership interest at a discounted value.
• Usually no taxes are incurred when funding a FLP.
• Provide GPs with management fees for operating the LLP.

DISADVANTAGES OF AN FLP

The advantages of an FLP include:
• Expensive to create and maintain.
• The creation of an FLP will not affect the avoidance of probate fees at death.
• Valuations used in the gifting process can be expensive.
• FLPs should not hold personal assets, such as the GP's principal residence, nor pay the GP's personal expenses.

EXAMPLES

Dr. St. Bernard and his spouse are in their mid-fifties and own a veterinary practice, related real estate, and other equity investments. They have three children. Dr. and Mrs. St. Bernard set up an FLP and make a capital contribution of their practice, rental property, and some investments. In exchange for their capital contribution, they receive 1,000 partnership units, each unit worth $30,000 in 2019. Two percent of these units are general partnership units, and the other 98% are limited partnership units.

Dr. and Mrs. St. Bernard begin a coordinated gifting program of the FLP units to their children. After application of prospective combined valuation discounts for lack of marketability (25%) and for a minority interest (25%), the gift tax value of an FLP unit is reduced to $15,000 instead of the $30,000 fair market value in the St. Bernards' hands. If they take advantage of gift-splitting provisions allowed under Internal Revenue Code Section 2513, they can give up to $30,000 ($60,000 fair market value) to each child each year, totally sheltered by annual gift tax exclusions. Dr. and Mrs. St. Bernard could give two limited partnership units to each child annually, or six units total per year, effectively reducing their potential taxable estate value by $180,000 each year.

Over time, the 98% LP interests are transferred to the children. If Dr. and Mrs. St. Bernard continue this annual gift-giving program for several years, they could substantially shift the value of their practice, real estate, and investments to their children while retaining some control of the assets as GPs. Dr. and Mrs. St. Bernard could only achieve half the tax benefits over the same period by making cash-only gifts.

CAUTIONS

• Do not assume the next generation will automatically take over the veterinary practice.
• The second generation must possess a passion for the veterinary practice.
• Children must have the management talent or technical talent needed for the success of the practice.
• The second generation will or may manage the practice differently than the practice owner.
• Practice employees may potentially resent a practice owner's children.
• Even for gifts less than or equal to $15,000 in 2019 in practice value, gift tax returns should be filed in case valuation discounts are questioned by the IRS.
• Retention of too much control by the older generation can be fatal to an FLP. Recently, the IRS has seized upon the "control" issue in FLP litigation.
• Reasonable compensation should be paid for a partner's FLP services.

14.23. RETIREMENT PLANNING

BASICS

OVERVIEW

Retirement plans for veterinary practice owners range from straightforward individual retirement accounts (IRAs) to more intricate Keogh plans. In general, each level of complexity allows for more flexibility and a higher rate of employer and, in some cases, employee contribution. Veterinary practice owners, including sole proprietors, limited liability company (LLC) members, and corporate shareholders, need to choose which retirement plan is best for them as owners, and best for their practice's employees. Common choices available are:

- Savings Incentive Match Plan for Employees (SIMPLE);
- simplified employee pension (SEP) plan;
- profit-sharing or money-purchase (Keogh) plan;
- defined-benefit plan;
- Internal Revenue Code (IRC) section 401(k) plan.

In general, practice owners wishing to maximize their retirement contributions have numerous factors to consider. A SIMPLE plan is a first option because the amount owners can contribute to their own retirement is larger, employees fund their own retirements, and they are easy to set up and administer. As a practice's discretionary income level rises, owners may choose either a SEP or profit-sharing plan so they can contribute more to their own retirement plan, which also requires funding their employees' retirement accounts in greater amounts.

TERMS DEFINED

Employee Retirement Income Security Act (ERISA): Employee Retirement Income Security Act of 1974. Title I of ERISA covers funding, vesting, and fiduciary standards applicable to employee benefit plans, and is enforced by the US Department of Labor (DOL).
Fiduciary: Any person who has discretionary authority over the administration of a plan or the management of plan assets, or who renders investment advice to a plan for a fee.

ISSUES AND OPTIONS

Under ERISA, any kind of employer-initiated retirement plan is subject to regulatory scrutiny. Limiting potential liability begins with:

- Implementing a written investment policy statement that provides documentation on how investment decisions are made, investments monitored, and investments replaced, if need be.
- Following the "prudent expert rule" by acting with the skill, prudence, and diligence of a prudent person with knowledge of such matters; choosing investments is a fiduciary duty under ERISA Section 404(a)(1)(B).
- Ensuring fees and expenses are reasonable for plans of similar size and complexity.
- Remitting plan contributions at the same time as deducted from employee payroll (not doing so constitutes a loan to the employer and is a DOL-prohibited transaction).

SIMPLE IRA

From a planning point of view, SIMPLE plans are useful for self-employed individuals who do not want the complexity of a qualified plan or the funding burden of an SEP.

- **Eligibility.** SIMPLE plans are available to employers who have no other retirement plan and 100 or fewer employees. Employees are eligible if they earn at least $5,000 in any two prior years and are expected to earn at least $5,000 in the current year, meaning that employees are not necessarily required to be covered once they turn age 21 and have one year of service (the participation level for qualified plans).
- **Contributions.** All employees, even highly compensated ones, can defer any percentage of their paycheck up to $13,000 per year in 2019 to a SIMPLE plan. Employees age 50 or older may contribute an additional $3,000 in 2019 as a catch-up contribution.
- **Employer matching.** Employers can either (1) match dollar for dollar up to 3% of compensation (no statutory compensation limit) for those employees who made contributions, or (2) choose to make a 2% (up to $280,000 of compensation in 2019) nonelective contribution for each eligible employee, whether or not the employee makes any contribution. Many employers choose the 3% versus the 2% approach.
- **Vesting.** Employee and employer contributions are immediately vested.
- **Filings.** SIMPLE plans are established by filing Form 5305-SIMPLE.

SEP PLANS

A SEP IRA allows employers to make contributions toward their own (if self-employed) and their employees' retirements on a nondiscriminatory basis. A SEP functions as a low-cost pension plan for small businesses. Employers are not required to make contributions in any year or to maintain a certain level of contributions to a SEP-IRA plan, so annual contributions may be based on profitability or cash flow requirements.

- **Eligibility.** All eligible employees must participate in the plan. An eligible employee is one who (1) has attained age 21, (2) has performed services for the employer during at least three out of the immediately preceding five years (including part-time work), and (3) received at least $600 in compensation from the employer for that year. Employers have the option to establish less-restrictive participation requirements, if desired, but may not impose more restrictive guidelines than these.
- **Contributions.** The plan is funded with tax-deductible employer-only contributions. Employers can contribute up to 25% of their employee's income, not to exceed $56,000. Sole proprietors may deduct a maximum of 20% of their net self-employment income. A SEP cannot discriminate in favor of highly compensated employees, and all contributions must bear a uniform relationship to includable compensation.
- **Employer matching.** None.
- **Deadlines.** For corporations with a March 15, 2020, tax-filing deadline, SEP contributions must be made by the due date of the practice's tax return, including extensions. Sole proprietors have until April 15, 2020, or to their October extension deadline, to make their SEP contribution. In both cases, contributions are deductible for tax year 2019 as if they had been paid during 2019.
- **Vesting.** SEP contributions are immediately vested.
- **Filings.** SEP plans are established by filing Form 5305-SEP by year end or as late as the extended due date of the income tax return for the year contributions are made.

PROFIT-SHARING AND/OR MONEY PURCHASE PLAN (KEOGH)

A profit sharing plan awards employees a slice of your practice's profits. The contribution levels and sharing ratio are the same as the SEP. Custom-designed Keogh plans encourage longevity with a vesting schedule and favor older employees with age-weighted contribution formulas. They may be established as either a defined-benefit or defined-contribution plan. As a defined-contribution plan, it is structured as a profit-sharing plan, a money-purchase plan, or a combination of the two.

- **Eligibility.** Keogh plans have administrative complexities, such as minimum coverage requirements and top-heavy rules testing.
- **Contributions.** For 2019, profit-sharing contributions are limited to the lesser of 100% of compensation up to $56,000. Money-purchase plans are limited to the lesser of 100% of compensation or $56,000, and if an employer elects a combination of the two, is the lesser of $54,000 or 100% of compensation per employee. The deduction limit for employers in 2019 is 25% of compensation or $56,000, whichever

is less. Profit-sharing contributions are based on practice performance and may vary from year to year. Plans must be funded by the tax-filing deadline of the practice, including extensions.
- **Deadlines.** The plan must be in place by the end of the taxable year.
- **Vesting.** Employer chooses immediate three-year cliff or six-year graded vesting.
- **Setup.** Must be established by last day of the business year.
- **Tax filings.** IRS Form 5500 is required for plans having assets of $250,000 if only including a business owner and their spouse in a Solo (K)-type plan, or for multi-employee plans.
- **Cost.** Because an actuarial cost method is adopted to determine plan contributions, this type of plan is generally more expensive to administer.

DEFINED-BENEFIT PLAN

Traditional defined-benefit plans consist of a promise to pay participants a certain amount of money at their normal retirement age based on a certain sum or formula. Defined-benefit plans are designed for practice owners aged 50 and over to contribute as much as is needed to receive an annual retirement payout of $225,000 (in 2019, adjusted for inflation thereafter) or 100% of the average of three highest consecutive pay years. Younger employees have much lower contribution limits. Defined-benefit plans are not very flexible.
- **Eligibility.** Employees who worked at least 1,000 hours in the past year; or two years if no vesting period.
- **Contributions.** Based on actuarial assumption with no set limit. Employees cannot contribute. Employer contributions are not optional.
- **Vesting.** Vesting is determined by the employer. Vesting takes years in most plans.
- **Tax filings.** The annual filing of Form 5500 is required.
- **Cost.** Because an actuarial cost method is adopted to determine plan contributions, this type of Keogh is generally more expensive to administer.

PLAN

Under Section 401(k) of the IRC, employees can set aside money for retirement on a pretax basis through a plan sponsored by their employer. If a practice employs more than 10 employees, a 401(k) is not prohibitively expensive to create and maintain.
- **Eligibility.** Plan cannot discriminate in favor of highly compensated employees. Testing complicated.
- **Contributions.** Employees may contribute pretax salary to a 401(k) plan and any size employer may adopt a 401(k) plan. For 2019, the salary deferral limit was $19,000 per year, rising to $18,500 in 2018. For employees 50 years or older, a $6,000 catch-up provision applies in 2019 and 2018.
- **Employer matching.** Employers may match part, all, or none of employee contributions.
- **Deadlines.** Annual.
- **Vesting.** Employees are 100% vested in their salary deferrals. Employer contributions may be vested on a graduated schedule.
- **Distributions.** Optional participant loans and hardship withdrawals add flexibility for employees.
- **Setup.** Sharebuilder.com offers a safe harbor 401(k) package for businesses with 26–50 employees or less that costs $495 to set up, $185 per month in administration fees, and 0.45–0.75% in asset management fees.
- **Tax filings.** The annual filing of Form 5500, an information filing only, is required.

EXAMPLES

The annual addition limit for any kind of defined contribution plan – 401(k), profit-sharing plan, money-purchase plan, or any combination of the three – is $56,000 in 2019. For example, participants could contribute $19,000 into a practice's 401(k) plan and receive a 100% match on that amount to total $37,000. If a profit-sharing contribution is also made on top of the 401(k) plan contributions, we could maximize contributions at $56,000 and still make a $6,000 catch-up contribution, if eligible.

CAUTIONS

- SEP-IRA and profit-sharing plan contributions made by an employer are optional. SIMPLE or money-purchase Keogh plans require a minimum contribution irrespective of practice profitability.
- A nondeductible tax penalty of 6% of the excess amount contributed will be incurred for each year in which an excess contribution remains in an IRA.
- In some instances, employees who withdraw retirement funds may be subject to possible 10% penalty if under age 59$^1/_2$, unless the distributions fall under the IRC Section 72(t) listed exemptions.

14.24. YOUR NEXT CAREER (REINVENTING YOURSELF)

BASICS

OVERVIEW

It is that age-old question posed to every kid, "What do you want to be when you grow up?" Do you find yourself asking this same question of yourself today – and you are no longer a kid? Why not consider a more positive approach to that question? What do you want to do, now that you have experienced the struggles of attaining the work-life balance, or now that you have developed new skills and have new professional interests? Changing your career path signals a mature stage of your professional life.

Reinventing yourself is really about taking your skills, perhaps in-demand or rare skills, and pairing those with some of your passions in order to take a different path. In some cases, you may be taking a path that is no longer in the veterinary industry; in others, you are on a path that runs within the industry but is a little bit different from your original path.

Reinventing yourself is not just for veterinarians. It also applies to technicians, client service representatives, kennel personnel, and practice managers. Everyone will have his or her own unique, personal reason for wanting to make this decision to change his or her career path.

It is so common to hear about compassion fatigue and burnout in the veterinary industry (see 2.8 – Compassion Fatigue and Burnout). Veterinary medicine is an emotionally demanding profession. Anyone caring for individuals (human or animal) in distress can suffer from burnout or compassion fatigue. However, these are just two of the reasons for wanting a change.

Other reasons are the desire to take on more challenges, to conquer the feelings of being uninspired or not motivated, to initiate progress in a chosen career, or to find more meaningful (purposeful) work. Whatever your reason, it is yours and it is a signal to you to explore your strengths and consider some changes. Begin by envisioning your goal or your destination. What do you need to know in order to achieve this goal?

TERMS DEFINED

Burnout: Physical or emotional exhaustion, especially as a result of long-term stress or dissipation.

Compassion Fatigue: Progressive loss of idealism, energy, and purpose experienced by people in the helping professions.

ISSUES AND OPTIONS

KEEPING ENERGIZED

- Sometimes, a "change of scenery" is the best way to overcome career burnout.
- Veterinarians, technicians, receptionists, and kennel personnel have many options for finding a new career path without leaving the pet-care field.
- Take time to think far ahead before making that career move (see 14.5 – Strategic Planning and Implementation). You want to invest your time and effort in a plan that will reap positive long-term rewards.
- Consider taking a sabbatical to investigate your future career options before you commit yourself to a course of action.
- Internships are not just for college students anymore. Some corporations do offer internships to those investigating a new career. This may be an excellent way for you to explore a new career.
- Apprenticeships are another option – they can be a great way to work with other professionals and learn new skills.
- Mentorships are one of the best ways to energize you and explore other career options. More than a professional coach, a mentor is someone you form an ongoing relationship with to assist you with developing skills and plotting your steps along the path of career growth or change (see 3.17 – Mentoring).
- Consider volunteer opportunities, both within the veterinary industry and outside. There is nothing like the feeling of rejuvenation when you spend time as a community service volunteer.

14.24. YOUR NEXT CAREER (REINVENTING YOURSELF)

BECOMING A SPECIALIST

• After a few years, general practitioners may begin to feel that they are seeing the same cases over and over, and not making a real difference for the pets entrusted to their care.
• Many general practitioners earn board certification in a specialized area as a way to refocus their interest in medicine and provide new challenges.
• According to the American Veterinary Medical Association (AVMA), there are currently 22 AVMA-recognized veterinary specialty organizations compromising 41 distinct specialites.[1]
• Technicians can explore numerous options as a veterinary technician specialist in emergency and critical care, dentistry, anesthesia, and many other disciplines. Contact the National Association of Veterinary Technicians in America (www.navta.net) for details (see 1.9 – Veterinary Paraprofessionals).

TURNING TO MANAGEMENT

• Many doctors who are tired of looking at "ears and rears" become reenergized by focusing on the challenges of running a successful business in the role of hospital administrator or consultant. Learning how to create a strategic business plan, market a business, manage finances, and direct a hospital team helps veterinarians become better leaders and fulfill an important role.
• Technicians and client service representatives also consider changing their career into management, as a team manager, a coordinator, hospital manager, or consultant.
• Programs like the Veterinary Management Institute (www.aahanet.org) are available to prepare oneself for the skills and knowledge necessary to take on management roles, as well as the Veterinary Hospital Managers Association (www.vhma.org), which offers a Certified Veterinary Practice Manager program.
• The Society for Human Resource Management offers a certified program (www.shrm.org) for a Professional in Human Resources® (PHR®) or a Senior Professional in Human Resources® (SPHR®). Although not veterinary specific, the intense program covers a wide range of human resource issues that also come into play when managing a veterinary practice.

FINDING A DIFFERENT CHALLENGE

• Many faculty members eventually leave academia to work in private practice, and others to work in industry.
• Other veterinarians reverse this course, going from private practice to a teaching or research career at a veterinary medical college.
• Alternatively, if you are a sole practitioner, consider the benefits of having colleagues. You could bring a partner into the mix or sell to a corporate group that allows you to continue to "run your own ship."
• Another interesting challenge is in the fields of writing/publishing/public speaking. With the explosive growth of online social media, jobs in blogging, writing newsletters, and writing for industry speakers and publications may be in line with strengths you have. Speaking and publishing are also possibilities, especially when you consider your unique experiences can offer material from entertaining to educational, from technical tips to motivational speeches. Check out your local Toastmaster's International (www.toastmasters.org) speakers' group or a local writers' club for inspiration.

BUYING INTO A PRACTICE

• Associates who lack enthusiasm for their jobs may simply be looking for an opportunity to take on more responsibility. Having the option to buy into the practice can reenergize associates and keep them focused on medicine (see 7.24 – Buying into a Practice as a Partner).
• Bringing your associate onboard as a partner can help lighten your load and free you to focus on what you enjoy most about being a veterinarian: patient care.

WORKING WITH A SPOUSE

• Many veterinarians find themselves in the potentially precarious, and often stressful, situation of working with a spouse. These couples typically find that their biggest challenge is separating home and business issues to avoid conflict. One of the most important aspects is to avoid a situation where one spouse is telling the other what to do.
• When two veterinarians practice together, they need to share responsibilities and decision-making. This is even more important when the veterinarians must go home together.

14.24. Your Next Career (Reinventing Yourself)

RELYING ON YOUR TEAM

• Feeling responsible for the success of the practice is key to keeping team members happy in practice and on the same page, but reaching this goal is a work in progress (see 1.11 – Functioning as a Healthcare Team).
• Veterinarians may tend to be "cowboys." They want to do their own thing, but they also have to be in charge of everything. Learning to rely on your hospital team will help you avoid burnout and to stay energized.
• Managing the details is not what a veterinarian does best. Doctors need to spend their time with clients and patients, and let staff focus on other aspects. You should surround yourself with people who excel in areas that you don't, so that you don't drain yourself and become burned out.

MOVING UP THE LADDER

• The opportunity for learning new skills and advancing within the practice is important for hospital team members. Continuing education/continuing professional development is a key ingredient for keeping everyone energized and reducing stress (see 3.14 – Staff Development).
• Offer your team continuing education opportunities, and monitor their desire and ability to learn. The stars will quickly shine.
• Consider implementing an advancement program at your practice. Let kennel attendants learn the skills necessary to become veterinary assistants, and help interested technicians pick up practice management skills.

KEEPING STAFF ENERGIZED

• Without satisfied hospital team members, client service will suffer at your practice (see 2.5 – Motivating the Healthcare Team). Your team is your front line, and they give clients their first exposure to the practice.
• Burnout and compassion fatigue strike your team in the same way; without proactive steps, it will build up until the individuals become emotionally overwhelmed (see 2.8 – Compassion Fatigue & Burnout).
• One simple way to keep your team energized is to offer a flexible work schedule. This makes it easier for them to juggle family and work, keeping them more focused when they are on the job (see 3.18 – Staff Scheduling Options).
• Listen to your team members. Are there practice areas that they are interested in? Help your team identify professional development areas, and then help them gain the skills necessary to grow.

EXAMPLES

• Consider these tips to combat burnout:
  ◦ Practice deep breathing exercises.
  ◦ Take time to celebrate a job well done before moving on to the next task.
  ◦ Delegate as much as possible.
  ◦ Set boundaries between work and other areas of your life.
  ◦ Do not overschedule your nonworking time.
  ◦ Practice positive affirmations.
  ◦ Identify things to look forward to each day.
• Many doctors feel compelled to handle all aspects of running a business. Over time, they learn to delegate to others such tasks as creating staff meeting agendas. This frees up their time to practice medicine and allows their hospital team members to take on additional responsibilities.
• Compassion fatigue can take its toll on the entire practice. Some steps to reduce or treat compassion fatigue include:
  ◦ Educate the entire veterinary healthcare team about compassion fatigue.
  ◦ Establish weekly debriefing sessions for the entire team to discuss needs, concerns, and cases that weigh upon them.
  ◦ Form teams of professionals who look out for one another in the workplace and who identify high-risk moments for compassion fatigue.
  ◦ Identify professionals within the community who understand compassion fatigue, and determine methods of access to these people.
  ◦ Establish a library for team members that contains books and resources on compassion fatigue and how to address it.
  ◦ Identify a sanctuary or "comfort room" where team members can be alone to meditate, relax, and debrief.
  ◦ Ensure that team members are fully informed about each case and are allowed to have adequate closure at the end of any patient's life.
  ◦ Whenever possible, work out sabbatical or continuing education opportunities for reward and growth. The break from caring can be very rewarding in the long run.
  ◦ Teach veterinarians and hospital team members limits and boundaries.
  ◦ Use humor whenever appropriate.

14.24. YOUR NEXT CAREER (REINVENTING YOURSELF)

CAUTIONS

- Establishing a good system for delegating responsibilities to hospital team members takes time.
- Symptoms of compassion fatigue can be dismissed as just signs of an ill-fitting employee. They include lowered tolerance for frustration, loss of confidence, dread of working with certain clients, subtle manipulation of clients to avoid painful/traumatic situations, and loss of enjoyment of one's career.
- If team members are unhappy, their negative attitudes will pervade the entire practice. Take time now to deal with unrest and you may find that you enjoy practicing medicine more than ever.
- There is no one cure for compassion fatigue, and there is no way to stop it from striking again.
- If your burnout level becomes so severe that none of these options appeals to you, it might be time to consider whether you really want to stay in veterinary medicine.
- This profession is looked upon as a "calling," and we need to recognize the fact that we have options. Do not pigeonhole yourself into one path; the veterinary profession has many career options.

Tallahassee, FL 32301

January 6, 2020

A Helping Paw Veterinary Associates
John Smith, Director
567 Orange Avenue
Tulsa, Oklahoma 74008

Dear Dr. Smith,

I enjoyed speaking with you on the phone last week. I sincerely hope that you enjoyed a great New Year's holiday, and I wanted to follow up regarding our conversation about the Lead Veterinarian position that you have available. For quite some time, I've been looking for an opportunity to take my career to the next level and move into such a position, and I believe that A Helping Paw represents the opportunity that I've been seeking.

After graduating with honors at the University of Florida's College of Veterinary Medicine, I've spent the past 12 years as an associate veterinarian at two top-notch clinics in the Sunshine State. During this time, I've been able to enhance and hone my skills and experience in multiple areas that are central to clinic success, including internal medicine, emergency surgery, and laboratory diagnostics. However, I'm most proud of my work in customer relations and communication, which I enjoy and has helped set me apart from my colleagues.

I was thoroughly impressed with how your organization has been recognized for its work within the community and the awards that you've won for animal care and customer relations. This cemented my interest in your Lead Veterinarian position, and I believe my accomplishments and my desire to excel in this area, plus my extensive experience as an associate veterinarian, make me a suitable candidate.

With that in mind, I've attached a copy of my resume. If you have any questions, please don't hesitate to reach out to me at my cell phone number or via email. I wish you well in the New Year, and I'll follow up with you later this month. Thank you very much for your time and consideration.

Sincerely,
Jane R. Doe, DVM

Tallahassee, FL 32301

Phone: (216) 555-1234
E-mail: j.doe@gmail.com

PROFESSIONAL SUMMARY

Small Animal Veterinarian with over 10 years of experience with two hospitals. Experience in internal medicine, soft tissue surgery, infectious disease, nutrition counseling, radiology, and behavior consultation. Customer-service focus with an emphasis on communication.

QUALIFICATIONS

- Twelve years of professional experience in organized veterinary medicine
- Six years of experience in a fast-paced, surgery-intensive clinic with high volume and tight deadlines
- Recognized for superior customer relations and communication at two veterinary clinics
- Earned a supervisory role among associate veterinarians, distributing workload and setting schedules

EDUCATION

University of Florida, College of Veterinary Medicine – Gainesville, FL (May 2007)
- Doctor of Veterinary Medicine, School of Veterinary Medicine (SVM)
- Master of Science, Comparative Biomedical Sciences, SVM
- Thesis: "The Frequency of Transmittable Pathogens Between Pet Owners and Pets: A Cross-Sectional Study of the United States"

Florida International University – Miami, FL (May 2002)
- Bachelor of Science in Biology, with a minor in Agriculture (Animal Science focus)

PROFESSIONAL EXPERIENCE

Welcome to the Jungle Veterinary Services—St. Petersburg, FL 2011–present
Associate Veterinarian
- Ran laboratory diagnostics, performed microscopy, and handled primary care appointments and walk-in sick patients for a busy four-doctor practice
- Small animal medicine, emergency medicine, and surgery (including orthopedic surgery); some exotics, geriatric, and nutritional medicine, as well
- Teamed with doctors to treat rodents, cats, dogs, chickens, and goats
- Helped increase volume by 22% through the use of more streamlined time management strategies, techniques, and systems, resulting in a 17% increase in revenue

Wild at Heart Animal Hospital—Miami, FL 2007–2011
Associate Veterinarian
- Obtained patient histories, triaged patients, obtained radiographs, and assisted in surgeries
- Responsible for wellness care, routine surgeries, and patient management
- Educated pet owners about proper pet care, parasite control, and behavior modification strategies
- Helped increase client base 15% by the end of the second year through increased customer service efforts based upon improved communication and consultation techniques

RELEVANT EXPERIENCE

Green Animal Hospital – Miami, FL 2004–2006
Student Externship
- Participated in all aspects of zoological medicine, including medical and surgical treatment, preventative medicine, quarantine protocols, pathology, and daily case rounds
- Assisted the veterinarians and veterinary technicians with all medical procedures during their rotation

Pet City – Miami, FL 2002–2004
Dog Trainer
- Used a variety of learning techniques to effect behavioral changes, including a combination of desensitization, operant conditioning, positive reinforcement, clicker training, hand signals, verbal cues, and reward systems

15.2. Sample Cover Letter and Résumé

HONORS/AWARDS

University of Florida School of Veterinary Medicine
- Small Animal Veterinary Graduate of the Year Award 2007

Florida International
- Undergraduate Excellence Award in Veterinary Medicine 2002

CERTIFICATIONS/MEMBERSHIPS

- Veterinary Medical License (state of Florida) 2007–present
- Florida Veterinary Medical Association (FVMA) 2007–present
- American Veterinary Medical Association (AVMA) 2007–present
- South Florida Veterinary Medical Association 2007–present

HOBBIES

- Licensed HAM radio operator
- Fluent in sign language and Morse code

HONORS AND AWARDS

University of Florida School of Veterinary Medicine
Small Animal Veterinary Graduate of the Year Award 2007
• Presented after an extensive selection process that included interviews, lab work, research papers, and community service.

Florida International
Undergraduate Excellence Award in Veterinary Medicine 2002
• Presented to an undergraduate student who has excelled within the university in numerous categories and compared to stringent predetermined benchmarks.

Dean's List
• University of Florida 2004–2008
• Florida International 2000–2004

Golden Key National Honor Society 1997–2001
Future Veterinarians Scholarship 1997

RESEARCH-RELATED ACTIVITIES

Society of Small Animal Veterinarians June 2009
Conference presenter
• Presented paper titled "The Role of Proper Communication and Owner Psychology in Accelerated Veterinary Care"

University of Florida "The Future of Veterinary Medicine" Initiative 2003
• Participated in graduate program project aimed at identifying challenges in Veterinary medicine during the next 10 to 20 years, including the formulation of solutions to the problems that those challenges present.

Florida International Biology Department
Supervisor: Dr. Charlie Brown 1999
Independent Research Project:
"The Role of Auditory and Tactical Stimulation in Veterinary Recovery Time"
• Observed and recorded interaction with various small animals following surgery (with a wide variety of control factors) and then observed and recorded recovery rates associated with each level of interaction.

GRANTS

• Humanitarian Veterinarian, "Small Animal Reproduction," $50,000 2010

SERVICE ORGANIZATIONS

• Volunteer Vets for Vets, Southeast United States Veterans Association 2008–present
  ◦ Treasurer, 2008–2011; Secretary 2011–2013; Vice President 2013–present

1.0 Executive Summary

The human–animal bond has never been stronger, and pet owners are taking better care of their animals than at any time in the past. Veterinary hospitals are about the delivery of high-quality medicine to animals, but they are also small businesses, and as such must have a sound financial basis.

For a veterinary practice to be successful, it takes an adequate number of pets needing services, a client base that can afford such services, and a facility and staff capable of offering the level of services needed. Systems need to be in place to track compliance and ensure that the services needed by pets are being delivered by the veterinary practice.

DEF Veterinary Clinic will concentrate on wellness care of animals. Animals requiring more intensive care, surgery, or diagnostics will be directed to ABC Veterinary Hospital, a hospital with the same ownership as DEF Veterinary Clinic.

1.1 Objectives

1. To have facility built by July 1, 2020.
2. To process 500 patient visits a month by December 31, 2020, at an average client transaction of $147.00.
3. To become recognized as a local source of high-quality veterinary medical care.
4. To add several additional services to our initial offering, including:
- ultrasonography;
- behavioral counseling;
- nutritional counseling;
- pet selection counseling;
- pet-specific care.

1.2 Mission

As an affiliate of ABC Veterinary Hospital, DEF Veterinary Clinic will offer compassionate high-quality wellness care to dogs and cats and to celebrate the human–animal bond as part of our daily routine.

1.3 Keys to Success

DEF Veterinary Clinic will concentrate on the most profitable aspect of veterinary healthcare for animals: wellness. Our goal is not to offer all possible veterinary services that are available, but to honestly assess the healthcare concerns for each individual animal and respond accordingly.

Veterinary medicine can be a business with high staffing and overhead costs. However, DEF will do almost all of its business in the examination and treatment rooms and will deal with preventive medicine as a priority.

2.0 Company Summary

We are currently organized as an LLC, being formed in October, 2018.

DEF will have a logo created, and trademark it through the US Department of Commerce Patent and Trade Mark Office.

2.1 Company Ownership

The two individuals forming this partnership are John Smith and William Jones, both licensed doctors of veterinary medicine.

Both doctors are presently affiliated with ABC Veterinary Hospital and are creating DEF Veterinary Clinic to handle wellness practice in a location 10 miles away from their existing hospital. Each doctor has over five years of experience practicing small animal veterinary medicine, and ABC Veterinary Hospital has a history of excellent client care and profitable performance. Financial statements for the past three years are included in the Appendix.

2.2 Start-up Summary

DEF Veterinary Clinic will be primarily staffed by Dr. Black, who has been an associate with ABC Veterinary Hospital for the past two years. She will be the primary veterinarian in the practice, with Drs. Smith and Jones rotating in to cover shifts as needed.

One of the receptionists from ABC Veterinary Hospital will also be making the move. Two veterinary technicians will be hired specifically to work at DEF Veterinary Clinic, and they may also fill in some shifts at ABC Veterinary Hospital, both for training and on an as-needed basis for staffing.

Drs. Smith and Jones are each investing $12,000.00 of their own capital in the business and are looking for financing for the additional amount to get the business launched and to carry it through the first two years, at which time a breakeven situation is anticipated. Start-up expenses, tables, and charts are included in the Appendix.

2.3 Company Locations and Facilities

DEF Veterinary Clinic will be utilizing a 2,450 sq. ft rental facility in a commercial plaza. There will be no overnight hospitalization on the premises. Maps and traffic-flow statistics are included in the Appendix.

15.4. Sample Business Plan

3.0 Services

DEF Veterinary Clinic will concentrate on wellness, referring all animals that require hospitalization or surgery to ABC Veterinary Hospital. Primary services are clinical examinations by a primary care veterinarian, disease screening and prevention, and owner counseling.

3.1 Service Description

DEF Veterinary Clinic's number one goal is to provide outstanding client service.

We show our dedication to client service by providing pet owners with personal service relating to all of their pets' wellness needs.

Initially, we will focus on just clinical examinations. In the near future, we will diligently pursue our goal of providing other services that do not require anesthesia and hospitalization, including behavioral counseling, nutritional counseling, dentistry, and ultrasonography.

3.2 Competitive Comparison

An examination is performed on each patient during the evaluation phase. This will allow us to determine the needs of the patient, and to create an individualized patient care plan through the remainder of the pet's life. A "personalized pet profile" will be generated, providing unique information on the pet's requirements, based on our "needs analysis" and documented for the owner. There will also be access to relevant healthcare needs and recommendations on the interactive website being created.

Currently, our competitors are not offering this personalized profile, nor access to healthcare information and resources through their websites.

3.3 Value Proposition

We believe that we have considered all of the relevant stakeholders in our decision to create this new veterinary office. Clients at ABC Veterinary Hospital have frequently reported that it is the personal touch that has caused them to return time and again. There are adequate numbers of specialists in the area that can handle medical issues beyond the realm of a primary care facility. The staff members that have volunteered to work in the new hospital are committed to developing lifelong relationships with clients, not just treating their animals when sick. From a competitive perspective, there are currently no other veterinary practices in the immediate trade area, which has many new homes and families, and if not for DEF Veterinary Clinic there would be a great opportunity for a direct competitor of ABC Veterinary Hospital to appear on the scene. That is less likely if DEF Veterinary Clinic proves to be meeting the needs of pet owners in the area.

3.4 Technology

DEF Veterinary Clinic will use the same practice management software that is in place at ABC Veterinary Hospital, and it will be possible to access medical records from both hospitals at either location.

3.5 Future Services

As stated earlier in 3.1, DEF Veterinary Clinic will eventually offer other services, including:

- ultrasonography;
- behavioral counseling;
- nutritional counseling;
- pet selection counseling;
- pet-specific care.

4.0 Market Analysis Summary

DEF Veterinary Clinic's target market consists of all owners of dogs and cats within a 10-minute drive time of its location.

4.1 Market Segmentation

The following demographic information was determined by our management consulting firm, Bizvet, Inc., for the immediate trade area.

Demographic summary

	2014	*2019*
Population	32,348	32,610
Households	12,695	12,904
Median household income	$82,123	$98,381

Consumer behavior/expected number of households/percent

Household owning any pet	5,456	43.0%
Household owning any cat	2,810	22.1%
Household owning any dog	3,709	29.2%
Bought pet food from veterinarian in last 12 months	963	7.6%
Bought flea control product from veterinarian in last 12 months	1,931	15.2%

See market analysis charts, tables, and graphics in the Appendix.

4.2 Service Business Analysis

If history is any indication and current trends continue, pet owners will continue to lavish exceptional care on their pets. The industry is considered almost recession proof, and revenues for veterinary practices have continued to grow even during periods of economic downturn.

4.2.1 Business Participants

At present, Drs. Smith and Jones will own DEF Veterinary Clinic in its entirety. There may be an opportunity for Dr. Black to earn an equity stake in the hospital at some future date.

DEF Veterinary Clinic is also creating some important business alliances. It is granting free web space to Darlene's Dog Grooming on its website. It is anticipated that as Darlene's existing clients visit her pages on the DEF website they will be exposed to the services offered by DEF, and hopefully to elect to try the service. Similar offers of strategic alliances have been extended to Palmer's Pet Supply and Ben's Pet Boarding.

4.2.2 Main Competitors

Our main competition is actually ABC Veterinary Hospital at the outset. It is hoped that the creation of DEF Veterinary Clinic will actually decrease the likelihood of competition in the future. It is anticipated that approximately 15% of ABC's clients will choose DEF for their wellness needs, returning to ABC when additional diagnostic or therapeutic intervention is warranted.

ABC's strengths are:

- experience
- education
- large client base.

Their weaknesses are:

- distances for clients in area being considered;
- limited ability to offer personalized service, because of full hospital service model.

The strengths and weaknesses, however, seem of little consequence as the local market by all accounts is untouched, and no other veterinary practices have yet moved into the area.

5.0 Strategy and Implementation Summary

Studies show that the number one issue with consumers today is "personal service." They want to know that someone really cares about their concerns and wants to resolve their problems. Clients want value for their money, and the primary strategy is the delivery of value with high-quality wellness care.

5.1 Competitive Edge

DEF Veterinary Clinic can provide the following benefits:
1. High-quality wellness care.
2. Referral to full-service hospital as needed.
3. Existing relationships of many anticipated clients from ABC Veterinary Hospital.

5.2 Marketing Strategy

A marketing plan will be developed by our management team at Bizvet, Inc. that will involve advertisements in community newspapers, guest appearances of DEF veterinarians on local radio call-in shows, a mailing to households of licensed dogs and cats, visits to local schools, and an open house when the facility opens.

5.2.1 Pricing Strategy

The pricing for services will be very similar to that at ABC Animal Hospital. This should allow a greater profit margin at DEF Veterinary Clinic, which actually has a much lower overhead. Our management consultant team at Bizvet, Inc. will create a routine pricelist based on cost-plus pricing and a calculated profit margin of 24%.

5.2.2 Promotion Strategy

Promotion of DEF Veterinary Clinic will focus on a celebration of the human–animal bond. There will be different tiers of service that will differentiate clients wanting only a very basic level of service, to those wanted truly personalized care packages.

5.2.3 Marketing Programs

With a service-oriented business such as this, long-term relationships must be developed. When we have successfully met the wellness needs of our clients, the practice will be more inclined to promote other aspects to pet owners that would benefit from our service. We intend to grow extensively through referrals from current clients.

In addition to the ongoing program discussed earlier, DEF will incorporate numerous other strategies simultaneously.

In general, they are:
- Search engine and mobile-optimized website, Facebook, Twitter, and other peer-to-peer networking strategies.
- A listing in the local Yellow Pages, despite its relatively infrequent use at present, but as an introduction for older potential clients.
- Networking as members of the Chamber of Commerce, local civic organizations, county veterinary associations.
- Attending and volunteering services for pet-related fundraisers and health fairs, maintaining an information booth where indicated.
- Networking with other professionals, such as medical and professional consultants, attorneys, and accountants, pharmaceutical representatives, and medical equipment salespeople.
- Affiliation with local and national peer organizations, including those available on the Internet.
- Advertising in local newspapers.
- Membership in the Better Business Bureau.
- Accepting an invitation to appear on a local radio talk show.
- Submitting several press releases annually to local newspapers.
- Writing articles for several publications in the area.

5.3 Revenue Forecast

The graphs and charts included in the Appendix reflect the realistic goals we have set.

5.4 Strategic Alliances

DEF Veterinary Clinic is a privately owned veterinary practice, but all practicing doctors in the hospital are members of the national and state veterinary associations, and active members of an area veterinary group.

Animals requiring hospitalization are referred to ABC Veterinary Hospital, and there is a wide variety of specialists within a 45-minute drive time, including an emergency clinic located a 20-minute drive away.

Though some laboratory work is processed on site, the majority is sent to a nationally prominent commercial laboratory, with sample pickups on a daily basis.

5.5 Milestones

See Milestone table in Appendix. The hospital plans to be seeing 500 patients monthly by December 31, 2020 at an average client transaction of $147.00. Other milestones are evident in the table.

6.0 Management Summary

Company ownership includes Drs. Smith and Jones. The hospital manager of ABC Veterinary Hospital will help oversee day-to-day operations, including payroll, inventory control, and regulatory compliance. Both hospitals also have the oversight of Bizvet, Inc., a company devoted to veterinary practice management.

7.0 Financial Plan

The business will be financed mainly through cash flow. With a service-oriented business, our main investment is for staffing, general and administrative expenses, and medical and computer equipment. During subsequent years, other than normal overhead, we will be looking at:
- advertising fees;
- renewal of memberships to local and national organizations;
- updates of reference manuals and books;
- office supplies and utilities;
- payroll and benefits.

7.1 Important Assumptions

This financial plan depends on important assumptions, most of which are shown in the tables in the Appendix, including short-term and long-term interest rates, tax rates, expenses in cash %, and personnel burden %. The plan also assumes that pets will continue to be valued family members and that veterinary services will continue to be warranted to maintain pet health.

7.2 Key Financial Indicators

The hospital will benchmark to the key financial indicators outlined in the Appendix, including average client transactions, staff hours per transaction, and client satisfaction indices.

15.4. Sample Business Plan

7.3 Break-even Analysis

The break-even analysis charts and graphs shown in the Appendix have a good balance of fixed costs and sufficient revenues to remain healthy. As with any business, the first few months will show negative financial numbers.

7.4 Projected Profit and Loss

Because of the initial costs for rent, payroll, equipment, office furniture, advertising and management/legal fees, DEF Veterinary Clinic will show a loss of $6,742.00 for the first two months of business operation. The pro forma profit and loss statement is included in the Appendix.

7.5 Projected Cash Flow

Initially, cash flow will be supported by the personal savings accounts of the two principals of this company. This means that the amount left to finance will come from this cash fund. The pro forma cash flow statement is included in the Appendix, as is the graph of cash flow and cash balance.

7.6 Projected Balance Sheet

The projected balance sheets for three fiscal years are included in the Appendix.

7.7 Business Ratios

A variety of profitability, activity, debt, liquidity, and other ratios are located in the Appendix.

APPENDICES

NOTE

This business plan is heavily abbreviated and devoid of charts, tables, and graphics because of space limitations.

15.5. Sample Marketing Plan

2020–2021

Introduction

This marketing plan is reflective of our desire to not only meet our clients' needs but exceed their expectations. Our practice is committed to offering the very best medical care and exceptional client service. We are patient advocates and enjoy the opportunity to interact with clients and their pets.

Situational Analysis

There are several relevant environmental factors to consider that affect the success of marketing our veterinary services. One is the human–animal bond, which is very important to our clients. Our clients want to partner with us to enhance this bond. In addition, clients today are looking for high-quality medical care, excellent client service, and value associated with the service they receive. Our practice is established and located in an upscale community. Clients are mostly educated with a mix of middle class to upper middle class in terms of socioeconomic status.

There are seven other established practices in close proximity. Owing to the resurgence in growth of the area, it is possible that another veterinary hospital might open. All of these practices are full-service hospitals with relatively nice facilities. Based on reliable client reports, as well as brief visits and phone calls to the hospitals, it appears that client service is variable and not considered to be outstanding at any practice. None of these hospitals appear to be offering any service that is not available at our facility.

A review of our client surveys and mystery shoppers shows that clients do not always feel our client service is exceptional. An analysis of our practice revenue data reveals growth opportunity in the following service utilization areas: dental prophylaxis, senior diagnostic testing, pet-specific care, feline wellness visits, and laser therapy.

Interactive discussions with team members have been helpful in identifying training needs and generating ideas for improved communication.

Marketing Planning

Marketing Objectives

• Provide exceptional client service. Raise the current level of client service to a gold standard level such that clients feel special. Clients will know the caring commitment we have to them and their pets. We will measure our progress by listening to our clients, reviewing client comments at monthly team meetings, hiring mystery shoppers to call and visit the practice, and quarterly client surveys. We have the following goals:
  ◦ increase dental prophylaxes performed per month by 15%;
  ◦ increase senior diagnostic testing revenue by 10%;
  ◦ increase feline wellness visits by 10%;
  ◦ institute pet-specific care initiatives within the next three months;
  ◦ increase laser therapy revenues by 25%.

Target Markets

• All clients relative to client service.
• All pets with periodontal disease.
• Dogs greater than seven years old.
• Cats greater than seven years old.
• Both dogs and cats with risks for common heritable conditions.
• Cat-owning clients that have not visited in the last six months.

Marketing Mix

Product: client service, dental prophylaxis, senior healthcare screens, feline wellness visits.

Price: the fees associated with the veterinary services have been reviewed and updated.

Promotion: marketing programs.
• Our electronic newsletter will feature an article on periodontal disease in the January issue and highlight that February is Dental Health Month. Our February issue will feature an article on the benefits of laser therapy.
• A new display dedicated to dental health and oral hygiene will be placed in the reception area.
• A dental healthcare kit will be provided to all pets who receive oral care or dental prophylaxis recommendations. This kit will contain a client education handout explaining the dental procedure and benefits. A brochure on oral hygiene products will be included, along with samples.
• Senior healthcare folders will be provided for dogs and cats over seven years of age. These folders will contain handouts and brochures on senior illnesses, senior nutrition, and diagnostic testing.
• A mailing on the importance of feline wellness visits will be sent to targeted clients.
• Training will be scheduled to educate all team members on the importance of senior care, dental care, pet-specific care, and nutrition.
• In-house training and webinars will be used in the next quarter to educate the team about the benefits of laser therapy and how to use the machine.

Promotion: client service.
• Team members will ensure that the exterior appearance of the hospital and the reception area are always clean and inviting.
• Telephone etiquette and client service training will ensure a positive experience for all clients.
• Wait times for clients will be no longer than 10 minutes except in the case of emergencies.
• The entire healthcare team will attend a continuing education meeting on "Providing Exceptional Client Service" January 10th and then discuss at the January 16th team meeting.

Place: all programs will be ongoing. Owners may drop off pets for senior health screenings.

Implementation and Control

• Dr. Smith will provide leadership and guidance for the plan.
• Hospital manager, Cindy, will oversee monthly progress of the plan and facilitate discussion at monthly staff meetings.
• Senior technician, Rachel, will be responsible for making the dental and senior kits.
• Dr. Black, associate DVM, will write the article on periodontal disease for the newsletter. Dr. Smith will write the article on laser therapy.
• Progress on service utilization for dentals, laser therapy, feline wellness visits, and senior testing will be tracked on the white board in the employee lounge.

Budget

• The administrative costs for the newsletter and mailings are included in the annual budget.
• The continuing education seminars, webinars, and training will cost $2,000.

WOM: Word of mouth
WSAVA: World Small Animal Veterinary Association

Glossary

1099-MISC form: The form a company issues to its independent contractors, citing all monies paid to the individual on an untaxed basis. It is then the responsibility of the independent contractor to file and pay all appropriate federal, state, and local taxes. Practices that pay independent contractors $600 or more in a year must file a 1099-MISC with the Internal Revenue Service and provide a copy to the recipient of the payment.

10-minute flex: The fastest-growing scheduling system in the industry today for companion animal practices. It is estimated that 35–45% of companion animal practices use this system. The system allows the user to determine the appropriate amount of time for the appointment based on the number of 10-minute blocks that are combined. Therefore, an appointment could be 10 minutes, 20 minutes, 30 minutes, or 40 minutes, as needed.

360 evaluation: Performance appraisal information collected from peers, supervisors, subordinates, and even customers to get a broader perspective on an employee's performance

4 As: The American Association of Critical-Care Nurses has developed a protocol to address "moral distress" in the workplace; it is summarized as Ask, Affirm, Assess, and Act.

401(k): A tax-qualified, defined-contribution pension account for US workers, defined by section 401(k) in the Internal Revenue Code.

Abandonment: The relinquishing of a right or interest with the intention of never again claiming it.

ABC analysis: An assessment of inventory items based on their economic value with usage, sales, and cost. An ABC analysis is an extension of the Pareto principle and a method of grading products based on their usage and turnover.

Absenteeism: The practice of regularly missing work without good reason.

Abuse: Improper usage or treatment for a bad purpose, often to unfairly or improperly gain benefit.

Abuse: Traditionally reserved for acts causing unnecessary injury or death to an animal, such as overworking, torturing, traumatizing, or mutilating.

Acceptance of employment offer: Acceptance of an offer may be manifested by a promise or by performance. The promise to become an employee can be verbal, leading to an implied contract, or by performance, that of beginning work, or of course by signing the agreement of acceptance in an employment contract.

Accountability: The obligation to be responsible and to act in the best interest of the organization and its mission.

Accountant: Term typically applied to accounting professionals, bookkeepers, tax preparers, enrolled agents, auditors, and general corporate-level accountants. Each is particularly suited for certain tasks at hand consistent with each of their discrete windows of experience.

Accounts payable: Amounts owed to your suppliers that are payable in the future. Without payables and trade credit, you would have to pay for all goods and services at the time you purchase them.

Accounts payable aging schedule: List of all amounts you owe to your suppliers over certain blocks of time (30, 60, 90 days, and more).

Accounts receivable: Money owed to a practice for services rendered or products sold that is not paid at the time of service or when the product is dispensed.

Accounts receivable aging schedule: List of customers who owe the practice for services and shows balances owed over certain blocks of time (30, 60, 90 days, and more).

Accounts receivable turnover (revenue-asset measurement): The relationship between sales made through credit and accounts receivable, computed by dividing sales on account by average net accounts receivable. The higher the accounts receivable turnover number, the quicker collections occur (and the higher the probability of successful collection).

Accrual basis accounting: Accounting method that recognizes income when it is earned and expenses when they are incurred, regardless of when cash is received or disbursed. under consideration.

Acid-test ratio (asset-liability measurement): Sum of cash, receivables, and marketable securities divided by current liabilities. The acid test provides a quick measure of the practice's ability to pay its near-term liabilities out of liquid assets. Passing the acid test requires that the sum of highly liquid assets be at least equal to current liabilities, if not greater.

Acquisition: The act of one entity acquiring control of another entity.

Acquisition cost: The unit cost at which a product or service can be purchased, including any delivery fees and/or taxes.

Actual value: Actual value is obtained from real performance. Actual values are either current for the time period being studied, or they may be historical from an earlier time period.

Adaptive leadership: Incorporating change by challenging the status quo, and adapting leadership styles to yield success.

Adherence: The extent to which patients take the medications prescribed, which requires the pet owner to fill and refill the prescription, administer the correct dose, timing, and use, and complete the prescribed course. Adherence is a term applied specifically to medications; it does not refer, for example, to recommendations for wellness checks, diagnostic screenings, and so on.

Adjusted gross income: The total of an individual's income (wages, salaries, interest, dividends, etc.) on a tax return after all allowable deductions have been subtracted.

ADOBE: A mnemonic that was created by the Bayer Animal Health Communication Project to facilitate the management of an angry client. ADOBE stands for Acknowledgement of the issue, Discovery of meaning, Opportunity to demonstrate compassion, Boundary clarification, Extension of the relationship to include a neutral third-party.

Adoption: A legal action that permanently alters the relationship with the child's biological or previous parents. After adoption, the biological parents give up all parental rights and obligation. As contrasted with guardianship, which a legal relationship between guardian and ward coexist with the biological or adopted parents.

Adverse drug event (ADE): Any adverse event associated with the use of an animal drug, whether or not considered to be drug related, and whether or not the drug was used in accordance with the approved usage. An ADE can also include lack of expected efficacy, product defect, or human exposure to the product either directly or due to residue violations and exposure in food.

Adverse outcome: Unanticipated harm that was induced by appropriate veterinary medical care. For example, the development of fibrosarcoma at the site of a rabies immunization in a young adult cat is an adverse outcome.

Advertising: A marketing effort to promote or sell a product, service, or idea

Advocate: Someone who speaks or takes action on behalf of another.

After-hours emergency practice: This type of facility provides emergency services when regular primary-care (first-opinion) practices are presumed to be closed

After-tax contributions: Contribution to a retirement plan made from employee earnings that have been included in the employee's taxable income for that year. When funds are finally withdrawn from the plan, the contribution itself is not taxed because this has already occurred.

Age Discrimination in Employment Act (ADEA): Federal law that protects employees over 40 years of age from discrimination in employment practices based on the employee's age.

Agenda: List of meeting topics to be covered for a specific meeting.

Aging accounts payable (liability computation): Accounts payable reported in layers, subtotaled by the duration of time the payable has been due to the vendor.

Aging accounts receivable (asset computation): Accounts receivable reported in layers, subtotaled by the duration of time the receivable has been outstanding and owing from the client. (Less than 30 days, 30–60 days, 60–90 days, >90 days.)

Agister lien: A lien on the animals under an agister's care, to secure payment of the agister's fee. An agister is one who takes and pastures grazing animals for a fee, a type of bailee for hire.

Air change/hour: The number of times the entire air volume of a room is completely removed and replaced within one hour.

ALARA: As-low-as-reasonably-achievable. Making every reasonable effort to maintain exposures to ionizing radiation as far below the dose limits as practical.

Alarm: A loud verbal or electronic sound possibly combined with a visual stimulant (strobe type light) that is used to alert people of an emergency situation of which they may not be aware. In small facilities, the alarm may just be yelling, "Fire, fire, fire!"

Allowance: Dollar amount assigned to a specific scope of work within a construction project to be used when the final requirements are not determined prior to bidding. For example, if the owner chooses to select carpet during construction, an allowance may be carried in a bid to cover the cost of materials. If the owner chooses carpet that is less expensive than the amount carried in an allowance, a credit will be due to the owner for the difference in cost.

Alternate: In construction, an option built into a design that may affect the cost of construction. Alternates may be included in a project as either an "add" alternate or a "deduct" alternate. When alternates can be identified early, the contractor can price them as options for the owner to choose from when the project finally bids. If the bids are below the budget, the owner may elect to add in some of the options or alternates that were previously thought to be unaffordable. Likewise, if the bid cost is higher than expected, deducting some of the alternates may allow the project to be brought into budget without going back to the drawing board.

Alternative minimum tax: Special tax system calculated on tax returns of itemized US filers. Typically applicable to taxpayers with significant deductions or preferences, passive losses, or capital gains.

Ambulatory practice: Generally used to refer to work with large animals and involves operating out of a vehicle, with or without additional equipment such as a portable ultrasound, x-ray unit, or dental equipment.

Ambulatory services: Services provided by a veterinarian at an owner's farm, away from the clinic.

American Association of Critical-Care Nurses: A 501(c)(3) nonprofit association; a community of acute and critical-care nurses offering unwavering professional and personal support in pursuit of the best possible patient care.

American Institute of Architects (AIA): A professional organization for architects. The AIA publishes industry standard contracts and other forms that are used for construction projects.

Americans with Disabilities Act: Federal law that prohibits discrimination in employment practices based on an employee's disability. The law also requires accommodations for disabilities in certain instances.

Amortization: A periodic expense attributed to the decline in usefulness of an intangible asset over its estimated useful life.

Amortization schedule: Uses the terms of a loan to provide due dates of payments, and the payment amount detailed by the principal and interest expense portions.

Analytics: The discovery and communication of meaningful patterns in data. Especially valuable in areas rich with recorded information, analytics relies on the simultaneous application of statistics, computer programming, and operations research to quantify performance.

Android: A Linux-based operating system designed primarily for touchscreen mobile devices such as smartphones and tablet computers. Google currently develops it in conjunction with the Open Handset Alliance.

Anesthesia: The rendering of a patient insensitive to pain, typically by means of gas inhalation or the administration of injectable drugs

Animal: Varies by jurisdiction. Common omissions include noncaptive wildlife, invertebrates, insects, fish, amphibians, or reptiles.

Animal drug: Any article intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease in animals other than humans.

Animal hospice: A philosophy or program of care that addresses the physical, emotional, and social needs of animals in the advanced stages of a progressive, life-limiting illness or disability. Animal hospices also typically address the emotional, social, and spiritual needs of the human caregivers in preparation for the death of the animal and the grief experience.

Animal Medicinal Drug Use Clarification Act of 1994 (AMDUCA): AMDUCA allows veterinarians acting within a valid veterinary–client–patient relationship to prescribe and dispense medications in an extralabel manner to food-producing animals subject to detailed regulations establishing the need for extralabel use and establishing withdrawal times.

Antivirus software: Used to prevent, detect, and remove malware (of all descriptions), such as computer viruses, adware, backdoors, malicious browser helper objects, dialers, fraudtools, hijackers, keyloggers, malicious layered service providers, rootkits, spyware, Trojan horses, and worms.

Anxiety: The anticipation of future danger that may be unknown, imagined, or real. It can result in physiologic responses similar to those associated with fear.

Anybody: Generic term used by many practices to identify a client that scheduled an appointment but did not request a specific doctor. Therefore, "anybody" can see this client.

Apathy: Lack of interest, lack of feeling; not caring.

Archetype: A recurrent symbol or motif in literature, art, or mythology.

Architect: In order to be called an architect, an individual must be registered by a specific state to practice architecture. Each state issues licenses separately. However, the examination and qualifications are roughly equivalent.

Archive: A collection of historical records, or the physical place they are located. Archives contain primary source documents that have accumulated over the course of an organization's lifetime.

Asset approach: A business valuation approach generally selected when 100% of the business will be sold. The practice is valued "cash free" and "debt free," meaning that the seller retains all the cash in the business and pays all liabilities, including equipment leases.

Asset sale: Sale whereby some part of the sale price is allocated to items which can be expensed, depreciated, or amortized by a buyer.

Assets: Things of value, such as cash, equipment, inventory, or buildings.

Associate veterinarians: Those veterinarians who work for the practice, but do not have any ownership in the business.

Attorney: A lawyer who is licensed to practice law in a given jurisdiction. Some lawyers study the law but do not take and/or pass the bar exam to be licensed to provide legal services. Unlicensed attorneys should not be used for providing legal documentation.

At-will employment: At-will employment means that the employee is serving the employer at the will of both parties. This allows an employer to terminate its employees with or without cause, without incurring liability for the resulting terminations. Likewise, the employee can terminate without cause or any fixed duration of time to stay on the job.

Audiences/stakeholders: The individuals that have the potential to be impacted by business situations and that represent the front line of accountability for a business.

Audit: Methodical examination and review of practice records to assess accuracy and completeness. A large practice may have one or more staff members whose sole responsibility is to perform audits.

Authenticity: Being genuine, truthful, honest.

Automated clearing house: The national automated payment clearing system in the United States.

Autonomic shifts: Physiological manifestations that reflect individual response, emotion, and reaction (e.g., flushing, blanching, tearing, sweating, piloerection, changes in breathing and pupil size, swallowing, and dry mouth).

Autoresponder: Automatic response (set up through e-mail system) that provides a prewritten message to anyone who sends an e-mail message to a particular e-mail address or uses an online feedback form.

Average transaction charge: Total revenue over a period of time divided by the total number of transactions during that same period; this represents the average amount spent by clients each time they visit the practice.

Baby Boom generation: Commonly called "Boomers," this generation of people was born after the end of World War II, between the years 1946 and 1964.

Backup: In information technology, a backup, or the process of backing up, refers to the copying and archiving of computer data so it may be used to restore the original after a data loss event.

Bad news: Any news that is likely to be perceived by the client as distressful, unwanted, or unexpected.

Bailee: A person or party to whom goods or property are delivered for a purpose, such as custody or repair, without transfer of ownership.

Balance sheet: A report on financial conditions that lists a practice's assets, liabilities, and owner's equity at a specific point in time.

Balloon payment: Large lump-sum payment scheduled at the end of a series of considerably smaller periodic payments.

Bandwidth: The average rate of successful data transfer through a communication path.

Base rent: The rent charged by a landlord without any additional expenses, often expressed on a dollars per square-foot, per year basis.

Basic accounting equation: Assets = Liabilities + Equity. The balance sheet reflects this underlying principle, but if yours does not, the data you see are not reliable.

Beacons: The technology enables smartphones, tablets and other devices to perform actions (such as receive push notifications, open web pages and social media activities) when in close proximity to a beacon. The technology uses Bluetooth low energy, also known as near-field communication, and is reliant on the client having turned on the functionality.

Bedside manner: Perception of how well a physician relates to a client or patient.

Behavioral interviewing: A job interviewing technique in which the applicant is asked to describe past behavior and experiences to help determine appropriateness for the current position.

Benchmarking: Process by which a practice compares itself with others (especially those known for outstanding performance) in an attempt to improve performance.

Benchmarks: Numbers, percentages, dollars, or some type of measurable quantity for a given period of time that are industry standards.

Beneficiary: The individual who benefits from a trust agreement.

Benefit schedule: Summary of covered services, benefit limitations, and applicable co-payments provided in an insurance policy.

Benefit stream: Any level of revenue (income), cash flow or earnings (profit) generated by a business entity.

Benefits: Generally indirect and noncash compensation paid to an employee. Examples include health insurance, paid time off, and retirement plan contributions. For products and services, benefits typically refer to how the features can improve a situation for the client. Benefits answer the question "So what?"

Bias: Prejudice in favor of or against one thing, person, or group compared with another, usually in a way considered to be unfair.

Bid: Formal proposal from a contractor to build a defined scope of work, for a fixed price, in a fixed schedule.

Binding contract: Document binding on all shareholders or owners of a given business, even though it may seem there is not separate consideration for this document. The consideration for signing this agreement is the mutual benefit that all parties get when they become the one party that wants to exit ownership.

Bioavailability: The degree to which a nutrient is actually available to be absorbed into the body and is utilized.

Biophilic design: Design inspired by humans' inherent need to connect with the natural world.

Biosecurity: Procedures used to reduce the risk of the introduction or internal spread of infectious organisms in a facility or operation. Cleaning, disinfection, quarantine, limiting access by unauthorized personnel, and limiting the introduction of potentially contaminated materials are essential practices.

Bioterrorism: A premeditated attack on people, animals, or plants using infectious biological agents as a weapon.

Biweekly payroll: In this case, the pay period covers two weeks, which represents 26 pay periods per year.

Blockchain: A digital ledger in which transactions for cryptocurrencies are recorded publicly and chronologically; a database that is shared across a network of computers.

Blog: A discussion or informational site published on the World Wide Web and consisting of discrete entries (posts) typically displayed in reverse chronological order (the most recent posts appearing first).

Bloodborne pathogens: Generally refers to disease-causing organisms present in blood, but could refer to any organism capable of infecting a human from blood or body fluid contact.

Bluetooth®: A low-power wireless technology that allows devices to communicate.

Board of directors: The collective ownership or overseers of the practice.

Body condition score: System of assigning a number to indicate a pet's degree of adiposity based on visual and tactile cues.

Bonding philosophy: There are two primary bonding philosophies in multidoctor practices. The first is to bind clients to the practice. An alternative philosophy is to schedule clients with the same doctor always. This approach bonds the client to a specific doctor, and the

relationship that develops over time can result in improved patient care.

Bonding rate: Practices that encourage clients to bond with a specific doctor typically calculate that doctor's bonding rate. Most tenured doctors strive for a 70% bonding rate, and exceptional doctors can have bonding rates approaching 100%.

Book value: Dollar amount at which assets and liabilities are recorded in financial statements; this amount generally is not reflective of the fair market value of a business or its assets; net book value is the difference between assets and liabilities as recorded in the financial statements.

Bottom line: Typically a synonym for profit, referring to the bottom line in financial statements that indicates net profit or loss. In calculations, Bottom line = Revenues − Cost of Goods Sold − Operating Expenses − Professional Salaries − Taxes.

Brand: A brand is made up of the name, symbol, design, messages, and ethos that together form the identity of your practice, differentiating it from your competitors. A brand allows those familiar with it to distinguish it among competitors.

Brand champion: Someone who advocates for and embodies your brand; enthusiastically promotes your practice with passion.

Brand identity: Unique set of associations that the brand strategist aspires to create or maintain.

Brand promise: The spoken or unspoken expression of the continuing, important, and specific benefits clients connect with a firm, service, or product.

Branding: The practice of creating a consistent image of your brand.

Breakeven point: The level of sales that will just cover all costs, both fixed and variable. It can be expressed in dollars or units sold (or, in a veterinary practice, the number of patients seen).

Bridging: A communication technique in which the discussion is redirected from its current path to a more appropriate one. Learning just a few bridging techniques is all you need to masterfully control and redirect a conversation toward a more positive outcome.

Bridging documents: Drawings and other documents that are more developed than schematic drawings, yet still not completely engineered permit and construction drawings. Bridging documents may be prepared by a veterinary-specific architect in order to convey the important aspects of veterinary design to a builder or another architect not familiar with veterinary hospital design requirements.

Broadband: An Internet connection with a much larger capacity than dial-up (e.g., cable, digital subscriber line, or fiber optics).

Brochure: A pamphlet or handout bound or folded in booklet form.

Budget: Quantitative expression of a financial plan of action for the practice.

Building cost: When building cost is quoted, it is important to understand what exactly is included. Typically, building cost does not include any soft costs, land costs, site work, or furnishings and equipment.

Build-out: The interior construction necessary before a tenant is able to use the space. Some landlords are willing to provide an upfront, lump-sum cash allowance to provide for a portion of the build-out expenses, effectively incorporating the financing for build-out into the term of the lease.

Built-in market: Because of this agreement, the family of a decedent is able to sell the share of the decedent, even if the shares are a minority interest, without having to go to the public to find an interested minority buyer.

Burden of proof: Level of proof that must be provided by the plaintiff in order to prevail in a legal action. In negligence actions, the plaintiff must usually prove that the probability of negligence and harm is "more likely than not." The legal term often applied to this burden of proof is "by a preponderance of the evidence," a much lower burden than the "beyond a reasonable doubt" required in criminal cases.

Burnout: A result of frustration, powerlessness, and inability to achieve work goals; the stress that evolves specifically from the interaction of the veterinary professional and the work environment.

Business affiliation escape: Provisions of a buy/sell agreement between associated business owners allowing for one or more shareholders to leave ownership for various reasons, including death.

Business Assessment Report Kard (BARK)™: Strategic planning process designed to evaluate veterinary practices.

Business contingency (continuity) planning: Process of developing, communicating, practicing, and evaluating a comprehensive emergency plan to keep a business operating in the face of adverse conditions and to recover quickly from a disaster.

Business life cycle: The business life cycle has four major phases that describe a business from the time it is formed until the time it is closed. These four phases are start-up, growth, plateau, and decline.

Business ownership: Act of a person having an equity or capitalized interest in the goodwill and tangible assets of a business. It does not include associate employees.

Business plan: Written document that details a proposed or existing venture. It seeks to define the objective, vision, current status, expected needs, strategies, defined markets, and projected results of the business.

Buy/sell agreements: Agreements between shareholders or limited liability company members, or agreements in partnership documents that explain and provide for the methodology of allowing owners to exit, how the practice will be priced, and how payments will be made upon that exit. They should provide for rights and methods of surviving shareholders to purchase an exiting shareholder's stock.

Buyer journey: A framework that acknowledges a buyer's progression through a research and decision process ultimately culminating in a purchase.

Buy-in: In management and decision-making, buy-in signifies the commitment of interested or affected parties to a decision to "buy in" to the action specified (i.e., to agree to give it support), often by having been involved in the process.

Byline: The line in a publication that denotes the author.

Calculation of value: A calculation of value occurs when the client and the valuator agree to specific valuation approaches, methods, and the extent of selected procedures and results in a calculated value. Calculation engagements require the client to have detailed knowledge regarding valuation methodology.

Call to action (CTA): A CTA is a request within a communication for the recipient to initiate a desired behavior (e.g., phone, email, visit the practice) to make a purchase or book an appointment.

Capital: Rights (equity) of the owners in a business enterprise.

Capital asset: A cost that has utility over more than one accounting period, such as a computer printer.

Capital budgeting: Involves the analysis of all the financial plans associated with the acquisition of all capital assets for a business.

Capital expenditures budget: Budget planning for future acquisition of facilities and equipment.

Capital gains: The difference between an asset's purchase price and selling price, when the selling price is greater.

Capital investment analysis: Management process for evaluating, planning, and controlling long-term investments in property, facility, and equipment.

Capital lease: Lease that includes contract provisions that result in treating the leased asset as a purchased asset in the accounts. A capital lease agreement may provide for a bargain purchase option at the end of the lease period, which would allow the lessee to purchase the property at a very low price.

Capital reinvestment: Periodic capital outlay required to maintain operations at existing levels; also referred to as sustaining capital reinvestment.

Capitalization rate: The rate of return needed to attract capital to the practice. This is essentially the rate of return a buyer would expect for investing in the practice. The rate is a reflection of the risks associated with the business, with emphasis on the practice's ability to maintain its net income.

Carbon footprint: A measure of the global warming potential of a given project, system, or activity using carbon dioxide equivalents.

Carcinogen: Substance or agent that is known to cause cancer.

Care pathway: Also known as clinical pathways and care maps, care pathways are evidence-based practices for specific groups of patients with a predictable clinical course in which professional intervention can be defined, optimized, and sequenced and in which the outcomes can be measured, contributing further to evidence-based evaluation.

Career pathing: Scheduled progression of responsibilities that helps an employee achieve a higher position. For example, a technician could become a shift manager, then a technician manager, and then a practice manager.

Career planning: The continuous process by which an individual assesses the current state of their career, sets specific objectives for advancement and/or growth, and takes action designed to meet those objectives.

Cash basis: Accounting recognizes revenues and expenses as cash received or disbursed, regardless of the earnings process or the matching concept.

Cash basis accounting: System that recognizes income only when cash is collected from a sale, and recognizes expenses when cash is actually paid for goods and services received, effectively resembling actual cash flow.

Cash flow: The amount of money available to the owners of a business to use for purposes such as debt repayment, equipment replacement, or to withdraw for personal use.

Cash flow statement: Report reflecting the sources of cash (like profit, increased debt, and collections on client accounts) and the uses of cash (like reducing debt or buying more drug and supply inventory) during a period of time. The current format groups these items by operating, investing, and financing activities.

Cash payback: The amount of time necessary between the capital expenditure and the complete recovery in cash (net after expenses) of the amount invested.

Cash payback period: Estimated period of time that will elapse between the date of a capital expenditure and the complete recovery of the amount invested.

Catchment area: Area from which a business draws its clientele. Also known as trade area.

Category I drugs: These drugs do not require a withdrawal period when used in a food-producing species.

Category II drugs: These drugs require a withdrawal period when used in food-producing animals and are regulated on a "no-residue" basis.

Central hospital: Multiple specialty practices coming together to form a central hospital similar to a human hospital model. There are several of these either ready to open or close to opening. The big plus with this concept is the economy of scale while maintaining independence and autonomy of each practice or practitioner participating in the hospital.

Certified Public Accountant: College-trained accounting professional who has attained certification in the state that he or she practices in by passing a comprehensive two- to three-day exam, maintaining continuous professional education, obtaining relevant years of experience, and subscribing to a heightened level of ethics in a challenging business context.

Certified Veterinary Practice Manager: A designation available since 1989 through the Veterinary Hospital Managers Association (vhma.org) to recognize the professional development of veterinary managers.

Change: To make or become different.

Change agent: An individual that serves as a catalyst for change within the organization.

Change management: Managing the people side of change to achieve a desired business outcome of change.

Change order: Contractual change to either the time allowed by the contract for construction or a change to the cost to be paid.

Charge-coupled device: Similar in function to a digital camera, light is detected and focused with lenses onto a computer chip, which generates the digital image.

Charitable corporation: A corporation that has been organized under state law as a nonprofit corporation and that meets the criteria under Internal Revenue Code Section 501(c)(3) to have its income exempted from federal income taxes and its donations tax deductible for the donors.

Chart of Accounts: An organized listing of all the income, expense, asset, liability, and equity categories used to record a practice entity's transactions that are monetarily measured.

Chartered Accountant: Canadian/UK certification for accountants, similar to the Certified Public Account designation in the United States.

Chattel lien: A statutory lien that secures payment for labor or materials supplied in improving, repairing, or maintaining personal property, such as an automobile.

Check 21 Act: The Check 21 Act, signed into law during 2003 and effective October 28, 2004, was created by Congress and supported by the Federal Reserve Bank to further automate the American check-processing system. Checks impacted by Check 21 include consumer checks, business checks, cashier checks, teller checks, Treasury checks, and travelers' checks. Check 21 does not apply to direct deposits, automated teller machine, or point-of-sale transactions, or to noncash items such as passbooks or certificates of deposit.

Check authorization companies: Companies providing approval for checks. Approved checks returned for "insufficient funds" will be paid.

Checklist: A list of things to be accomplished and/or verified.

Chemotherapy: The introduction of drugs into the body primarily used to treat cancers. Chemotherapy drugs are carcinogenic in long-term exposures outside of therapeutic treatments. Chemotherapy drugs are often referred to as cytotoxic drugs because they are toxic at the cellular level.

Click-through rate: Number of clicks a website has received, particularly in reference to advertising.

Client: An individual or group who engages in a professional working relationship with a veterinarian or veterinary practice for the delivery of veterinary services. Veterinary referral practices have two clients: the pet owner and the referring veterinarian. The referring veterinarian is considered to be the primary client.

Client communications: Information shared between the client, the client's agents, and the veterinarian and veterinarian's agents in pursuit of a diagnosis, treatment, or prognosis. This information may be protected under state evidentiary privilege laws from disclosure during a legal proceeding.

Client lifetime value: Often referred to as CLV or LTV, client lifetime value is a prediction of the net profit attributed to the entire future relationship with a customer.

Client or market niche: A subset of a client or market segment that possesses like characteristics. An example of a client or market niche is pet owners who go camping with their dogs.

Client persona: A semi-fictional representation of your ideal client based on market research and real data about your existing clients.

Client profiling: Understanding a practice's existing client (and patient) base by grouping together pet owners based on a variety of like traits and attributes. These resulting client "segments" are then assumed to have similar needs and wants based on these attributes.

Client segmentation: Using client profile data to categorize existing clients (and patients) into groups with similar characteristics.

Client service: Refers to meeting the needs of individuals with whom you hope to maintain a long-standing relationship.

Client-centered communication: An interaction with a focus on the client's needs, concerns, ideas, expectations, and preferences for the purpose of achieving a shared understanding between veterinarian and client.

Clinical sink: A wall- or floor-mounted flushing fixture that is used to dispose of large quantities of feces.

Closed-ended inquiry: Questions that have a restricted range of answers, such as yes or no.

Cloud: A communications network that often refers to the Internet, and more precisely to a datacenter full of services that is connected to the Internet.

Cloud computing: The use of computing resources (hardware and software) that are delivered as a service over a network (typically the Internet).

Cloud-based backup: Also known as online backup, this is a strategy for backing up data that involves sending a copy of the data over a network to offsite servers. The server is usually hosted by a third-party service provider. Fees are assessed per data storage usage.

Cloud-based software: Software available online, usually through a paid subscription.

Cloud-based storage: The ability to access files through the Internet, as opposed to local storage.

Coaching: An ongoing approach to managing people by creating a motivating environment. It improves employee performance and increases their success by providing timely feedback, recognition, clarity and support.

Code of conduct: A set of rules defining acceptable behavior within the hospital, some of which might apply to clients as well as staff.

Cognitive limitations: Veterinary medical mistakes that result from distraction or absent-mindedness. For example, failing to count sterile gauze squares prior to closure of a laparotomy is a cognitive limitation.

Coinsurance: Payments for medical services shared by insurance companies and individuals, usually expressed in percentages, such as 80% paid by the insurance company and 20% paid by the individual.

Collateral: Assets of value pledged to the lender, giving the lender a preferred interest in the assets in the event the borrower defaults on the loan.

Combination Veterinary Feed Directive (VFD) drug: An approved animal drug that is intended for use in or on animal feed in combination with at least another animal drug under the professional supervision of a licensed veterinarian. Animal feed containing a combination VFD drug must be authorized by a lawful VFD order.

Commissioning agent: A professional who is hired, usually as a third party, to verify that the building mechanical, electrical, and energy systems are operating correctly.

Commodity: An item that is considered interchangeable, and whose price is a reflection of supply and demand. For example, one 500 mg capsule of cephalexin is much like any other to a client, regardless of brand name and whether they get it at a veterinary hospital, at their local drug store, or through an online pharmacy.

Common cost: A cost incurred to support a variety of practice activities and objectives, but which cannot be traced to them individually. For example, the salary cost of a veterinarian or technician is a common cost to all of the clients seen and patients treated, but in most cases cannot be purely attributed and allocated to specific patients.

Common law: A product of judicial evolution, a sort of gap-filling or gloss established over generations by judges; compare with "statutory or code law," which is set forth by legislative ordinance.

Communication channels: The vehicles by which the above audiences/stakeholders can be reached.

Community pricing: Establishing a price for a good or service based on the prices charged by others.

Community relations: Continuing, planned, and active participation with and within a community to maintain and enhance its environment to the benefit of both an organization and the community.

Companioning: The act of helping someone through the process of grief, without having the education or designation of counselor or therapist.

Compassion fatigue (CF): Also known as secondary traumatic stress disorder, this is the gradual loss of compassion by people who work with individuals that are ill, suffering, or victims of trauma. This includes veterinary staff working with worried clients with sick or injured animals. Signs include indifference, disengagement, withdrawal from patients and coworkers, and even physical signs relating to chronic stress. "The cost of caring" – Charles Figley. The impact of providing a high level of compassion on a daily basis, causing emotional and physical symptoms. The result of two things being present: a caregiving relationship and an empathetic capability.

Compassion-fatigue-induced burnout: Burnout as a result of unidentified, and unmanaged compassion fatigue.

Compassion satisfaction: Deriving pleasure from being a caregiver, and feeling good about the ability to help and make a positive contribution.

Compelling: Motivating to the point that the target is likely to act – or is compelled to do something.

Compensation: Total monetary pay given to employees for their work during a given period. The term is sometimes used to represent both the monetary and nonmonetary amounts paid to employees.

Compensatory time: Time off given to the employee to compensate for extra time worked in a single workweek.

Competition: The process of two or more businesses vying for the same group or a fixed pool of customers.

Complementary therapies: Those therapies used to augment conventional medical and surgical remedies versus alternative therapies, which are those therapies used instead of conventional medical and surgical remedies.

Compliance: The extent to which pets receive a treatment, screening, or procedure in accordance with accepted veterinary healthcare practices. Compliance involves veterinary staff performing and/or recommending treatments, screenings, and procedures, and pet owner follow-through.

Compliance reminders: A reminder for a pet owner to apply a treatment (usually for prevention of parasites) when due rather than to simply repurchase it.

Compounding: Customized manipulation of an approved drug(s) by a veterinarian or pharmacist to meet the needs of a particular patient.

Compromise fatigue: An extreme sense of stress associated with repeated requests to make compromises on the basis of the medical or financial management of patient care.

Computed radiography: Similar in function to traditional film screen radiography, the image is captured on photostimulable storage phosphor and read by a separate machine to produce the digital image.

Computer networking: Provides basic connectivity between invoicing/billing systems, patient records, building security, building controls systems, and digital diagnostics equipment.

Conclusion of value: A conclusion of value requires that valuators use their professional judgment to determine the most appropriate approaches and methods to determine business value. Conclusions of value rely on the valuator's professional judgment, rather than requiring that the client also be well informed regarding valuation theory.

Conditional use: A zoning term meaning some level of city, administrative, and/or public review, input, and approval with "conditions" is required before submitting construction drawings.

Confidentiality: The duty of keeping secret or private information pertaining to a patient's health that was obtained during the formation of a diagnosis, treatment, or prognosis of the animal.

Considerate approach: Encompasses the interactions between the veterinary team, the patient, and inputs from the environment while veterinary care is being administered.

Consideration: In contract law, consideration is generally expressed in terms of a benefit to the promisor or a detriment to the promisee. In our most common scenario, a written employment contract, or at least a letter of intent similar to an employment contract, is where the employer provides the promise of consideration or monetary payment to the employee for the work performed. Then there is adequate consideration for enforcement of other terms of the contract.

Consolidation: The mergers or acquisitions of smaller companies into a single, larger company. Entities operating multiple practices within or across regions are often referred to as "consolidators."

Content: Broad category of substance conveyed through customer interactions. Content can be information, or it can be the customer's experience. In all cases, to be effective, content should be compelling and deliver customer value.

Contingency: An amount of money, often a percentage of the total construction cost, which is set aside for unknown and/or unexpected costs. By carrying a construction contingency, an owner will have a special fund to accommodate unforeseen conditions (especially on remodels), design omissions, or other changes required during construction. It is also a good idea to carry a design contingency during the design phase estimate to cover items that have not yet been anticipated but will eventually be included in the final project.

Continuing education: Also known as continuing professional development, the ongoing training of doctors and other team members through conferences, journals and texts, online programs, other live educational programs, and self-study courses.

Continuous quality improvement (CQI): CQI is an ongoing process of seeking small improvements in processes that have an overall effect of improving efficiency and productivity while reducing waste within an organization.

Contract administration: Also referred to as construction administration, this is the work performed by the architect during the construction phase of the project. During this time, the architect assists the owner to be sure the project is being built according to the plans and the owner's requirements. The architect also answers contractor questions and helps resolve any differences between the owner and contractor that may arise.

Contract documents: The final drawings and detailed specifications that will be used to construct the building. Technically, these documents also include other items, such as the agreement between the owner and the contractor and the general conditions of the contract, which define many of the responsibilities of the parties to the contract. The key point to remember is that the drawings and specifications form a part of the contract between the owner and the contractor.

Control: The power to direct the management and policies of a business.

Control adjustments: Modifications in the anticipated earnings of a business due to changes made by the majority owner(s).

Control risk: There are some risks you cannot prevent, such as storms, natural disasters, power failures, or accidents. There are processes, however, to minimize either the likelihood such an event will occur or the impact it will have on your business after it occurs.

Controlled premises (including veterinary practice facilities): Places where original or other records or documents required under the Controlled Substances Act are kept or required to be kept. Places, including factories, warehouse, or other establishments and conveyances, where persons registered under the act or exempted from registration under the act, or regulated persons may lawfully hold, manufacture, or distribute, dispense, administer, or otherwise dispose of controlled substances or listed chemicals or where records relating to those activities are maintained.

Controlled Substances Act: The Controlled Substances Act (84 Stat. 1242; 21 U.S.C. 801) and/or the Controlled Substances Import and Export Act (84 Stat. 1285; 21 U.S.C. 951).

Cookies: A cookie is a small amount of data generated by a website and saved by your web browser. Its purpose is to remember information or preferences about the user.

Co-pay: Specified dollar amount of covered services that is the insurance policyholder's responsibility.

Copayment: Insured individual's portion of the cost for a particular service; for example, $10 for an office visit.

Core values: Belief system of the practice – the cultural values that give team members the tools to make decisions for the practice.

Corporate buyers (or consolidators): Small or large groups of investors that seek to purchase and hold or resell after they have consolidated the purchased small animal practices into equity-group-demanded size of revenue streams (usually 10 to 100 practices).

Corporate bylaws: The written terms of agreement of the shareholders of a corporation that explains voting rights and management rights, which may also include some reference to successor ownership and procedural determinations for executive officers. The bylaws do not include all the terms needed in a buy/sell agreement.

Corporate practice: A veterinary hospital owned and managed by a group of investors, rather than by private veterinarians.

Cortisol: A steroid hormone produced by the adrenal gland in animals and people in response to stress. Cortisol can be measured in the blood, so it is an indicator of stress responses in scientific studies.

Cosignatory: Individual who is not the borrower but who has equal and immediate liability to pay the loan in accord with its terms in the event the primary borrower does not. Generally required of a borrower who has inadequate financial strength to qualify for a loan. The lender evaluates the cosigner's credit rating, financial statements, and income in combination with those of the primary borrower to document a stronger debt-to-income ratio that enables loan qualification. Somewhat more risky than functioning as a guarantor.

Cost: An exchange price at an acquisition date to obtain a present or future benefit.

Cost driver: Quantifiable measure used to assign costs to activities; reflects the consumption of costs by activities. Examples: labor, supplies, equipment, and associated depreciation.

Cost object: Any activity for which a separate measurement of costs is desired. Examples: services, service lines, products, product lines, processes, and responsibility centers (surgery, pharmacy).

Cost of goods sold: Variable expenses associated with revenue.

Cost of professional services: Direct costs of patient care and product retailing, including drug and pharmacy costs, professional and hospital supplies costs, laboratory supplies and reference laboratory fees, radiology and imaging supply costs, surgery and anesthesia supply costs, dietary product costs, mortuary costs.

Counseling: Providing advice to the management of an organization concerning policies, relationships, and communications; in effect, "what to do."

Covered entities: The entities covered under the Americans with Disabilities Act of 1990 include employers, unions, and joint labor–management committees.

Credentialed veterinary technician/nurse: A team member that has graduated from an American Veterinary Medical Association-accredited school, passed the Veterinary Technician National Exam (VTNE), and has achieved registration (RVT), certification (CVT), or licensure (LVT) by the state in which he or she practices.

Credibility: The extent to which a clinician is perceived as believable, expert, genuine, and trustworthy.

Credit policy: Written guidelines to assist in deciding to extend credit to a customer. Formulating a standard credit policy helps to avoid extending credit to pet owners who are unable to pay their accounts. A good credit policy should help you retain good relationships without jeopardizing cash flow. The credit policy for most small practices is informal and relies on a practice owner's instinct.

Credit report: Listing of all outstanding debt you have and your history of paying on that debt.

Credit terms: Time limits set for your customers' promises to pay for the merchandise or services purchased from your practice. Credit terms affect the timing of your cash collections.

Criminal negligence: Unlike intent, knowledge, or recklessness, criminal neglect does not involve a state of awareness. A person acts negligently when he or she inadvertently creates a substantial and unjustifiable risk of which he or she ought to be aware. His or her fault is inattentiveness.

Crisis: A situation, often unexpected, that has the potential to cause physical or reputational damage or harm to a facility, its personnel, and constituents.

Crisis management: A proactive approach to anticipating crisis situations and taking responsibility for how the situation is handled.

Crisis plan: A written document that anticipates possible crisis situations and details how such situations will be managed from operational and communication perspectives.

Critical path: The succession of connected tasks that will take the longest to complete. The critical path is the longest path to complete the project. Therefore, to complete the project on schedule it is the critical path and the tasks that are part of it that must be managed most closely.

Critical-care facility: A facility that is open 24 hours a day, seven days a week, and is able to handle emergencies and the critical care needs of patients similar to the urgent care facilities available to people.

Criticism: Negative feedback that is generally destructive in nature. Often focuses on the person rather than the behavior or the task. Delivered in this way, many recipients feel attacked, reject the feedback, and hence no behavioral change ensues.

Cross-purchase agreement: Another name for a buy/sell agreement where other shareholders individually buy out an exiting shareholder of the business.

Cubic feet per minute (cfm)/cubic meters per minute (m^3/min): The volume of air supplied or exhausted by the heating, ventilation, and air conditioning system within one minute.

Culture: The set of shared attitudes, morals, values, and goals that characterizes an organization.

Current asset: Cash or another asset that may reasonably be expected to be realized in cash, sold, or consumed within a year or less, through normal practice operations.

Current liability: Amounts owed to outside parties that are due and must be paid within the next 12 months.

Current ratio: Key financial performance indicator. Indicates how much you have in assets, cash, or items of value versus how much you owe on those assets, credit card debt, one year's principal payments, and so on.

Curriculum vitae: An ongoing account of an individual's education, qualifications, and experience

Customer: Someone who pays for goods or services.

Customer acquisition cost: This is the total cost of acquiring a client.

Customer insights: A window into how consumers think and the motivation behind their needs and wants are in a given product or service category. Used to predict future customer behaviors.

Customer relationship management: A strategy for managing all a practice's relationships and interactions with customers and potential customers. It helps to improve a practices profitability.

Customer relationship management (CRM) platforms: CRM is used by veterinary practices to manage and analyze client interactions and data throughout the pet life cycle to improve relationships with clients, deliver personalized healthcare, assist in client retention, and drive sales growth. CRM systems are designed to compile information on clients across different channels (points of contact between the client and the veterinary practice), which could include the practice management system, practice website, LiveChat, direct mail, marketing materials, and social media.

Customer service: Refers to assistance to individuals who are purchasing a product. Typically, the interaction involves one transaction.

Customer value: How well a service provider or product manufacturer does at satisfying customers' needs at any point in a transaction. A customer can assign value beginning with pre-purchase information to post-purchase service and follow-up.

Customization/flexibility: Regarding software, these terms describe the ability of software to adapt from general usage to the needs of your specific practice. There are two major types of customization. The first type includes those features that your staff members can modify with little or no assistance from the vendor. The second type requires the vendor to modify the features for you. This latter practice frequently results in extra costs and could negatively impact operations if valuable time is wasted waiting for the vendor. It is wise to avoid a purchase that relies on future changes to meet the practice's current needs.

Cybersecurity: The protection against the unauthorized or unlawful use of electronic data.

Cycle counting: An inventory management tool in which select products are counted on a periodic basis to detect inventory errors and for continuous quality improvement, so process problems can be detected before official inventory counts or audits.

Data architecture: Models, policies, rules, or standards that govern which data are collected, and how it is stored, arranged, integrated, and put to use in data systems and in organizations.

Days in accounts receivable (asset measurement): Divide 365 days by the accounts receivable (A/R) turnover ratio for the entire year's sales. In general, a measure of less than 40 days in A/R is considered a good measure of likely collection and would equate to an annual A/R turnover of approximately 9. The shorter the average days in A/R, the more likely collection of outstanding accounts. Conversely, the better payment and collection policies, the shorter the average days in A/R.

De minimis: A Latin term meaning minor, or lacking significance.

Debt service coverage ratio: A capital structure ratio that measures the ability to pay both the principle and interest with available net cash flow.

Debt to equity: Another key financial indicator. Reflects how much you owe in total as a ratio to how much you own free and clear of any debt.

Debt-to-income ratio: A measurement of financial stability. A debt-to-income ratio of zero indicates that debt matches income and there are no net gains or losses. Higher debt-to-income ratios indicate that debt exceeds income.

Decedent: A person who has died.

Decibel (dB): A measure of the intensity of sound, based on the human ear.

Decisional conflict: An experience whereby a client has ambivalent thoughts and feelings, which tend to both accept and reject a given course of action.

Decisional support: Skills and behaviors of the veterinarian to assist clients who are in decisional conflict.

Deductible: Amount an individual must pay for health services before the individual's insurance company starts to pay.

Defalcation: Misappropriation of money or funds by someone entrusted with their care or management.

Defections: Clients who choose to leave the practice during a specific unit of time (e.g., one year).

Deferred payment plan: A written document stating amount owed, dates, and amounts for expected payment installments; consequences of failing to make payments on time; and a signature line for the client to sign.

Deferred sales trusts: An installment sale to an independent trust followed by a sale to an ultimate purchaser

Define: Being able to pinpoint the scope, nature, and boundaries of what is being understood.

Delegating: Entrusting a task or a skill to another person.

Demising walls: Walls that separate a tenant's suite from another tenant's suite, typically in retail shopping centers and commercial buildings with multiple tenants.

Democratization: The process of making something accessible to everyone.

Demographics: Description of objective and quantifiable characteristics of an audience or population such as age, marital status, household income, and pet-spending index.

Dental calculus (tartar): Hardened dental plaque, often caused by the accumulation of minerals from saliva.

Dental plaque: A biofilm consisting of bacteria, mucus, and food particles that adheres to the surface of teeth.

Departmental floor plan: A plan with the hospital functions grouped or clustered into distinct, departmentalized areas.

Depreciation: Monetary amount of estimated annual normal wear and tear on assets or property improvements deducted annually from tax basis of property. Not applicable to land.

Design team: Refers to the architect and the architect's consulting engineers.

Design–bid–build: A conventional or typical project delivery method in which the owner contracts with separate entities for the design and construction of a project. A benefit of this method is that the design team is impartial and looks out for the interest of the owner. It also uses competition to improve the efficiency and quality for owners.

Design–build: This project delivery method uses a single entity known as the design-builder or design–build contractor to retain both design and construction services. This delivery method is used to prioritize costs and timeline and thereby to minimize the risks for the project owner. A downside to this system is that the owner sacrifices control and sometimes project quality.

Diagnostic local blockade: The use of local and regional perineural block and peri/intraarticular techniques to confirm pain's presence by the reduction of pain response once administered.

Differentiation: A manner of creating competitive advantage through offering products or services that stand out from rival businesses through the quality, service level, or cost of the services. Offering a unique combination of services or a uniquely focused set of services are other means of differentiation.

Digital imaging: Any imaging that captures image data in a digital format, for storage, manipulation, viewing, and distribution. All imaging modalities are capable of producing digital images, either inherently or through analog-to-digital converters built into their hardware.

Digital Imaging and Communications in Medicine: Image standard that allows communication between image capture devices, viewing software, storage and print devices.

Digital media: A form of electronic media where data are stored in digital (as opposed to analog) form.

Digital radiography: A term often used to encompass all methods of digital radiograph image capture. When used in this manner, it may include computed radiography, charge-coupled device (CCD) systems, and image capture with digital panel systems. Digital radiography is also used to refer more specifically to the latter of these (CCD and digital panel systems).

Direct expense (cost): An expense (cost) that becomes an integral part of a specific patient's care or client sale that can be physically and conveniently traced to it.

Direct labor hours: Costs associated with providing staffing for a service.

Disability: Any impairment, physical or psychological, that substantially affects a person's activities. Applicable federal or state laws can define the term "disability" differently.

Disaster and emergency: These terms are often used interchangeably when departments, agencies, or private entities are unexpectedly torn from their standard operating procedures or are required to obtain resources outside their normal authority. In some cases, government declarations give official status to an emergency or disaster, which may result in the release of additional resources for response and recovery.

Disaster declaration: An official designation of an event as a disaster by local, tribal, state, or federal authorities. An official declaration may often trigger economic or resource assistance.

DISC: DISC is a behavior assessment tool based on the DISC theory of psychologist William Moulton Marston, the original process focusing on four different behavioral traits: dominance, inducement, submission, and compliance. In more contemporary applications, the letters can also signify basic tendencies such as directing, influencing, steadiness, and compliant, or they can also stand for the following personality types: dominant, inspiring, supportive, and cautious (or conscientious). DiSC® is a branded form of the DISC assessment.

Discipline: Training people to obey rules and codes of behavior, using punishment as a deterrent for misconduct. Also used to define a branch of knowledge.

Discount: Reduction in price for services and/or products. This can be a partial or total reduction of fees.

Discount plans: Not insurance. Instead, this is a service by which pet owners pay a fee to receive discounted services from participating veterinarians.

Discount rate: A rate of return used to convert a future monetary sum into present value.

Dishonorable conduct: This term is referred to by some state practice acts to be the same as unprofessional conduct.

Disintermediation: Giving the user or the consumer direct access to information that otherwise would require a mediator. This is often done through technological innovation.

Disposable income: Income remaining after all taxes and mandatory expenses have been deducted that can be spent or saved at one's prerogative.

Disqualified person(s): Anyone who has contributions in excess of that allowed to the charitable corporation from its inception, or persons who manage or control the charitable corporation.

Diversification: A manner of attempting to gain increased sales through offering new products or services or by selling products or services into new markets.

Doctor's manual: A guide to help ensure that all doctors in a multidoctor practice are following the same basic protocols so as to avoid client confusion that will undermine client trust in the practice.

Doggy daycare: A service for dogs to play together in supervised group settings. This may be a drop-off day service, or it may be offered as an enhancement to overnight boarding.

Domain: An identification string that defines a realm of administrative autonomy, authority, or control on the Internet.

Download: Means to receive data to a local system from a remote system, or to initiate such a data transfer.

Driver: An aspect of a business that leads to change in other aspects of a business, usually in a positive fashion.

Dual-degree attorney: These are attorneys that have at least two concurrent degrees. Commonly, they include degrees in veterinary medicine and/or business administration. Dual-degree attorneys should theoretically be better qualified to advise businesses on operations while understanding the needs of legal liability protection.

Due diligence: The process by which persons conduct inquiries for the purposes of timely, sufficient, and accurate disclosure of all material statements/information or documents that may influence the outcome of the transaction.

Duplicate content: Content that is the same, or very similar, on two separate domains.

Duration of use: Regarding Veterinary Feed Directive (VFD), the length of time that an animal feed containing the VFD drug is allowed to be fed to the animal(s).

Earned media: Publicity gained through invitation to participate in media events, rather than paying for them.

Earnings: The profit remaining to the owners of a business after all normal business expenses have been paid.

Earnings Before Interest, Taxes, Depreciation, and Amortization (EBITDA): EBITDA represents a business's net income with certain accounting expenses, namely depreciation, amortization, plus income taxes and interest added back in. EBITDA is used to gauge a business's profitability as well as its ability to repay debt.

Economic euthanasia: A situation in which euthanasia is selected principally on the basis of a pet owner's unwillingness or inability to pay for needed veterinary care.

Economic life: The number of years over which cash is expected to be returned from an investment in property.

Economic order quantity: The most economical quantity of a product to order, factoring in both holding and ordering costs.

Economic value-added: Monetary value of an entity at the end of a time period minus the monetary value of that same entity at the beginning of that time period; that is, after-tax earnings minus the opportunity cost of capital.

Economy of scale: The reduction in cost per unit that results when operational efficiencies allow increased production. Thus, there are savings, because as production increases, the cost of producing each additional unit decreases.

Economy of scope: The reduction in cost that results when delivering two or more distinct goods or services, when the cost of doing so is less than that of delivering each separately. It is the efficiency attributed to variety and diversification rather than volume.

Electronic funds transfer (EFT): The process of moving transaction funds from one bank to another via the automated clearing house of the Federal Reserve network. An EFT processes preauthorized debits or credits from one bank account to another without using a check. This electronic, computer-based transaction process is governed by the Federal Reserve banking system.

Electronic medical records: The systematized collection of patient health information in a digital format.

Electronic prescribing (e-prescribing): The use of digital electronic prescriptions rather than providing a printed prescription or faxing a prescription.

E-mail: Electronic mail, commonly referred to as email or e-mail, is a method of exchanging digital messages from an author to one or more recipients. Modern e-mail operates across the Internet or other computer networks.

E-mail automation system: Software that allows you to automate e-mail sending. It is the most effective way to engage in e-mail marketing, enabling you to send out e-mails at specific times, or when a customer takes a specific action.

Embezzlement: The fraudulent appropriation of funds or property entrusted to your care, but actually owned by someone else.

Emergency: An unplanned event that is likely to cause significant harm to people or animals or property damage. Some emergencies require immediate action (such as a fire), whereas others provide warnings and possible reaction time (such as a wildfire or hurricane).

Emergency action plan: A specific written plan on how the practice will respond to a given emergency situation.

Emerging disease: A new disease or new strain of known disease that may impact human, animal, or plant health.

Emotional branding: The practice of building a brand that appeals directly to a consumer's emotional state, needs, and aspirations.

Emotional intelligence: The capacity to perceive, assess, and positively influence one's own and other people's emotions.

Empathy: The ability to understand and share the feelings of another.

Employee handbook (policy manual): An employee handbook is the document that describes the employment policies of a specific employer, describing what the employer expects of the employee, and what the employee can expect from the employer; this term puts the focus on the audience of the document so that it is produced for the employees.

Employee manuals: Written manuals running from a few pages to many pages explaining the terms and conditions employees must operate under while working for a given business.

Employee policy book: The policy book should be separate from the employee manual, in that it can include many operating policies giving more detail on the day-to-day operations than an employee manual can. The employee manual primarily directs behavior, attendance, and/or absences.

Employee relations: Responding to concerns and informing and motivating employees.

Employee Retirement Income Security Act (ERISA): Employee Retirement Income Security Act of 1974. Title I of ERISA covers funding, vesting, and fiduciary standards applicable to employee benefit plans, and is enforced by the US Department of Labor.

Employee stock ownership plan: A program that allows an organization's employees to have an ownership interest in the organization.

Employees: Workers hired by practice owners to perform specified job tasks during delineated time periods, subject to the authority and control of their employers.

Employer: As defined in the Americans with Disabilities Act, a person engaged in an industry affecting commerce that, as of July 26, 1994, employs 15 or more employees. This definition also includes an employer as a person acting as the agent of an employer, also being an employer.

Employment-at-will relationship: The most common form of employment relationship between an employee and an employer. Under this type of relationship there is no contract between the employer and employee; the employee may quit at any time or the employer may fire the employee for any reason that is not illegal. For example, an employer may fire an at-will employee for poor performance, to cut costs, or because the employer simply does not like the employee, but may not fire an at-will employee for

discriminatory reasons, to retaliate against the employee for reporting harassment, or because the employee exercised a legal right.

Empower: To give official authority or legal power to someone (e.g., she empowered her attorney to act on her behalf).

Empowerment: Authority of power given to someone to do something (carry out a task that has been delegated).

Encryption: Changing data so it is not readable by unauthorized parties who might intercept it.

Endowment: A fund, usually in the form of an income-generating investment, established to provide long-term support for an organization.

Energy recovery ventilator (ERV): An ERV recycles energy by "preconditioning" the air that goes into the building with the air that is exhausted. The two channels of air pass next to one another to facilitate thermal exchange, but they remain physically separate to prevent contamination.

Engage: Obtain someone's interest or attention as a result of some form of interaction.

Engaged: Involved in activity: occupied, busy; greatly interested; committed.

Engaged employee: An employee who is actively involved in his or her work, and highly committed to duties and the company mission.

Environmental Protection Agency (EPA): Government agency EPA established on December 2, 1970, to consolidate in one agency a variety of federal research, monitoring, standard-setting and enforcement activities to ensure environmental protection. The EPA regulates products used topically for the control of ectoparasites and insects on animals under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

EPA Regulation 40 CFR 261: The regulation that lists the categories of hazardous waste.

Epigenetics: The study of heritable changes in genetic expression caused by mechanisms other than those attributable to underlying DNA sequences.

Equal Employment Opportunity Commission: This is the commission at either the federal or state level that is responsible for implementing the regulations to enforce the Americans with Disabilities Act statutes, whether state or federal.

Equity: The portion of the practice's assets that belong to the owner or owners, not the creditors.

Equity loan: Money that you are able to borrow because an asset, generally real estate, but maybe value in your practice, is worth more than any outstanding debt against it.

Equity sale: A business valuation approach used when less than 100% of the business will be sold; for example, when an associate buys into the practice, as a partial owner.

Ergonomics: The study of injuries or disorders related to the musculoskeletal system. In the small animal veterinary profession, back injuries are the most common ergonomic injury. In the equine and food animal areas, muscle strains and "twisting" injuries are more common.

Escalation: Automatic increases to the base rent amount that occur at set times over the term of the lease.

E-slots or same days: These are two of the many terms practices use to describe appointments that are held open until that day to accommodate emergencies, walk-ins, or other situations that require a doctor's immediate attention.

Estimate: An opinion of probable construction cost prepared prior to the completion of the final pricing or bid documents. Estimates may be prepared by architects, engineers, cost-estimating consultants, or general contractors.

Estimate of value: A range of values when, in the sole professional judgment of the valuation analyst, an opinion of value cannot be stated.

Ethics exhaustion: Fatigue, emotional distress, and lack of will to continue to act in a way that is consistent with what you believe is the ethical thing to do.

Evidence-based medicine: A medical system that allows physicians to access empirical information pertaining to a particular illness and its treatment, to see which treatment modalities produce the best outcomes and thus compare treatment options based on the best available evidence.

Evidence-based practice: Use of the best currently available resources (research and clinical expertise) in making decisions about patient care.

Evolution: The gradual development of something, especially from a simple to a more complex form.

Exam room assistant manual: Resource for those technicians and aides responsible for assisting veterinarians in appointments and other exam room procedures ranging from pedicures to emergencies. It typically includes an index of all the practice's client education materials as well as a list of community resources for clients such as obedience schools, boarding kennels, and groomers. It may also contain guidelines for handling abandoned pets and how to manage wildlife until a certified wildlife rehabilitator can be contacted.

Exceptional: Unusually good; outstanding.

Excess earnings: The amount of earnings expected over and above the return on tangible assets; includes earnings as a result of intangible assets such as goodwill.

Exclusion: In insurance, a condition that is not covered under an insurance policy.

Exclusively organized and operated for charitable purposes: A charitable tax-exempt organization must be exclusively organized and operated solely for a recognized charitable purpose. If any part of its purpose or its operation is for anything other than a recognized charitable purpose, then the corporation could lose its tax-exempt status.

Executor: A person or entity appointed by a testator to carry out the terms of their will.

Exempt: Specific employees may be exempt from the minimum wage and overtime requirements of the Fair Labor Standards Act. Doctors are typically exempt employees.

Exempt employees: Professionals, executives, certain administrators, and computer workers are exempt from the minimum wage and overtime compensation present provision of the Fair Labor Standards Act if they meet specific regulatory tests.

Exhaust air: Exhaust air is mechanically exhausted to the outside without being reused by the heating, ventilation, and air conditioning unit.

Expectancy theory: The theory that motivation is increased when employees believe that increased effort leads to desired results.

Expectation: A strong belief that something will happen or will be the case in the future.

Expense: A measured outflow of services and/or goods, matched to the revenue generated for that outflow.

Expiration date: The specified period of time for which the Veterinary Feed Directive (VFD) is valid. After the expiration date of the VFD order the drug should not be fed. The expiration date cannot exceed six months after the issuance date of the VFD order.

Expungeability: After a prescribed period of time of good behavior, the ability of a convicted defendant to cleanse the criminal conviction from her record.

External crisis: A crisis that originates due to outside factors, in most cases, outside the practice's control.

External hard drive: External removable hard drive that typically connects via Universal Service Bus. Plug-and-play drive functionality offers system compatibility and features large storage options and portability.

External marketing: Written or verbal communication aimed at attracting new clients. Examples include exterior appearance of the hospital, advertising, mailings, community events, speaking engagements, hospital signage, website, digital marketing, social media, and converting phone calls to booked appointments.

Extralabel drug use: The use of an approved drug in a manner that is not in accordance with the approved labeling (e.g., the use of the product for another species, different indication, or dose).

Facilitator: The facilitator has the task of leading a group to a reasonable consensus.

Fair Labor Standards Act: Federal law that establishes minimum wage, overtime pay, recordkeeping, and child labor standards affecting full-time and part-time workers.

Fair market value: The price at which the property would change hands between a willing buyer and a willing seller, when neither is under any compulsion to buy or to sell, and both having reasonable knowledge of relevant facts.

Fair value: A statutory standard of value that varies from state to state. It is most commonly used in situations that will be litigated, particularly for dissenting shareholders. For these reasons, fair value is not commonly used in veterinary practice valuation.

Family and Medical Leave Act: Federal law that allows certain employees to take up to 12 weeks of unpaid, job-protected leave each year for the birth and care of a child, for placement with the employee of an adopted or foster child, for the employee's own serious health condition which causes them not to be able to work, or to care for a serious health condition of a child, spouse, parent, or next-of-kin military service member.

Family limited partnerships (FLPs): An FLP is a partnership created by two or more family members in accordance with state law consisting of two classes of partners: limited partners and general partners. An FLP is created when owners of a veterinary practice, and perhaps other assets, want to consolidate and centralize management of assets while reducing estate transfer costs. Both current value and future increases in value are transferred to heirs. The FLP is a pass-through taxpayer, so tax attributes flow to individuals holding FLP interests.

Fan coil system: In a fan coil system, hot and cold water is supplied from a remote boiler and chiller to fan coil units, which are mounted in each room. Fan coil systems are not practical for most veterinary hospitals, because they are relatively expensive and may not provide sufficient exhaust for rooms such as animal wards. However, they are often used in retrofits, because they are space efficient.

Favorable: Historically, people described budget variances as "under budget" or "over budget." These characterizations created confusion because sometimes being under budget was a good thing and sometimes it was a bad thing. In lieu of these characterizations, the term favorable should be used. A favorable result is always a desirable result.

Fear: An emotion that induces an animal to avoid situations and activities that may be dangerous. Pets may perceive danger where none exists. Perception is key.

Feasibility study: Feasibility studies aim to objectively and rationally uncover the strengths and weaknesses of an existing business or proposed venture, opportunities, and threats as presented by the environment, the resources required to carry out the venture, and ultimately the prospects for success.

Features: The characteristics of products, services, or programs you offer. Features answer the question "What does it do?"

Fee agreement: Clients of attorneys should have a signed fee agreement explaining the terms of the relationship and the expected cost to the client.

Feed: Data format used for providing users with frequently updated content.

Feminine/female: Used interchangeably in this context. Having qualities or appearance traditionally associated with women, especially humility, self-deprecation, softness, and emotionality.

FICO score: Score calculated using a computer model that compares the information in your credit report to what is on the credit report of thousands of other customers. This assesses a number of factors, such as past payment history, amount of outstanding debt, age of the credit, types of credit, and changes in amount of outstanding credit. FICO stands for Fair Isaac and Company, the company that developed the proprietary algorithm for the calculation.

Fiduciary: Any person who has discretionary authority over the administration of a plan or the management of plan assets, or who renders investment advice to a plan for a fee.

Fiduciary duty/relationship: A fiduciary duty is the highest standard of care. A person who has a fiduciary duty is called the fiduciary, and owes the duty of good faith, trust confidence and candor.

Fill rate: Percentage of available appointment slots that were scheduled during a specific period of time. If, for example, a doctor is seeing 15-minute appointments from 08:30 a.m. to 10:00 a.m., there are 10 available appointment slots. If six of these slots are scheduled, the fill rate for this appointment block is 60%. Most practices calculate fill rates by shift and by veterinarian each quarter and adjust the practice's scheduling guidelines accordingly.

Finance charges: The amount of money charged for payments that extend beyond an agreed-upon time limit. The amount charged is governed by the usury laws in the state within which you practice. The amount of finance fee charged must be clearly reflected on the invoices rendered.

Finance risk: One approach to risk management involves purchasing enough insurance to transfer responsibility for losses to your insurer. Insurance is an essential aspect of risk management.

Firewall: Any number of software-based or hardware-based programs installed in a computer to keep a network secure from outside threats.

First in, first out: Method whereby items first placed into inventory are the first taken out of inventory or sold.

Five stages of grief: Created by Elisabeth Kubler-Ross, the five stages are known as denial, anger, bargaining, depression, and acceptance. They do not happen in sequence, and a person does not necessarily experience all of these stages.

Fixed costs: Costs that do not fluctuate with revenue. For example, the rent paid to lease the building in which the veterinary practice is located is a fixed cost. Even if no clients come in the door and no revenue is generated by the practice, the business still has to pay rent.

Fixed expense: An expense that stays the same regardless of the amount of work the practice performs. Rent is an example.

Fixed schedule: The scheduling of staff members, their duties, their workday, and workweek are the same (fixed) week after week and do not change.

Flash drive: Data storage device that includes flash memory with an integrated Universal Serial Bus (USB) interface. USB flash drives are typically removable and rewritable, and physically much smaller than an external hard drive.

Floor workers: The floor workers are those people on the veterinary team who are doing the hands-on work of a veterinary practice; these people are not involved in the management of the business, but instead are the first line for taking care of the patients and clients.

Flow monitor or "flow switch": A device installed in the fire sprinkler piping that monitors any flow of water in the pipe, indicating that an automatic fire sprinkler has been activated. Automatic fire sprinkler systems with 100 or more sprinkler heads require flow monitors to be installed by code, with a notification system to alert the fire department in the event of fire sprinkler activation.

Flowchart: Graphic representation of the stages in a process or of the steps required to solve a problem. A flowchart is commonly used to

outline the sequence of functions in a complex process. For example, some practices have created a step-by-step graphic representation of a healthy pet wellness exam in order to identify all of the potential roadblocks to customer service and/or practice efficiency.

Focus group: A group of clients who are asked to participate in a discussion about a particular topic or issue. The information from the group is used to develop programs, improve service, or solve problems in the practice.

Follower: An adherent or devotee of a particular person, cause, business, or activity.

Food and Drug Administration (FDA): The FDA is an agency within the US Department of Health and Human Services that is responsible for protecting the public health by regulating the manufacturing, marketing, and distribution to ensure the safety, efficacy, and security of human biological products, human and veterinary drugs, and medical devices, cosmetics, and products that emit radiation.

Food and Drug Administration Center for Veterinary Medicine (FDA-CVM): The FDA-CVM is a branch of the FDA dedicated to ensure the safety and efficacy of animal drugs, devices, medicated feed for companion and food producing animals, and safety of food products made from treated animals. In addition, the FDA-CVM monitors the safety and effectiveness of animal drugs on the market, and ensures the safety of pet foods and food additives.

Foreclosure: A legal proceeding to terminate a debtor's interest in property, instituted by the creditor either to gain title or to force a sale in order to satisfy the unpaid debt secured by the property.

Foreign animal disease: A disease of great concern that is currently not endemic to the country. This may also be referred to as a transboundary disease.

Forming: Members are uncertain about rules, roles, and expectations.

Four Cs of onboarding: A memory tool used to recall four important content areas to include in the onboarding process: compliance; clarification; culture; and connection

Fractional owner: An owner who owns less than 100% of a business.

Fraud: An intentional misrepresentation of the truth to mislead another to bargain or act in reliance upon the misrepresentation.

Fraud triangle: Three key factors that identify individuals who may be susceptible to committing fraud: situational pressures, opportunities to commit fraud, and personal integrity.

Freestanding building: An unattached building with its own site that includes parking, landscaping, and utilities. Examples would include veterinary hospitals located on individual lots or on a pad site in a development.

Frequently asked questions: In the context of telephone service management, these would be commonly asked client questions that anyone who works in a veterinary practice should be able to answer fluently and well, such as the hospital's policies on spay and neutering, vaccinations, and parasite control, among others.

Fringe benefits: Any benefit provided in excess of compensation that is not excluded according to law. Pet care discounts is an example of a fringe benefit.

Full-time equivalent: A method of comparing practices based on a full-time schedule of 40 hours a week. If a practice has two veterinarians, one working 50 hours a week and one working 20 hours a week, that practice has 1.75 full-time equivalent veterinary positions: (50 + 20)/40.

Functionally illiterate: Lacking basic reading and writing skills.

Fungibility: The property of a good or commodity to have individual units that are essentially interchangeable. For example, in currency, bills and coins of equal value are considered interchangeable and are thus fungible.

Future value: The monetary value of some defined investment at some point in the future, given a specified rate of return.

Gain sharing program: Title of cost-savings commission programs instituted generally in manufacturing environments, but that are applicable to the veterinary practice as well. The goal is to devise a compensation plan that is self-funding. Volunteers representing each clinical department create a "design team," and facilitators guide the team in deciding how the team should measure and reward positive performance within set parameters. Employees strive to improve the hospital's patient-satisfaction scores, which in turn would increase employees' payouts and their own connection to how they impact total practice success.

Gamification: The integration of game dynamics and design to nongame applications, such as learning tools, to make them more engaging.

General and administrative expenses: All executive, organizational, and clerical expenses associated with the general management and operation of a practice, rather than with delivery of patient care, ancillary services such as pet boarding and grooming, or product/pharmacy sales.

General anesthesia: Drug-induced loss of consciousness to conduct invasive medical or surgical procedures.

General contractor: A builder that subcontracts for the majority or all of the trades associated with the construction of a freestanding building, renovation, or the build-out of a lease space. Although many contractors self-perform certain aspects of construction, their most important role is organizing and contracting with the specialty contractors needed for a construction project.

General ledger: Detailed listing of the activity that occurs in each account on the financial statements.

General partners (GP): GPs (you and/or a spouse) design the partnership to gift family limited partnership (FLP) shares to family members. GPs control the operations of the FLP and make day-to-day investment decisions.

Generally accepted accounting principles (GAAPs): Requires the use of accrual accounting; broadly describes the body of principles that governs the accounting for financial transactions underlying the preparation of a set of financial statements. GAAPs derive from such sources as the Financial Accounting Standards Board and the American Institute of Certified Public Accountants.

Generally recognized as safe (GRAS): GRAS refers to substances added to food that are generally recognized as safe by qualified experts. These do not need to be reviewed and approved by the Food and Drug Administration before being marketed.

Generation X: People in this generation were born between 1965 and 1981, but more generally this includes anyone born in the 1960s and 1970s.

Generation Y or Millennials: This generation includes anyone born between 1982 and 1999.

Generation Z: Also known as the iGeneration or Net Generation, these are individuals born after 1999. They grew up in the post 9/11 era and have always had familiarity with communications and media technology. Their tendencies in the workforce have yet to be fully characterized.

Generational wealth: The development of significant stable financial resources that can be passed down to future family generations.

Generic drugs: Generic drugs are Food and Drug Administration approved, which requires a demonstration of bioequivalence of safety and efficacy with the pioneer drug product.

Gentle control: Utilizing comfortable and safe positions for patients while administrating veterinary care with minimal restraint.

Gigabyte: Unit of computer memory or data storage capacity equal to 1,024 megabytes.

Goals of care: Discussions about goals of care are often framed when considering a veterinary treatment. For some clients, the primary goals may not necessarily be focused on medical issues and instead on personal goals, such as how they want their pet to live or if they

are enjoying life as fully as they can considering their health status. When client's goals of care are identified, this allows for a more intentional discussion for considering treatment options that can meet the needs which are most important to the client in making healthcare decisions for their pet.

Going concern: The premise that business is expected to continue to operate into the future.

Going concern assumption: Assumption that the business will remain in operation for the foreseeable future (as opposed to a liquidation assumption).

Goods and Services Tax: A tax paid by consumers on goods and services sold for domestic consumption. The tax is remitted to the government by the businesses selling the goods and services.

Goodwill: An intangible asset resulting from a business's reputation, name, location, products, services, customer base, and so on.

Goodwill value: Value attributable to goodwill, whether personal (related to a specific owner) or enterprise (related to the business as a whole).

Google AdWords: Google's search advertising platform.

GPS (Global Positioning System): A space-based satellite navigation system that provides location and time information in all weather, anywhere on the Earth.

Grantor: An individual who transfers or conveys ownership.

Grief: The constellation of internal thoughts and feelings we have when someone we love

Gross ignorance: An act or omission that reaches a level of incompetence or error much greater than that of a more common negligent or mistaken action or omission.

Gross income: Income resulting from all veterinary operations before any cost/expense deductions and excluding interest income, service charge income, rebates, sales tax collected, or any other income resulting from other than veterinary professional services, animal care ancillary services such boarding and grooming, and pharmacy/product retail income.

Gross profit (profitability measure): A monetary amount, computed by subtracting total cost of professional services from gross income.

Gross profit percentage (profitability measure): The ratio percentage resulting from gross profit divided by gross income.

Gross revenue: The total dollar amount taken in by a business before expenses are subtracted.

Guarantor: Similar to a cosigner, an individual who guarantees an obligation and has a legal duty to fulfill it. Common in commercial loans where the primary borrower is the business entity and shareholder or owner personally backs the loan. Unlike the case of a cosigner, the lender must first exhaust all means of collection against the primary borrower before the guarantor's income and assets are attached.

Guardian: One who has legal authority and duty to care for another's person (ward) or property because of the other's infancy, incapacity or disability.

Guardian ad litem: A guardian, appointed to the court to appear in a lawsuit on behalf of an incompetent or minor party.

Guardianship: The fiduciary relationship between a guardian and a ward, whereby the guardian assumes the role of owner to make decisions about the wards' person or property; guardianship is almost always an involuntary procedure imposed by the state on the ward. Guardianship implies a fiduciary duty in the relationship.

Guidelines: Routine or sound practices, often formed by consensus within veterinary organizations.

Hacker: Someone who accesses a computer system by circumventing its security system.

Handling: The manner by which pets are visualized, approached, and touched. Strive to replace the word "restraint" and its analogous thought process with "handling."

Harassment, direct: Occurs when one person is targeted for harassing, intimidating, or offensive behavior because that individual is a member of a protected group.

Hard costs: Cost of tangible items. This typically includes land cost, building construction cost, and furnishings and equipment.

Hard skills: These are teachable skills and quantifiable skills. This means they produce quantifiable results and you can be graded and/or evaluated for your ability.

Hardware: The collection of physical elements that comprise a computer system. Computer hardware refers to the physical parts or components of the computer such as monitor, keyboard, hard disk, mouse, and so on.

Hash code: A form of cryptographic security that, unlike encryption, cannot be reversed or decrypted.

Hazard: Any threat that could impact a nation, region, community, facility, or individual household. Hazards may be natural, man-made, accidental, intentional, low impact, high impact, low probability, high probability, local, or regional.

Hazard assessment: A review and analysis of the facility and the procedures of a practice with the goal of identifying potential hazards to the staff. Often referred to as a "physical exam" of the practice.

Hazardous chemical: Any chemical product that can cause physical harm to a person or to the environment, including seemingly mild products that can be irritating to the eyes or cause skin reactions.

Hazardous waste: Waste products harmful or toxic to humans, animals, or the environment. Chemotherapy drugs fall under this category.

Health education methods and strategies: Various ways for delivering health education to clients, such as providing written information sheets, showing educational videos in the waiting room, providing verbal information during the visit, and so forth.

Health Information Portability and Protection Act of 1996 (HIPPA): A federal law that governs medical privacy and contains provisions for safeguarding medical information. HIPPA specifically defines protected health information as being geared towards individuals, and, therefore does not apply to veterinary medical information.

Health literacy: Level of understanding that is required by the client to access, utilize, and follow through on recommendations to maintain the health of an animal in their care.

Health savings account: An account to be used in conjunction with a high-deductible health plan for individuals or families to use for paying health-related costs.

Healthspan: That portion of lifespan that the pet remains in good general health.

Heat pumps: A mechanical system that moves heat from one place to another. For example, in heating mode, heat is collected from the outside and moved to the inside of a building. In cooling mode, heat is collected from the inside and moved to the outside of a building. Heat pumps may derive heat from air (air source), ground (ground source), or via a commercial water source such as a boiler and chiller system.

Hedging: A risk management strategy used in limiting or offsetting probability of loss from fluctuations in the prices of cryptocurrencies. Hedging employs various techniques but, basically, involves instantly exchanging cryptocurrencies into the preferred currency used.

Hedonic adaptation: Sometimes referred to as the hedonic treadmill, this refers to the observed tendency of individuals to return to a relatively stable level of happiness despite major positive or negative events or life changes.

Held checks: Checks dated the day they are written, with a verbal agreement that you will hold them for deposit until an agreed-upon

date. This may be better than no money collected, but there is no guarantee the check will clear when deposited.

Herzberg's motivator–hygiene theory: The theory that meeting basic needs results in motivation and increased performance.

Hierarchy: Hierarchy refers to the classification of people in accordance to their professional standing or position of authority.

High density: Refers to any scheduling system where the doctor has access to more than one examination room. Common examples could be a doctor and technician working two exam rooms simultaneously; or a doctor, a technician, and an assistant working three rooms simultaneously. High-density scheduling requires a well-trained and well-choreographed staff that can leverage the available doctor's time and expertise, resulting in increased productivity.

High tech: Refers to practicing on the cutting edge, using highly technical or advanced equipment and procedures.

High touch: Refers to high-quality service and ambiance.

Historical benchmarks: Data from your own practice that represents various time periods. The most common historical data is collected at the end of each operating year, although other periods of time may be used depending on the specific focus of the research.

Holacracy: A flat organizational structure in which authority and decision-making are controlled by self-organizing teams rather than by a management hierarchy.

Holding (carrying) costs: All costs associated with maintaining inventory on the premises.

Horizontal analysis: Comparison of a specific account in one financial reporting period to the account balance or amount in another financial reporting period. Also, the comparison of one percentage or ratio in a financial period with that in another period.

Horizontal versus vertical organization: Technical terms for describing a nonteam environment (vertical) or a team environment (horizontal).

Hospice: A philosophy or program of care that addresses the physical, emotional, and social needs of animals in the advanced stages of a progressive, life-limiting illness or disability. Provided to the patient from the time of a terminal diagnosis through death, inclusive of death by euthanasia or by hospice-supported natural death. Addresses the emotional, social, and spiritual needs of the human caregivers in preparation for the death of the animal and the grief experience. Animal hospice care is enhanced when provided by an interdisciplinary team approach.

Hospice-supported natural death: Use of palliative care measures during a patient's terminal life stage, including the treatment of pain and other signs of discomfort under veterinary supervision until the natural death of the individual.

Hospital administrator: Similar to practice manager, with more responsibility for veterinary doctors and technicians (professional and paraprofessional staffing). This is an unregulated position, in that credentials are not needed to use this term.

Hospital safety manual: A collection of all the safety rules, and policies of the facility. It should contain the set training schedule for the staff, a written safety plan, safety data sheet library, and evacuation plans for emergencies. It must be stored in an easily accessible location and available to staff during their normal work shift.

Hostile work environment: This exists when conduct based on protected status, by anyone in the workplace, has the purpose or effect of creating a hostile, intimidating, or offensive work environment. The conduct can be verbal, nonverbal, or physical. Harassing conduct includes, but is not limited to, epithets, slurs or negative stereotyping; threatening, intimidating or hostile acts; denigrating jokes and display or circulation in the workplace of written or graphic material that denigrates or shows hostility or aversion toward an individual or group (including through e-mail or other Internet communication sites).

House call fee (or trip fee): An additional fee added to an invoice to reflect the veterinarian traveling to the client.

House call practice: A veterinary practice operated from a vehicle, where services are provided at a client's residence or place of business.

Human capital: The value of the skills, knowledge, and experience of persons within an organization.

Human resources: Hiring, training, firing, and supervising the activities of the entire healthcare team while maintaining the legal requirements of the management of people.

Human–animal bond: The relationship between humans and animals. The relationship is measurable from the human side but not well understood from the animal's perspective.

Humane euthanasia: The intentional termination of life by human intervention utilizing American Veterinary Medical Association-approved methods that cause minimal pain, discomfort, and anxiety for the purpose of relieving an animal's suffering.

Humanization of pets: The societal trend of treating pets more like human family members than as property or with lesser status than people.

Hybrid logs: These logs are a combination of patient and procedure logs. For example, a final care log lists the names of deceased pets and the actions that need to be completed such as requesting cremation or burial services. These logs may also serve as task checklists to ensure that all paperwork and communication related to a specific procedure are completed in a timely manner.

Hybrid schedule: This schedule has characteristics of both a fixed and rotating schedule. A typical hybrid schedule may include a fixed weekday schedule with a weekend rotation.

Hypertext Markup Language (HTML): HTML is the standard markup language for creating e-mails and web pages. HTML describes the structure of e-mails and web pages using markup. HTML elements are the building blocks of e-mails and web pages.

I-9: A US Citizenship and Immigration Services form called the Employment Eligibility Verification form to confirm employment eligibility in the United States.

Identify theft: A third party's fraudulent taking and use of another person's or business's uniquely identifiable information (social security/employer identification number, copied signatures, credit card numbers and holder's name) for the third party's financial gain.

Identity elements: The various ways in which a practice conveys who it is. This includes everything from the facility in which a practice is housed, to the behaviors of its people, to its manner of service delivery, to its visual identity (logo, icons, and symbols), to its messaging. Practices all convey some sort of identity – whether or not it is conscious or a reflection of how the practice wants to be seen.

IEEE 802.11: Currently the most widely used standard for wireless radio-frequency data transmission.

Implement: A verb: to put into effect.

Imprest system: A financial accounting system, most commonly used for petty cash, in which a fixed amount is reserved and then replenished at the end of the period or when circumstances require. So, if the period begins with $100 in the petty cash "float" and by the end of the period $75 has been spent from petty cash, then $75 is replenished and credited to the cash account, and the debits go to the appropriate expense accounts based on the petty cash receipts.

Income statement: Another commonly prepared financial statement that shows a business's performance over a period of time; this statement lists income and expenses during the covered period (also known as a profit and loss statement).

Income statement (or profit and loss statement): Financial report presenting income and expenses (with depreciation/amortization) made for a specific period of time.

Incremental cash flow: The change in the practice's net cash flow attributable to the capital investment.
Indemnity insurance: System of health insurance in which the insurance carrier reimburses the insured individual for medical expenses after care has been provided.
Independent contractors: Workers who are contracted by veterinary practice owners to perform certain jobs for the practice.
Individual development plan: A staff member's individual plan for self-development that is then approved by a manager to ensure it is aligned with the organization's goals.
Industry norms: Values derived from the analysis of a large number of practices. Most of the national groups that represent organized veterinary medicine publish some variety of industry norms. The most common examples would be the American Animal Hospital Association and the American Veterinary Medical Association.
In-floor radiant heat systems: Some veterinary hospitals supplement their heating, ventilation, and air conditioning system in animal wards with in-floor radiant heat to provide therapeutic floor surfaces and decrease floor drying time.
Information technology: Concerned with the development, management, and use of computer-based information systems.
Informed consent: Person's agreement to allow something to happen, such as a medical diagnostic or surgical procedure, that is based on full disclosure of the facts necessary to make an intelligent decision.
In-house laboratory services: All laboratory testing that can be readily completed at the hospital by the hospital team: chemistry profiles, complete blood cell counts, urinalysis, intestinal parasite testing, cytology, in-house testing kits, and so on.
Initial cost: Cost of materials and labor directly related to the initial construction of a project.
Initial investment outlay: The incremental cash flow that occurs at the start of the project's life. These initial cash outflows typically include the purchase price, shipping, and installation charges.
Inner leadership qualities: Qualities an individual must have as inner strengths to be an effective leader: vision, self-belief, integrity, courage, and being results focused.
Installment sale: A sale whereby any part of the purchase price is received in a tax year subsequent to the year of the sale.
Insurance: A form of risk management in which reimbursement for specified veterinary expenses is guaranteed in exchange for premium payments.
Insurance coverage: Insurance coverage, or cover, is the amount of risk or liability that is protected in an insurance contract.
Intangible assets: Nonphysical assets such as goodwill, contracts (noncompete covenants), trademarks, patents, copyrights, and so on, which provide value to a business.
Integrated diagnostic systems: Diagnostic tests that are linked to practice software; often, entering the diagnostic code will both order the test (in-house or outside) and input the charge for the test. Results typically are downloaded into the medical record and manual entry is not required.
Integration: Specialized tools to simplify the sharing of medical and related data between medical equipment and electronic health records.
Integrative medicine: The use of complementary and conventional diagnostics and therapies in health and disease.
Integrity: A sense of commitment to open and honest communication, inclusiveness, and high standards in discharge of professional responsibilities and actions.
Intensive care unit flow sheets: These are records of treatments, observations, and nursing notes that are often kept with the patient while in the hospital. Also known at treatment sheets.
Intentionally: The actor's conscious object is to perform an action of that nature or to cause such a result. The action is purposive.
Interest: The cost of borrowing money assessed by the lender over time and usually expressed as a percentage of the principal amount of borrowings. The percentage is expressed as a rate over a time period, and can change (variable rate) or stay the same over the term of the loan (fixed rate).
Intermediary installment sale: An installment sale through an intermediate limited liability company entity (usually with family members) followed by a sale to the ultimate purchaser.
Internal accounting controls: Process and mental controls set in place to provide management reasonable assurance that no practice resources are being lost, that financial reporting is reasonably accurate, and that profitability targets are achieved.
Internal crisis: A crisis that originates as a result of the actions of a practice employee or facility malfunction.
Internal marketing: In veterinary medicine, this refers to efforts to increase the utilization of services by existing clients. Internal marketing also refers to efforts by the practice to train and motivate staff to work together as a team to better meet client needs.
Internal rate of return: The calculated rate of return, given the cost and future value of an investment.
Internet: Worldwide network of computer networks.
Internet marketing: Also known as web marketing, online marketing, web advertising, or e-marketing, is referred to as the marketing (generally promotion) of products or services over the Internet. Internet marketing is considered to be broad in scope because it not only refers to marketing on the Internet, but also includes marketing done via e-mail and other online media.
Internet of Things: Physical devices containing hardware, software, and sensors which are connected to a network, enabling these objects to connect and exchange data.
Internship: A one-year, postgraduate, supervised educational learning opportunity within clinical practice to enhance the graduate's exposure to case management and/or to prepare the graduate for specialty training.
Interventional pain management techniques: The use of invasive interventions such as joint injections, epidural or spinal injections, perineural or local/regional blocks, infusion therapies usually preceded by or using advanced imaging techniques (computed tomography, fluoroscopy, magnetic resonance imaging, ultrasound).
Intrinsic value: The deemed asset worth derived by the practice owner, including how the equipment generates value for the practice.
Intrusion detector: A security-system device installed in a building to detect unauthorized access to the building. The most common types of detectors include door-ajar sensors and glass-break detectors.
Inurement: Inappropriate benefit of a private person or company from a charitable organization.
Inventory: Goods ready to be sold.
Inventory Chart of Accounts: A directory of codes related to products that will be used to determine cost centers and profit centers to be monitored within the accounting and practice management software.
Inventory turnover: Also known as inventory turns, merchandise turnover, stockturn, stock turns, turns, and stock turnover, this refers to the cost of goods sold divided by the average inventory. It is a measure of the number of times inventory is sold or used within a time period.
Investment thesis: The beliefs that investors decide to use when determining what investments to purchase or sell, when to take an action, and why. An investment thesis helps investors establish goals for their investments, and measures whether they have been achieved, either in written form or simply as an idea.
Investment value: The value to a specific buyer based on their unique requirements and expectations.

Invitee: Anyone who enters the premises by invitation and whose entry is connected with or may in some way enhance the business of the owner.

Ionizing radiation: Energy that causes ionization when it interacts with tissues. Ionization within tissues has been linked to free-radical formation, nucleic acid mutations, cell death, and cancer. There is no "safe" level of ionizing radiation. Thus, regulators (Nuclear Regulatory Commission) set a maximum permissible dose for occupational exposure (50 mSv/year).

iOS: Mobile operating system developed and distributed by Apple, Inc. Originally released in 2007 for the iPhone and iPod Touch, it has been extended to support other Apple devices such as the iPad and Apple TV.

IRS Code Section 1031: "No gain or loss shall be recognized on the exchange of property held for productive use in a trade or business or for investment if such property is exchanged solely for property of like kind which is to be held for productive use in a trade or business or for investment." This technique is used primarily in real estate sales to roll over the seller's cost basis from a relinquished property into a replacement property with no current tax due if rules are followed for complete tax deferral.

Job: A task or series of tasks that are performed to accomplish one's occupation. It is basically a specific piece of work. Examples of jobs include cleaning a cage, answering a phone, cleaning teeth, sterilizing a pack, filing charts, creating an invoice, and so on.

Job description: A written summary listing elements of a particular job that should include responsibilities, purpose, duties, qualifications, training, physical and mental demands, and working conditions associated with a specific job.

Job enlargement: Assignment of additional tasks similar to those the employee is already trained to accomplish. For example, asking an employee who is trained to do callbacks for one doctor to begin doing callbacks for all of the doctors.

Job enrichment: A method of making work more satisfying by expanding the tasks to increase not only their variety, but also the employee's responsibility and accountability.

Just-cause relationship: A relationship between an employer and employee in which the employee can only be disciplined or terminated for a sufficient reason (some examples are misconduct, negligence, or theft).

Just-in-time inventory: Receiving product as it is needed, rather than storing product as inventory.

Key performance indicators: Key metrics (financial and operational) used to measure performance of an organization.

Kinesics: Individual communication through facial expressions, body tension, gestures, use of touch, body position, posture, and angulation.

Knowingly: The actor is simply aware that his or her conduct is of the required nature or that the prohibited result is practically certain to follow from his conduct. A man or woman who wills that a particular act or result takes place has intent, whereas another who is merely willing that it should take place has knowledge.

Laboratory manual: A complete reference guide for technicians and doctors who may be working in the laboratory or processing samples through the laboratory. It typically includes step-by-step instructions on how to perform each in-house laboratory test, and it may describe how samples should be collected, processed, and shipped to each outside reference laboratory, as well as the preferred laboratory for each type of test.

Laser printer: Digital printing process that rapidly produces high-quality text and graphics on plain paper.

Lawyer: One learned in law.

Lead position (shift lead): This refers to the first level of management, the person who becomes responsible for providing the closest observation of the floor workers; this person still works their assigned floor position for the majority of their time. This person may oversee a certain position on the team or a certain area of the facility. Typically, this person serves in a leadership role in the event of a crisis during that person's work shift, particularly if the practice is open nights and/or weekends.

Leadership: The process by which an individual influences others to achieve a common goal.

Leadership fatigue: An extreme sense of stress associated with managing expectations regarding policies and procedures in the hospital.

Learning curve: Graphic showing the relationship between efficiency of the activity and length of experience with the activity. More experience is expected to result in better outcomes.

Lease type: A general classification of a type of commercial property lease dependent upon assignment of costs to either the landlord (lessor) or to the tenant (lessee). The costs above and beyond the base rent rate often include property taxes, insurance, and building maintenance and repair.

Lease, double net: A lease in which the property taxes and building insurance are the responsibility of the tenant, but the landlord covers the costs of any structural repairs or common-area maintenance. Also referred to as net-net.

Lease, single net: A relatively uncommon form for a commercial lease agreement in which only the cost of property taxes is passed through to the tenant. Also referred to as net.

Lease, triple net: An expression describing a commercial real estate lease based on the terms that the tenant is responsible for a base rent plus the property taxes, building insurance, and building maintenance and repair costs. This type of lease is common for single-tenant, freestanding buildings. Also referred to as net-net-net.

Leasing: Method of acquiring equipment without using large amounts of cash to purchase, thus freeing up dollars for the practice.

Ledger books: Actual physical books where cash is recorded chronologically when received or disbursed, and where the value of services is recorded when rendered on credit. These subsidiary ledgers are then summarized (or "closed") daily, monthly, and annually in a general ledger, the precursor of today's computer-generated financial records.

Legal duty: Any duty that is defined or regulated by laws in the jurisdiction where the veterinarian is licensed to practice.

Legal liability risk assessments: This is a form of practice audit where an attorney or lawyer can visit and review a practice to be sure there is coverage for the risk of malpractice and the risk of client lawsuits based on client injury.

Legend drug: A drug that can be dispensed to a client only with an order from a properly authorized individual (such as a veterinarian). Legend drugs are often more commonly referred to as prescription drugs.

Lessee: Person or company who uses the property that is the subject of the lease.

Lessor: Person or company who owns the property that is the subject of the lease or rental agreement.

Leveraged: Used creditor funds to purchase assets, based on the prediction that the rates of return on purchased assets will exceed the costs of borrowing.

Leveraging: Borrowing money (incurring debt/liabilities) to obtain capital needed to pay for the costs of revenue generation. In theory, the revenue thus generated is adequate to pay for newly incurred expenses, to pay interest on the debt, to retire (over time) the principal portion of borrowed funds, and to generate adequate additional profits for further capital investment in needed assets consumed to allow future revenue growth.

Liabilities: The practice's debts; that is, money owed to creditors.

Liability: The state of being responsible for something, especially by law.

Libel: Defamation of another's character, appearing in written form.
Licensee: Someone who enters the premises but does so for his or her own purposes rather than for the benefit of the business owner.
Lien: Claim against real or personal property until the debt associated with the property has been paid off.
Life Plan: A proactive personalized schedule of care and intervention for pets, based on risk factors identified and prioritized.
Life-cycle cost: Total cost of owning the facility, including initial costs and operating/maintenance costs.
Lifetime value (LTV): LTV is a metric that represents the total net profit a veterinary practice makes from any given pet. You can generally determine a client's lifetime value by multiplying the average number of pets owned by the client × the average number of times each pet visits the practice × the average value of each transaction × the number of years a client is expected to own pets × the number of friends each client might refer to the practice during his or her lifetime, and so on. In veterinary practice it is essential to understand that owners will have more than one pet during their own lifetime and as such should be treated at every touch point based on their LTV ($0,000's) rather than the profitability of a single transaction ($00).
Limited liability company (LLC): Business entity formed under the state laws of the state in which you live. Each statute is different, but generally the LLC is made up of members who actively manage the business but have no personal liability for its debt or obligations (unless signed on as personal guarantor for a mortgage, for example).
Limited Partners (LPs): LPs (your heirs) have an ownership interest in the family limited partnership (FLP), but they have very limited control. They share in the income generated by the FLP, depending upon how many shares of the FLP they own, with little or no management rights.
Linear accelerator: Device most commonly used to deliver highly focused beams of x-ray radiation in oncology treatments.
Linear floor plan: A plan with the front, middle, and back portions of the hospital one after the other in a line.
Liquidation: The cash that would be received under the premise that the business would be terminated and the assets sold piecemeal.
Liquidity: The ability to quickly convert assets to cash or to pay a liability.
Literacy sensitive: Providing health information in a manner that considers the health literacy level of the client.
Loan terms: Exact requirements of how a loan will be made to and repaid by the borrower.
Local area network: Connection of computers, printers, and other network devices in a localized area, such as within a single facility.
Local or regional anesthesia: Drug-induced analgesia that targets one or more body parts without rending the patient unconscious.
Local search: Search queries involving localized keywords such as "near me" or "nearby."
Logo: A symbol or other small design that identifies your products, uniform, vehicles, and so forth. Logos often include the company name and meaningful icons or images.
Long-term portion of loan: Principal portion of a loan that is due to be repaid in greater than 12 months.
Loyalty programs: Structured and long-term marketing efforts that reward and encourage loyal buying behavior from the client.
Major species: Means cattle, horses, swine, chickens, turkeys, dogs, and cats.
Majority owner: An owner who controls more than 50% of the organization and has significant influence or can control the direction of the business.
Malice: The intentional and wrongful doing of an act without lawful justification and with evil motivation.
Malpractice: A more limiting term specifically describing a professional's failure to practice the quality of medicine set by the similarly situated veterinarians in a given geographical area, if the accused is a general practitioner. If the accused is a specialist, then the standards of care are compared with a broader area than for a general practitioner.
Malpractice defense attorney: An attorney or licensed lawyer who is able to defend a client in a court of law in a given jurisdiction in a suit based on the veterinarian's possible deficient veterinary care, in which the patient treatment may not have achieved acceptable medical standards.
Malware: Short for malicious software. Software used or created to disrupt computer operation, gather sensitive information, or gain access to private computer systems. It can appear in the form of code, scripts, active content, and other software. Malware is a general term used to refer to a variety of forms of hostile or intrusive software.
Managed Care: Healthcare system under which healthcare professionals are organized into a group or "network" to manage the cost, quality, and access to healthcare.
Management: In this context, management refers to the combined efforts of the people responsible for overseeing the production of the employees and operations of the facility. There can be multiple levels of management depending upon the size of the facility and how many people it employs (i.e., a very large practice can have a hospital administrator, a practice manager, and an office manager in place).
Management support professionals: Individuals or teams with specific expertise in practice management, accounting, law, and other business-related disciplines that apply their skills to the betterment of veterinary practices.
Manager: Administrative staff member that oversees the daily operations of the veterinary practice.
Managerial accounting: Includes both historical and estimated data that management can use to conduct daily operations, planning future acquisitions, and developing business strategies.
Mandated reporter: Those individuals required by law to notify law enforcement of penal code violations. Good faith immunity from civil and criminal prosecution often protects those upon whom the duty to report is imposed.
Margin pricing: Also known as cost-plus pricing, this involves taking all the direct and indirect costs in providing a good or service and adding a set amount or percentage that corresponds to a gross profit margin to arrive at a retail price.
Marginally literate: Possesses the most basic of reading and writing skills.
Market: Your customers, prospective customers, and other consumers or providers of your products and service. Competition is central to the concept of market – clients can choose you, or other options, or not buy at all.
Market development: Promoting existing products to new markets.
Market identity: The results of positioning; the way in which a practice is perceived or understood by pet owners and in the marketplace. All practices have a market identity. Many times, the identity that the marketplace has is not in alignment with the desired reality of the practice. (See Perception gap.)
Market maturation: As a growth market for services or products begins to transition into a more stable market, this often marks a time when customer needs or demand are not evolving or growing rapidly. As a market shifts from growth to maturation, businesses need to adopt different strategies due to the nature of competition and the demands of the customer. Signs of mature markets often include competition, differentiation, and diversification.
Market penetration: The extent of sales of existing products and services to existing clients.
Market research: Determining attitudes and behaviors of various public segments and their causes in order to plan, implement, and

measure activities to influence or change those attitudes and behaviors.

Market segment: A piece or part of the overall market that shares similarities in its demographic traits, attitudes or views, that lead it to experience similar needs or desires.

Market segmentation: The process of splitting or segmenting the pet owner market into identifiable parts or segments that share similar traits. Market segmentation makes it easier for any business to identify and reach out to its most likely and/or lucrative targets.

Market viability: Determination of the probable success of a business venture based on an evaluation of demand, price, and quality of goods or services.

Marketing: The process of developing and delivering services and/or products matched to the needs of consumers with the ability, desire, and means to acquire them. Marketing includes service/product development, pricing, distribution, and promotion.

Marketing communications: Combination of activities designed to sell a product, service, or idea, including advertising, collateral (printed) materials, publicity, promotion, packaging, point-of-sale display, trade shows, and special events.

Marketing goals: The ultimate *measurable* outcome – or series of outcomes – that a business desires to achieve based on marketing opportunities and the realities of the marketplace.

Marketing mix: The unique blend of product, pricing, promotion, and place (distribution channel) designed to reach a specific group of consumers.

Marketing plan: Involves establishing marketing objectives, defining target markets, and deciding on the marketing mix.

Marketplace: A collective term for the representation of numerous market segments that span a wide range of consumer demographic and lifestyle traits.

Marketplace opportunity: An identified reason to pursue and reach out to a particular market segment as a result of unmet needs, dissatisfaction, inadequate delivery systems or other weaknesses affecting the segment.

Markup pricing: Pricing based on taking the acquisition cost and increasing it by percentage or factor to arrive at a retail price.

Masculine/male: Used interchangeably in this context. Having qualities or appearance traditionally associated with men, especially strength, aggressiveness and dominance.

Maslow's hierarchy of needs: People seek to satisfy basic needs and satisfying a lower level need results in the next level being a motivating factor.

Materials: Costs associated with providing products used for a service, including both direct and indirect costs.

Means test: A determination as to whether an individual, family, or group has the ability to pay for services without assistance (i.e., literally do they have the financial means to afford care without being subsidized).

Media relations: Relating with news media in seeking publicity or responding to their interest in an organization.

Medical records: Daily written reports by veterinarians on the animals he or she treats. They are required to be kept for each animal or companion animal. They may also be kept on herds or flocks, and for food- and fiber-producing animals.

Medicalese: Terminology used within the profession that may not be familiar to the client.

Medicalization: In veterinary medicine, this term has come to represent the percentage of animals that have been seen by a veterinarian at least once in a 12-month period. This is different from the sociologic use of the term to describe nonmedical issues that are described in medical terms of prevention, diagnosis, and treatment.

Medically important antibiotics: These are antibiotics that are used in both veterinary and human medicine and are characterized by the World Health Organization and the Food and Drug Administration as important for therapeutic use in humans. For example, macrolides and tetracyclines are "medically important" but ionophores are not, because they are not used therapeutically in humans.

Memory: The term memory is used for the information in physical systems which functions at high speed (i.e., random access memory).

Mentor: An experienced individual within your organization who is assigned to help the new employee navigate the culture and flow of the workplace, as well as manage office personalities and professional relationships.

Mentoring: An informal relationship where, on an ongoing basis, a more experienced individual offers guidance and/or career advice to a less experienced colleague.

Merchant: A business who accepts payments from consumers. Also, a type of bank account that allows businesses to accept payments by payment cards, typically debit or credit cards. A merchant account is established under an agreement between an acceptor and a merchant acquiring bank for the settlement of payment card transactions.

Merger: The act of several practices combining operations to create an economy of scale (reducing expenses) and improving the growth potential of the new entity.

Meta description: A snippet of text that summarizes a page's content, used primarily for search engine results purposes.

Microwave thinking: The mistaken perception that if changes are made, then results will be quickly evident. Most changes made will yield gradual improvement, which can be difficult to appreciate in times when instant gratification is expected.

Minimum order point: The level below which you do not want your stock to fall.

Minimum wage: There is a federal minimum wage; however, many states, cities or locales have higher minimum wages than the federal minimum wage. Ensure you are in compliance with the highest paid wage required in your location.

Mining: Cryptocurrencies are made through a very interesting self-limiting system called cryptocurrency mining, and the people who mine these coins are called miners. This involves commanding a computer, or a network of computers, to work around the clock to solve 'proof-of-work' problems.

Minor species: Animals, other than humans, that are not considered major species (i.e., cattle, horses, swine, chickens, turkeys, dog, cats).

Minority owner: An owner who does not have sufficient ownership to control business operations on their own.

Mission statement: Statement of the role, or purpose, by which a practice intends to serve its stakeholders.

Mixed animal veterinary practice: At least 25% of the client contacts are companion animal and at least 25% are either food animal or equine.

Mixed breed: An animal of unknown or mixed parentage. Mixed-breed dogs are sometimes referred to as mutts or mongrels; mixed-breed cats are sometimes referred to as moggies or mutt-cats.

Mobile application (mobile app): Software application designed to run on smartphones, tablet computers, and other mobile devices. They are available through application distribution platforms, which are typically operated by the owner of the mobile operating system, such as the Apple App Store, Google Play, Windows Phone Store, and BlackBerry App World. Some apps are free, whereas others have a price. Usually, they are downloaded from the platform to a target device, such as an iPhone, BlackBerry, Android phone, or Windows Phone, but sometimes they can be downloaded to less-mobile computers, such as laptops or desktops.

Mobile broadband: Term for wireless Internet access through a portable modem, mobile phone, Universal Serial Bus wireless modem, or other mobile devices.

Mobile device: Small, hand-held computing device, typically having a display screen with touch input and/or a miniature keyboard and

weighing less than 2 lbs (0.91 kg). Apple, HTC, Samsung, LG, Research in Motion (RIM), and Motorola are just a few examples of the many manufacturers that produce these types of devices.

Mobile health (mHealth): Subclassification of telehealth in which mobile applications (apps) and wearables are used to provide healthcare information for pets.

Mobile operating system: Also referred to as mobile OS, is the operating system that operates a smartphone, tablet, personal digital assistant (PDA), or other digital mobile devices. Modern mobile operating systems combine the features of a personal computer operating system with touchscreen, cellular, Bluetooth, Wi-Fi, GPS mobile navigation, camera, video camera, speech recognition, voice recorder, music player, near-field communication, PDA, and other features.

Mobile practice: Used to encompass house call and ambulatory practices, in which examinations and procedures take place inside the mobile unit, which may be equipped with an examination table, dental equipment, and/or a surgical suite.

Mobile search: Search taking place on a mobile device.

Mobile-friendly: A website that is easy to use on a mobile device or small screen size.

Modem: A device or program that enables a computer to transmit data over, for example, telephone, fiber optic, or cable lines.

Modified Accelerated Cost Recovery System: Depreciation system that applies to all recovery property (not land or intangibles) placed in service after 1986. This typically reflects a five-year depreciation on autos, light trucks, computers, and specialized equipment, and seven years on office equipment (except computers).

Modified income tax basis – cash: A method of accounting for income and expenses in accord with US tax laws, which in general, results in the reporting of revenues as payment is received from clients and of expenses as the practice makes payment to outside parties.

Mom-and-pop: A colloquial term for a small, closely held company in which the principals owning the business are also the principals working in the business.

Money factor: Term used in leasing that is similar to but not the same as interest on a loan. It determines how much you will pay in finance charges over the life of the lease. The lower the number, the lower the total final payment. To convert the money factor amount into an equivalent interest rate, simply multiply the money factor number by 2,400.

Monitored security system: An electronic building security system consisting of any combination of motion detectors, intrusion detectors, or other monitoring devices that is capable of relaying information to an off-premises company in order to alert the business owner or emergency personnel in case of a security breach. Security systems may also include panic buttons for manual notification by staff to the security company and/or police in case of emergency or fire.

Moral distress: When (1) you know the ethically appropriate action to take, but you are unable to act upon it, and (2) you act in a manner contrary to your personal and professional values, which undermines your integrity and authenticity.

Moral turpitude: The act of baseness, vileness, or the depravity in private and social duties that a human owes to his or her fellow human or society in general, contrary to accepted and customary rules of right and duty to others. It also includes acts or behaviors that gravely violate moral sentiment or accepted moral standards of a community.

Mortgage: Type of loan made on real property (real estate) in which the collateral for the loan is the real property.

Motivation: A method to move a person toward a goal using psychological, behavioral, cognitive, or social factors.

Motivators: Factors that create change in an employee's behavior, making his or her actions more consistent with or complementary to the practice's needs.

Mourning: When you take the grief you have on the inside and express it outside of yourself; the outward expression of grief.

Multimedia: Media and content that uses a combination of different content forms. Multimedia includes a combination of text, audio, still images, animation, video, or interactivity content forms.

Myers–Briggs type indicator (MBTI): A well-established test instrument that measures the personality traits and preferences of normal, healthy people. The test is a personality inventory, not a test of skills or abilities. The MBTI relies on four scales, each of which is a continuum ranging from a slight to a very clear preference for a particular characteristic. There are unofficial versions of the instrument available on the Internet, though their results may not be as reliable as the actual MBTI.

Myers–Briggs type indicator (MBTI) personality types: These (16 in all) are the result of individual preferences on the four MBTI scales. An individual's personality type does not change over time; however, people may express their type in somewhat different ways at different times, and at different ages and stages of life.

Myofascial trigger point diagnosis and therapy: The diagnosis and treatment of hyperirritable soft tissue (fascial, tendon, ligament, muscle) areas which are a source of pain, decreased healing, and altered function.

Mystery shoppers: Individuals known to management, but unknown to the team, who call or visit the practice and report back to management about their experience. Mystery shoppers can be used to assess the practice's client service efforts from the client's perspective.

National Animal Supplement Council (NASC): The NASC is a nonprofit industry that provides guidelines for product quality assurance, adverse event reporting, and labeling standards for animal supplements.

National Labor Relations Act: Federal law that grants employees the right to organize and bargain collectively with their employers (the most common means is through a labor union).

Natural disaster: A tornado, hurricane, blizzard earthquake, wildfire, or even severe weather such as lightning storms.

Near-field communication: A wireless technology that allows devices to communicate by touching or "tapping" them, or by holding them in close proximity to each other.

Need: Require something because it is essential or very important.

Negative feedback: Feedback pointing out what someone has done incorrectly so that they can change it. This form of feedback should still be framed positively; however, in many cases it is not and becomes criticism.

Negative stress: Also known as distress, this refers to the body's response to stress that lacks positive attributes and outcomes. Not all stress is bad, and negative stress refers to those stressors that cause anxiety or concern, is perceived as outside our coping abilities, can decrease performance, and can lead to mental and physical problems.

Neglect: Often relegated to negative acts causing unnecessary injury or death to an animal, such as deprivation of medical attention, ventilation, shelter, space, and sustenance.

Negligence: Doing an act that a person of ordinary prudence would not have done under similar circumstances, or the failure to do what a person of ordinary prudence would have done under the same or similar circumstances.

Negotiated bid: In some circumstances, it is a benefit to the owner to hire the contractor early and negotiate the project scope and cost. The benefit of this method is it maintains control for the owner, and yet reduces unknowns. However, this method may not yield the lowest cost as it is less competitive than design–bid–build.

Negotiation: Any communication process between individuals that is intended to reach a compromise or agreement to the satisfaction of both parties; a discussion aimed at reaching an agreement.

Net book value: The historical asset cost less accumulated depreciation since the purchase date.

Net capitalization cost: The amount that is actually being financed by a lease—the retail price minus any discounts and customer down payments

Net cash flow: Revenue less expenses plus noncash expenditures (depreciation and amortization expenses, for example).

Net operating profit: The dollar amount left over after all normal and necessary operating expenses calculated at fair market value rates are subtracted from the revenue of the practice.

Net present value: The value of an investment calculated by comparing the initial cash outlay with the present value of the future net cash flows by using a management-determined interest rate of return.

Net profit (profitability measure): A monetary amount equal to gross income from operations, less cost of professional services, and less general and administrative expenses (before interest income or expense, before income tax expense, before any other sources of income or expense other than from veterinary services and retailing).

Net promoter or net promoter score: A management tool that can be used to gauge the loyalty of a practice's client relationships. It serves as an alternative to traditional client satisfaction research and is correlated with revenue growth. www.netpromoter.com.

Network: A collection of computers and other hardware components interconnected by communication channels that allow sharing of resources and information.

New client target: Population characteristics affect the number of new clients each practice needs to maintain its transaction volume. The general rule of thumb is 30 new clients per month per full-time equivalent veterinarian. These 30 "new" clients represent replacements for the 10–15% typical client attrition. If a practice wishes to grow, it must exceed this number.

News media: Any number of news and information outlets that might have an interest in covering a practice's news situation.

Niche lender: Lender who has a particular expertise or area of interest for lending money. Factors other than availability of collateral and down payment are considered when evaluating a loan. Veterinarians are considered one of the best credit risks because, as a profession, they have a high payback history. There is a subcategory of lenders that lend only or primarily to veterinarians because of this fact.

No fault point policy: Generally, an employee accrues a point per absence with a tracking policy. Once the employee has accumulated a set number of absences, you would then subject the employee to increased levels of discipline. Also known as a progressive disciplinary policy. If the employee does not change course, he or she could have their employment terminated.

Noise reduction coefficient: A representation of the amount of sound energy absorbed by a particular surface.

No-Lo™ practice: A term coined by the Veterinary Valuation Council of VetPartners describing a practice with no profit–low profit or no value–low value.

Nomadic computer: Portable, wireless computer system, such as a tablet- or notebook-type personal computer or personal digital assistant. Nomadic computers and wireless networks can provide flexibility in a veterinary hospital.

Noncompete clause: In this case, it would be a contractual agreement between a landlord and a tenant to restrict a specific type of tenant from the development. For example, this type of agreement would not allow the introduction of a new PetSmart or large veterinary hospital into the same shopping center as an original, small-scale veterinary clinic.

Noncompetition: A noncompete agreement is a promise by an employee not to compete with his or her employer for a specified time and within a specified geographic region.

Noncompliance: This describes the veterinarian's lack of maintaining adequate medical records to meet the minimum requirements stated in a Veterinary Practice Act.

Nonexempt: Staff members covered by the Fair Labor Standards Act minimum wage and overtime regulations. Technicians and receptionists are typically nonexempt employees.

Nonlinearity: A relationship between x and y wherein a unit change in x will not always bring about an equal unit change in y. The graphic representation of this relationship is a curve rather than a straight line.

Nonoperating assets: Assets not related to ongoing operations of the business enterprise; if the assets were eliminated from the business, the resulting earnings would be unchanged. An example is a vehicle owned by the hospital but used exclusively by the business owner for personal transportation. Also referred to as redundant assets.

Nonprofit: An entity that is not conceived for the purposes of earning a profit, but rather to serve a public good.

Nonrelated business income: Income earned by a charitable corporation from the sale of goods or services unrelated to its charitable purpose. For example, a corporation sells pet supplies to raise money to treat the pets of indigent owners. The proceeds from the sale of the pet supplies are considered nonrelated business income. A corporation that earns income from providing medical services at a discounted rate for pets of indigent owners is earning related business income because the income is related to its charitable purpose (providing medical services to the pets of those in poverty).

Nonverbal communication: Aspects of communication, such as gestures and facial expressions or body postures, that do not involve verbal communication; this may include aspects of speech (accent, tone of voice, speed of speaking, etc.).

Normalizing: Providing a verbal message to the client that indicates the acceptance and normalcy of their preferences, thoughts, feelings, ideas, concerns, behaviors, and/or responses. For instance, "A lot of clients have trouble reading and remembering these materials. How can I help you?"

Normalizing adjustments: Adjustments made to financial data so that they conform to industry accounting principles and to eliminate nonrecurring, extraordinary and excess items.

Norming: Working styles are agreed to and systems are set up.

Not allowed: Zoning term meaning specific businesses or uses are not allowed on a site as zoned.

Note/loan: Promise to pay a debt. Debt secured by property used as collateral against which a lien has been filed is a secured note. If there is no collateral, the note/loan is unsecured and is the equivalent of a "handshake" loan.

Not-for-profit: Any activity that is conducted without purposes of earning a profit. Often used interchangeably with nonprofit.

Occupational exposure: Dose received by an individual during the course of employment.

Occupational Safety and Health Administration (OSHA): The OSHA is a division of the US Department of Labor. Twenty-five states and territories of the United States have state-level OSHA agencies.

Occupational stress: The particular stress that arises from working in a specific occupation.

Occupational workers: Workers who are expected to come in regular contact with radiation-producing sources. In the veterinary field, veterinarians and paraprofessional staff are typically considered occupational workers. Occupational workers must be at least 18 years of age.

Offer of employment: An offer is "a manifestation of willingness to enter into a bargain, so made as to justify another person an understanding, their assent to that bargain is invited, and so they will conclude it." As stated, the existence of an offer is presumed where the employment agreement is expressed. Where an employment agreement is implied, the offer may be oral or derived from writing such as a hiring letter or policy statement. The two main requirements for an offer to be enforceable are that it must be definite and it must be certain.

Office manager: Administrative staff primarily responsible for reception, clerical, and nonmedical staff in a practice. There is no standard definition for this term; and it is unregulated, so anyone can refer to himself or herself as an office manager.

Office politics: When an individual or group tries to circumvent the system to gain privileges or power by manipulating events or other people to their advantage, usually in an underhanded manner. This works against teamwork and fairness in the workplace.

Off-label: Pharmaceuticals prescribed, dispensed, or administered for an unapproved indication. Also referred to as extralabel drug use.

Omnichannel consumer: Consumer exposure to information and marketing messages, preferably seamlessly, through a variety of different channels, including bricks-and-mortar stores, the internet, apps, and so on.

On-boarding: The process of helping new employees become productive faster by providing them with documentation and training related to practice culture, vision, policies, protocols, and expectations.

On-the-job training: Method of training that focuses on employees acquiring skills within the work environment under normal working conditions. Through on-the-job training, team members acquire both general skills that they can transfer from one job to another and specific skills that are unique to a particular job. This form of training typically includes verbal and written instruction, demonstration and observation, as well as hands-on practice. In addition, the on-the-job training process involves one employee – usually a supervisor or an experienced employee passing knowledge and skills on to a novice employee.

Open-book management: The premise that employers should share with employees the measures of the practice's business success so that employees better understand the efforts that impact the success of the business.

Open-ended question: A question that cannot be answered with a yes or no but requires a developed answer. These questions help identify opinions, attitudes, and beliefs.

Operating agreements: Agreements that are the very essence of a limited liability company or can also be agreements used as part of a partnership agreement to explain the management terms and exit strategies for one or more of the owners.

Operating budget: The most common budget format encompasses a 12-month period of operations. Operating budgets typically include those items found on a profit-and-loss statement, but not usually items found on a balance sheet or cash-flow statement.

Operating expenses: Also known as "fixed expenses." These expenses are less likely to go up and down directly related to sales. Examples are rent, staff wages, employee benefits, telephone, advertising, insurance, and so on.

Operating lease: A true lease is generally for a short term, and ownership of the asset (the object being leased) remains with the lessor at the end of the lease.

Operating/maintenance costs: Ongoing costs incurred when you own a facility.

Operating system: A collection of software that manages computer hardware resources and provides common services for computer programs. The operating system is a vital component of the system software in a computer system. Application programs require an operating system to function.

Operational revenues: Increases in owner's equity resulting from veterinary professional activities and sales entered into for the purpose of earning income.

Operations manual: An organized resource for each of the processes that take place in delivering a business model; it includes documents that describe in detail the processes and systems that a company uses to provide its services.

Opinion of value: The most unambiguous expression of value, expressed as a single value.

Opportunity cost: A benefit that could have been realized, but was not, because an alternative was selected instead.

Optimization: In online terms, the strategy and tactics used to make a website favored in search.

Option to purchase: The rights given to surviving or remaining shareholders allowing them the chance to purchase available shares before they can be sold to any other third party.

Ordering costs: Costs associated with employee time used for shopping, ordering, receiving, and documenting purchased products.

Organizational behavior: The values and behaviors that contribute to the unique social environment within an organization.

Organizational chart: Overview of who reports to whom within an organization.

Organizational compassion fatigue: As a result of employing those with compassion fatigue, the effect on the organization where the personal symptoms of compassion fatigue are incorporated into the culture of the corporation; the productive mission of the organization is replaced by policies, procedures, and goals that reflect high levels of dysfunction.

Organizational pyramid: A charted structure that usually puts the front-line workers at the bottom or base of the pyramid, with increasing tiers of management levels ascending to the owners or executives of the company at the apex.

Orientation training: Introductory training that all new employees should receive. It is informational and typically covers hours of operation, confidentiality, pay and compensation, dress code, practice mission and philosophy, overview of how the hospital works and expected interaction between the departments, hospital policy and goals, grounds for dismissal, and the "trial period" for new employees.

Outbound telephone calls: Telephone calls to clients that are initiated by the practice. Their purpose is to increase the purchases of veterinary services, improve client service, and salvage lost accounts.

Outer leadership qualities: Qualities an individual must possess as outer signs that he or she can be an effective leader – communication skills, visibility, teamwork, attentiveness, and commitment.

Overcapacity: Situation in which there is capacity available to perform services, but inadequate demand to perform those services at capacity.

Overhead: Costs of operating a business, even if no clients avail themselves of any services.

Overtime: Hours worked in excess of the maximum regular number of hours fixed by statute, union contract, or custom. Typically, all time worked in excess of 40 hours per workweek.

Overtime compensation: In the United States, overtime compensation is typically one and a half times the regular rate of pay.

Owner: One who has the right to possess, use, and convey something.

Ownership: The bundle of rights allowing one to use, manage, and enjoy property, including the right to convey to others.

Page speed: The time it takes for the content on a website page to load.

Pain score: The application of an objective rating to a subjective acute physiologic, psychological hurtful experience.

Palliative care: Treatment that supports or improves the quality of life for patients and caregivers by relieving suffering; this applies to treating curable or chronic conditions as well as end-of-life care.

Paper light practice: A practice that uses practice information management software but continues to use some paper forms in the workflow of the practice.

Paperless practice: Digital utilization of the practice management software for recording patient history, invoicing, inventory control, marketing, financial tracking, production reporting, and team communication pertaining to patient care and status. In-house and outside laboratory services are connected, and reports stored digitally. Digital diagnostic devices such as radiography, ultrasound, magnetic resonance imaging reports are also stored as part of the patient medical history. Paper patient history charts are no longer utilized.

Paralanguage: Range of voice tone, rhythm, volume of speech, degree of emphasis, and rate of speech.

Parent: Be or act as a mother or father to someone.

Partner: A person who has joined together with one or more persons to carry on a partnership.

Partner clinic: A full-service veterinary practice to which a mobile practice may be affiliated.

Partnership: An association of two or more persons to carry on as co-owners of a business for profit.

Partnership agreements: An agreement between partners, whether a general partnership or a limited partnership, that explains the terms of management and exit strategy.

Partnership-at-will: Partnership in which the partners have not agreed to remain partners until the expiration of a definite term or the completion of a particular undertaking; in other words, to practice as partners for an indefinite term until one or all of the partners elect to leave or dissolve the partnership.

Partnership interest: All of a partner's interest in the partnership, including the partner's transferable interest and all management and other rights.

Pass-through of losses: The net income or loss of a pass-through entity is passed through and taken into account by the owners in proportion to their ownership. Thus, an S corporation shareholder or limited liability company member may use his or her pro rata share of losses to offset other income, subject to loss and basis limitations.

Patient log: Any record or list of patients that have received a particular service or product. The log generally has additional pertinent information, such as excerpts from the patient's medical record and/or items helpful in the billing process (e.g., laboratory logs and new-patient lists).

Pay period: Length of time covered by each payroll session. Pay periods typically include the amount of time covered as well as the specific starting and stopping points. The most common lengths of a pay period are weekly, biweekly, and semimonthly.

Payday: The day that the staff is supposed to receive their paychecks. When determining the payday, it is important to allow for a sufficient amount of time between the end of the pay period and payday to allow for check preparation. A common scenario is for a pay period to end on Sunday night at midnight, and payday to be on Thursday. This allows all day Monday, Tuesday, and Wednesday for processing.

Payment plan: A bundled medical plan in which specified veterinary services are provided and paid for in installments or prepaid, rather than at time of service. Sometimes referred to as wellness plans or concierge plans.

Payment plan management services: Companies that set up in-house payment plans for veterinary practices. These companies typically assess credit, set up automatic bank withdrawals from the pet owner's account, and follow up if payments are not made.

Pay-per-click (PPC): PPC is a model of internet marketing in which advertisers pay a fee each time one of their ads is clicked. Essentially, it's a way of buying visits to your site, rather than attempting to "earn" those visits organically.

Pay-per-view advertising: Online advertising in which the cost is determined by number of views.

Payroll: The amounts paid to employees as compensation for the services provided to the practice.

Payroll processing: This term encompasses all of the steps it takes to be able to pay staff. Processing begins with obtaining the time records for each hourly worker and entering them into your system; it ends with getting the checks signed and distributing them to your staff. How many steps are involved and how time consuming it is depends on each unique situation.

Payroll taxes: Taxes that are paid by employees and employers. During payroll periods, the employer pays one half of the taxes and withholds the employee's one half and submits payments to the state and federal government. These taxes are comprised of social security and Medicare taxes, which are mandated by the Federal Insurance Contributions Act, and unemployment taxes, which are mandated by the Federal Unemployment Tax Act and state counterparts.

Pedigreed: An animal whose ancestry is recorded by a registry organization.

Per diem: Staff members scheduled one day at a time as needed by the practice. For example, a former staff member hired on a per diem basis may be called in to cover operations during a staff meeting.

Perception gap: Sometimes, a practice wants to be understood or thought of in one way, but the marketplace has a different view. The result is a perception gap – the desired reality and the actual reality are not in alignment.

Performance appraisal: A system of determining how well an individual employee has performed during a period of time. The appraisal may include some form of a development plan to address insufficient performance and to reward appropriate and exceptional efforts.

Performance review: A formal individual performance appraisal and/or review process. Generally performed by a more senior staff member on or about a more junior employee.

Performing: Teams work positively, creatively, and productively together.

Periodontal disease: Disease of tissue surrounding the teeth – attached gingiva, alveolar bone, periodontal ligament, and cementum of the root

Peripheral: Generic term for all pieces of hardware excepting, of course, the computer itself. Accessory pieces such as printers and scanners, however, are considered hardware peripherals.

Perpetual inventory: System of inventory control in which the number and value of inventory items can be determined directly by stock records and are updated directly as transactions occur. By adhering to perpetual inventory principles such as the cycle of ordering, receiving, selling, and cycle counting, practices can develop an accurate quantity on hand within an automated inventory system such as through your practice information management system.

Perpetual survival: Businesses, if successful and profitable, need perpetual or uninterrupted existence, whether one or more shareholders desire to leave or not.

Perquisite (Perk): An incidental or "fringe" benefit.

Person: As defined in the Americans with Disabilities Act, "person" includes one or more individuals, governments, governmental agencies, political subdivisions, labor unions, partnerships, associations, corporations, or legal representatives. Thus, from this definition, it can be seen that employers include the private sector and state and local governments employing 15 or more employees. The federal government, however, is expressly excluded.

Personal protective equipment: Various pieces of equipment that need to be purchased and brought into the facility for the safety and protection of the staff. Examples include eyewash stations, safety goggles, and lead aprons for radiology.

Personalty: Personal property; compare "realty," which is real property.

Pesticides: Any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest. Generally speaking, pesticides must be registered with the Environmental Protection Agency prior to distribution or sale, unless they are otherwise excluded or exempted from regulations.

Pet-specific care: An approach that tailors veterinary care to individual pets based on their predicted risk of disease and likely response to intervention.

Pharmacovigilance: The science and activities relating to the detection, assessment, understanding and prevention of adverse effects or any other drug-related problem.

Phishing: Attempting to acquire such information as passwords, user names, and credit card details though electronic communication by posing as a trustworthy entity.

Phobia: Persistent and excessive fears of certain things or situations that are usually out of proportion to the actual threat that they present. Examples include fireworks, thunderstorms, and fire alarms.

Photovoltaic system: A solar-powered, energy-producing system used to generate electricity.

Picture archiving and communication system (PACS): A medical imaging technology that provides economical storage of, and convenient access to, images from multiple modalities (source machine types). Electronic images and reports are transmitted digitally via PACS; this eliminates the need to manually file, retrieve, or transport film jackets.

Piercing the corporate veil: Courts are often asked to issue a judicial order stating that the corporate owners are liable for the corporation's unpaid debts. If courts agree to issue the order, this is known as "piercing the corporate veil." Courts look at certain actions by business owners and management to determine if the order is warranted, such as whether owners failed to observe corporate formalities (keeping minute books, passing resolutions, holding board meetings, etc.) and if they treated the corporation as a separate entity or just as a continuation of themselves.

Pioneer drug: The brand name or patented version of a drug, later copied to make generic drugs after the patent expires.

Plan B: An alternate strategy, often considered as a second choice to a preferred strategy.

Planning, zoning, building, and permitting departments: Municipal entities that control, enforce, and maintain the physical development of land.

Points: A fee paid to the lender at the initiation of a loan, negotiated in exchange for a lower interest rate and that effectively equates to prepaid interest. One point equates to 1% of the borrowed principal amount.

Policy manual (employee handbook): The policy manual is the document that describes the employment policies of a specific employer, describing what the employer expects of the employee, and what the employee can expect from the employer; this term puts the focus on the content of the document, and the policies existing within the document.

Portal, patient: Healthcare-related online applications that allow clients to interact and communicate with their pet's healthcare providers, such as veterinarians. Typically, portal services are available on the Internet at all hours of the day and night.

Positioning strategy: Defining a practice and creating a market identity that's in alignment with the needs and desires of the practice's targets. A practice's positioning is conveyed through every way in which it interacts with pet owners, including the practice's facility, visual devices and symbols, people, services, and service delivery. All these elements work together to create an understanding of what pet owners can expect when they walk in the door.

Positive feedback: Feedback that is supportive of what someone has done, and framed positively.

Possessory lien: A lien allowing the creditor to keep possession of the encumbered property until the debt is satisfied. A power of sale may or may not be combined with this right of possession.

Postdated checks: Checks written on the current day, but dated for a future date. It is risky to accept these, and it may be illegal in some areas. Prosecutors likely will not prosecute a postdated check.

Post-traumatic stress disorder: The impact of experiencing a traumatic event first hand.

Practice app: Application used on smartphones that allows easy access to a business and improves the client experience.

Practice culture: Refers to the attitudes, motivation, values, role expectations, and beliefs that employees have about their daily work environment.

Practice information management software: The software that tracks client and patient data and interactions in a veterinary hospital. Also known as practice management software.

Practice management software: Software that deals with the day-to-day operations of a medical practice. Such software frequently allows users to capture patient demographics, schedule appointments, maintain lists of insurance payers, perform billing tasks, and generate reports. Also known as practice information management software.

Practice manager: Similar to an office manager, but typically with more responsibility for staff supervision and human resource issues. This is an unregulated term, although there is a certification program (Certified Veterinary Practice Manager) offered by the Veterinary Hospital Managers Association.

Practice models: The array of various aspects of ownership and management of veterinary practices, including the practice size and the scope and breadth of services or markets served.

Practice positioning: Defining how a practice wants to be understood in the marketplace; the space the practice seeks to occupy in the minds of pet owners. Positioning is essentially determining how a practice will "look and talk" in the marketplace.

Present value: The current monetary value of some defined investment return, given a specified rate of return.

Present value of money: The present value of an amount of money that is expected to be received at a specified time in the future is the amount that if invested today at a specified interest rate would accumulate to that given amount.

Presenteeism: The practice of being at work while ill or not performing to full potential while at work.

Pretax contributions: Contribution to a retirement plan made from employee earnings that are not included in the employee's taxable income for that year. When funds are finally withdrawn from the plan, the contribution is considered taxable income because it was not previously taxed.

Primary beam radiation: Ionizing radiation as it leaves the radiographic tube and collimator. This should never strike veterinary staff.

Primary care physicians: Physicians who coordinate and manage the regular medical care of patients. Also known as first-opinion physicians in some countries, they see patients for all services and refer to specialists as necessary.

Prime rate: Based on the federal funds rate set by the Federal Reserve, the prime rate is the interest rate used by banks in lending to their best clients.

Principal: Borrowed amount of money, excluding any interest on the outstanding amount. Over time, with regular payments, the principal balance of a loan gradually decreases. With a fixed payment amount per period, the earliest payments primarily satisfy

the interest accruing on the note. Loan payments made later in the term increasingly reduce the principal portions of the note.

Privacy policy: A written or legal statement that discloses how a practice uses or intends to use a client or customer's data. Generally pertains to nonmedical information, such as name and demographic data, but may also include purchasing data, credit card information, data gathered online, and other potentially sensitive information.

Private buyers: Individual associates at a practice or third-party private buyers. These individual buyers may be either veterinarians or nonveterinarians desiring to purchase to own an investment, where they may or may not work.

Private foundation: A nonprofit organization which is usually created via a single primary donation from an individual or a business and whose funds and programs are managed by its own trustees or directors.

Pro forma: Projection or estimate of what may result in the future, given current assumptions and predictions. This is the financial estimate of how the business will do if certain assumptions are achieved.

Probate: The court process by which a will is proved valid or invalid.

Procedure log: Procedure logs help ensure that tasks have been completed and/or completed in a specific manner (e.g., a practice housekeeping checklist or a record of dates evidencing that someone has calibrated the in-house laboratory instruments).

Processor: Processes the critical information and instructions that make your computer perform.

Product development: Developing new products or services for sale to existing clients.

Production: A form of commission paid to veterinarians on the basis of their revenue generation.

Production label claims: A label claim that was not for disease control, treatment, or prevention but was for an enhancement to production, such as "increased rate of weight gain" or "improved feed efficiency." These label claims were voluntarily withdrawn by drug manufacturers in 2016 and the Food and Drug Administration will no longer approve a drug application with a production claim.

Production report: Report produced by your practice management software that shows fees by service code (i.e., surgery, examinations, vaccinations, retail sales, etc.).

Productivity: The rate at which goods or services are produced per unit of labor. Productive employees are satisfied, motivated individuals working toward a common goal. A productive business is one that generates revenue from efficient inputs of resources and labor.

Professional development plan: A plan assembled by an organization's management for the purpose of enriching its employee's skills and enhancing their careers, and at the same time aligning the employees' motives with the organization's business needs and goals.

Professional liability: Insurance that protects against claims arising from acts, errors, or omissions in rendering services of a professional nature.

Professional salaries: Compensation paid to owner, associate, and relief veterinarians. In the case of owner compensation, it includes any monies received out of the practice due to ownership, whether they are from veterinary salary, owner bonuses, return on investment, management fees, or division of profits.

Profit and loss statement: Also known as the income statement, this is a report on financial performance that covers a period of time and reports income and expenses during that period.

Profit center: A section of a practice that can be assessed in terms of its revenues and expenses (e.g., surgery, imaging, or laboratory).

Profit center report: Report that tracks income from related service codes (e.g., all dentistry codes) and expenses related to producing that income (doctor and tech time, dental supplies, dental equipment, etc.), arriving at the profit (or loss) for those practice areas.

Profit margin: The dollar amount of profits divided by the gross revenue of the practice and expressed as a percentage.

Profitability: The revenue for a practice once all expenses are paid, a fair market facility rent is paid, and the owner is compensated at a rate similar to what employees in the same position are paid.

Pro-forma budget: Budget that charts a course of future action for the practice by outlining and defining the plans of the practice in financial terms.

Programming: Information-gathering process during which the design team gathers information from the owner regarding his or her needs. The product of programming may be a list of rooms and room sizes that may be referred to as the "program" or the "program plan."

Project: A project is a temporary endeavor with a defined beginning and end (usually time constrained, and often constrained by funding or deliverables), undertaken to meet unique goals and objectives, typically to bring about beneficial change or added value.

Project management: The discipline of planning, organizing, securing, managing, leading, and controlling resources to achieve specific goals.

Projected value: Projected value is your best guess for anticipated future performance. For example, if last year the practice generated $1,000 and next year it expects to generate $1,100, the practice's projected value is $1,100.

Promotion: The act of encouraging a trial or persuading an action to contribute to the growth and advancement of a business.

Property: All property owned and used in the operation of the partnership, including real estate, personal property, and tangible and/or intangible property.

Prophy: Colloquial term for a dental prophylaxis procedure.

Pros/cons analysis: A decision-making tool that weighs advantages (pros) and disadvantages (cons) of a contemplated change. Weighting may be assigned to various pros and cons.

ProSal: The practice of compensating veterinarians with a base salary and performance bonuses for personal production exceeding a specific threshold. The term is a conflation of "production" and "salary" and provides the security of a salary with the opportunity to earn more.

Prospect: An identified potential client that can be targeted for business.

Protocol: The form and etiquette observed for a specific event or procedure.

Pro-veterinary: Content that supports the message and recommendations of veterinarians and the veterinary profession.

Proxemics: Spatial relationships or distance between individuals when communicating, including barriers that may inhibit the communication process.

Psychographics: Research that attempts to explain behavior by analyzing people's personality traits and values.

Public affairs: Developing effective involvement in public policy, and helping an organization adapt to public expectations; also a term used by military services and some government agencies to describe their public relations activities.

Public relations: The art of developing reciprocal understanding and good will between a business and the public.

Publicity: The act of delivering information of news value as a means of gaining public attention or support.

Publics: Any group with some common characteristic with which an organization needs to communicate, including the media, government bodies, financial institutions, pressure groups, and so on, as well as customers and suppliers.

Pull marketing: The opposite of "push" marketing. Marketers seek to engage and connect with consumers through relevant and

compelling content with the goal of consumer engagement leading to sales.

Purebred: An animal bred from parents of the same breed or variety; one whose ancestry contains members of the same breed.

Push marketing: Promotional efforts that rely on aggressive advertising campaigns to disperse often one-sided information on products and services with the goal of consumer sales.

Push notifications: This allows a smartphone to receive and display alerts even when the device's screen is locked and the application that is pushing the notification is closed.

Quality of life: The total wellbeing of an individual animal that considers the physical, social, and emotional aspects of its life.

Quality-of-life score: The objective rating of criteria that determine how well an animal lives and daily functions long term, usually with a chronic disease, impairment, or pain.

Quantitative and qualitative research: Quantitative research generates numerical data or information that can be converted into numbers. Qualitative research, on the other hand, generates nonnumerical data.

Query: Precise request for information retrieval with database and information systems.

Quick asset: An asset that can be converted to cash (liquidated) rapidly: cash, accounts receivable, short-term notes receivable, certificates of deposit, and other short-term investments in marketable securities. Specifically excludes inventory.

Quid pro quo sexual harassment: Occurs when a supervisor conditions the granting of employment benefits upon the receipt of sexual favors from a subordinate, or when a supervisor punishes the subordinate for refusing to submit to his or her request for sexual favors.

Radiation dose: Measured in millisieverts (mSv) or rems (Roentgen equivalent man).

Radioisotopes: Versions of an element that have a greater atomic weight due to additional neutrons. Unstable isotopes that emit ionizing radiation are known as radioisotopes.

Radiology information system: System that integrates hospital management software with picture archiving and communications system and viewing software.

Ransomware: Malware that encrypts the files on the computer making them unreadable unless a ransom is paid.

Rate of return: The amount an investment appreciates or depreciates over time, often expressed as a decimal (e.g., 0.06) or a percentage (6%).

Reach: The total number of different people or households exposed to a medium during a given period.

Real estate investment trust (REIT): An investment company that owns and manages a portfolio of real estate properties and mortgages. Most REITs trade like stocks on financial markets, and REITs are sometimes referred to as "real estate stock."

Real-time laboratory testing: Laboratory testing performed at the hospital (in-house), by the hospital team, for immediate results.

Reasonableness: The subjective standard by which the actions of a veterinarian with similar qualifications, skills, and knowledge is determined.

Receptionist manual: Outlines all front-desk procedures in a step-by-step manner. Examples may include processing insurance claims, third-party payment applications, and payment plans. This manual typically includes customer service policies. It also outlines a vast array of procedures from how to answer the telephone to how to arrange for a pet's cremation. Furthermore, it includes step-by-step instructions on how to operate all of the standard features of the office automation equipment, including the telephone system, voice mail, facsimile machine, the credit card machine, and the practice management software.

Recklessly: The actor is consciously creating a risk that injury might result with a probability less than substantial certainty (if the actor knows that injury is certain to result, they act knowingly). It is an unjustified, substantial risk known by the actor and consciously disregarded by the actor. Their fault is indifference.

Recurring revenues: The portion of a company's revenue that is highly likely to continue in the future. This is revenue that is predictable, stable, and can be counted on in the future with a high degree of certainty, and usually does not require the major costs of new customer acquisition.

Red flag rules: A set of federal regulations that require certain businesses and organizations to develop and implement plans to keep client information secure in efforts to discourage identify theft.

Redemption agreement: Another name for the buy/sell agreement where the business entity or corporation is buying the shares of an exiting owner.

Reference laboratory: Offsite laboratory where tests are done on clinical specimens in order to get information about the health of a patient as pertaining to the diagnosis, treatment, and prevention of disease.

References: Individuals the candidate has personally selected who are willing to be contacted by a potential employer regarding the candidate's qualifications.

Referring veterinarian: The referring veterinarian is generally the primary care veterinarian for the pet that is usually a general practitioner.

Referring veterinarian liaison: A staff member such as a technician who works with the hospital manager and specialists to facilitate improved relationships with area practitioners. Duties include oversight of follow-up referral reports, fielding phone calls from referring veterinarians, organization of incoming medical records, assisting specialists with follow-up phone calls to area veterinarians, and clinic visitations.

Refills: The Veterinary Feed Directive cannot allow refills unless the label specifically allows refills. If a label is silent to refills, then refills cannot be authorized.

Reflective listening: Communication technique whereby the veterinarian demonstrates to the client that his or her interests and concerns have been heard. It focuses completely on what the client is saying and confirms understanding of the message content and the underlying emotions to ensure an accurate understanding.

Regenerative medicine: The process of creating and implanting living, functional tissues to repair or replace tissue or organ function lost due to age, disease, damage, or congenital defects.

Regular rate: The regular rate is an hourly rate equal to the amount an employee receives per hour for all time worked during any workweek, without regard to the manner and means by which employees' pay is earned.

Regulated medical waste: A subcategory of solid waste covering biohazardous or infectious waste produced by the diagnosis, treatment, or vaccination of animals.

Rehabilitation modalities and therapies: Techniques and tools used to enhance and restore functional ability and quality of life to those with physical impairments or disabilities via focus on connective and nervous tissues.

Relevant: Meaningful and applicable to a particular target; pertaining to the target in a way that members can relate.

Relinquished property: The property being sold.

Relinquishment: Giving up a pet for adoption or euthanasia.

Remote desktop: Remote desktop software refers to a software or an operating system feature allowing applications to be run remotely on a server while being graphically displayed locally.

Remote or cloud backup: Cloud-based backup systems are typically built around a software program that runs on a schedule, typically once a day, and usually at night while computers are not in use. This

program typically collects, compresses, encrypts, and transfers the data to the remote backup service provider's servers or offsite hardware.

Remote rate: A different hourly wage for working remotely as compared to working in the hospital. Some practices pay the same rate, others pay less, believing that remote work is an employee convenience, while others pay more to offset the employee's office expense.

Remotely: From a distance or without physical contact.

Remuneration: All monies received for time worked in a pay period, whether deemed wages, commissions, nondiscretionary bonuses, tips, or any other form of compensation for services rendered.

Reorder point: Inventory level at which additional product is ordered.

Replacement property: The property being purchased.

Request: Generic term used by many practices to indicate that a client has requested a specific doctor when scheduling an appointment.

Research: Determining attitudes and behaviors of publics and their causes in order to plan, implement, and measure activities to influence or change the attitudes and behavior.

Residency: A two- to three-year period of supervised, advanced training in a concentrated discipline of veterinary medicine with the intent to qualify for specialty certification. An internship may or may not precede a residency.

Resilient: Capable of absorbing impact without permanent deformation. Resilient flooring materials tend to be more comfortable under foot, especially during extended periods of standing as may be experienced in treatment or surgery areas.

Resinous: Self-leveling, or troweled-on, liquid-applied flooring materials consisting of epoxy, acrylic, or urethane resins.

Responsibility: The duty to perform or complete an assigned task.

Responsive design: A website design that automatically adjusts content based on screen size.

Restrictive covenant: Any type of agreement that requires an individual to take or abstain from a specific action.

Résumé: A brief summary of personal, educational, and professional qualifications and experience, typically used as part of a job application.

Retail-anchored practice: A veterinary practice affiliated with a retail entity.

Return on investment (ROI): Income that an investment generates compared with the cost of the investment. ROI is a measure of how effectively a firm uses its assets to generate profit.

Revenues: All sales of the practice for goods and services. Also referred to as income, and in some countries as "turnover."

Reverberant sound: Sound waves that bounce off surfaces.

Review: An evaluation of a publication, a product, a service, or a company.

Right of first refusal: The rights given to surviving or remaining shareholders allowing them to meet or match a third party's offer to purchase available shares of a business, within a prescribed specific amount of time.

Risk: The level of danger to an individual, business, or community based on an analysis of threat versus vulnerability.

Risk management: The identification and assessment of risks and minimizing their impact, such as with insurance or reducing risk factors.

Roadblock: Typically an employee who works to prevent another employee from achieving his or her goal(s).

Robust password: Meaning "tough" or "complex" password. It must contain at least eight characters, including at least one upper-case letter, at least one lower-case letter, at least one symbol, and at least one number. It may not contain words in the dictionary or proper names.

Roll-up merger: A roll-up (also known as a "roll up" or a "rollup") merger occurs when investors (often private equity firms) buy up companies in the same market and merge them together. Roll-ups combine multiple small companies into something bigger and better to be able to enjoy economies of scale. Private equity firms use roll-ups to rationalize competition in crowded and/or fragmented markets and to combine companies with complementary capabilities into a full-service business.

Rooftop unit (RTU): This is a term used to define a prepackaged heating, ventilation, and air conditioning unit that combines gas-powered heating, a fan unit, and cooling. RTUs are often combined with energy recovery ventilators, which reduces the RTU's required capacity. RTUs are the most common solution for veterinary hospitals.

Rotating schedule: The staff, their shifts, and their responsibilities rotate. The rotation may be always the same (fixed) or random in nature.

Router: A device that forwards data packets between computer networks, creating an overlay internetwork. A router is connected to two or more data lines from different networks. When a data packet comes in one of the lines, the router reads the address information in the packet to determine its ultimate destination.

Rule of 72: A simple method for estimating the time it would take for an investment to double in value, given a fixed compounding annual rate of interest.

Rule of thumb: A rough approximation that is not intended to be strictly accurate or reliable for every situation.

S corporation: A corporation that has between 1 and 100 shareholders and that passes through net income or losses to its shareholders.

Safety data sheet: A document prepared by the manufacturer of a product that contains detailed technical and safety information about the product.

Safety director: Person in charge of defining and implementing safety plans.

Safety manual: A guide that identifies hazards within the practice and delineates procedures for dealing with them. This manual includes relatively simple activities, such as how to properly use the autoclave and how to perform a daily leak test prior to using your anesthesia machine(s).

Safety stock: Inventory remaining past the reorder point.

Sales funnel: The system or process that companies lead customers through when purchasing a product or service.

SBA 504 loan: A loan program administered by the Small Business Administration (SBA). These loans are guaranteed by the US Government and cover up to 40% of the project cost, with another 50% financed conventionally, and a low 10% down payment from the owner. Although there are restrictions, SBA loans are a good option for many small business owners to cover a portion of their construction financing.

Scatter radiation: Ionizing radiation that scatters from the patient, table, equipment, and so on, after interaction with the primary beam, and which may travel directly toward veterinary staff. This radiation should be the focus of radiation safety in the veterinary practice.

Scavenger: A mechanical, physical, or chemical device that captures the waste anesthetic gases from the anesthesia machine and discharges them to a safe area or absorbs them into a filter.

Schematic design: These drawings typically indicate the general layout and design of the building and include floor plans drawn to scale, elevations or a perspective drawing illustrating the exterior building appearance, and a site plan.

Scienter: A legal term implying that the offender had knowledge of wrongdoing before the act was committed.

Scintigraphy: Imaging utilizing radioactive isotopes for contrast.

Scope: In project management, scope is a set of boundaries that define the extent of a project. These boundaries determine what falls inside or outside the project and what is included, or not, in planning.

Scope creep: This is the trend of adding more and more into a design or the project's scope of work. Obviously, costs escalate as the scope grows. Establishing a budget for a fixed program and sticking to it can eliminate this situation.

Search engine optimization: The process of affecting the visibility of a website or a web page in a search engine's "natural" or unpaid ("organic") search results.

Seasonal staff: Staff members who work only during a specific season of the year. The most common example is that of college students who have returned to the practice during the summer months and/or holidays.

Secondary traumatic stress: An indirect exposure to trauma through a firsthand account or narrative of a traumatic event; compassion fatigue is a form of secondary traumatic stress.

Section 125: This section is part of the Internal Revenue Service Code that allows employees to convert a taxable cash benefit (salary) into nontaxable benefits. Under a Section 125 program, employees may choose to pay for qualified benefit premiums before any taxes are deducted from their paycheck.

Section 179: An election to expense up to a certain dollar value of qualifying property in the year of acquisition. Qualifying property generally is tangible personal property acquired by purchase for use in the active conduct of a trade or business.

Security interest: The legal rights a lender takes in collateral to protect against loss in the event of borrower default on loan repayment. A security interest is perfected when the lender formally records the interest with a governmental agency, such as a county recorder's office.

Sedation: The administration of one or more drugs to reduce anxiety and improve patient tolerance of a medical or diagnostic procedure.

Segmentation: A marketing term referring to the aggregating of prospective buyers into groups (segments) that have common needs and will respond similarly to a marketing action. Market segmentation enables businesses to target different categories of consumers who perceive the full value of certain products and services differently from one another.

Self-awareness: The ability to know one's emotions, strengths, and weaknesses and their impact on others.

Self-directed teams: Self-managed group of employees who work together to produce a product or service. The process by which empowerment of team members at the local level is made to effectively make "operational" decisions without deferring to a supervisor or other manager for their area. These individual groups define and train for the process needed to achieve the goals of the practice.

Self-regulation: The ability to control or redirect one's disruptive emotions and adapt to changing circumstances.

Semimonthly payroll: In this scenario, paychecks are issued twice a month, typically on the first and the fifteenth of each month.

Semivariable costs: Costs that do not fluctuate directly with revenue, but still do not stay fixed in the sense that rent does. Staff salaries are an example. Often, these costs increase in a stepwise fashion. Staff salaries may be fixed over a certain range of revenue but increase once the high end of that range is reached.

Sensory marketing: Marketing that engages the consumers' senses and as a result affects their perception, judgement, and behavior.

Separate document: The buy/sell agreement in a closely held corporation is usually a standalone document and should not be part of the bylaws of the corporation. The buy/sell agreement may be called a shareholder agreement or incorporated into a shareholder agreement.

Serious adverse event: A serious adverse event is any adverse event that results in death, is life threatening, or results in persistent or significant disability/incapacity, or a congenital anomaly or birth defect.

Server: Physical computer (a computer hardware system) dedicated to run one or more services (as a host), to serve the needs of the users of other computers on the network.

Service: The action of helping or doing work for someone.

Service mix: The selection of services a practice offers that should be in alignment with, and reflective of, the needs of its targets. When services are structured around the needs of a target, it is easier for the target to understand the benefit or advantage they will gain from using the service.

Settlor: A person who has created a trust. Also known as a trustor or grantor.

Sexual harassment: Sexual harassment is defined as unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature when, for example: submission to such conduct is made either explicitly or implicitly a term or condition of an individual's employment; submission to or rejection of such conduct by an individual is used as the basis for employment decisions affecting such individual; or, such conduct has the purpose or effect of unreasonably interfering with an individual's work performance or creating an intimidating, hostile, or offensive working environment.

Shaping space: Arranging the physical space and nonverbal content of the veterinary encounter for enhancing the quality of care for the client and patient.

Shared decision-making: Shared decision-making addresses the ethical need to fully inform clients about the risks and benefits of treatments, as well as the need to ensure that clients' values and preferences play a prominent role.

Shared leadership: Sharing wisdom, knowledge, and influence through empowerment.

Shareholder agreement: Agreements between corporate shareholders that can and should include buy/sell agreement terms allowing one or more shareholders to exit the company having pre-committed buyers for the shares.

Shift differential: A premium that is added to regular pay in a 24-hour environment for working less-desirable shifts, such as weekends or overnights. Shift differentials are usually a specific dollar amount per hour or a percentage of regular hourly wage on top of the employee's regular hourly wage.

Short Message Service (SMS): In some countries, including the United States, SMS is more commonly referred to as text messages. Limited to, and charged at, 160 characters per message, including spaces. Smartphones enable up to four SMSs to be strung together.

Short Message Service (SMS) application program interface: Allows practice management software to directly integrate with SMS software, either to send messages or collect inbound responses (e.g., "reply 'YES' to confirm appointment or NO to cancel").

Shortage costs: The costs of not maintaining sufficient inventory so that the sale is lost when consumers go elsewhere.

Short-term (or current) portion of loan: Amount of a loan's principal balance that is due within the next 12-month span of time.

Shrinkage: The loss of product from inventory not resulting from sale, including product lost to employee theft, shoplifting, administrative and paperwork errors, and vendor errors/issues.

Situational analysis: Review of the current environment, including competitors as well as social, political, economic, and legal conditions. For established veterinary practices, the situational analysis includes looking carefully at the current state of affairs for the practice in terms of its ability to meet client needs.

Skill-based scheduling: A method of scheduling based on the known skill sets of individual employees and the needs of the practice. The more skill sets an employee has developed, the more flexible their scheduling options. Examples could include ensuring there is at least one assistant with client education skills, restraint skills, and phlebotomy skills in order to support appointments. This type of

scheduling ensures all typical tasks can be completed by the staff on-hand, instead of just ensuring an appropriate "body count."

Skill hog: Employee who has mastered a skill, but refuses to train others. These individuals are generally insecure in their position within the practice and believe that "hoarding" a specific skill set gives them job security or elevated status within the practice. For example, there is only one technician in the practice that can take dental radiographs, but they never seem to have time to teach anyone else this skill.

Skills-based compensation: A system of wages and raises based on achievement in different skill blocks as determined by the individual practice's need.

Small Business Administration (SBA): Independent agency of the executive branch of the US Government. Through its loan program, the SBA is a major provider of funds for borrowers who fit their lending requirements. Although independent lenders or banks provide the actual funds, the lender receives, in essence, a guarantee by the government that the loan will be repaid. Therefore, when a business applies for and receives an SBA loan, they are actually applying for a commercial loan, structured according to SBA requirements, which ultimately receives a guarantee that the SBA portion of the loan will be repaid. As such, the loan must also meet the underwriting requirements of the lending institution.

Small Business Association lender: A US Government lender partnership that lowers lenders' risk though guarantying a percentage of each loan.

SMART: Acronym for specific, measurable, attainable, related to mission, and time limited.

Smart device: An electronic device that is cordless (unless while being charged), mobile (easily transportable), always connected (via Wi-Fi, 3G, 4G, etc.) and is capable of voice and video communication, Internet browsing, "geo-location" (for search purposes), and that can operate to some extent autonomously.

Smartphone: Mobile telephone built on a mobile operating system, with more advanced computing capability and connectivity than a feature phone.

SOAP: An acronym that identifies the most common data entry format used by veterinary practices. The data are generally located in the progress notes portion of a problem-oriented medical record. S: Subjective – includes the chief complaints as well as the patient history. O: Objective – includes objective and observed information derived from the physical examination, laboratory reports, and other diagnostic data. A: Assessment – includes a provisional diagnosis, summary of abnormal findings and differential rule-outs. P: Plan – the most critical section for continuity of care, the plan should include plans being made for further diagnostic studies, treatments, and/or surgery.

Social media: Interactive platforms that individuals and communities create and share user-generated content.

Social skills: The ability to manage relationships and direct others in a desired direction.

Soft costs: Cost of intangible items that may include fees to regulatory agencies, any legal fees, financing costs, design fees, insurance costs, and relocation expenses.

Soft skills: Soft skills are personal attributes that enhance an individual's interactions, job performance, and career prospects. Unlike hard skills, which are about a person's skill set and ability to perform a certain type of task or activity, soft skills relate to a person's ability to interact effectively with coworkers and customers; these skills are broadly applicable both inside and outside the workplace.

Software: A collection of computer programs and related data that provide the instructions for telling a computer what to do and how to do it. Software refers to one or more computer programs and data held in the storage of the computer.

Solid waste: A term defined by the Environmental Protection Agency that covers a broad range of solid and liquid waste products. Most of the waste that is produced by a veterinary hospital is solid waste. Solid waste is then broken down into many different categories and subcategories.

Sound transmission class (STC): An empirically derived rating for materials or material assemblies that describes the number of decibels "screened" when noise passes through. For example, a wall that has an STC of 45 will screen 45 dB of sound. If the sound is 65 dB, then 20 dB will be audible on the other side of the wall. Generally, walls with greater mass screen more noise.

Spam: The use of electronic messaging systems to send unsolicited bulk messages, especially advertising, indiscriminately.

Special events and public participation: Stimulating an interest in a person, product, or organization by means of a focused "happening"; also, activities designed to enable an organization to listen to and interact with publics.

Specialty/emergency practice: A facility that opens an emergency facility to ensure 24-hour-a-day care for all hospitalized patients. The increasing number of specialists combining practices and the need for specialized care of patients 24/7 has opened the way for these practices to start and maintain emergency practices.

Spinal manipulation: The use of high-velocity, low-amplitude joint manipulations to treat neuromusculoskeletal pain and dysfunction in order to restore mobility within a particular musculoskeletal area.

Split scheduling: This is when an employee works for more than one business unit within a single workday or workweek. For example, a receptionist on a split schedule works in the general practice from 4.00 p.m. to 9.00 p.m. and then moves to the emergency practice from 9.00 p.m. to 11.00 p.m. to finish their shift.

Split shift: A shift that contains at least one break that is larger than a meal break. For example, a staff member may work 8.00 a.m. to noon, then 4.00 p.m. until closing. The advantage to the practice is it schedules employees during greatest need, so it uses payroll dollars very efficiently. However, an employee typically needs to live near the practice and have other ways to utilize their down time between shifts in order for this arrangement to be a win–win for both parties.

Spoliation: The intentional destruction of documents meant to be saved.

Spyware: A type of malware (malicious software) installed on computers that collects information about users without their knowledge. The presence of spyware is typically hidden from the user and can be difficult to detect.

Staff turnover: The rate at which workers leave a workplace and need to be replaced by new employees.

Stakeholder: An individual or a group with an interest in a particular business; the individual or group has something at risk (at stake).

Standalone specialty practice: A facility that does not have an emergency facility present on site and would send critical cases to an emergency practice for observation during the evenings and/or weekends.

Standard of care: Duty to exercise the care and diligence that is ordinarily exercised by a reasonably competent veterinarian under similar circumstances. In veterinary medicine, the term standard of care is often also used synonymously with protocol to identify guidelines that have been customized for use in a specific practice.

Standard operating procedures: Preferred methods of doing a procedure or protocol in the practice.

Standards of performance: Written protocols regarding patient care, customer service, and team professionalism.

Standing: The legal requirement for a party to prove that they can participate in a lawsuit. Simply put, standing is the legal right and ability to sue and be sued. The party must show that they have an actual harm, that there is causation between the behavior of the

other party and the actual harm, and the action of the court can actually correct the issue.

Statement of cash flow: The third of the commonly prepared financial statements listing the sources of cash in a business (such as revenue from services, proceeds from debt incurred, and collections on client accounts) and uses of cash (such as debt payments or purchases of drug and supply inventory) during a period of time.

Stationary practice: A traditional "brick and mortar" veterinary practice, compared with a mobile practice.

Step expense: An expense that increases or decreases in distinctive amounts rather than in a linear fashion. Any staff member with a guaranteed work schedule is considered a step expense. This is because each staff member has the capacity to complete a specific volume of work. For example, if a new technician supports $150,000 in revenue production, the practice will not need to hire another technician until the new technician is at full capacity. The next technician represents the next "step" in staffing costs.

Stock sale: A sale where a seller sells an interest in some type of entity, typically an S or C corporation, or limited liability company.

Stockout: A stockout, or out-of-stock event, is a situation in which the demand for an item cannot be met from the supply in inventory; the amount on hand is insufficient for the amount needed or wanted.

Storming: Members come into conflict over goals and personalities.

Straight 15s: Historically, the most common scheduling system. The staff would schedule a steady stream of appointments at 15-minute intervals (e.g., 08.00, 08.15, 08.30). Currently, it is estimated that 10–15% of companion animal practices still use this system.

Straight 20s: A popular expansion of the straight 15s approach. Appointments were scheduled at 20-minute intervals (e.g., 08.00, 08.20, 08.40). Currently, it is estimated that approximately 40% of companion animal practices use this system.

Straight 30s: A popular time-scheduling option in very competitive markets and perhaps the schedule of choice for new practices trying to bond clientele. It is estimated that only 5% of companion animal practices use this system.

Strategic partnerships and alliances: A relationship between businesses in which the parties work cooperatively in a business effort to achieve shared goals. The scope of a strategic partnership or alliance can range from an informal business relationship based on verbal commitment to a more formal contractual relationship such as a joint venture.

Strategy: A plan or action to achieve a specific end, typically within a long time frame (usually greater than a year). Often, strategies are achieved by utilizing various tactics to achieve specific aspects of the overall strategy.

Stress: Any chemical, physical, or emotional force that threatens an organism's homeostasis.

Structured on-the-job training (OJT): A form of OJT that is carefully defined based upon the needs of the business and structured to mirror and support the career path of employees. Structured OJT employs formal materials to support the learning process.

Structured sales: An installment sale whereby an installment obligation is assigned to an insurance company for an annuity payment.

Student loan: Debt associated with post-secondary education. Graduating with little or no student loans is the rare exception today.

Stylus: Computer accessory that is used to assist in navigating or providing more precision when using touchscreens.

Subscription: A purchase made by signed order, as for a periodical for a specified period of time or for a series of performances.

Succession: The legal transfer of real estate and/or business entities to another individual/entity.

Suffering: An unpleasant or painful experience, feeling, emotion, or sensation, which may be acute or chronic in nature; this is an umbrella term that covers the range of negative subjective experiences, including, but not limited to, physical and emotional pain and distress. In veterinary medicine, suffering can be experienced by the patient and the caregiver.

Supervisor: This refers to the next level of management, the person who is responsible for overseeing a larger number of people or larger area of the facility than the lead position; this person continues to work some of the time on the floor, but the majority of the time they are involved in the management of the business.

Support: Regarding software, this is technical assistance offered by the software vendor that helps you properly use the software product (i.e., technical support helps users troubleshoot and resolve problems). The two most important factors in evaluating the quality of support offered by a vendor are hours of availability and responsiveness to a user's inquiry (i.e., how quickly technical support contacts you to help you resolve your software problem).

Sustainable design: The application of design principles that use resources responsibly and reduce negative environmental impacts.

SWOT analysis: A strategic planning method used to evaluate the strengths, weaknesses/limitations, opportunities and threats involved in a project or in a business venture.

Sympathy: Feelings of sorrow for someone else's misfortune.

System failures: Deficiencies in the surrounding environment that contribute to or result in a veterinary medical error. For example, lack of mentorship and oversight of house officers in a veterinary teaching hospital is a system failure that may result in rookie mistakes.

Systems: Methods to create positive repeatable outcomes for the patient, the client, and the practice. Each area of the practice (client service, technical services, doctors' procedures, inventory, etc.) needs job descriptions or standard operating procedures.

Tablet computer: Any of a number of portable computers, approximately the same size as a notebook computer, in which the display screen serves as a touch-sensitive input device. The most common example is the iPad by Apple Computers.

Tactic: A plan or action to achieve a specific end, typically within a short time frame (usually less than a year, but occasionally spanning a few years).

Talent acquisition: The process of finding and acquiring skilled human labor for organizational needs and to meet any labor requirement.

Tangible assets: Physical assets such as cash, accounts receivable, inventory, property, facility, and equipment.

Target audience: A target audience is a specific group of people within a target market at which a product or the marketing message of a product/service is aimed.

Target market: A particular type of client that the practice wants to attract.

Target marketing: Identifying select target markets and directing marketing efforts to these targets. It is the opposite of mass marketing, in which all customers and prospects are treated the same.

Targeted marketing: The ability to specifically target which users see an advertisement, based on hundreds of data points, including location, employment, gender, and so on.

Task objective versus team objective: Many "teams" come together because a task needs to be completed and that is a bit of "the cart before the horse." It is important to remember that these are separate functions.

Tax basis: Total purchase price of property plus additional improvements minus all accumulated depreciation.

Tax bracket: Marginal federal tax rate assessed on your taxable income. It is the tax rate applied to each additional dollar of income. You need to know your current tax bracket in order to make informed decisions.

Tax credits: Incentive programs authorized by the Internal Revenue Service that provide incentives in the form of dollar-for-dollar tax reductions based on expenses incurred to encourage business owners to comply with the law in achieving certain commendable goals on behalf of society. Examples include providing accessibility to the disabled, hiring disadvantaged youth, establishing a presence in lower socioeconomic neighborhoods, and so on.

Taxes: All involuntary fees paid to federal, state, and local governments on the profits of the practice.

TCP/IP: TCP handles host-to-host communication. IP connects local networks, thus establishing internetworking.

Team: Trained and focused group of people working synergistically toward a goal.

Team/group stages: A team grows and changes markedly during its lifetime. The process of development has been described as having four stages: forming, storming, norming, and performing.

Teamship: The collective standard of behavior that is understood and appreciated by everyone participating on a team.

Technician manual: Designed to support the technicians in accomplishing their daily tasks in the back of the practice. It includes step-by-step instructions on how to operate and maintain all of the equipment in the practice, from intravenous pumps to pulse oximeters. It may also provide directions on how to complete daily, weekly, and monthly quality controls for equipment such as anesthesia machines and sterilizers. Depending on your specific practice model, it may also include instructions for proper charge capture and medical record auditing.

Teleadvice: Subclassification of telehealth in which only general advice is provided that is not specific to a particular patient's situation.

Teleconsulting: Subclassification of telehealth in which the consulting takes place between a primary-care veterinarian and a specialist.

Telehealth: Broad term to describe healthcare consulting delivered remotely; also referred to as virtual care.

Telemedicine: Telehealth delivered between a veterinarian and an animal-owning client, under the auspices of a veterinary–client–patient relationship.

Telemonitoring: A form of telehealth in which patients are monitored remotely.

Teletriage: Subclassification of telehealth in which assessment is made remotely regarding the need for urgent veterinary visitation. Teletriage does not include rendering any diagnosis, just advising regarding the potential urgency of the situation based on the information provided.

Template: Standard layout of a schedule that can be used to schedule into the future (such as a month in advance) or to speed up the creation of the fixed component of a schedule. Templates simplify schedule creation and allow staff members with fixed or standard rotations to predict their future work schedule in advance.

Terabyte: Unit of computer memory or data storage capacity equal to 1,024 gigabytes.

Terrorism: The unlawful use of force or violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof in furtherance of political or social objectives. 28 CFR 0.85.

Testator: A person who has made a will.

Text (SMS) messaging: The act of typing and sending a brief electronic message between two or more mobile phones or fixed or portable devices over a phone network.

Thin client: Computer or a computer program that depends heavily on some other computer (its server) to fulfill its traditional computational roles.

Thin slicing: The ability to find patterns in events based only on "thin slices," or narrow windows, of experience.

Third-party payment: Monetary reimbursement for medical services from someone other than the client/patient.

Time management: The process of organizing and planning how to divide time between specific activities and tasks.

Time tracking: Recording the amount of time employees have worked for each pay period.

Time worked: All time during which an employee is at work and not free to leave, including in most cases waiting time. Time worked does not include paid time off, such a sick leave, vacation days, or paid holidays, even if an employee is paid by the hour for that time.

Tip sheet: A document containing the latest information or "tips" for a particular topic.

Title VII of the 1964 Civil Rights Act: Federal law that prohibits discrimination in the workplace based on an employee's sex, race, religion, color, veteran status, marital status, genetic information, age, disability, or national origin.

Tooth resorption: Any resorption of tooth substance, most commonly seen in cats (feline odontoclastic resorption lesion). Type 2: odontoclastic or replacement resorption seen radiographically as roots are resorbed with loss of the periodontal ligament and replaced by bone. Lesions in the crowns are often filled with hyperplastic gingiva and can be painful.

Top line: Typically, a synonym for revenue, income (or turnover in some countries), referring to the top line in financial statements that indicates income received by the business.

Total project cost: Combined total of soft costs and hard costs.

Total quality management: Consistent performance, expectations, and consequences of nonperformance from all staff and doctors.

Touch gradient: Methods used to touch canine and feline patients to minimize fear, anxiety, and stress during veterinary procedures.

Trade area: Considered to be the geographic area from which the organization draws most of its customers and within which the organization's market penetration is the highest. The traditional benchmark for defining a trade area is the area that contains 80% of a business's clients. A trade area is also known as a "region of influence" or "catchment area."

Trade credit: Trade credit allows you to defer payment to vendors until a negotiated future date. A vendor payment discount may be available if you pay your bills quickly, within a certain period.

Traditional lender: Generally, banks, brokerage houses, or other sources that lend money. Collateral for the loan, down payment, and ability to service the debt from cash flow are deciding factors in willingness to loan money for a purchase.

Trainer: Someone in the practice who has mastered a specific skill well enough to be entrusted with the responsibility of teaching it to others.

Training: Regarding software, this describes the vendor's responsibility for training you how to use its software. Education options can range from an expert educator being placed onsite to train your staff, to a trainer guiding your staff via telephone or interactive webinar, to a vendor supplying your staff with a printed manual and telling them to "read the book."

Transfer risk: Where appropriate, practice owners may want to shift the responsibility for risk to practice lessors, vendors, subcontractors, competitors, and even pet owners.

Transferrable soft skills: These are skills that involve the way a person interacts with other people that can be transferred between positions and even between industries.

Travel sheet: Also known as a tracking sheet, this is a document that accompanies the patient and on which is detailed the services to be provided and (typically) the fees for those goods and services to ensure that nothing is missed when being recorded in the medical record and the invoice.

Travel surcharge: An additional fee added to an invoice to reflect travel-related expenses of the visit.

Trespasser: A person who goes on the premises without an express or implied invitation from the possessor.

Triangular floor plan: A plan with the front, middle, and back portions of the hospital in a triangular pattern.
Trigger: Anything that exacerbates or causes symptoms to occur.
Trust: A relationship whereby property is held by one individual for the benefit of another.
Trustee: The individual or organization who receives the settlor's property for the benefit of the beneficiaries.
Two-stage evaporative cooling: Also known as indirect/direct evaporative cooling, the first stage of cooling precools the air without adding humidity. The second stage cools and slightly humidifies the air.
Type A medicated article: This is a drug in its most concentrated form and is intended for creation of another Type A article or mixture into a Type B or C medicated feed.
Type B medicated feed: This feedstuff contains an animal drug that is mixed with including vitamins, minerals, and/or other nutritional ingredients by weight.
Type C medicated feed: This is a complete feed that is mixed from a Type A or Type B feed and is ready to directly feed "free-choice" or "top dress" another feed.
Unfavorable: An unfavorable result is always an undesirable result. For example, if the practice projected $1,000 in revenue and only produced $900, there results a $100 unfavorable variance.
Uninterruptible power supply: A battery pack used to provide temporary power to critical systems in the case of a power outage.
United States Department of Agriculture: Government agency that regulates animal vaccines and biologics under the Federal Virus, Serum, and Toxin Act.
United States Pharmacopeia (USP): Established in 1820, the USP is a nongovernmental organization that sets quality standards for medicines, food ingredients, and dietary supplements for the United States and other countries.
Universal Serial Bus: A connect standard for attaching peripheral devices to a computer, allowing fast data exchange.
Universal waste: A subcategory of hazardous waste that includes, but is not limited to, pesticides, mercury-containing equipment, fluorescent bulbs, and batteries. Most veterinary hospitals fall under the federal designation for small-quantity handlers of this material.
Unprofessional conduct: The finding of a state veterinary license board where the behavior of a veterinarian is below the standards of behavior set for a licensee. This behavioral violation may be related to actions within the practice scope or related purely to personal life situations, including but not limited to alcohol and/or drug-related behavior. Most every complaint before license boards, if not dismissed, has a finding of unprofessional conduct.
Up time: A metric that represents the percentage of time a system is operational and available to users.
Use by right: Zoning term meaning no review process is required to proceed with the submittal of construction drawings.
Vaccination: Inoculation with a killed or attenuated microbe with the purpose of preventing disease caused by that microbe.
Valuation: The determination of the economic value of an asset or liability.
Valuation approach: An overall theoretical way of approaching the valuation of a business – the three general ways used to determine value for a going concern are the asset-based, earnings-based, and market-based approaches.
Valuation date: The specific point in time on which the business value is determined; frequently a calendar or fiscal year end.
Valuation discounts: Generally, property is taxed for federal gift and estate tax purposes at its fair market value. The degree of control enjoyed by the interest being valued (minority discount), and the degree of its marketability (market discount), can significantly affect what an informed buyer will pay for that interest. Utilizing valuation discounts enables family limited partnership interests to be transferred at lower tax cost by using gift tax annual exclusions to shelter gifts or using reduced applicable credit amounts. Valuation discounts are typically highly scrutinized by the Inland Revenue Service in large-format gifting programs.
Valuation method: Specific techniques or methodologies within the three general valuation approaches to determine value. For example, the excess earnings method is usually considered an asset-based approach, whereas the single-period capitalization method is an income approach.
Value: Determined by what is important, desirable, and useful to clients.
Value disciplines: Three ways businesses deliver superior value to their customers: operational excellence, customer intimacy, and product leadership.
Value proposition: Description of the value that a product, service, or process will provide to the pet owner, hospital, and staff.
Value added: The increase in real or perceived value of a product or service is the value to the client after intervention less the value before the intervention. For example, "value added" might reflect the difference between when an animal is ill versus its value when it has returned to health.
Value-added tax: An indirect tax on consumption of goods and services in which the tax is incrementally added at each stage where value is added to the supply chain, from production to sale.
Variable costs: Costs that fluctuate directly with revenue. For example, variable costs in a veterinary practice would include anesthesia, drugs, and supplies. If no patients are seen, none of these items are used and there is no procedure-associated cost (other than the original cost of the existing supplies).
Variable expense: An expense that increases as the amount of work the practice performs increases. For example, the busier a practice becomes, the more drugs and supplies it uses.
Variable-rate loan: Borrowed funds in which the principal is subject to periodic adjustments in the lending rate (adjustable interest rate) usually based on an index, such as a bank's prime lending rate.
Variance: Variance is the difference between the projected value and the actual value for each line item in the budget. For example, if the practice's projected value for the current year was $1,100 and the actual value generated is $1,150, the variance is $50.
Vertical analysis: Comparison of a specific account in a financial reporting period to the total within that period. For example, the ratio of cash compared with all assets as of a specific date, or the percentage ratio of support staff wages to total practice revenues during a specified period of time.
Veterinarian–client–patient relationship (VCPR): A legal relationship between veterinarian and animal owner in which the veterinarian has assumed responsibility for making clinical judgements and the client has agreed to follow the veterinarian's instructions, the veterinarian has sufficient knowledge of the patient to make such judgements, continuing care is provided or available, the veterinarian provides oversight of treatment, compliance, and outcome, and patient records are maintained.
Veterinary assistant: A title sometimes used for individuals who have received training less than that required for identification as a credentialed veterinary technician, technologist, or nurse. There is no American Veterinary Medical Association-approved credentialing process for veterinary assistants at this time.
Veterinary Feed Directive (VFD) drug: A drug intended for use in or on animal feed which is limited by an approved application to use under the supervision of a licensed veterinarian. Use of animal feed bearing or containing a VFD drug must be authorized by a lawful VFD order.
Veterinary Feed Directive (VFD) order: A written (nonverbal) statement issued by a licensed veterinarian in the course of the veterinarian's practice that orders the use of a VFD drug or

combination VFD drug in or on an animal feed. This written statement authorizes the client (owner or caretaker) to obtain and use animal feed bearing or containing a VFD drug or combination VFD drug to treat the client's animal(s) only in in accordance with the conditions for use approved by the Food and Drug Administration.

Veterinary medical error: Unintentional harm that was induced by inappropriate veterinary medical care. For example, the accidental administration of one medication instead of another due to the similarity of their trade names or their packaging constitutes a veterinary medical error.

Veterinary Medicine Mobility Act: Allows ambulatory veterinarians with a Drug Enforcement Administration registration to transport controlled substances used to treat patients in the field.

Veterinary reference laboratory: A laboratory that performs comprehensive diagnostic testing for veterinary medicine.

Veterinary technician/technologist/nurse: A veterinary aide, often equated to a nurse, and referred to as a veterinary nurse in some countries. Typically, in the United States, technicians receive an associate's or bachelor's degree from an American Veterinary Medical Association-accredited program and are recognized in most state practice acts. However, in some areas there is no legal definition of technician/nurse, nor is there mandatory registration, and any veterinary aide may use the term.

Veterinary time equivalent: Method of assigning labor expenses on the basis of veterinary staffing expense. This allows a practice to calculate approximate labor expenses for procedures using veterinary expense as a standard.

Veterinary-specific lender: Any of a number of banks or mortgage brokers/lenders that specialize in servicing the veterinary industry. Many large banks operate specific divisions that cater to veterinarians. Just like dentists and other professionals, veterinary practices operate in a known risk range that is often desirable to minimize a bank's exposure to bad debt.

VetPartners: A US-based professional association for those involved in veterinary practice management (www.vetpartners.org).

Vicarious trauma: A set of cognitive, emotional, physical, and spiritual disturbances that result from helping trauma survivors; a painful set of symptoms that result from utilizing controlled empathy while listening to or seeing traumatic narrative content.

Virtual training: A medium of instruction where the trainer interacts with participants using web-based tools that mimic classroom experiences. These tools often include displaying slides, presenting video demonstrations, web conferencing, two-way chats, e-mail, and building a community of practice using social networking.

Virus (computer virus): A computer program that can replicate itself and spread from one computer to another. The term "virus" is also commonly, but erroneously, used to refer to other types of malware, including, but not limited to, adware and spyware programs that do not have a reproductive ability.

Vision statement: Statement that identifies where the organization intends to be in the future or where it should be to best meet the needs of its stakeholders.

Vulnerability: A population or resource threatened by a hazard.

W-2: Inland Revenue Service form called "Wage and Tax Statement" that reports income paid and taxes withheld by an employer for a particular employee during a calendar year.

W-3: Inland Revenue Service (IRS) form called "Transmittal of Wage and Tax Statements." This form summarizes the information on the W-2s and is filed with the IRS each year along with copies of the W-2s.

W-4: Inland Revenue Service form called "Employee's Withholding Allowance Certificate," used to determine the amount of federal taxes in the United States that the employer will withhold from a person's paycheck each pay period.

Waiver: A client may sign a form explaining that they have declined to accept (or have waived) the doctor's recommendations or advice.

Want: Have a desire to possess or do (something); wish for.

Ward: A person, usually a minor or incompetent, who cannot properly take care of themselves.

Waste anesthetic gas: Inhalation anesthetic gas that is not metabolized by the patient and subsequently exhausted from the machine or from the animal, preferably into a scavenging system.

Wayfinding: People's ability to find their way through a facility and to their selected destination.

Web-based application: An application that is accessed by users over a network such as the Internet. The term may also mean a computer software application that is coded in a browser-supported programming language (such as JavaScript, combined with a browser-rendered markup language like HTML) and reliant on a common web browser to render the application executable.

Weekly payroll: The most common length of pay period in veterinary medicine. Typically, paychecks are issued 52 times a year, or 13 times each quarter.

Weighted hourly wage: To simplify the budgeting process, many practices use a weighted hourly wage, calculated by averaging an employee's anticipated wage over the course of a year. For example, if it is anticipated that a staff member earning $10.00/hour in January is going to get a raise to $11.00/hour in July, the staff member's weighted hourly wage average throughout the year would be $10.50/hour (six months at $10.00 and six months at $11.00).

Wide area network (WAN): A computer network that spans a wider area than a local area network (LAN), usually connecting several LANs together. The Internet could be described as the largest WAN in the world. Smaller, private WANs that span large geographical areas operated by governments, universities, and large corporations serve as other examples of WANs.

Wi-Fi: An abbreviation for wireless fidelity, meaning you can access or connect to an Internet network without needing to use wires.

Will: Also known as a testament, the legal declaration by which a person names one or more persons to manage aspects of the estate after the testator's death.

Windows Mobile: Family of mobile operating systems developed by Microsoft for smartphones and pocket personal computers.

Wired equivalent privacy: An encryption protocol defined in IEEE 802.11, which is used to provide security of data transmissions over a wireless network.

Word-of-mouth marketing: Recommendation of an organization by a satisfied customer to a prospective customer.

Workday: Individual states may define a workday differently. Some may refer to it as a 24-hour period that includes a specific block of time away from the workplace, whereas others may refer to it as a single contiguous work shift.

Workers' compensation: A system for payment of benefits to injured workers and their families, primarily for lost wages and medical expenses incurred as a result of work-related injuries, sickness, disability, and death, usually without regard to negligence or fault.

Workflow: The consistent series of steps by which processes are completed within the organization.

Workflow dynamics: How the flow of work is organized to occur at the business place/hospital. This may or may not be the most efficient; the status quo is often evaluated to come up with a process that might lead to better efficiencies or better customer service.

Working capital: Current assets minus current liabilities.

Workplace violence: Physical harm or intimidation of a person or people by another person with or without the use of a weapon.

Work-related injury: Generally, any injury or illness arising from an event or exposure in the work environment that either caused or contributed to the resulting condition (or significantly aggravated a preexisting injury or illness) in the course of employment. Courts

have the ultimate decision-making authority as to what constitutes "work related" and can vary depending on the jurisdiction.

Workstation: A high-end microcomputer designed for technical or scientific applications. Intended primarily to be used by one person at a time, they are commonly connected to a local area network and run multiuser operating systems.

Workweek: Any period of seven consecutive 24-hour periods, as determined by employer. Once the workweek has been defined, it cannot be changed without notice.

Zoonosis: Disease that is transmissible between animals and humans.

Zoonotic disease: A disease that is common to both animals and humans. In the context of veterinary hospital safety, the greatest concern is for those diseases easily transmittable from animals to humans.
