Spigelon: Spigelia is included for neuritis, ciliary neuralgia, and trigeminal neuralgia (Reckeweg 2002). This valuable remedy contains Bryonia, which is useful for symptoms of increased tension of the eyeballs, lachrymation, and photophobia. Also contains Gelsemium, (see *Gelsemium homaccord*). Ranunculus is included for attacks of vertigo; swimming in the head; a sensation of heaviness; stabbing, tearing headaches with congestion of blood; and burning and itching of the eyelids with redness. Sulphur is useful because synthetic drugs and heavy metals easily block the SH-groups that are present in receptors and enzymes, and this forms the basis for the iatrogenic damage that follows the use of many drugs. Thus, Sulphur may be valuable in conditions following toxicity with these compounds (Reckeweg 2002). It can be used in scrofulous inflammation of the eyes with tendency to congestion, when the eyes are red and injected, when there are opacities and ulcerations of the cornea, and when there is extreme sensitivity to light. The eyeballs are painful, and the remedy is not useful when the external coats of the eyes are involved (Hpathy 2006). Spigelon may be indicated in Impregnation Phases, which attempt a regressive transformation into the Inflammation Phase. It has appeared in classic repertories for glaucoma (Shelton 2006).

Traumeel S: Can be used intermittently for its anti-inflammatory effects and to activate blocked enzyme systems. Contains Mercurius, which is useful in the hindrance of the outward flow of the intraocular fluid, i.e., glaucoma. (Nolte 1988).

Ubichinon compositum: Provides mitochondrial repair. Contains Benzochinon, which has parabenzoquinone for use in degenerative diseases of the eyes (retina) and ears, and also in diabetes mellitus. It also contains Conium for atypical ophthalmia with an unusually intensive photophobia, which bears no relationship to the actual degree of ophthalmia and which is only relieved in the dark and by pressure; corneal ulcers may also be present. Hydrastis canadensis is included for corneal ulceration. Sulfur, which when defined in physiological, chemical, or enzymological terms, achieves its effects by the reactivation of enzyme-based detoxifying procedures that have been destroyed. It is used for connective tissue lesions and numerous illnesses that are characterized as iatrogenic. Reddened mucosa, especially at orifices of the body, strik-

ingly red eyelids with tendency towards tubercular inflammations, styes, and blepharitis are also indications for Sulfur. Also contained is Ubiquinone (Coenzyme Q-10), which has special affinities for the eyes, e.g., conjunctivitis, but it is also indicated in toxoplasmosis, corneal erosions, paralysis of the eye muscles, and in infantile glaucoma. It may be used successfully in many cases of glaucoma and retinal disease, because it is a phase remedy in Degeneration Phase diseases (Reckeweg 2002).

Veratrum homaccord: This remedy contains *Veratrum album*, a remedy known in TCM for its treatment of "cold," stagnation conditions (Ben Jacob 2006). It is listed in *the Clarke Dictionary of Practical Materia Medica*, vol. 3, for loss of sight and headache with nausea and vomiting. The *Allen Encyclopaedia of Homeopathic Materia Medica* notes pressing pain in the eyes, with loss of appetite, vanishing vision and complete blindness, and Schroyen's synthesis notes loss of colors and loss of vision to be prescribing characteristics (Smit 2006). Veratrum is noted as a therapy for circulatory insufficiency and collapse. Veratrum homaccord acts favorably in various eye affections, especially when there is a tendency toward hemorrhage (Reckeweg 1996). In this regard, it may be a very valuable adjunct in diseases such as ehrlichiosis, which have a bleeding component in the initial causative mechanism of the glaucoma.

Ypsiloheel: Contains Glonoinum (see Glonoin homaccord). Also contains Paris quadrifolia with indications for a sensation that the eyeballs feel too large. It is a valuable remedy in certain forms of asthenopia with inability to fix the eyes on anything steadily. A peculiar symptom of asthenopia is a sensation as if a string were drawing the eye back into the head, as if the optic nerve were too short. *Ypsiloheel* is very useful for the sharp shooting and sticking pains accompanying glaucoma, which are worse at night and on motion (Hpathy 2006). This remedy also contains Ignatia for eye symptoms which may include optical illusions, e.g. white, flickering, shining zigzags at the periphery of the field of vision, as occurs in detachment of the retina (Reckeweg 2002). The ingredient Pulsatilla has specific indications for glaucoma in many of the classical repertories.

Authors' suggested protocols

Nutrition

Eye and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Vitamin C: 100 mg for every 15 pounds of body weight BID.

Eskimo fish oil: 1 teaspoon for each 20 pounds of body weight with meals.

Chromium: 25 mcg for every 25 pounds of body weight SID (maximum, 200 mcg).

Magnesium: 10 mg for every 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Acute glaucoma is a medical emergency. It may be prudent to send the patient to a board certified ophthalmologist for initial treatment. In addition, it may be necessary to use Western medications initially to preserve sight. Some patients may require concurrent Western medications, but the dose of the Western medications should be lower.

The authors use the herbal formula Glaucoma at a dose of 1 capsule per 10 to 20 pounds twice daily as needed. In addition to the herbs discussed above, Glaucoma contains chrysanthemum (Ju hua), leonurus (Yi mu cao), lepidium (Ting li zi), phragmites (Lu gen), platycodon (Jie geng), and safflower (Hong hua). These herbs help increase the efficacy of the formula.

Commonly selected acupuncture points include ST36, tai yang, and TH5 (Handbook of TCM Practitioners 1987).

Homotoxicology

Always treat conventionally to normalize the intraocular pressure. Many approaches may be needed to best manage these patients. The following are suggested for starting therapy only. Adjust therapy to patient response.

Initial emergency homotoxicology approach: Phosphorus homaccord, Belladonna homaccord, and Galium-Heel mixed together and given orally every 15 minutes initially until pressure reduces, and then BID to TID.

Injection therapy: Belladonna homaccord plus Spigelon as an injection, preferably an autosanguis, twice weekly initially, then once weekly. These may also be given as a subconjunctival injection, using a 30-gauge needle.

Cruroheel plus Oculoheel: 1 tablet each TID PO.

Oral cocktail: Veratrum homaccord, Traumeel, Glonoin-homaccord, and Gelsemium homaccord, or possibly Spigelon. Ypsiloheel may be added, if indicated.

BHI Pure eye drops mixed with Mucosa compositum: Instilled in the eyes as often as possible.

An unlikely candidate at first glance, but one with some very useful components is BHI Perspiration, which may be given BID or interposed.

In addition, treatment with *suis*-organ preparations is useful, but we do not currently have single injections in the United States. The recommended remedies are *Funiculus umbicalis suis*, *Oculus totalis suis*, *Corpus Vitreum suis*, and *Retina suis*. The former remedy is in several combinations, including Cutis compositum, Discus compositum, Placenta compositum, Thyroidea compositum, Tonsilla compositum, and Zeel. Because of the embryological origin of eye tissue, we suggest Cutis compositum in alternation with Placenta compositum for circulatory support.

The remaining *suis* preparations, with specific eye dilutions, may be obtained from Europe, because they are not currently available in the United States.

Conventional drug therapy should be initiated at once and may be reduced if a response to therapy occurs. Careful monitoring of intraocular pressure is recommended. Surgical therapy has a higher success in many cases and should be discussed with the owner. Surgical repair of lens luxation has the best prognosis.

Psorinoheel: Recommended intercurrently, on an intermittent basis.

Deep detoxification formula: Consider this formula because these are most often Degeneration Phase cases. The formula contains Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum, and Mucosa compositum mixed together and taken twice weekly orally. If strong detoxification starts, reduce or eliminate this step until the initial crisis is abated.

KERATOCONJUNCTIVITIS SICCA

Definition and cause

Keratoconjunctivitis sicca is deficient tear production, dry eye, and corneal irritation. The condition can be congenital or secondary to trauma, viral infections, metabolic conditions such as diabetes, immune-mediated, or from exposure to medications or toxic substances. Breeds that are more prone are Boston terriers, English bulldogs, Lhasa apsos, Shih tzus, Pekingese, and Pugs. Secondary irritation often leads to corneal and conjunctival irritation, ulceration, edema, vascularization, and pigmentation, and can lead to blindness (Champagne 2003, Salisbury 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy includes cyclosporine for immune-mediated conditions in combination with artificial tears, or drugs that promote tear formation such as pilocarpine. Topical antibiotics and corticosteroids are recommended with secondary inflammation and infection when no ulceration is present. Surgical transplantation of the parotid salivary duct is now recommended less frequently because of the success of cyclosporine therapy (Champagne 2003, Moore 1999, Salisbury 1995).

Anticipated prognosis

Prognosis is often good; however, lifelong medical therapy may be required (Champagne 2003, Moore 1999, Salisbury 1995).

Integrative veterinary therapies

Damage to the tear glands can occur from many causes such as trauma, pharmaceutical exposure, and viral infections. Loss of adequate tear secretion leads to ocular pain and compromise of the general defense system. Pigmentary deposition and corneal thickening can occur as the body attempts to protect the delicate ocular tissues. Auto-aggressive lymphocytic attack of lacrimal glandular tissue may lead to reduced tear film formation.

Cyclosporine suppresses the immune response and increases tear production; however, it does not address the inciting or underlying cause(s). An integrative approach uses nutrients, nutraceuticals, medicinal herbs, and com-

bination homeopathics that are anti-inflammatory and tissue-sparing to the cells of the tear duct and the eye and immune-modulating effects on the glands of the immune system.

Nutrition

General considerations/rationale

Therapeutic nutritional therapy can help to reduce and control the underlying inflammatory process, help to balance the immune response, and improve tear production and flow.

Appropriate nutrients

Nutritional/gland therapy: Glandular eye, adrenal, and thymus supply the intrinsic nutrients that help balance immune function, reduce cellular inflammation, and improve tear production and flow (see Gland Therapy, Chapter 2, for a more detailed explanation).

Betasitosterol: Betasitosterol is a plant sterol and immune-modulating agent that has immune-enhancing and anti-inflammatory effects (Bouic 1996, Gupta 1980).

Lutein: A member of the carotenoid family, lutein is a potent antioxidant that is beneficial for eye health (Dagnelie 2000, Seddon 1994).

Chinese herbal medicine/acupuncture

General considerations/rationale

Keratoconjunctivitis sicca is Dryness and Heat in the Lung and Liver. There may be a deficiency of Essence. According to the Western interpretation, the Liver opens to the Eyes in TCM, so Heat or Dryness in the Liver is evident from the signs of keratoconjunctivitis sicca. The Lung is given the task of distributing water, so Dryness and Heat in the Lung can manifest anywhere on the body. Essence is your basic being. It is what you are born with and the potential you have to grow. Western practitioners translate this concept into genetic potential. Animals with a genetic predisposition to develop KCS or congenital KCS are considered to have deficient Essence or a weak genetic constitution.

Appropriate Chinese herbs

Anemarrhena (Zhi mu): Inhibits bacteria and fungi (Yao Xue Qing Bao Tong Xun 1987). Anemarrhena also decreases inflammation. It was shown to increase the level of corticosterone in rat plasma (Chen 1999). This may make it beneficial in decreasing the inflammation in the eye.

Arctium (Niu bang zi): Has anti-inflammatory effects (Zhong Yao Xue 1998). It may help to decrease the inflammation associated with KCS. It also has demonstrated efficacy against some bacteria and fungi (Group of Internal Medicine 1960, Cao 1957).

Chrysanthemum (Ju hua): Has antibiotic activity (Yi Xue Ji Shu Zi Liao 1974). It may be helpful in cases of KCS due to bacterial infections.

Equisetum (Mu zei): Has anti-inflammatory properties (Zhong Yao Xue 1998).

Gypsum (Shi gao): Decreases inflammation. In one study, 126 human patients with inflammatory disease processes were treated with gypsum, and most showed improvement (Zhong Hua Wai Ke Za Zhi 1960).

Platycodon (Jie geng): Has anti-inflammatory properties by virtue of its ability to promote the secretion of corticosterone (Li 1984, Zhang 1984, Zhou 1979).

Prunella (Xia ku cao): Can enlarge the adrenal glands and increase the plasma cortisol level (Jiang 1988). This property may make it effective in counteracting ocular inflammation.

Red peony (Chi shao): Reduces ocular inflammation. It has been shown to reduce redness, swelling, and pain in the eyes (Bao 1999).

Rhubarb (Da huang): Inhibits both aerobic and anaerobic bacteria (Zhao 1999, Yang 1997). It has also shown efficacy against various viruses (Xie 1996). In addition, it has both anti-inflammatory and analgesic properties (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Scrophularia (Xuan shen): Inhibits bacteria and some fungi (Chen 1986, Zheng 1960, Cao 1957).

Scutellaria (Huang qin): Contains biacalin, which has antibiotic activity against many bacteria and a few viruses (Zhong Yao Xue 1988, Liu 2000). Biacalin along with a second component of Scutellaria, biacalein, suppress inflammation (Kubo 1984). This suggests that it may have efficacy on the inflammation associated with KCS.

Acupuncture

There are conflicting reports concerning the efficacy of acupuncture for the treatment of KCS. Gronlund et al. (2004) studied a group of 25 people with KCS. The participants were randomly assigned to the acupuncture group or a control group. This study concluded that acupuncture decreased discomfort but did not change any parameters that could be measured, such as tear quantity or quality. The conclusion of the researchers was that acupuncture may be useful as a complement to Western medicine. Niemtzow, et al. (2006) presented case reports of 4 people with KCS of various etiologies and found that the patients who were treated with acupuncture had positive responses. These patients had been receiving Western therapy with little response. When acupuncture was added to the regimen, the number of times the participants needed to apply eye drops decreased significantly.

Homotoxicology

General considerations/rationale

There are no documented antihomotoxic protocols or case reports for treatment of keratoconjunctivitis sicca in animals, but general biological treatment principles can be applied to this disease, which often represents Impregnation to Degeneration phase homotoxicoses. Palmquist has recently seen a German Shepherd dog reverse chronic KCS following deep detoxification therapy. Theoretically, if such cases were caught early in their pathogenesis, it might be possible to reverse the changes before they became permanent. Use of homotoxicology remedies in this fashion should be viewed as experimental, and they may benefit a patient in other ways while failing to cure the keratoconjunctivitis sicca. Use of appropriate pharmaceutical agents is indicated to reduce pain and reverse disease signs in those patients that respond. Artificial tear replacement or surgical transplantation of salivary ducts may be needed in advanced cases.

Appropriate homotoxicology formulas

Classical homeopathy texts list many remedies that may be useful for the complaint of dry eye. Among these are major remedies such as *Aconitum*, *Aluminum*, *Arsenicum album*, *Belladonna*, *Lycopodium*, *Mezereum*, *Nux moschata*, *Opium*, *Pulsatilla*, and *Nux vomica* (Kent 1999). Antihomotoxic medicants that contain these agents, or that might be useful in such cases, include:

Aconitum homaccord: Used to treat red skin and fever that historically accompanies the dry eye. Fearful pets are another indication for this remedy.

Apis compositum: Contains Apis (see BHI-Eye). Also contains Mercurius sublimates corrosives for keratitis, iritis, and highly acute inflammations of the mucosae of the eyes (Reckeweg 2002).

Arsuraneel: Works through the action of *Arsenicum album*, (which is also in *Traumeel*), a remedy known to be associated with dry eye in people. It is useful for exco-riating discharges, burning coryza, and conjunctivitis with burning secretion (Reckeweg 2002).

Belladonna homaccord: Treats dry eyes (see *Mucosa compositum*).

BHI-Eye: Useful for ocular fatigue, ocular irritation, and dry and red conjunctivae (Heel 2002). Useful components include Apis, which is indicated in inflammation of the eyes with intense photophobia and increased secretions, and in keratitis with intense chemosis of the conjunctiva. *Rhus toxicodendron* helps with conjunctivitis, in serious cases of keratitis, and possibly when attempts to open the eyelids are accompanied by a thick, purulent discharge with lacrimation. *Aethiops antimonialis* is included for scrofulous conjunctivitis with marked photophobia and keratitis (Reckeweg 2002). *Belladonna* (see *Mucosa compositum*) is also included.

BHI-Lymphatic: Not currently available. Tuberculinum, a useful nosode in conjunctivitis, styes, keratitis, and photophobia, was a component of this remedy (Reckeweg 2002).

BHI-Sinus: Contains Kali iodatum, which has been indicated in keratitis, photophobia, lachrymation, and burning in the eyes. Also contains Cinnabaris (see Nasoheel) (Reckeweg 2002).

Echinacea compositum: An antibacterial. This is indicated in Impregnation Phase disorders; its components include Aconitum, Sulphur, Influenzeum nodode, and Arsenicum album (Reckeweg 2000).

Galium-Heel: A cellular phase remedy that provides support of Deposition and Impregnation phase cases.

Gripp-Heel: Used when viral impregnation is suspected.

Hepar compositum: Contains *Lycopodium*, supports of the liver, and provides detoxification and drainage of hepatic tissues. In Traditional Chinese Medicine, the Eyes and Liver organs are connected, so liver support may benefit ocular conditions.

Lamioflur: Indications include photophobia and sharp, burning secretions. This remedy has an affinity for mucocutaneous junctions. It contains Mezereum (see *Mezereum homaccord*).

Lymphomyosot: Provides lymphatic drainage.

Mezereum homaccord: This remedy is known to assist in the sensation of dry eye and might be considered if other symptom pictures in the case match.

Mucosa compositum: Belladonna can be used in cases of dry eye. Belladonna's typical action on the eyes is well known. It is characterized by special symptoms that arise from atropine poisoning, such as cramps in the muscles of the eyes and eyelids, enlargement of the pupils and, in particular, an inflammatory or irritative condition of the conjunctiva with great photophobia, lachrymation, and pain linked with engorgement of the inner blood vessels. *Mucosa oculi suis* also supports ocular mucosal elements. "*Mucosa compositum*® consists of suis-mucosal extracts from various parts of the body combined with dilutions (8X to 10X) of pancreas and Belladonna, which stimulate the cornea and conjunctiva in specific ways that promote the secretory function, stabilizing it rather than replacing it. The stimuli sent by these substances are a kind of code that helps initiate neuronal stimulation, both locally and centrally" (Sradj 1996).

Nasoheel: Contains Cinnabaris (also in found in *BHI-Sinus*), which has a special reputation in corneal affections, syphilitic iritis, ulcerative destruction of the nasal septum, and chronic blepharitis (Reckeweg 2002).

Oculoheel: Contains the following remedies, and their indications: *Apis mellifica* for conjunctivitis, edema of the eyelids, and hordeolums; *Natrium muriaticum* for

dacrocystitis and burning, and acrid epiphora; *Rhus toxicodendron* for conjunctivitis with a tendency toward suppurations, edema of the eyelids, and epiphora; *Hepar sulfuris* for cases with a tendency toward suppurations, chalazions, and hordeolums; *Spigelia* neuritis for ciliary neuralgia and trigeminal neuralgia; *Staphisagria* hordeolums in chalazions, blepharoconjunctivitis, and dacrocystitis; and *Aethiops mineralis* for scrofulous ophthalmia and keratitis (Heel 1996). Palmquist has seen chronic keratoconjunctivitis cases reverse on this formula when used long-term and in conjunction with deep detoxification.

Solidago compositum: The component *Arsenicum album* is indicated in some cases of dry eye. It also supports renal tissue and provides elimination, which is helpful in Deposition, Impregnation, and Degeneration phase cases. Also contains *Mercurius sublimatus corrosives* (see *Apis compositum*).

Thyroidea compositum: A phase remedy in Impregnation and Deposition phases.

Tonsilla compositum: Indicated in autoimmune disorders to regulate immune response.

Traumeel S: Used as an anti-inflammatory agent.

Authors' suggested protocols

Nutrition

Eye and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID (maximum, 2 capsules BID)

Lutein: 5 mg for every 50 pounds of body weight.

Chinese herbal medicine

Herbal KCS: 1 capsule for every 10 to 20 pounds twice daily. In addition to the herbs mentioned above, Herbal KCS also contains cassia seed (*Jue ming zi*), lycium bark (*Di gu pi*), and mulberry bark (*Sang bai pi*), which help to increase the efficacy of the formula.

The recommended acupuncture points are ST36, SP6, PC6, LI3, LI11, and tai yang.

Homotoxicology

Symptom remedy: BHI-Eye and/or Oculoheel, given orally BID for several weeks. Recently, subconjunctival administration of *Mucosa compositum* ampules has been successful in treating dry eye (*keratoconjunctivitis sicca*). Also, *Mucosa compositum*, *Traumeel*, and Pure Eye Drops can be mixed and used as eye drops BID to TID topically. They can possibly be mixed with the patient's own serum.

Psorinoheel: Used as an *autosanguis* in refractory cases, along with *Lamioflur* and *BHI-Sinus* and/or *Nasoheel*.

PROGRESSIVE RETINAL ATROPHY/ RETINAL DEGENERATION

Definition and cause

Progressive Retinal Atrophy (PRA) is an inherited group of diseases of the retina. It usually begins early on as retinal dysplasia, or it can occur after the retina has fully matured (usually after 12 weeks of age). PRA can be related to a physical change in the retina or a nutritional deficiency or metabolic defect, or it can be secondary to a local, diffuse, or cellular autoimmune inflammatory process. In dogs it can be an inherited (autosomal recessive) disease that commonly affects collies, Irish setters, miniature poodles, cocker spaniels, and Labrador retrievers. In cats it can be autosomal dominant or recessive and more commonly affects Abyssinians.

Other causes of PRA can have a nutritional component. Experimental deficiencies of vitamins A and E can cause a partial degeneration of the retina. In cats, a taurine deficiency can cause retinal degeneration. Most veterinary ophthalmologists do not recommend nutritional supplementation because there have been no studies to substantiate their effectiveness or benefit (Glaze 1999, Narfström 1999, Smith 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

No medical therapies have been proven effective. Pyridoxine supplementation in cats for ornithine aminotransferase deficiency may increase the activity of the enzyme; however, it has not been proven to reverse the degeneration. Supplementing cats' daily diets with proper levels of taurine may halt the progression in taurine-deficient retinopathy.

Anticipated prognosis

Inherited PRA progresses to complete blindness. The progression is often slow enough for the patient to adapt to visual loss and is most often nonpainful, unless complicated with other conditions such as cataract formation or glaucoma. A degenerative process from previous inflammation or trauma usually does not progress unless a systemic disease such as uveodermatologic syndrome, blastomycosis, or toxoplasmosis causes persistent inflammation.

Integrative veterinary therapies

PRA appears to be a progressive degenerative process that is related to a local/cellular autoimmune reaction. There is often a genetic predisposition to the retina as the target

organ. As such, the initial free-radical-induced inflammation occurs locally in the retina, followed by a cascading, diffuse inflammatory process, leading to destruction of the rods and cones of the retina and finally loss of sight. Although the literature clearly states that there is no treatment for retinal degeneration and that blindness is inevitable, some veterinary ophthalmologists believe that nutritional antioxidant supplementation may slow the degeneration of the retina. In addition, specific herbal and homeopathic remedies may add to the neutralizing of the cellular inflammation with a slowing of the autoimmune attack of the retinal tissue.

Nutrition

General considerations/rationale

Early nutritional therapy can help to reduce free radical production, control the underlying inflammatory process, and nourish the cells of the retina in an attempt to slow down the degenerative process and preserve cellular integrity.

Appropriate nutrients

Nutritional/gland therapy: Glandular eye and liver supply the intrinsic nutrients to reduce cellular inflammation, improve organ function, and slow degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

Taurine: Dietary supplementation with taurine has led to clinical improvement in cats with retinal and cardiac disease (Kramer 1995, Monson 1989, Pion 1987).

Essential fatty acids: Proper levels of essential fatty acids, particularly DHA and EPA, are essential for healthy eye function and retinal development (Pawlosky 1997). Hemp oil is a plant-derived oil that is high in both linoleic (LA) and linolenic (LNA) fatty acids, which are the building blocks for the longer chained eicosapentaenoic (EPA) and docosahexaenoic acid (DHA). The analysis of hemp oil shows that more than 70% is polyunsaturated fatty acids and less than 20% saturated fats, making it extremely low in saturated fats (Kralovansky 1994, Weil 1993). Because of its high level of gamma linolenic acid (GLA), hemp oil is being investigated for its beneficial effects on immune function (Horrobin 1992).

Lutein: A member of the carotenoid family, lutein is a potent antioxidant that is beneficial for eye health. Seddon (1994) showed that people who received lutein showed a decreased risk of macular degeneration and had increased protection of the eye. Hankinson (1992) showed that lower levels of lutein were associated with increased risk of cataract. Dagnelie (2000) found that people with retinitis pigmentosa (RP) showed a significant improvement in visual acuity with lutein supplementation.

Flavonoids: Quercetin has been shown to lessen the progression of diabetic retinopathy (Varma 1986).

Another group of flavonoids, proanthocyanidans (POCs), which come from grape seeds or pine bark, have also been shown to limit the progression of retinopathy (Fromantin 1981, Verin 1978).

Chinese herbal medicine

General considerations/rationale

Traditional Chinese Medicine theory holds that retinal degeneration is due to Blood and Yin deficiency of the Liver and Kidney. There may also be some Liver Qi stagnation involved. The Liver opens to the Eyes and the Kidney nourishes the Liver. If the Kidney and Liver are not nourished, the Eyes show pathology. Liver Qi stagnation may describe pain if it is present. The Western understanding of herbal supplements has shown that herbs can be used to increase circulation, improve cellular nourishment, and help to reduce inflammation of the retina. Chinese herbal remedies for retinal degeneration may include some of the herbs listed below. Some of these herbs have been shown to improve circulation, thereby improving nourishment of the retina, while others have been shown to decrease inflammation and swelling. Studies have shown improvement in vision, even though the specific chemical component(s) of the herbs was not identified as being responsible for the effect.

Appropriate Chinese herbs

Astragalus (Huang qi): Increases red blood cell production to increase nutrition to the retina (Nan Jiang Zhong Yi Xue Yuan Xue Bao 1989). It also decreases immune disorders (Yun Nan Zhong Yi Za Zhi (1980).

Dendrobium (Shi hu): Nourishes the retina. Several studies have shown improvement in vision in diabetics with retinal degeneration who are given formulas containing dendrobium (Wang 1999, Ling 1999, Yang 2001).

Red peony (Chi shao): Reduces redness, swelling, and pain in the eyes. It is a component of formulas used to decrease retinal vein occlusion (Bao 1999).

Chinese wolfberry (Gou ji zi): Has more betacarotene than carrots. It contains zeaxanthin, which is related to lutein. It protects the retina by neutralizing free radicals from sunlight (Cheng 2005).

Ophiopogon (mai men dong): Shows a marked decrease in blurred vision, as was seen in elderly people given ophiopogon (Zhong Gou Zhong Yao Za Zhi 1992).

The following herbs have been shown to decrease inflammation: prinsepia (Rui ren rou), angelica root (Dang gui) (Yao Xue Za Zhi, 1971), White peony (Bai shao) (Zhong Yao Zhi 1993), peach kernel (Tao ren) (Zhong Yao Tong Bao 1986), cimicifuga (Sheng ma) (Zhong Yao Xue 1998), fresh rehmannia root (Sheng di huang) (Zhong Yao Yao Li Yu Ying Yong 1983), and ligustrum (Nu zhen zi) (Zhong Guo Zhong Yao Za Zhi, 1989).

Homotoxicology

General considerations/rationale

Retinal degeneration is a Degeneration Phase disorder with an Inflammation or Impregnation phase early in the onset. Improvement of circulation and reduction in reactive oxygen species are critical to slowing the progress of such disorders. Placenta compositum, Aesculus compositum, Secale compositum, and/or Cerebrum compositum may be helpful but have not been researched for this condition. These are general support remedies for the circulatory function of the eye, and have been used clinically by European practitioners, but there is no current research data that defines their use.

Appropriate homotoxicology remedies

As noted earlier, there are no reports documenting successful use of homotoxicology to reverse retinal atrophy. Therapy depends upon the primary pathological processes involved. Once a primary diagnosis is made, every attempt should be made to determine which conditions are causal. Based upon primary causation the following options are available for consideration:

Lymphomyosot: Use if the condition is inflammatory or autoaggressive in nature.

Oculoheel or BHI-Eye: Used for general ocular support.

For most cases, use:

Psorinoheel, Lymphomyosot, Galium-Heel: Use if the conditions hereditary. (There are not many options for hereditary cases except those that offer general support and detoxification).

Traumeel, Spigelon, Gelsemium, Phosphor homaccord, Galium-Heel, Ubichinon compositum, Phosphor homaccord, Coenzyme compositum: Use if the condition is due to metabolic/mitochondrial defects.

Veratrum homaccord, Scwef-Heel, Ubichinon compositum, Coenzyme compositum: Use for Degeneration Phase disorders.

Authors' suggested protocols

Nutrition

Eye and liver support formulas: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Taurine: 500 mg for every 20 pounds of body weight daily.

Lutein: 5 mg for every 50 pounds of body weight.

Quercetin: 35 mg for every 10 pounds of body weight SID.

Proanthocyanidans (PCOs): 20 mg for every 10 pounds of body weight daily.

Chinese herbal medicine

Retinal degeneration: 1 capsule for every 10 pounds of body weight BID.

Note for Chinese herbal formulation: In addition to the herbs listed above, the authors suggest an herbal preparation that contains the following herbs: codonopsis (dang shen), tribulus (bai ji li), carthamus (hong hua), leeches (shui zhi), eriocaulis (gu jing cao), equisetum (mu zhi), earthworm (di long), mugwort (liu ji nu), liquid amber (lu lu tong), scorpion (quan xie), and centipede (wu gong). These herbs help balance the formula, making it more specific for the intended clinical condition while minimizing potential side effects that are inherent in some multiple herbal formulations.

Homotoxicology

BHI-Eye, Traumeel, and Lymphomyosot: Mixed together; 1 dropper given BID.

EAR MITES

Definition and cause

Ear mites are caused by *Otodectes cynotis*, and they cause a severe inflammation and waxy accumulation in the external ear canal of both dogs and cats. Secondary to the self-trauma, the pinnae and face can become excoriated (Scott 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

After a thorough cleansing to remove the accumulated waxy build-up, the treatment is instilling a preparation that contains a chemical insecticide such as Pyrethrin or Ivermectin, as well as medications to soothe the ear and dissolve the wax.

Anticipated prognosis

If detected early before self-trauma of the ear and the potential to damage the eardrum, the prognosis is excellent.

Integrative veterinary therapies

Ear mites colonize the ear canal of cats, dogs, and many other mammalian species. Secondary infections are common, and ear mites are commonly encountered in clinical practice. Medical therapy is usually curative; however, chronic ear infections may result and integrative therapies can be helpful in reducing inflammation, protecting local cells and tissues, and improving general immune function.

Nutrition

General considerations/rationale

Nutritional support should be in combination with medical management to help reduce inflammation, boost immune function, and prevent chronic secondary infections.

Appropriate nutrients

Nutrition/gland therapy: Supports the ear and glands of the immune system in combination with antioxidants such as vitamins E, A, and C, which help prevent chronic infections.

Chinese herbal medicine

General considerations/rationale

Practitioners of TCM recognize ear mites to be external parasites.

Appropriate Chinese herbs

Cnidium fruit (She chuang zi): An effective antipruritic (Lin Chuang Pi Fu Ke Za Zhi 1983).

Dictamnus (Bai xian pi): Used for dermatological conditions. In one trial it was used to treat 45 people with chronic eczema as part of a formula called Qu Feng Zhi Yang (dispelling wind-pathogen and relieving itching) decoction. In addition to dictamnus, this formula contains Qin jiao (gentian root), Huang bo (sophora), Di Fu Zi (Kochia), Sheng Di Huang (rehmannia root), Wei Ling Xian (clematis), Huai Hua (Flos sophorae), Cang Er Zi (Xanthium), Chen Pi (citrus peel), Gan Cao (licorice), and Ku Shen (sophora root).

Qing Dai San, which contains dioscoria (Shan yao), dragons bones (Long gu), oyster shell (Mu li), cuttlebone (Hai Piao xiao), and madder (Qian cao gen), was applied topically. Fifty-eight percent of the patients had complete recovery, while another 24% improved (Wang 2000).

Realgar (Xiong huang): Has been used in moist types of skin lesions as part of a patent formula called San Huang Lotion. In addition to realgar, san huang lotion contains Da Feng Zi (hydrnocarpi), Fang Feng (siler), Bai Xuan Pi (dittany bark), Huang Bo (phellodendrom), Huang Qin (scutellaria), and Ku Shen (sophora root). Of 54 patients, 51% had complete resolution of lesions, and another 33% improved (Dong 1999).

Sophora root (Ku shen): Effective against rashes, itching, and eczema (Zhong Cao Yao Tong Xun 1976).

Sulfur (Liu huang): A commonly used substance in dermatology (Gupta 2004). There is anecdotal evidence that it may have activity against mites (Ayres 1986).

Homotoxicology

General considerations/rationale

Ear mite infestation initially constitutes an Excretion Phase disorder and the body's physiological response is to increase ceruminous and glandular secretion within the ear canal. Secondary infections may ensue as a result of accumulation of desquamated skin, mite waste, and bacteria. The bacterial species involved are not generally malignant and are attempting to reduce the quantities of Excretion Phase byproducts. Long-term infections resulting from untreated ear mite infestations can lead to Deposition Phase, Impregnation Phase, and Degeneration Phase disorders in extreme cases. Conventional treatment involves cleaning the debris from the ear canal, treating any infection present, and using an acaricidal product. Environmental controls may be needed.

There is no evidence-based antihomotoxic agent for specific treatment of ear mites. Homotoxicology can be used to manage other symptoms and help remove homotoxins from the affected tissue.

Appropriate homotoxicology formulas

Clean ears with appropriate solutions and apply an acaracidal agent. Formulas to consider:

Belladonna homaccord: Treats severely red ear canals with localized inflammation.

Echinacea compositum: Used in cases with secondary bacterial otitis and suppurative discharges.

Graphites homaccord: Used in greasy cases with pigmentation and slow healing.

Psorinoheel: An Excretion Phase remedy.

Traumeel S: Reduces irritation and inflammation and speeds healing.

Authors' suggested protocols

Nutrition

Ear and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Chinese herbal medicine

The authors use herbal ear mite solution. The powder is mixed with water and cooked; then the solution is used to clean ears BID for 1 week. In addition to the herbs cited above, ear mite contains alum (Ming fan), bunge prickly ash peel (Hua jiao), indigo (Qing dai), and phellodendron bark (Huang bai), which increase the efficacy of the formulation.

Homotoxicology

In addition to standard ear cleaning and acaracidal therapy:

Sulfur-Heel: May aid in the intense itching phase and improve healing.

Traumeel S: Use orally or in the ear directly (oral vial, 5 drops orally and 5 drops in the ear canal) BID for cases with extreme inflammation.

EXTERNAL OTITIS

Definition and cause

An inflammatory process of the external ear canal. Causes can be allergic, parasitic, auto-immune, mechanical, foreign bodies, and neoplasia. Secondary bacterial infections are common (Griffin 1993, Werner 2003).

A proper diagnostic approach is needed to best handle otitis externa. Otoscopic examination is vital to determine the extent of the disease. Otitis media should be identified and properly treated because it can lead to otitis externa. The state of the tympanic membrane should be noted because selection of topical agents is drastically affected by the presence of an open tympanum. Cytology of the ear canal exudates gives vital information as to the precise nature of the pathogens present. Thyroid and other endocrine testing may be needed in recurrent cases. Culture and sensitivity may be needed to properly evaluate the antimicrobial therapy selected.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Systemic and topical antibiotics, anti-inflammatories, antifungal, and/or anti-parasitic medications are all recommended based upon proper diagnostics and a full determination of the underlying cause(s).

Anticipated prognosis

The prognosis depends upon the stage of diagnosis and phase of disease. The prognosis for both external otitis and otitis media is good so long as there are no underlying complications such as stenosis of the canal. Recurrences are common (Griffin 1993, Werner 2003).

Integrative veterinary therapies

Chronic otitis externa with severe scarring and polyp formation carries a poor prognosis for cure, and the client should be advised that chronic maintenance (and not cure) is the goal in such cases. However, some cases make remarkable improvement once they are allowed to activate inflammation and undergo exudative processes with proper nutritional and biological therapy, so integrative treatments are a good option.

In simple infections, cleaning the ear may be all that is required. While antibiotic, anti-inflammatory, and anti-fungal agents are frequently used, these do not cure the predisposing cause. Rather, they only serve to suppress the symptoms of inflammation and allow for the return of homeostasis. This type of otitis externa has been observed in the period following routine vaccinations and likely represents regressive vicariation and healing. Biological therapy assists these cases greatly on their path to wellness (see Homotoxicology, below).

Exudative discharges must be removed regularly because they contain proinflammatory and toxic material. Bacteria and yeast rapidly overpopulate such environments in response to the increased nutrients provided by these exudates.

Nutrition

General considerations/rationale

Nutritional support should occur in combination with medical management to help reduce inflammation, boost immune function, and prevent chronic secondary infections.

Appropriate nutrients

Nutrition/gland therapy: Gland therapy to support the ear and glands of the immune system in combination with antioxidants such as vitamins E, A, and C are beneficial in preventing chronic infections.

Chinese herbal medicine/acupuncture

General considerations/rationale

External otitis is due to Damp and Heat in the Liver with Blood deficiency, leading to internal Wind. Damp and Heat are the purulent debris and inflammation is seen in the ear canal. If there is an accompanying Blood deficiency, the Liver is not nourished. When the Liver is not

nourished there is a fluid (Yin) deficiency. Because Yin and Yang are supposed to be in balance, a Yin deficiency means there is a relative Yang excess. Yang is Heat. One can envision this Heat rising up and causing Wind, just as a fire can cause wind gusts. One can liken the wind blowing trees to the gait of a swaying ataxic individual. Internal Wind or Wind generated inside the body can lead to dizziness. In Western terms, this is the dizziness, and ataxia is seen when otitis externa extends into the middle ear.

Treatment is aimed at eliminating the underlying cause of the otitis (bacteria, fungi, inhaled allergens, etc.), decreasing inflammation, and controlling pain.

Appropriate Chinese herbs

Angelica (Bai zi): Has anti-inflammatory properties (Zhong Guo Zhong Yao Za Zhi 1991).

Atractylodes (Cang zhu): Has activity against *Staphylococcus aureus* and dermatophytes (Zhong Yao Xue (Chinese Herbology 1998).

Bupleurum (Chai hu): Decreases the effect of histamine release (Zhong Yao Yao Li Yu Ying Yong 1983) and has antibiotic effects against streptococci (Zhong Yao Xue 1998).

Cicada slough (Chan tui): Has been used successfully in humans to treat chronic urticaria (Pi fu Bing Fang Zhi Yan Jiu Tong Xun 1972). It may be useful in decreasing the inflammation of the lining of the aural canal.

Honeysuckle (Jin yin hua): Has antibiotic effects against *Staphylococcus aureus*, *E. coli*, and *Pseudomonas aeruginosa* (Xin Yi Xue 1975), and is anti-inflammatory (Shan Xi Yi Kan 1960).

Licorice (Gan cao): Inhibits the growth of *Staphylococcus aureus* (Zhong Yao Zhi 1993). It contains glycyrrhizine and glycyrrhentic acid, which have corticosteroid activity (Zhong Cao Yao 1991).

Mint (Bo he): Relieves itching (Zhong Cao Yao Xue 1980) and has anti-inflammatory effects (Zhong Yao Xue 1998).

Moutan (Mu dan pi): Demonstrates anti-inflammatory actions via inhibition of prostaglandin synthesis and decreases vascular permeability (Sheng Yao Xue Za Zhi 1979, Zhong Guo Yao Ke Da Xue Xue Bao 1990). It inhibits the growth of *Staphylococcus aureus*, streptococci, and dermatophytes (Zhong Yao Cai 1991).

Platycodon (Jie geng): Decreases allergic reactions (Zhong Yao Yao Li Yu Ying Yong 1983).

Poria (Fu ling): Has inhibitory effects on *Staphylococcus aureus* (Zhong Yao Cai 1985).

Rehmannia (Sheng di huang): Has shown anti-inflammatory activity in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

Siegesbeckia (Xi xian cao): Inhibits the growth of *Staphylococcus aureus* (Kim 1979).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It also has antibiotic effects against *Staphylococcus aureus*, some streptococci, *E. coli*, *Pseudomonas aeruginosa*, and some dermatophytes (Xin Zhong Yi 1989).

There are few reports in the literature concerning the use of acupuncture to treat otitis. Yu (1990) used acupuncture to treat 81 people with suppurative otitis with some success.

Homotoxicology

General considerations/rationale

Eighty-five percent of otitis externa cases are allergic in origin (food, inhalant, contact, flea, etc.). Allergies and many adverse reactions to drugs are Impregnation Phase homotoxicoeses. Mild ear infections can occur and are Inflammation Phase conditions. Careful history and physical evaluation are advised, and therapy for allergies should be discussed with the client (also see Allergy protocols).

In some homotoxicoeses, particularly Deposition, Impregnation, and Degeneration phases, an inflammatory response may be required so that homotoxins—and tissue damaged by homotoxins—may be removed and repaired. This process involves redness, itching, and discharge.

The discharge ordinarily begins as a crusty, waxy, greasy-type material and progresses to lighter, oily material, and finally to pus or serous exudates. These stages can be seen in patients recovering biologically from Impregnation Phase diseases and must be gently handled with biological agents instead of suppressive drug therapy for optimum results to occur. In otitis in which pigmentation is noted, the client should be advised that inflammation will likely follow successful biological therapy, and if a client is unwilling to proceed, such therapy should be avoided.

Zymox is an effective agent in many of these cases, and does not interfere biologically with healing. Pavia wound care ointment is also extremely helpful in assisting patients that are undergoing regressive vicariation. It should be used in the ear for no more than 5 days and discontinued. After use of Pavia wound cream, a thick, waxy discharge will occur that requires gentle removal for approximately 5 days. In responsive cases rapid change occurs following this treatment. If the condition worsens, then use conventional medications to get it under control.

Appropriate homotoxicology formulas

Belladonna homaccord: Used for focal, intensely red areas of inflammation and for reactions following vaccinations.

BHI-Ear: Same remedy as *BHI-Chamomilla*, used for otitis media and externa. In mild cases this remedy alone may suffice. Contains *Aconitum* (also in *Aconitum homac-*

cord, *Barijodeel*, *Echinacea compositum*, *Traumeel*, *BHI-Chamomilla Complex*, *BHI-FluPlus*, and others) for surges of blood toward various organs, with a tendency for the capillaries to rupture. This results in petechial hemorrhages in the nasal and respiratory mucosa, catarrhs, neuralgic symptoms with paraesthesia, hyperthermia, encephalitis with very high temperatures (e.g., post-vaccinal encephalitis), and chronic middle-ear infections. Capsicum (also contained in *Sulphur-Heel*, etc.) is indicated for ulcerative glossitis, aphthae, pharyngitis, mastoiditis, purulent acute otitis media, and other Reactive Phases. Chamomilla (contained in *Traumeel*, *Calcoheel*, *BHI-Calming*, *BHI-Ear*, etc.) is particularly suited to states of nervous agitation as a tranquillizing remedy and for painful states such as toothache, catarrhs of the middle ear, rheumatism, and others. The typical Chamomilla earaches are pressive and tearing, and the ears are especially sensitive to cold air. Thus, it is useful in inflammatory illness (Inflammation Phase), in this case, otitis media, with violent episodes of pain, and other painful conditions.

The ingredient Ferrum phosphoricum (also in *Ferrum homaccord*, *Tonsilla compositum*, etc.) is indicated for feverish states, otitis media, pneumonia, or other feverish, inflammatory diseases of the respiratory organs. Hepar sulphuris calcareum (also in *Belladonna homaccord*, *Cantharis compositum*, *Coenzyme compositum*, *Echinacea compositum*, *Euphorbium compositum*, *Mercurius-Heel*, *Traumeel*, *BHI-Enzyme*, *BHI-Infection*, *BHI-Inflammation*, and *BHI-Injury*) is indicated for the following symptoms: hypersensitivity to touch, pain and cold air, and the tendency to suppuration or inflammation which rapidly changes to suppuration. Hepar sulph is also a remedy for chronic catarrhs of the respiratory organs, inflammation and suppuration of the skin and mucosae such as furuncles and pyoderma, and chronic purulent offensive discharge from the ears (possibly along with Graphites and other remedies), otitis media, and abscess of the palatine tonsils.

Plantago major (also in *Viburcol*, etc.) is for treatment of a disposition to lymphatic disorders. The main indications are: otitis media, mastoiditis and post-operative fistulae, and skin rashes. *Pulsatilla* (in *Abropermol*, *Causticum compositum*, *Coenzyme compositum*, *Cruroheel*, *Echinacea compositum*, *Euphorbium compositum*, *Mucosa compositum*, *Thyreoidia compositum*, *Tonsilla compositum*, *Viburcol*, *BHI-Enzyme*, *BHI-Inflammation*, *BHI-Sinus*, and many others) is indicated when eyelids are inflamed and there is itching with lacrimation. The external auditory canal may also be swollen and inflamed, as may the nasal mucosa. This is also indicated for otitis media with violent, stinging, pulsating pain; skin diseases; inflammations of the respiratory passages; and a tendency for the common cold (Reckeweg 2002).

BHI-Enzyme: Contains Malicum acidum, which is also in *Coenzyme compositum*, *Cor compositum*, *Hepar compositum*, and *Thyroidea compositum*. This is indicated in seborrhea; chronic dry, scaly eczemas; and eczema and fissures in the auditory canal. See also allergy protocols.

BHI-Skin: Contains several remedies that are useful in otitis externa and media, and is also of value in atopic/allergic cases. The remedies with indications for otitis include Petroleum (*BHI-Body Pure*, etc.), which can be of value in conditions that affect the mucosa of the eyes, with dacryocystitis, lacrimation, as well as otitis externa with chronic inflammatory discharge. These are associated with tinnitus and hearing impairment and fistulae.

Lycopodium (also in *Crurrohoheel*, *Hepar compositum*, *Hepeel*, *BHI-Allergy*, *BHI-Hair and Skin*, and many others) is a specific liver remedy. It can bring significant relief in liver damage, liver dysfunctions, and even in serious degenerative symptoms. A wide variety of symptoms depend on liver function, or else provide an alternate outlet for the elimination of homotoxins if the liver function is disordered. These include skin diseases such as urticaria or ulcers; pityriasis with alopecia; and skin conditions with moist eczemas, otorrhoea, and other reaction phase conditions.

Kreosotum (also in *Lamioflur*, *Mucosa compositum*, and many others) has an excoriating action on the skin and causes white patches on the oral mucosa and the tongue, followed by deeper destruction of the tissue. Excoriating, fetid, and burning discharges are characteristic, as are hemorrhages and ulcers. There may be pustular eczema with scurf on the extensor sides of the limbs, and possibly also Meibomian cysts and styes, burning, itching, moist eczema of the ears, and maybe chronic otitis media and tinnitus (Reckeweg 2002). General support comes from sepia and Sulphur.

Cutis compositum: Opens the skin to drainage, detoxification, and repair in all phases.

Echinacea compositum: Provides immune support in the face of infection.

Graphites homaccord: Used for pigmented, greasy, oily dermatitis and otitis externa in overweight animals.

Hormeel: Normalizes endocrine responses.

Lamioflur: Used for discharges and inflammation near mucocutaneous junctions. Contains several useful remedies, including *Hydrastis canadensis* (also in *Mucosa compositum*, *NasoHeel*, *Ubichinon compositum*, *BHI Sinus*, etc.). It is used principally in serious disorders of the autonomic nervous system; protracted catarrhs; influenza with great secretion of mucus; liver conditions with jaundice; cystitis; eczematous skin eruptions; congestive coryza; nasal ulcers; cholesteatoma; otorrhoea; and in any other acrid, raw, excoriating discharges when a general

deterioration of energy is present. It also contains Kali sulphuricum, which has main indications for yellow mucus or purulent discharges from the bronchi, conjunctivitis, pustular and vesicular eruptions, eustachian catarrh with deafness, and chronic otitis media with yellow discharge (Reckeweg 2002). Also contains Kreosotum (see *BHI-Skin*).

Psorinoheel: A constitutional remedy containing sulfur that is good for polypoid otitis and chronic cases of otitis externa.

Schwef-Heel: Sulfur-containing agent useful in allergic cases.

Sulphur-Heel: Used for red, dry, greasy, or bad-smelling cases.

Traumeel S: Has nonsteroidal anti-inflammatory actions. This remedy may serve as a helpful agent in all phases and all cases of otitis.

Authors' suggested protocols

Nutrition

Ear and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

H52 ImmunoDerm and H67 DermGuard: 1 capsule of each for every 10 to 20 pounds twice daily. In addition to the herbs discussed above, these preparations contain scutellaria (Huang Qin), fleece flower root (He shou wu), siler (Fang feng), tokoro (Bi xie), schizonepeta (Jing jie), dandelion (Pu gong ying), oldenlandia (Bai hua she cao), kochia (Di fu zi), xanthium fruit (Cang Er zi), bitter orange (Zhi ke), Angelica radix (Dang gui), buffalo horn shavings (Sui Niu jiao), earthworm (Di long), silkworm (Jiang can), and cnidium (Chuan xiong). The combination of these two formulas has anti-inflammatory, antipruritic, and antibacterial effects.

The underlying cause of recurrent otitis should also be determined. This formula works well on atopic otitis but is not effective for food allergies. The only effective therapy for food allergies seems to be avoidance, in the author's opinion.

Recommended acupuncture points include ST36, LI11, and GB2 (Handbook of TCM Practitioners 1987).

Homotoxicology

In addition to treatment of predisposing causes (see allergy, Autoimmune disease, Hypothyroidism, Cushing's disease):

Simple otitis externa: Traumeel, Belladonna homaccord, Echinacea compositum, combined and given orally BID. Broadfoot starts severe cases with Belladonna homaccord plus Echinacea compositum IV and as an autosanguis, and Belladonna compositum tablets BID to

TID. Traumeel vials can be opened and placed directly in the ear canal to reduce pain and swelling in acute cases, or use Pure Ear Drops, which are Traumeel in plastic vials for instilling into ear canals. Lamioflur, Abropernol, and Cruroheel may be considered in resistant cases.

Chronic otitis externa: Use Psorinoheel, added to the above.

Allergic cases: Give Schwef-Heel plus the Simple Otitis Externa combination. In allergies, consider repairing hepatic enzymes, covered in the allergic dermatitis section.

Chronic otitis externa with greasy discharge: Graphites homaccord combined with the above items as indicated BID PO.

Chapter Thirteen

Diseases of the Musculoskeletal System

ARTHRITIS

Definition and cause

Arthritis is a degenerative, progressive disease of the cartilage and synovial surface of the joint. Although arthritis is distinguished from immune-mediated arthritis because it is classified as non-inflammatory, inflammation is believed to be an important part of the initiation and ongoing breakdown of tissue in the joint. Arthritis in dogs and cats is assumed to be related to the aging process as well as secondary to other factors such as injury, physical deformity, overuse, and other diseases such as dental disease. Continual loss or breakdown of the joint surface often leads to pain, inflammation, and permanent deformity (Beale 1993, 2003; Cook 1927; Pederson 1978, 1989).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

More integrative options exist for arthritis than any other disease condition. The conventional approach is the use of anti-inflammatory and pain-suppressing drugs such as corticosteroids and NSAIDs. The potential side effects from the chronic use of these drugs have led to alternative approaches such as reconstructive surgical procedures and joint replacement. Dietary management is most commonly used for weight reduction. The newer trend in arthritis management is toward chondroprotective agents such as Adequan®, and nutraceuticals such as glycosaminoglycan (glucosamine), pain-relieving agents such as methyl sulfonyl methane (MSM), and free radical scavengers such as superoxide dismutase (SOD) (Beale 2003, Todhunter 1994).

Anticipated prognosis

Arthritis is a progressive degenerative disease. The approach of medically addressing the symptoms and sur-

gically correcting the problem simply corrects the associated symptoms. The addition of chondroprotective agents, nutraceuticals, and a weight loss program greatly increases the likelihood of control of the disease and offers a much improved prognosis. Arthritis offers a good example of the proven effects of the integrative approach to treating a disease condition.

Integrative veterinary therapies

The conventional medical approach to arthritis focuses upon the signs and symptoms of the disease. While the degenerative process is physically located in the joints, the underlying mechanism begins with an inflammatory process at the cellular level. This process initiates the pain and swelling, but also results in the decrease in synovial fluid production, leading to further friction, inflammation, and degeneration. Adding nutritional and alternative therapies helps to reduce free radical production, decrease inflammation, enhance synovial fluid production, and slow or prevent further degeneration. In addition, if started early, it can reduce the dependence upon or minimize the use of medications.

Nonsteroidal anti-inflammatory drugs frequently have adverse effects, now more commonly known by consumers. They are useful for short-term therapy and in cases of severely advanced osteoarthritis in which safer therapies no longer suffice.

Nutrition

General considerations/rationale

Nutritional and gland support are directed toward reducing inflammation and protecting cells and tissue. Medication, on the other hand, covers up the inflammation; however, it does not get to the underlying cause nor does it confer cellular protection. Nutritional therapies also focus upon improving nutrient flow to the cells and tissues of the joints and help to prevent a decrease in the production of synovial fluid.

Appropriate nutrients

Chondroprotective agents: The body uses glucosamine to make and repair joint tissue and cartilage. Glucosamine has been clinically proven to significantly reduce the pain, inflammation, and swelling associated with osteoarthritis in both people and animals (Crolle 1980, D'Ambrosio 1981, Tapadinhas 1982, Giordano 1996). Glucosamine has been shown to have none of the side effects of drugs, and can be as effective as prescribed medications (Pujalte 1980, Vaz 1982).

Several studies have demonstrated the effectiveness of glucosamine and chondroitin in the management of arthritis in dogs (Das 2000, Guastella 2005). Setnikar et al. (1986) has described how these compounds actually stimulate the body's own repair mechanism and help in the process of developing new cartilage. Numerous double-blind studies have compared the effectiveness of glucosamine against various NSAIDs, resulting in as good or, in many cases, even better pain control and removal of the clinical signs associated with osteoarthritis (Prudden 1974, Vaz 1982, DeAmbrosia 1982).

Chondroitin sulfate (CS) is found in the lining of the joints, and clinical evidence in double-blind studies shows that supplementation with CS reduces pain and inflammation and increases joint mobility (Leeb 1996, Morreale 1996, Pipitone 1992, Uebelhart 1998). In the veterinary field, Anderson (1999) and Canapp (1999) showed that there was significant reduction in pain and improved mobility as reported by survey veterinarians.

Fatty acids: In a double-blind study of people with rheumatoid arthritis, Joe (1993) showed that a number of people had significant benefits from the addition of evening primrose oil (EPO). Kremer (1995) has shown that fish oil helps to reduce inflammation in people with arthritis.

Botanical Cox2 inhibitors: Botanical Cox2 inhibitors have been shown to have anti-oxidative and anti-inflammatory effects (Bemis 2005). Botanical Cox 2 inhibitors reduce inflammation without the inherent side effects of Cox2 medications.

Vitamin C: Vitamin C has been studied clinically in animals. Brown (1994), Berg (1990), and Newman (1995) reported on the benefits of vitamin C in the treatment of degenerative joint disease and movement in dogs and horses. Belfield (1981, 1998) reported on the beneficial effects of vitamin C in treating and preventing hip dysplasia in dogs.

Chinese herbal medicine/acupuncture

General considerations/rationale

Practitioners of TCM consider arthritis to be a combination of Wind, Damp, and Cold. The Kidney, which has the function of controlling the bones, is the main organ that is involved. Wind is a traveling pathogen, according

to TCM. It refers to the tendency of arthritis to manifest in various joints on different days. Wind also refers to motion. Some animals with arthritis may have twitching of the muscles, spasms, or trembling in the affected area. Cold causes stiffness, as many practitioners note. Animals tend to have more trouble getting up and mobilizing on colder days. Cold also causes pain. The animals often prefer warm areas on cold days. People know from experience that a heating pad helps decrease the pain associated with arthritis. Damp refers to swelling in the joint, i.e., the accumulation of fluids in the joint.

In addition to treating the signs of arthritis, it is important to address the underlying cause, such as rickettsial diseases, bacterial infections, and excess weight. Immune-mediated arthritis must be treated differently than degenerative arthritis.

Appropriate Chinese herbs

Aconite (Fu zi): Effectively decreases joint inflammation (Zhong Yao Tong Bao 1988) and has analgesic properties (Zhong Guo Zhong Yao Za Zhi 1992).

Angelica (Bai zhi): Has anti-inflammatory and analgesic properties (Zhong Guo Zhong Yao Za Zhi 1991). It contains scopoletin, an effective muscle relaxant (Zhi Wu Yao Yao Xiao Cheng Fen Shou Ce 1986).

Atractylodes (Bai zhu): Has been shown to decrease pain related to chronic back and leg arthritis in humans (Hu Bei Zhong Yi Za Zhi 1982).

Bupleurum (Chai hu): Contains saikosaponin, which has analgesic properties (Shen Yang Yi Xue Yuan Bao 1984).

Cinnamon twigs (Gui zhi): Have analgesic effects (Zhong Yao Xue 1998). Licorice contains two compounds, glycyrrhizin and glycyrrhetic acid, which have shown efficacy in treating arthritis (Zhong Cao Yao 1991).

Ginger (Sheng jiang): Has been shown to be effective in decreasing arthritis pain in several studies (He Bai Xin Yi Yao 1972, Chi Zhi Jiao Yi Shi Za).

Notopterygium (Qiang hu): Has been shown to relieve muscular pain in mice (Zhong Cao Yao 1991).

Pubescent angelica root (Du hu): Has demonstrated anti-inflammatory and analgesic effects (Zhong Yao Yao Li Yu Ying Yong 1983).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It is an effective pain reliever (Shang Hai Zhong Yi Yao Za Zhi 1983), and in combination with gan cao is excellent for muscle spasms (Hu Nan Zhong Yi 1989, Zhong Yao Zhi 1993).

Acupuncture

Musculoskeletal disease is one of the most common reasons for seeking acupuncture treatment in this country.

Acupuncture has been used extensively and effectively in all types of arthritic conditions. There are generalized points one can choose for acupuncture. For example, bai hua is a good choice for treating generalized weakness associated with muscle atrophy. In addition to being a good point to increase the body's energy, it also serves as a local point for the hip joint, lumbar spine, and hind legs (Schoen A 1994).

Local points also may be chosen. The following is a list of specific areas and possible point choices according to the author's experience:

Neck: SI16, LI18, BL10

Shoulders: SI9, SI10, TH14

Elbow: LI11, Qiang Feng (Yu 2000).

Carpus: PC6, TH5

Back: Hua tuo jia ji (points just lateral to each vertebrae chosen according to the location of the pain)

Hip: BL54, GB28, GB29

Stifle: GB34, ST35

Hock: BL60, KI3

Homotoxicology

General considerations/rationale

Osteoarthritis, a degenerative, nonautoimmune form of arthritis, represents homotoxicoses in the Inflammation, Deposition, and Degenerative phases, and is a common entity in veterinary medicine. Therapy is aimed at reducing homotoxin levels, improving circulation and lymphatic flows, reducing inflammatory pain, and improving mobility. Proper diet, adequate exercise, and weight management are critical to the success of any program designed to assist the osteoarthritis patient. Agents should be chosen initially that have minimal risk to the patient. An initial treatment period of 5 to 8 weeks is needed to properly assess response. Biological agents frequently require a longer window to demonstrate their effects, and clients should be advised of this fact at the initiation of therapy.

Homotoxicology has many biological agents that assist in managing arthritis with a minimum of harmful side effects, and consumers appreciate this immensely. Many clinicians take their first steps toward biological therapy in pursuit of better methods of pain management and rehabilitation for their patients, as well as for themselves. Some evidence for the effectiveness of antihomotoxic pain medications is discussed in the homotoxicology chapter of this text.

Appropriate homotoxicology formulas

Homeopathic strategies vary depending upon the anatomical location of the osteoarthritis as well as the presence or absence of other aggravating factors (cold, damp, skin rashes, etc (also see Autoimmune Arthritis in Chapter

6). The following remedies have proven themselves in hundreds of cases in the authors' clinics:

Aconitum homaccord: Treats polyarthrtis, particularly when combined with *Rhododendroneel S* and *Bryaconeel*.

Aesculus compositum: Is primarily a peripheral circulatory agent, but contains Rhus tox, Ruta graveolens, and Arnica, which are all excellent arthritis remedies.

Atropinum compositum: Treats painful muscle spasms associated with arthropathy (Heel 2003).

BHI-Arthritis: Used for swollen, painful joints and muscle stiffness. Particularly useful for patients that are more affected in cold, wet weather (Heel 2002).

BHI-Back: Treats back pain, muscle spasm, arthropathy (Heel 2002).

Bryaconeel: Treats polyarthritis, particularly when combined with *Rhododendroneel S* and *Aconitum homaccord*.

Calcoheel: Used for disordered calcium metabolism.

Cimicifuga homaccord: Treats neck pain and chronic luxations of pedal joints.

Colnadul: Used for arthritis that worsens with wet weather. It is particularly suited to knee problems, e.g. chronic dislocations. The authors use this in stifle issues (Broadfoot 2004).

Colocynthis homaccord: Used as an initial therapeutic agent, particularly for acutely painful conditions involving the lower back and hips. Initially use it every 15 to 30 minutes, until relief is noted (Reckeweg 2000).

Cruroheel: Used particularly for afflictions of the hind limbs.

Discus compositum: Treats spinal arthropathy (Broadfoot 2003).

Dulcamara homaccord: Used for arthritis worsened by wet weather.

Ferrum homaccord: Treats shoulder pain and shoulder-hand syndromes.

Gelsemium homaccord: Treats head and neck pain and lower limb weakness (Demers 2005).

Graphites homaccord: Used for deforming arthropathies.

Lithiumheel: Treats osteoarthritis of the hip joints, and is useful in conjunction with *Graphites homaccord* in hip-dysplasia-induced osteoarthritis.

Osteoheel: Treats ankle pain.

Psorinoheel: Indicated in chronic polyarthritis. There is some evidence for microbial causes of arthritides, e.g., mycoplasmas, and this remedy may have applicability for therapy.

Rheuma-Heel: Treats left-sided arthritis of the shoulder or knee.

Rhododendroneel S: Treats polyarthritis, particularly when combined with *Bryaconeel* and *Aconitum homaccord*.

Traumeel S: Useful in the form of vials, drops, tablets, ointment, and gel in many applications in osteoarthritis cases, particularly in the early phases for control of acute pain. This formula has more scientific research than any other homeopathic remedy and is listed in the Physician's Desk Reference as a nonsteroidal anti-inflammatory agent (see the homotoxicology chapter for references).

Zeel: Useful in the form of ampules, tablets, ointment, and gel as the main long-term remedy for osteoarthritis. Revitalizes tissues through Catilago suis, Funiculus umbilicus, and Placenta suis. It includes a number of homeopathic botanicals that are useful in arthritis (Rhus tox, Arnica, Solanum dulcamara, Symphytum officinale, and Sanguinaria). It also has agents that assist in metabolism (Sulphur, Nicotinamide adenine dinucleotide [NAD], Coenzyme A, alpha-lipoic acid, and sodium oxalacetate) (Reckeweg 2002). It is useful for arthritic pathology in any location, but it is best for stifle arthritis. Combine with other agents to target specific anatomical areas (See the homotoxicology chapter references).

Authors' suggested protocols

Nutrition

Cartilage/ligament/muscle/skeletal support formula: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Evening primrose oil: 1 capsule (500 mgs) for every 25 pounds of body weight daily.

Zyflamend: One-half dropper for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

JointGuard: 1 capsule per 10 to 20 pounds twice daily. This supplement has analgesic, anti-inflammatory, and antipyretic effects. In addition to the herbs mentioned above, JointGuard also contains amenarrhena (Zhi mu), allium (Cong bai), siler (Fang feng), cnidium (Chuan xiong), platycodon (Jie geng), bitter orange (Zhi ke), peucedanum (Qian hu), poria (Fu ling), and jujube fruit (Da Zao).

Homotoxicology

Initial therapy: Traumeel S drops BID and Zeel tablets twice daily; recheck in 3 weeks. Injection therapy, bio-puncture, or autosanguis with these agents can be very useful and can be repeated every 2 weeks to speed up response. Select other agents to target specific locations or symptoms.

HIP AND ELBOW DYSPLASIA

Definition and cause

Hip and elbow dysplasia is a degenerative condition of the hip or elbow joints leading to a malaligned joint and secondary arthritic changes. Genetics, nutrition, and developmental changes affect the degenerative process in both conditions (Cook 1996; McLaughlin 2003; Rettenmaier 1991; Schwarz 2000, 2003; Tomlinson 1996; Wind 1986). For more information, please refer to Arthritis, above.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical treatment involves anti-inflammatories, analgesics, and NSAIDs such as aspirin, carprofen, deracoxib, meloxicam, or piroxicam; however, none of the medical therapies address the physical malformation nor stop the

degenerative process. Diet is directed toward weight control. Surgical correction or hip replacement often works. For elbows, surgical exploration of the joint and removal of any loose fragments often works well (Kapatkin 2002; Manley 1993; McLaughlin 1996, 2003, Schwarz 2003; Tomlinson 1996).

Anticipated prognosis

Prognosis for hips with surgery is good. Prognosis for elbows is more guarded based upon surgical intervention, medical therapy, and the status of degeneration of the elbow (McLaughlin 2003, Schwarz 2003).

Integrative veterinary therapies

Nutrition

General considerations/rationale

See Arthritis remarks and rationale, above.

Appropriate nutrients

See Arthritis recommended therapy, above.

Chinese herbal medicine/acupuncture

General considerations/rationale

Arthritis is considered to be Blood and Essence deficiency in the Liver and Kidney. There is also Blood and Qi stagnation. The Liver and Kidney control the ligaments and bones, respectively. These organs are not nourished when there is Blood deficiency, leading to disease in the parts they control. Essence is the potential for growth known as genetic potential in Western terminology. There is a genetic predisposition to developing hip and elbow dysplasia. When the Essence of the Liver and Kidney are deficient their associated structures degenerate. Blood and Qi stagnation lead to pain.

Appropriate Chinese herbs

Alisma (Ze xie): An anti-inflammatory herb. It was shown to ameliorate 2, 4-chloronitrobenzene-induced contact dermatitis in mice (Dai 1991). It may be able to reduce inflammation in the joints.

Angelica root (Dang gui): Is as strong as aspirin at decreasing inflammation and is 1.7 times as strong as aspirin for pain relief (Yao Xue Za Zhi 1971). Thirty-eight people with elbow arthritis were treated with modified Dang Gui Si Ni Tang (angelica root [Dang gui], white peony [Bai shao], astragalus [Huang qi], cinnamon [Gui zhi], white mustard seed [Bai jie zi], wild ginger [Xi xin], mulberry twig [Sang zhi], notopterygium [Qiang hu], aurantium [Zhi qiao], chaenomeles [Mu gua], eupolyphaga [Tu bie chong], licorice [Gan cao], and tetrapanax

[Tong cao]). Twenty-four percent of the participants had complete resolution, 68% improved, and 8% did not respond (Hu 1998).

Astragalus (Huang qi): A mild analgesic (Zhong Yao Tong Bao 1986).

Atractylodes (Bai zhu): Has been shown to decrease chronic leg pain (Hu Bei Zhong Yi Za Zhi 1982).

Corydalis (Yan hu suo): Has anti-inflammatory properties; works for both acute and chronic inflammation (Kubo 1994). It has analgesic activity. Corydalis has 1/100 the activity of morphine (Zhong Yao Yao Li Yu Ying Yong 1983). It works synergistically with acupuncture in providing analgesia (Chen Tzu Yen Chiu 1994).

Jujube (Da zao): Has anti-inflammatory effects. It can prevent egg-white-induced toe swelling in rats (Li 1997). This property may help prevent inflammation in the joints.

Lycopodium (Shen jin cao): Has analgesic and anti-inflammatory effects. It was shown experimentally to decrease heat-induced pain and inhibit formaldehyde-induced inflammation in rat hocks (Zeng 1999).

Peach kernel (Tao ren): Has anti-inflammatory properties. It was shown to prevent egg-white-induced arthritis in mice (Liu 1989).

Rehmannia (Sheng di huang): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983). It has been shown to be effective for arthritis pain (Tian Jing Yi Xue Za Zhi 1966).

White peony (Bai shao): Contains Paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It has analgesic effects. In one trial, 65% of people with painful conditions responded (Shang Hai Zhong Yi Yao Za Zhi 1983).

Acupuncture

Osteoarthritis and lateral epicondylitis (tennis elbow) are on the World Health Organization's list of disorders responsive to acupuncture (World Health Organization 2006). This suggests that hip and elbow dysplasia should also be responsive.

Homotoxicology

General considerations/rationale

See Arthritis remarks and rationale.

Appropriate homotoxicology formulas

See Arthritis.

Authors' suggested protocols

Nutrition

Cartilage/ligament/muscle/skeletal support formula: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight daily.

Chinese herbal medicine/acupuncture

Formula H20 Osteophyte: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs discussed above, H20 Osteophyte also contains burreed tuber (Shan leng), carthamus (Hong hua), codonopsis (Dang shen), cnidium (Chuan xiong), lycopus (Ze lan), poria (Fu ling), red peony (Chi shao), and zedoaria (E zhu).

The authors use the following acupuncture points: ST36, GB30, Baihui, GV4, LI11, PC6, SI9, BL20, and BL23.

Homotoxicology

Osteoarthritis of the hip or elbow: Graphites homaccord (and/or Calcoheel), Galium-Heel, and Zeel tablets, combined and given BID PO. BHI-Arthritis, Causticum compositum, and Sulfur-Heel all have components for chronic ailments, and some specific remedies for hip and elbow issues. Aesculus compositum can be useful as intermittent therapy, because it has rheumatic indications and several remedies with an affinity for hip problems. Coenzyme compositum can be given twice weekly PO. In cases with extreme pain, use Traumeel S by injection weekly, orally 2 to 4 times daily, or topically in the gel as needed for pain control. In cases with marked joint proliferation, consider Lithiumel BID PO. Osteoheel can be alternated with Traumeel at intervals as needed to control signs. Discus compositum may be given EOD. Colocynthis is a useful remedy for lower back, hip, and sciatic problems.

LIGAMENT CONDITIONS: ACL AND LUXATING PATELLA

Definition and cause

Patella luxation is a displacement of the patella from the trochlear groove. In most cases the condition is inherited and based upon conformation. Trauma can also be the cause. It is graded based upon the severity of the luxation and the resultant inflammatory process and clinical signs. Anterior cruciate conditions can range from a mild inflammation to a complete tear of the ligament. Causes are classified as traumatic, immune-mediated, or age-related degeneration of the ligament and conformational abnormalities (Brinker 1997, Johnson 1993, Moore 1996, Slocum 1998, Schwarz 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

For patella luxation, treatment is dependent upon the amount of movement and secondary inflammation. Medical therapy includes anti-inflammatories such as corticosteroids or NSAIDs such as aspirin, carprofen, metacam, or piroxicam. For more severe luxations, surgery is the treatment of choice. For anterior cruciate issues, ruptures require surgical repair. For strained or inflamed ligaments, the treatment of choice is rest along with anti-inflammatories or NSAIDs (Arnoczky 1998,

Johnson 1993, Kirby 1993, Moore 1996, Schwarz 2003, Willauer 1997).

Dietary recommendation of both patella luxation and anterior cruciate ligament issues is focused upon weight loss.

Anticipated prognosis

For both patella and cruciate ligament problems, surgical repair offers a good prognosis. However, the prognosis is more guarded if there is underlying degenerative or immune-mediated arthritis. For strained, stretched, and inflamed ligaments, often the prognosis is good for the episode if the patient is treated with rest and medication, but recurrences are likely (Johnson 1993, Kirby 1993, Schwarz 2003).

Integrative veterinary therapies

Surgery is the treatment of choice for most cases of cruciate rupture as well as chronically luxating patella. Disrupted or unstable ligaments create an unstable stifle joint and degenerative osteoarthritis is quick to develop. Pain-suppressing medications such as NSAIDs address the pain and inflammation; however, they do not address the healing of these areas. Additionally, animals that are not quieted or restricted by pain often continue to exacerbate the inflammation by using inflamed joints that should be rested.

Because other orthopedic abnormalities may increase the risk of ligamentous rupture or injury, these may be addressed and benefited by other therapeutic modalities including chiropractics, acupuncture, nutrition, weight management, physical therapy, exercise restriction, and prolotherapy (see Homotoxicology, below, for prolotherapy).

Nutrition

General considerations/rationale

Ligaments and tendons contain similar cellular structure as joints, and respond favorably to similar nutritional therapies. The key in any inflamed tendon, ligament, cartilage etc. is to reduce and not cover up the inflammation. Nutritional therapies focus upon reducing inflammation, improving nutrient flow to the cells and tissues, as well as balancing the immune system and minimizing an inherent mediated cellular attack.

Appropriate nutrients

See Arthritis, above, for a description of tissue support nutrients.

Plant sterols: Betasitosterol has anti-inflammatory effects (Gupta 1980).

Chinese herbal medicine/acupuncture

General considerations/rationale

Ligamentous lesions are a result of trauma, Kidney and Spleen deficiency, Blood and Qi stagnation, or Wind and Damp invading the body. Trauma is understood similarly in both medical views. In TCM theory, the organs involved are the Kidney and Spleen. The Kidneys control the bones so it makes sense that a deficiency in the Kidney could result in skeletal disease. The muscles are controlled by the Spleen. Muscle atrophy is commonly seen due to the animal's tendency not to use the painful limb. Blood and Qi stagnation refer to the pain and weakness observed in the condition. Wind is believed to blow pathogens into and around the body. Damp makes the joint "sticky" or stiff.

Appropriate Chinese herbs

Achyranthes (Niu xi): Has analgesic effects. This was demonstrated in body torsion and hot plate experiments in mice (Li 1999). It also has anti-inflammatory effects. It can prevent egg-white-induced foot swelling and formaldehyde-induced arthritis (Xong 1963).

Aconite/chuan (Chuan wu): Has a centrally mediated analgesic effect. In mice it was shown to be effective for decreasing inflammation and pain. It is stronger than aspirin at reducing inflammation (Xian Dai Zhong Yao Yao Li Xue 1997). It controlled the signs in 92% of 150 human patients with arthritis when given in combination with Cao wu, Qiang huo, Du hua, Fu zi, Mo yao, Ru xiang, Dang gui, Chuan niu xi, Ma huang, Gui zhi, Wu gong, Chuan xiong, and Ma qian zi (Nei Meng Gu Zhong Yi Yao 1986).

Angelica (Bai zhi): Has demonstrated anti-inflammatory effects in mice. It also decreases pain (Zhong Guo Zhong Yao Za Zhi 1991).

Angelica root (Dang gui): As strong as aspirin at decreasing inflammation and is 1.7 times as strong as aspirin for pain relief (Yao Xue Za Zhi 1971). Dang Gui plus ligusticus (Chuan xiong) was 97% effective in treating lower back and leg pain (Xin Zhong Yi 1980).

Atractylodes (Cang zhu): Has analgesic effects. This was demonstrated using body torsion and heat-induced pain tests (Zhang 1999, Zhang 1996). It also has anti-inflammatory effects. It has been shown to prevent xylene-induced ear swelling and carrageenin-induced foot swelling (Zhang 1998).

Cinnamon bark (Rou gui): Inhibits both acute and chronic inflammation. It has demonstrated the ability to inhibit carrageenin-induced foot swelling and prevent adjuvant-induced arthritis (Li 1989).

Corydalis (Yan hu suo): Has anti-inflammatory properties. It inhibits histamine release and formation of edema in rats and has been shown to be effective for both acute

and chronic inflammation (Kubo 1994). It increases the efficacy of acupuncture in inducing analgesia (Chen Tzu Yen Chiu 1994).

Dipsacus (Xu duan): Has anti-inflammatory properties. It can inhibit feet swelling in hamsters and dimethyl benzene-induced ear inflammation (Wang 1996).

Dragon's blood (Xue jie): Has been used to treat arthritis. In one study involving 150 participants with arthritis, 84% reported marked reduction in symptoms and 10% more reported some pain relief (Shan Xi Zhong Yi 1985).

Drynaria (Gu sui bu): Was used to treat 160 mice with osteoarthritis with good results (Zhong Yao Tong Bao 1987).

Eucommia bark (Du Zhong): An effective analgesic (Zhu 1986).

Jujube (Da zao): Has anti-inflammatory effects. It has been shown to prevent dimethylbenzene-induced ear swelling in mice and egg-white-induced toe swelling in rats (Li 1997).

Lycopodium (Shen jin cao): Has anti-inflammatory and analgesic effects. It ameliorates heat-induced pain and reduces dimethylbenzene-induced ear swelling (Zeng 1999).

Mastic (Ru xiang): Contains boswellic acids, which have anti-inflammatory effects in vivo and in vitro (Roy 2006). Mastic decreases signs of arthritis in dogs (Reichling 2004).

Myrrh (Mo yao): A very good analgesic, especially when combined with Ru xiang (Zhong Yao Xue 1998).

Pubescent angelica root (Du hou): Has demonstrated analgesic and anti-inflammatory effects in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

White atractylodes (Bai zhu): Has been used with some success in patients suffering from chronic leg pain (Hu Bei Zhong Yi Za Zhi 1982).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). In one trial, 65% of people suffering from painful conditions experienced relief when given Bai shao (Shang Hai Zhong Yi Yao Za Zhi 1983).

Acupuncture

Many people seek acupuncture therapy for musculoskeletal pain. Clinical trials have shown that arthritis can be treated successfully using acupuncture (Brattberg 1983, Junnila 1982).

Homotoxicology

General considerations/rationale

Traumatic tears of the cruciate ligament result in swelling and pain, which represent Inflammation Phase changes,

while the destruction of the ligament and damage to joint structures is a Degenerative Phase disorder. Surgery is advised in most cases.

Prolotherapy (proliferation therapy) involves injecting a sclerosing agent (such as hypertonic dextrose) into an area so that fibroplasia and resultant fibrosis develop as new collagen is laid down. Experienced prolotherapists can assist degenerating cruciate ligament patients, and the procedure has been used in fully torn ligaments as well. Traumeel is used by some prolotherapists but many prefer to avoid it, voicing the concern it may decrease fibroplasia, which is the desired effect of prolotherapy. This concern may not be warranted; one study demonstrated that Traumeel actually decreases pain by increasing the rate of healing (Lussignoli, et al. 1999). Zeel or Discus compositum may be superior choices for use in prolotherapy due to their proposed activation of stem cells. No controlled studies exist to compare these therapeutic variations; therefore, at this time no specific recommendations can be made in this regard, and choice is based upon the preference and experience of individual practitioners.

Luxating patella is caused by a developmental error. Mild cases have been addressed with prolotherapy, but more severe cases may need surgery. Clients should be advised about their options as soon as this condition is diagnosed because early surgery decreases the severity of osteoarthritis that develops from continued trauma in unrepaired joints.

Antihomotoxic drugs can be useful in managing pain and increasing healing, and they may be added to the mixture used in prolotherapy.

Appropriate homotoxicology formulas

See also Arthritis, Autoimmune Arthritis.

Aesculus compositum: Used to improve circulation in the extremities.

BHI-Arthritis: Treats swollen, painful joints and muscle stiffness. It is particularly useful for those patients that are more affected in cold, wet weather.

Causticum compositum: The primary ingredient, from which this remedy's name is derived, is Causticum. It is used in cases of a neuralgic-rheumatic nature with restlessness and pains in the nerves and muscles, especially at night and in the legs. It is possibly associated with paralytic conditions that are often brought on by dry cold. Its symptom picture includes a typical stiffness in the joints, the whole musculature, the back, and the sacrum, and is often associated with a high degree of weakness, trembling, and an unsteady gait.

Colnadul: Treats arthritis that worsens with wet weather. It is particularly suited to knee problems, e.g., chronic dislocations. The authors use this in stifle issues (Broadfoot 2004).

Cruroheel: Provides ligamentous support.

Discus compositum: Provides deep tissue support of connective tissue.

Placenta compositum: Improves the condition of peripheral circulation.

Sulphur-Heel: See Arthritis protocols, above, for a discussion of sulphur.

Traumeel: A nonsteroidal anti-inflammatory that is useful in controlling pain and swelling in acute incidents and in chronically painful areas (Wright-Carpenter, et al. 2004).

Zeel: Provides support of joints and control of joint pain, as well as activation of stem cells.

Authors' suggested protocols

Nutrition

Cartilage/ligament/muscle/skeletal support formula: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight daily.

Betathyme: 1 capsule for every 35 pounds of body weight BID (maximum, 2 capsules BID.)

Chinese herbal medicine

Formula H97 HipGuard: 1 capsule per 10 to 20 pounds twice daily. For ACL rupture and meniscus injury, the higher dose of 1 capsule per 10 pounds body weight twice daily is used. It may take up to 6 to 9 months to completely stabilize the joint. Obesity, hip dysplasia, and lack of exercise can affect the response. It is strongly recommended that overweight dogs be placed on an appropriate diet.

The author recommends the following acupuncture points to treat ligamentous injuries: ST36, GB30, Baihui, BL60, and BL23.

Homotoxicology

For pain in acute ligamentous tears and postoperatively: Traumeel S QID for 3 days, then BID PRN. Zeel, given BID long-term. Causticum compositum, given BID, Coenzyme compositum, given BID, and BHI-Inflammation, given BID to QID.

For swelling postoperatively: Galium-Heel, Lymphomyosot, and Arnica-Heel, mixed together and given BID. Long-term therapy: BHI-Arthritis and/or Colnadul. Discus compositum, given EOD. Sulphur-Heel, given as needed.

Following prolotherapy: Aesculus compositum BID PO, Cruroheel BID PO. Discus compositum once weekly. Placenta compositum once weekly.

OSTEOCHONDROSIS

Definition and cause

Osteochondrosis is a growth disturbance, often leading to an overproduction of cartilage. This thickened cartilage leads to degeneration and necrosis. Coupled with improper nutrition and trauma, this excessive cartilage can lead to osteochondritis dessecans in the shoulder, elbow, or stifle joint (Fox 1993; Paatsama 1971; Olsen 1975, 1976; Schwarz 2003). In addition, it is believed that improper nutrition and trauma to the cartilage surface contributes to the disease, often leading to a degenerative joint (Birkeland 1967, Hedhammer 1974, Palmer 1970, Schwarz 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Anti-inflammatory medications are used to control symptoms. They do not address the underlying degeneration, nor do they help to promote healing. Surgery is often indicated, especially when a flap of cartilage has formed. While surgery is often beneficial, it also does not address the underlying process and continual degeneration of the joint (Birkeland 1967, Clayton Jones 1970, Denny 1980, Smith 1975, Schwarz 2003).

Anticipated prognosis

Shoulder disease responds well to surgery and often results in pain-free and full mobility. The prognosis for other joints such as the stifle and elbow is more guarded. This depends upon the progression of the lesion and the extent of the associated degenerative joint disease (Grondalen 1979, Denny 1980, Schwarz 2003).

Integrative veterinary therapies

The cause of osteochondrosis is linked to developmental and nutritional factors. Suggested remedies include weight loss to ease the stress on the joint as well as chondroprotective agents that protect and strengthen the cartilage surfaces. In addition, the use of nutrients, antioxidants, phytonutrients, and anti-inflammatories that nourish tissues and reduce free radical cellular reaction as compared to medical suppression of the inflammation are beneficial for short- and long-term prognosis. Medicinal herbal and homeopathic remedies also further improve the prognosis.

Nutrition

General considerations/rationale

The focus of nutritional support is on reducing inflammation, nourishing joint cells and tissues, improving circulation, and enhancing healthy cellular and tissue formation.

Chondroprotective agents: Several studies have demonstrated the effectiveness of glucosamine and chondroitin in the management of arthritis in dogs (Das 2000, Guastella 2005). Numerous double-blind studies have compared the effectiveness of glucosamine against various NSAIDs, resulting in as good or, in many cases, even better pain control and removal of the clinical signs associated with osteoarthritis (Prudden 1974, Brown 1981, Vaz 1982, DeAmbrosia 1982). Additionally, the newer trend in the management of arthritis is toward chondroprotective agents such as glycosaminoglycans, pain-relieving agents such as methyl sulfonyl methane (MSM), and free radical scavengers such as superoxide dismutase (SOD) (Beale 2003, Todhunter 1994).

Super oxide dismutase: Super oxide dismutase (SOD) is a potent destroyer of free radicals that can protect cells against oxidative damage (Petkau 1975, Fridovich 1972). McCord (1974) reported that SOD can protect hyaluronate from free-radical damage and that it may have an anti-inflammatory effect (Salin and McCord 1975).

Vitamin C: Vitamin C has been studied clinically in animals. Brown (1994), Berg (1990), and Newman (1995) reported on the benefits of vitamin C in the treatment of degenerative joint disease and movement in dogs and in horses. Belfield (1981, 1998) reported on the beneficial

effects of using vitamin C in treatment and prevention of hip dysplasia in dogs.

Botanical Cox2 inhibitors: Botanical Cox2 inhibitors have been shown to have anti-oxidative and anti-inflammatory effects (Bemis 2005). Botanical Cox 2 inhibitors offer the benefit of inflammation reduction without the inherent side effects of Cox2 medications.

Chinese herbal medicine/acupuncture

General considerations/rationale

Osteochondrosis is the result of Kidney Qi and Yang Deficiency. Wind, Cold, and Damp invade the body, leading to Qi and Blood stagnation. The Kidneys control the bones in TCM theory. When the Kidney is deficient in energy (Qi) and heat (Yang), the bones can suffer. Wind can blow pathogens into the body and from one joint to the other. Cold and Damp make the joint stiff and painful. Application of warmth eases discomfort. When Qi and Blood cannot flow they accumulate and cause pain. Treatment involves decreasing inflammation and pain. TCM is different from Western medicine as different areas of the body are treated differently, even in the face of a single Western diagnosis. Therefore, separate formulas and acupuncture points are given for forelimb verses hindlimb disease.

Appropriate Chinese herbs for hindlimb osteochondrosis

Achyranthes (Niu xi): Has analgesic effects. This was demonstrated in body torsion and hot plate experiments in mice (Li 1999). It also has anti-inflammatory effects. It can prevent egg-white-induced foot swelling and formaldehyde-induced arthritis (Xong 1963).

Aconite/chuan (Chuan wu): Has a centrally mediated analgesic effect. In mice it was shown to be effective for decreasing inflammation and pain. It is stronger than aspirin at reducing inflammation (Xian Dai Zhong Yao Yao Li Xue 1997). It controlled the signs in 92% of 150 human patients with arthritis when given in combination with Cao wu, Qiang huo, Du hua, Fu zi, Mo yao, Ru xiang, Dang gui, Chuan niu xi, Ma huang, Gui zhi, Wu gong, Chuan xiong, and Ma qian zi (Nei Meng Gu Zhong Yi Yao 1986).

Angelica (Bai zhi): Has demonstrated anti-inflammatory effects in mice. It also decreases pain (Zhong Guo Zhong Yao Za Zhi 1991).

Angelica root (Dang gui): As strong as aspirin at decreasing inflammation and is 1.7 times as strong as aspirin for pain relief (Yao Xue Za Zhi 1971). Dang Gui plus ligusticus (Chuan xiong) was 97% effective in treating lower back and leg pain (Xin Zhong Yi 1980).

Attractylodes (Cang zhu): Has analgesic effects. This was demonstrated using body torsion and heat-induced

pain tests (Zhang 1999, Zhang 1996). It also has anti-inflammatory effects. It has been shown to prevent xylene-induced ear swelling and carrageenin-induced foot swelling (Zhang 1998).

Cinnamon bark (Rou gui): Inhibits both acute and chronic inflammation. It has demonstrated the ability to inhibit carrageenin-induced foot swelling and prevent adjuvant-induced arthritis (Li 1989).

Corydalis (Yan hu suo): Has anti-inflammatory properties. It inhibits histamine release and formation of edema in rats and has been shown to be effective for both acute and chronic inflammation (Kubo 1994). It increases the efficacy of acupuncture in inducing analgesia (Chen Tzu Yen Chiu 1994).

Dipsacus (Xu duan): Has anti-inflammatory properties. It can inhibit foot swelling in hamsters and dimethyl benzene-induced ear inflammation (Wang 1996).

Dragon's blood (Xue jie): Has been used to treat arthritis. In one study involving 150 participants with arthritis, 84% reported marked reduction in symptoms and 10% more reported some pain relief (Shan Xi Zhong Yi 1985).

Drynaria (Gu sui bu): Was used to treat 160 mice with osteoarthritis with good results (Zhong Yao Tong Bao 1987).

Eucommia bark (Du Zhong): An effective analgesic (Zhu 1986).

Jujube (Da zao): Has anti-inflammatory effects. It has been shown to prevent dimethylbenzene-induced ear swelling in mice and egg-white-induced toe swelling in rats (Li 1997).

Lycopodium (Shen jin cao): Has anti-inflammatory and analgesic effects. It ameliorates heat-induced pain and reduces dimethylbenzene-induced ear swelling (Zeng 1999).

Mastic (Ru xiang): Contains boswellic acids, which have anti-inflammatory effects in vivo and in vitro (Roy 2006). Mastic decreases signs of arthritis in dogs (Reichling 2004).

Myrrh (Mo yao): A very good analgesic, especially when combined with ru xiang (Zhong Yao Xue 1998).

Pubescent angelica root (Du hou): Has demonstrated analgesic and anti-inflammatory effects in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

White atractylodes (Bai zhu): Has been used with some success in patients suffering from chronic leg pain (Hu Bei Zhong Yi Za Zhi 1982).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). In one trial, 65% of people suffering from painful conditions experienced relief when given white peony (Shang Hai Zhong Yi Yao Za Zhi 1983).

Appropriate Chinese herbs for forelimb osteochondrosis

Aconite/chuan (Chuan wu): See above.

Angelica (Bai zhi): See above.

Cinnamon twigs (Gui zhi): Have analgesic properties (Zhong Yao Xue 1998). In one trial, 30 patients were treated with a formula containing cinnamon twigs and other herbs. There was complete recovery in 50%, marked improvement in 20%, and some improvement in 17%. Thirteen percent did not respond (Shi Zhen Gua Yao Yan Jiu 1991).

Ginger (Sheng jiang): Has anti-inflammatory effects. It decreases dimethylbenzene-induced ear swelling in mice and egg-white-induced toe swelling in rats (Zhang 1989). It has been used to treat patients with arthritis. In one trial 113 of 125 people with arthritis responded to injections of ginger into acupoints (He Bai Xin Yi Yao 1972, Chi Jiao Yi Shi Za Zhi 1977).

Jujube fruit (Da zao): See above.

Licorice (Gan cao): Has analgesic effects, especially when administered with white peony (Bai shao) (Zhong Yao Xue 1998).

Lycopodium (Shen jin cao): See above.

Mastic (Ru xiang): See above.

Myrrh (Mo yao): See above.

Notopterygium (Qiang huo): Has both anti-inflammatory and analgesic effects. It can inhibit xylol-induced ear lobe swelling and carrageenin-induced foot swelling in mice, and increase the thermal pain threshold (Xu Hui Bo 1991).

White peony (Bai shao): See above.

Acupuncture

Many people seek acupuncture therapy for musculoskeletal pain. Clinical trials have shown that arthritis can be treated successfully using acupuncture (Brattberg 1983, Junnila 1982).

Homotoxicology

General considerations/rationale

Osteochondrosis represents a Deposition or Degeneration phase homotoxicosis. Therapy is directed at improving the status of the mesenchymal tissues. In early cases, these lesions may heal without surgery, and early intervention with antihomotoxic medications may assist the body in its innate reparative processes. Early diagnosis through radiography, MRI, or bone scans may assist in determining the optimal therapy for each patient.

Appropriate homotoxicology formulas

See Arthritis and Autoimmune Arthritis for a more complete discussion of remedies.

No controlled studies exist at this time for use of anti-homotoxic agents in osteochondrosis, but appropriate selections include:

Coenzyme compositum: Supports energy metabolism. Succinate is useful in retarded development, which this condition may represent.

Discus compositum: Treats inflammation and degeneration of mesenchyme.

Lymphomyosot: Reduces swelling and improves lymphatic drainage with a corresponding decrease in local homotoxin levels.

Osteoheel: Supports bony structures. Can be alternated with *Traumeel* for maximal effect.

Placenta compositum: Provides support of stem cells and vasculature.

Molybdan compositum: Provides trace elements in degenerative conditions.

Thyroidea compositum: Acts on the thymus and therefore may assist in growth irregularities and support a wide variety of endocrine tissues. It is also a powerful agent in drainage of the mesenchyme.

Traumeel S: Used for inflammation and to unblock inactivated enzymes.

Ubichinon compositum: Provides support of energy metabolism in deeper homotoxicoses.

Zeel: An anti-inflammatory agent with regenerative potential through activation of stem cells.

Authors' suggested protocols

Nutrition

Cartilage/ligament/muscle/skeletal support formula: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight, daily.

Zyflamend: One-half dropper for every 25 pounds of body weight BID.

SOD: Follow manufacturer's suggested dosage.

Chinese herbal medicine

The author recommends Formula H3 ElboPhlex for osteochondrosis of the front legs and H97 HipGuard for osteochondrosis of the hind legs at a dose of 1 capsule per 10 to 20 pounds, twice daily. They can be combined with NSAIDs and/or nutraceuticals as needed. Generally speaking, it takes up to 3 to 6 months for complete resolution of signs in most cases.

H97 HipGuard: Contains achyranthes (Niu xi), aconite/chuan (Chuan wu), angelica (Bai zhi), angelica root (Dang gui), astragalus (Huang qi), atractylodes (Cang zhu), cinnamon (Rou gui), citrus (Chen pi), corydalis (Yan hu suo), curcuma (Yu jin), dioscorea (Chuan shan long), dipsacus (Xu duan), dragon's blood (Xue jie), drynaria (Gu sui bu), eucommia bark (Du Zhong), eupolyphaga

(Tu bie chong), jujube (Da zao), lycopodium (Shen jin cao), mastic (Ru xiang), morinda (Ba ji tian), myrrh (Mo yao), pubescent angelica root (Du huo), white atractylodes (Bai zhu), and white peony (Bai shao). The herbs not mentioned above (under Appropriate Chinese Herbs) help increase the efficacy of the formula.

H3 ElboPhlex: Contains aconite/chuan (Chuan wu), angelica (Bai zhi), centipede (Wu gong), cinnamon twigs (Gui zhi), codonopsis (Dang shen), dioscorea (Chuan shan long), ginger (Sheng jiang), jujube fruit (Da zao), licorice (Gan cao), lycopodium (Shen jin cao), mastic (Ru xiang), mulberry twig (Sang zhi), myrrh (Mo yao), notopterygium (Qiang huo), papaya (Mu gua), pueraria (Ge gen), and white peony (Bai shao). The additional herbs not discussed above (under Appropriate Chinese Herbs) increase the efficacy of the formula.

For the hindlimbs, the author recommends the following acupuncture points: ST36, ST37, Baihui, BL60, GV4, and BL23. For the forelimbs, the author recommends LI11, PC6, SI9, Baihui, and BL23.

Homotoxicology

Discus compositum: Give every 3 days PO or SQ, alternating with Thyroidea compositum. Give Ubichinon compositum twice weekly.

Aesculus compositum, Traumeel, and Lymphomyosot: Mix together and give orally BID.

Osteoheel, Calcoheel, and/or BHI-Bone: Give orally BID as indicated by the individual case.

Zeel: Give tablets BID, and/or Zeel P vials injected into acupoints for the affected joint every week.

Molybden SID: Use for mineral donor support.

SPINAL ARTHRITIS/SPONDYLOSIS

Definition and cause

Spinal arthritis/spondylosis is a degenerative condition of the bony spinal column with associated osteophytic activity between vertebrae. It occurs in both dogs and cats and is believed to have an inherited predisposition or be the result of continual localized trauma and secondary inflammation to the bony vertebrae (Glenney 1956, Read 1966)(see Arthritis). Spondylosis is often discovered radiographically with no associated clinical signs (Joseph 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Once clinical signs of pain, inflammation, and reduced mobility become evident, the treatment is corticosteroids or NSAIDs such as carprofen, deracoxib, meloxicam, or aspirin. Nothing has been reported to prevent progression of the condition (Romatowski 1986, Joseph 2003).

Anticipated prognosis

The prognosis depends upon the extent of the arthritis and the resultant pain and impact upon the spinal cord. Pain and inflammation control offer good control of the signs. When the disease is progressive and has impacted the spinal cord and is causing neurological symptoms, the prognosis is more guarded (Hoerlein 1965, Joseph 2003).

Integrative veterinary therapies

Spinal arthritis occurs at the articular surfaces and has the same underlying mechanism as degenerative arthritis of the limbs. Medical treatment is directed toward the pain and inflammation, while integrative therapies are directed at the underlying cause of the inflammation and the associated degeneration that leads to the osteophytic process and potential compression of spinal nerves. Conventional medications address the inflammation and pain; however, they do not correct the underlying initiating inflammatory process.

Nutrition

General considerations/rationale

Nutritional and gland support are directed at reducing inflammation, protecting cells and tissue, and slowing the degenerative process.

Appropriate nutrients

Nutrition/gland support: Several studies have demonstrated the effectiveness of glucosamine and chondroitin

in the management of arthritis in dogs (Das 2000, Guastella 2005). Setnikar et al (1986) has described how these compounds actually stimulate the body's own repair mechanism and help in the process of developing new cartilage. Numerous double-blind studies have compared the effectiveness of glucosamine against various NSAIDs, resulting in as good or, in many cases, even better pain control and removal of the clinical signs associated with osteoarthritis (Prudden 1974, Vaz 1982, DeAmbrosia 1982).

Fatty acids: In a double-blind study of people with rheumatoid arthritis, Joe (1993) showed that a number of people had significant benefits from the addition of evening primrose oil (EPO). Kremer (1995) has shown that fish oil helps to reduce inflammation in people with arthritis.

Botanical cox2 inhibitors: Botanical Cox2 inhibitors have been shown to have anti-oxidative and anti-inflammatory effects (Bemis 2005). Botanical Cox2 inhibitors offer the benefit of inflammation reduction without the inherent side effects of Cox2 medications.

Vitamin C: Vitamin C has been studied clinically in animals. Brown (1994), Berg (1990), and Newman (1995) reported on the benefits of vitamin C in the treatment of degenerative joint disease and movement in dogs and horses. Belfield (1981, 1998) reported on the beneficial effects of using vitamin C in treating and preventing hip dysplasia in dogs.

Lecithin/phosphatidyl choline: Lecithin/phosphatidyl choline is a phospholipid that is integral to cellular membranes. Lecithin/PC is an essential nutrient for the membranes of nerve cells and is essential for the proper conduction of nervous impulses (Hanin 1987).

Chinese herbal medicine/acupuncture General considerations/rationale

Spinal arthritis is due to Wind, Damp, and Cold invading the body. This causes Kidney Qi and Yang deficiency, and Qi and Blood stagnation. Wind both blows the pathogen into the body and blows it around the body so the pain may wander from joint to joint. Damp causes stiffness and Cold implies that the condition tends to respond well to heat. Most people with degenerative skeletal conditions report that heat soothes the pain. Qi and Blood stagnation cause pain. The Kidney is charged with controlling bones, so when the Kidney suffers deficiency, arthritis may result. Again, as Yang is heat, a Kidney Yang deficiency may result in a sore skeletal lesion that responds well to heat therapy. Older patients are more likely to have degenerative spinal conditions and they are also more likely to have Kidney Yang deficiency. The Yang of the Kidney is used over the life of the individual.

Treatment options are designed to increase mobility and decrease pain and inflammation.

Appropriate Chinese herbs

Atractylodes (Cang zu): Increases the pain threshold (Zhang 1999). In addition, it can counteract xylene-induced ear swelling and carrageenin-induced foot swelling (Zhang Ming Fa 1998), which indicates that it may be useful in decreasing inflammation at the site of degenerative changes.

Aconite root (Fu zi): Reduces swelling and inflammation in joints (Zhong Yao Tong Bao 1988). It has been shown to have analgesic properties (Zhong Guo Zhong Yao Za Zhi 1992).

Angelica (Bai zhi): Has been shown to have anti-inflammatory and analgesic effects in mice (Zhong Guo Zhong Yao Za Zhi 1991).

Angelica root (Dang gui): As strong as aspirin at decreasing inflammation and is 1.7 times as strong as aspirin for pain relief (Yao Xue Za 1971).

Astragalus (Huang qi): Has demonstrated mild analgesic effects in mice (Zhong Yao Tong Bao 1986).

Cinnamon twigs (Gui zhi): Have analgesic properties (Zhong Yao Xue 1998). Cinnamon twigs were part of a formula used in 30 patients with arthritis. There was complete recovery in 50% of those treated, marked improvement in 20%, and some improvement in 17%. Thirteen percent did not respond (Shi Zhen Gua Yao Yan Jiu 1991).

Coix (Yi yi ren): Has analgesic and anti-inflammatory effects. It suppresses dimethylbenzene-induced auricular swelling and carrageenin-induced foot swelling in mice (Zhang Ming Fa 1998). It was shown to help women with severe menstrual cramps (Zhang Yong Luo 1998), which may indicate that it would be useful in treating the pain associated with spinal arthritis and spondylosis.

Earthworm (Di long): Has a significant analgesic effect (Chen 1996).

Jujube fruit (Da zao): Decreases inflammation. It was shown to reduce dimethylbenzene-induced auricular inflammation in mice and egg-white-induced toe swelling in rats (Li 1997). This implies that it may be useful for decreasing the inflammation involved with degenerative vertebral conditions.

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone. They decrease edema and have anti-arthritic effects (Zhong Cao Yao 1991). Licorice has demonstrated analgesic effects in mice, especially when combined with white peony (Bai shao) (Zhong Yao Xue 1998).

Notopterygium root (Qiang huao): Has anti-inflammatory and analgesic effects. In mice it was shown to decrease xylol-induced ear lobe swelling and carrageenin-induced foot pad edema, and increase the thermal pain threshold (Xu 1991).

Sichuan aconite (Chuan wu): Seems to have a centrally mediated analgesic effect. In mice it was shown to be effective at decreasing inflammation and pain. It is stronger than aspirin at reducing inflammation (Xian Dai Zhong Yao Yao Li Xue 1997). It controlled the signs in 92% of 150 human patients with arthritis when given in combination with Cao wu, Qiang huao, Du hua, Fu zi, Mo yao, Ru xiang, Dang gui, Chuan niu xi, Ma huang, Gui zhi, Wu gong, Chuan xiong, and Ma qian zi (Nei Meng Gu Zhong Yi Yao 1986).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It has demonstrated specific effects on pain in the lower back (Yun Nan Zhong Yi 1990).

Acupuncture

The World Health Organization (2006) lists lower back pain as one of the indications for acupuncture. One study looked at the use of abdominal acupuncture and electroacupuncture for treatment of prolapsed lumbar intervertebral discs. In this study there was complete relief from symptoms in 35% of the patients, significant improvement in 45% of the participants, slight improvement in 16%, and no response in 4% (Guo 2003).

Homotoxicology

General considerations/rationale

Arthritis is a Deposition Phase disorder wherein material accumulates and eventually impedes the function of the joint. True arthritis of the spine occurs on the articular surfaces of the vertebral facets and is potentially painful. Spondylosis indicates degeneration of the spinal anatomy and is classified as a Degeneration Phase homotoxicosis. Spondylosis must be differentiated from spondylitis, and appropriate diagnostics conducted to rule out infectious agents.

Appropriate homotoxicology formulas

Also See Arthritis protocols, above, for a more detailed discussion of these remedies.

Atropinum compositum: Used for muscle spasm and pain. Currently only available in the United States as a tablet, but is extremely useful for acute, severe back pain.

BHI-Back: An important and commonly used formula supportive of the spinal column, and particularly the lower back. The component *Colocynthis* is indicated for sharp, tearing pain in the back that improves with warmth and deep pressure. Anger may be involved in these cases, and colitis may be an associated sign as well. *Gnaphalium polycephalum* is included for pain and/or numbness of the back and pelvis. *Gelsemium sempervirens* is included for neurologic weakness and muscle stiffness. *Rhus toxic-*

dendron is an important classical remedy for pain in tendons, ligaments, and soreness of condyles. *Arsenicum album* and *Chamomilla* complete this formula, with indications for cramps and neuralgia (Heel 2002).

BHI-Sciatic Rx: Used for sciatica and neuralgia of the legs.

BHI-Spasm-Pain: Treats muscle spasm and back pain. Components of this formula help with sharp pains and spasms. This is a good alternative due to *Atropinum compositum*. Febrile conditions with back pain may respond due to *Aconitum nepellus*. Treats inflammation of other serosal membranes (joints and the abdomen) due to *Bryonia alba*. *Colocynthis* and *Cuprum sulfuricum* are included for sharp pains and menstrual-like cramps and other muscle spasms (Heel 2002).

Cimicifuga homaccord: Treats pain and spasm of the cervical spine.

Coenzyme compositum: Supports energy metabolism.

Colocynthis homaccord: Treats lower back pain.

Discus compositum: Supports connective tissue that is associated with the spine.

Neuralgo-Rheum-Injeel: Contains *Silicea*, which is a major remedy for vaccinosis. *Silicea* is also contained in *BHI-Alertness*, *BHI-Migraine*, *BHI-Neuralgia*, *Cruroheel*, *Discus compositum*, *Spigelon*, *Strumeel*, and *Zeel*.

Osteoheel: Stimulates bone healing.

Spascupreel: Indicated for muscle spasm and pain. Compare its use to that of *Atropinum compositum* and *BHI-Spasm-Pain*. Contains *Agaricus*, a toxic mushroom indicated in homeopathic dilution for seizures, excitable conditions, motor tics, and sensitivity to cool air, among many other signs. It is helpful for migraine headaches and a wide variety of muscular spasmodic issues (Reckeweg 2000).

Testes compositum: Used for strengthening and draining the matrix in male patients with weakness. Contains *Conium maculatum*, which is useful in ascending hind-limb ataxia, weakness, and hemiplegia. *Conium* is also possibly useful in an older dog, and is also found in *Cerebrum compositum*, *Cocculus compositum*, *Ginseng compositum*, *Rauwolfia compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Ubichinon compositum*, *Vertigoheel*, *BHI-Circulation*, *BHI-Dizziness*, *BHI-Lightheaded*, and *BHI-Stramonium complex*. This remedy may cause detoxification/vicariation reactions and should be given with good observation and client education. It is highly useful in geriatric, male patients (Reckeweg 2000).

Traumeel S: A critically important formula that activates blocked enzymes. It is a nonsteroidal anti-inflammatory agent (See the homotoxicology Chapter for more extensive citations) (Heel 2003).

Zeel: A commonly used anti-inflammatory that reduces pain and improves mobility (see the homotoxicology chapter for more extensive citations) (Heel 2003).

Authors' suggested protocols

Nutrition

Cartilage/ligament/muscle/skeletal support and brain/nerve support formulas: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight daily.

Zyflamend: One-half dropper for each 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Chinese herbal medicine

Formula H39 Backrelief: 1 capsule per 10 to 20 pounds twice daily. It can be combined with NSAIDs and nutraceuticals if desired. It generally takes 2 to 4 weeks to see a response. In addition to the herbs listed above, Backrelief also contains *aconite/cao* (Cao wu), *allium* (Cong bai), *carthamus* (Hong hua), *papaya* (Mu gua), *poria* (Fu ling), and *siler* (Fang feng). These herbs increase the efficacy of the formula.

Recommended acupuncture points include BL23, BL40, GV4, ST36, Baihui, and GV3 (Handbook of TCM Practitioners 1987).

Homotoxicology

Symptom cocktail: *Traumeel*, *Aesculus compositum*, *Cimicifuga homaccord* (neck) or *Colocynthis homaccord* (lower spine), and *Zeel*, and/or *BHI-Back* mixed together and given orally BID to TID. *Discus compositum* given initially by injection and then orally 1 to 3 times weekly. *Spascupreel*, as an initial injection, then *Atropinum compositum* PRN (if available). Consider *Dulcamara homaccord* and *Causticum compositum*, if indicated, and *Rhododendroneel*, particularly if condition is worse with weather changes. Give *Atropinum compositum* tablets PRN.

Deep detoxification formula: *Galium-Heel*, *Lymphomyosot*, *Hepar compositum*, *Solidago compositum*, *Thyroidea compositum*, *Coenzyme compositum*, and *Ubichinon compositum* mixed together and given orally twice weekly for 2 to 4 weeks and then every other day. Adjust dosing based upon detoxification reactions observed.

TRAUMA: SPRAINS, STRAINS, AND FRACTURES

Definition and cause

Simple sprains, strains, and fractures represent an inflammatory process at the cellular and tissue level. Addressing these conditions depends upon the location and extent of the damage.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy is based upon the condition. Surgery, splinting, or bandaging is often required for fractures. Sprains and strains often require rest in combination with topical or systemic anti-inflammatory medication such as corticosteroids or NSAIDs, but these may reduce healing while controlling pain.

Anticipated prognosis

The prognosis depends on the injury and/or the location. The prognosis is generally favorable for healing.

Integrative veterinary therapies

The focus of integrative therapy for sprains, strains, and fractures is on the status of the body's healing ability and state of degeneration, rather than entirely on the injury or its location. First, animals that are in a stage of degeneration

are more prone to injury. Second, the injury in a degenerating animal may heal on the surface; however, the trauma may exacerbate the process of degeneration. Finally, medications may also contribute to the degeneration by causing untoward side effects. The selection of appropriate therapeutic nutrients and biological therapies can help minimize side effects of medication, reduce inflammation, and improve the immune status of the body. An improved immune status can assist healing and help to stabilize or reverse underlying degeneration (Goldstein 2005).

Nutrition

General considerations/rationale

The understanding of the concept listed above in Integrative Veterinary Therapies can expand clinicians' focus to include not only the injury and location, but also the status of the healing and immune systems. The selection of appropriate therapeutic nutrients helps to reduce inflammation and free radicals, and enhances immune system balance and function.

Appropriate nutrients

Nutrition/gland support: Cartilage, antioxidants, and essential fatty acids that contain omega-3 and -6 acids help reduce inflammation and free radicals and support and improve immune function.

Fatty acids: In a double-blind study of people with rheumatoid arthritis, Joe (1993) showed that a number of people significantly benefited from the addition of oil of evening primrose oil (EPO). Kremer (1995) has shown that fish oil helps to reduce inflammation in people with arthritis.

Plant sterols: Betasitosterol is a plant sterol and immune-modulating agent that has immune-enhancing and anti-inflammatory effects (Bouic 1996, 1999; Gupta 1980; Vanderhaeghe 1999).

Chinese herbal medicine/acupuncture

General considerations/rationale

Trauma leads to Blood and Qi stagnation, which can cause pain. Western practitioners state that trauma leads to inflammation.

Appropriate Chinese herb

Notoginseng (San qi): Has nonsteroidal anti-inflammatory action. It has been shown to be more COX-2 selective than ibuprofen and naproxen (Seaver 2004).

Acupuncture

Acupuncture has been accepted as an effective modality for the treatment of musculoskeletal disorders by the World Health Organization (2006). It decreases the pain associated with the injury. In one study, 9 of 12

volunteers reported that acupuncture increased the pain threshold (Stacher 1975).

Homotoxicology

General considerations/rationale

Simple sprains, strains, and fractures represent Inflammation Phase disorders. In cases where the patient is in the Impregnation Phase, the tissues are less elastic and more prone to injury. Fractures can also occur in Degeneration and Dedifferentiation phases; therefore, the clinician should examine the case and determine if simple therapy with Traumeel S is sufficient, or if deeper homotoxicoses exist. Clients need to be fully educated about the patient's current phase so they are not surprised when the desired regressive vicariation reactions occur.

Corticosteroids can decalcify bone and decrease healing. Using excessive levels of nonsteroidal drugs can actually decrease fibroplasia and prolong recovery, as well as injure other organ systems such as the liver, kidney, and intestinal lining (Busti, et al. 2005; Adebayo, Bjarnason 2006). Because the intestinal lining is critical to proper immune function, these drugs can theoretically impact the immune system in ways far greater than currently understood. Use of biological therapy may avoid such damage and is desirable, and it is well tolerated by patients.

Topical therapy with Traumeel gel or ointment and Zeel ointment have brought good control of pain in simple strains and sprains, and are widely used by human athletes and their trainers with no known major adverse effects.

Appropriate homotoxicology formulas

Aesculus compositum: Promotes circulation and healing.

Belladonna homaccord: Used in cases with intense inflammation and redness.

BHI-Arthritis: Used for joint pain.

BHI-Arnica ointment: Can relieve pain associated with trauma when applied topically.

BHI-Inflammation: Treats joint pain and inflammation.

Placenta compositum: Assists extremity vasculature in poorly healing injuries.

Cruroheel: Treats sprains and strains, and assists with ligamentous healing.

Discus compositum: Used for tendency toward strains, and improves healing function.

Osteoheel: Stimulates bone healing and is used in ankle injuries of all kinds.

Traumeel S: When given orally in drops or applied topically as gel or ointment, assists in reducing inflammation and stimulating and accelerating healing (Lussignoli, et al. 1999).

Zeel: Used for bone and joint pain. Stimulates healing and pain control over several weeks' duration. Traumeel is more clinically effective for acute pain.

Authors' suggested protocols

Nutrition

Cartilage/ligament/muscle/skeletal support formula: 1 tablet for every 25 pounds of body weight BID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for each 35 pounds of body weight for dogs.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight daily.

Betathyme: 1 capsule for every 35 pounds of body weight BID (maximum, 2 capsules BID.)

Chinese herbal medicine

The authors use a patent formula called Yun Nan Bai Yao (also known as Yunnan Bai Yao or Yunnan Paiyao) at the supplier's recommended dose. In addition to the herb cited above, Yun Nan Bai Yao may also contain *Dioscorea nipponica* (Chuan shan long), *erodium* (Lao guan cao), *inula flowers* (Xuan fu hua), and/or other herbs, depending upon the manufacturer.

Acupuncture points for trauma include GB20, LI11, TH5, GB34, BL37, BL60, GB30, and ST36. (Basic and Express Acupuncture therapy 1969). The practitioner may also consider local points.

Homotoxicology

In all cases: Topical Traumeel gel mixed with Lymphomyosot gel, as needed for control of pain and swelling. Traumeel drops given every 15 minutes for 4 to 5 dosages, then QID day 1, TID days 2 and 3, and BID day 4 and as needed. Discus compositum given at the dose of 1 tablet every other day. BHI-Inflammation is also a useful remedy selection, if available.

In all cases: Topical Zeel ointment BID mixed with Traumeel gel. Zeel tablets given twice daily.

For fractures and other injuries involving bone: Osteoheel for fractures PO QID day 1, TID day 2, BID days 3 and beyond. BHI-Injury given BID, possibly alternating with Bone BID, particularly for non-union fractures.

For sprains and strains: Cruroheel PO BID alternated with Traumeel and Osteoheel as needed.

In cases of severe swelling: Lymphomyosot and Apis given orally QID day 1 and as needed afterward.

Diseases of the Respiratory System

BRONCHITIS: ACUTE, ALLERGIC, AND CHRONIC

Definition and cause

Inflammation is the underlying mechanism in bronchitis. Acute and allergic forms are caused by exposure to environmental irritants, mechanical (collapse), allergens, infections, and toxins. Chronic bronchitis results from ongoing airway irritation, inflammation, swelling, increased mucus production, smooth muscle spasms, narrowing, and chronic coughing. It is common in both dogs and cats (see Feline Bronchial Asthma, below) (Bonagura 1991, 1994; Dye 1996; Forrester 1997; Johnson 1997; McKiernan 2003; Padrid 1990; Schaer 1989).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy for bronchitis is directed at the inflammation and cough. However, it is important to first rule out other underlying causes such as heart disease, dental disease, infection, infestation, and cancer. Commonly recommended drugs include antitussives such as hydrocodone, antibiotics, corticosteroids, and bronchodilators such as aminophylline and theophylline. No dietary or supplemental guidelines are recommended (Forrester 1997, McKiernan 2003, Padrid 1990).

Anticipated prognosis

The prognosis depends on finding and addressing the underlying cause. Bronchitis is a progressive disease in which the signs can be controlled; however, it is not considered to be a curable disease (Padrid 1990).

Integrative veterinary therapies

The integrative approach to bronchitis focuses on enhancing toxin elimination and reducing inflammation. Allergic

bronchitis involves the immune system's reaction to allergens, with the bronchus as the target organ for the inflammatory response. Local bacterial populations often invade secondary to the chronic irritation, resulting in bronchial infection. The medical focus is upon the cough, irritation, and infection, and does not address the underlying cause; therefore, recurrences are common, often leading to chronic bronchitis.

When nutritional, herbal, and biological therapies are added to the prevention and treatment protocols, cellular elimination of wastes is encouraged, cellular inflammation is reduced, and secondary bacterial invasion is less likely.

Nutrition

General considerations/rationale

Therapeutic nutrition adds nutrient and gland support for the lungs and organs of the immune system. In addition, nutrients can help decrease local cellular inflammation while improving elimination of toxins.

Appropriate nutrients

Nutrition/gland therapy: Glandular adrenal, thymus, bronchus, and lung provide intrinsic nutrients that nourish the organ, help to neutralize cellular inflammation, and help to balance the immune system (see Gland Therapy, Chapter 2, for a more detailed explanation).

Vitamin B₆ (pyridoxine): Vitamin B₆ can be beneficial for animals with allergic bronchitis similar to those with asthma. Asthmatics have reduced levels of vitamin B₆, which has a natural antihistaminic effect. This can be a real deficiency or a side effect of bronchodilating medications such as theophylline, which can cause a B₆ deficiency (Collipp 1975, Weir 1990). In clinical trials, vitamin B₆ supplementation has been found to help reduce the levels of required medication as well as decrease the frequency of allergic reactions such as asthmatic episodes (Collipp 1975, Reynolds 1995). Other studies found that some asthmatic patients still required corticosteroids to control the symptoms (Sur 1993).

Quercetin: Quercetin is a flavonoid that has potent antioxidant properties. Quercetin also has been proven to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). This antihistamine attribute is beneficial in the treatment of allergic conditions such as asthma and can improve breathing in compromised conditions such as pneumonia. Quercetin inhibits the enzyme lipoxygenase, which contributes to the clinical signs associated with asthma (Welton 1986).

Bromelain: Bromelain is a proteolytic enzyme that comes from pineapples. It has anti-inflammatory properties and is beneficial for the upper respiratory system (Taub 1966). Ryan (1967) showed an improvement in the treatment of sinusitis with bromelain in a double-blind study. Another characteristic of bromelain is its ability to reduce the thickness of mucus in the respiratory system, which is beneficial for allergic conditions such as asthma and all inflammatory and infectious respiratory diseases (Schaefer 1985). In addition, bromelain has been shown to positively affect white blood cells and the immune response, which is also beneficial for respiratory infections (Desser 1994, Kelly 1996, Munzig 1995).

N-acetyl cysteine (NAC): N-acetyl cysteine is an amino acid derivative of cysteine that helps break down mucous accumulations. In double-blind clinical trials, people with bronchitis showed improved symptoms and a decrease in recurrences when supplemented with NAC (Bowman 1983, Grandjean 2000). NAC is also a potent antioxidant that is protective of bronchial and pulmonary tissues (Van Schayck 1998). NAC has been shown to help break up mucus, and in a double-blind study, people with chronic bronchitis showed reduced coughing and an improved ability to expectorate. Another trial linked these benefits to the reduced viscosity of the sputum (Jackson 1984, Tattersall 1983).

Chinese herbal medicine/acupuncture **General considerations/rationale**

Practitioners of TCM recognize different patterns of bronchitis. Patients with dry, unproductive coughs have a diagnosis of Qi and Yin deficiency. Yin refers to the fluids of the body. A Yin-deficient cough is therefore dry and non-productive. Patients with a productive cough have Qi and Yang deficiency. Yang and Yin balance each other according to TCM theory. Therefore, a Yang deficiency leads to a relative Yin excess. Yin is cold and moist. Cold discharges are white. Put together, the term Yang-deficient cough translates into a wet, productive cough with slight to copious, clear to white discharge. It is important to clear these discharges.

The Qi deficiency leads to immunosuppression because the immune system is a function of the energy of Qi. Therefore, the patient is susceptible to secondary bacterial, fungal, or viral pathogens. A clinician treating a

patient with bronchitis, even if not initially caused by a pathogenic organism, must be prepared to recognize and treat secondary infections.

Appropriate Chinese herbs for dry nonproductive coughs

Adenophora (Sha shen): Suppresses coughs (Zhong Hua Yi Xue Za Zhi 1956) and has antifungal activity (Zhong Hua Pi Fu Ke Xue Za Zhi 1957).

Anemarrhena (Zhi mu): Has antibacterial properties (Yao Xue Qing Bao Tong Xun 1987).

Apricot seeds (Xing ren): Decrease coughing (Zhang 1991).

Aster (Zi wan): Demonstrates significant expectorant activity and is effective against several bacteria, viruses, and fungi (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Licorice (Gan cao): Contains glycyrrhizin. This compound has demonstrated antiviral effects against several classes of viruses and antibiotic effects against various bacteria (Zhu 1996, Zhong Yao Zhi 1993). It suppresses coughing and has expectorant activity (Zhong Yao Yao Li Yu Ying Yong 1983).

Mulberry leaf (Sang ye): Has demonstrated antibacterial activity against several types of bacteria (Zhong Yao Yao Li Yu Ying Yong 1983).

Ophiopogon (Mai dong): Has demonstrated antibacterial effects (Zhong Yao Xue 1998).

Platycodon (Jie geng): Has both expectorant and antitussive activity (Zhong Yao Yao Li Yu Ying Yong 1983).

Schisandra (Wu Wei zi): Has demonstrated activity against many bacteria (Zhong Yao Xue 1998).

Stemoma (Bai bu): Acts on the central nervous system to suppress coughs (Zhong Yao Yao Li Yu Ying Yong 1983).

Tangerine peel (Chen pi): Causes bronchial dilation (Shang Hai Yi Yao Za Zhi 1957).

Appropriate Chinese herbs for productive coughs

As above, the following herbs can be used for their antibacterial effects:

Coltsfoot flower (Kuan dong hua): Suppresses coughs, decreases respiratory tract secretions, and relieves wheezing (Zhong Yao Yao Li Yu Ying Yong 1983).

Dolichos seed (Bian dou): Has antibacterial and antiviral effects (Dictionary of Chinese Medicines 1997).

Poria (Fu ling): Inhibits *Staphylococcus aureus*, *Bacillus coli*, and *Bacillus proteus* (Nanjing College 1976).

Schisandra (Wu Wei zi), ophiopogon (Mai men dong), licorice (gan cao), and aster (zi wan): Ophiopogon (Mai men dong) also increases mucociliary transport velocity in quails and decreased respiratory tract mucus secretion (Tai 2002).

Acupuncture points

LU1, BL13, CV22, LI11, GV14, and Ding-chuan can be used to stop coughing (Zhong Yi Shi Xi Yi Shi Sou Ce 1987).

Homotoxicology

General considerations/rationale

Acute bronchitis is an Inflammation Phase condition, but acute flares of inflammation often occur with deeper phase homotoxicoses as they attempt to improve through regressive vicariation. Allergic bronchitis represents an Impregnation Phase disorder and quickly may deteriorate into a Degeneration Phase problem. Chronic bronchitis usually occurs in the Impregnation and Degeneration phases. The body deposits many homotoxins into the pulmonary connective tissue and the Deposition Phase is generally asymptomatic. Iatrogenic damage from antibiotics and prior infections (viral particles, endotoxins, etc.) may play a part in the genesis of chronic bronchial and pulmonary diseases. The clinician needs to look carefully at the patient and medical history to determine which phase is most represented in choosing the therapy. Diagnostic procedures are indicated as needed to separate diagnoses and determine therapy.

It is not expected that a rapid cure will occur in cases to the right of the Biological Divide. Autosanguis therapy is indicated in such cases (Broadfoot 2004). These patients can undergo sudden and dramatic increases in the secretory activity of the bronchial mucosa. Such sudden changes represent movement to the left of the Six-Phase Table of Homotoxicology and are desirable, although they can present the clinician and owner with difficult choices. Generally, supporting treatments, which move the patient toward inflammation and excretion, will lead to improved conditions over longer periods of time.

As an example, Palmquist treated an aged poodle suffering from chronic allergies and chronic obstructive pulmonary disease with great success. On presentation the dog was nonresponsive to standard drug therapy and had failed therapy at a boarded internist's practice. This dog was treated with autosanguis therapy and developed immediate copious mucus excretion and severe coughing and dyspnea. The patient was treated for 2 years and gradually improved until it was able to function with no pharmaceutical drugs. Chronic antihomotoxic therapy was needed for patient comfort for the remainder of its life.

Appropriate homotoxicology formulas

Respiratory disease is a complex issue and there are many possible combinations of remedies needed to obtain a clinical result. The following major remedies provide a starting place for the clinician interested in biological therapy.

***Aconitum homaccord*:** Used for animals that are fearful; avoid touch; or experience aggravations following dry, cold weather or very hot weather. Other symptoms: sensitive to noises, feels like water trapped in left ear, red eyes, epiphora, dry-short or hacking cough that is especially worse late at night (Boericke 1927; Skaltsa, Philianos, and Papaphilippou 1997); red, flushed skin; tachycardia with pain in left shoulder; intermittent fever and chills; cough with nausea (Reckeweg 2000). A recent study of a Brazilian homeopathic combination including *Aconitum* indicates a possible mechanism of action affecting macrophage function directly (de Oliveira, et al. 2006). Useful as first prescription in inflammation and inflammatory fevers.

***Atropinum compositum*:** Oral and injectable vials are not currently available in the United States, but tablets are and can be very useful for spasmodic bronchial coughing.

***Belladonna homaccord*:** Used for acute onset conditions; dry nose; mucus catarrhal discharge, possibly with blood; tickling dry cough; whooping cough, possibly with pain in the left hip; may cry out in sleep; painful, high fever (Boericke 1927); delirium; aggression; sudden biting behavior. Canine distemper patients often benefit from this remedy (Heel 2003). Echinacea supports immune response. *Belladonna homaccord* is frequently indicated after *Aconitum homaccord*, when the flu-like, chill symptoms of Aconite have passed the critical point and localized symptoms such as pharyngitis and bronchitis have commenced (Reckeweg 2002). *Belladonna* is found in a variety of remedies.

***BHI-Bronchitis*:** Treats wet and dry coughs and coughs worsened by smoke exposure (Heel 2002).

***BHI-Chest*:** Treats cough with rib pain.

***BHI-Cough*:** Treats mild coughs, wet and dry coughs, and smoke-induced coughs. Contains *Quebracho* for bronchial asthma and asthmatic bronchitis with dyspnea; also in emphysema (Reckeweg 2002). Also found in *Tartephedreel*.

***Bronchalis*:** Treats acute and chronic bronchitis. The remedy *Kreosotum*, which is also common to *BHI-Bronchitis*, *Lamioflur*, and *Mucosa compositum*, is useful in chronic mucosal conditions with offensive, acrid, excoriating discharges; chronic bronchitis; bronchiectasis; and spasmodic cough (Reckeweg 2002).

***Bryaconeel*:** Treats chronic bronchitis and pulmonary changes, particularly in aging animals.

***Coenzyme compositum*:** Activates energy pathways and provides repair following mitochondrial damage by antibiotics and other drugs. Contains *Baryta oxalsuccinica*, which is indicated for chronic bronchitis (Reckeweg 2002). This remedy is also found in *BHI-Enzyme*.

***Drosera homaccord*:** Treats cough aggravated by or originating following cold, wet weather; bronchial asthma; and spasmodic cough.

***Echinacea compositum*:** Treats inflammation and provides immune support in viral and bacterial infections and febrile disorders. The ingredient *Sanguinaria canadensis* is particularly useful; it is indicated for patients with a history of violent pains in the mouth, chest, larynx, and trachea when coughing and breathing, which are aggravated at night. Eructation during or after coughing is also a typical symptom. Also treats bronchitis with tough, thick mucus; bronchiectasis with spastic cough; and right-sided pneumonia. This remedy contains *Thuja* for asthmatic bronchitis with copious expectoration at night (Reckeweg 2002).

***Engystol N*:** Provides sulfur and matrix drainage in viral cases, and increases activity of the immune system.

***Euphorbium compositum*:** An antiviral that is useful in clearing upper respiratory passages in sinusitis. Consider its use in viral bronchitis. May be helpful during regressive vicariation with signs compatible with viral homotoxins.

***Galium-Heel*:** Used for chronic cases and allergy. Provides cellular detoxification and matrix drainage.

***Husteel homaccord*:** Treats dry cough, chronic nasal discharge, sore neck, and catarrhal respiratory tract. The remedy *Arsenicum iodatum*, which is common to *Tartepedreel*, is particularly indicated for purulent respiratory diseases (Reckeweg 2002).

***Lamioflur*:** Used for putrefied sputum and foul nasal discharges.

***Lymphomyosot*:** Provides drainage of connective tissue and lymphatics. Used for mucocutaneous lesions.

***Mercurius-Heel S*:** Used for catarrhal, suppurative conditions. It is antiviral and antibacterial.

***Mucosa compositum*:** Used in Degeneration Phase homotoxicoses and during the recovery phase following initial infection and to repair damage from pharmaceutical agents.

***Phosphor homaccord*:** Treats laryngitis, cough tending to develop pneumonia, and bloody sputum. Constitutionally, these patients tend to be tall/long and thin. They may be fearful of thunderstorms (Boericke 1927) and they may experience frequent swallowing from a sensation of a ball in the throat (Reckeweg 2000).

***Psorinoheel*:** Contains *Bacillinum*, which is indicated for chronic bronchitis (Reckeweg 2002).

***Schwef-Heel*:** Contains sulfur, and is used in allergic cases, particularly allergic dermatitis. Sulfur is also present in *Engystol*, which is used more frequently in respiratory cases. These cases have red skin, itchiness, and a bad odor. May be used intermittently as the case shifts.

***Spascupreel*:** Treats spasmodic coughing and bronchospasm.

***Tartepedreel*:** Treats cough with ropery mucus, pain in the region of the third rib (star anise), coughs with nausea (ipecacuanha); and there is a history of asthma (Reckeweg

2000). Also contains *Blatta orientalis*, which is suited to corpulent patients and those that are aggravated in rainy weather. The lower potencies are preferred in acute attacks, and in chronic cases the higher ones are preferred (Reckeweg 2002). This component is common to *BHI-Cough*, as well.

***Tonsilla compositum*:** Provides support of the endocrine system and immunity, particularly in chronic disorders. It is a phase remedy for Degeneration cases.

***Thyroidea compositum*:** Drains matrix and supports endocrine function. It is a deep detoxification formula component and a phase remedy in Impregnation Phases.

***Traumeel S*:** Used intermittently in inflammatory conditions and regulation rigidity.

***Ubichinon compositum*:** Used as a Degeneration Phase remedy and following antibiotic therapy.

Authors' suggested protocols

Nutrition

Bronchus/lung and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Vitamin B₆: 25 mgs for every 25 pounds of body weight SID.

Bromelain: 100 mgs for each 25 pounds of body weight, with food.

Quercetin: 50 mgs for each 10 pounds of body weight SID.

N-acetyl cysteine (600-mg tablets): One-quarter tablet for each 25 pounds of body weight SID.

Chinese herbal medicine

For dry, unproductive coughs, the authors recommend the herbal supplement H1 at a dose of 1 capsule per 10 to 20 pounds twice daily. This supplement increases tracheal and bronchial secretions to moisten the respiratory tract, suppresses coughing, and inhibits bacterial growth. In addition to the herbs listed above, this formula also contains codonopsis (*Dang shen*), poria (*Fu ling*), angelica root (*Dang gui*), donkey skin gelatin (*E jiao*), angelica (*Bai zhi*), siler (*Fang feng*), and allium (*Cong bai*).

For productive coughs, the authors recommend the herbal supplement H95, which inhibits the tracheal and bronchial secretions, has expectorant effects, and inhibits bacterial growth. The dose is 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs listed above, this supplement also contains ginseng (*Ren shen*), *atractylodes* (*Bai zhu*), ginger (*Sheng jiang*), and jujube fruit (*Da Zao*).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

These are highly individualized cases, and it is difficult to recommend a "one size fits all" protocol, but as a starting

point, we can consider the remedies below. The authors often inject the initial remedies, both IV and subcutaneously, in the manner of an autosanguis. In chronic cases, it can be of immense value to nebulize the saline-based injectable or oral remedies (do not nebulize alcohol-based remedies or tablets), because it then gives us direct access to the afflicted tissues.

Acute bronchitis: Engystol, Traumeel, and Coenzyme compositum as a mixed injection. Belladonna homaccord or Aconitum homaccord (if febrile), Lymphomyosot, Echinacea compositum (bacterial), Spascupreel, and Bronchalis mixed together and given every 15 minutes for 3 to 5 doses and then BID to TID orally.

Allergic bronchitis: Galium-Heel, Engystol N, Lymphomyosot, Phosphor homaccord, Coenzyme compositum, Hepeel, BHI-Allergy, and Tartephedreel, mixed together and given TID to BID orally. Deep detoxification formula consisting of Galium-Heel, Thryoidea compositum, Hepar compositum, and Solidago compositum, given orally every 3 days for 120 days.

Chronic bronchitis: Tonsilla compositum, preferably as an autosanguis. Psorinoheel, Lymphomyosot, Galium-Heel, Bronchalis, Engystol, and Ubichinon compositum combined and given orally TID to BID. Add deep detoxification formula as above for allergic bronchitis with the addition of Mucosa compositum given orally every 3 days for 120 days or until response wanes.

FELINE BRONCHIAL ASTHMA

Definition and cause

Feline bronchial asthma is an allergic and inflammatory reaction in the airway that is most often secondary to allergen exposure and results in bronchoconstriction. Symptoms include wheezing, coughing, dyspnea, and potentially death from severe bronchoconstriction.

Common suspected underlying causes are environmental contaminants such as secondary smoke, chemical and household cleaners, pollen, and dust. Although unproven, many clinicians believe that there is a hereditary and/or and autoimmune component to feline asthma (Corcoran 1995, Moise 1989, Noone 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy for asthma is directed at the inflammatory process in the upper airways. Corticosteroids, antihistamines, bronchodilators, anti-serotonin medication such as cyproheptadine, and immunomodulators such as cyclo-

sporine have all be used to treat asthma, with varying degrees of success (Dye 1996, Padrid 1996, Livingstone 1994).

Anticipated prognosis

Prognosis for management is generally good if caught early. Success is totally dependent upon client compliance and response to medication. Relapses are common when medication is stopped (Dye 1992, 1996; Livingstone 1994; Noone 2003).

Integrative veterinary therapies

Allergies to any substance can worsen asthmatic symptoms. Pollen allergy is a common cause of aggravation in these cases and should be suspected in cases presenting with a history of seasonality. Mold spores can aggravate allergies and cause direct trauma to the respiratory tissues. Mold reactions may be particularly hard to control. Careful evaluation of medications and supplements is advised in asthmatic patients because adverse reactions to many substances can aggravate asthma.

Any agent that traumatizes respiratory membranes can aggravate asthma as a primary homotoxin. Environmental pollution is common, and oxides of sulfur and nitrogen combine with water in the respiratory tree to yield acids (nitric acid, nitrous acid, and sulfuric acid). Ozone can cause major injury to cell membranes and is present in general air pollution. It is also generated by many popular air-deodorizing devices. Authorities have expressed concern over ozone-generating air purifiers because these may aggravate asthma in humans (Britigan, et al. 2006).

One author has identified a case of feline asthma that improved following removal of ozone-generating air filtration equipment, and specifically recommends removal of any such equipment from the home of cats suffering from asthma (Palmquist 2005).

Tobacco smoke is another common irritant, as is the out-gassing of noxious chemicals from building materials and new carpeting. Perfumes, scented candles, incense, room deodorizing sprays, laundry detergents, fabric softeners, and aromatic oils can all elicit respiratory pathology in sensitive individuals. Some animals may be congenitally missing detoxification systems or membrane receptors resulting from genetic alterations, making them more susceptible to such effects. Such issues are known to occur in collies and most certainly involve other species as well (Geyer, et al. 2005).

Routine vaccinations may play a part in this condition, and avoidance of unnecessary vaccination is desirable. Certainly we know that allergic patients are more prone to vaccination reactions and immune imbalances, and

it is logical to assume that this condition operates similarly.

Integrative therapies can work well with medications because recovery and cure are not always possible. The conventional medical symptom control through suppression of the immune system and bronchodilation are key elements for day-to-day quality of life. The use of therapeutic nutrients, herbs, and biological therapies can help to control symptoms and decrease asthmatic episodes, and in many cases result in reduced use of pharmacologic agents.

Nutrition

General considerations/rationale

While medical therapy is focused locally upon the breathing and suppression of the immune response, therapeutic nutrition adds nutrients, antioxidants, and gland support to help reduce local cellular inflammation, balance immune response, and encourage toxin elimination via the respiratory system.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, and lung provide intrinsic nutrients that nourish the organ, help to neutralize cellular inflammation, and balance the immune system response (see Gland Therapy, Chapter 2, for a more detailed explanation).

Thymus extract: The oral administration of thymus extract has been shown in early and double-blinded clinical trials to improve the symptoms and course of asthma in people. It is believed that this effect is related to the thymus gland extract's ability to balance immune function and reaction (Bagnato 1989, Cazzola 1987, Genova 1983, Kouttab 1989).

Vitamin B₆ (pyridoxine): Asthmatics have reduced levels of vitamin B₆, which is considered to have natural antihistaminic effects. This could be a real deficiency or a side effect of bronchodilating medications such as theophylline, which can cause a B₆ deficiency (Collipp 1975, Weir 1990). In clinical trials B₆ supplementation helped reduce the levels of required medication and decreased the frequency of asthmatic episodes (Collipp 1975, Reynolds 1895). However, other studies found that asthmatic patients still required corticosteroids to control the symptoms (Sur 1993).

Fish oil: In a double-blind clinical trial in people with asthma it was shown that there was some reduction in symptoms when the diet was supplemented with fish oil. In other double-blind trials, asthmatic children showed a significant improvement in symptoms when taking fish oil (Arm 1988, Nagakura 2000).

Quercetin: Quercetin is a flavonoid that has potent antioxidant properties. Quercetin also has been proven to inhibit cells from releasing histamines (Middleton 1986,

Ogasawara 1985). This antihistamine attribute is beneficial in the treatment of allergic conditions such as asthma and can improve breathing in compromised conditions such as pneumonia. Quercetin inhibits the enzyme lipoxygenase, which contributes to the clinical signs associated with asthma (Welton 1986).

Chinese herbal medicine

General considerations/rationale

According the TCM theory, asthma is due to Lung and Kidney Qi deficiency. Lung Qi deficiency causes weakness and coughing. According to TCM, one function of the Kidney Qi or Kidney energy is to grasp the breath from the Lung and pull it downward. With Kidney Qi deficiency, the Kidney is not able to grasp the Lung breath. Because there is no energy pulling the air downward, the patient cannot take a full, deep breath. The breathing becomes shallow and rapid.

Appropriate Chinese herbs

Aster root (Zi wan): Can help clear the respiratory tract of irritants or pathogens. It can increase the excretion of phenol red from the respiratory tracts of mice. Two components seem to play a major role in the expectorant effect: shionone and episuberol (Lu 1999). It also has an antitussive effect (Zhao 1999).

Astragalus (Huang qi): Was used in 41 human patients with asthma. They were treated with an astragalus preparation via injection into ST36. The patients were treated twice weekly for 3 months, then rested for 2 weeks. This protocol was repeated 3 to 4 times as required according to symptoms. Eighty-five percent had a significant improvement in symptoms (Zhong Hua Er Ke Za Zhi 1978).

Cordyceps (Dong cong xia cao): Can relieve asthma by dilating the bronchi (Fu Jian Yi Yao Za Zhi 1983).

Fritillaria (Bei mu): Dilates bronchi at low concentrations (Zhong Yao Xue 1998). It contains peimine and peiminine, which have been shown to decrease coughing in rats (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Gecko (Ge jie): Has an antiasthmatic effect via the relaxation of the bronchi (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Mulberry bark (Sang bai pi): Decreases coughing (Zhong Yao Xue 1998).

Schisandra (Wu wei zi): Was used in a study involving 50 human patients with severe asthma. The treatment period ranged from 7 months to 2 years. Of the 50 participants, 1 achieved complete remission while 47 became stable. Two patients did not respond (Zhong Yi Za Zhi 1988). Schisandra also increases the depth of respiration (Zhong Yao Yao Li Yu Ying Yong 1983).

Homotoxicology

General considerations/rationale

Reckeweg reported more than 5 decades ago the observation that human childhood asthma seemed to appear as an Impregnation Phase disease following allopathic treatment of childhood diseases such as streptococcal pharyngitis and otitis media. He particularly identified the use of antibiotics as a causative or associated factor in the progressive vicariation following such treatment. According to this line of reasoning, the homotoxicosis surfaces in an Inflammation Phase disorder, which becomes an asymptomatic Deposition Phase disorder when suppressed allopathically. This later deteriorates into an Impregnation Phase homotoxicosis and disease signs resurface as the injured tissue's function is compromised. Further suppression leads to progressive vicariation into the Degeneration Phase (chronic obstructive lung disease, chronic bronchitis, etc.). Upon continuing suppression or concurrent actions of other homotoxins, this can develop into neoplasia. A similar situation exists in feline medicine with the association of exposure to tobacco smoke with increased rates of lymphosarcoma (Bertone et al. 2002). To date, no one has examined this specific cycle of pathogenesis in cats, but it seems a theory well worth pursuing.

Biological therapy strives to create circumstances that favor regressive vicariation. In accordance with Hering's Law, cats treated biologically frequently demonstrate mild signs of upper respiratory disease, fevers, skin problems (pruritus, miliar dermatitis, alopecia, and seborrhea), otitis externa and interna, mild gastrointestinal reactions, and sinusitis as homotoxins are excreted from the system and tissues begin repair. The process of biological healing may require several years. The veterinarian should support this process and avoid allopathic drugs wherever possible, while at the same time preserving the patient's life and health with needed interventions.

Appropriate homotoxicology formulas

Apis homaccord: Treats a desire for fresh air and lung congestion.

BHI-Allergy: Treats generalized allergic reactions involving the respiratory tree (Heel 2002).

BHI-Asthma: Soothes bronchial asthma symptoms (Heel 2002).

BHI-Bronchitis: Supports bronchial tissues.

Bronchalis: Provides bronchial support.

Causticum compositum: Promotes regressive vicariation for burning sensations in the airways and promotes metabolic pathways.

Coenzyme compositum: Provides metabolic support.

Cor compositum: Supports cardiac tissues. Helpful in asthma occurring in cardiac cases.

Echinacea compositum: Provides immune support and normalization.

Engystol N: An antiviral that is supportive of allergic conditions through Sulfur; often treats skin rashes concurrently. Several mechanisms may be involved in its action (Enbergs 2006; Oberbaum, et al. 2005; Fimiani, et al. 2000).

Galium-Heel: Treats allergies and provides cellular detoxification.

Lymphomyosot: Provides lymph drainage and detoxification.

Mucosa compositum: Supports mucosal tissues throughout the body. A phase remedy in Degeneration Phases.

Solidago compositum: Supports the kidney and urinary tract, and is a phase remedy in Deposition Phase disorders.

Spascupreel: Treats spasms of smooth muscle; may function as an effective emergency drug during acute attacks. It can be given prior to steroids in milder attacks and where avoidance of corticosteroids is advisable (diabetics, etc.).

Tartheppedreel: Treats bronchial asthma and bronchial coughs.

Tonsilla compositum: Provides support and detoxification of reticuloendotelial tissues, immune modulation, and support of the hypothalamus and adrenal glands.

Traumeel S: An anti-inflammatory that activates blocked sulfur-containing enzymes that are needed for detoxification.

Ubichinon compositum: Provides metabolic support.

Zeel: Has anti-inflammatory effects through its inhibition of COX and LOX enzymes. Asthma is a LOX-5-mediated condition, and Zeel moderates LOX-5, as well as COX-1 and COX-2, without the side effects of conventional drugs (Jaggi, et al. 2004).

Authors' suggested protocols

Nutrition

Immune and bronchus/lung support formulas: 1 tablet for each 10 pounds of body weight BID.

Quercetin: 50 mgs for each 10 pounds of body weight SID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for each 35 pounds of body weight for dogs.

Vitamin B₆: 35 mgs daily.

Chinese herbal medicine

H91 Asthma: 1 capsule per 10 to 20 pounds twice daily as needed to control signs. In addition to the herbs cited above, H91 Asthma contains cooked rehmannia (Shu di huang), ginseng (Ren shen), and walnut (Hu tao ren).

Homotoxicology (Cat dose: 5 drops PO)

This condition responds best to a combination of auto-sanguis and oral therapies and requires long-term treatment and frequent follow-ups. The authors use the following protocols and make therapeutic adjustments as required:

Autosanguis therapy:

1. BHI-Allergy
2. Engystol N plus Galium-Heel
3. Mucosa compositum
4. Echinacea compositum
5. Coenzyme plus Ubichinon compositae

Oral cocktail: Traumeel S, Causticum compositum, Lymphomyosot, Galium-Heel, Tartheppedreel, and Bronchialis OR BHI-Bronchitis mixed together and given BID PO.

Zeel: TID PO.

Cor compositum: Once a week.

Solidago compositum: Once a week.

Spascupreel: May be used frequently during attacks and may prove successful as an emergency drug in these cases.

PLEURAL EFFUSION

Definition and cause

Pleural effusion is fluid in the pleural space caused by an abnormal accumulation of fluid, a decrease in the resorp-

tion of fluid, or a combination of both. Accumulation of fluid can occur secondary to heart disease such as valvular disease or congestive heart failure, trauma such as a diaphragmatic hernia, osmotic pressure imbalance such as secondary to hypoalbuminemia, viral or bacterial infections such as pyothorax, lymphatic dysfunction such as chylothorax, or neoplasia (Bauer 1995, Forrester 1988, Fossum 1994, Lehmkuhl 2003, Padrid 1997, Sherding 1994, Wolf 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Because respiratory distress is the primary symptom, the initial treatment is thoracocentesis followed by a cytological evaluation of the fluid. Once the diagnosis is established, the appropriate therapy is selected. Ongoing thoracocentesis and diuretics are generally recommended for heart disease. Antibiotics are recommended for infectious causes. Surgery is often recommended for trauma and diaphragmatic hernia, chylothorax, and neoplasia (Bauer 1995, Forrester 1988, Fossum 1994, Sherding 1994, Wolf 1997).

Anticipated prognosis

The prognosis is related to identification and correction of the underlying cause. Trauma, once corrected, often results in a good prognosis. Most other causes of pleural effusion carry a poor or guarded prognosis (Fossum 1994, Lehmkuhl 2003).

Integrative veterinary therapies

The integrative approach depends upon a definitive diagnosis and identifying the underlying cause. The therapy is directed toward the cause. (For neoplasia, please see Chapters 31 through 34 on cancer). The addition of therapeutic nutrients, herbs, and biological therapies are directed at both the fluid accumulation as well as the underlying cause such as cardiac, trauma, etc.

Nutrition

General considerations/rationale

Once the underlying cause has been established, therapeutic nutrients will be recommended based upon the organ condition or malfunction.

Appropriate nutrients

Nutritional/gland therapy: Glandular bronchus/lung and heart provide intrinsic nutrients required by these organs for proper function. They also help to reduce associated inflammation and cellular degeneration

(see Chapter 2, Gland Therapy, for more detailed information).

Bromelain: Bromelain is a proteolytic enzyme that comes from pineapples. It also has anti-inflammatory properties and is beneficial for the upper respiratory system (Taub 1966). In a double-blind study, Ryan (1967) showed an improvement in the treatment of upper respiratory inflammation and sinusitis with bromelain. Another characteristic of bromelain is its ability to reduce the thickness of mucus in the respiratory system, which is beneficial for all inflammatory and infectious respiratory diseases (Schaefer 1985). In addition, bromelain has been shown to positively affect white blood cells and the immune response, which is beneficial for preventing upper respiratory inflammation and infections (Desser 1994, Kelly 1996, Munzig 1995).

Vitamin E: Besides its antioxidant functions, vitamin E is involved in the proper functioning of the heart muscle. It particularly improves cardiac output and circulation, and helps to reduce platelet aggregation (Traber 1999, 2001). Vitamin E reduces inflammation and improves circulation by helping vessels to dilate and reduce the agglutination of blood platelets.

Coenzyme Q10 (CoQ10 or ubiquinone): Clinical research in people has shown that CoQ10 is beneficial in controlling cardiac disease. Results of clinical studies showed an improvement in the related symptoms of heart diseases such as a reduction in dyspnea and edema and well as improvements in blood pressure and helping to normalize heart rate (Gaby 1996, Giugliano 2000).

Chinese herbal medicine/acupuncture

General considerations/rationale

Pleural effusion is a result of Qi and Blood deficiency in the Spleen and Lung. The Spleen then loses the ability to transport water and fluids and the Lung loses its ability to distribute the water, so that it accumulates in the chest cavity.

The Spleen takes the water that is ingested and prepares it for action by the Lung. The Lung then distributes the water to the body. When the Spleen and Lung become deficient, they cannot perform these functions. Fluid builds up in abnormal spaces. Treatment objectives include treating the underlying cause of the Qi and Blood deficiency and draining the excess fluid from the chest, either by direct diuretic action or by improving circulation.

Appropriate Chinese herbs

Astragalus (Huang qi): Has been shown to have diuretic actions in dogs, rats, and humans (Modern TCM Pharmacology 1997). It also increases cardiac output while decreasing hypertension (Xu 1999, Luo 1999). This may help patients with pleural effusion secondary to heart failure. Astragalus may also help patients with neoplastic

causes. It has been shown to inhibit some solid tumors (Liu 1999, Shi 1999).

Codonopsis (Dang shen): Can lower blood pressure, increase cardiac output, and improve blood perfusion (Zhong Yao Xue 1998).

Dianthus (Qu mai): May have diuretic effects (Li 1996), which may make it useful in draining pleural fluid.

Fritillaria (Bei mu): Has anti-neoplastic effects. It has been shown to inhibit the growth of cancerous cells in vitro and cause apoptosis (Li 1998).

Ophiopogon root (Mai men dong): Improves cardiac function. It has a positive inotropic effect and can increase cardiac output (Hua Xi Yao Xue Za Zhi 1991).

Platycodon root (Jie geng): Can decrease blood pressure and tachycardia (Zhong Yao Yao).

Scutellaria (Huang qin): Lowers blood pressure (Tong 1995). It contains baicalein, which has been shown to cause apoptosis of human melanoma cells in vitro (Zi 2005). It is possible that it may have efficacy against other cancers.

Trichosanthes root (Tian hua feng): Has demonstrated anti-neoplastic activity. It was shown to inhibit hepatocarcinoma in mice (Modern TCM Pharmacology 1997). It also inhibited the growth of colon and gastric carcinomas in mice (Xu 1997, Bi Li Qi 1998, Xu 1998, Bi Li Qi 1998), which indicates that it may have efficacy against other solid tumors.

White peony (Bai shao): Causes vasodilation and mildly reduces blood pressure (Zhong Guo Yao Li Xue Tong Bao 1986).

Acupuncture

Acupuncture has been shown in several studies to decrease dyspnea secondary to pulmonary diseases (Jobst 1995). It has also shown efficacy in decreasing hypertension. Williams found that stimulation of Liv3, St36, LI11, and a point in the groove behind the ear used for blood pressure modification caused a decrease in diastolic blood pressure (Williams 1991). A study by Ballegaard (1993) indicated that acupuncture may have the ability to normalize cardiovascular function.

Homotoxicology

General considerations/rationale

Pleural effusions typically represent Inflammation, Impregnation, Degeneration, or Dedifferentiation phase homotoxicoses. Exudates usually are inflammatory in nature and represent the organism's attempt to remove homotoxins through inflammatory reactions. Transudates occur due to microvascular or lymphatic malfunction and are commonly seen with more severe pathologies, which often represent Degeneration or Dedifferentiation phase disorders. These can occur during both progressive and regressive vicariation.

Appropriate homotoxicology formulas

Apis homaccord: Treats pulmonary edema.

Bryaconeel: A very useful remedy containing Bryonia, which is indicated for inflammation of serous membranes, bronchial cough with chill, following acute inflammation of the respiratory organs, pleura, and peritoneum. There are often catarrhs of the larynx, of the trachea with hoarseness, accumulation of tough mucus with a dry cough, constriction of the chest, and pleuritic pains with deep inspiration. Often useful in pleurisy accompanied by pneumonia (Reckeweg 2002). Bryonia is common to *Bronchialis*, *BHI-Bronchitis*, *Echinacea compositum*, and *BHI-Inflammation*. Other ingredients are Aconitum (acute febrile diseases, influenza) and Phosphorus (bronchopneumonia, nighttime cough, bloody expectorate, and diseases of the lung and larynx) (Reckeweg 2000).

Coenzyme compositum: Used in chronic diseases to activate energy metabolism and after therapy with allopathic medications that damage mitochondrial function (antibiotics) (Ouedraogo, et al. 2000).

Echinacea compositum: An important Inflammation Phase remedy. Also indicated in Impregnation Phases marked by recurring infections. Used as a natural antibiotic in bacterial and viral conditions. Contains major remedies consisting of Echinacea, Aconitum, Sanguinaria, Sulfur, Baptista, Lachesis, Bryonia, Eupatorium, Pulsatilla, Mercurius sublimatus, Thuja, Influenzium nosode, Phosphorus, Cortisonum, Streptococcus nosode, Staphylococcus nosode, Phytolacca, Zincum, Gelsemium, Hepar sulfuris, Rhus tox, Arnica, Arsenicum, Argentum and Euphorbium (Reckeweg 2000).

Engystol N: Used for viral infections through the action of Vincetoxicum and Sulfur. Excellent for asthma in cats and pneumonia. This remedy directly stimulates immune function. (Ben-Yakir 2004; Oberbaum, et al. 2005; Enbergs 2006).

Galium-Heel: A phase remedy in all phases from Deposition through Degeneration due to its draining effects on the matrix as well as its ability to improve and activate the greater defenses. A main remedy for any chronic disease.

Glyoxal compositum: Treats chronic diseases in the Degeneration and Dedifferentiation phases. Decouples homotoxins from receptors and other proteins such as enzymes.

Hepar compositum: Provides support of the liver. Part of the deep detoxification formula for use in chronic diseases. Contains Lycopodium, which may be useful in cases of allergic rhinitis (Colin 2006).

Lymphomyosot: Provides lymph drainage and support.

Phosphor homaccord: Treats pulmonary parenchymal disorders, laryngitis, and bleeding tendencies. Phosphorus has proved its worth in pneumonia (orally or injected, in

the potencies 10, 30, 200, and 1,000 times) (Reckeweg 2002). This component is also common to *Apis compositum*, *Bryaconeel*, *Echinacea compositum*, *Galium-Heel*, *Gripp-Heel*, *Mucosa compositum*, *NasoHeel*, and *BHI-Bleeding*.

Tonsilla compositum: An important phase remedy for Impregnation and Dedifferentiation conditions. Supports the endocrine and immune systems in chronic disease.

Traumeel S: Treats inflammatory conditions anywhere in the body as well as sinusitis and rhinitis. It is useful in regulation rigidity and important after regressive vicariation following use of *Pulsatilla compositum*. Used intermittently in many cases to reduce inflammation and improve patient comfort and healing.

Ubichinon compositum: Contains Anthrachinon, which has strong indications in afflictions of the lungs, pleurisy, pneumonia, and respiratory illness, where there is effusion in most cases. The remedy Ubiquinone (Coenzyme Q10) is useful in chronic mucosal inflammations and suppurations with excoriating secretions, in septic cold infections, descending bronchitis, febrile pneumonia, and asthmatic attacks and those with persistent nocturnal cough, particularly when provoked by movement (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Cardiac and bronchus/lung support formulas: 1 tablet for every 25 pounds of body weight BID.

Bromelain: 100 mgs for each 25 pounds of body weight, with food.

Vitamin E: 50 IU for each 20 pounds of body weight SID.

Coenzyme Q10: 15 mg per 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Formula H38 pleural effusion/cardiac: 1 capsule per 10 to 20 pounds twice daily as needed. It may be combined with Western drugs such as steroids, chemotherapeutics, and cardiac medications as needed. In addition to the herbs cited above, H38 pleural effusion/cardiac also contains angelica root (Dang gui), lily bulb (Bai he), pharbitis (Qian niu zi), and talc (Hua shi). These help to increase the efficacy of the formula.

Acupuncture points which may be used include those mentioned above.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

For pleural effusion, in addition to proper medical care, consider Traumeel-S, Galium-Heel, Lymphomyosot, and Apis Homaccord combined and taken orally TID. Treat

other disorders as diagnosis demonstrates (neoplasia, cardiac, infectious, foreign body, vascular permeability issues, hypoproteinemia, etc.) (see notes for Chylothorax in Chapter 7).

PNEUMONIA

Definition and cause

Pneumonia is an inflammatory reaction to a foreign material in the lungs. The underlying cause for pneumonia can be broadly categorized as allergic (antigenic-allergens, heartworms), infectious (bacterial or viral), or fungal, and also can be secondary to other conditions such as aspiration, heartworm disease, and neoplasia (Bauer 1989, Hawkins 1995, Kuehn 1991, Greene 1998, Roudebush 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy for pneumonia is dependent upon the underlying causative agent(s). Antibiotics are given for bacterial infections, corticosteroids are given for allergic causes, and antifungal drugs are used for fungal infestation (Bauer 1989, Hawkins 1995, Kuehn 1991, Roudebush 2003, Wolf 1995).

Anticipated prognosis

Prognosis also depends upon the underlying cause. Allergic causes—including heartworm infestation—if identified and eliminated, often offer a good prognosis. Bacterial infections if diagnosed and treated early also offer a good prognosis. Chronic bacterial, fungal, and pneumonias secondary to other serious diseases such as neoplasia often offer a guarded prognosis. Recurrences are common (Bauer 1989, Roudebush 2003, Taboada 1997).

Integrative veterinary therapies

While the medical approach to respiratory problems is to look for the causative agent (bacteria, viral, fungal etc), alternatives take into consideration that the lungs and the upper respiratory system is an avenue of toxin elimination. The enhancement of toxin elimination and the reduction of inflammation are the focus of the integrative approach. When nutritional, herbal and biological therapies are added, elimination is encouraged, cellular inflammation is reduced, secondary invaders such as bacteria cannot take hold, grow and cause the disease.

Nutritional treatment of respiratory disorders involves reducing toxin levels (providing clean, properly humidified air), correcting dehydration when present so that secretory efforts are assisted and promoted. Also, assuring proper nutrition with attention to those nutrients which assist secretion and thin mucus as well as protect against and overly acid or oxidative environment. Therapy also provides the proper mix of exercise to stimulate lung motion and lymphatic movement and periods of rest in order that damage can be repaired.

Nutrition

General considerations/rationale

Therapeutic nutrition adds nutrient and gland support for the lungs and organs of the immune system. In addition, nutrients can help decrease local cellular inflammation while improving elimination of toxins.

Pneumonia can be a serious disease of a major organ of detoxification and can affect the body and organs systemically. It is therefore recommended that blood be analyzed medically and physiologically to determine organ

involvement and disease. This allows clinicians to formulate therapeutic nutritional protocols that address the upper respiratory system as well as other organs of elimination and detoxification such as the liver and kidney (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular lung, adrenal, and thymus supply the intrinsic nutrients used to reduce inflammation and improve organ function as well as enhance the cellular elimination of toxins (see Gland Therapy, Chapter 2, for a more detailed explanation).

Quercetin: Quercetin is a flavonoid that has potent antioxidant properties. Quercetin also has been proven to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). This antihistamine attribute is beneficial in the treatment of allergic conditions such as asthma and can improve breathing in compromised conditions such as pneumonia. Quercetin inhibits the enzyme lipoxygenase, which contributes to the clinical signs associated with asthma (Welton 1986). Knekt (1997) has reported that Quercetin has proved beneficial in the inhibition of lung and other cancers.

Bromelain: Bromelain is a proteolytic enzyme derived from pineapples. Bromelain has anti-inflammatory properties and is beneficial for the upper respiratory system (Taub 1966). In a double-blind study, Ryan (1967) showed an improvement in the treatment of sinusitis with bromelain. Another characteristic of bromelain is its ability to reduce the thickness of mucus in the respiratory system, which is beneficial for asthma and all inflammatory and infectious respiratory disease (Schaefer 1985). In addition, bromelain has been shown to positively affect white blood cells and the immune response, which is beneficial for upper respiratory infections such as pneumonia (Desser 1994, Kelly 1996, Munzig 1995).

N,N-Dimethylglycine (DMG): N,N-Dimethylglycine has been widely researched in both humans and animals. DMG has been found to increase energy and enhance immune function (Barnes 1979, Graber 1981, Kendall 2000, Reap 1990, Walker 1988). In a double-blind study, Graber (1981) showed that DMG has a protective and therapeutic effect in people with pneumonia. DMG also can help the body to eliminate toxins that may predispose and cause the upper respiratory infections (Kendall 2003).

Chinese herbal medicine/acupuncture

General considerations/rationale

Pneumonia results from Wind and Heat leading to Yin and Qi deficiency in the Lungs. Wind is thought to blow the pathogen into the body; the pathogen then attacks the Lung. This causes Heat or inflammation in the Lung. The

Lung Qi and Yin become damaged by the pathogen. Initially, the cough is strong, as the body's defenses are strong, but as the condition becomes chronic, the Lung Qi is depleted and the cough becomes weaker. As the Yin, or fluids, becomes damaged, the cough becomes dry and hacking and potentially chronic if the Yin is not replenished.

Appropriate Chinese herbs

Anemarrhena (Zhi mu): Has exhibited inhibitory effects against multiple strains of bacteria (Yao Xue Qing Bao Tong Xun 1987).

Apricot seed (Xin ren): Contains amygdalin. This compound increases phagocytic activity of Kupffer's cells in the respiratory tract of mice (Li 1991). This helps to clear pathogens from the trachea, bronchi, and alveoli. It also has expectorant and antitussive effects (Zhang 1991).

Citrus (Chen pi): Has expectorant effects (Huang 1999).

Fritillaria bulb (Chuan bei mu): Was shown in one experiment to decrease coughing in mice that were exposed to ammonia. It also has an expectorant effect (Zhu 1992).

Houttuynia (Yu xing cao): Possesses antimicrobial effects. It is useful against both bacteria and some viruses (Zhong Yao Xue 1998). It increases phagocytic activity of white blood cells (Xin Yi Yao Xue Za Zhi 1973), which can help to clear pathogens. In one trial it was used in human patients with pneumonia. Response to herbal therapy in this trial was considered excellent (Zhong Hua Nei Ke Za Zhi 1963).

Gypsum (Shi gao): Increases the phagocytic activity of macrophages (Zhong Yao Xue 1998), which helps to clear the pathogen from the respiratory tract.

Licorice (Gan cao): Contains glycyrrhizin, which has been shown to inhibit various viruses (Zhu 1996). Licorice also has antibacterial properties (Zhong Yao Zhi 1993). In addition, it has antitussive and expectorant effects, as was demonstrated in experiments involving guinea pigs. It is thought to act on the central nervous system to mediate the cough suppressant effects (Zhong Yao Yao Li Yu Ying Yong 1983).

Morus bark (Sang bai pi): Has antitussive actions (Zhong Yao Xue 1998).

Ophiopogon (Mai men dong): Has antibacterial properties (Zhong Yao Xue 1998). It also enhances mucociliary clearance rates and decreases the secretion of mucus in the respiratory tract (Tai 2002).

Perilla seeds (Su zi): Decrease coughing. In one trial 40 patients with persistent cough were treated with perilla seeds. Sixty-two percent had excellent results and 37% had some improvement (Zhong Yao Tong Bao 1986).

Poria (Fu ling): Enhances cellular immunity. In one experiment it increased the phagocytic efficacy of macro-

phages in mice (Lu 1990). It also has direct antibacterial effects (Nanjing College of Pharmacy 1976).

Rhubarb (Da huang): Contains emodin, rhein, and aloe-emodin, which have antibiotic effects (Zhong Yao Xue 1998). It inhibits both aerobic and anaerobic bacteria (Zhao 1999, Yang 1997). Furthermore, it has demonstrated antiviral effects (Xie 1996). In addition to the direct activity against pathogens, it also enhances immunity. Rhubarb has been shown to decrease endotoxin-induced secretion of interleukin 6 by pulmonary macrophages, which helps protect the lungs from damage (Miao 1998). It has been shown to increase phagocytic activity by macrophages (Zhang 1997).

Trichosanthes root (Tian hua fen): Shows antimicrobial effects against a variety of bacteria and viruses (Zhong Yao Yao Li Yu Ying Yong 1983).

Acupuncture

Acupuncture can be used to help stop coughing, clear phlegm, decrease inflammation, and stop wheezing. In one trial, 106 people with chronic cough and asthma were treated by acupoint injections at BL13, CV22, Lu 1, CV17, and St 36. Three to 4 acupoints were used per treatment. Forty-six percent experienced significant improvement and 44% had some improvement (Dai 1991).

Homotoxicology

General considerations/rationale

Pneumonia represents an Inflammation Phase disorder of the respiratory tract. It can occur as a progressive vicariation as homotoxins injure delicate pulmonary tissue. This can occur due to overwhelming of the organism's greater defenses, particularly the upper respiratory tree. Failure to trap homotoxins and expel them by the action of the mucosa and local immune barriers leads to the necessity for inflammatory actions. Inflammation localizes and destroys many homotoxins, but it can do further damage to the organism as well.

The clinician should not forget that pneumonia can also occur as a regressive vicariation. When homotoxins become trapped and alter the matrix, tissue, and cells, the body may require inflammation so that damaged tissues can be liquefied and removed for later repair. Bacteria may gain access to compromised tissues and set up bacterial infections. It is possible that such bacterial infections may actually assist the body in freeing homotoxins. Pneumonias resulting from Deposition, Impregnation and Degeneration phase diseases may be quite difficult to treat and may well require allopathic medications to preserve a patient's life. As with all biological therapy, the long-term approach to deeper cases involving Impregnation, Degeneration and Dedifferentiation phases is indicated.

Antihomotoxic medications are used to speed excretion and activate the body's greater defense mechanisms. In this phase the practitioner should select those remedies that are indicated based upon classical homeopathic prescribing. These consist of the symptom remedies and homaccords. Each of these is discussed below. Simple detoxification using Heel's Detox Kit, which consists of *Nux vomica* homaccord, *Berberis* homaccord, and *Lymphomyosot*, is helpful after removing the patient from the area of contamination. Such homotoxicoses usually respond fairly rapidly.

Inflammation Phase homotoxicoses, such as pneumonia, result when the offending homotoxin cannot be adequately excreted or inactivated, resulting in further damage to the mucosal elements. Inflammation can occur in cases of more chronic irritation from harsh chemicals and particulates, or in the instance of overwhelming damage from exposure to homotoxins. Disruption of the mucosal barrier leads to invasion and activation of cellular and humeral elements of the immune system. The inflammatory reaction is an important response that is necessary to properly remove debris and bacterial endotoxins; however, excessive inflammation sets the stage for deeper homotoxicoses and pathology.

Serious inflammation can quickly cause progressive vicariation to the Degeneration Phase. Fever often occurs in this phase and should not be interfered with unless it is life threatening. Fever activates the immune elements, makes tissue inhospitable to pathogens, and assists in removing trapped homotoxins from the area. When properly selecting antihomotoxic medications, the patient will often be found to develop a febrile response and this is generally a good prognostic sign. This happens frequently with agents such as *Engystol-N*, *Echinacea compositum*, and *Tonsilla compositum*.

Inflammation Phase diseases are treated by selecting the proper symptom remedy, supporting tissue repair and drainage, and providing adequate support to the patient's efforts at recovery. Antibiotics may be needed but may cause progressive vicariation by their action of releasing increasing amounts of endotoxins into the environment, as well as damaging mitochondria and other cellular organelles (Ouedraogo, et al. 2000; Yu, et al. 2004; Sourdeval, et al. 2006). If antibiotics are necessary, the practitioner should realize that an Impregnation or Degeneration phase disorder will often result and steps should be taken to support the patient by administering proper remedies to help reverse these states.

Deposition Phase homotoxicoses are generally subclinical and asymptomatic, and pneumonia may develop through the process of regressive vicariation into the Inflammation Phase. The body's defenses deposit homotoxins into the large connective tissue volume of the lungs and associated tissues. Two common clues to the presence

of Deposition Phase disease are the presence of obesity or pigmentary skin lesions. In patients suspected of being in this phase, the use of *Solidago compositum*, *Galium-Heel*, *Lymphomyosot*, and *Placenta compositum* actually drains away and cleanses the deeper matrix, commonly resulting in regressive vicariation and the appearance of inflammatory conditions such as pruritus, cough, or oculonasal discharges. All of these results represent desirable healing on the part of the patient's immune system. It may be that intercepting homotoxicosis in this phase prevents or delays the onset of Impregnation disorders. Because Deposition Phase diseases are more easily treated than those of the Impregnation Phase—which lie on the other side of the biological divide—clinicians should strive to begin biological therapy before the patient's disease progresses. Research into this theory may yield several very valuable techniques for the veterinarian's wellness practice.

Impregnation Phase disorders frequently involve the respiratory system and represent difficult conditions, which often frustrate owners and veterinarians alike. Allergic pneumonia, such as pulmonary infiltrates of eosinophils, and viral infections are common examples of Impregnation Phase homotoxicoses. Because the homotoxins present in this phase have altered normal structures such as enzymes and receptor sites, the cell's ability to repair and change its condition are sorely affected. Conventional therapy involves avoiding allergens, suppressing immune response, and hyposensitization. Many patients gradually worsen as the condition becomes more degenerative and as damage accumulates from use of allopathic agents. Biological therapy in these conditions involves deep detoxification and matrix repair and drainage. When this is done properly, it can yield surprisingly good results as the body undergoes regressive vicariation in its attempt to repair chronic disease states. Organ-building therapy and energy metabolism are critical components as well. The *compositae* class of antihomotoxic drugs plays an important role here and in all phases that follow this one.

Pneumonia can result from degradation of the host defenses in Degeneration Phase conditions such as collapsing trachea, chronic obstructive disease, emphysema, bronchiectasis, and pulmonary fibrosis. Rapid patient demise may occur and aggressive therapy using an integrative approach is indicated. Allopathic drugs are needed to save the patient's life and produce adequate comfort for proper rest and rehabilitation. Biological therapies help the patient become stronger and repair damage from both disease and iatrogenic factors. Degeneration Phase cases may give surprisingly good responses in some conditions when approached over long periods of time with *compositae* class antihomotoxic medicines, good nutrition, and client education. Patients that respond will likely remain with abnormal function, but their conditions can be greatly improved.

Both authors find that autosanguis therapy is an essential component of biological therapy for many respiratory diseases, including pneumonia. New practitioners should read Chapter 34 in this text on autosanguis therapy and develop some comfort with this procedure. Many cases of chronic respiratory disease will not make any progress until autosanguis is performed. An oral version of autosanguis can be done, but in the hands of the authors does not appear to work as well as the injectable form.

Appropriate homotoxicology formulas

Obtaining an excellent working knowledge of classical homeopathic remedy selection greatly assists clinicians as they design treatment protocols for pneumonia. A detailed discussion of these protocols is beyond the scope of this text. In many cases, recovery is so rapid that both client and practitioner are happily surprised when the proper homeopathic remedy is chosen and applied. In other cases, the response is slower. The following are only superficial descriptions of antihomotoxic medicines; deeper study will clarify many of their roles as the biological therapist gains more experience (Bellavite, et al. 2006). Note that the areas of application for specific antihomotoxic medicines are included in their description.

Aconitum homaccord: An initial remedy used in Inflammation Phase conditions that is useful for fever, chills, hot skin, painful/hard coughs, and influenza-like conditions. It is indicated in fearful cases (Reckeweg 2000).

Abropermol: Contains Abrotanum, which can be useful in chronic pleurisy with effusion and other exudative processes, including the after-effects of chest surgery for hydrothorax or empyema. Difficult respiration and a dry, persistent cough, plus sensitivity to cold air, are characteristic of this remedy. Nitricum acidum is contained in this remedy for mucosal and respiratory conditions (Reckeweg 2002).

Apis homaccord: Treats pulmonary edema.

Arnica-Heel: Contains many agents that are active in respiratory conditions, such as Bryonia (inflammation and pleuritis), Mercurialis perennis (influenza and sepsis), Eupatorium (influenza with intermittent fever), and Solanum (worsening after wet weather) (Reckeweg 2000).

Belladonna homaccord: An Inflammation Phase remedy that is used for focal, intensely inflamed lesions and all septic conditions such as septic pneumonia. Also used for acute phases of canine distemper (pneumonia, seizures, and vocalization) and bloody sputum (Macloed 1983, Reckeweg 2000).

BHI-Cough: Useful in mild cases of viral respiratory infections (Heel 2002).

Bronchalis-Heel: A major symptom remedy that is useful in bronchitis and smoker's catarrh (secondhand smoke injury in pets living in smoking households). Contains many major homeopathic respiratory remedies including Belladonna, Lungwort, Kalium stibyltartaricum, Kreosotum, Ipecacuanha, Lobelia, Hyoscyamus, and Bryonia.

Bryaconeel: A very useful remedy containing Bryonia, which is indicated for inflammation of serous membranes, bronchial cough with chill following acute inflammation of the respiratory organs, pleura, and peritoneum. There are often catarrhs of the larynx and of the trachea with hoarseness, accumulation of tough mucus with a dry cough, constriction of the chest, and pleuritic pains with deep inspiration. Bryaconeel is often useful in pleurisy accompanied by pneumonia (Reckeweg 2002). Bryonia is common to *Bronchalis* and *BHI-Bronchitis*, *Echinacea compositum*, and *BHI-Inflammation*. Other ingredients are Aconitum (acute febrile diseases and influenza) and Phosphorus (bronchopneumonia, nighttime cough, bloody expectorate, and diseases of the lung and larynx) (Reckeweg 2000). This remedy is very useful in the authors' clinics in treatment of chronic obstructive and geriatric lung diseases involving chronic cough. May be used long term.

Chelidonium homaccord: Contains Lycopodium for serious inflammation of the respiratory organs. This is especially helpful in cases of pneumonia that reach a dangerous stage, when expectoration is difficult to expel, is possibly purulent and yellow or greenish-yellow and offensive, and in many cases is attributable to a liver dysfunction. The Chelidonium component is helpful in right-sided pneumonia, which may occur as a consequence of liver disturbance (Reckeweg 2002). This remedy also contains Belladonna.

Coenzyme compositum: Used in chronic diseases to activate energy metabolism and after therapy with allopathic medications that damage mitochondrial function (antibiotics).

Drosera homaccord: The main constituent, Cuprum aceticum, is indicated for whooping-cough-like conditions, bronchiolitis, bronchial asthma, spasmodic coughing fits, and smooth muscle cramping with or without seizures (Macloed 1983, Reckeweg 2000).

Dulcamara homaccord: Used for conditions that worsen after wet weather, rhinitis, neuralgia and fever, and tonsillitis.

Echinacea compositum: An important Inflammation Phase remedy. Also indicated in Impregnation Phases marked by recurring infections. Used as a natural antibiotic in bacterial and viral conditions such as tonsillitis, bronchitis, and pneumonia. Contains major remedies consisting of Echinacea, Aconitum, Sanguinaria, Sulfur, Baptista, Lachesis, Bryonia, Eupatorium, Pula-

tilla, Mercurious sublimatus, Thuja, Influenzium nosode, Phosphorus, Cortisonum, Streptococcus nosode, Staphylococcus nosode, Phytolacca, Zincum, Gelsemium, Hepar sulfuris, Rhus tox, Arnica, Arsenicum, Argentum, and Euphorbium (Reckeweg 2000).

Engystol N: Used for viral infections through the action of Vincetoxicum and Sulfur. Excellent in asthma in cats and in pneumonia. This remedy is not antiviral, but it directly stimulates immune function (Ben-Yakir 2004; Oberbaum, et al. 2005; Enbergs 2006).

Euphorbium compositum and nasal spray: Has antiviral activity. A mainstay remedy that is extremely useful in chronic rhinitis and sinusitis in cats and dogs.

Galium-Heel: A phase remedy in all phases from Deposition through Degeneration due to its draining effects on the matrix as well as its ability to improve and activate the greater defenses. A main remedy for any chronic disease.

Glyoxal compositum: Used for chronic diseases in the Degeneration and Dedifferentiation phases. Decouples homotoxins from receptors and other proteins such as enzymes.

Gripp-Heel: Provides excellent support of immunity in viral infections such as influenza and influenza-like syndromes. Used frequently by the authors in feline upper respiratory cases, bronchopneumonia, and some viral tracheobronchitis cases.

Hepar compositum: Provides liver support. Part of the deep detoxification formula for chronic diseases. Contains Lycopodium, which may be useful in cases of allergic rhinitis (Colin 2006).

Husteel: Used for coughs, chills, colds, spasmodic bronchitis, bronchopneumonia, and pleurisy. The cough characterizing this formula is more dry and irritating. Husteel is often selected for cardiac coughs in older patients.

Lymphomyosot: Provides lymph drainage and support.

Mucosa compositum: Provides repair and drainage of the mucosal tissues. Useful as a phase remedy in Degeneration Phase diseases and following recovery from illness. Also may assist in returning mucosal elements to normal after iatrogenic damage to the gut lining following antibiotic therapy.

Naso-Heel: A main antihomotoxic medicine for rhinitis and sinusitis that is acute or chronic in nature.

Natrium homaccord: Treats chronic catarrhal rhinitis.

Phosphor homaccord: Treats pulmonary parenchymal disorders, laryngitis, and bleeding tendencies. Phosphorus has proved its worth in pneumonia (orally or injected, in the potencies 10, 30, 200 and 1,000 times) (Reckeweg 2002). This component is also common to *Apis compositum*, *Bryaconeel*, *Echinacea compositum*, *Galium-Heel*, *Gripp-Heel*, *Mucosa compositum*, *Naso-Heel*, and *BHI-Bleeding*.

Pulsatilla compositum: A remedy for regulation rigidity and nasal and mucosal catarrhal reactions. May assist in reversing damage from corticosteroids (Cortisonum aceticum). Contains Pulsatilla and Sulfur, which is commonly used in human homeopathy for allergic rhinitis (Colin 2006). Inflammation may suddenly appear following use of this formula, and support of patient functions through *Traumeel S*, *Echinacea compositum*, *Tonsilla compositum*, and *Engystol N* may prove helpful in completing the inflammatory reaction without doing further iatrogenic damage from allopathic drug administration.

Tartepedreel: Treats bronchial coughs, bronchial asthma, and prolonged coughing, especially when catarrhal respiratory conditions exist (Reckeweg 2000).

Tonsilla compositum: An important phase remedy for Impregnation and Dedifferentiation conditions. Supports the endocrine and immune systems in chronic disease.

Traumeel S: Treats inflammatory conditions anywhere in the body, as well as sinusitis and rhinitis. Useful in regulation rigidity. *Traumeel S* is important after regressive vicariation following use of *Pulsatilla compositum*. It is used intermittently in many cases to reduce inflammation and improve patient comfort and healing.

Spascupreel: May soothe coughs associated with bronchospasm by relaxing smooth muscles.

Ubichinon compositum: Contains Anthracinon, which has strong indications in affections of the lungs, pleurisy, and pneumonia and respiratory illness, where there is effusion in most cases. The ingredient Ubiquinone (Coenzyme Q10) is useful in chronic mucosal inflammations and suppurations with excoriating secretions, septic cold infections, descending bronchitis, febrile pneumonia, asthmatic attacks, and in patients with persistent nocturnal cough, particularly when provoked by movement (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Bronchus/lung and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Quercetin: 50 mgs for every 10 pounds of body weight SID.

Bromelain: 100 mgs for each 25 pounds of body weight, with food.

DMG: Liquid—one-half ml per 25 pounds of body weight (maximum, 2 mls); tablets—125 mg—1 tablet for every 40 pounds of body weight (maximum, 3 tablets).

Chinese herbal medicine/acupuncture

H23 Pneumonia: 1 capsule per 10 to 20 pounds twice daily for 2 to 4 weeks after signs have resolved, depending upon the severity of the pneumonia. In chronic cases,

therapy may be continued indefinitely. This formula is indicated for pneumonia of various etiologies (bacterial, viral, eosinophilic, allergic) as well as kennel cough and bronchiopneumonitis. It can be combined with antibiotics or steroids if needed.

In addition to the herbs cited above, H23 Pneumonia also contains glehnia root (Sha shen), lophatherum (Zhu ye), mulberry leaves (Sang ye), pseudotellaria (Tai zi shen), and trichosanthes seeds (Gua lou ren) to increase the efficacy of the formula.

Schoen (1994) has recommended the following acupuncture points for pneumonia in horses: BL13, BL14, BL15, BL17, GV11, GV12, GV14, GV16, SP20, SP 1, GB 1, and LI16.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Echinacea compositum as an initial injection: In acute viral pneumonias, Gripp-Heel plus Engstol N are indicated. Chronic cases may benefit from an autosanguis therapy with Tonsilla compositum. The following remedies can be considered for oral therapy: Abropernol, Arnica-Heel, Phosphor homaccord, BHI-Inflammation, Ubichinon compositum, and Chelidonium homaccord for liver support. The selections may be mixed in an oral cocktail, often with the remains of the syringe which was used for the autosanguis therapy, and given 2 to 4 times daily, or as needed to control the symptoms.

Deep detoxification formula: Used in refractory or recurrent cases. Contains Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum, and Mucosa compositum; given orally every 3 days for long periods of time.

SINUSITIS AND RHINITIS

Definition and cause

Sinusitis and rhinitis occur in both dogs and cats and can be acute or chronic. The most common underlying causes are infectious (bacterial, viral, and fungal) and are more often secondary. In cats, sinusitis is most commonly caused by viral infections (see FIV and FIP in Chapter 18, Infectious Diseases). Noninfectious causes are secondary to allergy, trauma, foreign body, parasites, and neoplasia. Common signs are sneezing, nasal discharge, and bleeding (Davidson 2000, Forrester 1997, Gaskell 1999, Wolf 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Antibiotics are the treatment of choice for primary and secondary infections. Corticosteroids and antihistamines are recommended when there is an underlying allergic component. Antifungal drugs, both systemic and local, are recommended for fungal infestations. Neoplasia requires radiation therapy, chemotherapy, and surgical interventions. Chronic and nonresponsive cases may also require surgical intervention (Gaskell 1999, Mason 2003).

Anticipated prognosis

The prognosis is related to the underlying cause. Trauma and foreign bodies carry a good prognosis, while chronic infection, infestation, and neoplasia carry a more guarded prognosis (Mason 2003).

Integrative veterinary therapies

The reduction of inflammation and the enhancement of toxin elimination is the focus of the integrative approach to sinusitis. Immune system organs also require support when there is an allergic component involving an immune reaction to allergens and the sinuses are the target tissue. With chronic irritation, local bacteria can invade, leading to a more chronic, moist form of sinusitis.

When nutritional, herbal, and biological therapies are added to the prevention and treatment protocols, cellular elimination of wastes is encouraged, cellular inflammation is reduced, and secondary invaders such as bacteria are more controlled by a healthier, more balanced immune mechanism.

Nutrition

General considerations/rationale

Therapeutic nutrition adds nutrient and immune gland support. In addition, nutrients can help decrease local

cellular inflammation while improving elimination of toxins.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal and thymus supply the intrinsic nutrients that reduce cellular inflammation, thereby helping to improve organ function. This helps to spare these organs from cascading inflammation and eventual degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

Bromelain: Bromelain is a proteolytic enzyme that comes from pineapples. In addition to being an enzyme, it has anti-inflammatory properties and is beneficial for the upper respiratory system (Taub 1966). In a double-blind study, Ryan (1967) showed an improvement in the treatment of sinusitis with bromelain. Bromelain also can reduce the thickness of mucus in the respiratory system, which is beneficial for sinusitis (Schaefer 1985). In addition, bromelain has been shown to positively affect white blood cells and the immune response, which can help to prevent sinusitis from becoming secondarily infected and chronic (Desser 1994, Kelly 1996, Munzig 1995).

Quercetin: Quercetin is a flavonoid that has potent antioxidant properties. Quercetin also has been proven to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). This antihistamine attribute is beneficial in the treatment of allergic conditions and can improve breathing in more compromised conditions such as pneumonia. Quercetin inhibits the enzyme lipoxygenase, which contributes to the clinical signs associated with asthma (Welton 1986).

N,N-Dimethylglycine (DMG): N,N-Dimethylglycine has been widely researched in both humans and animals. DMG has been found to increase energy and enhance immune function (Barnes 1979, Graber 1981, Kendall 2000, Reap 1990, Walker 1988). In a double-blind study, Graber (1981) showed that DMG has a protective and therapeutic effect in people with pneumonia. DMG also can help the body to eliminate toxins that may predispose and cause the upper respiratory infections (Kendall 2003).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM, sinusitis and rhinitis are due to Damp and Heat in the Lung and Liver (Handbook of Traditional Chinese Medicine Practitioner 1987).

Although it is not intuitive to Western practitioners, the Liver controls the face. The meridians of the Liver channels cover the face so Liver pathology can affect the face and sinuses. The Lung opens to the Nose and Sinuses so Dampness in the Lung refers to the mucoid secretions that block the nasal passages and fill the Sinuses. Heat refers to the inflammation, which may be a result of the interac-

tion between the immune system and secondary invaders i.e., bacteria, viruses and fungi, a reaction to foreign bodies or neoplastic cells, or a result of allergic reactions. Treatment goals include decreasing the signs associated with the condition as well as treating the underlying cause of the disease.

Appropriate Chinese herbs

Angelica (Bai zhi): Has been shown to have anti-inflammatory effects in mice. In addition, it has analgesic properties (Zhong Guo Zhong Yao Za Zhi 1991).

Atractodes (Cang zhu): Has shown efficacy against viruses, bacteria, and fungi (Zhong Yao Xue 1998).

Magnolia flower (Xin yi hua): Has been shown to be quite effective for rhinitis and sinusitis in several studies. It decreases mucous secretion, reduces inflammation, and is effective against several bacteria that may cause secondary infections, such as staphylococcus and streptococcus (Zhong Yao Cai 1990, Zhong Yao Xue 1998, Zhong Yao Tong Bao 1985).

Pinellia (Ban xia): Has demonstrated anti-inflammatory effects (Shen 1998).

Schizonepeta (Jing jie): Has analgesic properties (Zhong Yao Cai 1989). Humans with sinusitis report headaches so it is reasonable to assume animals suffer the same pain.

Scutellaria (Huang qin): Has demonstrated antibacterial effects against bacteria, viruses, and fungi (Zhong Yao Xue 1988, Wang 2000). It also decreases inflammation related to allergic reactions in mice (Kubo 1984).

Rhinitis has been recognized by the World Health Organization as being responsive to acupuncture (World Health Organization list of common conditions treatable by Chinese medicine and acupuncture). One trial studied 45 people with allergic rhinitis and found that acupuncture was better at controlling symptoms than antihistamine therapy (Chari 1988).

Homotoxicology

General considerations/rationale

The respiratory system is a common location of pathology in veterinary patients. Homotoxins gain access directly via the airways, through hematogenous spread via the systemic circulation, and through direct traumatic incidents. The Six-Phase Table of Homotoxicology is extremely helpful in the creation of treatment plans for respiratory patients, and both the development of disease, as well as its resolution, follows this table. Hering's Law is also seen in very clear fashion while managing many of these cases.

Excretion Phase diseases occur when homotoxins first contact the mucosal elements of the respiratory system. Veterinarians in clinical settings commonly see simple, acute rhinitis and sinusitis. Exposure to harsh chemicals

(bleach, ozone, disinfectants, tobacco smoke, scented products, air pollutants, etc.) or particulates leads to direct respiratory mucosal insult and resulting physiological efforts to dilute and excrete the material. Serous and mucous secretions assist in dilution and removal of homotoxins. The epithelial, mucosal elements provide the primary barrier to invasion and damage of this system. Intimately associated with the mucosa are rich lymphatic and neurological components used in monitoring and defense. Providing support of the flushing effects of this humeral phase treats Excretion Phase conditions of the nose and sinuses.

Rhinitis and sinusitis often present to veterinarians as Inflammation Phase disorders. If inflammation is effective, such homotoxicoses demonstrate regressive vicariation to Exudation Phase homotoxicoses. This is seen clinically as the production of serous drainage following the Inflammation Phase. It is often mistaken for further symptoms of disease and is suppressively treated by antihistamines and decongestants, which act to stop or block the removal of homotoxins and thereby prevent the organism from complete healing. Such homotoxins may be deposited into tissues and lead to a clinically silent Deposition Phase conditions.

Allergic and viral rhinitis and sinusitis represent Impregnation Phase diseases and can rapidly deteriorate into Degeneration Phase diseases. This is often seen in brachycephalic, longhaired feline patients that are persistently infected by the feline herpes virus.

Treatment of all phases of rhinitis and sinusitis involves reducing homotoxin levels (providing clean, properly humidified air), correcting dehydration when present so that secretory efforts are assisted and promoted, assuring proper nutrition with attention to those nutrients which assist secretion and thin mucus as well as protect against and overly acid or oxidative environment, and providing a proper mix of exercise to stimulate lung motion and lymphatic movement and periods of rest so that damage can be repaired. Antihomotoxic medications are used to speed excretion and activate the greater defense mechanisms of the body. In this phase the practitioner should select those remedies that are indicated based upon classical homeopathic prescribing. These consist of the symptom remedies and homaccords, each of which is discussed below. Simple detoxification using Heel's Detox Kit, which consists of Nux vomica homaccord, Berberis homaccord, and Lymphomyosot, is helpful after removing the patient from the area of contamination. Such homotoxicoses usually respond fairly rapidly.

Inflammation Phase rhinitis and sinusitis result when the offending homotoxin cannot be adequately excreted or inactivated, resulting in further damage to the mucosal elements. Bacterial rhinitis and sinusitis are typical Inflammation Phase diseases. Inflammation can occur in cases

of more chronic irritation from harsh chemicals and particulates, or from overwhelming damage from exposure to homotoxins. Disruption of the mucosal barrier leads to invasion and activation of cellular and humoral elements of the immune system. The inflammatory reaction is an important response that is necessary to properly remove debris and bacterial endotoxins; however, excessive inflammation sets the stage for deeper homotoxicoses and pathology.

Serious inflammation can quickly cause progressive vicariation to the Degeneration Phase. This is common in fungal rhinitis and sinusitis. Fever often occurs in this phase and should not be interfered with unless it is life threatening. Fever activates the immune elements, makes tissue inhospitable to pathogens, and assists in removing trapped homotoxins from the area. When properly selecting antihomotoxic medications, the patient will often be found to develop a febrile response and this is generally a good prognostic sign. This happens frequently with agents such as Engystol N, *Echinacea compositum*, and *Tonsilla compositum*.

Inflammation Phase diseases are treated by selecting the proper symptom remedy, supporting tissue repair and drainage, and providing adequate support to the patient's recovery efforts. Antibiotics may be needed but may cause progressive vicariation by releasing increasing amounts of endotoxins into the environment and damaging mitochondria and other cellular organelles (Ouedraogo 2000, Yu 2004, Sourdeval 2006). If antibiotics are necessary, the practitioner should realize that an Impregnation or Degeneration phase disorder will often result, and steps should be taken to support the patient by administering proper remedies to aid in reversal of these states.

Deposition Phase homotoxicoses of the nasal cavity and sinuses are generally subclinical. The body's defenses deposit homotoxins into the large connective tissue volume of the lungs and associated tissues. Deposition Phase disorders are often subclinical and asymptomatic. Two common clues to the presence of Deposition Phase disease are obesity or pigmentary skin lesions. In patients suspected of being in this phase, *Solidago compositum*, *Galium-Heel*, *Lymphomyosot*, and *Placenta compositum* actually drain away and cleanse the deeper matrix, commonly resulting in regressive vicariation and the appearance of inflammatory conditions such as pruritus, cough, or oculonasal discharges, all of which represent desirable healing on the part of the patient's immune system. It may be that intercepting homotoxicoses in this phase prevent or delay the onset of Impregnation disorders. Because Deposition Phase diseases are more easily treated than Impregnation Phase diseases, which lie on the other side of the biological divide, clinicians should strive to begin biological therapy before the disease progresses. Research into this theory may yield several very valuable techniques for the veterinarian's wellness practice.

Impregnation Phase disorders are frequently seen involving the nasal cavity and sinuses, and represent difficult conditions that often frustrate owners and veterinarians alike. Chronic, recurring allergic issues and viral infections are common examples of Impregnation Phase homotoxicoses. Because the homotoxins present in this phase have altered normal structures such as enzymes and receptor sites, the cell's ability to repair and change its condition is sorely affected. Conventional therapy involves avoiding allergens, suppressing immune response, and hyposensitization. Many patients gradually worsen as the condition becomes more degenerative and as damage accumulates from use of allopathic agents. Biological therapy in these conditions involves deep detoxification and matrix repair and drainage, and when properly done, can yield surprisingly good results as the body undergoes regressive vicariation in its attempt to repair chronic disease states. Organ-building therapy and energy metabolism are critical components as well. The *compositae* class of antihomotoxic drugs plays an important role here and in all phases that follow this one.

Degeneration Phase conditions such as destruction of the nasal turbinates and loss of normal immune barriers, as well as destruction of cellular organelles (such as mitochondrial, Golgi apparatus, or genetic damage) represent more advanced and potentially irreversible conditions. However, some conditions may give surprisingly good responses when approached over long periods of time with *compositae* class antihomotoxic medicines, good nutrition, and client education. Patients that respond will likely remain with abnormal function, but their conditions can be greatly improved.

Cases that have progressed to the Dedifferentiation Phase are dealt with in the section on neoplasia in this text.

Both authors find that autosanguis therapy is an essential component of biological therapy for many respiratory diseases. New practitioners should read the autosanguis section in Chapter 34 and develop some comfort with this procedure. Many cases of chronic sinusitis and rhinitis will not make any progress until autosanguis is performed. An oral version of autosanguis can be done, but in the hands of the authors does not appear to work as well as the injectable form.

Appropriate homotoxicology formulas

Obtaining an excellent working knowledge of classical homeopathic remedy selection greatly assists clinicians as they design treatment protocols for rhinitis and sinusitis. A detailed discussion of these is beyond the scope of this text. In many cases, recovery is so rapid that both client and practitioner are happily surprised when the proper homeopathic remedy is chosen and applied. In other cases, the response is slower. The following are only superficial descriptions of antihomotoxic medicines, and

deeper study will clarify many of their roles as the biological therapist gains more experience (Bellavite, et al. 2006). Note that the areas of application for specific antihomotoxic medicines are included in their description.

Belladonna homaccord: An Inflammation Phase remedy that treats focal, intensely inflamed lesions and all septic conditions such as septic pneumonia. It also treats acute phases of canine distemper (pneumonia, seizures, vocalization) and bloody sputum (Macloed 1983, Reckeweg 2000).

BHI-Sinus: Useful in sinusitis cases (Heel 2002).

Coenzyme compositum: Used in chronic diseases to activate energy metabolism and after therapy with allopathic medications that damage mitochondrial function (antibiotics).

Echinacea compositum: An important Inflammation Phase remedy that is also indicated in Impregnation Phases marked by recurring infections. Used as a natural antibiotic in bacterial and viral conditions such as tonsillitis, bronchitis, and pneumonia. Contains major remedies consisting of Echinacea, Aconitum, Sanguinaria, Sulfur, Baptista, Lachesis, Bryonia, Eupatorium, Pulsatilla, Mercurius sublimatus, Thuja, Influenzium nosode, Phosphorus, Cortisonum, Streptococcus nosode, Staphylococcus nosode, Phytolacca, Zincum, Gelsemium, Hepar sulfuris, Rhus tox, Arnica, Arsenicum, Argentum, and Euphorbium (Reckeweg 2000).

Engystol N: Used for viral infections through the action of *Vincetoxicum* and *Sulfur*. Excellent in asthma in cats and in pneumonia. This remedy directly stimulates immune function (Ben-Yakir 2004; Oberbaum, et al. 2005; Enbergs 2006).

Euphorbium compositum and nasal spray: Has antiviral activity. A mainstay remedy that is extremely useful in chronic rhinitis and sinusitis in cats and dogs.

Galium-Heel: A phase remedy in all phases from Deposition through Degeneration due to its draining effects on the matrix as well as its ability to improve and activate the greater defenses. A main remedy for any chronic disease.

Glyoxal compositum: Treats chronic diseases in the Degeneration and Dedifferentiation phases. Decouples homotoxins from receptors and other proteins such as enzymes.

Gripp-Heel: Provides excellent support of immunity in viral infections such as influenza and influenza-like syndromes. Used frequently by the authors in feline upper respiratory cases, bronchopneumonia, and some viral tracheobronchitis cases.

Hepar compositum: Provides liver support and is part of the deep detoxification formula for chronic diseases. Contains Lycopodium, which may be useful in cases of allergic rhinitis (Colin 2006).

Lymphomyosot: Provides lymph drainage and support.

Mucosa compositum: Used for repair and drainage of the mucosal tissues. Useful as a phase remedy in Degeneration Phase diseases and following recovery from illness. Also may assist in returning mucosal elements to normal after iatrogenic damage to the gut lining following antibiotic therapy.

Naso-Heel: A main antihomotoxic medicine for rhinitis and sinusitis that is acute or chronic in nature.

Natrium homaccord: Treats chronic catarrhal rhinitis.

Phosphor homaccord: Treats pulmonary parenchymal disorders, laryngitis, and bleeding tendencies. Phosphorus has proved its worth in pneumonia (orally or injected, in the potencies 10, 30, 200, and 1,000 times) (Reckeweg 2002). This component is also common to *Apis compositum*, *Bryaconeel*, *Echinacea compositum*, *Galium-Heel*, *Gripp-Heel*, *Mucosa compositum*, *Naso-Heel*, and *BHI-Bleeding*.

Pulsatilla compositum: A remedy for regulation rigidity and nasal and mucosal catarrhal reactions. May assist in reversing damage from corticosteroids (Cortisonum aceticum). Contains Pulsatilla and Sulfur, which are commonly used in human homeopathy for allergic rhinitis (Colin 2006). Inflammation may suddenly appear following use of this formula, and support of patient functions through *Traumeel S*, *Echinacea compositum*, *Tonsilla compositum*, and *Engystol N* may prove helpful in completing the inflammatory reaction without doing further iatrogenic damage from allopathic drug administration.

Tonsilla compositum: An important phase remedy for Impregnation and Dedifferentiation conditions. Supports the endocrine and immune systems in chronic disease.

Traumeel S: Treats inflammatory conditions anywhere in the body, as well as sinusitis and rhinitis. Useful in regulation rigidity. Also important after regressive vicariation following use of *Pulsatilla compositum*. Used intermittently in many cases to reduce inflammation and improve patient comfort and healing.

Ubichinon compositum: Contains Anthracinon, which has strong indications in affections of the lungs, pleurisy, pneumonia, and respiratory illness, where there is effusion in most cases. The remedy Ubiquinone (Coenzyme Q10) is useful in chronic mucosal inflammations and suppurations with excoriating secretions, in septic cold infections, descending bronchitis, febrile pneumonia, and asthmatic attacks, and in those with persistent nocturnal cough that is provoked by movement (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Gingival/mouth and immune support formulas: 1 tablet for each 25 pounds of body weight BID.

Bromelain: 100 mgs for each 25 pounds of body weight, with food.

Quercetin: 50 mgs for each 10 pounds of body weight SID.

DMG: Liquid—one-half ml per 25 pounds of body weight (maximum, 2 mls); Tablets—125 mg—1 tablet for every 40 pounds of body weight (maximum, 3 tablets).

Chinese herbal medicine/acupuncture

For chronic sinusitis or rhinitis caused by allergies or bacterial, fungal, or viral infections, the authors recommend H57 Sinusitis at a dose of 1 capsule per 10 to 20 pounds twice daily. Based on our clinical observation, H57 Sinusitis helps to clear the infection in the nasal cavity and sinuses and controls secondary bacterial, fungal, and viral infections in the nasal passage.

Foreign bodies must be removed for treatment to be effective. Neoplasia must be addressed with herbs that are designed for cancerous conditions (see cancer/nasal cancer in Chapters 32 and 33).

In addition to the herbs mentioned above, H57 Sinusitis also contains, arisaema root (Dan nan xing) and leaven (Shen qu). These herbs help to enhance the functions of the herbs cited above.

Acupuncture points recommended by the authors include LI4, LI11, BL13, BL18, GV24, GV25, and GV26.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Rhinitis: Euphorbium compositum, Nasoheel, Belladonna compositum, Natrium homaccord, and BHI Allergy mixed together and given orally TID. In bacterial rhinitis add Echinacea compositum. In viral rhinitis add Engystol-N. In fungal rhinitis add Tonsilla compositum and Galium-Heel. Nebulizing or using Euphorbium nasal spray can be extremely helpful in rhinitis cases. In refractory or recurrent cases use Deep Detoxification Formula for long periods of time.

Sinusitis: Euphorbium compositum mixed with saline and used as a nose drop BID to TID. Mix a cocktail of Lymphomyosot, Belladonna homaccord, Echinacea compositum, and Engystol as orally BID to TID. In mild cases BHI-Sinus may be adequate; use TID. In refractory or recurrent cases use deep detoxification formula for long periods of time.

Chapter Fifteen

Diseases of the Urogenital System

ACUTE AND CHRONIC NEPHRITIS

Definition and cause

Acute nephritis is the sudden onset of kidney disease, usually secondary to decreased blood flow, toxins, infection, or serious inflammation of the renal tissues. Chronic renal disease is the result of a slow degeneration of the kidney and often becomes symptomatic when more than 75% of renal tissue is no longer functional. As a result, the well-known signs and symptoms of azotemia, dehydration, anemia, polydysia, and polyuria are present.

Underlying causes besides idiopathic include congenital; nephrotoxins; urinary obstruction; infectious bacterial; leptospirosis; fungal; viral; or secondary to other diseases such as cancer, kidney or bladder stones, diabetes, and Addison's disease (Adams 2003; Brown 1992; Cowgill 2003; Grauer 1995; DiBartola 1995; Krawiec 1989; Kruger 1995; Polzin 1992, 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Dietary recommendations include low-protein, phosphorus, and sodium diets with higher levels of omega-3 fatty acids. Medical therapy is directed at the loss of kidney function and minerals as well as the elevated level of blood urea nitrogen and creatinine. Water-soluble vitamins B and C are recommended due to poor appetite. Fat-soluble vitamins such as vitamin A are not recommended because of storage and elevated levels in the body.

Additional recommendations include ongoing fluid diuresis and anti-nausea drugs such as famotidine and cimetidine, potassium supplementation, phosphate binders, calcitriol to increase blood calcium levels and prevent further bone loss, erythropoietin to address the secondary anemia, and ACE inhibitors such as benazepril or enalapril for hypertension and glomerular support. Some people may elect kidney transplant surgery (Adams

2003; Brown 2000, 2003; Cowgill 2003; Grauer 2000; Gregory 1993; Jacob 2002; Mathews 2000).

Anticipated prognosis

The prognosis depends upon the damage to kidney function; the involvement of other organ diseases; and the severity of the azotemia, elevated phosphorus levels, anemia, adherence to dietary programs and continuous supportive therapy. The disease is progressive, and therefore requires continual adherence to the medical and dietary treatment plans (Adams 2003, Cowgill 2003, Syme 2003).

Integrative veterinary therapies

The veterinary literature makes it clear that there is no medicine that can restore lost nephrons; and therefore, prevention should be the main course of action for the clinician.

In a prevention-oriented approach, it is therefore important for the clinician to view and improve the body's overall metabolism because the kidney is a main receptacle for metabolic and toxic wastes. In homotoxicology, this is called second-hand homotoxicosis (see Homotoxicology, below, for a more detailed explanation). In therapeutic nutrition this is referred to as reducing the metabolic load on the kidney (see Chapter 2, Glandular Therapy, for a more detailed discussion).

Toxic wastes can arrive at the kidney from all parts of the body and can be from environmental toxicity, medications or vaccinations, chemically preserved foods, household chemicals, or toxins, etc. It is important that the clinician focus upon reducing the toxic load, preventing cascading free radicals, and improving the elimination capability of other organs responsible for toxin elimination, such as the skin, lungs, and bowel.

Chinese medicine has long seen a relationship between the Liver and the Kidney. These 2 blood-filtering organs work together to eliminate many toxins. If the Liver is

unable to remove waste material, then they remain in the circulation and arrive at the Kidney, Lung, and Skin for handling. If toxin elimination is blocked or negatively affected, then this accumulation of material leads to disease in the organ. Kidney tissue is very susceptible to the deposition and subsequent development of pathology from such toxicoses, and since the kidney has limited reparative ability, we expect to see this organ more frequently affected by inflammatory problems. This fact is borne out in clinical practice.

Integrating therapeutic nutrition, medicinal herbs, and biological therapies that address the elimination of these toxins and the reduction of inflammation is therefore important to preventing the disease and slowing organ degeneration.

Nutrition

General considerations/rationale

The nutritional approach to kidney disease adds nutrients, antioxidants, and gland support for the metabolic organs involved in urea production and metabolic waste excretion (kidney, pituitary, liver, thyroid, and adrenal glands). See Chapter 2, Gland Therapy, for a more complete discussion.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, pituitary, liver, thyroid, and kidney provide intrinsic nutrients that nourish organ cells, help neutralize cellular immune inflammation, and improve waste elimination (see Gland Therapy in Chapter 2 for a more detailed explanation).

Note: Kidney disease often involves multiple organ dysfunction and it is recommended that blood be analyzed both medically and physiologically to determine related organ involvement and disease. This allows for a more specific gland and nutritional support protocol (see Nutritional Blood Testing in Chapter 2).

Arginine: Double-blind studies in people have confirmed that arginine is beneficial in the treatment of congestive heart failure and helping to improve kidney function in these patients (Rector 1996, Watanabe 2000).

Alpha-lipoic acid: ALA is involved in mitochondrial activity and is referred to as the universal antioxidant. As a potent antioxidant, it has been proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, Coenzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Scholich 1989).

Essential fatty acids: Studies have shown that dietary essential fatty acids increase intestinal calcium absorption and assist vitamin D in decreasing urinary calcium losses (Hertz-Picciotto 2000). It has also been shown that

calcium may reduce the absorption of oxalates and may indirectly reduce the formation of kidney stones in people. Perhaps this is an area for veterinary researchers to study the increasing incidence of calcium oxalate crystals and stones in dogs and cats (Barilla 1978, Curhan 1993).

Vitamin E: Vitamin E is involved in the formation of scar tissue, and helps to reduce it. Vitamin E also has organ- and tissue-sparing properties (Myers 1982; Shklar 1982, 1987).

Vitamin B₁₂: Studies showed that people who supplemented their diets with vitamin B₁₂ had significantly reduced neuropathy and pain associated with kidney disease (Yamane 1995, Kuwabara 1999). Deficiencies of vitamin B₁₂ are also associated with anemia and decreased function of the immune system (Kondo 1998) showed that vitamin B₁₂ supplementation treats anemia.

Quercetin: Quercetin, a flavonoid, is a potent antioxidant; one of its main health benefits is its ability to help reduce inflammation (Ames 1993). Research has proven that flavonoids increase the body's level of the antioxidant glutathione, thereby helping to control, reduce, and eliminate inflammation at the pre-disease level. Several studies have indicated that flavonoids can help regulate the immune response and have a controlling effect of over-reactivity of immune-mediated cells such as T- and b-lymphocytes, mast cells, and neutrophils (Middleton 1986, 1992; Myhrstad 2002; Panthong 1994; Roger 1998).

Chinese herbal medicine

General considerations/rationale

Renal failure is considered to be Yin and Yang deficiency in the Kidney and Spleen, accompanied by internal toxin accumulation. Yin and Yang deficiency of the Kidney is easily translated into loss of Kidney function in Western terms. Yang is the energy of the Kidney to perform its functions, and the loss of Yin can be thought of as dehydration in modern terms. The Spleen functions to make Blood, so a deficiency in the Spleen explains the anemia seen in chronic renal failure. The Spleen also controls the muscles, so a deficiency in the Spleen can lead to muscle wasting and weakness. Toxin accumulation translates into uremia.

Treatment is aimed at treating the deficiency of the Kidney and strengthening the body.

Appropriate Chinese herbs

Astragalus (Huang qi): Useful in cases of renal deficiency. It decreases the amount of protein present in the urine (Zhong Guo Sheng Li Ke Xue Hui, Di Er Ci Hui 1963). It has been shown to decrease blood pressure in dogs, rabbits, and cats, and may be useful in cases of renal secondary hypertension (Guo Wai Yi Xue Can Kao Za Zhi 1977). It also improves renal function in humans with glomeronephritis (Zhong Xi Yi Jie He Za Zhi 1987).

Atractylodes (Bai zhu): Protects the kidneys. It prevents degenerative changes, including sclerosis of renal corpuscles and the widening of Bowman's space (Jing 1997). It counteracts anemia by stimulating the bone marrow. It stimulates both the erythroid-colony-forming unit (CFU-E) and the burst-forming unit (BFU-E). These units are responsible for enhancing differentiation of red blood cells (Hou 1999).

Codonopsis (Dang gui): Can help in renal patients with anemia because it can increase the packed cell volume (Zhong Yao Xue 1998). Hypertension is common in cases of renal failure. Codonopsis can lower blood pressure yet increase cardiac output, and thus improve tissue blood perfusion (Zhong Yao Xue 1998).

Ginger (Sheng jiang): Inhibits thrombus formation (Gao 1996). We now know that anti-thrombin III is lost in the urine in advanced cases of renal failure, which can lead to thromboembolic disease. The addition of ginger to the supplement may help prevent this complication.

Jujube (Da zao): Increases body weight muscle strength in mice (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1985).

Oyster shell (Mu li): Has been shown to have efficacy in preventing gastric ulcers (Nie 1994). Because uremia has been shown to cause ulceration of the stomach, addition of this herb to supplements may help prevent ulcers from developing.

Peach pit (Tao ren): Helps prevent thromboembolism by helping to dissolve thrombi (Shang Hai Zhong Yi Yao Za Zhi 1985).

Red peony (Chi shao): Has been shown to have a strong anti-thromboembolic action. Red peony was able to prolong the prothrombin time and thrombin time in experiments involving rabbits (Deng 1991). It has been shown to inhibit thrombin and both the intrinsic and extrinsic coagulation systems (Wang 1990). Red peony inhibits platelet clumping in humans and rats (Lui 1983, Ji 1999).

Rhubarb (Da huang): Rhubarb preparations have been shown to decrease BUN and creatinine levels in humans (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou 1994). Rhubarb was shown to prevent progression of the condition in rats with hyperplastic glomerulonephritis (Li 1999).

White peony (Bai shao): Decreases the secretion of gastric acid (Zhong Yao Zhi 1993), which may help to reduce the incidence of uremic gastritis. It also has mild anti-thrombotic abilities. It decreases the aggregation of platelets (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Acute nephritis is an Inflammation Phase disorder, while chronic nephritis is usually an Impregnation or Degenera-

tion phase disorder. In acute nephritis the organism's defense mechanisms mobilize to destroy homotoxins present in the area. In chronic nephritis the binding of homotoxins and resulting deterioration of protein structures negatively impacts the organism's ability to repair tissues, metabolize homotoxins, and excrete them, thereby hindering the defense mechanisms. The blockage of enzyme function and production is particularly important in this phase.

The clinician is well advised to search out distant causes of the reactions noted because often the kidney is involved in "secondhand" homotoxicoses, since homotoxins arrive from other areas and damage the delicate renal tissues. Homotoxins may be ingested or absorbed through various epithelial surfaces (drugs, heavy metals, pathologic bacteria, viruses, fungi, etc.). They may also be generated within the organism at a distant site, such as in periapical dental abscesses, chronic periodontal disease, and tumors. Therefore, in considering the genesis of any homotoxicoses involving the kidney, one needs to tend to the health of the immune system, gastrointestinal tract, respiratory system, skin, and particularly the liver.

Appropriate homotoxicology formulas

Aesculus compositum: Improves renal blood flow (Reckeweg 2000).

Apis compositum: Treats acute and chronic glomerulonephritis and nephrosis. For readers who own the Biotherapeutic Index, *Apis compositum* is listed as *Albumoheel* (Reckeweg 2000).

Apis homaccord: Used for renal edema and proteinuria.

Atropinum compositum: Treats painful spasms, urolith passage, renal colic.

Belladonna homaccord: Treats hyperemic inflammations, congestion, and acute painful issues. It also supports the immune system through Echinacea (Heel 2003).

Berberis homaccord: Treats inflammation of bile ducts and urogenital tract (Heel 2003). Berberines contained in this formula have demonstrated anti-inflammatory effects (Ikram 1997; Ivanovska, Philipov 1996).

BHI-Inflammation: Formerly contained *Staph* and *Strep nosodes* as well as host-defense-supporting Echinacea. It reduces inflammation similar to *Traumeel*. Note that the new product on the U.S. market has omitted the nosodes and seems to be less effective than its predecessor. The authors frequently use a combination of *Traumeel* and *Echinacea compositum* in its place.

BHI-Kidney: Used for renal pain, dysfunction and renal colic, hematuria, and albuminuria.

BHI-Spasm-Pain: Treats painful spasms associated with renal or bladder pathology.

BHI-Uri-Control: Used for minor urinary pain, increased urgency, and mild incontinence.

Cantharsis homaccord: Treats irritation of the urinary tract with painful, burning urination and a frequent need to urinate.

Coenzyme compositum: Supports energy metabolism functions.

Echinacea compositum: Stimulates the defenses in infection.

Engystol N: Provides support of the immune system.

Galium-Heel: Treats proteinuria and Deposition, Impregnation, and Degeneration phase disorders. Provides cellular detoxification and drainage.

Lymphomyosot: Used for lymph drainage and tubular swelling.

Mucosa compositum: Supports renal epithelial tissues. Contains the E. coli nosode. It is useful in recovery phases, as well as Degeneration Phase homotoxicoses.

Phosphor comaccord: Provides support for the kidney.

Populus comaccord: Treats recurring painful urination and burning, as well as urine dribbling.

Rauwolfia compositum: Supports cardiac function. Contains Ren suis for kidney function (Reckeweg 2000).

Reneel: Treats urinary passage inflammation, particularly in acute phases, and is used to detoxify urinary tissues (Reckeweg 2000).

Schwef-Heel: Used in cats per the Veterinary Guide (Heel 2003).

Solidago compositum: Provides drainage and support or urogenital tissues, especially in the Deposition, Impregnation, Degeneration, and Dedifferentiation phases (Reckeweg 2000).

Spascupreel: Treats spasms and pain.

Tonsilla compositum: Stimulates the defenses and helps activate enzymes through catalyst activity. Used in chronic cases that may have immune challenges.

Traumeel S: Used for hematuria and bladder inflammation and in regulation rigidity cases that are stuck in the Inflammatory phase. The components of *Traumeel S* directly affect the immune system (Bellavite 2006).

Ubichinon compositum: Provides deep support of mitochondrial function.

Authors' suggested protocols

Nutrition

Kidney and pituitary support formulas: 1 tablet for every 25 pounds of body weight BID.

Liver and thyroid support formulas: One-half tablet for each 25 pounds of body weight SID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

Vitamin E: 100 IU for each 25 pounds of body weight.

Arginine: 50 mg per 10 pounds of body weight daily.

Omega-3,6,9: 1 capsule for each 25 pounds of body weight with food.

Quercetin: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine

Kidney Guard: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, this formula contains aconite (Fu zi), angelica radix (Dang gui), bamboo shavings (Zhu Lu), carthamus (Hong hua), coptis (Huang lian), eupatorium (Liu yue xue), fossil bones (Long gu), licorice (Gan cao), ligustrum (Nu zhen zi), ophiopogon (Mai men dong), perilla seed (Zhi Shu zi), and pseudotellaria (Tai zi shen). This combination of herbs helps improve renal blood circulation, regulate blood pressure, eliminate toxic byproducts, stimulate the appetite, and improve hydration.

There are no reported Western trials on the effect of acupuncture on serum BUN, phosphorus, or creatinine levels. Practitioners of TCM have used acupuncture for centuries and feel that it helps. Some recommended points include CV3, CV4, SP6, BL23, GV4, GV20, ST36, and Baihui (Handbook of TCM Practitioner 1987).

Homotoxicology

Acute nephritis: Berberis homaccord, Belladonna Homaccord, Lymphomyosot, mixed together and given BID PO. Solidago compositum given every 3 days.

Chronic nephritis: Solidago compositum, Coenzyme compositum, Ubichinon compositum every 3 days orally or by injection into relevant acupuncture points. Berberis homaccord and Galium-Heel given BID PO.

GLOMERULAR NEPHRITIS

Definition and cause

Glomerular nephritis is the presence of immune complexes that cause immune-mediated glomerular damage. Inciting causes can be genetic predisposition, infectious agents, toxins, neoplasia, any sustained inflammatory process, or secondary to other disease processes such as Lyme disease (Dambach 1997). In dogs, common causes are secondary to tick-borne disease, and in cats, secondary to FIP or FeLV. This immune-mediated inflammatory process sets off a cascade reaction that can result in a deposition of proteinaceous material, cellular infiltrative (lymphocytes, macrophages), or swelling and thickening of the glomeruli interfering with kidney function (Cook 1996; Finco 1995; Grauer 1992, 2000, 2003; Jergens 1987; Kruger 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Immunosuppressing drugs such as corticosteroids and cyclosporine are often used to block the immune response; however, there are no proven clinical results regarding this choice. Dietary recommendations include a high-quality, low-protein diet; however, in people, this is now being questioned because of problems with hypoalbuminemia. No proof of this exists in animal studies (Finco 1995, Grauer 2003, Polzin 1986). ACE inhibitors such as benazopril and enalapril are often recommended to help control hypertension and reduce urinary protein loss (Grauer 2000).

Anticipated prognosis

Prognosis is always guarded and often the disease progresses in spite of medical therapy and dietary adjustments (Cook 1996, Grauer 2003).

Integrative veterinary therapies

Genetic predisposition may be a strong factor in some cases of glomerular nephritis. The accumulation of toxins results in damage to the delicate glomerular structures, which leads to an inability of the nephron to function

optimally. A wide variety of agents can lead to such injury, including chronic viral infections, repeated vaccination, chronic bacterial infection, parasites, chemical injury, radiation, drug therapy, aflatoxins, endotoxins, hypertension, genetic error, hormonal imbalances, and pesticide exposure (Newman 2002, Sobel 2005).

The causation and progression of inflammatory changes associated with glomerular disease are widely researched and an area of intense interest due to the frequency of this condition in both veterinary and human patients. Conventional medicine is actively researching anti-inflammatory agents as potential therapeutic modalities due to this pathogenesis (Sugaru 2005).

Many changes involving development and improvement of glomerulonephritis are linked to the presence of cytokines and other inflammatory mediators, as well as mast cells themselves, and the interrelationships of the immune responses associated with these compounds (Border 1990, Okudal 1990, Hohegger 2005).

The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics may help protect against destructive autoaggressive reactions through their anti-inflammatory, immune-balancing, and tissue-sparing effects (Goldstein 2005).

Nutrition

General considerations/rationale

The therapeutic nutritional approach to glomerular nephritis focuses upon kidney cell protection and balancing the immune system's response against this target organ. Adding nutrients, antioxidants, and gland support can help control inflammation and slow degeneration.

Appropriate nutrients

Nutritional/gland therapy: Glandular kidney, adrenal, thymus, liver, and pituitary provide the intrinsic nutrients that nourish organ cells and help neutralize cellular autoimmune inflammation and resultant cellular degeneration (see Gland Therapy, Chapter 2, for a more detailed explanation).

Note: Because glomerular nephritis can involve all glands and have multiple underlying causes, a medical and physiological blood evaluation is recommended to assess glandular and immune health. This allows clinicians to formulate therapeutic nutritional protocols that address the kidney as well as an associated immune-mediated cellular process (see Chapter 2, Nutritional Blood Testing, for additional information).

Alpha-lipoic acid: Alpha lipoic acid is involved in mitochondrial activity and is referred to as the universal antioxidant. It has been proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, Coenzyme Q10, and glutathione, making them

more readily available for bodily function (Busse 1992, Scholich 1989).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties that appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune-suppressing effects is beneficial in immune-mediated disease. Bouic (1996) reports on the immune-enhancing and balancing effect of plant sterols, which are beneficial to animals with immune-mediated conditions.

Essential fatty acids: Research has demonstrated the importance of essential fatty acids in the daily diet and on the clinical management of various degenerative diseases (Reinhart 1996, Holub 1995, Herman 1998).

Vitamin E: Vitamin E is involved in the formation of scar tissue, and also helps to reduce it. Vitamin E also has organ- and tissue-sparing properties (Myers 1982; Shklar 1982, 1987).

Chinese herbal medicine/acupuncture

General considerations/rationale

Glomerulonephritis is due to Heat and Damp accumulation in the Lower Burner, which invades the Kidneys and Bladder. This can be due to excess Heat and Damp or to Qi and Yin deficiency in the Kidney and Spleen.

Author's interpretation

This is how ancient physicians described the chronic phase: The Lower Burner is the lower Abdomen and Pelvis. It is used to discuss the Kidney and Bladder. Heat and Damp refer to inflammation and purulent debris. This can be due to excess causes such as pathogens, toxins, or immune mediators. Later on the Qi, or Energy, can become deficient from fighting the excess, and the Yin, or fluids, can become deficient from evaporation by the heat.

The patient is weakened at this point in the progression of the disease. The inflammation may be greatly reduced because the immune system is now depressed. However, the organs are damaged and the patient is more ill despite the decrease in inflammation. The Kidney deficiency results in polyuria and polydipsia. However, the Spleen is also deficient at this stage and therefore does not have the Qi (energy) to extract the nutrients from the food well enough to heal the body. This explains why this is an irreversible condition.

Treatment is aimed at reversing the underlying pathology; controlling the cause of the damage; normalizing blood chemistries; and controlling secondary effects such as renal hypertension, anemia, hyperlipidemia, and thromboembolism.

Appropriate Chinese herbs

Achyranthes (Niu xi): Has anti-inflammatory effects. It decreases egg-white-induced foot swelling in rats (Xong 1963).

Angelica root (Dang gui): As strong as aspirin at decreasing inflammation (Yao Xue Za Zhi 1971). It inhibits platelet aggregation as well as aspirin (Yao Xue Xue Bao 1980). Angelica root has been shown to inhibit thrombus formation (Zhong Guo Yao Li Xue Tong Bao 1981). It also has antibacterial properties (Hou Xue Hua Yu Yan Jia 1981), which may be useful in controlling bacterial causes of glomerulonephritis.

Astragalus (Huang qi): Can increase serum albumin and decrease proteinuria, which in turn helps to preserve amino acids, and improves the dysfunctional protein metabolism in glomerulopathy (Zhou 1999). It has demonstrated the ability to lower the blood pressure of cats, dogs, and rats under anesthesia (Modern TCM Pharmacology 1997, Xu 1999, Luo 1999).

Cnidium (Chuan xiong): Dilates blood vessels and reduces blood pressure (Zhong Yao Yao Li Yu Ying Yong 1989). It also inhibits blood platelet aggregation induced by ADP, collagen, and thrombase (Pharmaceutical Industry Research Institute of Beijing 1977). One component, chuanxiongine, has been shown to inhibit the formation of arterial thrombi (Wu 1992).

Codonopsis (Dang shen): Can increase the hematocrit and lower blood pressure (Zhong Yao Xue 1998). It can decrease serum cholesterol in rats with experimental hyperlipidemia (Hua 1994), which may help to control the hypercholesterolemia seen in some patients with glomerulonephritis.

Corn silk (Yu mi xu): Has been shown to lower blood pressure in dogs (Zhong Yao Da Chi Dien 1977). In a trial involving 9 people with chronic nephritis, 3 recovered completely and 2 improved after 2 weeks to 6 months. Kidney function improved, edema was reduced, and urinary production loss decreased (Zhong Hua Yi Xue Za Zhi 1956).

Eucommia bark (Du Zhong): Lowers blood pressure. In humans, the zinc:copper ratio in RBC is elevated in hypertensive people as compared to individuals with normal blood pressure. Eucommia can lower the zinc:copper ratio and blood pressure (Wang 1997). One component, chlorogenic acid, has antibacterial effects (Wang 1993).

Fleece flower root (He shou wu): Decreases cholesterol (Zhao 1984, Mei 1979). It also has antibacterial properties (Zhen 1986). It may be of use in bacterial causes of glomerulonephritis.

Giant knotweed root (Hu zhang): Lowers blood pressure (Xi An Yi Ke Da Xue Xue Bao 1982). It has anti-inflammatory properties (Zhong Guo Yi Yuan Yao Xue Za Zhi 1988). One component, resveratrol, lowers serum cholesterol levels in rats (Zhong Yao Yao Li Yu Ying Yong 1983).

Honeysuckle (Jin yin hua): Contains chlorogenic acid and isochlorogenic acid, which have antibacterial func-

tions (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). It has demonstrated anti-inflammatory effects in mice and rabbits (Shan Xi Yi Kan 1960). In addition, it decreases blood lipid levels. In rats it decreases absorption of cholesterol from the intestines (Ke Xue Chu Ben She 1963).

Imperata (Bai mao gen): Has been used to treat renal inflammation. In a trial of 11 children with acute nephritis who were treated with imperata, 9 recovered completely and 2 showed moderate improvement. Edema and hypertension resolved and hematuria and proteinuria cleared (Guang Dong Yi Xue 1965).

Isatis root (Ban lan gen): Has demonstrated antiviral and antibacterial properties in numerous studies (Xu 1987, Cao 1999, Li 1994).

Leonurus (Yi mu cao): Has anticoagulant properties. It was shown to decrease fibrinogen levels in rabbits (Han 1992). In one experiment it was shown to decrease renal damage in gentamicin-induced acute renal failure in rats (Xia 1997), which indicates that it has protective influences on the kidney. It may also protect the kidney from damage from immune mediators.

Moutan (Mu dan pi): Inhibits bacterial proliferation (Zhong Yao Cai 1991). It may be efficacious in treating underlying bacterial infections. It also possesses anti-inflammatory properties. In mice, it can prevent dimethylbenzene-induced ear inflammation and carrageenin-, formaldehyde-, or egg-white-induced foot swelling (Wu 1990). Moutan can decrease blood pressure (Liao Ning Yi Xue Za Zhi 1960).

Ophiopogon (Mai dong): Has antibiotic properties (Zhong Yao Xue 1998).

Phellodendron (Huang bai): Has antibacterial effects. It inhibits leptospirosis, a disease known to affect the kidneys (Zhong Yao Xue 1998, Zhong Yao Da Ci Dien 1977, Zhong Cao Yao 1985). It also decreases blood pressure (Zhong Guo Yao Li Xue Tong Bao 1989).

Poria (Fu ling): Has antibacterial effects (Nanjing College of Pharmacy 1976).

Rehmannia (Sheng di huang): Lowers blood pressure (Zhong Yao Xue 1998).

Salvia (Dan shen): Controlled the signs in 70% of 48 patients with chronic nephritis in one study (Shang Hai Yi Yao Za Zhi 1981). It also reduces blood pressure (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1991).

Scrophularia (Xuan shen): Can lower blood pressure (Zhang 1959). It also inhibits bacteria (Chen 1986, Zheng 1960).

White atractylodes (Bai zhu): Decreases platelet aggregation (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). It can increase the proliferation rate of CFU-E and BFU-E colonies (Hou 1999), which may make it useful for treating the anemia associated with glomerulonephritis. It also decreases the degeneration rate of the

kidney (Jing 1997), which may help protect the kidney from damage from the immune complex deposition.

Wolfberry (Gou qi zi): Has several functions in an herbal supplement designed for renal disease. It increases the production of red blood (Zhong Yao Xue 1998), lowers serum cholesterol and LDL levels (Wang 1998), and decreases blood pressure (Zhong Yao Zhi 1984). It also has antibacterial effects (Jin 1995) and may be useful in bacteria-induced glomerulonephritis.

Homotoxicology

General considerations/rationale

Glomerulonephritis constitutes a progressive condition beginning as an Inflammation Phase and progressing to the Impregnation and Degeneration phases (Reckeweg 2000).

Autosanguis and antihomotoxic agents have long been used to treat this condition, and further research into their effects on immune responses, including Th1 and Th2 modulation, may help explain how they might benefit patients receiving these antihomotoxic and physiologic regulation medicines (Khan, et al. 2005, Heine 2004). The reader is referred to the Acute and Chronic Nephritis protocol, above, for a more detailed discussion of factors involved in urinary system phase response and therapeutic options.

Aspects contributing to this disease likely continue silently through the Deposition Phase.

Appropriate homotoxicology formulas

Because managing glomerulonephritis depends upon finding and handling the primary cause of the inciting chronic inflammatory reaction, literally any other medical issue may be involved. Elimination of dental disease is a critical issue. The clinician should seek these primary homotoxicoses out and apply whatever other protocol information from this text that may be needed. Particularly see the Acute and Chronic Nephritis protocol, above.

***Apis compositum*:** A major remedy for renal disease (especially albuminuria and edema), formerly known as *Albumoheel*. It is also used for glomerulonephritis (acute and chronic) and nephrosis, renal edema (*Apis mellifica*), parenchymal damage and degeneration (Phosphorus), acute nephritis and bladder spasm (*Mercurius sublimatus corrosives*), and bleeding from the kidney and bladder (*Nux moschata*). It also treats renal pain on the right side (Reckeweg 2000). This agent may modify mast cell activity, which may be a theoretical explanation of its mechanism of action.

***Berberis homaccord*:** A major remedy for urinary issues. Treats biliary and urogenital irritation, nephrolithiasis, nephritis, and colic and collapse. It also acts as a stimulant for the adrenal gland.

***Lymphomyosot*:** Provides lymph drainage and immune and endocrine support. Specific urinary tract support may be found in the component *Equisetum hiemale*, which is used for diseases of the kidneys and urinary tract. *Nasturtium aquaticum* is included for irritation of the urinary tract collection system. *Sarsaparilla* is included for urinary gravel, dribbling of urine when sitting, and inflammations and irritations of the urinary organs (Reckeweg 2002).

***Populus compositum*:** Although this remedy is not currently available, it has been used for recurring albuminuria, cystitis, disturbance of renal function, cystopyelitis, nephrolithiasis, prostatic hypertrophy, hydronephrosis, urethritis, and bladder spasm with burning (Reckeweg 2000). It contains *Mercurius sublimatus corrosivus*, which exhibits characteristic mercurial action in acute affections of the mucosa, acute glomerulonephritis with albuminuria, hematuria, and tenesmus. Mental notes include shivering, trembling of the limbs, brain symptoms, fear, restlessness, and unquenchable thirst. This component is also found in *Solidago compositum* (Reckeweg 2002).

***Rauwolfia compositum*:** Contains *Ren suis* and is used most often for hypertension associated with renal disease. Though primarily a cardiac remedy, *Ren suis* has specific urinary tract indications, including nephrolithiasis, hydronephrosis, urinary-tract infections, albuminuria, hypertrophy of the prostate, and nephroses. It is also used for edema, oxaluria, and depressed renal function with oliguria and hyperhydrosis. Do not give in the acute stage of glomerulonephritis (Reckeweg 2002). Also contains *Lycopodium*, which is indicated in cystitis, nephrolithiasis, and red sediment in the urine. It is said to be valuable in uric acid diathesis and when there is a tendency toward gravel and renal colic (Reckeweg 2002). Contains *Belladonna* (see *Belladonna homaccord*), *Conium* (see *Cerebrum compositum*), and Sulphur (see *Klimakteel*).

***Reneel*:** Provides drainage and detoxification of the renal system. Can be used in cases with or without stone formation. Treats inflammatory diseases of urinary passages (Reckeweg 2000).

***Solidago compositum*:** An extremely useful agent for Deposition, Impregnation, Degeneration, and Dedifferentiation phase disorders. Treats nephrosis, nephritis, uroliths, hydronephrosis, pyelonephritis, prostatic hypertrophy, urinary incontinence, acute glomerulonephritis, oxaluria, and stimulation of diuresis. It contains *Coxsackie virus nosode*, which is indicated in pyelonephritis and acute and chronic cystitis. It also treats nephritis, orchitis, and oophoritis (Reckeweg 2002). It is part of the deep detox formula used so often by homotoxicologists.

Appropriate homotoxicology formulas

Nutrition

Kidney and pituitary support formulas: 1 tablet for each 25 pounds of body weight BID.

Immune and liver support formulas: One-half tablet for each 25 pounds of body weight SID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

Betathyme: 1 capsule for each 35 pounds of body weight BID. (maximum, 2 capsules BID)

Omega-3,6,9: 1 capsule for each 25 pounds of body weight with food.

Vitamin E: 100 IU for each 25 pounds of body weight.

Chinese herbal medicine

H87 Shar pei fever: 1 capsule per 10 to 20 pounds twice daily. This supplement is designed for renal disease with an immune component. In addition to the herbs above, H87 also contains areca peel (Da fu pi), ciborium (Gou ji), fossil bones (Long gu), oldenlandia (Bai hua she cao), oyster shell (Mu li), pyrola (Lu xian cao), and tortoise plastron (Gui ban) and carapace (Bie jia).

Recommended acupuncture points include PC6, CV12, ST36, SP9, BL23, SP6, and BL28 (Handbook of TCM practitioners 1987).

Homotoxicology

Berberis homaccord, Populus compositum, Reneel, Apis compositum, and Lymphomyosot: Mix together and give orally BID. Solidago compositum given daily for 2 weeks and then twice weekly orally. In chronic cases such as chronic nephritis add the Deep Detox formula. Rauwolfia compositum may be added in chronic cases, twice weekly, particularly in animals with concurrent cardiac disease, but avoid this agent in acute glomerular diseases.

RENAL DYSPLASIA

Definition and cause

Renal dysplasia is a non-inflammatory disease of the kidney tissue with inadequate or malformed nephrons.

These changes are either acquired or genetic and involve many possible errors in growth and development. Many individual defects can occur. Both feline and canine breeds are involved. The list of affected breeds and disorders continues to expand (Greco 2001, Morita 2005). Renal dysplasia is also referred to as juvenile renal disease or hereditary nephropathy (Bovee 1984, Finco 1995, Greco 2001, Kruger 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment for renal dysplasia usually takes a quality of life approach with supportive fluid replacement therapy and phosphate binders along with the typical low-protein and low-phosphorus diets (Finco 1983, Polzin 1986). Transfusion and erythropoietin are recommended for associated anemia.

Anticipated prognosis

The prognosis depends upon the extent of the kidney tissue dysfunction. The disease is irreversible, and often requires ongoing medical and dietary support. In most instances the prognosis for long-term survival is poor (Bovee 1984, Greco 2001.)

Integrative veterinary therapies

Because this is a non-inflammatory disease, the approach to renal dysplasia focuses on nourishing kidney cells, making dietary adjustments, and providing gland support to help reduce metabolic wastes and support of the organs of protein metabolism (liver, pituitary, thyroid, and adrenal).

Nutrition

General considerations/rationale

The nutritional approach to kidney disease adds nutrients, antioxidants, and gland support for the metabolic organs involved in the production of urea and excretion of metabolic wastes (kidney pituitary, liver, thyroid, and adrenal glands) (see Chapter 2, Gland Therapy, for a more complete discussion).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, pituitary, liver, thyroid, and kidney provide intrinsic nutrients that nourish organ cells and improve waste elimination (see Gland Therapy in Chapter 2 for a more detailed explanation).

Note: Because renal dysplasia can involve multiple organ systems, a medical and physiological blood evaluation is recommended to assess glandular and immune

health. This allows clinicians to formulate therapeutic nutritional protocols that address the kidney as well as an associated immune-mediated cellular process (see Chapter 2, Nutritional Blood Testing, for additional information).

Arginine: Double-blind studies in people have confirmed that arginine is beneficial in the treatment of congestive heart failure and helping to improve kidney function in these patients (Rector 1996, Watanabe 2000).

Essential fatty acids: Studies have shown that dietary essential fatty acids increase intestinal calcium absorption and help vitamin D decrease urinary calcium losses. (Hertz-Picciotto 2000). It has also been shown that calcium may reduce the absorption of oxalates and may indirectly reduce the formation of kidney stones in people. Perhaps this is an area for veterinary researchers to study the increase incidence of calcium oxalate crystals and stones in dogs and cats (Barilla 1978, Curhan 1993).

Vitamin E: Vitamin E is involved in the formation of scar tissue, and also helps to reduce it. Vitamin E also has organ- and tissue-sparing properties (Myers 1982; Shklar 1982, 1987).

Vitamin B₁₂: Neuropathy and pain associated with diabetes or kidney disease were significantly reduced in studies with people who supplemented their diets with vitamin B₁₂ (Yamane 1995, Kuwabara 1999). Deficiencies of vitamin B₁₂ are associated with anemia and decreased function of the immune system (Kondo 1998); therefore, supplementation will treat the condition.

Chinese herbal medicine/acupuncture

General considerations/rationale

Renal dysplasia is due to Vital Essence deficiency with Qi and Yang deficiency in the Spleen and Kidney. This leads to Qi and Blood stagnation and internal toxin accumulation. Any congenital condition is considered to be a deficiency of the Vital Essence.

The Vital Essence is the basic genetic makeup of the individual. When deficient, the affected individual either has birth defects or does not mature properly. The Kidney and Spleen are considered to be the seat of genetic and environmental contributions, respectively, to the growth and development of the organism. The Kidney is what the parents of an organism contribute. In modern terms, this would translate into the genetic makeup of the individual. The Spleen is the environmental source of energy for growth because it is charged with the transformation of food into life energy. Yang is the warmth of life and Qi is the energy of life.

When the Kidney and Spleen lack energy there is no way for the affected individual to develop correctly. In the case of renal dysplasia this deficiency is expressed by the clinical signs of polyuria and polydipsia, which are easily attributed to the Kidneys. Other signs include

weight loss and anemia, which the practitioners of TCM assigned to the Spleen because it is responsible for turning food into Blood and the Spleen controls the muscles. Internal toxins are called uremic toxins by Western practitioners.

Blood and Qi stagnation are evidenced by lethargy and fatigue.

Appropriate Chinese herbs

Astragalus (Huang qi): Useful in cases of renal deficiency for several reasons. It decreases the amount of protein present in the urine (Zhong Guo Sheng Li Ke Xue Hui, Di Er Ci Hui 1963). It has been shown to decrease blood pressure in dogs, rabbits, and cats, and may be useful in cases of renal secondary hypertension (Guo Wai Yi Xue Can Kao Za Zhi 1977). It also improves renal function in humans with glomeronephritis (Zhong Xi Yi Jie He Za Zhi 1987).

Atractylodes (Bai zhu): Protects the kidneys. It prevents degenerative changes, including sclerosis of renal corpuscles and the widening of Bowman's space (Jing 1997). It counteracts anemia by stimulating the bone marrow and stimulates both the erythroid colony-forming unit (CFU-E) and the burst-forming unit (BFU-E). These units are responsible for enhancing differentiation of red blood cells (Hou 1999).

Codonopsis (Dang gui): Can help in renal patients with anemia because it can increase the PCV (Zhong Yao Xue 1998). Hypertension is common in cases of renal failure. Codonopsis can lower blood pressure yet increase cardiac output, and therefore improve tissue blood perfusion (Zhong Yao Xue 1998).

Ginger (Sheng jiang): Inhibits thrombus formation (Gao 1996). We now know that anti-thrombin III is lost in the urine in advanced cases of renal failure, which can lead to thrombo-embolic disease. The addition of ginger to the supplement may help prevent this complication.

Jujube (Da zao): Increases body weight and muscle strength in mice (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1985).

Oyster shell (Mu li): Has been shown to have efficacy in preventing gastric ulcers (Nie 1994). Since uremia has been shown to cause ulceration of the stomach, adding this herb to supplements may help prevent this development.

Peach pit (Tao ren): Helps prevent thromboembolism by helping to dissolve thrombi (Shang Hai Zhong Yi Yao Za Zhi 1985).

Red peony (Chi shao): Has been shown to have a strong anti-thromboembolic action. In experiments involving rabbits, red peony was able to prolong the prothrombin time and thrombin time (Deng 1991). It has been shown to inhibit thrombin and both the intrinsic and extrinsic coagulation systems (Wang 1990). It also inhibits platelet clumping in humans and rats (Lui 1983, Ji 1999).

Rhubarb (Da huang): Preparations have been shown to decrease BUN and creatinine levels in humans (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou 1994). In rats with hyperplastic glomerulonephritis, rhubarb was shown to prevent progression of the condition (Li 1999).

White peony (Bai shao): Decreases the secretion of gastric acid (Zhong Yao Zhi 1993), which may help to reduce the incidence of uremic gastritis. In addition, it has mild anti-thrombotic abilities. It decreases the aggregation of platelets (Zhong Yao Xue 1998; 831:836).

Homotoxicology

General considerations/rationale

Diseases in this category represent the Degeneration Phase, and as such, they are not curable. However, support and proper care can extend the quality and quantity of life for individuals so affected. Palmquist has treated 3 exotic cats for polycystic kidney disease and all have done well clinically. The oldest of these cats is now 11 years old and still has normal renal parameters in spite of severe changes confirmed on ultrasound. The treatment strategy for these cats is to support the remaining kidney tissue and avoid factors that might further damage renal function.

Regular laboratory screening and physical examination is indicated in all such patients. Urine cultures and blood pressure monitoring are particularly important. Renal failure is treated according to standard approaches for chronic renal disease.

Appropriate homotoxicology formulas

Also see the Acute and Chronic Nephritis protocol, above.

Galium-Heel: Particularly applicable to all congenital and cellular phases. Affects renal tubular function through Apis. Used in feline polycystic kidney disease cases by the authors.

Psorinoheel: Used for its deep acting characteristics. Treats miasmatic disorders.

Authors' suggested protocols

Nutrition

Kidney and pituitary support formulas: 1 tablet for each 25 pounds of body weight BID.

Liver support formula: One-half tablet for each 25 pounds of body weight BID.

Vitamin E: 100 IU for each 25 pounds of body weight.

Arginine: 50 mg per 10 pounds of body weight daily.

Omega-3,6,9: 1 capsule for each 25 pounds of body weight with food.

Chinese herbal medicine/acupuncture

Kidney Guard: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, this formula contains aconite (Fu zi), angelica radix (Dang gui), bamboo shavings (Zhu Lu), carthamus (Hong hua), coptis (Huang lian), eupatorium (Liu yue xue), fossil bones (Long gu), licorice (Gan cao), ligustrum (Nu zhen zi), ophiopogon (Mai men dong), perilla seed (Zhi Shu zi), and pseudotellaria (Tai zi shen). This combination of herbs helps improve renal blood circulation, regulate blood pressure, eliminate toxic byproducts from the body, stimulate the appetite, and improve hydration.

There are no reported Western trials on the effect of acupuncture on serum BUN, phosphorus, or creatinine levels. Practitioners of TCM have used acupuncture for centuries and feel that it helps. Some recommended points include CV3, CV4, SP6, BL23, GV4, GV20, ST36, and Baihui (Handbook of TCM Practitioner 1987).

Homotoxicology

The following is a theoretical discussion because with the exception of polycystic kidney disease, the authors are unable to document treatment results of any of the other diagnoses in this list through biological therapy.

Renal agenesis: As for acute and chronic nephritis.

Renal ectopia, tubulo-interstitial nephropathy: As for acute and chronic nephritis.

Polycystic kidney disease: Initially Galium-Heel, and as disease progresses as for acute and chronic nephritis.

Renal telangiectasis (vascular abnormalities in multiple organs): Consider experimental use of Aesculus compositum and/or Placenta compositum.

Renal amyloidosis: As for acute and chronic nephritis.

Nephroblastoma, renal cystadenocarcinoma: See cancer sections, chapters 31 through 34.)

Fanconi syndrome and primary renal glucosuria: As for acute and chronic nephritis.

Congenital nephrogenic diabetes insipidus: See Diabetes Insipidus, Chapter 16.

CYSTITIS

Definition and cause

Cystitis is an inflammatory process in the urinary bladder. Causes are most commonly idiopathic, infection, urolithiasis, or secondary to other diseases such as kidney disease or cancer. Signs are frequent urination, straining, blood in urine, and continual licking of the genitals. Chronic recurrences are labeled interstitial cystitis. Dietary causes related to high mineral or magnesium content as well as the feeding of dry foods are actively debated in feline lower urinary tract disease syndrome. In cats, cystitis is part of the lower urinary tract syndrome, and besides the above causes, also has a behavioral and litter

box component (Bartges 2003; Buffington 1999; Grauer 1992; Lees 1986, 2003; Lulich 1995; McCall 1989; Osborne 1996, 2000, 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment focuses on the clinical signs and the underlying cause. Antibiotics are generally recommended for infection. Additional common recommendations include giving urinary acidifiers and antispasmodics, increasing water consumption, and changing from dry-food diets to canned or fresh, low-mineral content foods (Buffington 1998, 1999; Lees 1986; Markwell 1999).

Anticipated prognosis

A good prognosis is expected when cystitis is treated early; however, recurrences are common when the underlying cause has not been identified and addressed (Grauer 1992, Lees 1986).

Integrative veterinary therapies

Antibiotics are the accepted therapy for urinary tract infections. Concerns regarding the relationship between continual use of antibiotics in urinary tract infections and the development of antibiotic-resistant strains of pathogens have been raised (Reid 1990, Lidifelt 1991). An integrative approach to urinary tract infection focuses on reducing inflammation and protecting the cells of the urogenital tract. The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on the bladder wall cells may reduce reliance on chronic medication.

Nutrition

General considerations/rationale

Therapeutic nutrition adds nutrients, antioxidants, and gland support for the tissues of the urogenital tract. These nutrients can help to reduce inflammation, are cellular protective, and help in the elimination of metabolic wastes and toxins.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, and kidney provide intrinsic nutrients that nourish and help neutralize cellular immune inflammation and degeneration (See Gland Therapy in Chapter 2 for a more detailed explanation).

Vitamin A: Vitamin A has been shown to help prevent and treat many types of infections, and is protective of the skin and mucous membrane linings of the body

(Halliwell 1994, Hussey 1990). People taking multi-vitamin combinations that are high in vitamins A and C showed an improved immune function and a significant reduction in infections, including those of the urinary tract (Chandra 1992).

Vitamin C: Vitamin C has been recommended for both acute and chronic urinary tract infections. It has been proven effective against *E. coli*, one of the main causes of UTI in people. Vitamin C (ascorbic acid) temporarily acidifies the urine, which provides a less unfriendly environment for bacterial growth (Axelrod 1985, Sirsi 1952).

Bromelain: The proteolytic enzyme bromelain has been shown to enhance the effectiveness of antibiotics in people with urinary tract infections. A double-blind study showed that 100% of the people taking the enzyme had complete resolution of the UTI as compared to 46% for those taking the placebo (Mori 1972).

Cranberry and blueberry: Research suggests that the use of cranberry or blueberry extract is beneficial in the treatment of cystitis. In double-blind trials, adding cranberry to the diet decreased the urine bacterial count and the frequency of urinary tract infections (Avorn 1994, Dignam 1997, Walker 1997). A study using blueberry showed prevention of bacterial adhesion to the wall of the bladder (Ofek 1991). The author suggests that the underlying mechanism of these fruit extracts may also be related to the phytonutrient and antioxidant levels (Goldstein 2006) (see Phytonutrients and Antioxidants in Chapter 2 for a more detailed explanation).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM theory, cystitis is due to Heat and Dampness in the Lower Burner affecting the Kidney and Bladder. There is associated Qi stagnation and water distribution disturbance. The Lower Burner is the lower one-third of the body. Heat refers to the inflammation, i.e., the pain and hematuria associated with urinary tract infections. Dampness refers to the cloudy appearance of the urine due to white blood cells and protein. Qi stagnation causes pain. Animals with cystitis may experience pain upon urination. Qi stagnation may also lead to insufficient energy to void properly, resulting in stranguria. The term water distribution disturbance refers to the inability to have normal urine flow.

To treat the cystitis, the practitioner must decrease inflammation by eliminating its cause. We now recognize bacteria and uroliths as common causes of the inflammation seen in cystitis. The ancient Chinese did not know about bacteria, yet many of the herbs used to treat cystitis were later shown to have significant antibacterial properties.

When faced with a patient with recurrent cystitis, modern veterinarians often recommend increasing water

intake to induce diuresis to prevent subsequent episodes. The ancient Chinese used herbs with diuretic properties to drain the “Heat” from the urinary tract. Although the terminology used differs between the two forms of practice, it is clear that the objective is the same—flush the urinary tract and remove the cause of the condition.

Appropriate Chinese herbs

Angelica root (Dang gui): Has an immunostimulatory effect. It increases phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978).

Bupleurum (Chai hu): Stimulates both humoral and cellular immunity in mice (Shang Hai Yi Ke Da Xue Xue Bao 1986).

Dianthus (Qu mai): Causes diuresis (Li 1996).

Glecoma (Jin qian cao): Acts to dissolve urinary tract stones and prevent their reformation. In addition to the effect on uroliths, glecoma has a significant diuretic effect (Guang Xi Zhong Yi Yao 1990). Furthermore, glecoma has demonstrated efficacy against *E. coli* and *Staphylococcus aureus* (Zhong Yao Yao Li Yu Ying Yong 1983).

Scutellaria (Huang qin): Contains baicalin, which has antibiotic activity against *E. coli*, *Staphylococcus aureus*, *b-hemolytic streptococcus*, *Pseudomonas aeruginosa*, and *leptospira*. Furthermore, baicalin has shown synergistic effects with ampicillin, amoxicillin, methacillin, and cefotaxime. It can help overcome B-lactam resistance (Zhong Yao Xue 1988, Liu 2000). Additionally, scutellaria can help flush bacteria from the renal tract via its diuretic effects (Zhong Yao Xue 1988).

Sophora root (Ku shen): Has antibiotic efficacy against one of the most common causes of urinary tract infections, namely *E. coli*. *E. coli* is implicated in up to 50% of chronic urinary tract infections. Sophora root is also efficacious against several other bacteria such as *Bacillus proteus*, *B hemolytic strep*, and *Staph* (Zhong Yao Xue 1988). Sophora root has immunostimulant effects. One experiment demonstrated its ability to stimulate the production of interferon in mice (Zhu Li 1998).

Wolfberry (Gou qi zi): Wolfberry extract has demonstrated significant antibacterial effects on multiple strains of bacteria, including *Staphylococcus* species, *Bacillus* species, and *Pseudomonas aeruginosa* (Jin Zhi Cui 1995). Experiments on the immunostimulatory effects of wolfberry have shown that it increases both the phagocytic activity of macrophages and the total T cell count (Geng 1988). It also has been shown to increase the production of white blood cells in mice (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

In the purest sense, cystitis is an inflammatory reaction of the bladder; however, many cases of cystitis represent

deeper homotoxicoses and vicariation reactions, especially Impregnation and Deposition phase disorders.

The sudden appearance of cystitis may represent regressive or progressive vicariation. The clinician must carefully examine the health history to determine the direction in which the case is shifting on the Six-Phase Table of Homotoxicology. When simple remedies do not solve the problem, it is likely rooted in deeper pathology that has shifted in a beneficial manner toward the Inflammation Phase, because the homotoxins are eliminated from the urinary tract through the action of inflammatory cells and mucus secretion. Bacteria may well play a beneficial role by consuming such homotoxins as they are mobilized and eliminated. The presence of a deeper homotoxicosis should then be considered in any case that presents with a history of recurrent cystitis.

Appropriate homotoxicology formulas

***Apis compositum*:** Used for acute nephritis, albuminuria, burning with scant urine, copious casts, and when the last drops burn. Patients may cry or run away on last bit of urination.

***Belladonna homaccord*:** Treats localized inflammation, sudden and painful cystitis, urine retention and pain on passing urine, and dark urine with bloody casts. *Echinacea agustifolia* supports the immune system for inflammation of any kind (Reckeweg 2000).

***Berberis homaccord*:** Drains the urinary tract and liver, and supports adrenal tissue. Treats mucus with red tinge and polyuria alternating with reduced urine production. It is useful in general detoxification of the urinary tract. The components *Veratrum album* and *Citrullus colocynthis* are useful for renal colic and spasmodic pain associated with cystitis. Also useful in cases of urolithiasis (Reckeweg 2000).

***BHI-Bladder*:** Treats cystitis, urinary pain, urinary tract infection, peripheral edema, albuminuria, and hematuria.

***BHI-Kidney Rx*:** Treats straining, stones, and bloody urination.

***BHI-Uri-Cleanse*:** Indicated for strong urine, urine with bad odor, kidney pain, red urine, scanty urine, and urinary pain.

***BHI-Uri-Control*:** Treats burning urination, the constant desire to urinate, and straining.

***Cantharis compositum*:** Treats stranguria, straining, and urinary pain.

***Echinacea compositum*:** Provides support during any bacterial infection, and is a phase remedy for Inflammation Phase conditions. Contains *Aconitum*, *Gelsemium*, *Hepar sulphuris*, *Mercurius corrosivus*, *Pulsatilla*, *Strep-tococcus nosode*, and *Thuja*, which all have bladder indications (Reckeweg 2002).

Mercurius homaccord: May be useful in cases of localized inflammation and sepsis due to its antibacterial and antiviral effects.

Mucosa compositum: Rehabilitates the body's mucosal elements, particularly the urinary tract. Used in Degeneration Phase disorders and following antibiotic therapy.

Populus homaccord: Used in obstructed male cats and prostatitis cases which suffer from intense burning and difficulty in urination.

Reneel: Provides drainage and detoxification of renal and urinary tissues. Treats cystitis, urolithiasis, and stranguria. Contains Causticum Hahnemanni for bladder atony and aluminum oxide for bladder paresis. Also treats albuminuria and nephrosclerosis (Heel 2003).

Solidago compositum: Stimulates the defense mechanisms of the urinary tract and treats bladder and kidney inflammation and infection. A phase remedy for Deposition Phase homotoxicoses and part of the deep detoxification formula.

Spascupreel: Used for spasmodic, cutting pain. A previous remedy, *Atropinum compositum*, which is only available in tablet form in the United States, is excellent for these patients, but in its absence *Spascupreel* is the next best choice.

Tonicoheel: Useful for the mental and emotional aspects that often characterize this problem. Contains several remedies that are valuable in bladder issues: Hypericum, Kali Phos, Helonias dioica, and Nux vomica (Reckeweg 2002).

Tonsilla compositum: Supports immune function in Impregnation and Dedifferentiation phases.

Traumeel S: Used as an intermittent agent in all inflammatory reactions.

Appropriate homotoxicology formulas

Nutrition

Urinary support formulas: 1 tablet for each 25 pounds of body weight BID.

Immune support formula: One-half tablet for each 25 pounds of body weight BID.

Bromelain: 250 mgs for each 25 pounds of body weight with food.

Cranberry extract: 100 mg for every 25 pounds of body weight.

Chinese herbal medicine/acupuncture

Formula H51 Chronic cystitis: 1 capsule per 10 to 20 pounds twice daily. In acute cases 2 weeks may be sufficient. In chronic cases long-term use is advised. If the animal develops recurrent problems upon discontinuation of the herbal supplement, it may be used continuously for years with no side effects.

In addition to the herbs cited above, H51 Chronic cystitis also contains amber (Hu po), fritillaria (Bei mu), licorice (Gan cao), lophatherum (Dan zhu ye), mantis egg case (Sang piao xiao), and rehmannia (Sheng di huang).

Because cystitis is a complicated condition, no single protocol can resolve every case.

Homotoxicology

Symptom formula: Populus homaccord, Cantharis compositum, BHI-Bladder mixed together and given 4 to 5 times daily for the first day or until symptoms improve, then given BID PO. Solidago compositum, Coenzyme compositum, and Ubichinon compositum as a mixed injection to start. Berberis homaccord can also help with the considerable spasm. For extremely painful cases, Cantharis compositum, Spascupreel, and Traumeel may also be considered as injections. Tonicheel may be considered for the emotional strain on these pets, particularly in cats. If bacterial or viral issues are part of the pathology, Echinacea compositum may be tried as a regulating agent.

General detoxification: Detox Kit (Lymphomyosot, Nux vomica homaccord, Berberis homaccord) PO BID for 30 days in simple cases.

Deep detoxification: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum mixed together and given PO every 3 days for 120 days. Use this in chronic or recurring cases, particularly those in Impregnation, Degeneration, and Dedifferentiation phase cases.

FELINE LOWER URINARY TRACT DISEASE SYNDROME (FLUTDS/FUS)

Definition and cause

Feline lower urinary tract disease syndrome is defined as a group of disorders of the urinary tract of cats that cause blood in the urine, straining, and increased frequency of urination that can be complicated with urolithiasis and blockages. Causes include bacterial or viral infection, dietary imbalances, drinking inadequate amounts of fluids, feeding dry food, feeding food that is too acid or alkaline, elevated ash and magnesium levels in the food, interstitial or recurrent cystitis, etc. The basic underlying process is inflammation of the lower urinary tract leading to the disease process (Osborne 1996, 2000, 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Dietary management should include increasing water consumption and feeding moist foods that are acidifying or alkalinizing if there is consistent urolithiasis (Buffington 1998, 1999). Depending on the underlying cause, medical therapy usually consists of antibiotics, antispasmodics, pain management, and urinary acidifiers in some cases. There is some evidence that suggests that some cats may benefit from the addition of glycoaminoglycans to the diet, which protects the membrane lining of the bladder (Buffington 1996) (see IVM below for more details). Some clinicians give cats suffering from FLUTDS corticosteroids with the idea that they may relieve swelling and reduce inflammation. A double-blind clinical study failed to demonstrate efficacy of this practice (Osborne 1996). Other rare issues, such as prostatic neoplasia, can be responsible for symptoms (Caney 1998). Surgery is indicated for blockages.

Anticipated prognosis

While most cases of FLUTDS respond well to medical therapy, recurrence and chronic infections are common and often require ongoing medical therapy, dietary restrictions, and urinary acidifiers or alkalinizers (Osborne 2003).

Integrative veterinary therapies

In FUS, cats fed a dry, high-vegetable/-cereal diet containing excess magnesium levels and reduced water intake become dehydrated. High magnesium levels in the diet can couple with high urine pH to favor the development of struvite crystals and calculi, and this combination of mucus and struvite can lead to blockage and urinary discomfort. When other diets are fed, the physiological scale tips and we see oxalate stones form. The cat's attempt to remove the material through inflammation results in clinical signs and presentation to the veterinarian for diagnosis and treatment.

The cause of FLUTDS is unclear at this time. Large population studies show definite differences in the incidence of differing types of diseases encountered in cats. Breed, age, sex, surgical alteration, and diet have all been associated with differing risk factors (Lekcharoensuk 2001). Surgically altered pets have higher risks in many categories (Lekcharoensuk 2001). Some evidence exists that affected cats may have problems with the protective layer of glycoaminoglycans in the mucous secretion of the bladder (Buffington 1996). These cases may benefit from supplementation of a product containing these agents, but this has not been proven in studies. Clinically, some cats with refractory disease improve suddenly following administration of glycoaminoglycan products, and because these agents are generally safe, it may be sensible to consider their use in difficult cases. Whether these defects are solely genetic or acquired is not known, but it is likely that genetic differences may predispose some individuals to these conditions. Because all proteins are produced through genetic encoding, a myriad of physiological errors can occur with genetic alterations.

As in all frustrating disease entities, there is a strong intention to assist these patients in their discomfort, and many medications are used in to attempt to manage this condition. It is important to assess the risk-to-benefit ratio of any agent given because pharmaceutical agents may do harm as well as assist. The practice of routinely administering antibiotics to these cats is questionable and controversial, because many have sterile urine. However, routine testing cannot identify all infected cats and antibiotic trials may be needed in difficult or recurring cases. Likewise, assuming that stress is the cause and automatically administering antidepressant medication makes little sense from a biological therapy view, because these drugs simply do further harm to the autoregulatory centers of the body and have not been shown to assist with symptoms of patients presenting with acute signs. In fact, they have actually worsened recovery by increasing risk of recurrence (Kruger 2003).

A theory exists regarding vaccination-strain live virus impregnating into the bladder of cats and later being

expelled. This has not been supported by studies; however, wild viruses have been recovered (Kruger 1996). No studies have yet been designed to examine the rate of these conditions in cats vaccinated routinely, those with reduced exposure to vaccinations, or those that have received no vaccinations and have been raised on raw food diets. Whether these viruses recovered from FLUTDS cats constitute causative agents is not clear. Other unknown pathogens, such as impregnated viral particles, mycoplasma, or L-forms, may be involved. An attempt to identify *Mycoplasma* and *Ureaplasma* by PCR yielded negative results (Abou 2006). Fungi are also associated, and when present often indicate serious homotoxicoses and terrain imbalance.

Emotional and personality issues may be involved, and treatment steps to address these issues can be rewarding. Whether the response to stress is learned or genetic or a combination of the two, personality type seems to be associated with risk factors for this condition. A new study by Buffington (2006) observed, "Cats with clinical signs of lower urinary tract disease had significantly greater owner-observed gastrointestinal tract signs and scratching, fearful, nervous, and aggressive behaviors."

The aforementioned study is interesting to CAVM practitioners, because Traditional Chinese Medicine has postulated this for many years. Bach flower remedies for stress relief have long been used for this condition, and the connection between gastrointestinal complaints and disorders of the psychoneuroendocrine-immune system is tempting, to say the least, because factors which increase gastrointestinal permeability can cause widely divergent physical symptomology. These cats might be yet another manifestation of inflammatory bowel-like disease, a fact that makes dietary therapy very intriguing.

Finally, these data could reflect differences in owner psychological status because guardians who are more concerned with litter box contents might be found to be overly worried or anxious about their cat's health. The final word is still out, but this area provides fascinating opportunities for research and understanding. From the simplest standpoint, stress can reduce water consumption and the resulting dehydration by itself may predispose some of these cats to clinical breaks. On a positive note, use of chin pheromone diffusers has shown promise in cats thought to have emotional causations as well.

Water intake and dietary type are major factors in these cases. Dry commercial foods may place these cats in an abnormal situation wherein they fail to adequately excrete homotoxins, which accumulate and ultimately trigger the Inflammation Phase. Many cases respond to dietary changes involving feeding less dry food and more canned food, or use of a prescription diet designed for the cat's particular situation. FUS cats may respond to acidification

of urine and magnesium restriction, but this is not always needed for cats in the FLUTDS category of disease, and excess acidification may cause other metabolic problems that are also of concern.

The authors have seen many chronically affected cats respond to raw food diets, and while increased water intake may be the case, there may be other factors at work in these cats' recovery as well. Our present state of knowledge in this area is simply incomplete, but we know that cats are not small dogs in regard to dietary needs. Clients may present data to veterinarians that raw food diets completely prevent FLUTDS or FUS, but this is not the experience of Palmquist, who has seen several cats requiring strict prescription diets to control their problems after becoming obstructed on raw foods. Furthermore, raw diet formulation must be carefully supervised to prevent dietary nutritional drift, and guardians must be aware that their cats may shed fecal pathogens such as salmonella. However, many cats seem to do well on raw food diets, and perhaps these few cats which have problems on raw diets represent a genetic predisposition or another factor yet undiscovered, which explains their tendency for problems in this area.

An integrative approach to FLUTDS focuses upon reducing inflammation and protecting urogenital tract cells. FLUTDS is complex in its approach due to the numerous factors that have been researched and remain unresolved (diet, ash, acid, alkaline, antibiotics, urinary acidifiers). Therefore, the approach must be preceded by a complete workup, medical history, and understanding of the condition for that patient. At that point the appropriate nutrition, herbal, and biological program can be specifically designed (with medication or as a free-standing protocol) for the patient.

Nutrition

General considerations/rationale

Therapeutic nutrition consists of nutrients, antioxidants, and gland support for the tissues of the urogenital tract. These nutrients can help to reduce inflammation, are cellular protective, and enhance the elimination of metabolic wastes and toxins. The following nutrients are the basic nutritional support recommendations. Additional nutrients can be added after a complete evaluation of the patient. For example, an acid-forming supplement program should be recommended with struvite crystals, and an alkaline-forming supplement program should be chosen for calcium oxalate (see Cystitis, above, for additional protocol recommendations).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, kidney, and pituitary provide intrinsic nutrients that nourish and help neutralize cellular immune inflammation

and degeneration (see Gland Therapy, Chapter 2, for a more detailed explanation).

Bromelain: The proteolytic enzyme bromelain has been shown to enhance the effectiveness of antibiotics in people with urinary tract infections. A double-blind study showed that 100% of the people taking the enzyme had complete resolution of the UTI as compared to 46% for those taking the placebo (Mori 1972).

Glycoaminoglycans (glucosamine): There is some evidence that enhancing the protective layer of glycoaminoglycans in the bladder may be beneficial for cats, particularly those with refractory disease (Buffington 1996). Because these compounds are safe, they are indicated particularly in these nonresponsive cases.

Chinese herbal medicine/acupuncture

General considerations/rationale

Feline urological syndrome is a result of Heat and Damp accumulation in the Lower Burner. Qi stagnation is associated with the Lower Burner. Heat refers to the inflammation and hematuria. Damp may refer to proteinuria or the mucin plugs that may block the urethra. Stagnation leads to pain, so Qi stagnation refers to the pain associated with the condition. With Qi stagnation, the patient is unable to urinate because there is no energy to make the urine stream move.

Appropriate Chinese herbs

Glechoma (Jin qian cao), licorice (Gan cao), lygopodium (Hai jin sha), plantago (Che qian zi): 7 human patients with uroliths were treated with an herbal supplement containing these herbs in combination with dianthus (Qu mai), talc (Hua shi), clematis (Chuan mu tong), and cyathula (Chuan niu xi). 100% eliminated the stones within 10 days (Zhe Jiang Zhong Yi Za Zhi 1983).

Achyranthes (Niu xi): Has anti-inflammatory properties (Zhong Yao Tong Bao 1988). This may help to control the signs of FUS by decreasing inflammation in the lower urinary tract.

Alisma (Ze xie): Decreases calcium oxalate crystal formation in the renal tubule in hamsters, inhibiting the formation of kidney stones (Yi 1996, Yi 1997). It has been proven to have diuretic effects in people. It also increases sodium and urea output (Shi 1962, Xu 1963, Deng 1961).

Centipede (Wu gong): Has antibacterial effects (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Earthworms (Di long): Earthworms are potent analgesics (Chen 1996). They may help decrease the discomfort associated with bladder irritation.

Eupolyphaga (Tu bie cong): Has analgesic properties (Zhe Jiang Zhong Yi Za Zhi 1983). Humans have reported discomfort associated with urinary dysfunction, so it is reasonable to assume animals also suffer.

Glechoma (Jin qian cao): Helps to dissolve urinary tract stones and has been shown to prevent their reformation. It is more efficacious against renal uroliths than cystic calculi. It also has a significant diuretic action (Guang Xi Zhong Yi Yao 1990).

Phellodendron (Huang bai): Has demonstrated antibiotic efficacy against a variety of pathogens (Zhong Yao Xue 1998, Zhong Yao Da Ci Dian 1977). Therefore, it may be of use in bacterial causes of FUS.

Pyrrosia leaf (Shi wei): Has demonstrated antiviral activity (Zhong Guo Yao Li Xue Tong Bao 1989). Some researchers have hypothesized a viral etiology for FUS, so this herb may be useful for this condition.

Vaccaria seed (Wang bu liu xing): A component of a formula used to treat 95 patients with urinary tract stones with an 88% success rate (An Hui Zhong Yi Xue Yuan Xue Bao 1986).

Wolfberry (Gou qi zi): Has antibacterial effects against many strains of bacteria (Jin 1995). In addition, it has immunostimulant properties. It can increase the phagocytosis rate of macrophages (Geng 1988). These abilities may make it valuable for use in bacterial causes of FUS.

Acupuncture has been used successfully to treat urolithiasis. Most practitioners combine acupuncture with herbal therapy. In one study involving 127 human patients, 69% had complete resolution and 20% experienced improvement when treated with a combination of auricular acupuncture, body acupuncture, and herbal supplements (Cao 1989).

Homotoxicology

General considerations/rationale

In the purest sense, cystitis-urethritis is an inflammatory reaction, however, many cases represent deeper homotoxicoses and vicariation reactions, especially Impregnation and Deposition phase disorders. It is the author's belief that many cases of FLUTDS and FUS fall into this latter category. The general medical aspects have been summarized in conventional literature (Gerber 2005, Hostutler 2005).

The clinician needs to carefully examine the patient's health history to determine which way the case is shifting on the Six-Phase Table of Homotoxicology. All cats presenting with urinary signs should have a dietary and environmental history taken; receive a full physical examination; and have at minimum a urinalysis; and preferentially a urinalysis, urine culture and sensitivity, and full blood evaluation. Identifying the correct cause of FLUTDS is critical to successfully handling these cats, and the cause may not be apparent even with complete testing. The lack of growth on a routine culture may not rule out bacterial infection, either, because cat urine is antibacterial and may suppress bacterial growth in transit to the laboratory. Furthermore, some agents may not grow on routine

media (i.e. *Mycoplasma*). Bacteria, although part of the pathogenesis of infectious causes, may appear and persist because of primary changes in the biological terrain and may well play a beneficial role by consuming such homotoxins as they are mobilized and eliminated.

A recent study showed that when *Corynebacterium urealyticum* was isolated, treated with appropriate antibiotic medication, and the affected bladder lining was surgically stripped, these patients improved and resolved the infection with *Corynebacterium* only to commonly recur with another bacterial agent, an indication of compromise of the basic immune functions in the area (Bailiff 2005). Thus, we see the theoretical application of antihomotoxic agents in accordance with the Six-Phase Theory of Reckeweg may decrease the risk of future infections by cleaning the terrain and improving immune function, while failing to damage further mucosal borders and permeability of gut and urinary mucosal elements.

The presence of a deeper homotoxicosis should then be considered in any case which presents with a history of recurrent cystitis.

As with all chronic and recurring conditions, treatment can be frustrating. No one protocol works for all patients. Some may respond very slowly while others respond remarkably fast, and clients need to be counseled to watch for signs of urinary obstruction during the 2 to 4 weeks after first presentation, so that more serious urinary blockage can be detected if it occurs. When simple symptom remedies and food changes do not solve the problem, it is likely rooted in deeper pathology that has shifted in a beneficial manner toward the Inflammation Phase as the homotoxins are eliminated from the urinary tract through the action of inflammatory cells and mucus secretion. Homotoxicology remedies alone are usually not sufficient in these cases and response rates seem to be best when these agents are combined with integrative methods such as proper diet, increased water intake, and stress reduction, along with herbal and nutritional support. This area is open for research and improved clinical approach.

Appropriate homotoxicology formulas

***Apis compositum*:** Used for acute nephritis, albuminuria, burning with scant urine, copious casts, and when the last drops burn. Patients may cry or run away on last bit of urination.

***Atropinum compositum*:** Incredibly effective for pain relief in cases of renal colic/spasm. Not currently available as a vial, but may still be obtained as a tablet in the United States. The company will do special runs if sufficient quantity is ordered (Reckeweg 2000). Contains several useful therapeutics, including Pareira brava (also in *Reneel*, *Solidago compositum*, *BHI-Kidney*, *BHI-Uri-Cleanse*) for unremitting strangury with overwhelming pain and urine with thick, viscous, white mucus or brick-

dust sediment. Also treats hypertrophy of the prostate and renal colic (Reckeweg 2002).

***Belladonna homaccord*:** Used for localized inflammation, sudden and painful cystitis, urine retention and pain on passing urine, and dark urine with bloody casts. Echinacea agustifolia supports the immune system for inflammation of any kind (Reckeweg 2000).

***Berberis homaccord*:** Drains the urinary tract and liver, and supports adrenal tissue. Treats mucus with red tinge and polyuria alternating with reduced urine production. Useful in general detoxification of the urinary tract. *Veratrum album* and *Citrullus colocynthis* are included for renal colic and spasmodic pain associated with cystitis. Also useful in cases of urolithiasis (Reckeweg 2000).

***BHI-Bladder*:** Treats cystitis, urinary pain, urinary tract infection, peripheral edema, albuminuria, and hematuria.

***BHI-Inflammation*:** Reduces inflammation and provides immune support.

***BHI-Kidney Rx*:** Used for straining, stones, and bloody urination.

***BHI-Uri-Cleanse*:** Used for strong urine, urine with bad odor, kidney pain, red urine, scanty urine, and urinary pain.

***BHI-Uri-Control*:** Treats burning urination, a constant desire to urinate, and straining. Broadfoot reports some success with placing this agent in the food for patients that are difficult to medicate.

***Cantharsis compositum*:** Used for stranguria, straining, and urinary pain.

***Echinacea compositum*:** Provides support during any bacterial infection.

***Mercurius homaccord*:** May be useful in cases of localized inflammation and sepsis due to the antibacterial and antiviral effects of this remedy. It is not intended for long-term use.

***Mucosa compositum*:** Rehabilitates the mucosal elements of the body, particularly the urinary tract. Also used in Degeneration Phase disorders and following antibiotic therapy.

***Populus homaccord*:** Used in obstructed male cats and prostatitis cases that suffer from intense burning and difficulty urination.

***Reneel*:** Provides drainage and detoxification of renal and urinary tissues. Treats cystitis, urolithiasis, and stranguria. Treats bladder atony through *Causticum Hahnemanni* and bladder paresis through aluminum oxide. Also used for albuminuria and nephrosclerosis (Heel 2003).

***Sabal homaccord*:** Treats cystalgia, as in prostatic diseases with straining and difficult urination, and urine leakage (Reckeweg 2000).

***Solidago compositum*:** Stimulates the defense mechanisms of the urinary tract and treats bladder and

kidney inflammation and infection. A phase remedy for Deposition Phase homotoxicoses and part of the Deep Detoxification formula.

Spascupreel: Treats painful spasm of the urinary tract.

Tonsilla compositum: Supports immune function in Impregnation and Dedifferentiation phases.

Traumeel S: An intermittent agent in all inflammatory reactions.

Authors' suggested protocols

Nutrition

Urinary support formulas: 1 tablet BID.

Immune support formula: One-half to 1 tablet BID.

Bromelain: One-fourth capsule with food.

Glucosamine sulfate: 125 mgs BID.

Chinese herbal medicine/acupuncture

Formula H27 CrystaClair: 1 capsule per 10 to 20 pounds twice daily. This formula is indicated for a variety of crystals and stones as well as inflammatory diseases of the lower urinary tract. The lower dose is used for prevention and the higher dose for dissolution of the uroliths. In addition to the herbs mentioned above, CrystaClair also contains centipede (Wu gong), eupolyphaga (Tu bie cong), lindera (Wu yao), malva (Dong kui zi), scorpion (Quan xie), and wolfberry (Gou qi zi). These additional herbs help increase the efficacy of the formula. In general, no diet change or drugs are needed.

The authors use the following acupuncture points: BL28, SP6, CV3 and SP9 (Handbook of TCM Practitioners 1987).

Homotoxicology

Symptom formula per Broadfoot and Palmquist: Populus homaccord, Cantharsis compositum, and BHI-Bladder mixed together and given 4 to 5 times daily for the first day or until symptoms improve, then given BID PO. If Populus homaccord is not available, substitute Berberis homaccord and Sabal homaccord. If spasm is bad, consider Atropinum compositum or Spascupreel.

Alternative protocol per Martin Goldstein: Combine 4 BHI-Inflammation and 4 BHI-Bladder with 1 ounce of spring water and succuss. Give orally BID to QID depending upon symptoms. Keep mixture refrigerated (Goldstein 1999).

General detoxification: Detox Kit (Lymphomyosot, Nux vomica homaccord, and Berberis homaccord) PO BID for 30 days in simple cases.

Deep detoxification: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum, and Mucosa compositum mixed together and

given PO every 3 days for 120 days in cases that recur or do not respond.

URINARY INCONTINENCE

Definition and cause

Urinary incontinence is the inability to store urine and the loss of control of urination. The underlying cause is most commonly post spaying or neutering and decrease in hormonal control of the sphincter. Neurological deficits (spinal cord, central nervous system), bladder storage deficits, chronic inflammation or infection, urolithiasis, and anatomical abnormalities are the other common underlying causes (Arnold 1992; Goodkin 1996; Labato 1994; Lane 1994, 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The underlying cause should be determined and addressed before initiating therapy if possible. The treatment of choice for hormonal imbalances is hormone replacement

therapy (diethylstilbesterol and testosterone). Alternatively, adrenergic agonists such as phenyl-propanolamine are also effective. Surgery may be recommended in refractory cases (Holt 1992; Moreau 1989; Richter 1985, 1989).

Anticipated prognosis

Many animals respond well to medical therapy and are controlled; however, the potential for medication side effects increases because the therapy is lifelong. The prognosis is more guarded when the incontinence is secondary to other diseases, blockages, chronic urinary infections, and urolithiasis.

Integrative veterinary therapies

The integrative approach to urinary incontinence is multifaceted, focusing upon the nervous and muscular control of the bladder and urethra, the reduction of inflammation in the lower urogenital system, and general nutrient support for the endocrine (hormonal) glands. In some cases the reliance on drugs to control the incontinence may be reduced or eliminated.

Nutrition

General considerations/rationale

Therapeutic nutrition focuses upon nutrients that can help to improve organ function and hormonal control.

Appropriate nutrients

Nutritional/gland therapy: Glandular pituitary, hypothalamus, brain, and ovary/uterus or prostate/testicular supply the intrinsic nutrients that help reduce cellular inflammation and improve organ function. These glandular materials are hormone free and support general gland function even when the animal has been spayed or neutered. In these animals the pituitary and adrenal glands, which are responsible for picking up the “hormonal slack,” receive nutrient support (see Gland Therapy in Chapter 2 for a more detailed explanation).

Magnesium: Magnesium has been associated with neuromuscular function and conditions such as muscle cramping, weakness, and neuromuscular dysfunction. Magnesium is recommended for weakening muscle function (Bibley 1996, Levin 2002).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient that is required by the nerves and all of the body's cells for general health and wellness (Hanin 1987).

Phosphatidyl serine: Phosphatidyl serine is a phospholipid and an essential ingredient in cellular membranes, particularly those of brain cells. It has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). The addition of PS in people with Alzheimer's disease resulted in a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Chinese herbal medicine/acupuncture

General considerations/rationale

Urinary incontinence is due to Qi and Yang deficiency in the Lung, Spleen, and Kidney. There is associated Blood stagnation and Phlegm accumulation. The Blood stagnation and Phlegm block the meridians to the Brain. With Kidney Qi and Yang deficiency there is not enough energy to hold the urine. The Lung and Spleen help to properly distribute water. Incontinence can result when either one lacks energy. Quite often, patients with incontinence are older. These patients sleep deeper and may be senile. They may not sense that the urine is coming, which leads to incontinence. This confusion is attributed to Phlegm because it is thought that Phlegm can fog the mind.

Appropriate Chinese herbs

Mantis egg case (Sang piao xiao): Has been used to treat bedwetting in adults and children. In one study 45 of 50 patients had complete resolution using an herbal supplement containing sang piao xiao (Xin Yi Xue 1974). Another study of 11 patients who experienced bedwetting were given a different herbal supplement containing mantis egg case. All experienced improvement (Zhong Yi Za Zhi 1965). Three patients with frequent urination were treated with Ma Zi Ren Wan (Ma zi ren, Da huang, Shan yao, Zhi zi, Hou po and Xing ren) modified by the addition of Fu pen zi and Sang piao xiao. All reported improvement in signs (Wu 1985).

Rubus (Fu pen zi): Has been shown to have estrogen-like activity on the vaginal mucosa (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995). Many spayed female dogs experience urinary incontinence that is responsive to estrogenic hormones, indicating that rubus may help improve urinary retention ability.

Acupuncture

Studies have shown that acupuncture is an efficacious modality for treating incontinence. In one study 15 elderly women who had not responded sufficiently to standard pharmacological therapy for incontinence were treated with acupuncture. Most responded well, with 80% still reporting improvement 3 months after acupuncture therapy ended (Bergstrom 2000). In another study of 76 men, electroacupuncture at 200 hz was delivered to CV3, St28, BL23, BL28, SP6, SP9, KI3, and scalp points. Half

were cured and 26% more reported improvement (Zhang 1999).

Homotoxicology

General considerations/rationale

Urinary incontinence represents an Impregnation/Degeneration Phase homotoxicosis. Such urinary incontinence can be common in bitches following routine ovariohysterectomy. There are obviously many different causes for this condition, but if the body is damaged to the point of incontinence one can be sure that the patient has crossed the biological divide. Incontinence can be frustrating to treat for this reason, and pharmaceutical therapy may be needed. Careful evaluation of the musculoskeletal, neurological, endocrine, and urinary systems are advised in all such cases. Neoplasia can cause incontinence; this represents Dedifferentiation Phase disease.

Appropriate homotoxicology formulas

BHI-Uri-Control (Also known as **BHI-Bladder**): Treats burning urination, a constant desire to urinate, straining, minor urinary pain, increased urgency, and mild incontinence. Indicated for urinary gravel, dribbling of urine when sitting, and pain on micturition (strangury) (Reckeweg 2002).

Berberis homaccord: Supports adrenal functions and urinary drainage. Treats pain from renal calculi, especially renal colic, as well as other diseases of the genitourinary system, such as cystitis with pyelitis and urinary tenesmus with cloudy, mealy, red, or flaky urine. Also treats adrenal exhaustion (Reckeweg 2002). Contains *Colocynthis*, which is helpful in cases of weakened lower back and even straining to pass stool, especially if colitis-type signs are present.

Cerebrum compositum (behavioral): Supports cerebral tissue and detoxification, and improves mentation. Contains Conium for inability to finish mating, along with involuntary interruption of the flow of urine. Conium-containing formulas may be useful, particularly in hypertrophy of the prostate. Such cases may be accompanied by cystitis with purulent urine. Also consider Conium in the neoplastic and preneoplastic phases (Reckeweg 2002). Embryo suis is included for burning pain in the bladder and urethra with urine that is strong and offensive. Gelsemium is quite particularly indicated in states of paralysis, e.g., after apoplexy, in weakness of the bladder and urinary incontinence, and in spastic states. Hyoscyamus is included for paralysis of the sphincters of the bladder and anus. Kali phosphoricum, considered to be the universal nerve remedy, can be invaluable in cases of urine incontinence and in bladder irritation, and is a supporting remedy in albuminuria. Manganum phosphoricum is indicated for spinal paralysis, frequent urination with pressure in kidneys, and incontinence when walking (must

urinate frequently to prevent this). Medorrhinum is well indicated in nocturnal enuresis, renal colic, cystitis, and urethritis along with general itching and leucorrhea.

Phosphoricum acidum is included for irritable conditions of the bladder, prostatorrhoea before urination, frequent urination at night, burning or cutting pains during urination, retention of urine, or when urine has red sediment and a greasy layer on the surface. Selenium is included for catarrh of the bladder, with dribbling of urine after urination and involuntary passage of urine while walking. In the past, selenium was often used as a chief remedy in chronic, post-gonorrheal urethritis, along with Sepia, Kali iodatum, and Sulphur. Thuja has some additional urinary indications, such as sharp pains in the kidneys (possibly associated with inflammatory symptoms); burning-hot urine; and nonspecific inflammations such as cystitis or urethritis, pyelitis, and paralysis of the bladder. Thuja also may be valuable in prostatitis with a constant urging to urinate and yet the patient must wait a long time before being able to pass urine (Reckeweg 2002).

Discus compositum: Used in cases originating from neurological disease involving the back.

Gelsemium homaccord: Used in classical homeopathy for rear leg weakness and urinary incontinence. Treats bladder paralysis, dilute urine, dizziness or lethargy, cases with fearful history, and weakness and trembling of limbs. Gelsemium is particularly indicated in states of paralysis, e.g., after apoplexy, and in weakness of the bladder and urinary incontinence. It can be useful in spastic conditions and urinary incontinence (Reckeweg 2002).

Hormeel: Supports endocrine functions (Heel 2003). Sepia is included for hyperactivity; nervous disorders with a sensation of bearing-down and fullness in the urinary organs, pressure on the bladder, and frequent passing of urine with flatulence in the lower abdomen; and inflammations of the urinary organs. The urine contains a sediment like clay, and may also have an offensive odor; this is also useful in cases manifesting disorders in voiding from the urinary bladder. In enuresis, the incontinence usually takes place during first sleep. Mentals include conditions of exhaustion; disorders of emotional or otherwise psychological nature; and depressive emotional discord or upset. This remedy also contains Pulsatilla, which has as an indication for disorders of voiding from the bladder (Reckeweg 2002).

Ovarium compositum: May help to improve connective tissue function when the ovaries have been removed.

Plantago homaccord: Treats urine leakage and burning, cystalgia, and urinary incontinence (Reckeweg 2002). Many dogs have been successfully treated using this remedy. It can take several weeks before any change is noted, so patience is recommended. A 60-day trial is not inappropriate.

Populus homaccord: Used for urine dribbling and in obstructed male cats and prostatitis cases that suffer from recurring painful intense burning and difficulty urination. Contains Populus compositum with Kreosotum for incontinence at night as well as profuse pale urine and a violent urging to urinate. Also contains Mercurius sublimatus corrosivus for affections of the mucosa, acute glomerulonephritis with albuminuria, hematuria, and tenesmus. Mental notes include shivering, trembling of the limbs, brain symptoms, fear, restlessness, and unquenchable thirst. Populus homaccord is also found in *Solidago compositum* (Reckeweg 2002). Uva ursi is included for cystitis, pyelitis, urethritis, and urinary incontinence (Reckeweg 2002). Other remedies in this combination include: Equisetum, Solidago, Berberis, and a number of other well-indicated components.

Reneel: Contains Causticum. Low potencies are indicated for urinary incontinence following ovariohysterectomy (Day 1990). This single component is used in disorders of the respiratory passages, disorders of the urinary tract, chronic eczema, chronic disorders in the field of rheumatic diseases, spasmodic contractions, paralysis, emotional discord or upset, itching of the urethral orifice, tenesmus of urine, tenesmus at stool, fruitless attempts at urination, raw pain in the bladder, and enuresis day or night. Treats stress incontinence of urine, especially on coughing, blowing the nose, or sneezing (Reckeweg 2002). Provides drainage and detoxification of the urinary system and treats urinary passage inflammation, particularly in acute phases (Reckeweg 2000). Also treats cystitis, urolithiasis, and stranguria. Causticum Hahnemanni is included for bladder atony and aluminum oxide is included for bladder paresis. Treats nephrosclerosis (Heel 2003) and albuminuria.

Sabal homaccord: Treats difficult urination and dribbling urine. Particularly well suited in prostatic issues. Also used for paralysis of the urinary sphincter (Boericke 1927).

Solidago compositum: Phase remedy for Deposition Phases and in detoxification and drainage of the urinary tract.

Spascupreel: Well suited for spasms, pain, and cutting pain. A previous remedy, Atropinum compositum, is excellent for these patients, but is now only available as tablets. The Gelsemium component of *Spascupreel* is particularly indicated in states of paralysis, or weakness of the bladder and urinary incontinence (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Female or male, pituitary/hypothalamus/pineal support formulas: 1 tablet for each 25 pounds of body weight BID.

Brain nerve support formula: One-half tablet for each 25 pounds of body weight BID.

Magnesium: 10 mgs for every 10 pounds of body weight SID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Phosphatidyl serine: 20 mgs for each 15 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Formula H37 Incontinence Support: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs discussed above, H37 Incontinence Support also contains alpinia fruit (Yi zhi ren), astragalus (Huang qi), cinnamon bark (Rou gui), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), fossil bones (Long gu), linden (Wu yao), oyster shell (Mu li), psoralea (Bu gu zhi), rehmannia (Shu di huang), and schizandra (Wu wei zi). These additional herbs increase the efficacy of the formula.

Acupuncture points commonly employed include SP6, ST36, CV3, and CV4 (Basic and Express Acupuncture Therapy 1969).

Homotoxicology

Proper diagnosis is important to long-term treatment plans. Conventional medication may be necessary.

Palmquist starts most cases on Plantago homaccord and Reneel orally BID, then reassesses the case and responds as is appropriate. For refractory cases, continue the protocol below.

Ovarium compositum: Inject weekly for 4 to 6 weeks.

Gelsemium homaccord, Plantago homaccord, Sabal homaccord, Reneel, and Hormeel: Combine and give orally twice daily for several weeks. Continue as needed for ongoing control.

Broadfoot begins with Cerebrum compositum as an injection, and continues 2 to 3 times weekly. Give Gelsemium homaccord BID. Consider Hormeel, Testis compositum, and Tonico-Heel.

UROLITHIASIS: CALCIUM OXALATE, STRUVITE, URATE

Definition and cause

Urolithiasis is one of the most researched conditions of dogs and cats. Volumes of well-researched clinical and scientific studies have been conducted, and diets have been designed to prevent and treat urolithiasis. It is beyond the scope of this book to present an in-depth discussion of the cause and medical, dietary, and surgical approaches to this condition. A number of references that thoroughly discuss the cause, prevention, and treatment of urolithiasis in domestic animals appear below. The causes of urolithiasis include infection, diet (including dry foods), elevated ash and magnesium content, acidifying and alkalinizing diets, supersaturated urine, and genetic

predisposition (Lulich 2000, 2003; Osborne 1995, 1996, 1999, 2000, 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment of urolithiasis in dogs and cats is multifaceted and depends on the animal, underlying cause, behavior, and diet. Common treatment methods include restricted and specially formulated diets such as Hills C/D, U/D, and S/D; antibiotics; urinary acidifiers or alkalizers; surgery; retrograde urohydropulsion; and behavior modification techniques (Abdullahi 1984; Bartges 1996, 1999, 2003; Collins 1998; Lulich 1992, 1993, 2001; Osborne 1981, 1990; Sorenson 1993).

Anticipated prognosis

Medical therapy, surgery, dietary adjustments, and behavior techniques can produce good results and prognosis; however, recurrences are often likely and client compliance is mandatory (Lulich 2000; Osborne 2000, 2003).

Integrative veterinary therapies

An integrative approach to urolithiasis considers reducing inflammation, enhancing elimination of toxins and metabolic wastes, tissue sparing of the cells of the urogenital tract, and supporting the organs of the immune system (see Cystitis, above, for more detailed information). Nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on the glands of the urogenital and immune systems can be used with or independent from required medication are beneficial.

Struvite stones may be dissolved once normal urinary terrain is established, but oxalate and urate stones present a challenge. Homotoxicology and other alternative modalities, especially Traditional Chinese Medicine, may result in reduction of stone size and the breaking apart of larger stones, and integrate nicely into treatment plans for patients suffering from nonemergency urolithiasis. Surgery and chronic antibiotic therapy may be needed. In many cases, this is a recurrent problem and continued diet management along with long-term detoxification strategies are needed to obtain control of the situation.

Nutrition

General considerations/rationale

Therapeutic nutrition adds nutrients, antioxidants, and gland support for the tissues of the urogenital tract. These nutrients can help to reduce inflammation, are cellular protective, and can enhance the elimination of metabolic wastes and toxins.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, kidney, and pituitary provide intrinsic nutrients that nourish, reduce cellular inflammation, and improve elimination of metabolic wastes (see Gland Therapy in Chapter 2 for a more detailed explanation).

Bromelain: The proteolytic enzyme bromelain has been shown to enhance the effectiveness of antibiotics in people with urinary tract infections. A double-blind study showed that 100% of the people taking the enzyme had complete resolution of the UTI as compared to 46% for those taking the placebo (Mori 1972).

Essential fatty acids: Studies have shown that dietary essential fatty acids increase intestinal calcium absorption, thus assisting vitamin D in decreasing urinary calcium losses (Hertz-Picciotto 2000). Calcium may reduce the absorption of oxalates and may indirectly reduce the formation of kidney stones in people. Perhaps veterinary researchers will study the increased incidence of calcium oxalate crystals and stones in dogs and cats (Barilla 1978, Curhan 1993).

Vitamin E: Vitamin E is involved in the formation of scar tissue, and also helps to reduce it. Vitamin E also has organ- and tissue-sparing properties (Myers 1982; Shklar 1982, 1987).

Chinese herbal medicine/acupuncture

General considerations/rationale

In traditional Chinese Medicine, urolithiasis is due to Qi and Blood stagnation with Heat and Damp accumulation in the Lower Burner. Heat refers to the inflammation and hematuria. Damp refers to proteinuria. Stagnation leads to pain, so Qi and Blood stagnation refer to the pain associated with the condition. With Qi stagnation, the patient is unable to urinate because there is no energy to make the urine stream move.

Appropriate Chinese herbs

Glechoma (Jin qian cao), licorice (Gan cao), lygopodium (Hai jin sha), and plantago (Che qian zi): Seven human patients with uroliths were treated with an herbal supplement containing these herbs in combination with dianthus (Qu mai), talc (Hua shi), clematis (Chuan mu tong), and cyathula (Chuan niu xi). There was a 100% success rate in eliminating the stones within 10 days (Zhe Jiang Zhong Yi Za Zhi 1983).

Alisma (Ze xie): Decreases calcium oxalate crystal formation in the renal tubule in hamsters, inhibiting the formation of kidney stones (Yi 1996, Yi 1997). It has been proven to have diuretic effects in people. It increases sodium and urea output (Shi 1962, Xu 1963, Deng 1961).

Glechoma (Jin qian cao): Helps to dissolve urinary tract stones and has been shown to prevent their reformation.

It is more efficacious against renal uroliths than cystic calculi. It also has a significant diuretic action (Guang Xi Zhong Yi Yao 1990).

Vaccaria seed (Wang bu liu xing): A component of a formula used to treat 95 patients with urinary tract stones with an 88% success rate (An Hui Zhong Yi Xue Yuan Xue Bao 1986).

Homotoxicology

General considerations/rationale

Uroliths represent Deposition Phase disease. Stones can form for a wide variety of reasons, but homotoxicology views this issue as stemming from homotoxins that have accumulated in the area. Inflammatory Phase disease can progress to stone formation (Deposition Phase) and symptomatic Impregnation Phase disease (former toxin ingestion, vaccination impregnation, iatrogenic damage from drugs, etc.), which can begin to improve through regressive vicariation leading to the development of stones. Dietary imbalances can contribute to urolith formation. Primary organ failure or serious disease (hepatic shunt, hypercalcemia, and neoplasia) can lead to stone formation. Infection by bacteria, viruses, and fungi can also contribute, but biological therapists view such infections as predispositioned by the presence of homotoxins.

Therapy is aimed at eliminating the homotoxins, repairing damaged tissues, controlling infection, removing stones, and exercising preventative maintenance.

Appropriate homotoxicology formulas

Arsuraneel: Used in cases involving the right kidney.

Atropinum compositum: Very effective for painful urethral spasm but only available in the United State in tablet form. The authors hope that the oral or injectable vials are brought back due to their high efficacy in relieving pain.

Berberis homaccord: Antihomotoxic medication of choice for nephrolithiasis. Often combined with other remedies. Berberis drains the urinary tract and hepatobiliary tract, and supports adrenal function (Reckeweg 2000).

BHI-Uri-Cleanse: Treats pain and burning on urination, urinary urgency, strong smelling or scanty urine, pain in the kidney region, and renal colic with dribbling after urination (Heel 2002). The component Pareira brava is a classical remedy for pain from urinary calculi (Day 1994).

Cantharis compositum: Treats burning urination.

Coenzyme compositum: Used for cytosol energy production.

Engystol N: Helpful in cases involving the left kidney when used in combination with *Veratrum homaccord*. Consider *Engystol* when allergy or viral disease may be involved.

Galium-Heel: Deposition phase remedy.

Lithiumeel: Indicated for articular deposition of uric acid. Possibly consider its use in urate uroliths as an experimental application (Reckeweg 2000).

Lymphomyosot: Phase remedy that is useful for lymph drainage and immune/endocrine support.

Sabal homaccord: Treats prostatic disease and urethral narrowing that results in difficult urination.

Mucosa compositum: Rehabilitates the mucosal elements of multiple organs, including the urinary tract. Useful after antibiotic therapy or infection.

Plantago compositum: Used for hypersensitivity to sounds, localized inflammation phases, nocturnal enuresis, increased urine flow, popular dermatitis, and itching.

Populus compositum: Used in cases with prostatic disease, urethral burning, and narrowed urine stream.

Solidago compositum: A urinary Deposition Phase remedy. It is an *E. coli* nosode.

Spascupreel: Used for renal colic and spasmodic pain associated with uroliths (Heel 2003).

Reneel: Supports and detoxifies the urinary tract. Useful in cases of renal colic (Reckeweg 2000).

Ubichinon compositum: Used after antibiotics and in cases that have shifted to the Degeneration Phase.

Veratrum homaccord: Used when there is left kidney involvement, nausea, collapse, shock, or psychosis.

Authors' suggested protocols

Nutrition

Urinary support formula: 1 tablet for each 25 pounds of body weight BID.

Immune and pituitary support formulas: One-half tablet per 25 pounds of body weight SID.

Bromelain: 250 mgs for each 25 pounds of body weight with food.

Vitamin E: 100 IU for each 25 pounds of body weight SID.

Omega-3,6,9: 1 capsule for each 25 pounds of body weight with food.

Chinese herbal medicine/acupuncture

CrystalClair: Use for both prevention of urolithiasis and to dissolve stones. For dissolution, use 1 capsule per 5 to 10 pounds twice daily. For prevention, use 1 capsule per 20 pounds twice daily. In addition to the herbs mentioned above, CrystalClair also contains *achyranthes* (Niu xie), centipede (Wu gong), earthworm (Di long), eupolyphaga (Tu bie cong), linden (Wu yao), malva (Dong kui zi), phellodendron (Huang bai), pyrrisia (Shi wei), scorpion (Quan xie), and wolfberry (Gou qi zi). In general, no diet change or drugs are needed to control the condition when using this herbal supplement.

Homotoxicology

Symptom Formula: Berberis homaccord, Reneel, and Spascupreel (if painful) mixed together and given orally BID to TID.

Detoxification: Lymphomyosot, Galium-Heel, Solidago compositum, Coenzyme compositum, and Mucosa compositum mixed together and given twice weekly for 10 to 12 weeks minimum.

Chapter Sixteen

Metabolic and Endocrine Diseases

ADDISON'S DISEASE

Definition and cause

Addison's disease may be defined as a pathological reduction in the production of glucocorticoid and/or mineralocorticoid hormones by the adrenal glands. The most common cause of this reduced production is an autoimmune process. Other causes include pituitary gland underproduction, histoplasmosis, trauma, reaction to medications such as o,p-DDD, granulomatous disease, and cancer (Bonagura 2000, Ettinger 1989, Feldman 1996, Kintzer 2003, Verge 1995, Volpe 1977). Because of the central role of the adrenal glands in metabolism and immune function, multiple organs are often affected, leading to multiple, simultaneous diseases (Bowen 1986, Greco 2001, Nuefeld 1981).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The recommended treatment for Addison's disease is lifelong replacement therapy with prednisone, fluorocortisone, or DOCP (Kintzer 2003).

Anticipated prognosis

The prognosis is generally favorable with lifelong replacement therapy, except when there are multiple associated organ diseases (Bonagura 2000, Greco 2001, Kintzer 2003).

Integrative veterinary therapies

The adrenal glands are exhausted and function is low in Addison's disease, and stabilization is required with medical therapy. Nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have tissue-sparing and regenerative effects on cells can help the

adrenals and all of the body's other interrelated glands such as the pituitary gland.

If animals with Addison's disease are diagnosed early and medicated properly, the integration of alternative therapies may help with stability and a return of normal adrenal function. In certain animals it may be possible to reduce medication to lower levels along with appropriate organ systems management.

Nutrition

General considerations/rationale

While medical therapy is focused upon adrenal stability, the nutritional approach adds nutrients, antioxidants, and gland support for the adrenal glands and other related organ systems.

Because Addison's disease is serious and affects multiple organ systems, a medical and physiological evaluation of the blood is recommended to assess total glandular health. This information helps clinicians formulate therapeutic nutritional protocols that address adrenal support as well as underlying organ conditions that may be or have been affected by the compromised adrenal function (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, kidney, liver, pituitary, and hypothalamus provide the intrinsic nutrients that nourish and help improve overall organ function and help to slow degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

N,N-Dimethylglycine (DMG): N,N-Dimethylglycine (DMG) has been widely researched in both humans and animals. DMG has been found to increase energy and enhance immune function (Barnes 1979, Graber 1981, Kendall 2000, Reap 1990, Walker 1988).

Vitamin C (ascorbic acid): Studies have shown that vitamin C can help balance, attenuate, and balance circulating cortisol levels (Brody 2002, Peters 2001).

Chinese herbal medicine

General considerations/rationale

According to TCM, Addison's disease is due to a Yang deficiency in the Spleen and Kidney. Yang can be thought of as energy or heat. The lack of Yang causes the hypometabolic state that is seen in patients with hypoadrenocorticism. The Spleen controls the muscles so a deficiency in Spleen Yang causes the weakness that is exhibited by patients. Kidney Yang warms the body so a deficiency could lead to the hypothermia that is often seen. In some cases there may be melena and or hematemesis. The Spleen is responsible for digestion and holding the blood in the vessels according to TCM, so a deficiency in Spleen Yang explains these signs. Treatment involves treating the slow metabolism (bradycardia) and weakness. When possible, TCM aims to restore the body to normal levels. Therefore, herbs that increase the adrenocortical hormones to normal levels are indicated.

Appropriate Chinese herbs

Astragalus (Huang qi): Increases the basal metabolic rate in mice (Zhong Yao Yao Li Yu Lin Chuang 1985).

Cinnamon (Rou gui): Contains cinnamaldehyde, which has positive inotropic and chronotropic effects on the heart (Yuan 1981).

Cornus (Shan zhu yu): Has demonstrated positive inotropic effects in cats. This lead to increased blood pressure and better peripheral perfusion (Hu 1988).

Deer horn gelatin (Lu jiao jiao): Strengthens muscles. When given to mice, there was a significant increase in the length of time they were able to swim (Wang 1992).

Dioscorea (Shan yao): Decreases muscular fatigue (Zhang 1996).

Epimedium (Yin yang huo): Increases the secretion of corticosterone and cortisol (Zhong Yao Da Ci Dian 1977).

Licorice (Gan cao): Possesses glucocorticoid and mineralocorticoid effects due to the glycyrrhizin and glycyrrhetinic acid components. These compounds cause reabsorption of sodium and water and potassium excretion and they prolong the effect of cortisones in the body either by decreasing its metabolism in the liver or by increasing the plasma concentration by decreasing protein binding (Zhong Yao Zhi 1993). Licorice was shown to be very effective in treating Addison's disease in a group of human patients (Bai Qui En Yi Ke Da Xue Xue Bao 1978).

Rehmannia (Shu di huang): Has been shown to increase the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Addison's disease is a Degeneration Phase disorder. Endocrine function of the adrenal gland is so depressed that

sudden collapse and even death can occur. If patients are caught in earlier phases, improvement may be achieved through rest and support of the adrenal functions. Therapy with pharmaceutical agents is indicated, and after some time the practitioner may attempt to decrease the dosage of drugs but should monitor the patient's biochemical and physical status carefully.

Some cases will be found to require markedly lower doses of hormonal replacement after biological therapy (Palmquist 2003).

Appropriate homotoxicology formulas

The first 3 antihomotoxic medicines are the most important in this protocol, but combination with other formulas is needed to individualize therapy.

Berberis homaccord: A mainstay of therapy in adrenal gland disease (Heel 2003). It provides drainage and detoxification of the adrenal gland, kidney, and liver. A wide range of bioactive compounds are present in *Berberis vulgaris* extracts. Research is ongoing in this area (Food Consortium 2005, Fatei, et al. 2005).

China homaccord: Used for generalized weakness, collapse and shock, and hypotension (Reckeweg 2000).

Coenzyme compositum: A catalyst that supports cytoplasmic energy production.

Galium-Heel: A cellular and matrix detoxification and drainage formula with support for kidney. It is a phase remedy for diseases involving the Deposition, Impregnation, Degeneration, and Dedifferentiation phases.

Ginseng compositum: Used for exhaustion and weakness.

Glyoxal compositum: Depolymerizes homotoxins from cell membrane systems that block receptor recognition and function as well as other enzyme actions.

Hormeel: Normalizes hormonal functions.

Ovarium compositum: Provides drainage of the matrix and support of endocrine function in females.

Phosphor homaccord: Provides antihomotoxic benefits in all parenchymal organ diseases.

Testes compositum: Provides drainage of the matrix and support of endocrine function in males.

Thalamus compositum: Supports the central nervous components and endocrine system from a top-down approach. Provides glandular support for the pineal gland, optic thalamus, and adrenal gland. Cyclic AMP in dilution stimulates regulatory enzyme activity in cellular phases of the disease (Broadfoot, Demers, Palmquist 2006).

Thyroidea compositum: Provides normalization of hormonal function and matrix drainage in deep cases.

Tonsilla compositum: Offers immune support and deep support for the endocrine system. Alternate with *Thyroidea compositum* in endocrine dysfunction cases.

Ubichinon compositum: A catalyst that supports mitochondrial function and deblocking of enzyme function.

Authors' suggested protocols

Nutrition

Adrenal and kidney support formulas: 1 tablet for each 25 pounds of body weight BID.

Pituitary/hypothalamus/pineal and liver support formulas: One-half tablet for each 25 pounds of body weight BID.

DMG: Liquid—One-half ml per 25 pounds of body weight (maximum, 2 mls); tablets—125 mg—1 tablet for every 40 pounds of body weight (maximum, 3 tablets).

Vitamin C: 100 mgs for each 15 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H101 Addison's disease: 1 capsule per 10 to 20 pounds to effect twice daily. This supplement also contains alisma (Ze xie), codonopsis (Dang shen), ligustrum (Nu zhen zi), loranthus (Sang ji sheng), mouton (Mu dan pi), poria (Fu ling), psoralea (Bu gu zhi), and wolfberry (Gou qi zi). These herbs help increase the efficacy in patients with hypoadrenocorticism. The herbal combination helps to regulate pituitary-adrenal functions and helps the body to produce more natural cortisol. It may be used alone or with low doses of corticosteroids if necessary.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom formula: Berberis homaccord, Galium-Heel, China homaccord, and Phosphor homaccord mixed together and given orally BID to TID. After initial crisis is over alternate Hormeel BID with China homaccord. Give Ginseng compositum if there is weakness or infirmity, particularly in geriatric animals.

Deep detoxification formula: Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Tonsilla compositum, Coenzyme compositum, and Ubichinon compositum mixed together and given twice weekly for 12 weeks. Glyoxal compositum given by injection initially and at intervals when improvement has waned. Thalamus compositum as an initial injection and repeated intermittently.

Testes compositum or Ovarium compositum: Base on patient gender; give weekly by injection, especially in neutered pets.

HYPERADRENALCORTICISM (CUSHING'S DISEASE)/ PITUITARY-DEPENDANT HYPERADRENOCORTICISM (PDH)

Definition and cause

Hyperadrenocorticism (Cushing's disease) is defined as an excessive production or presence of cortisol, which has indirect and pronounced effects on multiple organ systems. The cause is most commonly due to oversecretion of ACTH by the pituitary gland, and is caused by hyperplasia or a tumor. It is less commonly caused by an adrenal tumor (or hyperplasia) or the excessive administration of glucocorticoids. In all cases the pituitary can no longer recognize, respond to, or control the elevated blood cortisol levels. The literature reports an increased incidence of Cushing's disease in Golden and Labrador Retrievers; Poodles; Boston, Scottish, and Yorkshire Terriers; Boxers; Dachshunds; and German Shepherds (Feldman 2004, Kemppainen 1997, Kintzer 2003, Peterson 1984, Witt 2004). The disease is rare in cats (Duesberg 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy focuses on the affected gland and ultimately reduces the production of circulating cortisol. The most commonly used drugs for cortisol reduction are o,p-DDD (Mitotane, Lysodren), Ketaconazole, Deprenyl, and Vetoryl (Trilostane). Other options include surgery and/or radiation therapy (Barker 2005; Braddock 2004; Bruyette 1997; Kintzer 1994, 1995, 2003; Peterson 1997; Witt 2004). Nutritional recommendations address secondary complications such as diabetes, kidney disease, or polyarthritis. Vitamin C may be indicated to help reduce cortisol levels (Brody 2002).

Anticipated prognosis

Untreated Cushing's disease carries a poor prognosis. Due to the excessive circulating cortisol and the associated immunosuppressing effects, numerous secondary diseases can worsen the prognosis. Short-term response for 4 to 6 months is quite favorable. Average survival time is about 2 years, considerably less with a malignancy of the adrenal gland. The goal of therapy is to reduce the hormonal load, thereby improving the day-to-day quality of life and minimizing secondary organ system disease (Barker 2005; Braddock 2004; Bruyette 1997; Duesberg 1997; Feldman 2004; Kintzer 1994, 1995, 2003; Peterson 1997; Ramsey 2004; Sannello 2004; Witt 2004).

Integrative veterinary therapies

The pituitary and adrenal glands have major metabolic and control responsibilities in the body, and therefore are often overworked and prone to degeneration. At the cellular level, stress, exposure to chemicals and toxins, improper nutrition, and lack of antioxidants can lead to local inflammation, excessive production of free radicals, and the production of auto-antibodies. This process can result in degeneration or inflammation of the pituitary or adrenal gland. Progression of this free-radical-based inflammatory process can lead to hyperplasia and set the stage for a malignancy. The appropriate use of antioxidants, vital nutrients, herbs, and homeopathic remedies can address this inflammatory/degenerative process by either quieting or slowing the process and thereby reducing the dependent need for medication and improving quality of life. For a more in-depth discussion of causes of cancer, toxicity, and loss of control over cellular division, refer to Chapters 31 through 34.

While chemotherapeutics are the drugs of choice for Cushing's disease, these medications are directed at the destruction of the hormone-secreting cells, thereby reducing the secondary effects of excessive levels. Medical therapy for Cushing's disease does not reduce the cellular inflammation that leads to the hyperplasia, nor does it ameliorate the degenerative process that sets the stage for formation of adenoma or carcinoma. It is in these areas that integrative veterinary therapies are beneficial. They improve the response to medication and reduce cellular inflammation, which protects and spares cells from the side effects of the drugs, helps to balance the gland response of the immune system, and improves the animal's day-to-day quality of life. In addition, certain nutrients and herbs reduce cortisol levels and therefore can be used as a freestanding therapy (Craveri 1971, Kosaka 1966).

Nutrition

General considerations/rationale

Besides the many metabolic processes and the production of cortisol, the adrenal glands play a central role in the immune system. The cells of the adrenal glands can begin to overfunction during periods of chronic inflammation related to excess free radicals and depleted antioxidant reserves. As the inflammation spreads to surrounding glands, a cascade effect can occur, leading to glandular hyperactivity. While this is a Degenerative Phase disease at the cellular level, there is either hyperactivity or even tumor formation, and the use of antioxidants and anti-inflammatory nutrients can often help to reduce the inflammatory response and lessen the hyperproduction of cortisol.

Appropriate nutrients

Glandular therapy: Glandular adrenal, pituitary, pineal, and liver have been shown to have an anti-inflammatory and regenerative effects on the adrenal gland and can improve general function (Craveri 1971). See Gland Therapy in Chapter 2 for a complete description and mechanism of action.

Dehydroepiandrosterone (DHEA): DHEA has been shown to lower the plasma levels of cortisol such as those produced by hyperactive adrenal glands (Kroboth 2003). In addition, it has also been shown that a lack or decrease in the amounts of available DHEA may have an overall suppressing effect on the immune system in general (Kroboth 2003, Wisniewski 1993, Morio, et al. 1996).

Vitamin C (ascorbic acid): Studies have shown that vitamin C can help balance, attenuate, and reduce circulating cortisol levels (Brody 2002, Peters 2001). In addition, vitamin C can help offset the high alkalinity often associated with Cushing's disease and the secondary increase in the levels of alkaline phosphatase in the blood.

Vitamin B₆ (pantothenic acid): Vitamin B₆ has an overall anti-inflammatory effect in the body and also has been shown to help decrease circulating cortisol levels (Kosaka 1966, Tahiliani 1991, Tarasov 1985).

Phosphatidylserine: Phosphatidylserine is a phospholipid that is a structural component of the biological membranes in animals and plants. In studies, supplemental PS has been shown to improve mood and blunt the release of cortisol in response to physical stress (Monteleone, et al. 1990, Kelly 1999, Benton, et al. 2001).

Melatonin: Melatonin is produced by the pineal gland and has been proven to affect the sleep-awake cycles and the circadian rhythm and help induce normal sleep. It has been proven that in both adrenal and pituitary Cushing's disease patients, the levels of melatonin in the blood are significantly reduced and that the addition of melatonin increases the actual ratio of DHEA to cortisol (Soszynski, et al. 1989, Pawlikowski, et al. 2002).

Chinese herbal medicine

General considerations/rationale

Many herbs can be combined to treat pituitary hyperadrenocorticism, which is a complex condition that affects the body in a multitude of ways. The authors primarily approach this disease as a pituitary tumor condition and also address the associated physical abnormalities such as hypertension and hyperglycemia. If the diagnosis is confirmed as an adrenal tumor, then the CHM program is adjusted as listed below.

Appropriate Chinese herbs

Some herbs can be combined to treat hyperadrenocorticism because it is a complex condition affecting the body in a multitude of ways.

Some herbs, such as scrophularia (xuan shen) (Zhong Yao Yao Li Du Li Yu Lin Chuan 1992) and atractylodes (cang zhu) (Zhong Hua Yi Xue Za Zhi 1985), decrease blood glucose levels.

The following herbs help lower blood pressure, a common sequelum of Cushing's disease: astragalus root (Huang qi) (Gou Wai Yi Xue Can Kao Za Zhi 1977), rehmannia (Sheng di huang) (Zhong Yao Xue 1998), milettia (Ji xue teng) (Zhong Cao Yao Yao Li Xue 1983), ginseng (ren shen) (Ji Lin Yi Xue, 1983), and apricot seed (xing ren) (Chinese Medical Herbology and Pharmacology 2001).

Some herbs have hepatoprotective effects such as astragalus root (Huang qi) (Shang Hai Yi Yao Za Zhi 1998) and rehmannia (sheng di huang) (Zhong Yao Xue 1998).

Other herbs have been shown to decrease blood cholesterol or triglyceride levels. Myrrh (Mo yao) (Zhong Yi Za Zhi 1988) and sargassum (hai zao) (Shi Yong Nei Ke Za Zhi 1987) are included in this category.

Because some animals with Cushing's disease have a neoplastic etiology, herbs that inhibit neoplastic cell proliferation may be helpful. Cremastra (shan ci gu) (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin 1995) and barbat skullcap (ban zhi lian) (Wong 1996) have this action.

Note: If the diagnosis is an adrenal mass, the following herbs can be used: achyranthes (Niu xi), agrimony (Xian he cao), amber (Hu po), angelica radix (Dang gui), astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), Chinese sage (Shi jian chuan), cinnamon bark (Rou gui), cnidium (Chuan xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), kelp (Kun bu), licorice (Gan cao), mastic (Ru xiang), myrrh (Mo yao), notoginseng (San qi), oldenlandia (Bai hua she cao), oyster shell (Mu li), peach kernel (Tao ren), poria (Fu ling), pteropus (Wu ling zi), red peony (Chi shao), rehmannia (Sheng di huang), rhubarb (Da huang), scorpion (Quan xie), and zedoaria (E zhu). Please see Chapters 34 through 35 on cancer for more details on the treatment of tumors.

Homotoxicology

General considerations/rationale

Both functionally hypersecreting hypophyseal and adrenal tumors represent Dedifferentiation Phase disorders. Because these conditions are right of the biological division, therapy is generally palliative. However, spontaneous regression of hypophyseal masses may occur (Reckeweg 2000). These conditions represent end-stage homotoxicoses involving deep cellular damage and neoplastic transformation with subsequent loss of inherent autocontrol mechanisms. While no evidence-based veterinary protocols using antihomotoxic medica-

tions exist for this condition, therapy is commonly directed at reconditioning cellular organelles, especially energy production systems, draining toxic materials away from the diseased area, improving the microenvironment of the matrix, and improving detoxification and repair capabilities. Antihomotoxic medicines in the compositae category are especially helpful (Reckeweg 2000, Smit 2004).

Appropriate homotoxicology remedies

Berberis homaccord: Provides support of diseased adrenal gland, liver, and renal tissue.

Coenzyme compositum: Activates cellular energy production pathways.

Cutis compositum: Provides support and drainage for the skin. Useful in all phases of cutaneous disorders, especially in cases of pruritus (Heel 2003).

Galium-Heel: Activates the host's greater defense mechanisms in cellular phases.

Glyoxal compositum: Provides decoupling and activation of metabolism in enzyme blocked systems.

Graphites compositum: Provides constitutional support.

Hormeel: Normalizes hormonal pathways (Reckeweg 2000).

Hypothalamus compositum: Supports pituitary and hypothalamic tissue.

Lymphomyosot: Provides lymph drainage and immunendocrine support.

Ovarium compositum or Testis compositum: Supports gender-based hormonal axis.

Placenta compositum: Provides vascular and stem cell support.

Pulsatilla compositum: Provides support in cases of damage from corticosteroids and in cases of regulation rigidity.

Solidago compositum: Used for drainage, detoxification, and support of urinary organs.

Thyroidea compositum: Provides deep tissue drainage and hormonal support. Phase remedy in Impregnation Phase disorders. Used as a deep detoxification remedy and in cases of regressive vicariation. Patients taking this medication frequently discharge material from body orifices. This generally is a beneficial sign of the excretion of homotoxins, and as such, should not be interfered with by suppressive medicants. Pigmentary lesions often regress into inflammatory lesions and may cause pruritus as homotoxins deposits are mobilized (Reckeweg 2000).

Tonsilla compositum: Supports the immune system in Dedifferentiation Phase disorders.

Traumeel S: Activates sulfur-containing enzymes and supports inflammatory processes.

Ubichinon compositum: Used for mitochondrial rehabilitation and support of aerobic metabolism.

Authors' suggested protocols

Nutrition

Adrenal and pituitary/hypothalamus/pineal support formulas: 1 tablet for each 25 pounds of body weight BID.

Liver support formula: One-half tablet for each 25 pounds of body weight BID.

Melatonin: 1 mg for each 20 pounds of body weight SID (maximum, 5 mgs).

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Dehydroepiandrosterone (DHEA): 5 mgs for each 20 pounds of body weight SID.

Vitamin C (ascorbic acid): 100 mgs per 10 pounds of body weight BID.

Vitamin B₆ (pantothenic acid): 25 mgs for each 25 pounds of body weight SID (maximum, 100 mgs).

Chinese herbal medicine

Uro-G-Plus: 1 capsule for each 10 pounds of body weight BID. Decrease to 1 capsule for every 20 pounds of body weight twice daily if indicated based upon results of an ACTH response test.

IMPORTANT NOTE: The authors use the Uro-G-Plus formula, which also contains prunella (Xia ku cao), scrophularia (xuan shen), subprostrata sophora root (shan dou gen), and codonopsis (dang shen). These additional herbs help balance the formula. Do not combine Uro-G-Plus with lysodren or ketoconazole to avoid a potential Addisonian crisis. For adrenal tumors, the authors recommend Adrenal Tumor (H83) at a dose of 1 capsule per 5 to 8 pounds twice daily along with dietary restrictions appropriate for patients with neoplasia.

Homotoxicology (Please refer to the Dosage Schedule, Table 4.6 in Chapter 4, for homotoxicology remedies)

In pituitary tumors:

Deep detoxification—Lymphomyosot, Solidago compositum, Hepar compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum, Hypothalamus compositum, Placenta compositum, Testis compositum OR Ovarium compositum PO every 3 days.

Hormeel, Galium-Heel, Berberis homaccord: PO BID.

Tonsilla compositum: 1 tablet PO EOD.

Glyoxal: 1 tablet weekly.

In adrenal tumors (surgery if possible):

Deep detoxification—Lymphomyosot, Solidago compositum, Hepar compositum, Thyroidea compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Cutis compositum. PO every 3 days.

Galium-Heel, Traumeel, Graphites homaccord, Berberis homaccord: PO BID.

Glyoxal compositum: 1 tablet weekly.

DIABETES MELLITUS (TYPES 1 AND 2)**Definition and cause**

Diabetes mellitus is categorized as the inability to remove and use sugar from the blood; however, metabolically, the disease affects all body systems, organs, and tissues. Pancreatic metabolism dysfunction, secondary kidney disease,

neuropathy, and retinal changes occur with the disease. Causes include genetic predisposition, immune-mediated, pancreatic infections, adverse drug reactions, or are secondary to other diseases that lead to insulin deficiency, inadequacy, or inability to properly use insulin.

Long-standing insulin deficiency leads to ketoacidosis, an emergency situation that requires intensive medical therapy (Crenshaw 2003; Nelson 1995; Nichols 1995; Norsworthy 1995; Wallace 1990, 2003).

A recent study has revealed that early changes in intestinal permeability precede the development of type 1 diabetes in human patients (Bosi 2006). Dietary and environmental factors (high-carbohydrate diets, obesity, reduced exercise, etc.) are contributors. Insulin-dependent or type 1 diabetes mellitus is most commonly diagnosed in cats and dogs, but a metabolic-like syndrome exists in overweight cats that can manifest as persistently elevated blood glucose levels. In older reports this is referred to as type 2 diabetes.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Dietary therapy focuses upon weight reduction and increasing fiber content. Increased dietary fiber has been shown to help with obesity and improve control of blood glucose levels. The diet should also contain complex vs. simple carbohydrates (Nelson 1995; Plotnick 1995; Wallace 1990, 2003). A high-fiber, low-fat diet may benefit some cats, and most diabetic cats do better on higher protein, moderate-fat diets such as those produced by prescription diet companies. Homemade or commercial raw food diets may be well accepted by many patients as well. Glargine insulin has been associated with improved remission rates in cats, as have high protein diets (Weaver, et al. 2006).

The drug of choice for both dogs and cats is insulin (Greco 1995). Oral hypoglycemic agents such as Glipizide may be helpful in type 2 diabetes (Ford 1995; Garcia 1998; Miller 1995; Nelson 1994, 1995; Norsworthy 1995).

Anticipated prognosis

The prognosis is generally good for both dogs and cats with proper dietary and medical therapies. The disease is considered permanent in dogs. Complications such as ketoacidosis carry a much more guarded prognosis (Crenshaw 2003; Wallace 1990, 2003).

Integrative veterinary therapies

Causes of diabetes include genetic predisposition, immune-mediated, pancreatic infections, adverse drug reactions, or

are secondary to other disease, and result in insulin deficiency, inadequacy, or inability to properly use insulin.

The underlying mechanism of the insulin deficiency or improper utilization is most commonly inflammatory (auto-immune, infection, drug reaction, etc.). The integrative approach therefore is aimed at reducing the inflammatory process and protecting pancreatic cells. In addition, it is important to include multi-glandular support because diabetes and sugar metabolism affect all cells.

The addition of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, protective, and regenerative effects is indicated. If instituted early, integrative therapies can help slow progressive inflammation and improve overall organ function.

Nutrition

General considerations/rationale

Medical therapy is focused upon the regulation of blood glucose levels. Therapeutic nutrients, antioxidants, and gland support should focus upon multiple organ systems. Sugar metabolism affects all cells and organs, and therefore it is important to support overall bodily function. A medical and physiological blood evaluation is recommended to assess glandular health. This helps clinicians to formulate therapeutic nutritional protocols that address not only blood sugar regulation but also other organs that are affected by or contribute to the condition (see Chapter 2, Nutritional Blood Testing, for a more detailed discussion).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, spleen, pancreas, pituitary, thyroid, and liver provide intrinsic nutrients that nourish and help neutralize cellular immune inflammation and degeneration and can help improve organ function (See Gland Therapy in Chapter 2 for a more detailed explanation).

Vitamin E: It has been shown that people with lower blood levels of vitamin E are more prone to the development of both type 1 and 2 diabetes (Knekt 1999, Salonen 1995). In addition, it has been shown that vitamin E supplementation has improved glucose tolerance (Paolisso 1993). Vitamin E has also been shown to be beneficial in diabetic side effects such as retinopathy and nephropathy (Bursell 1999, Ross 1982).

Magnesium: It has been shown that diabetic people are traditionally low in magnesium, which is corrected with supplementation (Eibl 1995, Paolisso 1990). In addition, magnesium supplementation has been shown to improve the production of insulin in people with type 2 diabetes (Paolisso 1989). Studies also have shown that the requirements for insulin in people with type 1 diabetes are lower when supplemented with magnesium and that

retinopathy is more likely to occur when magnesium is deficient in the diet (McNair 1978). The American Diabetes Association suggests that there is a “strong association . . . between magnesium deficiency and insulin resistance;” however, the association will not confirm that this is a connection between a deficiency and the risk of developing diabetes (American Diabetes Association 1992).

Zinc: Type 1 diabetes in people has been linked to zinc deficiencies, which also may adversely affect general immune function (Nakamura 1991, Mocchegiani 1989). It has also been shown that supplementing the diet with zinc can help to lower blood glucose levels (Rao 1987).

Alpha-lipoic acid (ALA): ALA, which is involved metabolically in sugar and fat metabolism, has been clinically shown to be beneficial in the management and treatment of diabetes and diabetic neuropathy often found in people (Konrad 1999, Nickander 1996, Packer, 1997). Estrada has shown that ALA has improved glucose uptake in animals. The American Diabetes Association recommends ALA along with vitamin E for helping to prevent diabetic complications such as neuropathy, atherosclerosis, and cataract formation (Ou 1996, Yi 2006).

Coenzyme Q10: Coenzyme Q10 (CoQ10) is required for the normal metabolism of sugar. Studies have shown that animals with diabetes are reported to be deficient in CoQ10. People with type 2 diabetes have been shown to have significantly lower levels of coenzyme Q10 than healthy subjects (Miyake 1999). In another study it was shown that diabetics’ blood sugar levels declined more than 30% when supplemented (Shigeta 1966).

Chromium: Chromium helps release sugar from the blood to the muscles and other tissues, and is indicated in the treatment of diabetes mellitus. Early reports in the literature show that brewer’s yeast, which is rich in chromium, can be helpful in the treatment of diabetes and the improvement of glucose tolerance (Anderson 1998, 2000; Offenbacher 1980). Improvement has been reported in people with both type 1 and 2 diabetes, which is believed to be due to improved sensitivity to insulin (Gaby 1996, Evans 1989).

Chinese herbal medicine/acupuncture

General considerations/rationale

Diabetes is a result of Yin deficiency in the Lung, Stomach, and Kidney. This may be secondary to improper diet, stress, lack of exercise, and/or excess Dry and Heat.

Yin deficiency in the Lung allows the heat resulting from the relative Yang excess to dry up the body fluids, leading to thirst. The Yin deficiency in the Stomach makes the patient polyphagic in an attempt to cool the fire in the Stomach. The deficiency in the Kidneys leads to polyuria.

Stress, diet, and lack of exercise are all risk factors for diabetes in Western medicine. A tendency to suffer from

Dry or Heat is a term used in TCM to indicate a constitutional characteristic. It can be translated into a genetic tendency toward development of diabetes in Western terminology.

Appropriate Chinese herbs

Achyranthes (Niu xi): Contains ecdysterone and inokosterone. Experimentally, these compounds have been shown to inhibit hyperglycemia induced by glucagon, alloxan, and anti-insulin serum (Song 1970, Ogawa 1974, Ye 1986).

Anemarrhena (Zhi mu): Contains anemars A, B, C, and D, which all lower blood glucose (Ri Ben Yao Wu Xue Za Zhi 1971).

Ophiopogon (Mai men dong): Has been shown to decrease blood glucose in mice with alloxan-induced diabetes (Wan 1998).

Acupuncture

Some practitioners use acupuncture to treat type 2 diabetes. One study found that BL18, 20; ST25; SP8; LI11; and GB9 increased pancreatic output. Some physicians use BL13, 20, 21, 23; RN4; SP6; and ST36 to control the symptoms of diabetes (Li 2000).

Homotoxicology

General considerations/rationale

Diabetes mellitus represents a Degeneration Phase homotoxicosis. This disease probably represents a continuum of progressive vicariation and may have genetic causation in some patients. In some cases, it may result as a consequence of chronic pancreatitis.

Insulin-dependent diabetes mellitus must be treated appropriately with insulin replacement therapy. Homotoxicology can assist these patients generally because it provides support for the Impregnation and Degeneration phases that affect the patient. Type 2 patients can greatly benefit from biological therapies and can even reverse their disease in some instances. This can happen with dietary therapy alone or when combined with proper homeopathic and herbal support.

Appropriate homotoxicology formulas

In addition to the remedies below, also see the protocols for pancreatitis, obesity, and cardiac disease.

Aesculus compositum: Provides vascular support. Contains a wide array of remedies for peripheral circulatory support. Should be combined with *Placenta compositum* for maximum efficacy.

Arsuraneel: Indicated for emaciation, dystrophy, diabetes mellitus, and anemia. The primary ingredient, Arsenicum album, is included for exhaustion, restlessness, anxiety, insatiable thirst, and emaciation. Contains Acciticum acidum for edematous swellings, waxy appearance,

diabetes mellitus, anemia, and excessive thirst. Has Curare (see *Syzygium compositum*) and Secale (see *Placenta compositum*).

BHI-Pancreas: Contains Podophyllum. Also found in *Leptandra homaccord*, *Momordica compositum*, and *Ubichinon compositum*, which may be used in a wide range of potencies in the treatment of pancreatic problems, including acute and chronic pancreatitis. *Momordica* (also in *Momordica compositum*, and *Mucosa compositum*) is indicated in pancreatitis (Reckeweg 2002). The herb *Momordica charantia* has been shown to help regenerate the beta cells in type I diabetes by providing the insulin-like substance P-insulin (polypeptide-P) that lowers blood sugar (Broadfoot 2006). Contains *Leptandra*, *Pancreatinum*, and other pancreatic support remedies.

Coenzyme compositum: Provides metabolic support. One of the most effective injections for diabetes mellitus is *Coenzyme compositum*, which is useful for diabetic gangrene along with *Circulo-Injeel*. It contains alpha-Ketoglutaricum acidum (common to *Causticum compositum*, *Cor compositum*, *Hepar compositum*, *Syzygium compositum*, *Thyroidea compositum*, *BHI-Enzyme*, and others). It is an active factor in the citric acid cycle and redox systems, and in Impregnation Phase pathologies helps to improve cell respiration. *Natrum pyruvicum* (see *Placenta compositum*) and *Sulphur*, a critical component in the makeup of the mesenchymal support system, are included. Defined in physiological, chemical, or enzymological terms, its function is the reactivation of enzyme-based detoxifying procedures which have been altered biochemically (Reckeweg 2002).

Galium-Heel: Provides cellular detoxification and supports kidney function.

Lymphomyosot: Provides lymphatic drainage. Has been shown to benefit human diabetics in reducing lymphoedema and distal extremity pathology and in improving wound healing.

Chelidonium homaccord: Supports liver excretion and gallbladder function. Bitter melon has been shown to assist diabetics.

Glyoxal compositum: Has catalytic and unblocking action on damaged respiratory enzymes and toxins, and is indicated in all cellular phase and viral diseases. It is given in infrequent doses.

Hepeel: Used intermittently to support liver detoxification and repair.

Hepar compositum: Deep detoxification formula that supports liver, gastrointestinal, and pancreatic function. The ingredient Molybdenum compositum is a tremendously useful mineral donor for enzymatic function. *Kali asparaginicum* (Potassium aspartate), one of the potassium salts, is one of its components; it serves as a coupling factor to potassium through salt formation and shows a particular affinity for important intermediate conversions. Aspartic

acid is known to be a sugar former, a so-called glucoplastic amino acid. Because potassium salts perform an important function of the so-called “sodium pump” in the cell membrane, the combination with aspartic acid appears especially noteworthy for influencing intracellular enzyme mechanisms, and thus, is generally used in preparations aimed at stabilizing or regenerating the enzyme functions. *Manganum gluconicum* (also in *BHI-Enzyme*) contains manganese salts which have a strong enzyme action (e.g., in the citric acid cycle), in which energy in the mitochondria is obtained from glucose. Manganese salts in the form of an organic compound (with gluconic acid) afford the opportunity for rapid entry into the cell.

Gluconic acid occupies a key position in the oxidation of glucose via the pentose-phosphate cycle (Warburg-Dickens-Horecker schema). Manganese gluconate is usually given in combination with other enzyme-activating factors. *Zincum gluconicum*, which is gluconic acid coupled with zinc, allows for enhancement of various enzyme functions. Zinc has many trace element functions to fulfill in the body, and is the second most abundant trace element, after iron. Zinc forms complexes with insulin when the peptide chains in the insulin crystal are attached to the imidazole groups because of a chelation. The insulin-producing cells of the islets of Langerhans are particularly rich in zinc, so they are probably attached to zinc complexes. Pancreatic carboxypeptidase also contains zinc. Thus, by administering zinc compounds, it is possible to influence important enzyme functions (e.g., in anemia, diabetes mellitus, liver damage, kidney diseases, and Degeneration Phases) (Reckeweg 2002). Sulphur is also contained in this remedy, along with a host of other critical components.

Mucosa compositum: Can be thought of as a cellular “washing agent” which helps to normalize the mucosal surfaces throughout the body. Based on the individual homeopathic constituents of *Mucosa compositum*, there are therapeutical possibilities for the affections of the mucosa, as well as of the digestive glands. This is also a possible auxiliary remedy for pancreatitis, cholecystitis, and cholangitis. Furthermore, it is possible that it can be used to purify the homotoxic terrain in neoplasm phases. *Mucosa compositum* contains numerous mucous membranes and anti-inflammatory agents (*Argentum nitricum*, *Belladonna*, etc.), as well as preparations intended specifically for the treatment of the epigastrium, pylorus, pancreas, and small and large intestines (*Veratrum*).

Mucosa compositum also exerts a prophylactic action against progressive vicariation (in the sphere of the cellular phases). It contains *Momordica balsamina* for gripping, colicky pains in the epigastrium, gastroduodenal syndrome, and pancreopathy. It treats *ceanothus*—a “tangled” sensation on the left side—diabetes, and splenic

disorders. *Pancreas suis* (see *Syzygium compositum*, below) is included for pancreopathy, chronic enteritis, marasmus, and cachexia (Reckeweg 2000). *Kreosotum* is included for neuralgias, particularly of the sciatic nerve and primarily accompanying diabetes or albuminuria. A sickness of a wide variety of mucosa runs throughout the whole symptom picture of *Kreosotum*, so that profuse and loathsome discharges with ulceration and severely depleted vital energy are typical (Reckeweg 2002). Sulphur (see *Coenzyme compositum*) is also contained in this remedy.

***Placenta compositum*:** Stimulates the peripheral circulation of the blood in arteriosclerosis, gangrenous conditions of the distal limbs caused by diabetes mellitus, gangrenous ulcers, and decubitus. *Placenta compositum* is the parenteral equivalent of *Aesculus compositum* drops, and should be administered in combination for arteriosclerotic deficiency phenomena to relieve the connective tissues more rapidly from Deposition Phase homotoxins. It contains numerous revitalizing factors, such as *Arteria suis* (Artery). The attenuations of this sarcode are prepared from the fresh arteries of a healthy pig, and are indicated for disturbances of circulation, periarteritis, and venous spasm. Useful in diabetes mellitus, gangrene, and cramps in the calf muscles. A catalytic remedy, *l(+)-Lacticum acidum* (sarcolactic acid), is useful for disturbed cell respiration, with specific indications for diabetes mellitus. *Natrum pyruvicum* is a remedy that should be considered in disorders of glucose metabolism, especially when there is a circulatory disturbance (diabetic gangrene). *Secale* is included for blood circulatory disorders associated with arterial diseases (Reckeweg 2002).

***Solidago compositum*:** Deep detoxification formula that supports urogenital tissues.

***Syzygium compositum*:** Supports the pancreas and a wide variety of tissues that are negatively affected by diabetic pathology. Contains *Hepar suis* for liver repair. This is a broad reaching, diabetes-mellitus-specific remedy (Reckeweg, 2000). *Syzygium compositum* represents an important preparation for long-term medication. *Syzygium jambolanum*, whose main indication is diabetes mellitus, is included. *Pancreas suis* (also found in *Hepar compositum* and *Mucosa compositum*) is useful in diabetes mellitus (of pancreatic origin), cachexia, enteritis, enterocolitis, metabolic support, pancreatic repair, and malabsorption. Small quantities of Phlorizine, injected subcutaneously, precipitate a severe glycosuria, which occurs without any preceding hyperglycaemia and continues even when the blood-sugar level becomes low because the kidney has become permeable to lower levels of blood glucose. Glycosuria occurs late, or minimally in kidney disease. Thus, it seems obvious and consistent with the Law of Similars and the reversal effect (Arndt-Schulz) to use Phlorizine in the treatment of diabetes mellitus.

However, in most cases of diabetes mellitus we are dealing with Degeneration Phases or genetically determined phases on the right of the Biological Divide that are difficult to cure with single homeopathic remedies.

A number of curative possibilities can be realized through E. Bürgi's synergistic principle, such as combination remedies. These are especially effective if they are used parenterally, and thus come into close contact with the body's greater defensive system, and possibly undiluted. *Curare* has some specific indications for diabetes mellitus and muscular debility.

This remedy also contains alpha-ketoglutaricum (see *Coenzyme compositum*) and *Secale* (also found in *Aesculus compositum*, *Arsuraneel*, *Circuloheel*, *Placenta compositum*, *Arteria-Heel*, *Syzygium compositum*, *BHI-Varicose*, and others), which are useful when there is a sensation of numbness, cramps and paralysis of the extremities, gangrene (especially in diabetics with excess fat tissue), venous spasms, and varicose ulcers (Reckeweg 2002). *Arsenicum album* (see *Arsuraneel*) and *Plumbum metallicum* (for arteriosclerosis, nephrosclerosis, paresis with emaciation, muscular atrophy) are included. *Acidum phosphoricum* is indicated for physical and mental exhaustion and emaciation. *Acidum sulfuricum* treats chronic gastritis and diabetes. *Acidum L (+)-lacticum* (sarcolactic acid) is used for acid-base regulation in the connective tissues. *Kreosotum* (beech tar creosote) treats catarrh of the mucosa with acrid secretions and secondary conditions from diabetes such as pruritus, cataract, gangrene, and disorders of the peripheral circulation. *Kalium picrinicum* is included for symptoms of exhaustion (Reckeweg 2000).

***Thyroidea compositum*:** Provides deep detoxification and support of endocrine functions.

***Tonsilla compositum*:** Supports the immune system and endocrine system; used in alteration with *Thyroidea compositum*.

***Ubichinon compositum*:** Provides metabolic support. Has many enzyme activators, including Naphthaquinone with indications for patients that either gradually lose more and more weight in spite of eating well, or is used for obese patients with pale, yellowish, sallow skin. *Parabenzoquinone* is useful in degenerative diseases of the eyes (retina) and diabetes mellitus. *Alpha-lipoic acid* (see *Syzygium compositum*), *Podophyllum* (see *BHI-Pancreas*), and Sulphur (see *Coenzyme compositum*) are also included.

Authors' suggested protocols

Nutrition

Immune, pancreas, endocrine/exocrine, and liver support formulas: 1 tablet for each 25 pounds of body weight BID.

Magnesium: 10 mgs for every 10 pounds of body weight SID.

Zinc: 15 mg for each 25 pounds of body weight SID.

Vitamin E: 100 IU for each 25 pounds of body weight.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

Coenzyme Q10: 25 mgs for every 10 pounds of body weight daily.

Pan chelate (chromium GTF): 1 capsule for each 35 pounds of body weight SID.

Chinese herbal medicine

Ketoacidotic crises require emergency Western medication for stabilization. The recommended patent formula is Yu Nu Jian, which contains achyranthes (Niu xi), anemarrhena (Zhi mu), gypsum (Shi gao), ophiopogon (Mai men dong), and rehmannia (Shu di huang). In the author's experience, this formula may decrease the amount of insulin required for the patient, but rarely is sufficient on its own. It is given at the supplier's recommended rate.

Some acupuncture points to consider include ST36, KI3, BL13, BL20, LI11, CV4, and BL23 (Handbook of TCM practitioners 1987).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom remedy: Syzygium compositum, Lymphomyosot, Aesculus compositum mixed together and given BID long-term. The dosage is adjusted according to the disease, the clinical picture, and the stage of the illness. In the first stage of therapy give this combination 6 times daily orally, and as time passes use it BID to QID orally. Give Placenta compositum, Mucosa compositum, and Coenzyme compositum as intercurrent injections, possibly as an autotransfusion.

Deep detoxification: Galium-Heel, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum mixed together and given every 3 days for 3 to 6 months or until phase shift occurs. Give Glyoxal compositum once a week. BHI-Pancreas, Leptandra, and/or Momordica compositum can be given BID for long-term pancreatic support.

DIABETES INSIPIDUS**Definition and cause**

Diabetes insipidus (DI) is an uncommon entity in veterinary medicine, and little is known about the physiopathology involved in its development. Two basic syndromes exist: (1) Central diabetes insipidus, in which there is a deficiency in secretion of antidiuretic hormone (ADH); and (2) Nephrogenic diabetes insipidus, whereby toxins affect the kidney and block the physiologic action of ADH. As an example, drugs like alcohol bind to receptor sites for ADH and block its action, leading to diuresis and loss of fluids and electrolytes. It is defined as an imbalance in water metabolism, which leads to polydipsia, polyuria, and low urine specific gravity. Central DI commonly involves genetic inheritance. Nephrogenic DI may be inherited or secondary to kidney disease or metabolic/endocrine diseases such as hyperadrenocorticism (Feldman 1997; Gunn-Moore 2005; Nichols 2001, 2003).

Medical Therapy Rationale, Drug(S) of Choice, and Nutritional Recommendations

Once diagnosed, the therapy of choice for CDI is Desmopressin (DDAVP) and for NDI is chlorothiazide (Nichols 2003).

Anticipated prognosis

The prognosis for medical control is generally good. Underlying causes such as trauma and neoplasia carry a more guarded prognosis. In all instances, continual medical therapy is often required; otherwise death will occur. Current genetic research is focusing on identifying

the underlying genetic cause with the goal of correcting the genetic malformation (Nichols 2003).

Integrative veterinary therapies

Because DI is most commonly inherited, the IVM approach is to support pituitary health. In other causes, such as nephrogenic, see the appropriate disease protocol. The recommended protocols include nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on the cells.

Nutrition**General considerations/rationale**

Nutritional and glandular support focuses upon the posterior pituitary gland and kidney and their function.

Appropriate nutrients

Nutritional/gland therapy: Glandular pituitary, hypothalamus, and kidney supply intrinsic nutrients that are used to improve organ function and reduce cellular inflammation. This helps to spare these organs from continued degeneration (Cima 2000, Goldstein 2000) (see Gland Therapy in Chapter 2 for a more detailed explanation).

Chinese herbal medicine/acupuncture**General considerations/rationale**

In TCM, diabetes insipidus is due to Spleen and Kidney Yang deficiency with Cold accumulation. The Spleen and Kidney are responsible for water metabolism in the body. When there is a Yang deficiency in these organs, one result may be an inability to maintain normal water homeostasis. One sign of Cold in the body, according to TCM, is copious clear urination.

Appropriate Chinese herbs

Because diabetes insipidus is a rare condition, there is little Western research into the use of herbs. The following herbs have actions that may, in the author's opinion, be the mechanism behind their efficacy. Similarly, no Western studies have addressed diabetes insipidus.

Astragalus (Huang qi): Can help promote kidney function. It increases plasma proteins and helps decrease the output of urinary protein (Zhou 1999). Astragalus helped to protect the kidneys of mice with experimental diabetes mellitus (Shi 1999). It may have a similar effect of protecting kidneys in other disease processes.

Rubus (Fu pen zi): Has been shown to increase hormone secretion from the hypothalamus and pituitary (Chen 1996). It also may be able to increase the secretion of vasopressin, although no studies have yet been published.

Gypsum (Shi gao): Was shown to decrease spontaneous water consumption in mice (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Reckeweg considers DI an Impregnation or Degeneration phase disorder, but there is absolutely nothing published in any homotoxicology literature regarding this condition, so the following is simply theoretical discussion from the author. Tumors can result in diabetes insipidus and represent Dedifferentiation Phase disease. Because all of these phases lie on the right of the Six-Phase Table of Homotoxicology, it is thought that many cases that are so involved would not resolve and would require hormone replacement therapy, aggressive medical management, and careful evaluation of drugs used in the case (Gunn-Moore 2005, Nichols 2001). The emphasis is on management and not cure. Attention to hydration is critical because dehydration can lead to renal compromise and death. Recovery may occur in the event of nephrogenic cases resulting from toxin exposure because diuresis is an Excretion Phase physiologic response that leads to removal of the offending homotoxin. The prognosis for traumatic cases may be better and management of trauma may lead to recovery.

The theoretical approach to such a case involves phase remedies to approach the chronic Impregnation Phase or Degeneration Phase conditions. Clinicians treating such cases biologically must inform owners of the experimental nature of antihomotoxic agents in this condition, and they should carefully record their treatment plans and results and share these with others interested in forwarding biological therapy.

Appropriate homotoxicology formulas

No veterinary studies exist on the use of antihomotoxic agents in diabetes insipidus. Neither author has treated a case biologically. Theoretical possibilities include:

Arteria-Heel: This remedy, renamed *Secale*, addresses peripheral vasculature.

Berberis homaccord: Supports the renal tubular excretion phase and adrenal cortical function (Reckeweg 2000).

Bryaconeel: Indicated in neuralgias and commonly used in geriatric medicine. Acts on serous membranes and meninges.

Coenzyme compositum: Supports energy production through enzyme induction and repair, and is useful in repairing damage to enzyme systems of metabolism and following administration of drugs injurious to metabolism. Phase remedy in Degeneration and Dedifferentiation phases.

Galium-Heel: Phase remedy in matrix and cellular phases. Provides powerful support of the immune system

(*Echinacea augustifolia*). Assists in drainage of cell and matrix, is supportive of renal tubular function, and decreases swelling and edema (*Apis mellifica*, *Galium aparine*, and *Galium mollugo*). It is a critical component in the deep detoxification formula. Dosing should consider clinical condition and response, with the dose reduced if strong reactions are noted (Reckeweg 2000).

Glyoxal compositum: Provides mitochondrial repair of damaged enzyme systems in Degeneration and Dedifferentiation phase disorders.

Hepeel: Provides liver drainage and detoxification.

Lymphomyosot: Used after cortisone therapy and mesenchymal purging in chronic disease states.

Nervoheel: *Ignatia* and *Sepia officinalis* are well known remedies for depression and anxiety. These and other ingredients have affinity for neurological tissues.

Ovarium compositum: Provides organ support and drainage of ovaries in females.

Placenta compositum: Supportive of hypophysis after cortisone therapy. Contains sulfur to support enzyme and metabolic repair and repairs vascular structures. Regenerative of hypophyseal-adrenal axis. Used intermittently in endocrine disorders.

Pulsatilla compositum: Used in regulation rigidity cases. Contains *Pulsatilla pratensis*, Sulfur, and *Cortisonum aceticum*, and is useful for repairing damage following steroid administration. Often a case will rapidly activate following administration of this agent, and in cases of strong regressive vicariation the administration of *Traumeel S* moves the patient toward healing and resolution. Used in conjunction with catalyst therapy.

Solidago compositum: Deposition Phase remedy that is needed to remove debris from the matrix after regressive vicariation begins.

Syzygium compositum: Reckeweg lists this as a component of basic therapy for diabetes insipidus, but no explanation is presented in any of his writings (Reckeweg 2000).

Testes compositum: Provides organ support and drainage in males.

Thalamus compositum: Supports thalamus, pineal gland, adrenal gland, and cellular regulation through glandular content and homeopathically diluted cyclic adenosine monophosphate (cAMP). Assists in establishing autoregulation of psychoneuro-endocrine immune functions (Reckeweg 2000).

Thyroidea compositum: Provides matrix drainage and repair of autoregulation. Contains low levels of thyroid, pineal, spleen, bone marrow, umbilical cord, and liver to support glandular function and repair. *Galium aparine* drains matrix and cellular components. *Cortisonum aceticum*, in low potency, assists in repairing damage from excess levels of cortisone. Precursors and Krebs cycle

constituents promote energy metabolism through the Michaelis-Menten law of enzyme activity. Pulsatilla and Sulfur assist in regulation rigidity-type situations. Part of the deep detoxification formula (Reckeweg 2000).

Tonsilla compositum: The main antihomotoxic drug for repairing chronic diseases involving endocrine disorders. Supports a wide number of tissues including tonsil, lymph node, bone marrow, umbilical cord (stem cell precursors), spleen, hypothalamus, liver, embryo, and adrenal cortex (Heine 2004). Contains Cortisonum aceticum and thyroid hormone in nanodilutions. Also contains Psorinum for deep constitutional, lack-of-reaction cases. Degeneration phase agent (Reckeweg 2000).

Traumeel S: Provides anti-inflammatory action that is useful in trauma cases and possibly other forms of disease.

Ubichinon compositum: Provides mitochondrial repair of energy production mechanisms. Used in chronic diseases and iatrogenic injury to mitochondria from antibiotic therapy, and is part of the deep detoxification formula.

Authors' suggested protocols

Nutrition

Pituitary/hypothalamus/pineal and kidney support formulas: 1 tablet for each 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula CDI: 1 capsule per 10 to 20 pounds twice daily according to response. In addition to the herbs mentioned above, CDI contains aconite (Fu zi), albizzia flower (He huan hua), anemarrhena (Zhi mu), cimicifuga (Sheng ma), cinnamon bark (Rou gui), cornus (Shan zhu yu), crataegus (Shan zha), dendrobium (Shi hu), dioscorea (Shan yao), licorice (Gan cao), polygonum stem (Ye jiao teng), poria (Fu ling), rehmannia (Sheng di huang), and wolfberry (Gou qi zi). These additional herbs help increase efficacy.

Monitor urine production and specific gravity. If necessary, combine the herbal supplement with Western therapy. About 50% to 60% of animals need concurrent Western therapy.

Some acupoints that may be of use include ST36, BL20, BL23, and BL13 (Handbook of TCM practitioners 1987).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

All homotoxicology is done in conjunction with conventional therapy, including hormonal supplementation. Some cases may be able to reduce supportive drug therapy levels after a period of time, but most require lifetime pharmaceutical support.

Reckeweg's oral protocol for humans: Arteria-Heel TID, Nervoheel TID, and Bryaconeel TID as primary therapy. Possibly give those 2 to 6 times daily. Give Syzygium compositum and Traumeel intermittently (Reckeweg 2000).

Reckeweg's injection therapy for humans: Autosanguis therapy with Hypophysis-Suis Injeel, Arsenicum album-Injeel, Bryaconeel Injeel S, and Galium-Heel. Give Hepeel, Acidum phosphoricum-InjeelS, and Acidum lacticum-Injeel for thirst. Give coenzyme compositum and Ubichinon compositum at intervals. Use the collective catalyst pack with Testes compositum for males and Ovarium compositum for females (Reckeweg 2000).

HYPOTHYROIDISM

Definition and cause

True hypothyroidism is a common endocrinopathy in dogs, but is not a significant clinical entity in cats unless their thyroid glands have been damaged directly (i.e., in surgery or radiation). The most common diagnosis in dogs is an immune-mediated autoimmune thyroiditis, wherein lymphocytes attack and destroy vital thyroid tissue, resulting in an inability to produce adequate thyroid hormone. Less common causes include neoplasia, dietary deficiency of iodine, and are secondary to pituitary disease (Chastain 1995; Panciera 1994, 1998; Tyler 2003; Reed 1998).

The basic underlying result is a direct decrease in the production of thyroid hormone and a corresponding decrease in metabolic activity. Congenital hypothyroidism is an infrequent cause (Tyler 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment is thyroid hormone replacement, and response to therapy is generally good unless there are additional causes or there is secondary disease (Dixon 2002, Ferguson 2002, Greco 2000, Panciera 1997, Tyler 2003).

Anticipated prognosis

The prognosis for control of hypothyroidism is generally good; however, continual thyroid replacement medication is required to control disease signs. Hypothyroidism that is secondary, or other diseases such as neoplasia or pituitary disease, often have a more guarded prognosis (Tyler 2003, Reed 1998).

Integrative veterinary therapies

The most common underlying cause of hypothyroidism is an autoimmune process. Environmental agents can aggravate this condition, and a link between rabies vaccination and an increase in antithyroid antibody has been reported (Scott-Moncrieff, et al. 2002). Dodds has noticed a connection between vaccination and the appearance of hypothyroidism in purebred dogs and has recommended prudent use of vaccinations in dogs that are at risk (Dodds 1995, 2001, 2002, 2003). Sick euthyroid syndrome is a common entity in small animal practice. In this situation, the thyroid levels are found to be low in association with the presence of other pathologies. Thyroid levels return to normal if these pathologies are successfully addressed. Pharmaceutical agents such as general anesthesia, glucocorticoids, potentiated sulfas, radio-contrast dyes, phenobarbital, iodine, furosemide, aspirin, and phenylbutazone can cause artificially lowered serum thyroid levels and a careful drug history should be taken in cases in which hypothyroidism is encountered (Nelson 1995).

Conventional medical therapy focuses on replacing deficient thyroid hormone, rather than upon the autoimmune process. Hypothyroidism is a classic example of a cellular autoimmune reaction, whereby the target organ begins to weaken from multiple causes such as a vaccine reaction or free radical inflammation. Thyroid cells die and the cellular debris evokes autoantibody production, resulting in an immune attack, cascading inflammation, further cell death, and finally a hypofunctioning gland. The introduction of therapeutic nutrients, medicinal herbs, and biological therapies can often help quiet the autoimmune process and slow ongoing organ degeneration, and may even help reduce the dose of or the reliance upon medication.

There are additional medical options. In clinical studies, the use of desiccated thyroid, which contains both T3 and T4, used in conjunction with thyroxine was more effective than L-thyroxine alone (Bunevicius 1999). Desiccated thyroid (Armour) is a good option to maintain thyroid hormone levels along with alternative therapies. Another study showed that iodine deficiencies can also lead to hypothyroidism, and therefore dietary sources are important (Thilly 1993).

Nutrition

General considerations/rationale

While medical therapy is focused upon thyroid hormone replacement, the nutritional approach adds nutrients, iodine, antioxidants, and gland support for the pituitary/thyroid axis. These nutrients nourish organ cells and help control ongoing inflammation.

Appropriate nutrients

Nutritional/gland therapy: Glandular thyroid, pituitary, and hypothalamus supply the intrinsic nutrients that are used to reduce cellular inflammation and improve organ function. This helps to spare these organs from further immune attack, cascading inflammation, and eventual degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

Note: Because hypothyroidism can affect multiple organ systems such as the skin, gastrointestinal, cardiovascular, and central nervous, a medical and physiological blood evaluation is recommended to assess general glandular health. This allows clinicians to formulate therapeutic nutritional protocols that address the pituitary and thyroid glands as well as other organ disease that may be present (Cima 2000, Goldstein 2000)(see Chapter 2, Nutritional Blood Testing, for additional information).

Alpha-lipoic acid (ALA): ALA is involved in mitochondrial activity and is referred to as the universal antioxidant. A potent antioxidant, it has been proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, Coenzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Scholich 1989). This is important in autoimmune reactions such as thyroiditis.

Marracci (2002) and Morini (2004) found that ALA slowed progression of the autoimmune response and the disease process. Free radical inflammation is implicated as the initiator of many disease processes that are discussed in this book. ALA and other antioxidants have the proven function of reducing this initiating inflammation, and therefore are indicated in the prevention of many of these disease conditions.

Coenzyme Q10: Coenzyme Q10 is a strong antioxidant that helps reduce the associated inflammation that is the predecessor to many chronic diseases. CoQ10 has indications in the prevention and treatment of common diseases such as gingivitis and periodontal disease, heart disease, arthritis, diabetes, and many types of cancer (Gaby 1998, Shigeta 1966).

Chinese herbal medicine/acupuncture

General considerations/rationale

Hypothyroidism is a result of Spleen and Kidney Qi and Yang deficiency. The Spleen controls the muscles; there-

fore, Qi and Yang deficiency in the Spleen can lead to muscle weakness. The patient usually feels cold, with poor blood circulation, and fatigue, which is due to Kidney Qi and Yang deficiency.

Treatment is aimed at increasing the thyroid hormone levels and reversing the secondary signs such as high cholesterol and muscle weakness.

Appropriate Chinese herbs

Alisma (Ze xie): Lowers the serum cholesterol and LDL levels (Institute of Pharmacy 1976).

Dioscorea (Shan yao): Contains diosgenin, a compound which decreases intestinal cholesterol absorption and therefore blood cholesterol levels (Cayen 1979, Zagoya 1971). It also increases muscular endurance and improves muscle contractility (Zhang 1996).

Rehmannia (Shu di huang): Can increase serum T4 levels (Qu 1998, Zhang 1999, Hou 1992).

Sage tangle (Kun bu): Can reverse hypothyroidism due to iodine deficiency (Jiangsu New Medical College 1998). In addition, it treats the sequela of hypothyroidism. It can decrease total serum cholesterol, b-lipoprotein, and triglyceride, and can raise the levels of HDL-C and HDL2-C (Tang 1989). It promotes the elimination of cholesterol (Huang 1998).

Sargassum (Hai zao): Contains high levels of iodine (Zhong Yao Xue 1998).

Wolfberry (Gou qi zi): Lowers the total serum cholesterol, triglyceride level and the LDL-C fraction (Wang 1998).

Acupuncture has successfully treated hypothyroidism. In one study, acupuncture was used to treat hypothyroidism in patients recovering from serious brain injuries. Thyroid function improved in all 14 patients and the T4 and T3 values returned to normal (Yu 1996).

Homotoxicology

General considerations/rationale

Autoimmune thyroiditis represents an Impregnation Phase disorder in the early stages, which may progress rapidly to a Degeneration Phase homotoxicosis. Patients with genetic defects may be properly classified as Degeneration Phase cases and handled appropriately. Sick euthyroid syndrome cases can be assisted by organ support, detoxification, drainage, and excretion of homotoxins through various antihomotoxic agents. Proper diagnosis, treatment, and monitoring are required to assure maximum success, and the clinician should recognize that in many cases hormone replacement therapy is vital to long-term health and well being.

Autoimmune thyroiditis can be attenuated by the use of antihomotoxic drugs (particularly Thyroidea compositum). Early screening with the purpose of identifying at-risk dogs may assist breeders in reducing the incidence of

this condition, and may have the further benefit of identifying dogs with a predisposition to thyroid dysfunction. Such dogs may benefit from early treatment with antihomotoxic drugs. Supplementation with thyroid hormone is needed in cases with low levels and thyroid hormone replacement therapy is compatible with antihomotoxic drugs.

Appropriate homotoxicology formulas

As with all homotoxicoses, therapy should begin in the earlier phases of the disorder. Common remedies that may prove useful in hypothyroidism include:

BHI-Enzyme: Contains Baryta (also found in *Coenzyme compositum*) for goiter (Reckeweg 2002).

Coenzyme compositum: Provides metabolic support of cytoplasmic energy production. Degeneration Phase remedy.

Echinacea compositum: The components Influenzinum and Staphylococcus nosodes both have indications in cases of thyroid dysfunction. Staph nosode can be used to good effect in connective tissue lesions (possibly also in obesity) and in thyroid illnesses. It is especially effective in combination with Streptococcus haemolyticus nosode, which is also contained in *Echinacea compositum*. Influenzinum is used in patients with a tendency to corpulence and adiposity—even in children—arising from thyroid hypofunction. It has tonic action in exhaustion, tiredness, and chronic hoarseness (Reckeweg 2002).

Galium-Heel: Provides cellular drainage and detoxification. Important phase remedy in Deposition, Degeneration, and Dedifferentiation phase homotoxicoses.

Hepar compositum: Assists in detoxification, drainage, and organ support of the liver. Used as part of the deep detoxification formula that is commonly applied to patients in deeper phases (Deposition, Impregnation, Degeneration, and Dedifferentiation).

Lymphomyosot: Provides lymph drainage and support. Contains Levothyroidinum (Thyroxine) in homeopathic dilution, which can stimulate endocrine function per the Arndt-Schulz Principle. This formula should be used with caution in patients that are sensitive to compounds that contain iodine. It is an important drainage and detoxifying agent in all Impregnation, Degeneration, and Dedifferentiation phase disorders.

Molybden compositum: Supplements trace minerals and regulates mineral metabolism. Use 1 tablet for trace mineral supplementation daily for 3 to 4 days and then every second or third day. If undesirable symptoms occur, discontinue for several days and restart as needed at a longer dose frequency such as once weekly. No adverse side effects are expected at normal dosing, but use caution with this preparation if combining therapy with other trace mineral supplements (Reckeweg 2000). Keep out of the reach of children or pets. The authors have experi-

enced no undesirable effects from this product when properly dosed.

Mucosa compositum: Supports mucosal elements and helps with repair and detoxification. Phase remedy in Degeneration Phase disorders.

Placenta compositum: Provides repair and detoxification of vascular structures in chronic disease. Useful for patients with cold extremities. May assist stem cell function in repair.

Psorinoheel: Constitutional remedy that is useful in Excretion Phase and Degeneration Phase disorders. Consider in suspect genetic cases, especially those with dermal issues and/or seizure disorders.

Solidago compositum: Assists in detoxification, drainage, and organ support of the kidney and urogenital systems. Used as part of the deep detoxification formula that is commonly applied to patients in deeper phases (Deposition, Impregnation, Degeneration, and Dedifferentiation).

Strumeel: Contains Calcium iodatum for chronic glandular indurations, goiter, and tonsillar hypertrophy. The iodine component of this remedy activates metabolic processes and connective tissue function (Reckeweg 2002). This remedy also contains Fucus vesiculosus and Spongia tosta, as found in *Thyroidea compositum*.

Thyroidea compositum: The main formula for hypothyroidism; it is also indicated in Impregnation Phase cases. It is particularly useful in deep matrix drainage and detoxification. Contains glandular therapy elements of thyroid, thymus, pineal gland, spleen, bone marrow, umbilical cord (stem cell elements), and liver, which gives it a far reaching organotrophic effect. Early use may delay onset of clinical disease; some patients have thyroid hormone levels improve some weeks to months after initial therapy (Palmquist 2005). Also contains Cortisonum aceticum (cortisone acetate) for adrenal cortex damage and iatrogenic damage from prior steroid therapy, and numerous metabolic precursors of the citric acid cycle that benefit metabolism. Galium (goose grass) drains cellular elements. It is helpful in a wide variety of preneoplastic and neoplastic conditions (Reckeweg 2000).

This agent may bring on desirable regressive vicariation and should be assisted with proper biological support. Areas of depigmentation and alopecia may become inflamed as homotoxins are metabolized and excreted. It is not uncommon for patients undergoing regressive vicariation to have discharge from the eyes, ears, and other mucous membranes. These are not adverse reactions, but rather helpful biological responses. If they are excessive, reduce the dosage frequency and continue forward gently. Long-term therapy is often needed. This is an ingredient in the deep detoxification formula that is so commonly used in deeper homotoxicoses. It also has components with specific affinity for thyroid disorders: Calcium flu-

oratum, Fucus vesiculosus, and Spongia tosta (Reckeweg 2002).

Tonsilla compositum: Contains Thyroxine. If the thyroid gland is absent, either in thyroid aplasia or thyroidectomy, a typical deficiency disease known as myxedema develops. The metabolism of food and energy is reduced by up to 50% in degeneration of the thyroid gland, and possibly in cases of goiter with colloid atrophy, but it can be normalized again by the administration of thyroid hormone. The thyroid hormone has particular importance for the functioning of the interstitial mesenchyme, which is generally accelerated and activated by thyroxine, thyroindium, or the thyroid hormones. Thus, doses of the hormone are given not in substitutive, but in excitative dosage (higher potencies), and are included in combination remedies that are aimed at activating the mesenchyme and removing the homotoxic deposits in the connective tissue.

Ubichinon compositum: Provides metabolic support of mitochondrial elements. Degeneration phase remedy that is useful in reversing damage from antibiotics to the mitochondrial membrane and enzyme system.

Authors' suggested protocols

Nutrition

Thyroid and pituitary support formulas: 1 tablet for each 25 pounds of body weight BID.

Alpha-lipoic acid: 10 mgs per 15 pounds of body weight daily (maximum, 100 mgs).

Coenzyme Q10: 25 mgs for every 10 pounds of body weight daily.

Chinese herbal medicine/acupuncture

Formula H81 Hypothyroidism: 1 capsule per 10 to 20 pounds twice daily to effect. In addition to the herbs described above, H81 Hypothyroidism also contains aconite (Hei fu zi), angelica root (Dang gui), antler (Lu jiao), cinnamon bark (Rou gui), cistanche (Rou cong rong), cnidium (Chuan xiong), cornus (Shan zhu yu), cuscata (Tu si zi), eucommia bark (Du zhong), ginger (Gan jiang), and laminaria (Hai dai). These herbs increase the efficacy of the formula.

The authors recommend the following acupuncture points: BL20, BL23, and GV4 (Lei 1996).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom remedy: Thyroidea compositum, as a single remedy by injection (SQ, IV, IM) or 1 tablet 1 to 3 times weekly PO, or as part of the deep detoxification formula listed below. Abropernol and Strumeel given BID. All these can be combined and then administered BID orally.

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum mixed together and given 1 to 3 times weekly PO.

HYPERTHYROIDISM**Definition and cause**

Hyperthyroidism, defined as an excessive production of thyroid hormone by the thyroid gland, is one of the most common endocrine diseases of senior cats. It is less frequently seen in dogs, and is usually associated with malignancy of the thyroid gland.

In cats, the underlying pathology is a hyperplastic, overactive gland or a nodular or adenomatous mass that is usually benign. Because of the thyroid gland's central role in metabolism, many organ systems are affected by the overactivity of the gland and the resultant increased

levels of thyroid hormone (Feldman 1996; Graves 1992, 1997, 2003; Mooney 2002; Peterson 1994).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

After the positive diagnosis of hyperthyroidism, medical therapy is directed at the hyperactivity and the resultant elevation in circulating thyroid hormone levels. Treatment may involve surgical removal of the overactive gland, radioactive iodine, or anti-thyroid medication such as methimazole or ipodate (Oragraffin). Because hyperthyroidism can affect multiple organ systems, therapy must take into consideration damage from elevated blood pressure and other affected organs such as the heart and kidney (Graves 1995, 2003; Hoffman 2003; Mooney 1997; Murray 1997).

Because of the elevated rates of metabolism, a highly bioavailable and absorbable diet that is rich in protein is recommended (Martin 2002, Graves 2003).

Anticipated prognosis

The prognosis is dramatically improved if there are no secondary organ system problems such as heart or kidney damage. Medical management is based upon client compliance and potential side effects from the drugs, and therefore a better prognosis is seen with either surgical removal or radioactive iodine treatments (Graves 2003).

Integrative veterinary therapies

Proper handling of hyperthyroid patients is important to preserve their health because of the toxic effects of excessive thyroid hormone on the heart, kidney, and liver. Hypertension and cardiac and renal disease frequently result from hyperthyroidism.

Recent studies have shown a significant difference in the survival of cats depending upon their treatment. The use of methimazole followed by I_{131} isotope therapy gave excellent results (Milner 2006). It is recommended that red blood cell and white blood cell levels be monitored while the patient is on pharmaceutical agents to detect toxic reactions to medications. Careful supervision of renal function is strongly recommended.

IVM offers viable alternatives to clients that resist surgery, radioactive iodine treatment, or methimazole because of side effects such as vomiting, anorexia, and weight loss. The use of lower doses of methimazole in combination with alternative therapies, nutraceuticals, medicinal herbs, and antihomotoxic agents offers these clients a good alternative along with proper monitoring of thyroxine levels.

Nutrition

General considerations/rationale

The cause of thyroid gland enlargement or overproduction of hormones remains unclear. The authors' opinion is that a possible mechanism can be a process similar to goiter in people, which can be caused by an autoimmune process or exposure to environmental toxins or medication (Gaitan 1988, 1990; Goldstein 2005).

This cellular immune attack of the thyroid can result in gland hyperactivity in cats and similarly gland hypofunctioning in dogs. The therapeutic nutritional approach therefore is directed at quieting the underlying free-radical-induced inflammatory process (from exposure to environmental chemicals, overvaccination, other diseases, etc.), ultimately leading to the overactive thyroid gland.

Appropriate nutrients

Nutritional/gland therapy: Glandular thyroid, pituitary, and hypothalamus as well as kidney and heart supply the intrinsic nutrients that are used to reduce cellular inflammation and improve organ function. This helps to protect and spare the thyroid (and other organs) from ongoing immune attack, cascading inflammation, and eventual degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

Alpha-lipoic acid: ALA is involved in mitochondrial activity and is referred to as the universal antioxidant. A potent antioxidant, it has been proven to reduce oxidative stress and inflammation. It has been shown to increase the effectiveness of other antioxidants such as vitamins C and E, Coenzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Scholich 1989).

Marracci (2002) and Morini (2004) found that ALA slowed progression of the autoimmune response and the disease process. Free radical inflammation is implicated as the initiator of many diseases discussed in this book. ALA and other antioxidants have the proven function of reducing this initiating inflammation, and therefore are indicated in the prevention of many cellular autoimmune disease conditions.

Coenzyme Q10 (CoQ10 or ubiquinone): Coenzyme Q10 is a strong antioxidant that helps reduce the associated inflammation that is the predecessor to many chronic diseases. CoQ10 has indications in the prevention and treatment of common diseases (Gaby 1998, Shigeta 1966).

Chinese herbal medicine

General considerations/rationale

In TCM, hyperthyroidism is a combination of Qi and Phlegm stagnation, Yang excess in the Liver, and Yin deficiency in the Liver and Heart.

Excess Yang energy causes nervousness, tachycardia, and hypertension. This increased blood pressure in turn causes the elevated liver enzymes or renal damage often associated with a hyperthyroid state. Yin deficiency can lead to a relative Yang excess. In Western terms this can be manifested as panting to cool the body. The Shen (Mind) resides in the Heart. The Yin is the fluid aspect of the body. It nourishes the body. Yin deficiency in the Heart means that the Shen is not nourished. Behavioral changes occur when the Mind is not nourished. This refers to crying at night, aggressive behaviors, nervousness, etc. Because the Liver is responsible for the smooth flow of Qi, it causes irritability when there is Qi stagnation in the Liver. Phlegm stagnation is a mass, i.e., the hypertrophied thyroid gland.

Appropriate Chinese herbs

Dioscorea bulb (Huang yao zi): Was used to treat 25 patients with thyroid tumors with a 80% efficacy rate (Fu Jian Yi Xue Yuan Xue Bao, 1964). There was no effect on normal thyroid glands in rats, but it markedly reduced the size of the gland in rats with experimentally induced thyroid gland hypertrophy (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995).

Figwort root (Xuan shen): Has been shown to cause vasodilation in rabbits and mice. In addition to lowering blood pressure, it can also decrease the heart rate (Zhong Yao Yao Li Yu Ying Yong 1983).

Fritillaria (Bei mu): Has antihypertensive effects (Zhong Yao Xue 1998).

Gentiana (Long dan cao): Demonstrates hepatoprotective effects from a variety of insults and increases the content of hepatic glycogen. Two of the components, gentiopicroside and sweroside, counteract CCl₄- or GALN-induced liver damage. Gentiopicroside also reduces liver lipid peroxidation in hungry mice (Zhang 1991, Zhong Guo Yao Li Xue Tong Bao, 1986, Hu 1989). In addition, it decreased liver enzymes in humans with chronic infectious hepatitis (Shang Hai Zhong Yi Yao Za Zhi 1965). Another component, gentianine, has sedative effects (Lei 1982).

Prunella (Xia ku cao): Helps to normalize blood pressure in patients with hypertension (Zhong Yao Yao Li Yu Ying Yong 1983).

Rehmannia (Sheng di huang): In an experiment in which rehmannia was given to hyperthyroid mice, it lowered the concentration level of T₃ and increased the level of T₄. This resulted in a decrease in polydipsia and polyuria and prevented the weight loss associated with hyperthyroidism (Hou 1992). In addition, it also decreases blood pressure (Zhong Yao Xue 1998).

Sage tangle (Kun bu): Contains laminine, which reduces blood pressure (Yao Xue Za Zhi 1983). In one study, sage tangle was capable of slowing the metabolic rate and relieving the signs in people with hyperthyroidism (Jiangsu New Medical College). Another study in 110 humans showed a 76.4% efficacy in treating hypertension (Zhong Cao Yao Tong Xun 1974).

Salvia (Dan shen): Decreases blood pressure (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1991). It has hepatoprotective effects. Salvia promotes the regeneration of liver cells and has been used in mice with cirrhosis (Zhong Xi Yi Jie He Za Zhi 1988).

Scorpion (Quan xie): Decreases the heart rate and causes prolonged decreases in blood pressure (Shen Yang Yi Xue Yuan Xue Bao 1987).

Tortoise shell (Bie jia): Has been shown to decrease the size of nodules and masses and may help to decrease the size of the thyroid gland (Zhong Cao Yao Xue 1980).

White peony (Bai shao): Can cause mild vasodilation and thereby reduce blood pressure (Zhong Guo Yao Li Xue Tong Bao 1986). It also has sedative effects to help with the anxiety or irritability hyperthyroid patients experience (Zhong Yao Tong Bao 1985).

Homotoxicology

General considerations/rationale

Hyperthyroidism most commonly occurs in small animal veterinary medicine due to a benign tumor in the thyroid of cats or a malignant tumor in dogs. This represents a Dedifferentiation Phase disorder. Short-term elevation of serum thyroid hormone can occur during recovery from illness and is a natural and desirable response that does not require specific treatment.

Dobias (2006) has reported limited success in treating hyperthyroid cats using homeopathy, particularly with a remedy known as *Natrum muraticum* (Nat mur), which consists of homeopathically prepared sodium chloride. Patients that fit this symptom picture may respond, and this response could suggest toxicity from excessive levels of sodium chloride in pet diets or some other imbalance in halogen metabolism that later negatively impacts the thyroid gland, leading to disease. This is an interesting area for further investigation (Dobias 2006).

Appropriate homotoxicology formulas

Surgery or radiation therapy is recommended in cases of likely malignant neoplasia. Antihomotoxic drugs can be given according to the patient's condition (see Cardiac Arrhythmias, Cardiomyopathies, and Con-

gestive Heart Failure in Chapter 9; Acute and Chronic Nephritis in Chapter 15; and cancer in chapters 31 and 32). Other hyperthyroid patients may benefit from the following:

Aletris-Heel: Treats exhaustion, anemia, weakness, and thyrotoxicosis.

China homaccord: Treats weakness and exhaustion.

Coenzyme compositum: Provides metabolic support.

Engystol N: May help to clear the matrix in cases of viral impregnation.

Gelsemium homaccord: Used for affectations of the head, headache, and weakness of the head and posterior.

Glyoxal compositum: Used in all Dedifferentiation Phase disorders as a phase remedy.

Glonoin homaccord: Nitroglycerin, the active agent, supports heart function and is effective for the sensation of palpitations that originate in the chest and extend up the neck (which causes cats to vocalize loudly at night). Glonoin is also useful for a sensation of imminent death. It contains Lycopodium for tachyarrhythmias and Crataegus for cardiac muscle support (Reckeweg 2000).

Natrum homaccord: Contains Natrum muraticum, which may prove useful according to work in classical homeopathy by Dobias. Its effectiveness is unproven at this time. Palmquist has attempted two feline cases with no measurable benefit.

Strumeel: Supports thyroid tissues following initial therapy for thyrotoxicosis.

Thalamus compositum: Used for central control, particularly in neoplastic phases.

Thyroidea compositum: Supports hormonal axes, and the thyroid in particular. Viscum is indicated in Dedifferentiation Phases. Also provides central support of the hypothalamus and pituitary.

Tonico-Injeel: Used for hypertension, exhaustion, depression, neural injury, neuroasthenia, and gastric and hepatic upsets.

Traumeel: Used for inflammatory phases, which may contribute to the progression of this disease.

Ubichinon compositum: Provides metabolic support.

Veratrum homaccord: Treats vomiting, diarrhea, and personality changes that tend toward psychosis.

Authors' suggested protocols

Nutrition

Kidney and cardiac support formulas: One-half capsule BID.

Thyro complex: One-half capsule SID.

Alpha-lipoic acid: 35 mgs daily.

Coenzyme Q10: 30 mgs for daily.

Chinese herbal medicine

Formula H55 Hyperthyroidism: 1 capsule per 10 to 20 pounds twice daily. The dose is adjusted based upon clinical and laboratory findings. Clinical observation found this formula helps to reduce T3 and T4 levels, the size of thyroid glands in most the cases, and the heart rate, and improves the liver functions.

In addition to the herbs mentioned above, Hyperthyroidism contains anemarrhena (Zhi mu), cremastra (Shan ci gu), gentiana root (Long dan cao), gypsum (Shi gao), oyster shell (Mu li), sargassum (Hai zao), tortoise plastron (Gui ban), vaccaria (Wang bu liu xing), and zedoaria (E zhu).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom formula: Glonoin homaccord, Gelsemium homaccord, Aletris-Heel (thyrotoxicosis), or Tonico-Injeel (thyrotoxicosis and hypertension) mixed together and given PO TID.

Deep detoxification formula: Galium-Heel, Thyroidea compositum, Hepar compositum, Coenzyme compositum, Ubichinon compositum mixed together and given every 3 days.

Neurological Disorders

COGNITIVE DYSFUNCTION

Definition and cause

Cognitive dysfunction (CD) is broadly defined as the onset of age-related behavioral changes that are not associated with any physical or medical causes. CD can occur in both dogs and cats. Some of the common symptoms are lethargy, apathy, loss of house training, confusion, restless sleep, pacing, staring into walls or corners, howling, or other abnormal vocalization. Ruehl (1996) surveyed companions who lived with elderly dogs and found that more than 60% had at least 1 symptom of CD. One of the common findings in people with Alzheimer's disease and dogs and cats with CD is the deposition of amyloid plaques (Cummings 1996, Landsberg 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Selegiline (Anipryl) is the recognized treatment for CD. It appears to be able to slow the progressive degeneration of cognition. Treatment is generally recommended for the life of the animal (Landsberg 1997).

Anticipated prognosis

When CD is diagnosed early, before multiple clinical symptoms appear and are medically treated, the prognosis is good. The prognosis is more guarded with longstanding CD and when there are underlying complicating diseases.

Integrative veterinary therapies

An integrative approach to cognitive dysfunction takes into consideration not only the brain and nerves, but all of the organ systems. The focus is upon the initiating inflammation that precedes the degenerative process, the deposit of amyloid, and the resulting behavior changes.

The use of nutrients, antioxidants, phytonutrients, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on brain and nerve cells can help improve the clinical picture and slow the degenerative process. Numerous studies and references show the benefits of alternative therapies in people with age-related cognitive decline and dementia (Brayne 1995, Craik 1992, Hanninen 1996, Levy 1994, Smith 1996).

Nutrition

General considerations/rationale

Cotman (2002) and Milgram (2002) documented the benefits of improved, antioxidant-rich diets for the clinical picture of dogs with cognitive dysfunction. Joseph (1998) showed that diets that are rich in antioxidants and phytonutrients help slow the progression of a cognitive decline. Nutritional supplements that improve circulation, reduce free radical load and inflammation, protect brain and nerve cells, and supply the necessary nutrients for proper function have a positive effect on the animal's quality of life and help to control or eliminate symptoms of CD.

Appropriate nutrients

Nutritional/gland therapies: Glandular brain supplies intrinsic nutrients and can help improve circulation and reduce inflammation in the brain and central nervous system (Goldstein 2000) (see Gland Therapy in Chapter 2). Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is essential for cellular membranes, particularly those of brain cells. It has been studied and shown positive results in people with impaired mental functioning and degeneration (Crook 1991). In people with

Alzheimer's disease the addition of PS led to a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

PS was found to improve cognition in another human study (Maggioni 1990). In a double-blind study of 494 geriatric people, PS showed significant improvement in both cognition and behavior. (Cennachi 1993).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. Lecithin, as part of the cell membranes, is an essential nutrient that is required by all of the cells of the body for general health and wellness (Hanin 1987).

Acetyl-L-carnitine: Acetyl-L-carnitine is a derivative of the amino acid L-carnitine, which is involved in the production of acetylcholine and the proper function of the brain and the transmission of nerve impulses. Studies have indicated that acetyl-L-carnitine can slow the development of Alzheimer's disease and improve cognition in people. People taking acetyl-L-carnitine showed an improvement in memory and their day-to-day demeanor and mood (Cipoli 1990, Genazzani 1990, Garzya 1990).

Blue-green algae: Blue-green algae has been observed to create a generalized feeling of well being in humans, and it may prove helpful in veterinary patients. Its effects are usually observed to be slower in onset; the benefits take 3 to 4 weeks to appear. This may be due in part to their content of natural antihistaminic compounds or their levels of omega-3 fatty acids (Bruno 2001).

Many recent studies have confirmed the beneficial results from these critical fatty acids. *Aphanizomenon flos aquae*, a blue-green algae, has been shown in clinical settings to have positive effects on brain function. In addition to the aforementioned omega-3 fatty acids, it contains a full spectrum of essential amino acids, a broad-based mineral content, a rapidly assimilable glycolipoprotein cell wall, and a wide variety of vitamins. It has mild chelating properties, and thus may be valuable in heavy metal toxicoses such as Thimerosal reactions. It is a tremendous asset as a micronutrient resource and figures prominently in many treatment programs (Broadfoot 1997).

Chinese herbal medicine/acupuncture

General considerations/rationale

Cognitive dysfunction is a result of Liver and Kidney Qi and Blood deficiency, Yin and Yang deficiency, Phlegm accumulation, and blockage of the meridians.

Author's interpretation

Cognitive dysfunction is seen in the elderly. These patients are deficient in Blood, Yang, Yin, and Qi because they

have used these substances up during life. The Liver nourishes the Kidney, and it cannot perform this function when it becomes deficient. The Kidney houses the Essence, or life potential, so when it becomes deficient in all substances, the individual suffers the ravages of old age, including senility.

Phlegm can be thought of as sticky substances that "gum up" the mind, to use a colloquial expression. If it blocks the meridians' flow of thought, the result is forgetfulness.

Appropriate Chinese herbs

Curcuma root (Yu jin): May be able to prevent free radical tissue damage (Cui 1990). Free radical damage has been implicated in degenerative changes.

Fleece-flower root (He shou wu): Has been shown to increase life expectancy and slow aging in laboratory animals (Zhong Yao Yao Li Yu Lin Chuang 1989).

Gastrodia (Tian ma): Causes proliferation of large gliocytes in rats, indicating that it may improve the patient's memory (Liu 1997). It can increase SOD levels in the blood (Bai Xiu Rong 1996). Gastrodia also was shown to improve the learning and memory of mice that have suffered from cerebral ischemia (Du 1999).

Grassleaved sweetflag rhizome (Shi chang pu): May improve the ability to learn. One study compared the ability of mice to navigate a maze with and without grassleaved sweetflag root treatment. The mice were placed in the same maze for 6 days. Mice that received grassleaved sweetflag root made fewer mistakes and finished the maze faster than those given saline (Zhong Cao Yao 1992). This suggests that the herb improved the mice's memory of the maze.

Scorpion (Quan xie): May protect the brain. One study examined people suffering from a cerebral embolism. Most of the patients treated with scorpion seemed to respond positively (Ji Lin Zhong Yi Yao 1989).

White peony (Bai shao): Improves memory. It contains paeoniflorin, which can help scopolamine-damaged rats improve maze performance (Ohta 1993).

Zizyphus (Suan zao ren): Increases the activity of superoxide dismutase, creatine phosphatase, and lactic dehydrogenase in the brain, and can decrease the content of lactic acid (Bai 1996). These actions may prevent nerve cell damage and may help improve memory.

Acupuncture

Acupuncture may help improve the condition of the central nervous system. One study found that comatose patients recovered better if acupuncture was added to the customary Western treatments (Frost 1976). Another study found that patients who suffered from vascular dementia experienced quicker and more complete recovery when treated with acupuncture (Zhuang 1998).

Homotoxicology

General considerations/rationale

This condition generally represents Degeneration Phase changes in the neurological system. Oxidative damage is indicated as a contributory factor (Rofina et al. 2006). Therapy is aimed at removing homotoxins, rehabilitating organelles and cellular function, and improving circulation in the area. Interest in complementary and integrative approaches has recently increased (Kline 2002). Of particular interest to homotoxicologists and other physiological regulation medicine practitioners is the use of mitochondrial enzyme cofactors (Milgram 2002). The authors are unaware of any controlled, evidence-based studies on homeopathic agents in this condition, although a nonrefereed publication dealing with dementia in human patients has recently appeared (Smit 2006).

Application of the Six-Phase Table of Homotoxicology can be helpful in such cases. Often cognitive dysfunction represents congestion and clogging of the matrix followed by decreasing efficacy of cellular function and elimination of wastes. Typically this process is silent in the Deposition and early Impregnation phases and becomes more evident in the late Impregnation and Degeneration phases of pathogenesis. Most patients in this category benefit from the deep detoxification formula because it supports elimination organs and provides drainage of the cells and matrix. Further judicious use of catalyst therapy can greatly assist geriatric patients by providing adequate cellular energy metabolism to perform the requested tasks involved in homotoxin removal and excretion. Such cleansing is a fundamental requirement for cellular healing to occur.

Regressive vicariation of the central nervous system can be a startling experience for client and clinician alike. Patients suffering from subclinical Impregnation disease that undergo regressive vicariation can experience depression, headache, photophobia, sleep disorder, muscle twitching, and both petit mal and grand mal seizures. The client needs to be fully informed before such steps are taken in elderly pets, and while such signs usually represent healing and are beneficial, in the acute phases they can be alarming and require medical attention. The key to minimizing such events is the slow progression of both organ support and drainage. If a patient is affected by strong neurological signs, the biological therapist will know to reduce the frequency and dose of the detoxification and drainage remedies, thus allowing the body time to remove and process homotoxins that have been liberated through healing.

Impregnation and Degeneration phase disorders are usually not curable, but can be managed with long-term therapy and an integrative approach. Clients will often report improved conditions in 2 to 4 weeks of therapy. Brighter eyes and more interest in play and other activities

are most often reported. An initial period of deep rest and reduced activity may occur, especially with the use of catalysts such as Glyoxal compositum, and this is believed to be due to initial movement of homotoxins out of organelles and into the matrix. Palmquist recommends using the deep detoxification formula only twice per week for 3 to 4 weeks prior to raising the dosage or beginning other therapies on such patients. Nutritional therapy during this period seems very helpful (Milgram, et al. 2002).

The importance of rehabilitative exercise and play cannot be overstated. Numerous studies have shown that proper mental stimulation, challenge and play, and exercise directly assists in drainage through improved circulation and lymph milking by skeletal muscles during exercise (Goldstein 2005). Once again the clinician must be aware of homotoxins moving into connective tissue and the resultant discomfort that can occur. Such patients frequently have an initial exacerbation of musculoskeletal discomfort and this can be greatly helped by use of biological therapeutic agents which assist the patient in moving toxins. Lymphomyosot (lymph motion and drainage), Byaconeel (pain in small joints of the hand and feet resulting from regressive vicariation), Cruroheel (connective tissue drainage and support in regressive vicariation), and Arsuraneel (serious vicariations) are commonly required in these stages (Reckeweg 2000). The use of compositae class remedies provides support for connective tissue and stem cell elements and seems to diminish such negative symptoms as well (Reckeweg 2000).

Appropriate homotoxicology formulas

***Aesculus compositum*:** Useful in improving circulation following stroke or reduced cerebral circulation (*Aesculus hippocastanum* and *Secale cornutum*). Contains *Arteria suis* for support of arteries. *Solanum nigrum* further supports cerebral function, particularly in cases with confusion, epileptic seizures, or disorientation. Several other agents support removal of homotoxins and improve vessel stability (Reckeweg 2000). *Baryta iodata* (also in *Circuloheel*, *BHI-Circulation*, and *BHI-Stramonium Complex*) is included for arteriosclerosis, coronary ischemia, and heart problems in aged pets. *Dulcamara* is used for certain states of confusion and dull headache coupled with hardness of hearing, and is also very useful for the rheumatic afflictions that occur with damp weather. *Plumbum metallicum* (also in *Placenta compositum* and others) is included.

This remedy treats arteriosclerosis with fatty heart and ventricular hypertrophy; bleak, despondent mood; emaciation in paretic syndromes and other diseases of the nervous system; hepatic disorders; and states of confusion. *Rhus toxicodendron* treats a multiplicity of symptoms that suggest a rheumatic origin and

include mental confused, difficulty in understanding, and absent-mindedness.

Secale cornutum treats the emotional and intellectual functions that are particularly disordered. Predominant symptoms include difficulty in thinking, deficient understanding and comprehension, a certain dullness of intellect, great forgetfulness and sensory delusions, and sometimes vertigo and staggering and an inability to stand upright. *Secale* also treats the impairment of the central emotional control by the brain or the impairment of the autonomic central control, with spastic symptoms developing in the whole abdomen. *Viscum album* (also in *Ginseng compositum*, *Rauwolfia compositum*, *Secale*, *Thalamus compositum*, *Thyroidea compositum*, and *Viscum compositum*) is included for melancholia, hypotension and hypertension, sensations of vertigo, coronary stenosis, arrhythmia, and articular diseases of attrition (Reckeweg 2002).

Apis homaccord: Generally useful in edema, but also in cerebral sensitivity. May assist cardiac-induced cerebral weakness through *Scilla*, *Apisinum*, and *Apis mellifica*.

Barijodeel: Useful in senile dementia, cerebral sclerosis, memory failure, anxiety, arteriosclerosis, and depression. Very useful agent in geriatric patients (Reckeweg 2000). The primary component is *Baryta carbonica* (also in *Placenta compositum*, *Tonsilla comp*, and *Ginkgo*), which is suited to anxious patients who shun the company of others and exhibit weakness and slowness of mental activity. It is also helpful for hypertension and angiosclerosis (Reckeweg 2002). The remaining remedies are also very strongly suited to the mental and emotional issues that accompany aging pets and the attendant behavior and physical changes, and are common components of therapies used in older animals (Broadfoot 2006).

BHI-Alertness: Used for depressed, dull, geriatric patients.

BHI-Ginkgo complex: Supports cerebral blood flow and improves awareness. Contains the remedy *Ginkgo* for symptoms of senility disorders: forgetfulness, mental exhaustion, lack of concentration, numbness, vagueness, dull mental state, avoidance of company, confusion, apathy, and irrational fears. The physical symptoms include vertigo, insomnia, and vision impairment. This remedy strongly affects the kidney and lung channels, according to Traditional Chinese Medicine, and is used in cases with phlegm; wheezing, asthma, and leukorrheal discharge; frequent urination; incontinence; dysphagia; and dry mouth. The abdomen is tense and swollen and the patient may experience cough, dyspnea, etc. The urogenital area and respiratory symptoms, as well as the mentals, all relate to TCM's connection to the kidney channel. This remedy also contains *Baryta carbonica* (see *Barijodeel*).

BHI-Recovery: Used for post-stroke recovery.

Cactus compositum: Supports cardiac function in senile dementia that originates from a weakening cardiac status.

Causticum compositum: The remedy picture of *Causticum*, the primary remedy, embraces complaints of a neuralgic-rheumatic nature that are possibly associated with paralytic conditions. They include a high degree of weakness, frequent association with trembling and an unsteady gait, and nocturnal enuresis. On the emotional side, *Causticum* corresponds to sadness and depression. *Causticum* complements *Rhus tox* and *Sulphur* well, especially in the treatment of rheumatism. *Embryo suis* (also found in *Cerebrum compositum*, *Placenta compositum*, *Testis compositum*, and others) is useful for anxiety, impaired concentration, confusion, mental dullness, and fatigue. *Fumaricum acidum* (also in *Coenzyme compositum*, *Thyroidea compositum*, and *BHI-Enzyme*, to name a few) is used for disturbances of lipids and steroids in the metabolism and with premature arteriosclerosis. It works in combination with malic acid to treat hypertension. And also treats and prevents embolism and is used for a feeling of weakness or relaxation that leads to sleep or excessive physical irritability. The component *alpha-Ketoglutaricum* (also in *Coenzyme compositum*, *Thyroidea compositum*, and *BHI-Enzyme*) may be used for paralysis following a stroke, as well as total exhaustion, restlessness at day and night, and poor appetite. Fatigue and daytime sleepiness are prominent symptoms with mental dullness, forgetfulness, irritability, concentration issues, anxiety, and mental confusion (Reckeweg 2002). This remedy also contains *Natrum oxalaceticum* (see *Ginseng compositum*).

Cerebrum compositum: Supports cerebral tissue, stem cells, and vessels (*Cerebrum suis*, *Placenta suis*, *Placenta suis*, *Arnica montana*). It helps to improve memory (*Selenium*, *Thuja occidentalis*, *Acidum phosphoricum*, *Manganum phosphoricum*, *Semecarpus anacardium*, *Ambra grisea*, *Conium maculatum*, and *Medorrhinum-Nosode*). This remedy also supports cerebral function and vascular structures (*Kalium phosphoricum*). It treats vertigo, stupor, and headache (*Gelsemium sempervirens*, *Kalium bichromicum*, and *Ruta graveolens*) and supports capillary and other circulation as well as lymph (*Aesculus hippocastanum*). Further indications include anxiety (*Aconitum napellus*) and exhaustion (China, *Amarita cocculus*).

Cerebrum compositum supports enzyme systems and helps with difficulty sleeping (*Hyoscyamus niger*) (Reckeweg 2000). It contains *Ambra grisea* (also found in *Cocculus compositum*, *Vertigoheel*, *BHI-Dizziness*, *BHI-Lightheaded*, and *BHI-PMS-Mulimen*) and is used for nervous excitement, hearing impairment, and difficulty in concentration. Predominant in its symptom picture we find nervous symptoms of a primarily chronic nature such as nervous weakness of vision and hearing, vertigo, weak-

ness of memory, deterioration of brain function and senility with general mental prostration, nervous hyperexcitability and nervous exhaustion, insomnia, autonomic dysregulation, angiosclerosis, and premature aging (Reckeweg 2002).

A case study in a *Biological Therapy Journal* article profiles adjuvant therapy of Alzheimer's patients with age-related dementias, and extrapolation to canine patients may prove interesting. Regular, intensive memory training is important in human patients, and antihomotoxic medicine offers an interesting therapeutic option for detoxification and metabolism activation using catalyst preparations and suis organ preparations. This study used *Cerebrum compositum*, *Coenzyme compositum*, and *Ubichinon compositum* to good effect (Shperling 1996). *Cerebrum compositum* was studied in a large group of patients, and showed very good therapeutic efficacy and was well tolerated. The preparation's broad spectrum of efficacy is the result of its variety of botanical and mineral components; as well as *Cerebrum suis*, *Embryo suis*, *Hepar suis*, and *Placenta suis*, which specifically stimulate organic function; and the nosodes *Luesinum* and *Medorrhinum*, two constitutional remedies for exerting a positive influence on the organism's general responsive status. The overall action of *Cerebrum compositum* is directed not only toward improving brain function, but also toward alleviation and prevention of arteriosclerotic circulatory disturbances with attendant deterioration in cerebral performance, a factor particularly valuable in the treatment of aged patients (Weiser 1995).

Coenzyme compositum: Provides metabolic support and energy. Used in cases of exhaustion.

Galium-Heel: Used for support of chronic disease states; is a cellular phase remedy.

Gelsemium homaccord: Treats neuralgia and nerve pain, headache, and posterior weakness. Commonly required in aging large breed dogs.

Ginseng compositum: Increases energy and awareness in geriatric pets. Primarily named for the Ginseng component *Aralia quinquefolia* (also in *Testis compositum*). The principal indications are: states of nervous exhaustion, weakness of intellect, confusion, and dulled senses. There may be vertigo, and a tendency to sleep, or weakness of vision with hypersensitivity to light. ATP (Adenosine Triphosphate, which is also found in *Coenzyme compositum*, *Thyroidea compositum*, *Ubichinon compositum*, and *BHI-Enzyme*) is useful for damage to the energy-utilizing systems (e.g., citric acid cycle and others), especially iatrogenic damage. Patients may be angry, excitable, or irritable, and demonstrate restlessness with difficult concentration. The Conium component (common to *Cerebrum compositum*, *Cocculus compositum*, *Testis compositum*, et al.) can be considered when there is a history of paralysis which ascends from below.

Rotatory vertigo is one of the main indications for Conium. Other symptoms include old age, arteriosclerosis and progressive cachexia, and symptoms of sensory irritation. In the area of brain function, Conium can treat weakness of memory, reduced mental ability, and possibly also tremors, tinnitus and sleeplessness. In the mucosa we may see irritation with dryness, and ulcers with offensive discharge.

Natrum oxalaceticum (also in *Causticum compositum*, *Coenzyme compositum*, *Thyroidea compositum*, *Ubichinon compositum*, and others) is indicated for vertigo that does not respond to other remedies; vertigo and cerebral ischemia; anxiety; mental confusion; depression and sadness; and nerve pain with hypersensitivity to noise, light, and touch. *Viscum album* (also in *Aesculus compositum*, *Thalamus compositum*, *Thyroidea compositum*, *Viscum compositum*, and others) is mainly indicated for hypotension and hypertension, sensations of vertigo, coronary stenosis, arrhythmia, and articular diseases of attrition (Reckeweg 2002).

Glyoxal compositum: Supports metabolism and unblocks receptors and enzymes.

Lymphomyosot: Provides lymph drainage.

Ovarium compositum: Supports ovarian tissue and drainage.

Placenta compositum: Used for vascular support and headache.

Selenium homaccord: Treats diminished mental activity and cerebral function, especially as it relates to atherosclerosis (Reckeweg 2000).

Testis compositum: Supports testicular function and provides drainage. Primary remedy is *Testis suis* with premature senility as the main indication. States of exhaustion are another indication. This remedy, which also contains Ginseng and Conium (see *Ginseng compositum*), raises the level of vitality (Reckeweg 2002).

Ubichinon compositum: Supports deep metabolism and the cytochrome oxidase system.

Vertigoheel: Possibly increases cerebral circulation (Klopp, Niemer, Weiser 2005).

Authors' suggested protocols

Nutrition

Brain/nerve and behavior emotional support formulas: 1 tablet for each 25 pounds of body weight BID.

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Acetyl-L-carnitine (500 mgs): One-half capsule per 25 pounds of body weight daily.

Blue-green algae: One-fourth teaspoon for each 25 pounds of body weight daily.

Chinese herbal medicine/acupuncture

Senility B: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs discussed above, Senility B contains angelica root (Dan gui), antler powder (Lu jiao jiao), arisaema/bile (Dan nan xing), black sesame seeds (Hei zhi ma), bulrush (Pu huang), fossil teeth (Long chi), licorice (Gan cao), longan fruit (Long yan rou), mulberry (Sang shen zi), polygala (Yuan zhi), poria (Fu ling), pseudotellaria root (Tai zhi shen), red peony (Chi shao), rehmannia (Shu di huang), salvia (Dan shen), silk-worm fungus (Jiang can), and trichosanthes (Quan gua lou). These herbs help improve the function of the formula.

The classically recommended acupuncture points are KI1 and KI4 (Lei 1999). In addition, the author also recommends ST36, PC6, Baihui, SP6, BL18, BL20, and BL23.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom remedy: Cerebrum compositum given by injection and then orally 1 to 3 times weekly. Can be added to the following detoxification formula and used long term.

Detoxification therapy: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum Coenzyme compositum, Ubichinon compositum, and Placenta compositum mixed together and given twice weekly for 3 to 4 months. Add Mucosa compositum if diarrhea or other gastrointestinal issues arise.

DEGENERATIVE MYELOPATHY

Definition and cause

Degenerative myelopathy (DM) is a slow, progressive degeneration of the spinal cord, which often leads to loss of motor control of the hind legs. While no proven cause is known, it is believed that an autoaggressive process may be involved with the observed degeneration of the spinal cord. Although it is most commonly found in German Shepherds, DM has also been seen in other breeds such as old English Sheepdogs, Belgium Shepherds, and Weimaraners (LeCouteur 1989, Sisson 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Once diagnosed, there is no proven therapy for DM. Clemmons (1989) states that “the current treatment of DM is designed to suppress the immune disease, but does nothing to correct the immune alterations which led to the disease state.” Clemmons has proposed an immune-mediated cause in German Shepherds, and as such recommends a combination of controlled exercise to improve tone and circulation, vitamins and other supplements, n-acetyl-cysteine, and aminocaproic acid (EACA), which have shown an improvement or stabilization of the condition in more than 50% of the animals with DM. No controlled trials have been reported, however (Clemmons 1989, Sisson 2003).

Anticipated prognosis

Most animals diagnosed with degenerative myelopathy slowly lose nervous control and become non-ambulatory within 1 to 2 years of diagnosis. Late-stage DM is often complicated with both fecal and urinary incontinence (Sisson 2003). Clemmons (1989) offers a better prognosis (see medical therapy above).

Integrative veterinary therapies

The authors recommend an augmented version of Dr. Roger Clemmons' protocol for the treatment of DM in dogs (Clemmons 2002). The enhancements to Dr. Clemmons' program include adding the authors' specific glandular, Chinese herbal, acupuncture, and homotoxicology remedies to his published protocol.

Nutrition

Gland therapy: Glandular brain, adrenal, thymus, and spleen supply the intrinsic nutrients that help reduce autoimmune cellular inflammation, neutralize free radicals, and improve organ and nerve function. This helps to slow and spare the nerves from progressive degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now believed to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

General considerations/rationale

Many of the following considerations and recommendations are taken from the web site of Clemmons (2002): http://neuro.vetmed.ufl.edu/neuro/DM_Web/DMofGS.htm. Updated August 27, 2002.

"Diet may have a powerful influence on the development of chronic degenerative diseases. New information suggests a significant connection between dietary regulation and the progression and development of diseases such as multiple sclerosis. Eliminating toxins from processed food may help prevent a number of immune-related disorders. The current treatment of DM is designed to suppress the immune disease, but does nothing to correct the immune alterations which led to the disease state.

Diet might help to correct this defect and allow the immune system in DM dogs to stabilize. The principles of dietary therapy, including a homemade diet, are outlined here. For those who cannot cook for their dog, the basic diet should be supplemented with the additional ingredients listed below. It is best to choose a dog food

that is close in protein content and is as natural as possible. Wild dogs were not meat eaters. They ate bodies, including intestinal contents that were often laden with plants and plant materials. Dogs have evolved so that eating animal fats and protein do not cause them to suffer the same problems as humans when eating these sources of saturated fats. Even so, dogs probably suffer from the same causes of dietary and environmental intoxication that affect humans.

Basic diet (1 serving for 30 to 50 pounds body weight)

- 2 oz. boneless pork center loin chop (boiled, baked, or fried in olive oil)
- 4 oz. tofu
- 8 oz. long grain brown rice (3 oz. cooked in 6 oz. water)
- 2 teaspoons extra virgin olive oil
- 1/4 cup molasses
- 2 carrots (boiled and then chopped)
- 1 cup spinach (cooked)
- 4 tablespoons green bell pepper (chopped and steamed)
- 4 broccoli spears (boiled and chopped)

This diet provides approximately 1,160 to 1,460 calories per serving. Poultry meat, beef, and lamb can be substituted for the pork chop. This alters the composition slightly, mainly by adding fat. The weight of the meat is based upon boneless weight. Most of the items can be prepared in a microwave.

Based upon the dog's body weight, more or less will need to be prepared. For example, multiply all the ingredients by 1.5 times to 2.5 times for dogs weighing 80 pounds (daily caloric requirements may vary by dog).

This recipe can be made in advance, divided into appropriate quantities, and frozen. Just before feeding, thaw in hot or boiling water or defrost in the microwave.

To complete the diet, add the following combination before serving (recipe makes 1 serving; multiply or divide as needed):

- 1 teaspoon dry ground ginger
- 2 raw garlic cloves (crushed)
- 1/2 teaspoon dry mustard
- 1 teaspoon bone meal

Approximately 1 serving of the above diet equals 1 can of commercial dog food. The exact requirements for a dog can be approximated by substituting the diet on that basis. The dog should be weighed each week, and the amount of the diet increased if it is losing weight (or decreased if the dog is gaining weight). Eventually, the correct amount will be clear.

Many German Shepherds have sensitive stomachs; therefore, it may be wise to phase in the new diet by mixing it with existing food until the dog adapts. Start by mixing the diet with existing food in equal amounts. After 1 week increase the diet to replace 75% of the original

food. After another week, switch completely to the new diet. This diet is balanced and high in most of the vitamins and minerals that dogs need. Any shortcomings can be corrected with the supplements given below.”

Appropriate nutrients

B-complex: B vitamins are water-soluble, and any excess amount is eliminated through the urine. They may help in neural regeneration and should be given to dogs. No dog should die while having cheap urine. There is altered absorption of some B vitamins in DM, and supplementation can correct this.

Vitamin E: Vitamin E is an important nutrient that has been shown to have a number of physiologic and pharmacologic effects. It is a potent antioxidant that reduces fat oxidation and increases the production of HDL cholesterol. At higher doses it also reduces cyclooxygenase and lipooxygenases activities, decreasing production of prostaglandins and leukotrienes. As such, it is a potent anti-inflammatory drug. It reduces platelet function and prolongs the bleeding time slightly in healthy individuals. There are no known side effects to vitamin E at levels less than 4,000 to 6,000 IU per day (except in cats, where levels over 400 IU/day might create hepatolipidosis). This drug slows the progression of DM and corrects for low serum and tissue levels. In DM, there appears to be a deficient absorption and tissue-binding protein which accounts for the low serum and tissue concentrations of vitamin E.

Vitamin C: Vitamin C works with vitamin E and helps with its regeneration, potentiating its antioxidant effect. Vitamin C supplementation does no harm, because the excess is excreted through the kidney. While dogs produce vitamin C in their bodies (unlike humans, pigs, and guinea pigs, who must obtain it from their diet), they may need vitamin C in excess of their manufacturing capacity when they are suffering from stress or disease.

Selenium: Selenium is an important mineral that has antioxidant properties similar to vitamin E. Vitamin E can replace the requirement for selenium in the body, but selenium cannot substitute for vitamin E. In addition, selenium does not cross the blood-brain barrier like vitamin E. On the other hand, selenium may help vitamin E to be more effective. Many plant sources are low in selenium and supplementation may be important.

Omega-3 fatty acids: Omega-3 fatty acids such as EPA (eicosapentaenoic acid) and DHA (docosahexaenoic acid) are the constituents of fish oils that act as anti-inflammatory agents. They may be worth trying in dogs with autoimmune disorders or arthritis.

Gammalinolenic acid: Borage oil, evening primrose oil, and black currant oil are natural sources of gammalinolenic acid, a fatty acid that is hard to get in the diet. GLA is an effective anti-inflammatory agent with none of the side

effects of anti-inflammatory drugs. It also promotes healthy growth of skin, hair, and nails. It may be good for skin conditions, arthritis, and autoimmune disorders. It takes 6 to 8 weeks to see changes after adding GLA to the diet.

Soybean lecithin: Lecithin is a fat-like substance found in the cells of the body. It may combat atherosclerosis, improve memory, and fight Alzheimer's disease in people. However, there is no scientific evidence to support these claims. On the other hand, lecithin is harmless. It is not necessary as a supplement unless a dog has DM and the client elects not to use the diet outlined above (tofu contains plenty of soybean lecithin).

Coenzyme Q: Coenzyme Q, also called CoQ10, is a natural substance that assists in oxidative metabolism. It may improve the use of oxygen at the cellular level, and patients with heart, muscle, and nerve problems may find it worth trying in doses of 30 to 100 mg per day. Some people report that it increases their aerobic endurance.

Medication: The following medications are recommended by Clemmons:

Over the last 2 decades, we have found 2 medications which appear to prevent progression or result in clinical remission of DM in many (up to 80%) of patients: aminocaproic acid (EACA) and n-acetylcysteine (NAC). Clemmons recommends giving EACA as a solution, using the generic product. This product, while designed for injection, can be mixed with chicken broth to provide a palatable solution for oral usage. Clemmons recommends mixing 2 parts of aminocaproic acid solution (250 mg/ml) with 1 part chicken broth and giving 3 ml of this mixture orally every 8 hours. In his experience, this mixture has been equally, if not more, effective to the tablet form of EACA. Furthermore, the solution is much less expensive than the tablets. The generic form of EACA solution can be obtained from American Regent, 1-(800) 645-1706 (outside of New York). The generic drug from American Regent may be obtained through prescription with the help from a local pharmacy.

An alternative source for EACA is to have a compounding pharmacy make the solution from chemical grade EACA. WestLab Pharmacy in Gainesville, Florida, can be reached at 1-800-4WESTLA (1-352-373-8111) and can mail the medication and bill the client directly. Occasional gastrointestinal irritation is the only side effect that has been attributed to EACA. This only presents a problem in a few patients, usually those who have pre-existing GI problems that the medication might exaggerate. A local pharmacist can help determine whether any additional drugs might be contraindicated or lead to possible drug interactions with the recommended therapy. The only known interaction is with estrogen compounds, and only in high doses.

Acetylcysteine is a potent antioxidant that has powerful neuroprotective effects. Clemmons gives 75 mg/kg divided

in 3 doses a day for 2 weeks. After that, give the 3 doses every other day. The N-acetylcysteine comes as a 20% solution and must be diluted with chicken broth (or other compatible substitute) to 5% to prevent stomach upset. This new treatment is expensive unless purchased through compounding pharmacies. Again, WestLab Pharmacy has this product and can send it to clients upon veterinary prescription. Using N-acetylcysteine at the above dose does not appear to have side effects. It can produce vomiting and may increase the bleeding time. The GI upset is likely due to the sodium content of the pharmaceutical product, which requires high concentration of base to buffer to pH 7.4. WestLab's product does not have as many side effects because the pH is reduced during preparation. Giving fresh ginger 30 minutes before and giving the NAC with food (or on a full stomach) often reduces this effect.

The combination of aminocaproic acid, N-acetylcysteine, dietary supplements, and exercise is the best treatment we have discovered. It corrects those aspects of the immune dysfunction, which we can treat, based upon our belief that DM is an immune-mediated inflammatory disease. We always hope that all patients will respond to our treatment protocol. Although it does not work in all cases, this combined treatment has been up to 80% effective in patients diagnosed at the University of Florida. The chances of successful treatment are improved if the therapy is begun early in the course of DM rather than later. A response to the drugs should be evident within the first 7 to 10 days. There are no other medications that Clemmons has found to provide any real benefits in the long-term treatment of DM. For further information about treatments for DM, Clemmons recommends *Current Therapy X*, pages 830–833, and *Vet. Clin. Nor. Am.* 22:965–971, 1992.

Chinese herbal medicine/acupuncture **General considerations/rationale**

Degenerative myelopathy is due to Qi, Blood, Yin, and Essence deficiency in the Kidney, Liver, Spleen, and Stomach. The Spleen and Stomach produce the nutrients that in turn nourish the Muscles and Nerves and support the Kidney. Therefore, deficiencies in these organs lead to deficiencies in those structures. The Liver controls ligaments and the Spleen controls Muscles, so Blood and Yin deficiency in these organs leads to weakness and atrophy. The Kidneys control the Marrow or interior of Bones. The Spinal Cord is inside the Vertebrae, so this structure falls under the auspices of the Kidney. Qi deficiency in these organs defines the weakness seen in the condition. The Stomach also suffers from deficiency of Qi, preventing it from extracting enough Blood and fluids from food to reverse the pathology. There seems to be a genetic predisposition to development of degenerative myelopathy. It is

most often seen in German shepherds. This suggests a deficiency of Essence, or genetic predisposition in Western terms.

Appropriate Chinese herbs

Achyranthes (Niu xi): Has anti-inflammatory effects. It can ameliorate egg white-induced foot swelling in rats (Xong 1963), which may make it efficacious in decreasing inflammation in the spinal cord.

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid. These compounds have 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). If an autoimmune etiology is truly the cause, this property could be quite beneficial.

Milletia (Ji xue teng): May modify the immune system. It has an inhibitory effect on cellular immunity (Yang 1997, Xu 1993). It may decrease immune-mediated destruction of the nervous system.

Rehmannia/cooked (Shu di huang): Has anti-inflammatory properties (Zhong Yao Yao Li Yu Ying Yong 1983) and has been used for nervous system inflammation. It was one component of a supplement that also contained Rou cong rong, Lu han cao, Gu sui bu, Yin yang huo, Ji xue teng, and Lai fu zi that was used in 1,100 patients with myelitis. Seventy-three percent had significant improvement in clinical signs, and another 13% had moderate improvement (Liao Ning Zhong Yi Za Zhi 1982).

Sichuan aconite (Chuan wu): Decreases inflammation (Xian Dai Zhong Yao Yao Li Xue 1997).

Acupuncture

Degenerative myelopathy is similar to multiple sclerosis in people. Acupuncture has been shown to help decrease symptoms in affected humans. Naeser (1996) reviewed studies in human medicine related to spinal cord disorders and multiple sclerosis. A total of 42 people participated in the various studies. Acupuncture was shown to improve incontinence and muscle spasms. One woman who had been unable to walk without assistance was able to walk short distances after 1 year of treatment. Clemmons (2006) has found that acupuncture therapy slows the rate of progression of the degenerative myelopathy in dogs.

Homotoxicology

General considerations/rationale

Degenerative myelopathy is a progressive Degeneration Phase disease with no known cure. Practitioners are unable to address such homotoxicoses until too late in the pathophysiology for cure. This condition may represent a genetic deterioration involving only a few breeds. Autoimmune disease is another possible cause. Theoretical approaches to such conditions involve draining the matrix, supporting organelle repair, and supporting energy metabolism.

The authors have not used homotoxicology as a sole agent to treat any patients with confirmed diagnosis of degenerative myelopathy, and are unaware of any published cases that have responded favorably in a measurable way. Success in assisting these patients has been reported by Wynn and Marsden using acupuncture, herbs, and nutraceuticals (Wynn, Marsden 2003).

Clemmons feels there may be similarities to multiple sclerosis in humans, a homotoxicosis that has some history of therapy in homotoxicology. Unfortunately, many of the constituents of this experience are not available in the United States (Reckeweg 2000).

Classical homeopathic doctors have reported success in individual cases. While no controlled studies on homeopathy for degenerative myelopathy exist, further research may reveal useful information based upon known data on the use of aminocaproic acid and n-acetylcysteine (NAC) in conjunction with antioxidant therapy, Chinese herbs, and acupuncture as the desired foundational therapy.

Appropriate homotoxicology formulas

Aesculus compositum: Supports vascular tissues.

Arsuraneel: Useful when the patient feels there is no hope. Symptoms include weakness, exhaustion, disability, and polyneuritis. Contains Curare (also contained in *Circulo-Injeel*, *Syzygium compositum*, and *Testis compositum*).

BHI-Recuperation: Contains Causticum, Gelsemium sempervirens, and Plumbum metallicum, which are commonly indicated for weakness and paralysis.

Causticum compositum: Usually indicated for burns, radiation injuries, and other sharp burning pains, Causticum is useful for weakness of the rear legs and paralysis of single parts. Unsteady walking is a symptom. It is also contained in *Barijodeel*, *Husteel*, *Neuralgo-Rheum-Injeel*, *Reneel*, *Rheuma-Heel*, *BHI-Arthritis*, *BHI-Bladder*, *BHI-Recuperation*, *BHI-Throat*, and *BHI-Uricontrol*. The ingredient Embryo suis has been used for muscular dystrophy. Other ingredients support chronic degenerative conditions.

Circulo-Injeel: Contains Curare for weakness and paralysis, as well as polyneuritis.

Coenzyme compositum: Supports metabolism.

Discus compositum: Combination remedy that supports connective tissue.

Echinacea compositum: May normalize inflammatory reactions.

Galium-Heel: Treats cellular diseases and provides matrix drainage. Contains Galium mollugo for detoxification (Reckeweg 2000). Also treats precancerous conditions. Echinacea augustifolia strengthens immunity and is used in inflammatory conditions. Useful in autoimmune conditions.

Gelsemium homaccord: Main remedy for rear leg weakness; trembling is common. Gelsemium is also contained in *BHI-Back*, *BHI-Headache*, *BHI-Heart RX*, *BHI-Neuralgia*, *BHI-Recovery*, *BHI-Recuperation*, *BHI-Sciatic*, *Cerebrum compositum*, *Echinacea compositum*, *Spascupreel*, and *Spigelon*.

Ginseng compositum: Treats weakness and exhaustion.

Glyoxal compositum: Depolymerizes homotoxins from receptors and enzymes and assists in energy production and receptor activation.

Graphites homaccord: Treats weakness in the lower back in overweight patients with history of skin affectations and constipation. Patients are easily chilled.

Lymphomyosot: Provides lymph drainage and immune support.

Lyssin-Injeel: Not available in the United States, but is included because this is homeopathically prepared rabies virus. Due to the possibility of progressive vicariation reactions resulting from vaccination, this remedy may prove helpful in some cases.

Medulla spinalis suis-Injeel: Nosode therapy for the spinal cord.

Neuralgo-Rheum-Injeel: Contains Silicea, and is a major remedy for vaccinosis. Also contained in *BHI-Alertness*, *BHI-Migraine*, *BHI-Neuralgia*, *Cruroheel*, *Discus compositum*, *Spigelon*, *Strumeel*, and *Zeel*.

Phosphor homaccord: Supports spinal weakness in thin animals that are prone to hemorrhage. Constitutional remedy.

Psorinoheel: Miasmatic medicine that reaches deep homotoxicoses for all chronic diseases. Also act as an Excretion Phase remedy.

Schweif-Heel: Contains homeopathic dilutions of Sulfur, which activate blocked enzyme systems, assist in construction of structural substances of the matrix, activate blocked or stalled cases, and treat heaviness or paretic limbs (Boercke 1927).

Selenium homaccord: Treats weakness and exhaustion.

Testes compositum: Provides strengthening and drainage of the matrix in male patients with weakness. Contains Conium maculatum for ascending hindlimb ataxia, weakness, and hemiplegia. This also may be helpful for older dogs. Also found in *Cerebrum compositum*, *Cocculus compositum*, *Ginseng compositum*, *Rauwolfia compositum*, *Thyreoida compositum*, *Tonsilla compositum*, *Ubichinon compositum*, *Vertigoheel*, *BHI-Circulation*, *BHI-Dizziness*, *BHI-Lightheaded*, and *BHI-Stramonium Complex*.

Traumeel S: Anti-inflammatory agent which activates blocked enzyme systems. Treats regulation rigidity.

Ubichinon compositum: Supportive of metabolism in cellular diseases and Degeneration Phase diseases.

Authors' suggested protocols

Nutrition

Brain/nerve and immune support formulas: 1 tablet for each 25 pounds of body weight BID. These formulations contain glandular brain, adrenal, lymph, thymus, spleen, alpha-lipoic acid, L-carnitine, N-acetyl cysteine, phosphatidyl choline, and phosphatidyl serine.

The combination of these brain/nerve and immune support formulas contains the following nutrients per serving for a 75-pound dog:

Vitamin A—3,750 IU
 Vitamin E—525 IU
 Vitamin C—750 mg
 N-Acetyl Cysteine—75 mg
 Selenium—105 mcg
 Lecithin—300 mg
 Phosphatidyl serine—75 mg

In addition to the above 2 formulations which add multiple glandular support, Clemmons recommends adding the following nutrients and additional vitamins and minerals to those listed above to achieve his recommended, target dosage schedule of:

Vitamin C—1,000 mg BID
 Vitamin E—2000 IU daily
 Selenium—200 mcg daily

Vitamin B complex: Give high potency B-complex (with approximately 50 mg of most of the B components) to healthy dogs. Dogs with DM should receive stress formula B-complex with 100 mg of most of the B components.

Coenzyme Q10: 100 mgs daily.

Fatty acids: Many versions of these substances are on the shelves of health food stores, from salmon oil to capsules of concentrated EPA. However, eating some cooked salmon or sardines may have benefits over capsular forms of the fish oils. Alternatively, dogs can be given ground flax seeds, flax oil, or hemp oil as a dietary supplement instead of fish oils. These materials reduce platelet function for a brief period in dogs, but it seems that dogs compensate for this within about 8 weeks. Omega-3 fatty acids replace the 2-series fatty acids over time. As such, cellular stimulation produces 3-series prostaglandins and thromboxanes. The latter does not cause inflammation nor does it reduce blood flow like the 2-series thromboxanes do. All dogs should receive 1,000 mg of fish oil capsule, 1 tablespoon ground flax seeds, or 2 sardines every day.

Gamma-linolenic acid: 500 mgs BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Blue-green algae: One-fourth teaspoon for each 25 pounds of body weight daily.

Chinese herbal medicine/acupuncture

The authors use a formula called Degenerative Myelopathy at a dose of 1 capsule per 10–20 pounds twice daily to effect. In addition to the herbs discussed above, Degenerative Myelopathy also contains Antler gelatin (Lu jiao shuang), arisaema/bile (Dan nan xing), astragalus (Huang qi), bamboo silicea (Tian zhu huang), centipede (Wu gong), citrus (Chen pi), dragon's blood (Xue jie), earthworm (Di long), ginger (Ren shen), salvia (Dan shen), silkworm (Jiang can), and uncaria (Gou teng). These herbs help increase the efficacy of the formula.

The authors recommend the following acupuncture points: BL18, BL23, BL30, BL60, ST36, Baihui, and GV4.

Homotoxicology (Dose:10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

The two protocols below are strictly experimental. The first is based upon current protocols used by Broadfoot; the second is based upon Reckeweg's protocol for multiple sclerosis. Results, positive or negative, should be reported for further evaluation.

Broadfoot's protocol for neurological degeneration:

Autosanguis Therapy (for the full procedure, see Advanced Homotoxicology: Autosanguis Therapy, chapter 33): (give half of each injection subcutaneously to patient and place the remainder in the symptom cocktail formula which follows below): Traumeel S, Galium-Heel plus Neuralgo Rheum, Circulo Injeel plus Engystol N, Discus Compositum, and Coenzyme compositum plus.

Ubichinon compositum. Give half of each injection subcutaneously to the patient and place the remainder in the following symptom cocktail:

Symptom cocktail: Phosphor homaccord, Gelsemium homaccord, Aesculus compositum, Ginseng compositum, and autosanguis (above) mixed together and given orally BID. Arsuraneel at 1 tablet BID orally.

Glyoxal compositum: 1 vial weekly. Circulo-Heel at 1 vial weekly.

Multiple sclerosis per Reckeweg:

Psorinoheel, Galium-Heel, Schwef-Heel, Graphites homaccord, Lymphomyosot mixed together and given 2 to 6 times daily. Injection therapy using Echinacea compositum (forte) and Cerebrum compositum every 2 to 4 days. Ubichinon compositum and Coenzyme compositum at intervals. Glyoxal compositum given once and repeated once change ceases. Medulla spinalis-Injeel (if available) given once weekly IM. Autosanguis therapy using the above-mentioned injections are recommended.

EPILEPSY

Definition and cause

Epilepsy is defined as a seizing condition in which there are no physical conditions or lesion in the brain. While the mechanism that incites epilepsy and convulsions is not known, it is believed that there is an underlying biochemical imbalance. Epilepsy is more common in Golden and Labrador retrievers, St. Bernards, Springer spaniels, Shetland sheepdogs, and Corgis. It is rare in cats.

Seizures can originate from a wide variety of causes. Anything that interferes with the complex and delicate neurophysiological, autoregulatory system may trigger seizure activity, and a partial list of precipitating causes includes acute trauma, hypoxia, infectious agents, parasites, brain swelling, scar tissue, impregnation of viral particles or toxins, metabolic disturbances, adverse reactions to medications, allergies, psychosomatic stressors, organ diseases (cardiovascular, hepatic, endocrine), electromagnetic disturbances, radiation damage, genetic factors, enzyme deficiencies or damage, and neoplasia (Dayrell-Hart 1991; Ettinger 1989; Lane 1990; Podell 1994, 1996; Trepanier 1995). The presence of seizures alone is not sufficient to diagnose epilepsy (Bagley 2005).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The most popular therapy is a combination of phenobarbital and potassium bromide. Other therapies that are often recommended include dilantin, diazepam, and primadone (Ettinger 1989). There is little evidence to support diet in the control of seizures; however, several reports

point to food allergies as the source of the seizures via an immune-mediated process. These studies indicate that a restricted diet was responsible for the resolution of the seizures. In people, studies have indicated that seizures can be controlled with a hypoallergenic type of diet; they showed that the seizures began again when other foods were reintroduced (Collins 1994, Crayton 1981). Despite the little amount of evidence, many veterinarians recommend a hypoallergenic type of diet when managing dogs and cats with epilepsy, often with surprisingly good results.

Anticipated prognosis

While control of seizures is possible with combinations of drugs such as phenobarbital and potassium bromide, complete control is often difficult. Side effects of medications that are refractory to chronic medications and the potential for status epilepticus lessen the course and prognosis.

Integrative veterinary therapies

Epilepsy is a chemical and electrical imbalance in the brain. Medical therapies are prescribed to stop seizures; however, they do not address the underlying cause or inciting factors leading to this imbalance. When approaching epilepsy from an integrative viewpoint, a double phase approach must be taken. First, the diagnosis must be confirmed and the proper medical or alternative therapies that control the convulsions implemented. Second, if possible, the approach should include a determination of the cause and the necessary steps to eliminate inciting factors. Assessing the animal's internal and external environments is important. In addition, the diet should be thoroughly examined; all chemical additives, preservatives, environmental toxins, and other potential seizure-causing substances should be eliminated; side effects of medications should be considered; and prior and future vaccinations should be evaluated for the long-term control of seizures (Gorham 1996, Levin 2002).

General considerations/rationale

Epilepsy has been linked to allergic food reactions. One report showed that there was significantly more biological evidence to an allergy component to epileptic people than non-epileptic people (Campbell 1973, Crayton 1981, Stevens 1965).

Appropriate nutrients

Nutritional/gland therapy: Glandular brain, pituitary, hypothalamus, pineal, liver, and adrenal glands supply the intrinsic nutrients that help to reduce cellular inflammation and improve the function of the brain and nerves,

liver, and adrenal glands (see Gland Therapy in Chapter 2 for a more detailed explanation).

Note: Epilepsy can have multiple causes, and therefore a medical and physiological blood evaluation is recommended to assess general glandular health. This helps clinicians to formulate therapeutic nutritional protocols that address the central nervous system as well as other organ weaknesses (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Vitamin E: Research has found that adding vitamin E to medical therapy reduced the frequency of seizures (Horn 1991, Ogunmekan 1989, Sullivan 1990, Tupeev 1993).

Fatty acids: In preliminary studies it was found that omega-3 fatty acids significantly reduced the frequency of seizures in human patients (Schlanger 2002).

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is essential in cellular membranes, particularly those of brain cells. It has been studied in people with mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by all the cells of the body for general health and wellness (Hanin 1987).

Magnesium: Physiologically, magnesium activates adenosine triphosphatase, which is required for the proper functioning of the nerve cell membranes and fuels the sodium potassium pump. Magnesium has also been associated with neuromuscular function and conditions such as muscle cramping, weakness, and neuromuscular dysfunction. Magnesium is recommended for therapy for epilepsy and weakening muscle function (Bibley 1996, Levin 2002).

Chinese herbal medicine

General considerations/rationale

According to Traditional Chinese Medicine, epilepsy is caused by Wind and Phlegm obstructing the Mind. There is also Liver Qi stagnation.

Author's interpretation

In Western terms, wind is motion. Epilepsy is a form of motion (wind) that is manifested by tonic/clonic muscular activity. Wind also refers to a condition that comes and goes suddenly, just as a gust of wind may do. Seizures tend to have this pattern. The patient is normal between episodes.

According to TCM, the Liver controls the Tendons and Ligaments. Therefore, smooth flow of Liver Qi is needed

to keep the Limbs supple. When the suppleness is lost, movement becomes spastic.

The loss of consciousness experienced during a seizure is defined as interference with the functioning of the Mind (phlegm obscuring the Mind). When the Mind does not function properly, the patient is unable to interact normally with the environment (in other words, the patient loses consciousness).

The central nervous system must be sedated to prevent wind from creating the excess nerve activity that leads to seizures.

Appropriate Chinese herbs

In cases of active seizing, valium, barbiturates or inhalant anesthetics should be administered as required. Herbal therapy is helpful in decreasing the frequency, severity, or duration of seizures. The following herbs have demonstrated anti-epileptic effects:

Scorpion (Quan xie): Decreased the severity, duration, and frequency of seizures when administered to rats with induced epilepsy (Shen Yang Yi Xue Yuan Xue Bao 1988).

Silkworm (Jiang can): Reduces the frequency of seizures in humans (Jiang Su Yi Yao 1976).

Grass-leaf sweet-flag (Shi chang pu): Decreases seizure activity in humans (Yao Xue Tong Bao 1982).

Polygala root (Yuan zhi): Can help decrease seizure frequency (Zhong Yao Yao Li Yu Ying Yong 1983).

Uncaria (Gou teng): Contains rhynchophylline, a chemical that has been shown to decrease spontaneous activity and strengthen phenobarbital-induced sedation in mice (Shi 1993). It has been proven to prevent seizures in animals (Hsieh 1999).

In addition to herbal therapy, acupuncture may be considered to decrease the duration or frequency of the seizures. The efficacy of acupuncture reported in the literature varies greatly. Some researchers find that it has no effect, while others are more positive. In one study, 5 dogs with intractable epilepsy were treated with gold bead implants in acupuncture points. Three dogs responded but 2 dogs relapsed after 5 months. Reports of 2 other dogs treated with acupuncture in the ear (Shen-men point) demonstrated that acupuncture was able to decrease seizure episodes by 80% (Joseph 1992, van Niekerk 1988).

Homotoxicology

General considerations/rationale

Seizuring cases may represent Inflammation to Dedifferentiation phase homotoxicoses. For that reason, and because selection of correct antihomotoxic medicines depends upon proper identification of phase, the clinician must properly diagnose the condition and identify any extrinsic factors associated with the onset of seizures.

Typically, idiopathic epilepsy is thought to represent a Degeneration Phase disorder (Reckeweg 2000).

In cases in which other causes of seizure activity have been eliminated and the signs and history indicate idiopathic epilepsy, homotoxicology therapy can decrease seizure activity and reduce dependency upon pharmaceutical agents, and may help improve other pathological processes in a patient's condition. Antihomotoxic medicants are appropriate and can be used in conjunction with a wide variety of other supportive and pharmaceutical agents to manage seizures. Drugs are necessary and recommended for patients that have severe, life-threatening seizures, or when seizure intervals are too short.

Patients so treated often undergo regressive vicariation and it should be noted that in some instances, the seizure activity might worsen as neurological tissues become inflamed, swell, and discharge homotoxins. Many of these patients recover from their disease signs following such responses. Canine distemper virus signs, including mentation changes (with or without misemotional states), fever, tonic-clonic tics, oculonasal mucoid discharge, and coughing, can occur (Palmquist 2003). Such biological responses are predicted by Hering's Law and are necessary for healing; however, clients may not accept them readily, and they should be well informed before beginning such treatment.

Appropriate homotoxicology formulas

Autosanguis therapy may be needed to shift the organism's position to the left on the Six-Phase Table. A large number of homeopathic remedies are indicated for seizures, and a complete listing is not practical in such a text. The following list covers major antihomotoxic formulas; others may be indicated depending upon the entire case's manifestations:

Aconitum homaccord: Treats seizures aggravated by or associated with fear, fever, or red skin. Use early in the history because this is an Inflammation Phase remedy.

Apis homaccord: Reduces swelling.

Atropinum compositum: Treats convulsions and muscle spasms. Argentum nitricum is indicated in epilepsy when the pupils are enlarged for hours or days before the attack. It seldom produces a full and final cure; however, distinct improvements can often be achieved, e.g. in the frequency and violence of the attacks. Also note that it is absolutely necessary (for humans) to maintain a diet that is strictly free of pork toxins. The remedy also contains Atropinum sulphuricum, which acts like Belladonna but is to be preferred in neuralgias, painful states, biliary colic, and epilepsy. It should be used if Belladonna fails. This remedy is also found in Spascupreel. Cuprum aceticum is considered in diseases accompanied by a tendency to spasmodic conditions, such as cerebral seizure disorders (Reckeweg 2002).

Belladonna homaccord: Used in Inflammation Phase disorders and in acute seizures to reduce severity and length. It is the agent of first choice for acute seizure.

BHI-Body-Pure: Treats environmental toxicity issues, especially petroleum products, tobacco, drug exposure, and emotional upset.

BHI-Calming: Used for stress-induced issues.

Cerebrum compositum: Supports cerebral tissues with the help of Hyoscyamus. The indications include states of excitement with great restlessness, mobility, depression to the point of melancholia, dull apathy, delirium, weakness of thinking and memory, and a dulling of the powers of comprehension. Attacks of epileptic spasms with tetany, convulsions, trismus, congestion of blood in the head, and headaches are also typical. The eyes have a glazed stare and an unusual sheen, and there may be protrusion, distortion, and spasms of the eye muscles. Further indications are conjunctival discharge, marked pupilelargement, dullness of vision, weakness of vision, and myopia (these are also indications for Belladonna).

A summary of the main Hyoscyamus symptoms presents the following remedy picture: symptoms of cerebral irritation with convulsions, muscle twitching, catalepsy, and epileptiform spasms. Another contributing note comes from Ignatia, which should also be borne in mind in numerous reotoxic phases. The irritability of the nervous system may provide a clue (effects of strychnine and brucine), because this is characteristic of Ignatia and constitutes the organic foundation for the changing symptoms that occur in Impregnation Phases. It is a nerve remedy above all, suited to hypersensitivity of the sensory organs, including the skin, nasal organs, and taste. This remedy also treats trembling and twitching. It is used for Sydenham's chorea and epileptiform attacks (Reckeweg 2002).

Coenzyme compositum: Provides catalyst support of the metabolism. Important in nearly all cases.

Galium-Heel: Use in most epilepsy cases. It is a Deposition, Impregnation, Degeneration, and Dedifferentiation phase remedy that is very important in cellular detoxification and matrix drainage and cellular repair. It contains a wide variety of agents, especially Apis, which reduces swelling.

Hepar compositum: Provides liver detoxification and support.

Solidago compositum: Provides kidney support and detoxification.

Hepeel: Detoxifies and supports the liver.

Lymphomyosot: Used for lymph drainage and swelling reduction, especially when combined with *Apis homaccord* and/or *Traumeel*.

Lyssinum-Injeel: Not available in the United States but can be useful in cases of seizures associated with rabies vaccination reactions (Reckeweg 2000).

Molybdan compositum: Treats trace mineral disorders and chronic diseases.

Nux vomica homaccord: Treats gastrointestinal issues, food allergy, adverse reactions to food or food additives, emotional upsets, and anger.

Psorinoheel: Deep acting remedy that contain Bufo (toad venom), which is useful in Inflammation and Degeneration phase homotoxicoses. Signs may include alternating torpor and convulsions, and epileptiform attacks occur. A peculiar state of agitation is noticed before these symptoms appear, and deep sleep may be seen after the convulsions (Reckeweg 2002).

Also found is *Cicuta virosa*. The main indications include pica appetite, convulsions with worm infestation, epileptiform attacks, and meningitis with hypersensitivity and attacks. It is a complementary remedy in tubercular meningitis, and is indicated in a wide variety of psychoses and conditions of the brain and spinal cord that include cramps that may be caused by worms. There also may be stomach cramps with hematemesis, paralysis of the bladder, and skin diseases with simultaneous disturbances of the peripheral nervous system.

Spascupreel: Treats convulsions and muscle spasm. *Agaricus muscarius* is included for Sydenham's chorea, tics, states of agitation, epileptiform attacks, itching, crawling sensations, burning pains, sensations of numbness, general restlessness of the muscles with a compulsion to move in unusual ways (cf. *Stramonium*). The symptoms may change to tetany, stupor, conditions of excessive excitement, reduction of excitability of the nervous system, sequelae of drug and medication abuse, state of confusion, and cerebral seizure disorders (Reckeweg 2002).

Schwef-Heel: Sulfur-containing enzyme that is used for reactivation and detoxification. Dosing is intermediate (Heel 2003).

Strophanthus compositum: Contains *Aesthusa cynapium* for convulsions associated with vomiting (Reckeweg 2000). The tincture of Fool's Parsley produces considerable toxic effects that are particularly noticeable in disturbances of the nervous system: various kinds of spasms, dulling of faculties, loss of consciousness, oppressed mood with anxiety, restlessness, irritability, possibly hallucinations, delirium, and sleepiness, sometimes to the point of unconsciousness. Epileptiform spasms also may occur, along with dilated pupils and particularly great weakness of the lower limbs (Reckeweg 2002).

Thyroidea compositum: Provides hormonal support and matrix drainage. *Corpus Pineale Suis* exhibits certain counterpoint actions to the pituitary. May be tried experimentally as a supporting or intercurrent remedy in epilepsy, Sydenham's chorea, and Degeneration Phases generally (Reckeweg 2002).

Traumeel: Reduces inflammation in traumatic or inflammatory issues.

Ubichinon compositum: Provides catalyst support of the metabolism in later cases. Naphthoquinone is also indicated in epilepsy with a brief aura, traumatic epilepsy, shock following serious head injury, and threatened vaccinal encephalitis from which seizures may result (Reckeweg 2002).

Valerianaheel: Mildly neurotonic and tranquilizing for stress-induced issues or difficulty sleeping. Contains Kali Bromatum (potassium bromide). The main indications are: restlessness, always busy and occupied, trembling hands, nervousness, conditions of excessive excitement associated with the central nervous system, cerebral seizure disorders, nightmares, sleepwalking, insomnia, reduced cerebral emotivity as with paralysis, and sequelae of cerebrovascular accidents (Reckeweg 2002). This component is also found in *Nervoheel*.

Viscum compositum: Used in Dedifferentiation Phase cases.

Authors' suggested protocols

Nutrition

Brain/nerve support formula: 1 tablet for each 25 pounds of body weight BID.

Pituitary/hypothalamus/pineal and immune support formulas: One-half tablet for each 25 pounds of body weight SID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Omega-3 fatty acids: Eskimo fish oil—one-half to 1 teaspoon per meal for cats, 1 teaspoon for each 35 pounds of body weight for dogs; hemp or flax oil—1 teaspoon for every 25 pounds of body weight with food.

Additional vitamin E: 50 IU for each 25 pounds of body weight.

Magnesium: 10 mgs for every 10 pounds of body weight SID.

Chinese herbal medicine

Epitrol (White Crane Herbs): 1 capsule per 10 to 20 pounds BID to effect.

Important note: The Epitrol formulation also contains the following herbs: Abalone shell (Shi jue ming), snake skin slough (She tui), typhonium gigantum rhizome (Bai fu zi), arisaema pulvis (Dan nan xing), bamboo shavings (Zhu ru), red tangerine peel (Ju hong), gentiana root (Long dan cao), scutellaria (Huang qin), forsythia (Lian qiao), gypsum/raw (Shi gao), and hoelen spirit (Fu shen). These herbs help to balance the formula and increase the efficacy of the herbs mentioned above. They also help to increase the antiseizure activity of the formula.

The authors occasionally use the following acupuncture points for treatment of active seizing or to prevent future seizures; they are generally used in conjunction with herbal or Western therapy: GB20, Bai hui, PC6, St36, Bl15, and Bl18.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom formula: Start cases on the following mixture for 8 to 12 weeks: Galium-Heel, Spascupreel, Belladonna homaccord, Atropinum compositum BID to TID PO as needed. In acute seizures this mixture can be given several times in close succession. Adjust this mixture as the case dictates. In cases in which constitutional seizures are suspected, consider Psorinoheel if no or poor response is obtained.

Deep detoxification formula: Thyroidea compositum, Hepar compositum, Solidago compositum, Coenzyme compositum every 3 days for several months. Handle regressive vicariation as needed during this process.

Note: After several months attempt to reduce anticonvulsant dosage slowly.

ENCEPHALITIS

Definition and cause

Encephalitis is an inflammatory process of the brain that may or may not involve the meninges and/or the spinal cord. It is often caused by infections and immune-

mediated processes, especially in pugs and Maltese dogs. Encephalitis occurs in both dogs and cats, and is commonly associated with the following causes: viral (canine distemper or feline viral diseases), bacterial, rickettsial, protozoan, and mycotic (Appel 1969, Braund 1994, Greene 1990, Sisson 2003, Summers 1995, Vandeveld 1980). There is some evidence of post-vaccinal encephalitis (Bestetti 1978, Cornwell 1988, Hartley 1974).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy is directed to the underlying causes along with symptomatic treatment such as the control of seizing. Specific therapies are directed to the causative agent or process once the diagnosis is made. Common medical therapies include corticosteroids, antibiotics, antifungal agents, and mannitol to reduce edema (Braund 1994, Sisson 2003, Summers 1995).

Anticipated prognosis

The prognosis depends upon the underlying cause and the extent of the inflammatory process. The prognosis for infectious agents is generally fair if treated promptly. Viral and immune-mediated processes carry a more cautious prognosis. Post-vaccinal encephalitis can be mild but often causes permanent damage to the brain (Braund 1994, Sisson 2003). Pug encephalitis is difficult to manage and is often fatal (Hasegawa 2000).

Integrative veterinary therapies

The underlying process is inflammatory and more commonly immune-mediated. The integrative approach, therefore, is to use nutrients, medicinal herbs, and combination homeopathics that have anti-inflammatory properties and that can help balance the immune system and quiet the exaggerated response. Clinicians should use any appropriate therapy in these cases. Integrative therapy using conventional medicine, nutrition, and biological agents may speed recovery, as well as improve patient comfort (Kline 2002).

Nutrition

General considerations/rationale

After the cause of the encephalitis is identified, the clinician should include nutritional support for the brain and nervous system, as well as the immune glands and the liver along with indicated medical therapy.

Appropriate nutrients

Nutritional/gland therapies: Glandular brain, adrenal, thymus, spleen, and liver supply intrinsic nutrients, help

protect the organs' cells, reduce inflammation, and improve circulation to the brain (see Gland Therapy in Chapter 2).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Betasitosterol: Betasitosterol is a plant-derived sterol that has anti-inflammatory properties similar to those of corticosteroids and aspirin (Gupta 1980). Sterols also have been proven to enhance immune function (Bouic 1996). They have been found to be able to enhance T-lymphocyte production and moderate B cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an auto-immune reaction (Bouic 1996).

N,N-Dimethylglycine (DMG): DMG has been widely researched in both humans and animals. It has been found to increase energy and enhance immune function (Barnes 1979, Graber 1981, Kendall 2000, Reap 1990, Walker 1988).

Chinese herbal medicine/acupuncture

General considerations/rationale

Encephalitis is caused by Heat and Wind accumulation in the Heart and Lung, which dries the body fluid into Phlegm. The Phlegm in turn moves upward to brain and blocks the meridians. The Heart houses the Shen, or Mind. Heat in the Heart can upset the Mind. The term "Phlegm blocking the meridians" translates into a clouding of the mind. In other words, in this condition the patient cannot interact properly with its environment. It also refers to the decrease of consciousness. Heat can also refer to the fevers seen in some cases. The term Wind refers to seizure activity.

Appropriate Chinese herbs

Centipede (Wu gong): Has antiseizure effects (Zhong Yao Xue 1998). It also inhibits various bacteria (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Curcuma (Yu jin): Contains curdione, which has sedative effects on the central nervous system (Hao 1994).

Forsythia (Lian qiao): Decreases inflammation by decreasing capillary permeability, which contributes to its inhibitory effect on edema. It also decreases fever (Ke Yan Tong Xun 1982, Ma 1982) and pain (Rui 1999). Forsythia has antiviral and antibacterial effects (Zhang 2002, 1982).

Grass-leaf sweet-flag root (Shi chang pu): Contains alpha-asarone, which has demonstrated an efficacy of

approximately 85% in treating seizures in 90 people (Yao Xue Tong Bao 1982).

Gypsum (Shi gao): Has antipyretic effects. In one study of 200 patients with fevers, 90% experienced a significant reduction of temperature (Xin Zhong Yi 1980). It stimulates the phagocytic activity of macrophages (Zhong Yao Xue 1998) and concurrently decreases inflammation (Zhong Hua Wai Ke Za Zhi 1960).

Honeysuckle (Jin yin hua): Contains multiple compounds with antibacterial effects. The strongest among these are chlorogenic acid and isochlorogenic acid (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). In addition, honeysuckle has demonstrated anti-inflammatory and antipyretic effects in rabbits and mice (Shan Xi Yi Kan 1960).

Isatis leaves (Da qing ye): Has antibacterial and antiviral activity (Health and Epidemic Prevention Station of Lingling 1975, Wang 1983). In addition to direct antipathogen effects, it enhances the immune system by increasing the phagocytic activity of macrophages and increasing serum lysozyme (Li 1996). Finally, isatis leaves have an anti-inflammatory action (Li 1996).

Licorice (Gan cao): Has glycyrrhizin and glycyrrhetic acid, which have significant anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisol and can help prevent the formation of granulomas (Zhong Cao Yao 1991). Licorice has an analgesic effect (Zhong Yao Xue 1998). It also has demonstrated both antibacterial and antiviral effects (Zhong Yao Zhi 1993, 1996).

Lophatherum (Zhu ye): Decreases fevers. It is as effective as phenacetin. It also has diuretic effects (Zhong Yao Yao Li Yu Ying Yong 1977), which may help decrease cerebral edema.

Red peony (Chi shao): Contains paeoniflorin, a compound that has demonstrated antiseizure and sedative effects in animals (Zhong Yao Xue 1998).

Saussurea (Mu xiang): Has demonstrated antibacterial effects against several strains of bacteria (Zhong Yao Yao Li Yu Ying Yong 1983).

Scorpion (Quan xie): Has been shown experimentally to control caffeine- or megimide-induced seizures in mice (Shen Yang Yi Xue Yuan Xue Bao 1988). A similar study of induced seizures in rats showed a decrease in severity, duration, and recurrence rates (Shen Yang Yi Xue Yuan Xue Bao 1989).

Silkworm (Jiang can): Has been proven effective at decreasing seizure activity in mice with experimentally induced seizures (Zhong Cao Yao Xue 1980). In one trial, 77% of humans with epilepsy who were treated with Jiang can responded well (Jiang Su Yi Yao 1976). It was shown to have synergistic activity with phenobarbital in mice (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). It is especially efficacious in cases of

pyrexia-induced seizures (Zhong Guo Nong Cun Yi Xue 1984). As an added benefit, it has been shown to inhibit several strains of bacteria (Zhong Yao Xue 1998).

Uncaria (Gou teng): Has been shown to prevent seizures in animals (Hsieh 1999).

Acupuncture

There are few studies involving the use of acupuncture for encephalitis per se. Schoen (1991) postulated that it would be helpful in cases of encephalitis by decreasing inflammation and preventing muscle spasms. It helps alleviate seizures, possibly by causing the release of serotonin and GABA (Wu 1988).

Homotoxicology

General considerations/rationale

Acute bacterial encephalitis represents an Inflammation Phase condition. Parasitic encephalitis are found in the Deposition Phase, while viral conditions are categorized as Impregnation Phase homotoxicoses. Most other inflammatory conditions are Impregnation or Degeneration phase disease manifestations. Such conditions can undergo rapid progressive vicariation to the Degeneration Phase.

Treatment involves supporting the immune system in its efforts to eliminate pathogens and associated homotoxins, as well as controlling swelling and pain to minimize damage to the delicate central nervous system. Moderate fevers help to remove homotoxins. The overuse of nonsteroidal antipyretics is undesirable from a biological therapy viewpoint.

Appropriate homotoxicology formulas

No veterinary studies exist on the use of antihomotoxic agents in encephalitis and meningitis, but Reckeweg developed protocols for human patients that can be applied to veterinary patients when biological therapy is desired. Appropriate remedies for consideration include:

Aconitum homaccord: Aconitum (also common to *Barijodeel*, *Bryaconeel*, *Cerebrum compositum*, *Echinacea compositum*, *Gripp-Heel*, *Pectus-Heel*, *Rhododendroneel*, *Spascupreel*, *Strophanthus compositum*, *Traumeel*, *BHI-Chamomilla Complex*, *BHI-FluPlus*, *BHI-Injury*, and *BHI-Spasm-Pain*) is the main remedy. It is one of the most important homeopathic fever remedies, especially when the skin is hot, there is alternating fever and chills, and there is possible hyperthermia and paresthesia. Often, the patient exhibits great anxiety and a rapid, tense pulse that is strong and possibly dysrhythmia. Low potencies are normally given in pyrexia and organic complaints, catarrhs, neuralgic symptoms with paresthesia, hyperthermia, and encephalitis with very high temperatures (e.g., post-vaccinal encephalitis or meningoencephalitis (Reckeweg 2002).

***Aesculus compositum*:** Helps to improve circulation following stroke or reduced cerebral circulation (*Aesculus hippocastanum* and *Secale cornutum*). *Areteria suis* supports the arteries. *Solanum nigrum* further supports cerebral function, particularly in cases with confusion, epileptic seizures, or disorientation. Several other agents support homotoxin removal and improve vessel stability (Reckeweg 2000). This remedy also contains *Baptisia*, which is also found in *Arnica-Heel*, *Atropinum compositum*, *Echinacea compositum*, *Populus homaccord*, and *Solidago compositum*. It has indications in typhoid fevers, sepsis, and septic sore throat, as well as encephalitis and meningitis with states of confusion. It should be given intercurrently in all septic fevers (Reckeweg 2002).

Apis mellifica, a central component of several other remedies such as *Apis compositum*, *Belladonna homaccord*, *Apis homaccord*, *Arnica-Heel*, *Cruroheel*, *Galium-Heel*, and *Populus compositum*, is also included. There is also a certain oversensitivity to touch and frequently to any jarring, so that the patient yells out at the slightest bump. This may occur in meningeal irritation. In the latter, regarding human patients, such a typical penetrating scream (known as the “cri encephalique”) may begin with no apparent cause. Thus, *Apis* is a remedy that is frequently indicated in inflammatory conditions of the serous membranes, the meninges, the synovial membranes, or the mucous membranes (Reckeweg 2002).

***Apis homaccord*:** Generally useful in edema, but also in cerebral sensitivity. May assist cardiac-induced cerebral weakness through *Scilla*, *Apisinum*, and *Apis mellifica*. See *Aesculus compositum*, above.

***Arsuraneel*:** Used for patients that do not respond to initial therapy. This formula may move them into a recovery phase through stimulation of the general defenses. It is useful in cases with seizures, anxiety feeling worse at night, paresis, and muscular disability (Reckeweg 2000).

***Belladonna homaccord*:** With an affinity for the central nervous system, *Belladonna* is useful in patients who manifest seizures and scream out at night. Violent delirium is characteristic of *Belladonna*, above all in fever. *Belladonna*’s typical action on the eyes is also well known. It is used for cramps in the muscles of the eyes and eyelids, and enlargement of the pupils, particularly in an inflammatory or irritative condition of the conjunctiva with great photophobia, epiphora, and pain. *Belladonna* is indicated in incipient boils; tonsillitis; surface inflammations such as erysipelas, conjunctivitis, and scarlet fever; otitis; cholangitis; meningitis; and other inflammatory affections. A delirious state occurs with a violent rise in temperature with considerably raised sensitivity of all the senses and a disproportionate sensitivity to touch, noises, light, cold air (especially draughts and jarring) as can be the case in meningitis. Along with nasal catarrhs, there

may be catarrhs of the larynx and trachea, with slight mucus, accompanied a typical cough that is dry, rough, and barking, with hoarseness. In the digestive organs, *Belladonna* affects acute gastric catarrhs (Reckeweg 2002).

***Bryaconeel*:** Treats neuralgia, serous membrane inflammation such as meningitis (*Bryonia cretica*), acute feverish conditions, and influenza-like signs. Contains *Phosphorus* to support parenchymatous organs such as the lung and liver. Moderates severe or overaggressive vicariations. Used in meningitis in cases that do not respond to primary therapy (Reckeweg 2000).

***Cerebrum compositum*:** Supports cerebral tissue, stem cells, and vessels (*Cerebrum suis*, *Placenta suis*, and *Arnica montana*). *Cerebrum suis* is indicated in states of mental exhaustion and disturbances in development. Symptoms include functional weakness, circulatory disturbances of the brain, progressive paralysis (retrospective treatment), paraplegia, arteriosclerotic dementia, encephalomalacia (Reckeweg 2002), memory loss, and forgetfulness (*Selenium*, *Thuja occidentalis*, *Acidum phosphoricum*, *Manganum phosphoricum*, *Semecarpus anacardium*, *Ambra grisea*, *Conium maculatum*, *Medorrhinum-Nosode*). Supports cerebral function and vascular structures (*Kalium phosphoricum*). Treats vertigo, stupor, and headache (*Gelsemium sempervirens*, *Kalium bichromicum*, *Ruta graveolens*), anxiety (*Aconitum napellus*), and exhaustion (China, *Amarita cocculus*). Supports capillary and other circulation, as well as lymph (*Aesculus hippocastanum*) and enzyme systems and difficulty sleeping (*Hyoscyamus niger*) (Reckeweg 2000).

***Coenzyme compositum*:** Supports energy production through enzyme induction and repair, and is useful in repairing damage to enzyme systems of metabolism and following administration of drugs injurious to metabolism. Phase remedy in Degeneration and Dedifferentiation phases.

***Cruroheel*:** Has strong connective tissue effects and is useful in difficult cases or those with strong vicariation signs.

***Echinacea compositum*:** Contains *Zincum metallicum* (also in *Discus compositum*, *BHI-FluPlus*, etc.) *Zincum metallicum* is a great nerve remedy, exerting a fundamental action on the brain and the autonomic centers and the sympathetic and the parasympathetic nervous systems. Symptoms of cerebral irritation occur after vaccination and when there is a threat of viral encephalitis. In these cases, *Zincum metallicum*, together with other medications which provoke a regressive vicariation, is able to release the homotoxins from the nervous system and break them down by way of the vaccination pustules, which once more become inflamed. Similar action has been known in *Sulphur* and *Cuprum*. In particular, these effects of reactivating blocked enzyme systems have often

been described with reference to Sulphur. Chronic nerve pains and muscular twitching, as well as a general nervousness and hypersensitivity and high degree of excitability with emaciation, exhaustion, and paralytic weakness, may also indicate a need for Zincum. These conditions may proceed to the point of complete paralysis or hemiparesis with twitching, tremors, and weakness, as well as spasmodic conditions, neuralgia, and diseases that afflict the spine, brain, and spinal cord (Reckeweg 2002).

Engystol N: Has antiviral effects through immunostimulation.

Galium-Heel: Phase remedy in matrix and cellular phases. Provides powerful support of the immune system (*Echinacea augustifolia*). Assists in drainage of cell and matrix, is supportive of renal tubular function, and decreases swelling and edema (*Apis mellifica*, *Galium aparine*, and *Galium mollugo*). It is a critical component in the deep detoxification formula. Doses should be administered with regard to clinical condition and response, with the dose reduced if strong reactions are noted (Reckeweg 2000).

Gelsemium homaccord: Treats neuralgia and nerve pain, headache, and posterior weakness. Commonly required in aging, large-breed dogs.

Glyoxal compositum: Provides mitochondrial repair of damaged enzyme systems in Degeneration and Dedifferentiation phase disorders.

Lymphomyosot: Used after cortisone therapy and mesenchymal purging in chronic disease states.

Placenta compositum: Supports hypophysis after cortisone therapy. Contains sulfur to support enzyme and metabolic repair. Regenerative of hypophyseal-adrenal axis. Repairs vascular structures and is used intermittently in endocrine disorders.

Secale compositum: The principle remedy (also found in *Aesculus compositum*, *Arsuraneel*, *Circulo-heel*, *Discus compositum*, *Placenta compositum*, *Secale* [also known as *Arteria-Heel*], *Syzygium compositum*, *BHI-Headache II*, *BHI-Migraine*, and *BHI-Varicose*). Symptoms of meningitis may occur, with stiffness of the neck, muscular weakness, and periodic muscular pain with spasm and heaviness of the limbs and drawing and jerking pains. There also may be cramps, twitching and trembling of the limbs, or rigidity and stiffness of the limbs and joints (Reckeweg 2002).

Solidago compositum: Deposition Phase remedy needed to remove debris from the matrix after regressive vicariation begins. Contains Coxsackie Virus Nosode with indications that include abacterial meningitis and headache, possibly including pareses (Reckeweg 2002).

Spigelon: Helpful for symptoms of headache, cerebral conditions with inflammation, and weakness of connective tissues (Reckeweg 2000).

Thyroidea compositum: Provides matrix drainage and repair of autoregulation. Contains low levels of thyroid, pineal, spleen, bone marrow, umbilical cord, and liver to support glandular function and repair. *Galium aparine* drains matrix and cellular components. *Cortisonum aceticum*, in low potency, assists in repairing damage from excess levels of cortisone. Precursors and Krebs cycle constituents promote energy metabolism through the Michaelis-Menten law of enzyme activity. *Pulsatilla* and *Sulfur* assist in regulation rigidity-type situations. Part of the deep detoxification formula (Reckeweg 2000).

Tonsilla compositum: Main antihomotoxic drug for repairing chronic diseases involving endocrine disorders. Supports a wide number of tissues including tonsil, lymph node, bone marrow, umbilical cord (stem cell precursors), spleen, hypothalamus, liver, embryo, and adrenal cortex (Heine 2004). Contains *Cortisonum aceticum* and thyroid hormone in nanodilutions. Also contains *Psorinum* for deep constitutional, lack of reaction cases. Degeneration phase agent (Reckeweg 2000).

Ubichinon compositum: Provides mitochondrial repair of energy production mechanisms. Used in chronic diseases and iatrogenic injury to mitochondria from antibiotic therapy. Part of deep detoxification formula.

Authors' suggested protocols

Nutrition

Brain/nerve support: 1 tablet for 25 pounds of body weight BID.

Immune support formula: One-half tablet for each 25 pounds of body weight BID.

Liver support formula: One-half tablet for each 25 pounds of body weight SID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

DMG: Liquid—One-half ml per 25 pounds of body weight (maximum, 2 mls); tablets—125 mg to 1 tablet for every 40 pounds of body weight (maximum, 3 tablets).

Chinese herbal medicine

Formula H90 Encephalitis: 1 capsule per 10 to 20 pounds twice daily. It can be used in both acute and chronic encephalitis and is especially effective in cases with seizures. In addition to the herbs discussed above, H90 Encephalitis also contains *arisaema/bile* (Dan nan xing), orange peel (Ju hong), *pinellia* (Ban xia), and *salvia* (Dan shen), which increase the efficacy of the formula.

This formula can be combined with any Western therapy as needed (i.e., anticonvulsants, antibiotics, anti-inflammatories). Some acupuncture points to consider include PC6, SP6, PC7, ST40, CV26, GV14, and KI3 (Handbook of TCM Practitioners 1987).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

According to Reckeweg, the following protocol is useful. Note that it has not been tested in animals.

Initial therapy: Belladonna homaccord and Apis homaccord mixed together and used orally TID. In viral issues, give Engystol N by injection or orally daily. In bacterial infections, consider Echinacea compositum given daily by injection (the initial dose is often given I.V., followed by sub-q dosing, often in the manner of an auto-sanguis injection). Spigelon given daily by injection or orally if there are signs of headache. Aesculus compositum and Echinacea comp forte, BID to TID orally.

In refractory cases that do not respond to initial therapy after 1 to 2 days: Cruroheel-S, Arsuraheel, and Bryaconeel mixed together and taken orally every 15 to 30 minutes. Aesculus compositum given in massive initial doses every 5 to 10 minutes and then TID orally as an aid to circulatory issues.

Following improvement: Cerebrum compositum, Placenta compositum, and Tonsilla compositum to improve cerebral, vascular, and lymphatic/immune status. Initially given by injection, then followed by oral dosing either together or on alternate days in succession twice weekly.

GRANULAMATOUS MENINGOENCEPHALITIS(GME)/ PERIPHERAL NEUROPATHIES

Definition and cause

Peripheral neuropathies may represent numerous specific diagnoses. Many are inherited and have no successful treatment. When diagnosing such conditions it is helpful to divide them into categories of disease, including degenerative, genetic, idiopathic, inflammatory-noninfectious, inflammatory-infectious, metabolic, neoplasia, trauma, and vascular. Each particular case has a pathophysiology responsible for neurological dysfunction, and this identification may be immensely helpful in selecting proper biological therapy.

Often, the pathophysiology of many of these cases is never fully elucidated and clinicians may be forced to select therapy without a full understanding of the true condition. Common causes are immune-mediated, infectious, secondary to degenerative diseases such as diabetes or cancer, or secondary to a toxic reaction to chemotherapeutics or chemical toxins.

Establishing a complete diagnosis is well worth the effort. It may be very helpful to cooperate with internists and neurologists to determine successful treatment plans for patients suffering from neuropathies. Clients need to be counseled early on that these conditions may not respond and may even continue to deteriorate, even if the correct causation is determined (Braund 1980, 1982, 1988, 1995; Cuddon 1997; Cumming 1982, 1991; Griffiths 1985; Towell 1994).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy depends upon the underlying cause. If properly diagnosed and treated, the hope is that the neuropathy will resolve. Immune-mediated neoplasia most often require ongoing immunosuppressing therapies such

as corticosteroids and chemotherapeutics (Braund 1995, Cuddon 1997, Cummings 1992).

Anticipated prognosis

The prognosis depends upon determining the underlying cause. Generally, a response is seen 1 to 3 months after initiating the therapy. The prognosis is poor to guarded if there is no response to the initial medical therapy (Cuddon 1997).

Integrated veterinary medicine

The underlying process is inflammation of the central nervous system. While the specific cause is not reported, inflammation and immune-mediated processes most often necessitate the selection of corticosteroids as the primary therapy. The integrative approach, therefore, is to use nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory properties and can help to balance the immune system and reduce an exaggerated response. Clinicians should use any appropriate therapy in these cases; integrative therapy using conventional medicine, nutrition, and biological agents may speed recovery and improve patient comfort (Kline 2002).

Nutrition

General considerations/rationale

While medical therapy is focused locally upon inflammation, the nutritional approach adds glandular support for the organs of the immune system as well as nutrients to help improve brain and nerve function.

Note: Because GME and its symptoms can range from local to systemic, it is recommended that blood be analyzed both medically and physiologically to determine concurrent disease. This helps clinicians to formulate therapeutic nutritional protocols that address the central nervous system as well as other organ systems (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular brain, nerve, adrenal, and thymus supply the intrinsic nutrients that help to reduce cellular inflammation and improve nerve and immune function. This helps to spare the brain and nerve from ongoing immune attack and helps slow degeneration and loss of function (see Gland Therapy in Chapter 2 for a more detailed explanation).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of

phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Phosphatidyl serine: Phosphatidyl serine is a phospholipid that is essential for the integrity of cell membranes, particularly those of nerve and brain cells. It has been studied extensively in people with impaired mental functioning and degeneration with positive results (Cenacchi 1993).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by all of the body's cells for general health and wellness (Hanin 1987).

Magnesium: Physiologically, magnesium activates adenosine triphosphatase, which is required for the proper functioning of the nerve cell membranes and fuels the sodium potassium pump. Magnesium is associated with neuromuscular function and conditions such as muscle cramping, weakness, and neuromuscular dysfunction. Magnesium is recommended for therapy for epilepsy and weakening muscle function. (Bibley 1996, Levin, 2002).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties that appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune suppressing effects is beneficial in any inflammatory process in the central nervous system. (Bouic 1996) reports on the immune enhancing and balancing effect of plant sterols that are also beneficial to animals with immune-mediated diseases.

Essential fatty acids: Research also confirms the benefits of essential fatty acids' calming effect on the central nervous system (Erasmus 1993).

Chinese herbal medicine/acupuncture

General considerations/rationale

GME is a combination of External Wind, Heat, and Toxin invading the Ying and Blood, which affects Wei and Qi at the same time. This leads to Heart and Pericardium disturbances.

Peripheral neuropathy may be a result of trauma or it may be due to Cold and Wind invasion, leading to Qi and Blood stagnation in the Meridians.

In GME, the Wind blows the pathogenic influence into the body. Heat and Toxins then invade the Ying and Blood layers of the body. The Heat refers to fever and inflammation. Toxins are the substances that cause the inflammation. Wei is the immune system, so there is a disruption of immunoregulation, which is in agreement with the Western understanding of an immune basis to

this disease. Neurological signs appear when the Ying level is affected. At the Xue level, the Heart and Pericardium, which house and protect the mind, are disturbed. When this occurs, the patient does not react properly to the environment. This can explain the seizures with the attendant loss of consciousness.

Treatment is aimed at decreasing the inflammation, fever, and pain, and normalizing the neurological function.

In peripheral neuropathy the ancient Chinese physicians were well aware of the ability of trauma to damage nerves. When they could not point to trauma as a cause, they theorized that Wind blew Cold into the body. Cold was able to slow the transit of Blood and Qi in the Meridians. Without a normal flow of Blood and Qi, the limbs could not function properly. Treatment is aimed at normalizing limb function.

Appropriate Chinese herbs for GME

Achyranthes (Niu xi): Has shown analgesic effects. In mice it was shown to decrease pain reactions to body torsion and hot plates (Li 1999). It also demonstrated anti-inflammatory effects (Xong 1963).

Arctium Niu bang zi: Has anti-inflammatory and antipyretic effects (Zhong Yao Xue 1998).

Buffalo horn shaving (Niu jiao): A strong pain reliever that also decreases edema (Mao 1997).

Coix (Yi yi ren): Can help control pain and inflammation. It helps prevent carrageenin-induced foot swelling and dimethylbenzene-induced ear swelling in mice (Zhang Ming Fa 1998). A study involving 26 women with severe dysmenorrhea found that coix significantly decreased pain by more than 90% (Zhang Yong Luo 1998).

Forsythia (Lian qiao): Has anti-inflammatory, analgesic, and anti-pyretic effects and can prevent edema (Ma 1982, Rui 1999).

Gastrodia (Tian ma): Can help decrease pain. It decreases the level of dopamine in the brain, and this may be responsible for the analgesic effect (Huang 1993). It was shown to decrease agar-induced swelling in mice and carrageenin- and 5-HT-induced swelling in the feet of rats (Yu 1989). This anti-inflammatory action may be useful in treating GME.

Grass-leaf sweet-flag root (Shi chang pu): Contains alpha-asarone, which demonstrated an efficacy of approximately 85% in treating seizures in a group of 90 people (Yao Xue Tong Bao 1982). It may help decrease seizures in patients with GME.

Honeysuckle (Jin yin hua): An anti-inflammatory and antipyretic herb (Shan Xi Yi Kan 1960).

Isatis (Da qing ye): Has anti-inflammatory effects (Li 1996).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have anti-inflammatory effects. They

have approximately 10% of the corticosteroid activity of cortisone. They decrease edema and decrease the formation of granulomas (Zhong Cao Yao 1991).

Lophatherum (Dan zhu ye): An antipyretic herb (Zhong Yao Yao Li Yu Ying Yong 1977).

Mint (Bo he): Decreases fever and inflammation (Zhong Yao Xue 1998).

Platycodon (Jie geng): Contains platycodin, which has antipyretic effects (Li 1984, Zhang 1984). It also has anti-inflammatory effects via its ability to increase corticosterone secretion (Li 1984, Zhang 1984, Zhou 1979).

Pueraria (Ge gen): Reduces fevers (Modern TCM Pharmacology 1997).

Schizonepeta (Jing jie): Has analgesic properties (Zhong Yao Cai 1989).

Scutellaria (Huang qin): Contains baicalin and biacalein, which have been shown to suppress inflammation in mice (Kubo 1984). It also can lower fever (Xu 1999).

Silkworm (Jiang can): Has been shown to be effective in stopping experimentally induced seizures in mice (Zhong Cao Yao Xue 1980). In one trial, 77% of humans with epilepsy who were treated with Jiang responded well (Jiang Su Yi Yao 1976). This suggests that it may help reduce seizure activity in patients with GME.

Uncaria (Gou teng): Has been proven to prevent seizures in animals (Hsieh 1999).

Acupuncture for GME

The World Health Organization recognizes the efficacy of acupuncture for the treatment of headache (World Health Organization 2006). In addition, acupuncture has been shown to be better than phenobarbital at stopping fever-induced seizures in children (He 1997). This may have a dual effect of addressing both the seizure and fever aspects of GME.

Appropriate Chinese herbs for forelimb neuropathies

Angelica root (Dang gui): Increases phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978), which may help patients with infectious peripheral neuropathies. It also decreases inflammation (Yao Xue Za Zhi 1971), which may make it beneficial in inflammatory etiologies.

Astragalus (Huang qi): Can improve humoral and cellular immune functions (Jiao 1999), which may help in the case of bacterial or viral neuropathies.

Centipede (Wu gong): Has antibiotic properties. It inhibits cancer cells in vitro (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994), which indicates that it may be useful for neuropathies secondary to these causes.

Cinnamon twig (Gui zhi): Inhibits some bacteria and viruses (Zhong Yao Xue 1998).

Earthworm (Di long): Has anti-neoplastic effects. The mechanism is not yet elucidated, but it may be due to enhanced immunity and scavenging of free radicals (Wang 1991). This may help in some forms of neoplastic neuropathy.

Jujube fruit (Da zao): Can inhibit dimethylbenzene-induced ear swelling in mice, and egg white-induced toe swelling in rats (Li 1997). It may also ameliorate inflammatory neuritis.

Licorice (Gan cao): Inhibits bacteria (Zhong Yao Zhi 1993) and viruses (Zhu 1996). It may be efficacious in viral and bacteria-mediated neuropathies.

Milettia (Ji xue teng): Has antiviral effects. It has been shown to inhibit herpes virus I (simplex), a virus known to be neurotropic (Meng 1995). In addition, it has demonstrated activity against cancers via increased NK activity in mice (Hu 1997, Xu 1996).

Rehmannia/cooked (Shu di huang): May help improve the conditions of nerves. One trial examined the results of an herbal supplement containing rehmannia with Rou cong rong, Lu han cao, Gu sui bu, Yin yang huo, Ji xue teng, and Lai fu zi in 1,100 patients with myelitis. 73% had significant improvement, and another 13% had moderate improvement in clinical signs (Liaoning Journal of Chinese Medicine 1982).

Tumeric (Jiang huang): May decrease neuronal inflammation. It inhibits MIP-2 (macrophage inflammatory protein-2) production. This chemical has been implicated in traumatic brain injury (Singh 2006), which strongly suggests applicability in patients with neuropathy.

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). In addition, it seems to have a neurotropic effect. It contains gallotannin, which prevents neuron damage in mice with cobalt-induced seizures (Sunaga 2004). This may make it a powerful herb for decreasing neuronal inflammation.

Wild ginger (Xi xin): Inhibits carrageenin-induced foot swelling (Xie 1995). It may prevent inflammation in the nervous system, thereby treating inflammatory neuropathies.

Appropriate Chinese herbs for hindlimb neuropathies

Achyranthes (Niu xi): Decreases egg-white-induced foot swelling in rats (Xong 1963). It may help decrease inflammation in the nervous system.

Alpinia (Yi zhi ren): Has demonstrated some anti-neoplastic activity (Zhong Guo Zhong Yao Za Zhi 1990).

Antler powder (Lu jiao jiao): Enhances the phagocytic function of macrophages and can be used as an adjuvant in cancer treatment (Du 1981).

Astragalus (Huang qi): See forelimb paralysis, above.

Cornus (Shan zhu yu): Can inhibit carrageenin-induced toe swelling in rats and mice (Zhao 1996). This suggests

that it may be useful in cases of inflammatory etiologies.

Dioscorea (Shan yao): Stimulates both the humoral and cellular immune system (Miao 1996). It may help with infectious causes of neuropathy.

Eucommia (Du zhong): Contains chlorogenic acid, which has antibacterial effects (Wang 1993). It stimulates cellular immunity (Liu 1998), which may make it useful when the neuropathy is due to infectious etiologies.

Ophiopogon (Mai men dong): Effective against *Staphylococcus albus*, *Bacillus subtilis*, *E. coli*, and *Salmonella typhi* (Zhong Yao Xue 1998).

Papaya (Mu gua): Has inhibitory effects on tumors (Zhong Cao Yao Tong Xun 1975).

Poria (Fu ling): Has antibiotic effects (Zhong Yao Cai 1985). It also stimulates cellular immunity (Lu 1990). Finally, it has demonstrated anti-neoplastic activity (Chen 1986).

Rehmannia/cooked (Shu di huang): See forelimb paralysis, above.

White atractylodes (Bai zhu): Has demonstrated anti-neoplastic efficacy (Zhong Liu Yu Zhi Tong Xun 1976).

Appropriate Chinese herbs for facial neuropathies

Angelica root (Dang gui): See forelimb neuropathies, above.

Centipede (Wu gong): See forelimb neuropathies, above.

Cnidium (Chuang xiong): Increases the phagocytic function of macrophages (Lang 1991). It may be helpful in infectious neuropathies.

Gastrodia (Tian ma): Decreases nerve pain from toxins and vascular causes (Ji Lin Yi Xue Yuan Xue Bao 1982).

Ginseng (Ren shen): Prevents the decrease in plasma T3 and T4 levels as laboratory animals age (Shi 1998). It may be useful in hypothyroid-induced neuropathies.

Siler (Fang feng): Has antibiotic properties (Zhong Yao Tong Bao 1988). It is also anti-neoplastic (Li 1999).

Silkworm (Jiang can): Can inhibit some bacteria (Zhong Yao Xue 1998).

White aconite (Bai fu zi): May help with facial nerve disorders. In one study, 90% of 418 people with facial numbness recovered completely when an herbal formula containing typhonium (Bai fu zi), angelica root (Dang gui), scorpion (Quan xie), sick silkworm (Jiang can), and centipede (Wu gong) was injected into acupoints (Hu Bei Zhong Yi Yao Za Zhi 1982).

Homotoxicology

General considerations/rationale

GME is an intracranial proliferative inflammatory process involving mesenchymal cells, which may present in a

generalized inflammatory form or a mass form. The cause is unknown. Lymphocytes and macrophages are the primary inflammatory cells that are present (Bagley 2005).

There is no published material on this condition in any homotoxicology references, which makes the material that follows an academic discussion. Goldstein (2006) has successfully used the protocol below in combination with other integrative modalities discussed in this section.

Because connective tissue elements function in an abnormal and deleterious manner, this condition represents a disease to the right of the Biological Divide, most likely the Impregnation and Degeneration phases. There may be Dedifferentiation Phase factors involved. Examination of such cases for chemical or viral agents may prove interesting in researching the cause. Antihomotoxic agents discussed in the encephalitis/meningitis section are applicable. Phase remedies and deep detoxification with support of energy-producing enzyme systems represent a logical clinical approach to this condition. The expected prognosis is guarded. The use of drugs such as corticosteroids and immunosuppressants are warranted to preserve patient comfort and ability. As with all neurological problems, use of a qualified neurologist may be helpful in establishing the correct diagnosis and most current treatment options.

Selecting symptom remedies and detoxification protocols is extremely important in neurology cases. Many homeopathic and herbal agents have affinity for neural tissue in specific body regions (neck, face, lumbar spine, extremities), and the integrative clinician should always be sure to consider the anatomical region is designing proper treatment programs. In traumatic cases, the use of simple single antihomotoxic formulas such as Traumeel S may give immediate improvement. Most cases of peripheral neuropathies presented to veterinarians represent deeper homotoxicoses and require combinations of therapy and careful monitoring of progress. Always remember that the goal of therapy is regressive vicariation and that signs of inflammation and discharge may well represent the beginning of healing in a patient. Inherited conditions generally carry a guarded prognosis, but may improve or stabilize with biological therapies integrated with conventional medical handlings, and it is beneficial to have a basic understanding of these approaches when faced with a nonresponsive or difficult case.

The development of acutely painful conditions similar to shingles in humans may represent the movement of homotoxins from chronic Impregnation and Degeneration phases to the Inflammation Phase, and should be welcomed as a potentially good sign. Other neurological signs may occur during these regressive vicariations (i.e., altered awareness, personality changes, tics, and seizures) and may require experienced handling as the patient

moves from right to left of the Six-Phase Table of Homotoxicology.

Appropriate homotoxicology formulas

Aesculus compositum: Useful in improving circulation following stroke or reduced cerebral circulation (*Aesculus hippocastanum* and *Secale cornutum*). *Areteria suis* supports the arteries. *Solanum nigrum* further supports cerebral function, particularly in cases with confusion, epileptic seizures, or disorientation. Several other agents support homotoxin removal and improve vessel stability (Reckeweg 2000).

Apis homaccord: Generally useful in edema, but also in cerebral sensitivity. May assist cardiac-induced cerebral weakness through *Scilla*, *Apisinum*, and *Apis mellifica*. The main symptoms of *Apis* may be summed up as follows for quick reference: sensitivity to touch and jarring; irritation of the meninges, especially from suppressed eruptions; diseases of the serosa, joints, and meninges; infiltration of the cellular tissues; and serous meningitis (Reckeweg 2002). *Apis* is also found in *Aesculus compositum*, *Cerebrum compositum*, *Placenta compositum*, and *Tonsilla compositum*.

Arsuraneel: Used for patients not responding to initial therapy; this formula may move them into a recovery phase through stimulation of the general defenses. Useful in cases with seizures, anxiety, feeling worse at night, paresis, and muscular disability (Reckeweg 2000).

Belladonna homaccord: *Belladonna*, which has an affinity for the central nervous system, is useful in patients manifesting seizures and who scream out at night. Violent delirium is characteristic of *Belladonna*, above all in fever. *Belladonna*'s typical action on the eyes is also well-known, with cramps in the muscles of the eyes and eyelids, enlargement of the pupils and, in particular, an inflammatory or irritative condition of the conjunctiva with marked photophobia, lachrymation, and pain. *Belladonna* is indicated in incipient boils, tonsillitis, and surface inflammations such as erysipelas, conjunctivitis, scarlet fever, otitis, cholangitis, meningitis, and other inflammatory affections. A delirious state occurs with a violent rise in temperature with considerably raised sensitivity of all the senses and a disproportionate sensitivity to touch, noises, light, cold air—especially draughts and jarring—as can be the case in meningitis. Along with nasal catarrhs, there may be catarrhs of the larynx and trachea, with slight mucus, accompanied a typical cough, which is dry, rough, and barking, with hoarseness. In the digestive organs, *Belladonna* affects acute gastric catarrhs (Reckeweg 2002). *Belladonna* is also common to *Traumeel*, *Spigelon*, *Viburcol*, *BHI-Inflammation*, *BHI-Neuralgia*, and *BHI-Recovery* formulas.

BHI-Inflammation: Contains *Rhus toxicodendron* for cases of weakness and paresis. Cases may be aggravated

after lying in wet grass. Patients that benefit may have pustular, pruritic skin conditions; joint pain; myelitis; vertigo/dizziness; intercostal pain; and other types of neuralgia. Commonly used in combination with other antihomotoxic agents.

Bryaconeel: Used for neuralgia, serous membrane inflammation such as meningitis (*Bryonia cretica*), acute feverish conditions, and influenza-like signs. Contains Phosphorus to support parenchymatous organs such as the lung and liver. Moderates severe or overaggressive vicariations. Used in meningitis in cases not responsive to primary therapy (Reckeweg 2000).

Cerebrum compositum: Supports cerebral tissue, stem cells, and vessels (*Cerebrum suis*, *Placenta suis*, *Arnica montana*). Treats memory loss and forgetfulness and improving memory (Selenium, *Thuja occidentalis*, *Acidum phosphoricum*, *Manganum phosphoricum*, *Semecarpus anacardium*, *Ambra grisea*, *Conium maculatum*, *Medorrhinum-Nosode*). Supports cerebral function and vascular structures (*Kalium phosphoricum*). Treats vertigo, stupor, headache, and weakness (*Gelsemium sempervirens*, *Kalium bichromicum*, *Ruta graveolens*) anxiety (*Aconitum napellus*), and exhaustion (China, *Amarita cocculus*). Supports capillary and other circulation, as well as lymph (*Aesculus hippocastanum*) and enzyme systems and difficulty sleeping (*Hyoscyamus niger*) (Reckeweg 2000).

Coenzyme compositum: Supports energy production through enzyme induction and repair, and is useful in repairing damage to enzyme systems of metabolism and following administration of drugs injurious to metabolism. Sulfhydryl groups in Cysteine assist in repairing therapeutic damage and in cases of forelimb weakness. Phase remedy in Degeneration and Dedifferentiation phases.

Cruroheel: Has strong connective tissue effects and is useful in difficult cases or those with strong vicariations.

Discus compositum: Clears the deep matrix and supports connective tissue repair, and treats irritation originating in the spinal column. Contains a number of useful remedies that particularly benefit musculoskeletal function, including *Funiculus umbilicalis suis* (also contained in *Cutis compositum*, *Placenta compositum*, *Thyroidea compositum*, *Tonsilla compositum*, and *Zeel*) for debility. Treats arteriosclerosis, cervical spondylosis, collagen diseases, scleroderma, fibromas, vascular pathology, geriatric indications of all kinds, dystonia of the autonomic nervous system, autoimmune diseases, damage from antibiotics and other drugs, general iatrogenic damage, multiple sclerosis, and muscular atrophy. Also contains Nicotinamidum, which is used to activate the energy metabolism in insufficiencies of the respiratory chain. The substance, which occurs naturally in the body, is an important component of NAD and NADP. Treats defi-

ciencies of Nicotinamidum that lead to mental and neurological disturbances (Reckeweg 2002). It is common to the remedies *Coenzyme compositum*, *Discus compositum*, *Ginseng compositum*, *Ubichinon compositum*, *Zeel*, and *BHI-Enzyme*.

Echinacea compositum: Contains *Aconitum*, which is indicated for catarrhs, neuralgic symptoms with paresthesia, hyperthermia, and encephalitis with very high temperatures (e.g. post-vaccinal encephalitis or meningo-encephalitis, which may be activated by the implantation of living cells). Low potencies are normally given in pyrexia and organic complaints (Reckeweg 2002). The component *Aconitum* is common to several useful remedies, including *Barijodeel*, *Bryanconeel*, *Cerebrum compositum*, *Gripp-Heel*, and *Traumeel*. *Baptisia* is included for meningitis and encephalitis, serious feverish infections, general blood poisoning, and states of confusion (Reckeweg 2002). *Aesculus compositum*, *Arnica-Heel*, and other complexes are also included.

Engystol N: Has antiviral effects through immunostimulation.

Galium-Heel: Phase remedy in the matrix and cellular phases. Provides powerful support of the immune system (*Echinacea augustifolia*). Assists in drainage of cell and matrix, supports renal tubular function, and decreases swelling and edema (*Apis mellifica*, *Galium aparine*, and *Galium mollugo*). It is a critical component in the deep detoxification formula. Doses should be administered with regard to clinical condition and response, with the dose reduced if strong reactions are noted (Reckeweg 2000).

Gelsemium homaccord: Treats neuralgia and nerve pain, headache, and posterior weakness. Commonly required in aging large-breed dogs. This is a major antihomotoxic agent used in many neuropathy cases. Think of this agent in trembling pets because *Gelsemium* is known as the “trembling” remedy.

Ginseng compositum: Treats eyelid weakness and exhaustion.

Glyoxal compositum: Provides mitochondrial repair of damaged enzyme systems in Degeneration and Dedifferentiation phase disorders.

Listeriosis nosode: This remedy is not available in any of the homotoxicology combinations, but could be useful as a single remedy. The zoonotic organism *Listeria monocytogenes* causes a disease characterized by granulomatous meningoencephalitis in small animals (Reckeweg 2002).

Lymphomyosot: Used after cortisone therapy and for mesenchymal purging in chronic disease states.

Neuralgo-Rheum-Injeel: The components *Causticum* Hahnemanni and *Rhus toxicodendron* are powerful neurological remedies that cover a wide variety of chronic rheumatic-arthritis complaints, skin conditions, and intercostal-sciatic neuralgias.

Placenta compositum: Supports hypophysis after cortisone therapy. Contains sulfur to support enzyme and metabolic repair. Regenerative of hypophyseal-adrenal axis, and repairs vascular structures. Used intermittently in endocrine disorders.

Psorinonheel: Useful in deep, constitutional/genetic homotoxicoses. Consider in experimental application in inherited conditions. This remedy contains Cicuta, which is indicated for meningitis with hypersensitivity. It is a complementary remedy in tuberculous meningitis (Reckeweg 2002).

Solidago compositum: Deposition Phase remedy needed to remove debris from the matrix after regressive vicariation begins. In Traditional Chinese Medicine, the Kidney Chi governs the Brain, and as such, neurological issues may benefit from support of the Kidney and related tissues. Part of the deep detoxification formula. An interesting indication in this remedy is for Coxsackie virus nosode, which is used for abacterial meningitis and encephalitis (Reckeweg 2002).

Spigelon: Helpful for symptoms of headache, cerebral conditions with inflammation, and weakness of connective tissues (Reckeweg 2000).

Thyroidea compositum: Used for matrix drainage and autoregulation repair. Contains low levels of thyroid, pineal, spleen, bone marrow, umbilical cord, and liver to support glandular function and repair. Galium aparine drains the matrix and cellular components. Cortisonum aceticum in low potency assists in repairing damage from excess levels of cortisone. Precursors and Krebs cycle constituents promote energy metabolism through the Michaelis-Menten law of enzyme activity. Pulsatilla and Sulfur assist in regulation rigidity-type situations. Part of the deep detoxification formula (Reckeweg 2000).

Tonsilla compositum: Main antihomotoxic drug for chronic diseases involving endocrine disorders. Supports a wide number of tissues including tonsil, lymph node, bone marrow, umbilical cord (stem cell precursors), spleen, hypothalamus, liver, embryo, and adrenal cortex (Heine 2004). Contains Cortisonum aceticum and thyroid hormone in nanodilutions. Also contains Psorinum for deep constitutional, lack of reaction cases. Degeneration Phase agent (Reckeweg 2000).

Ubichinon compositum: Provides mitochondrial repair of energy production mechanisms. Used in chronic diseases and iatrogenic injury to mitochondria from antibiotic therapy, and is part of the deep detoxification formula. Parabenzochinon, a critical component in this regard, is indicated for autoimmune issues, and has been recommended for a state of paresis occurring after poliomyelitis, encephalitis or vaccinations, disturbance in neuromuscular coordination, conditions such as multiple sclerosis and tumors in the spinal area with pains and paresis, and brain tumors. In many cases of meningeal irritation, para-

benzoquinone deals with the terrible pains better than an opiate.

Authors' suggested protocols

Nutrition

Brain/nerve and immune support formulas: 1 tablet for each 25 pounds of body weight BID.

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Essential fats: One-half teaspoon for every 35 pounds of body weight with food.

Magnesium: 10 mgs for every 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

For GME, the patent formula is Yin Qiao San. It contains arctium (Niu bang zi), forsythia (Lian qiao), honeysuckle (Jin yin hua), licorice (Gan cao), lophatherum (Dan zhu ye), mint (Bo he), phragmites root (Lu gen), platycodon (Jie geng), schizonepeta (Jing jie), and soybean (Dan dou chi). It is dosed according to the manufacturer's recommendation. Yin Qiao San has been shown experimentally to decrease inflammation. It inhibited dimethylbenzine-induced increase in skin capillary permeability (Fu 1993). It also has antipyretic effects similar to aspirin (Xu 1986, Shen 1987). In addition it has been shown to have antibacterial and antiviral efficacy (Zhang 1981, Wang 1958, Shanghai Health and Epidemic Prevention Station 1960). Finally, it has analgesic properties as demonstrated using hot plate and acetic torsion experiments in mice (Zhou 1990). It was used to treat encephalitis B in 37 people with good response (Liu 1958). In another study on people with encephalitis (nonspecified origin), 74 of 81 people recovered completely, 2 did not respond completely and 5 people died (Wu 1965).

An alternative herbal supplement is H25 GME Disorder at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs in Yin Qiao San, H25 GME also contains achyranthes (Niu xi), buffalo horn shavings (Niu jiao), chrysanthemum (ju hua), coix (Yi yi ren), gastrodia (Tian ma), grass-leaf sweet-flag root (Shi chang pu), hoelen spirit (Fu shen), isatis leaf (Da qing ye), isatis root (Ban lan gen), papaya (Mu gua), phellodendron (Huang bai), pueraria (Ge gen), scutellaria (Huang qin), silkworm (Jiang can), and uncaria (Gou teng).

These formulas can be combined with conventional drugs, but often are only needed for a short period of time.

The author uses the following acupuncture points for GME: ST36, GV14, CV17 and GB20.

For forelimb neuropathies, the authors recommend H41 Forelimb Paralysis at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs discussed above, H41 Forelimb Paralysis contains codonopsis (Dang shen) and scorpion (Quan xie), which increase the efficacy of the formula.

The author recommends the following acupuncture points: LI11, SI9, TH6, LI10, ST36, and Bai Hui.

For hindlimb neuropathies the authors recommend H 72 Hindlimb Paralysis/Incontinence at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, H72 Hindlimb Paralysis/Incontinence contains American ginseng (Xi yang shen), ciborium (Gou ji), cynomorium (Suo yang), fossil bones/raw (Long gu), linden (Wu yao), mantis egg case (Sang piao xiao), polygonatum (Yu zhu), and tortoise plastron (Gui ban). These herbs enhance the function of the herbal supplement.

The author uses the following acupuncture points: ST36, UB60, BL30, and Bai Hui.

For facial neuropathies the authors use H 73 Facial Nerve Paralysis at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs listed above, H 73 Facial Nerve Paralysis contains scorpion (Quan xie) to improve the efficacy of the formula.

The author recommends the following acupuncture points: ST4, ST6, ST7, and SI9.

Homotoxicology

Deep detoxification may assist noninherited conditions, and support of energy metabolism through the use of catalysts should be considered. Use of antihomotoxic agents that match the patient's symptoms may be helpful. Treatment must be individualized to the specific patient's needs. Any clinician successfully treating either inherited or acquired polyneuropathies should report their findings for publication.

Granulomatous meningoencephalitis (GME)

Symptom formula: Two protocols exist.

1. Administer Echinacea compositum IV and Solidago compositum and Galium-Heel as an autosanguis, and dispense an oral cocktail consisting of Traumeel, Psorinoheel, and Aesculus compositum BID to TID. Use Ubichinon compositum orally BID. Administer Spigelon for pain and inflammation associated with the illness, and consider Listeria nosode, obtained from a single remedy company, or Heel-Germany.
2. Administer Gelsemium homaccord, BHI-Inflammation, Spigelon, and Traumeel S mixed together and given PO BID for 3 weeks, then alternate with Pulsatilla compositum in an attempt to shift regulation rigidity. Give Cerebrum compositum 1 to 3 times weekly. Consider autosanguis therapy.

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum (alternated with Tonsilla compositum in inflammatory conditions), Coenzyme compositum, and Ubichinon compositum combined and given orally twice weekly. Consider giving these and the above symptom formula agents as autosanguis therapy.

Acquired peripheral neuropathies

In nearly all cases it would be appropriate to administer Neuralgo-Rheum and Discus compositum 2 to 3 times weekly by injection.

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum (alternated with Tonsilla compositum in inflammatory conditions), Coenzyme compositum, and Ubichinon compositum combined and given orally twice weekly. Consider giving these agents as autosanguis therapy.

Diabetic polyneuropathy

Lymphomyosot, Syzygium compositum, and Mucosa compositum given orally in conjunction with alpha-lipoic acid. (See also Diabetes mellitus protocol).

Hypothyroid polyneuropathy

Administer in addition to proper thyroid hormone replacement therapy. Thyroidea compositum given twice weekly alone or as part of the deep detoxification formula if the condition is stable.

Iatrogenic pharmaceutical injury (vincristine, vinblastine, and colchicines)

Deep detoxification formula, IV fluid support, and avoidance of the offending drug until it can be cleared.

Idiopathic

Deep detoxification formula, and also consider BHI-Body Pure for 1 to 3 months.

Immune-mediated (autoimmune such as systemic lupus erythematosus)

See autoimmune protocols.

Infectious (Neospora caninum and FeLV)

Use clindimycin for Neospora. See the FeLV protocol section. Tonsilla compositum given twice weekly and Echinacea compositum daily by injection during acute involvement. Engystol may improve immune function given daily. Traumeel S if acute inflammation or swelling is involved.

Toxic injury (metals, solvents such as carbon tetrachloride, organophosphate, insecticides)

Deep detoxification formula in conjunction with appropriate antidote, plus supportive and chelation therapy.

LARYNGEAL PARALYSIS

Definition and cause

Laryngeal paralysis is a degenerative process that affects the normal functioning of the larynx, leading to an interference with the normal flow of air to the lungs. Secondly, there may be gagging, excessive salivation, vomiting, and aspiration pneumonia. Underlying causes are believed to be genetic inheritance, trauma to the nervous innervation of the larynx, neuropathy, chronic larynx disease, immune-mediated inflammation, or secondary to other diseases such as neoplasia (Braund 1995, Bjorling 1995, Harpster 2003, Harvey 1981, Venker-van Haagen 1992).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The treatment of choice for laryngeal paralysis is a laryngeal tie-back surgery. This procedure is reported to produce good success rates. If the client declines surgery, medical therapy with tranquilizers or anti-inflammatory drugs may be used with varying degrees of success.

Surgery can offer patients tremendous relief but may be associated with high complication rates, particularly

death from pneumonia, and may require repeated procedures (Hammel, Hottinger, Novo 2006). A new procedure involving injection of autogenous cartilage shows some promise (Lee, et al. 2006).

In cases of trauma, temporary tracheostomies can be life saving. Neoplastic cases require appropriate therapy depending upon the type, location, and size of the tumor. Many cases of neoplasia in cats involve squamous cell carcinoma or lymphosarcoma. A larger complement of neoplastic types are involved in dogs. Patients suffering from laryngeal paralysis are prone to hypoxia, overheating, and difficulty swallowing; as a result, they have an increased chance of aspiration of resultant pneumonia and a more guarded prognosis (Braund 1995, Harvey 1981, Harpster 2003).

Anticipated prognosis

Surgical correction often improves the condition and results in a good prognosis. Multiple surgeries may be necessary in some animals. Paralysis secondary to neoplasia offers a guarded prognosis (Harpster 2003, Venker-van Haagen 1992).

Integrative veterinary therapies

Causes secondary to trauma and genetic inheritance require alternative therapy support. In chronic inflammatory and immune-mediated cases, the nerves, larynx, and glandular immune system should be taken into account. Reducing inflammation, protecting cells, and preventing ongoing degeneration and cell death will help improve the clinical picture, as will surgery if it is required. The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects can often control the clinical signs and improve the day-to-day level of comfort for the animal.

Nutrition

General considerations/rationale

While surgery can often help with day-to-day comfort and function, nutritional therapies can help improve nerve control and gland support can help the immune system. This can help reduce inciting inflammation and slow degeneration.

Appropriate nutrients

Nutritional/gland therapy: Glandular brain, adrenal, thymus, pituitary, and hypothalamus supply the intrinsic nutrients that help to improve nervous system and organ function and reduce cellular inflammation. This helps to spare these organs from expanding inflammation and can slow degeneration (see Gland Therapy in Chapter 2 for a more detailed explanation).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient that is required by nerves for general health and wellness (Hanin 1987).

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is an essential ingredient in cellular membranes, particularly those of brain cells. It has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). When people with Alzheimer's disease were given PS, they showed a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Coenzyme Q10: Coenzyme Q10 (ubiquinone) is found in the mitochondria and is involved in the cells' energy production that is required for the daily functioning of the body. It is essential in the manufacture of ATP, the energy source for all the body's cells and tissues. CoQ10 is also a potent antioxidant and helps to neutralize free radicals and protect cells (Thomas 1997, Weber 1994).

Blue-green algae: Blue-green algae has been observed to create a generalized feeling of well being in humans, and may prove helpful in veterinary patients. Its effects are usually observed to be slower in onset, with the resultant benefits taking 3 to 4 weeks to appear. This may be due in part to their content of natural antihistaminic compounds or their levels of omega-3 fatty acids (Bruno 2001).

Many studies in recent years have confirmed the beneficial results from these critical fatty acids. *Aphanizomenon flos aquae*, a blue-green algae, has been shown in clinical settings to have positive effects on brain function. In addition to the aforementioned omega-3 fatty acids, it also contains a full scope of essential amino acids, a broad-based mineral content, a rapidly assimilable glyolipoprotein cell wall, and a wide variety of vitamins. It has mild chelating properties, and thus, can be valuable in heavy metal toxicoses such as Thimerosal reactions. It is a tremendous asset as a micronutrient resource and figures prominently in many treatment programs (Broadfoot 1997).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM, laryngeal paralysis is caused by Yin deficiency in the Lung and Kidney. The Lung controls the

Throat. The Kidney is responsible for misting fluid up to the upper part of the body. If the Kidney has a Yin deficiency it cannot send fluids up to the Lungs. The Yin deficiency leads to a relative excessive Yang because Yin and Yang balance each other. Yang is warm, and the resulting heat, or inflammation, rises up, burning and paralyzing in the throat.

Treatment involves correcting the underlying etiology if possible and decreasing inflammation.

Appropriate Chinese herbs

NOTE: This section seems to overemphasize neoplastic etiologies. This reflects the lack of well-controlled studies concerning the use of herbs to treat laryngeal paralysis.

Astragalus (Huang qi): Has been shown to inhibit the growth of tumors (Liu 1999, Shi 1999). It may help control underlying neoplastic causes of laryngeal paralysis.

Belamcanda (She gan): Has demonstrated antiviral activity (Zhong Yao Yao Li Yu Ying Yong 1990). It may help control viral neuropathies.

Centipede (Wu gong): Has antineoplastic properties (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). It may help if the laryngeal paralysis is secondary to cancer.

Forsythia (Lian qiao): Has an anti-inflammatory effect (Ma 1982). Methanol-based extract of Lian qiao has anti-inflammatory and analgesic effects (Rui 1999).

Honeysuckle (Jin yin hua): Has anti-inflammatory effects (Shan Xi Yi Kan 1960).

Prunella (Xia ku cao): Has anti-inflammatory actions (Zhong Yao Xue 1998). It can increase serum cortisol levels (Jiang 1988), which may help decrease swelling.

Red peony (Chi shao): Has anticancer properties (Hu 1990).

Rehmannia (Sheng di): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983). This may be useful in cases in which laryngeal paralysis is secondary to inflammatory conditions.

Salvia (Dan shen): Has anti-neoplastic effects (Li 1999). It may help treat neoplastic causes of laryngeal paralysis.

Subprostrata sophora (Shan dou gen): Has anticancer properties, most likely due to the matrine, oxymatrine, and sophocarpine components (Zhong Guo Yi Xue Ke Xue Xue Bao 1988). It may help control neoplastic etiologies.

Scorpion (Quan xie): Has antineoplastic properties (Jiang Su Yi Yao 1990).

Acupuncture

Many studies have been performed on stroke victims. EEG maps and somatosensory evoked potentials reveal

that patients treated with acupuncture improve faster than those who are not (Chen 1990). A review by Ionescu-Tirgoviste (1981) showed that some forms of peripheral neuritis respond to acupuncture. These studies show that the nervous system is amenable to treatment with acupuncture.

Homotoxicology

General considerations/rationale

Laryngeal paralysis is a significant disease in dogs, and is more rarely seen in cats. Trauma is a rare cause in both dogs and cats, and can represent the Inflammation Phase, or the Degenerative Phase in more severe injuries. Inherited conditions affect several breeds of dogs and represent Dedifferentiation Phase disease, because the genetic complement is no longer intact. Inherited cases generally present between 4 and 8 months of age. Tumors can also result in this condition; this is rare in dogs and more common in cats. Vagal neuropathies (cranial nerve X) in conjunction with abnormalities of the spinal accessory nerve (cranial nerve XI and its branch, the recurrent laryngeal nerve) result in this condition (Bagley 2005).

Many cases commonly seen in veterinary clinics represent idiopathic disease (Impregnation or Degeneration phase), and these most often present in dogs from 2 to 12 years of age. Many cases are beyond reversal by the time they are presented to the veterinarian for diagnosis (Harpster 1997). Other polyneuropathies can present with laryngeal signs (hypothyroidism, etc).

Appropriate homotoxicology formulas

Barijodeel: Contains Causticum Hahnemannii, which is indicated for intractable paralytic conditions such as Bell's palsy and laryngeal paralysis. Arnica, Ignatia, and Kali phos are other remedies with nerve damage or dysfunction indications that are included in this formula. All of these remedies have a particular affinity for neck, laryngeal, or pharyngeal dysfunctions (Reckeweg 2002). Causticum is also contained in *Causticum compositum*, *Neuralgo-Rheum-Injeel*, *Reneel*, and *Rheuma-Heel*.

BHI-Allergy: Though not an obvious first choice for laryngeal paralysis, this remedy nonetheless contains a number of useful components for this condition, among them the aforementioned Arnica and Ignatia. In addition, it contains Selenium for neurasthenia, laryngitis, hoarseness, and inflammation of the upper respiratory passages. *Sulphuricum acidum* in this remedy also has some laryngitis, coughing attacks with regurgitations, dyspnea, and shortness of breath as indications (Reckeweg 2002).

BHI-Inflammation: Used as an immune supportive agent. It combines effects similar to *Traumeel* along with *Echinacea*.

Coenzyme compositum: Supports energy production through enzyme induction and repair. It is useful in repair-

ing damage to enzyme systems of metabolism and following administration of drugs injurious to metabolism. It is a phase remedy in Degeneration and Dedifferentiation phases.

Discus compositum: Useful in cleansing deep matrix and supports connective tissues.

Galium-Heel: Phase remedy in matrix and cellular phases. Provides powerful support of the immune system (*Echinacea augustifolia*). Assists in drainage of cells and matrix, supports renal tubular function, and decreases swelling and edema (*Apis mellifica*, *Galium aparine*, and *Galium mollugo*). It is a critical component in the deep detoxification formula. Dosing should be done with regard to clinical condition and response, with the dose reduced if strong reactions are noted (Reckeweg 2000).

Gelsemium homaccord: A generally useful remedy in neurological weakness and paralysis.

Glyoxal compositum: Provides mitochondrial repair of damaged enzyme systems in Degeneration and Dedifferentiation phase disorders.

Ignatia homaccord: Usually used in cases of depression and anxiety, this formula is also used for the sensation of a lump in the throat (globus hystericus) and might have usefulness in cases associated with shock or sadness from loss occurring prior to the onset of difficulties. Kent (1921) lists this remedy for use in difficulty breathing as well.

Lymphomyosot: Used after cortisone therapy and mesenchymal purging in chronic disease states.

Phosphor homaccord: Provides parenchymal organ support. Treats laryngitis and disorders of nutritive organs (Heel 2003).

Pulsatilla compositum: Used in regulation rigidity cases. Contains Pulsatilla pratensis, Sulfur, and Cortisonum aceticum for repairing damage following steroid administration. Often a case will rapidly activate following administration of this agent, and in cases of strong regressive vicariation the administration of *Traumeel S* moves the patient toward healing and resolution. It is used in conjunction with catalyst therapy.

Solidago compositum: Deposition Phase remedy needed to remove debris from the matrix after regressive vicariation begins.

Thyroidea compositum: Used for matrix drainage and repair of autoregulation. Contains low levels of thyroid, pineal, spleen, bone marrow, umbilical cord, and liver to support glandular function and repair. *Galium aparine* drains matrix and cellular components. Cortisonum aceticum in low potency assists in repairing damage from excess levels of cortisone. Precursors and Krebs cycle constituents promote energy metabolism. Pulsatilla and Sulfur assist in regulation rigidity-type situations. Part of Deep Detoxification Formula (Reckeweg 2000).

Traumeel S: Treats Inflammation Phase disorders, particularly in cases of trauma. May prove useful in reducing

inflammation from laryngeal fluttering. It is an alternative to corticosteroids that is worthy of consideration and examination.

Ypsilobeel: Assists in central autoregulation. Contains Lachesis, which is indicated in laryngeal paralysis and globus hystericus (sensation of a ball in the throat, which may manifest in veterinary patients as extending the neck and swallowing frequently) (Kent 1927). Because Ypsilobeel can also assist in cases of centrally mediated vomiting, clinicians should be alert to these signs in selecting remedies.

Authors' suggested protocols

Nutrition

Brain/nerve and pituitary/hypothalamus/pineal support formulas: 1 tablet for each 25 pounds of body weight BID.

Immune support formula: One-half tablet for each 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Coenzyme Q10: 25 mgs for every 10 pounds of body weight daily.

Blue-green algae: One-fourth teaspoon for each 25 pounds of body weight daily.

Other fatty acid sources: Beyond Essential Fats—one-half teaspoon for every 35 pounds of body weight with food (maximum, 100 pounds); oil of evening primrose, hemp oil, flax oil, and fish oil—follow manufacturer's dose recommendations.

Chinese herbal medicine

Formula H53 Laryngeal Paralysis at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs discussed above, H53 Laryngeal Paralysis contains adenophora (Sha shen), codonopsis (Dang shen), ophiopogon (Mai men dong), phragmites (Lu gen), and scrophularia (Xuan shen) to help improve the efficacy of the formula.

The author uses the following acupuncture points: LI11, CV22, CV23, BL13, and BL23.

Homotoxicology

Proper treatment depends upon the causation involved.

Traumatic cases: Tracheostomy as needed. Traumeel S given orally or by injection TID for 3 days and then BID for 2 days.

Idiopathic cases: Surgery is likely needed. Barijodeel and BHI-Allergy, given TID orally. Also consider Traumeel-S and Phosphorus homaccord if laryngitis is present. Possibly also give Gelsemium homaccord BID orally. Deep detoxification formula consisting of Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum,

Thyroidae compositum, Coenzyme compositum, and Ubichinon compositum mixed together and given orally twice weekly.

Neoplasia: See chapters 31 and 32, cancer and IVM Cancer Treatment Protocols.

INTERVERTEBRAL DISC DISEASE—PARESIS/PARALYSIS

Definition and cause

Intervertebral (IV) disc disease is a degeneration of the intervertebral disc, which is characterized by leakage of the disc material, leading to spinal cord compression and neurological deficits. While no proven genetic link has been determined, certain breeds such as dachshunds, beagles, and corgis are more predisposed to the condition. The literature links the cause to aging and degeneration of the disc tissue. The neurological deficits are secondary to compression (Braund 1993, Gage 1975, Hoerlein 1987, Smith 2003, Toombs 1993).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The medical or surgical approach to IV disc disease, pain, paresis, and paralysis depends upon the severity of the inflammation and the compression of the cord. Restricted activity or cage rest is recommended in most cases. Corticosteroids are often recommended for their anti-inflammatory effects. Surgical intervention (hemilaminectomy or fenestration) is often necessary because pain or neurological deficits are common. The dietary recommendation focuses on weight reduction in obese animals. Vitamin E is beneficial for cats but has no proven indications for dogs (Braund 1993, Smith 2003).

Anticipated prognosis

The prognosis depends upon the damage to the cord. Patients with painful episodes generally carry a better prognosis than animals with neurological deficits, paralysis, paresis, and incontinence. The prognosis with surgery is good if the surgery occurs within 48 hours of the rupture (Gage 1975, Toombs 1993, Smith 2003).

Integrative veterinary therapies

Paresis refers to weakness of motor function without total paralysis. Paralysis is a lack of motor function. Anything that negatively impacts function of the motor unit can result in signs of paresis or paralysis. Damage to the upper motor neuron or central nervous system can result in paresis due to loss of conscious proprioceptive functions. Nervous tissue is extremely susceptible to a wide variety of injurious processes, and determining the cause of paresis can be challenging. Paresis in this section of text refers to neurological deficits, but the reader should remember that musculoskeletal problems can also lead to gait weaknesses, and that all paresis is not necessarily neurological in origin.

An integrative approach to IV disc-related paresis focuses upon the integrity of the disc itself as well as the secondary compression, inflammation, and resultant cell death. The addition of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory and potentially regenerative effects on the nerves and IV disc cells can often help improve the clinical signs and the day-to-day level of comfort, and can enhance the healing process. In addition, complementary and alternative veterinary modalities (CAVM) can also strengthen surrounding discs and help prevent recurrences in adjacent locations.

Nutrition

General considerations/rationale

While surgery can help relieve the compression and improve clinical function, nutritional therapies can help improve nerve regeneration and return of function.

Appropriate nutrients

Nutritional/gland therapy: Glandular brain and cartilage supply intrinsic nutrients that help to improve nervous and organ function, reduce cellular inflammation, and strengthen connective tissue (see Gland Therapy in Chapter 2 for a more detailed explanation).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in

brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient that is required by cells for general health and wellness (Hanin 1987).

Coenzyme Q10: Coenzyme Q10 (ubiquinone) is found in the mitochondria and is involved in the cells' energy production that is required for the daily functioning of the body. It is essential in the manufacture of ATP, the energy source for all of the body's cells and tissues. CoQ10 is also a potent antioxidant that helps to neutralize free radicals and protect cells (Thomas 1997, Weber 1994).

Chinese herbal medicine/acupuncture

General considerations/rationale

Intervertebral disc disease may be a result of trauma, as in Western theory. It may also result from Wind, Damp, and Cold invading the Kidneys, which leads to Qi and Yang deficiency.

Trauma is self-explanatory. It was also thought that Wind could blow Cold into the body, where it could attack the Joints. Application of Heat often relieves the signs in these patients. Damp tends to make things tight and sticky, which explains the stiffness many patients feel in damaged Joints. The Kidneys control the Bones, so Kidney pathology can cause Osseous and Joint lesions. When there is Qi and Yang deficiency, the patient has little energy to move and too little warmth to warm his body and Joints.

Treatment is aimed at decreasing the inflammation associated with injuries, increasing mobility, and decreasing pain.

Appropriate Chinese herbs

Atractylodes (Cang zu): Increases the pain threshold (Zhang 1999). In addition, it can counteract xylene-induced ear swelling and carrageenin-induced foot swelling (Zhang Ming Fa 1998). This indicates that it may be useful in decreasing inflammation at the site of disc disease.

Aconite root (Fu zi): Reduces swelling and inflammation in joints (Zhong Yao Tong Bao 1988). It has been shown to have analgesic properties (Zhong Guo Zhong Yao Za Zhi 1992).

Angelica (Bai zhi): Has been shown to have anti-inflammatory and analgesic effects in mice (Zhong Guo Zhong Yao Za Zhi 1991).

Angelica root (Dang gui): Is as strong as aspirin at decreasing inflammation and is 1.7 times as strong as aspirin for pain relief (Yao Xue Za 1971).

Astragalus (Huang qi): Has demonstrated mild analgesic effects in mice (Zhong Yao Tong Bao 1986).

Cinnamon twig (Gui zhi): Has analgesic properties (Zhong Yao Xue 1998). It was part of a formula used in 30 patients with arthritis; 50% recovered completely, 20% showed marked improvement, 17% showed some improvement, and 13% did not respond (Shi Zhen Gua Yao Yan Jiu 1991).

Coix (Yi yi ren): Has analgesic and anti-inflammatory effects. It suppresses dimethylbenzene-induced auricular swelling and carrageenin-induced foot swelling in mice (Zhang Ming Fa 1998). It was shown to help women with severe menstrual cramps (Zhang Yong Luo 1998), which may indicate that it would be useful in treating the pain associated with intervertebral disc disease.

Earthworm (Di long): Has a significant analgesic effect (Chen 1996).

Jujube fruit (Da zao): Decreases inflammation. Jujube fruit was shown to reduce dimethylbenzene-induced auricular inflammation in mice and egg-white-induced toe swelling in rats (Li 1997), which implies that it may be useful for decreasing the inflammation involved with intervertebral disc disease.

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone. They decrease edema and have anti-arthritic effects (Zhong Cao Yao 1991). Licorice has demonstrated analgesic effects in mice, especially when combined with white peony (Bai shao) (Zhong Yao Xue 1998).

Notopterygium root (Qiang huo): Has anti-inflammatory and analgesic effects. In mice, it was shown to decrease xylol-induced ear lobe swelling and carragenin-induced foot pad edema, and increase the thermal pain threshold (Xu 1991).

Sichuan aconite (Chuan wu): Seems to have a centrally mediated analgesic effect. In mice, it was shown to be effective for decreasing inflammation and pain. It is stronger than aspirin at reducing inflammation (Xian Dai Zhong Yao Yao Li Xue 1997). It controlled the signs in 92% of 150 human patients with arthritis when given in combination with Cao wu, Qiang huo, Du hua, Fu zi, Mo yao, Ru xiang, Dang gui, Chuan niu xi, Ma huang, Gui zhi, Wu gong, Chuan xiong, and Ma qian zi (Nei Meng Gu Zhong Yi Yao 1986).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It has demonstrated specific effects on pain in the lower back (Yun Nan Zhong Yi 1990).

Acupuncture

The World Health Organization lists lower back pain as one of the indications for acupuncture (World Health Organization 2006). One study looked at the use of abdominal acupuncture and electroacupuncture for treatment of prolapsed lumbar intervertebral discs. In this study there was complete relief from symptoms in 35% of the patients, significant improvement in 45% of the participants, slight improvement in 16%, and no response in 4% (Guo 2003).

Homotoxicology

General considerations/rationale

It is beyond the scope of this text to fully deal with all causes of paralysis and paresis. This section primarily addresses fibrocartilagenous embolic and intervertebral disease, which represents Impregnation or Degeneration phase homotoxicoses.

Appropriate homotoxicology formulas

Aesculus compositum: Treats post-embolic circulatory disorders such as infarct and stroke. It is worthy of evaluation in fibrocartilagenous embolic disease, but no studies exist. Supportive of circulation (Aesculus hippocastanum, Secale cornutum, Tabacum, Solanum nigrum, Arnica Montana, Barium iodatum, Hamamelis virginiana, Arteria suis, and Rhuta graveolens). Cuprum assists with spasm. Aesculus has specific antiCOX-1 and COX-2 inhibitory effects; other agents also affect vascular structures (Sato, et al. 2005; Suter, Bommer, Rechner 2006; Fujimura, et al. 2006). It is supportive of joints and muscles and is useful for sharp pains and counteracting the effects of cold, wet weather (Solanum dulcamara). *Apis* helps reduce swelling and pain (Reckeweg 2000).

Atropinum compositum: The oral and injectable vials are currently off the market in the United States, but oral tablets are available. This agent is highly effective for spasm and pain associated with diseases of the spine and back. If this remedy is not available consider *Spascupreel* in its place.

Barijodeel: Treats paresis post stroke.

BHI-Inflammation: Rhus toxicodendron assists in cases of paresis. Cases may be aggravated after lying in wet grass. Patients may have pustular, pruritic skin conditions, joint pain, myelitis, vertigo/dizziness, intercostal pain, and other types of neuralgia. Commonly used in combination with other antihomotoxic agents.

Cerebrum compositum: Used in the recovery phase. Placenta suis assists in peripheral circulation while improving vitality and awareness, particularly in aged patients.

Cimcifuga homaccord: Has regional affinity for cervical spine neuralgia and pain originating in the

sacral area and passing cranially. Treats cervical spine spasm.

Coenzyme compositum: Supports energy production through enzyme induction and repair. Useful in repairing damage to enzyme systems of metabolism and following administration of drugs injurious to metabolism. Phase remedy in the Degeneration and Dedifferentiation phases.

Colocynthis homaccord: Regional remedy for pain in the sacral and lumbar region. Useful in colitis cases and for sciatica (Reckeweg 2000).

Discus compositum: The principal antihomotoxic medication for intervertebral disc disease. *Discus compositum* contains 37 ingredients, making it a balanced agent that helps a wide variety of spinal and matrix-clearing issues. Signs of homotoxin off-load is common following use of *Discus compositum* (Reckeweg 2000, 2002).

This compositae class agent combines animal, mineral, and plant agents to assist in healing, drainage, and detoxification. Tissue receives direct support through *Discus intervertebralis suis* (intervertebral disc), *Funiculus umbilicus suis* (umbilical cord, which supports vascular and stem cell tissues), *Cartilago suis* (cartilage), *Medulla ossis suis* (bone marrow), *Embryo suis* (embryo), and *Glandula suprarenalis suis* (adrenal gland). It is useful in all cases of intervertebral or degenerative spinal disease. This remedy treats sciatica and sciatic neuralgia (*Citrullus colocynthis*, *Cimicifuga racemosa*, Picric acid, Ammonium chloride). It also supports energy metabolism and tissue repair (vitamin C, vitamin B₁, vitamin B₂, vitamin B₆, Nicotinamide, Coenzyme A, Nicotinamide Adenine Dinucleotide, Sodium osalacetate, Thiocetic acid, Calcium phosphate, Silicic acid, and Sulphur). *Zincum metallicum* is a strong nerve remedy that is included for peripheral symptoms in the nervous system, with numbness of the soles of the feet and cutting pains in the heel, which may proceed to the point of complete paralysis or hemiparesis with twitching, tremors and weakness.

Engystol N: Creates a “channeling effect” in the mesenchymal tissues and lymphatic system (Reckeweg 2000).

Galium-Heel: This phase remedy in matrix and cellular phases provides powerful support of the immune system (*Echinacea augustifolia*). Assists in drainage of cell and matrix, supports renal tubular function, and decreases swelling and edema (*Apis mellifica*, *Galium aparine*, and *Galium mollugo*). It is a critical component in the deep detoxification formula. Dosing should be done with regard to clinical condition and response, with the dose reduced if strong reactions are noted (Reckeweg 2000).

Gastricumeel: Useful in supporting gastric and duodenal function following spinal pathology (Heel 2003).

Gelsemium homaccord: Used for headache, depression, posterior weakness, and fear of open spaces (Reckeweg 2000). Main formula for paresis. *Gelsemium semperervirens* has long been used in herbal medicine because it has an affinity for nervous tissues. Strong neuroprotection results from low-dose use of *Gelsemium* (Bousta 2001).

Glyoxal compositum: Used to unblock cellular receptors and provides mitochondrial repair of damaged enzyme systems in Degeneration and Dedifferentiation phase disorders.

Lymphomyosot: Used after cortisone therapy and mesenchymal purging in chronic disease states. Reduces swelling and pressure. Contains *Aranea diadema* for periodic neuralgia, spinal nerve irritation, paralgesia, and painful articular disease. Calcium phosphoricum is indicated for calcium deficiency and spinal affections. *Fumaria officinalis* has indications for tightness in the back over the right kidney. Treats back pain and cutting pain on the right side, along with lumbar pain or sudden weakness in the lumbar region and cervical tension on the right side. *Myosotis arvensis* is used for conditions that include left-sided cervical pain or constriction in the cervical region. This also treats pressing pain in the lumbar region and right-side scapular pain that is stabbing (Reckeweg 2002).

Nux vomica homaccord: Provides enteric protection following spinal injury (Heel 2003).

Ovarium compositum: Supports gonadal tissue in geriatric patients.

Placenta compositum: Supports hypophysis after cortisone therapy. Contains sulfur to support enzyme and metabolic repair. Regenerative of hypophyseal-adrenal axis and vascular stem cells. Repairs vascular structures and is used intermittently in endocrine disorders.

Rhododendroneel S: Treats paresis of the radial nerve (Reckeweg 2000).

Solidago compositum: Deposition Phase remedy needed to remove debris from the matrix after regressive vicariation begins.

Spascupreel: Treats stabbing pains, muscle spasm, and neuralgia. Very useful in managing spasmodic pain. It is an alternative for *Atropinum compositum*.

Testes compositum: Supports connective tissue.

Thalamus compositum: Supports thalamus, pineal gland, adrenal gland, and cellular regulation through glandular content and homeopathically diluted cyclic adenonsine monophosphate (*cAMP*). Assists in establishing autoregulation of psychoneuroendocrine-immune functions (Reckeweg 2000). Assists in resetting pain thresholds.

Thyroidea compositum: Used for matrix drainage and repair of autoregulation. Contains low levels of thyroid, pineal, spleen, bone marrow, umbilical cord, and liver to

support glandular function and repair. Galium aparine drains matrix and cellular components. Cortisonum acetum in low potency assists in repairing damage from excess levels of cortisone. Precursors and Krebs cycle constituents promote energy metabolism through the Michaelis-Menten law of enzyme activity. Pulsatilla and Sulfur assist in regulation rigidity-type situations. Part of the deep detoxification formula (Reckeweg 2000).

Traumeel S: Has nonsteroidal anti-inflammatory effects. Useful in acute intervertebral disc herniation to reduce swelling (Apis) and pain, and activates blocked enzymes. Listed in the Physician's Desk Reference.

Ubichinon compositum: Provides mitochondrial repair of energy production mechanisms. Used in chronic diseases, iatrogenic injury to mitochondria from antibiotic therapy, and is part of the deep detoxification formula.

Zeel: Useful for its anti-inflammatory effects and supportive qualities for chronic arthritis.

Authors' suggested protocols

Nutrition

Brain/nerve and cartilage/ligament/muscle/skeletal support formulas: 1 tablet for each 25 pounds of body weight BID.

Coenzyme Q10: 25 mgs for every 10 pounds of body weight daily.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H39 BackRelief: 1 capsule per 10 to 20 pounds twice daily. If necessary it can be combined with steroids, nonsteroidal anti-inflammatory drugs, and nutraceuticals. (NOTE: it is never recommended to combine NSAIDs and steroids). In addition to the herbs listed above, BackRelief also contains aconite/cao (Cao wu), allium (Cong bai), carthamus (Hong hua), papaya (Mu gua), poria (Fu ling), and siler (Fang feng). These herbs increase the efficacy of the formula.

Recommended acupuncture points are "Ashi" points, BL23, BL25, BL57, BL40, Baihui, ST36, and GB30 (Handbook of TCM Practitioner 1987).

Homotoxicology (dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom formula: Traumeel S and Discus compositum given initially by injection, preferably into applicable acupoints. Traumeel Gel and Lymphomyosot Gel mixed together and massaged into the affected areas BID to TID. Spascupreel, Aesculus compositum, Lymphomyosot, and Traumeel S combined and given orally BID to TID. Add Cimicifuga homaccord (cervical disc or pain), Gelsemium homaccord (posterior weakness), Colocynthis homaccord

(lumbosacral disease or sciatica). Zeel and Discus compositum orally twice per week and Cerebrum compositum weekly.

Deep detoxification formula: Galium-Heel, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum mixed together and given orally twice weekly to every other day.

RADIAL NERVE PARALYSIS

Definition and cause

Radial paralysis is most commonly associated with trauma, and more specifically with a fracture of the humerus (Browne 1960, Hoerlein 1978, Knecht 1974). More often, however, the trauma involves multiple nerves of the brachial plexus. Radial nerve damage also can ensue from space-occupying lesions involving the brachial plexus of dogs and cats (Knecht 1974, 1985).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Surgical exploration of the brachial plexus is recommended in compression and space-taking lesions, as well as neoplasia. Other treatments include a splint, fusing the joint, and amputation (Knecht 1977, Swaim 1978).

Anticipated prognosis

If the trauma results in stretching as compared to rupture, the prognosis is much improved. Surgical removal of a space-occupying lesion improves the prognosis; however, the tumor type also affects prognosis (Knecht 1985).

Integrative veterinary therapies

Cases with no deep pain perception and no reflexes carry a grave prognosis. If deep pain is present, then long-term therapy may yield results. Regular evaluation is recommended at 24 hours, 1 week, 2 weeks, 1 month, and 2 months post injury. Some lesions may slowly improve, and final decisions should not be made before allowing sufficient time for healing to manifest. Neuritis and accompanying neurodermatitis may result during healing and must be managed to avoid further injury. During recovery it is vital to protect the foot from further trauma. Boots, bandages, and reduced exercise with physical therapy are all important steps for long-term care.

An integrative approach to radial paralysis focuses upon the damaged nerve, local inflammation, regenerating nerve cells, and improving nervous function. Nutrients, medicinal herbs, and combination homeopathics that have anti-inflammatory and potentially regenerative effects on the nerves can help improve healing.

Nutrition

General considerations/rationale

Nutritional therapies can often help improve nerve function and speed up regeneration of nerves and surrounding tissues.

Appropriate nutrients

Nutritional/gland therapy: Glandular brain supplies intrinsic nutrients that help to reduce associated inflammation and improve nerve cell metabolism and healing (see Gland Therapy in Chapter 2 for a more detailed explanation).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by all of the cells of the body for general health and wellness (Hanin 1987).

Coenzyme Q10: Coenzyme Q10 (ubiquinone) is found in the mitochondria and is involved in the cells' energy production that is required for the daily functioning of the body. It is essential in the manufacture of ATP, the energy source for all the body's cells and tissues. CoQ10 is also a potent antioxidant that helps to neutralize free

radicals and protect cells (Thomas 1997, Weber 1994).

Acetyl-L-carnitine: Acetyl-L-carnitine is a derivative of the amino acid L-carnitine, which is involved in the production of acetylcholine and the proper function of the brain and the transmission of nerve impulses. Studies have indicated that acetyl-L-carnitine can slow the development of Alzheimer's disease and improve cognition in people. People taking acetyl-L-carnitine showed an improvement in memory and their day-to-day demeanor and mood (Cipoli 1990, Genazzani 1990, Garzya 1990).

Chinese herbal medicine/acupuncture

General considerations/rationale

Peripheral neuropathy may be due to trauma, as in Western medicine, or it may be due to Cold and Wind invasion leading to Qi and Blood stagnation in the Meridians.

Wind has the ability to blow a pathogen into the body. In physics, we were shown how cold can thicken fluids, making them flow more slowly. In the TCM concept of peripheral neuropathy, Cold can slow the flow of Qi and Blood in the Meridians. When Blood does not flow to a limb, the limb is not nourished and will atrophy, and it will have no energy to move.

Appropriate Chinese herbs

Disclaimer: Few Western studies use herbs for radial paralysis, so the authors were unable to find well-controlled clinical trials. The following herbs have shown effects on the nervous system, which may indicate that they are useful for radial nerve paralysis. Controlled studies must be conducted to further evaluate their efficacy.

Rehmannia (Shu di): Has an effect on the central nervous system. It was used as part of a supplement along with Rou cong rong, Lu han cao, Gu sui bu, Yin yang huo, Ji xue teng, and Lai fu zi in 1,100 patients with myelitis. Seventy-three percent had significant improvement, and another 13% had moderate improvement in clinical signs (Liaoning Journal of Chinese Medicine 1982). It also may be able to affect peripheral nerves, although this must be further investigated.

Scorpion (Quan xie) and centipede (Wu gong): May have a positive effect on nerves. In one trial, 47 people experiencing a first-time episode of cerebral embolism were treated with scorpion (Qian xie), bungarus (Bai hua she), and centipede (Wu gong). Twenty-four patients recovered completely and 17 showed some response. Six did not respond (Ji Lin Zhong Yi Yao 1989). This suggests that these herbs may be useful in other neuropathies.

White peony (Bai shao) and licorice (Gan cao): These herbs were used in a study of 10 patients with congenital

myotonia. One participant had marked improvement and 4 more showed moderate improvement when treated with a decoction containing white peony (Bai shao), licorice (Gan cao), achyranthes (Niu xi), cicada (Chan tui), coix (Yi yi ren), silkworm (Jiang can), and chaenomeles (Mu gua)(Zhong Xi Yi Jie He Za Zhi 1984). While its use for radial paralysis has not been studied specifically, these other findings suggest that it may be useful in a variety of neurological diseases. White peony (Bai shao) has also been shown to stop the pain of trigeminal neuralgia (Zhong Yi Za Zhi 1983), which is further evidence that it may have an effect on nerves.

Acupuncture

The World Health Organization has listed peripheral neuropathies as an indication for acupuncture (World Health Organization Accessed 2006). Acupuncture may help nerves repair themselves. Neurological function was improved as a result of acupuncture therapy in studies on hemiplegic patients who suffered as a result of cerebral infarctions (Hu 1993, Bai 1993).

Homotoxicology

General considerations/rationale

Mild traumatic lesions are Inflammation Phase disorders, while more severe traumatic lesions can be Impregnation Phase (partial damage) or Degeneration Phase (more severe damage with nerve fiber death) disorders. In rare cases radial paralysis can result from neoplasia, and this represents a Dedifferentiation Phase disease. For a discussion of neoplasia see Chapters 31 through 34. The following discussion relates to less severe injuries in which nerve fibers still exist and there is some hope of regeneration.

Appropriate homotoxicology formulas

Aesculus compositum: Provides vessel repair. More specifically, *Aesculus* has indications for paraesthesia and a paralytic sensation in the left hand and left arm (Reckeweg 2002).

Apis homaccord: For use if edema is marked.

Arnica-Heel: Used in acute trauma.

BHI-Neuralgia: Contains *Spigelia*, *Gelsemium*, *Silicea*, and other connective tissue and nerve-related remedies (Reckeweg 2002).

Coenzyme compositum: Assists energy metabolism in deeper homotoxicoses.

Discus compositum: Provides deep matrix clearing of connective tissue, and stem cell activation.

Galium-Heel: Used in cellular and matrix phases, this remedy assists with swelling and drainage of homotoxins.

Glyoxal compositum: Used in Degeneration and Dedifferentiation phase disorders to reduce homotoxin polymerization and enzyme blockage.

Lymphomyosot: Provides lymph drainage.

Placenta compositum: Provides stem cell activation and vessel repair in peripheral vasculature.

Spigelia: Contains *Castoreum* as a nerve remedy for rheumatic and neuralgic conditions with spasmodic tension in the intercostal region and the musculature of the neck, shoulders, and back; and neuralgias of the arm (Reckeweg 2002).

Spigelon: Treats neuralgia, stabbing pains, headache, neuropathy, neuritis, and general weakness of connective tissue (Reckeweg 2000).

Traumeel S: Given systemically by injection or orally by liquid or tablet; has nonsteroidal anti-inflammatory mechanisms.

Ubichinon compositum: Assists with energy metabolism in deeper homotoxicoses.

Authors' suggested protocols

Nutrition

Brain/nerve support formula: 1 tablet for each 25 pounds of body weight BID.

Acetyl-L-carnitine (500 mgs): One-half capsule per 25 pounds of body weight daily.

Coenzyme Q10: 25 mgs for every 10 pounds of body weight daily.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H41 Forelimb Paralysis: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, H41 Forelimb Paralysis contains angelica root (*Dang gui*), astragalus (*Huang qi*), cinnamon twig (*Gui zhi*), codonopsis (*Dang shen*), earthworm (*Di long*), jujube fruit (*Da zao*), miltetia (*Ji xue teng*), tumeric (*Jiang huang*), and wild ginger (*Xi xin*). These herbs increase the efficacy of the formula.

The authors use the following acupuncture points: LI11, SI9, TH6, LI10, ST36, and Bai Hui.

Homotoxicology (dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Traumeel S: Given IV and then QID for 2 days, then TID for 3 days.

Lymphomyosot and Aesculus compositum: Given orally BID for 2 to 4 weeks. BHI-Neuralgia given BID.

Discus compositum and Placenta compositum: Alternated and given with *Spigelon* twice weekly.

VESTIBULAR SYNDROMES

Definition and cause

Vestibular syndromes are defined as a head tilt along with other signs associated with a dysfunction of the vestibular apparatus: ataxia, loss of balance, falling toward the head tilt, nystagmus, etc. The cause of the vestibular imbalance is most often an inflammatory reaction secondary to bacterial/viral infection; exposure to toxins or drugs such as metronidazole; immune-mediated such as a polyneuropathy; or secondary to other conditions such as trauma, otitis involving the inner ear, polyneuropathy, or neoplasia. The literature also reports vestibular ataxia secondary to a thiamine deficiency (Bagley 2005, Cochrane 2003, de Lahunta 1993, Thomas 2000).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy depends upon the severity of the clinical signs. Topical and systemic antibiotics are recommended when the cause is confirmed secondary to inner ear problems. Corticosteroids are often recommended to reduce inflammation as well as suppress the immune reactions. Thiamine is recommended with those animals that have confirmed vitamin B₁ deficiencies. When the vestibular disease is secondary to other conditions such as hypothyroidism or cancer, the primary therapy must include the primary disease (Bagley 2005, Clemmons 1997).

Anticipated prognosis

Primary vestibular disease often responds well to medical therapy consisting of reducing inflammation and giving antimicrobials. The prognosis is less favorable if the vestibular disease is secondary to other conditions such as GME or cancer.

Integrative veterinary therapies

Vestibular syndrome covers a wide variety of neurological disorders, including anomalous, metabolic, neoplastic, idiopathic, infectious inflammatory, noninfectious-inflammatory, traumatic, toxic, vascular, and metabolic categories (Bagley 2005). The term “idiopathic vestibular syndrome” is not a comprehensive diagnosis and can consist of a myriad of actual abnormalities that lead the patient to manifest disturbances in the functioning of the vestibular system. Patients with infections, parasites, allergies, masses, or vascular lesions all require different selections of appropriate conventional and complementary veterinary medical therapies. The contribution of iatrogenic vestibular conditions is very important.

Evaluation of a patient in this category should include careful assessment of drug history, because ototoxic medications such as aminoglycoside antibiotics, furosemide, chlorhexidine, and cisplatin, as well as metronidazole, can cause adverse effects that result in vestibular signs. In some instances, removal of the drug leads to rapid improvement as the patient undergoes regressive vicariation (Deposition and Impregnation phases), while in other instances such changes may be permanent (Degeneration Phase iatrogenic homotoxicoses) (Paquette and Sammut 2006)(see Chapter 4, Homotoxicology). Clinicians need accurate diagnoses to properly select and implement maximally effective treatment plans. An in-depth history (including diet, travel, and drug history; physical and neurological examination (including otoscopic examination); blood work consisting of CBC, biochemistries, and thyroid testing; and any necessary medical imaging should be considered. Otitis media and otitis interna cases can sometimes be difficult to diagnose, and can mislead clinicians during the diagnostic process. MRI and CT scans may offer critical data to properly understand and treat many patients afflicted by vestibular syndrome.

Because vestibular syndrome is an inflammatory process, often with an immune component, the use of nutrients, medicinal herbs, and combination homeopathics that have anti-inflammatory effects are beneficial for the restoration of equilibrium and healing.

Nutrition

General considerations/rationale

While medical therapy is focused locally upon the reduction of inflammation and control of infections, nutritional therapies including antioxidants and glands help to reduce inflammation and support the immune system organs.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, and brain supply the intrinsic nutrients that reduce cellu-

lar inflammation and improve organ function (see Gland Therapy in Chapter 2 for a more detailed explanation).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of the nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by the cells of the body for general health and wellness (Hanin 1987).

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is essential for cellular membranes, particularly those of brain cells. It has been studied in people with impaired mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). People with Alzheimer’s disease who were treated with PS showed a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Betasitosterol: Betasitosterol is a plant-derived sterol that has anti-inflammatory properties similar to corticosteroids and aspirin (Gupta 1980). In addition, sterols have been proven to enhance immune function (Bouic 1996). Sterols have been found to be able to enhance T-lymphocyte production and moderate B cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Bouic 1996).

Chinese herbal medicine/acupuncture

General considerations/rationale

Vestibular disease is due to Wind in the Liver with rising Yang. There may be Yin, Yang, Qi, and/or Blood deficiency.

Wind can be a description of ataxia. The swaying of an ataxic individual is similar to the swaying of trees in the wind. It can also be responsible for blowing a pathogen into the body, i.e., a bacterium for otitis media. The Liver is given the responsibility for ensuring the smooth flow of energy in the body. When there is Liver pathology, energy becomes affected and function may become jerky. When the Heat or Yang of the Liver rises there may be dizziness, irritability, and headaches.

This condition is seen quite often in elderly patients. They may be dehydrated (deficient in fluids or Yin), weak (deficient in energy or Qi), coolness and heat seeking (deficient in Heat or Yang), and/or anemic (deficient in Blood). If these conditions exist they must also be addressed. Basic therapy is aimed at treating the dizziness, any underlying cause of the disorder, and the inflammation that the etiological agent incites.

Appropriate Chinese herbs

Angelica root (Dang gui): Has antibiotic activity against both gram-positive and gram-negative bacteria (Hou Xue Hua Yu Yan Jia 1981).

Astragalus (Huang qi): Has demonstrated efficacy against various strains of bacteria (Zhong Yao Zhi 1949).

Bupleurum (Chai hu): Contains an anti-inflammatory chemical called saikosaponin (Shen Yang Yi Xue Yuan Bao 1984). It is one component of Fu Yuan Hou Xue Tang. This patent formula also contains trichosanthes (Gua lou), angelica root (Dang gui), licorice (Gan cao), pangolin scales (Pao shan jia), peach pit (Tao ren), carthamus (Hong hua), pueraria (Ge gen), and clematis (Wei ling xian). When it was used to treat 38 people with vertigo, 68% of the participants had complete resolution of signs and another 18% improved (Tang 1997).

Citrus (Chen pi): An anti-inflammatory. It decreases the permeability of blood vessels and reduces inflammation (Zhong Yao Yao Li Yu Ying Yong 1983). It also seems to have a dual effect on the immune system. It increases serum lysozyme levels but decreases the T-lymphocyte transformation rate (Jin 1992).

Fleece flower root (He sou wu): Has demonstrated antibacterial action against a variety of bacteria (Zhen 1986).

Ginger (Sheng jiang): Has anti-inflammatory effects. It can decrease capillary permeability (Zhang 1989). In addition, it is a strong anti-emetic (Xi 1990), which is helpful when the vestibular disease causes vomiting.

Haematite (Dai zhe shi): Has been used to treat people with vertigo. It was part of a supplement that also contained Ban xia, Che qian cao, and Xia ku cao. It was 94% effective in a trial involving 86 patients (Zhong Cao Yao Tong Xun 1972).

Jujube (Da zao): Can decrease inflammation and swelling (Li 1997).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). But while licorice is anti-inflammatory, it is also an immunomodulant. It can either stimulate or inhibit the phagocytic activity of macrophages (Zhong Yao Xue 1998). This indicates that it may be able to normalize the immune system. It may improve the immunodeficient patient but also decrease immunoreactivity in immune-mediated disease.

Poria (Fu ling): Inhibits various bacteria (Nanjing College of Pharmacy 1976).

Scutellaria (Huang qin): Contains baicalin, which has antibiotic activity against a wide variety of viruses and bacteria, and also has a synergistic effect with ampicillin, amoxicillin, methacillin, and cefotaxime (Zhong Yao Xue 1988, Liu 2000). In addition, baicalin and another component, baicalein, are anti-inflammatory (Kubo 1984).

Acupuncture

Several studies have shown that vertigo is quite responsive to acupuncture therapy. Zhou treated 63 patients with

acupuncture at GV20, PC6, and ST36, along with additional points as required based upon the TCM pattern. Sixty-five percent of the patients recovered fully while another 29% improved (Zhou 1998).

Meniere's disease is a condition seen in humans that seems to be related to increased pressure in the inner ear due to increased amounts of endolymphatic fluid. This condition can cause severe, even debilitating, vertigo. Yan then treated 189 patients with Meniere's syndrome with acupuncture at SP6, Kid3, GV20, GB20, GB34, PC6, HT7, ST40, and CV4. Ninety-two percent had complete resolution of symptoms while another 6% improved (Yan 1999).

Homotoxicology

General considerations/rationale

As in all conditions, it is useful to determine the relative position on the Six-Phase Table of Homotoxicology. Many of these patients are found to the left of the biological divide. Impregnation Phase diseases (chronic inflammation, allergy, viral, and some hemorrhages), Degeneration Phase diseases (embolic stroke and hemorrhage), and Dedifferentiation Phase homotoxicoses (congenital anomalies and neoplasia) are common causes, but Inflammation Phase cases (meningitis, abscess, infection, and trauma) may also occur. It is important to realize that earlier homotoxicoses may ultimately lead to a vestibular syndrome and it is desirable to treat these as earlier, less irreversible conditions. Proper use of biological therapies may resolve a condition before progressive vicariation occurs. Deposition Phase signs such as obesity and inactivity should warn the practitioner of ongoing disease and steps should be taken as early as possible to prevent the patient's crossing over the biological divide.

Appropriate homotoxicology formulas

Also see the allergy protocols located in Chapter 10, Diseases of the Dermatological System.

BHI-Recovery: Used as a reparative agent following stroke. Contains Gelsemium sempervirens (vertigo and difficulty swallowing) and Melilotus officinalis (hypertension and blood congestion of the cranium) (Heel 2002).

Aesculus compositum: Although it is considered to be in the realm of a primary peripheral circulatory remedy, this combination includes a large group of remedies with some specific indications for vertiginous syndromes: Aesculus hippocastanum (for headaches, especially above the eyes, accompanied by flickering vision, with a heavy sensation, as if numbed, with vertigo, and especially with occipital pain), Aethusa (see Strophanthus, below), Secale (for a subcutaneous sensation of crawling; there may be a preponderance of nervous symptoms such as lassitude, vertigo, and convulsive twitching alternating with spasmodic contractions of individual areas of muscle; there

may be symptoms similar to those indicated for *Strophanthus*, *Tabacum*, and *Viscum album* (hypotension and hypertension, sensations of vertigo, coronary stenosis, and arrhythmia) (Reckeweg 2002).

***Cactus compositum*:** Used in cases resulting from cardiac causes.

***Carbo compositum*:** Used for cerebral hemorrhage, collapse, circulatory failure, and brain congestion (Reckeweg 2000).

***Cerebrum compositum*:** Useful in many cases of vestibular syndrome, especially stroke (Morawiec-Bajda, Wasilewski 2000; Kuznetsova, Lukach 2004).

***Cocculus homaccord*:** A classical remedy for dizziness and motion sickness.

***Coenzyme compositum*:** Supports cytosol energy mechanics.

***Cralonin*:** Used in circulatory disturbances stemming from cardiac disease (See Chapter 9, Diseases of the Cardiovascular System, for more details).

***Galium-Heel*:** Provides matrix and cellular drainage and support. Part of the deep detoxification formula.

***Gelsemium homaccord*:** Used for headache, depression, and posterior weakness, as well as fear of open spaces (Reckeweg 2000). *Gelsemium semperervirens* has long been used in herbal medicine because of its affinity for nervous tissues. It has been shown to have antiseizure activity in rats that have undergone experimental neurological damage (Peredery, Persinger 2004). Also provides strong neuroprotection from low doses of *Gelsemium* (Bousta 2001).

***Ginseng compositum*:** At first glance, this remedy may seem less likely as a first line of therapy. Nonetheless, it contains some very useful vertigo remedies: ATP and Nadidum have general indications for vertigo. *Natrum oxalaceticum* can be used in cases that are unresponsive to other remedies. This combination also contains *Conium* (see *Vertigoheel*) and *Pulsatilla* for consideration in cases in which there may be vertigo with a tendency to vomit and aggravation when lying down. *Viscum album* (see *Aesculus compositum*) is also included. Finally, the ingredient for which it takes its name, *Ginseng* (*Aralia quinquefolia*), is used for vertigo, hemicrania with ptosis of the eyelids, heat in the head, and tendency to sleep, characteristic paralytic ptosis, difficulty in opening the upper lids, a certain weakness of vision with hypersensitivity to light, visual distortion, and double vision (Reckeweg 2002).

***Glyoxal compositum*:** Used for unblocking receptors and activating blocked enzymes in cellular phase homotoxicoses.

***Hamamelis homaccord*:** A hemorrhage remedy that also treats venous congestion and thromboembolic diseases. If seizures are present, also consider *Belladonna homaccord*, *Traumeel S*, and *Cruroheel* (Reckeweg 2000).

***Hepar compositum*:** Provides liver support and drainage. Part of the deep detoxification strategy.

***Lymphomyosot*:** Provides lymphatic drainage and immune support.

***Phosphor compositum*:** Useful in bleeding issues, it also contains *Argentum nitricum* for vertigo that is accompanied by general weakness, trembling, and tinnitus, such as one finds in Meniere's syndrome.

***Solidago compositum*:** Used for support and drainage of the kidney, which is involved in the function and degeneration of the brain in Traditional Chinese Medicine. It is a component in the deep detoxification formula.

***Spigelon*:** Useful for headache.

***Strophanthus compositum*:** Used primarily as a cardioactive remedy, it contains *Aethusa* for disturbances of the nervous system, with various kinds of spasms, dulling of faculties, or loss of consciousness. It is also used for reflex vomiting, gastrointestinal symptoms, and great exhaustion with a sensation of coldness and a tendency to develop vertigo, as well as loss of consciousness. *Tabacum* is another useful component; it is useful in collapse with pallor and cold sweat, trembling, coldness of the limbs, neuralgia, vertigo and Meniere's syndrome. *Tormentilla* is indicated for lightheadedness, vertigo that is better while lying down and worse on rising or standing or walking, and intermittent nausea (Reckeweg 2002). Also contains *Carbo veg* for bleeding, collapse, and shock, and *Latrodectus mactans* for lowered coagulability (thus, it is potentially valuable in cases of stroke).

***Thyroidea compositum*:** Provides matrix drainage and endocrine support, and is part of the deep detoxification formula.

***Traumeel S*:** A nonsteroidal anti-inflammatory agent that is useful in stroke, trauma, Inflammation Phases, and hemorrhage cases.

***Ubichinon compositum*:** Provides mitochondrial support and detoxification, and supports improved energy mechanics.

***Vertigoheel*:** Highly effective agent that is useful for vertigo of many differing causations. Major remedy for vertigo/dizziness that apparently treats microvascular circulation (Klopp, Niemer, Weiser 2005). Commonly used in human medicine for senile vertigo (Issing, Klein, Weiser 2005). Contains an array of vertigo-specific therapeutics, most notably *Ambra grisea*, a remedy for nervous symptoms of a predominantly chronic nature such as nervous weakness of vision and hearing, vertigo, weakness of memory, deterioration of brain function, and senility with general mental prostration. *Cocculus* is for vertigo, which occurs on traveling, and Meniere's syndrome with migraine-like symptoms and nausea and vomiting. *Conium* treats rotary vertigo, and *petroleum* treats vertigo, often with nausea, heaviness, swimming in the head, and

tinnitus associated with dull, drawing headaches (Reckeweg 2002).

***Viscum compositum*:** Useful for sudden attacks of vertigo and precancerous and Dedifferentiation Phase diseases. Supports intracellular regulation via *cAMP*. It is also a useful geriatric medication (Reckeweg 2000).

***Ypsiloheel*:** Thuja occidentalis is a constitutional remedy used for many purposes, including proliferative processes and hemorrhagic stroke of the left frontal lobe. Used to assist in regaining cranial autoregulation. Also useful in many centrally mediated conditions as an intermittent remedy (Reckeweg 2000).

Authors' suggested protocols

Nutrition

Ear support formula: 1 tablet for each 25 pounds of body weight BID.

Immune support formula: One-half tablet for each 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID.) **Alternative:** Moducare—follow manufacturer's directions.

Vitamin B₁ (thiamine): Cats—25 mgs SID; dogs—25 mgs for each 35 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Formula Vestibular Disease: 1 capsule per 10 to 20 pounds twice daily as needed. In addition to the herbs cited above, Vestibular Disease contains alisma (Ze xie), bamboo shavings (Zhu ru), codonopsis (Dang shen), haliotis (Shi jue ming), pinellia (Ban xia), and uncaria (Gou teng). These herbs increase the efficacy of the formula.

Recommended acupuncture points include GV20, PC6, ST36, SP6, and SI9 (Handbook of TCM practitioners 1987).

Homotoxicology (dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Also see protocols for individual diseases such as otitis, neoplasia, meningitis/encephalitis, GME, etc.

Embollic stroke: Vertigoheel orally TID. Carbo compositum, a wonderful remedy that is no longer available, given initially by injection or orally. Consider Strophanthus compositum as an alternative, especially if known cardiac issues exist. Arnica-Heel alternated with Traumeel, given orally every 30 to 60 minutes for 5 hours, then TID for 3 days and BID for 2 days. Cerebrum compositum alternated with Cor compositum every week.

Hemorrhagic stroke: Vertigoheel, Cinnamomum homaccord (if available; as an alternative consider BHI-Bleeding and/or Strophanthus compositum), and Phosphor homaccord mixed together and given orally TID. Hamamelis homaccord is an intermediate remedy given during early phases of hemorrhage. Cerebrum compositum given twice weekly in recovery phases.

Idiopathic vestibular syndrome: Vertigoheel TID orally. Aesculus compositum twice daily. Barijodeel and/or Ginseng compositum, twice daily, may be useful in refractory cases, particularly in aged animals with circulatory deficits.

Deep detoxification in cases that are right of the biological divide: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum mixed together and given orally twice per week, alternating with Cerebrum compositum and Placenta compositum twice weekly.

SECTION 3

Integrative Therapy Protocols for Infectious Diseases

Integrative Therapy Protocols for Infectious Diseases

CANINE CORONAVIRUS DIARRHEA

Definition and cause

Coronavirus diarrhea in puppies is similar to parvovirus; however, death from the disease is not as prevalent. The disease is characterized by severe inflammation in the intestines, leading to persistent diarrhea and dehydration. Vomiting is generally not associated with coronavirus enteritis. The disease is passed from infected animals by contact with the stool. Vaccination for coronavirus generally prevents the disease (Carmichael 2005; Decaro 2004; Ettinger 1995; Pratelli 2001, 2005).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

There is no specific treatment for the virus. Supportive care of antibiotics, antidiarrheal medication, and fluid therapy is indicated. The diarrhea generally lasts 2 to 3 weeks, unless the puppy has other complicating diseases such as parvovirus.

Anticipated prognosis

If the virus is detected early and is not complicated by other disease, the chance of complete resolution is above 90%.

Integrative veterinary therapies

Although the intestines are the target tissue of coronavirus infection, the organs of the immune system are also compromised, allowing the virus to propagate. An integrative approach takes into consideration the intestines and control of diarrhea as well as general immune system support. The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-protective and regenerative effects on the intestines and immune system organs helps to control symptoms as well as speed recovery.

Nutrition

General considerations/rationale

Therapeutic nutrition takes into consideration support and protection of the gastrointestinal tract, the immune system, and the viral-induced inflammation and tissue destruction. The nutritional approach is multifaceted and consists of reducing intestinal inflammation, supporting the intestines and immune system organs (thymus, adrenal, bone marrow) with nutrients, and enhancing the elimination of metabolic wastes and toxins.

Appropriate nutrients

Nutrition/gland therapy: Glandular adrenal, thymus, bone marrow, and intestines help to neutralize viral-induced inflammation and protect the intestines and organs of the immune system (see Gland Therapy in Chapter 2).

Note: Because coronavirus disease and the associated diarrhea can be serious in puppies, it is recommended that blood be analyzed both medically and physiologically to determine organ involvement and disease. This can help the clinician specifically formulate nutritional support based upon the animal's individual needs (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Sterols and sterolins: Animal studies have demonstrated that phytosterols have anti-inflammatory and antipyretic effects (Gupta 1980). Pegel (1997) feels that sterols are essential for a properly functioning immune system. In studies on cats with FIV, sterols are believed to have an immune-modulating effect and help to maintain proper lymphocyte levels (Bouic 1997). While the sterols have no direct antiviral properties, the balancing and stimulation of the immune system is enough to control the spread and effects of the virus.

N,N-Dimethylglycine (DMG): DMG has been shown to support immune function and improve toxin removal (Verdova 1965). DMG has immune modulating ability and has been clinically proven to increase both tumor necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988).

Vitamin C: Vitamin C has been clinically proven to be a potent antioxidant and immune-enhancing agent specifically against infectious agents (Pauling 1976). Vitamin C in large doses may help puppies with coronavirus, but no controlled studies exist. Preservative-free vitamin C should be used if this is part of the treatment plan.

Glutamine: Glutamine can enhance immune function, is beneficial for the intestinal tract, and can help improve cellular integrity as well as permeability (Souba 1985, Windmueller 1982, Yoshimura 1993).

Chinese herbal medicine

General considerations/rationale

According to TCM, this type of diarrhea is caused by Heat, Dampness, and toxins in the Blood.

Author's interpretation

Heat refers to Blood in the diarrhea and Dampness refers to any pus. The toxins translate into the viral or secondary bacterial particles in modern terminology.

Appropriate Chinese herbs

Ash bark (Qin pi): Had an 80% success rate in treating people with bacterial dysentery (Zhong Yao Xue 1998).

Coptis root (Huang lian): Caused marked improvement in all participants in a study of 100 people with acute gastroenteritis (Si Chuan Yi Xue Yuan Xue Bao 1995).

Phellodendron bark (Huang bai): Has been used for chronic bacterial diarrhea (Zhong Yi Za Zhi 1959).

Homotoxicology

General considerations/rationale

Canine coronavirus, like all viral infections, initially constitutes an Impregnation Phase disorder that can rapidly lead to a Degeneration Phase condition. Young puppies without proper maternal or vaccinal protection are most likely to be infected with coronavirus. Most infections are minor and, therefore, coronavirus is not included in the recommended core vaccinations for canine patients.

Standard medical therapy consists of supportive aggressive fluid and electrolyte therapy, antibiotics, and antiemetics when needed for patient comfort. Antiemetics have been associated with prolonged hospitalizations in canine parvovirus enteritis and their use should be carefully considered before they are administered (Mantione 2005). Biological therapeutic theory considers vomiting and diarrhea as effective methods for the elimination of excess viral particles and other homotoxins.

Use of antihomotoxic medications can assist these patients in recovering and can help handle signs which may occur from latent healing, which manifests as regressive vicariation.

Appropriate homotoxicology formulas

See also Canine Parvovirus.

BHI-Bleeding: Treats severe intestinal hemorrhage.

Cactus compositum: Used for coronary insufficiency, endocarditis, and myocarditis, and for improved circulation in febrile or septic conditions.

Coenzyme compositum: Provides metabolic assistance.

Cor compositum: Provides cardiac support after injury.

Cralonin: Supports cardiac function.

Diarrheel: Used as a symptomatic agent for profound diarrhea. Not used in most cases.

Duodenoheel: Treats vomiting later in the course as the virus damages the duodenum and lower gastrointestinal tract. Use when the patient does not respond to *Gastricumheel*.

Echinacea compositum: Effective against bacterial invasion.

Engystol N: Stimulates white blood cell activity through Vincetoxicum. This remedy is commonly used in viral infections to activate the host immune response. It is not specifically antiviral.

Gastricumheel: Used in cases of vomiting early in infection, especially when *Veratrum homaccord* has not been successful.

Mercurius Heel: Has antiviral and antibacterial effects in diarrhea.

Mucosa compositum: Helps the bowel to heal following trauma and Degeneration Phase disorders. Helps with leaky gut and may reduce sensitization to food items that can occur following parvovirus infection.

Nux vomica homaccord: Used for intestinal complaints.

Podophyllum compositum: Treats gushing diarrhea with jelly-like mucus, colicky pain, and vomiting.

Tanacet-Heel: Used for concurrent worm infestations and collateral damage to the GI system.

Tonsilla compositum: Provides immune support in Impregnation and Degeneration phase conditions. Supports the spleen and bone marrow.

Ubichinon compositum: Provides mitochondrial resuscitation following antibiotics, and is used as a phase remedy in Degeneration Phase homotoxicoses.

Veratrum homaccord: Indicated for bloody vomitus, rapid depression, collapse, and shock.

Vomitushell: Treats vomiting.

Authors' suggested protocols

Nutrition

Immune and intestinal/IBD support formulas: 1 tablet for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight daily.

Vitamin C: 100 mgs per 10 pounds of body weight BID. Care should be taken because oral vitamin C may cause diarrhea in some animals and a lower dose adjustment may be required.

Chinese herbal medicine

The patent formula, Bai Tou Weng Tang, contains pulsatilla (Bai tou weng), phellodenron bark (Huang bai), coptis root (Huang lian), and ash bark (Qin pi). This formula has strong antibacterial, antiviral, and antiparasitic effects. It also helps to control diarrhea and abdominal pain. It is dosed according to the label on the bottle.

Homotoxicology (Dose: 10 drops PO for 50-pound dog, 5 drops PO for small dog)

Broadfoot routinely uses the following approach on initial presentation: Nux vomica homaccord as an IV, then Engystol N, Coenzyme compositum, and Gripp-Heel, plus Aconitum homaccord or Traumeel as an auto-sanguis on presentation (especially for desperately ill puppies).

Symptom formula: Veratrum homaccord, Engystol N, Echinacea homaccord, Mercurius-Heel, Cactus compositum, Cralonin 6 to 8 times daily as needed, then tapered to TID.

Detoxification and repair following improvement: Galium-Heel, Mucosa compositum, Coenzyme compositum, Ubichinon compositum every 3 days for 2 to 3 weeks.

CANINE DISTEMPER

Definition and cause

Canine distemper (CDV), which is caused by a morbillivirus, is a contagious disease that affects the GI, respiratory, and central nervous systems. Canine distemper often causes signs such as fever, anorexia, weakness, and debilitation. While vaccination can cause high antibody titers, the vaccine can sometimes incite the disease (Durchfeld 1990, Montali 1983, Spencer 1992).

Often distemper begins as an upper respiratory infection resulting in sneezing, coughing, a thick yellowish ocular and nasal discharge, high fever, and intractable diarrhea. Left untreated, the disease can progress to encephalitis, head-tilt, circling, paralysis, convulsions, and finally, death. Most veterinarians recommend euthanasia when distemper manifests in the nervous system, but recovery is sometimes possible. Animals with a strong immune system often remain subclinical and survive (Appel 1987, 1999; Greene 1998; Spencer 1982).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy is symptom-oriented, such as antibiotics for secondary infections, fluid therapy, ocular ointments, anti-diarrheal, and anti-convulsive medications such as phenobarbital. Dietary recommendations are usually to feed whatever the dog will eat, and bland diets to address the diarrhea. Antiviral drugs have been reported to be ineffective (Appel 1999; Green 1987, 1998).

Anticipated prognosis

With good support medical care, the prognosis for an animal with an active, noncompromised immune system is generally 50%. Because this disease is so severe, vaccination is recommended for all dogs at least once after 12 weeks of age. Yearly boosters are not indicated for most dogs, and continuing immunity can be monitored by blood titers (Palmquist 2003). Many dogs

obtain lifelong protection from one such vaccination (Durchfeld 1990, Montali 1983, Spencer 1992, van Heerden 1980).

Dogs infected with this virus depend on their own immunocompetence and require intense clinical support to survive the disease cycle. Many survivors have marked physical damage resulting from cellular damage. With proper therapy a large number of such dogs may survive, but clients need to be advised of the possibility of death, and more importantly of the frequency of other issues (seizures, visual disturbances, dermatological syndromes, tonic tics, possible mentation changes, and general debility). Recovery is a protracted, labor-intensive process that not all clients or veterinarians are willing to undertake (Appel 1999, Green 1998).

Integrative veterinary therapies

Because conventional treatment offers few options except for supportive care, the addition of integrative modalities often improves the treatment success. This is primarily due to the nourishment of the body as well as the help in maintaining immune competence. In many instances the addition of therapeutic nutritional support as well as appropriate selected herbal and biological remedies help control the symptoms and the spread of the viral infection.

Nutrition**General considerations/rationale**

The addition of therapeutic nutrition takes into consideration the immune system, the viral-induced inflammation, and the destruction of tissue, as well as the overwhelmed immune system.

The nutritional approach is often multifaceted and consists of nutrient support of the brain, thymus, adrenal, bone marrow, and upper respiratory system, enhancement of toxin elimination, and general support of the immune system.

Appropriate nutrients

Nutrition/gland therapy: Glandular adrenal, thymus, bone marrow, lung, intestines, and brain help to neutralize viral-induced inflammation, spare the involved organs, and nourish a compromised immune system (see Chapter 2, Gland Therapy, for additional information).

Note: Because canine distemper is a serious systemic disease, it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease. This can help clinicians specifically formulate nutritional support based upon the animal's individual needs (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Sterols and sterolins: Animal studies have demonstrated that phytosterols have anti-inflammatory and antipyretic effects (Gupta 1980). Pegel (1997) feels that sterols are essential for a properly functioning immune system. In studies on cats with FIV, sterols are believed to have an immune-modulating effect and help to maintain proper lymphocyte levels (Bouic 1997). Treated cats showed a 20% mortality rate as compared to the nontreated cats (mortality rate of 75%). It was further reported that there were no deaths in these cats 3 years following treatment with the sterols. While the sterols have no direct antiviral properties, the balancing and stimulation of the immune system is enough to control the spread and effects of the virus.

N,N-Dimethylglycine (DMG): DMG has been shown to support immune function and improve toxin removal (Verdova 1965). DMG has immune-modulating ability and has been clinically proven to increase both tumor necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988).

Maitake mushrooms: Studies with maitake mushrooms have shown that they help enhance immune function and the ability to handle stressful conditions. They also help organ systems maintain balance and homeostasis (Nanba 1987).

Chinese herbal medicine

General considerations/rationale

Canine distemper is an external infectious pathogen. It is considered to be a febrile disease, mainly external Heat, Wind, and Toxins.

The external pathogenic factors that TCM alludes to are the canine distemper virus itself and any secondary bacterial invaders. The Heat is, of course, the inflammation, which is manifested as fever and purulent discharge. The Toxins are the inflammatory mediators. Wind can refer to the seizures in neurological disease or the manner by which the disease is “blown” into the body.

Canine distemper is treated according to the presenting signs. Initially there is an inflammatory febrile disease (Heat). This accompanies the gastrointestinal or respiratory disease. Gastrointestinal inflammation is due to toxic mediators and is evidenced by vomiting and diarrhea. Respiratory tract disease is manifested as coughing and dyspnea (pneumonia). These signs are caused by inflammation in the Lungs. Treatment is aimed at stopping the infection and secondary (bacterial) invaders. In addition, the specific signs such as coughing, seizures, vomiting, and diarrhea are addressed.

Appropriate Chinese herbs for pulmonary manifestations

Anemarrhena (Zhi mu): Has antibiotic effects (Yao Xue Qing Bao Tong Xun 1987).

Apricot seed (Xing ren): Promotes the phagocytic activity of Kupffer's cells and tracheal, bronchial, and lung alveoli macrophages in mice (Li 1991). It helps to clear phlegm and relieve cough (Zhang Wen Juan 1991).

Citrus (Chen pi): An effective expectorant (Huang Min 1999).

Fritillaria bulb (Bei mu): Helps decrease coughing (Zhu an Ni 1992) and has expectorant effects (Yao 1993, Li 1993).

Houttuynia (Yu xing cao): Has been used to treat humans with pneumonia with excellent results (Zhong Hua Nei Ke Za Zhi 1963).

Licorice (Gan cao): Decreases coughing and has expectorant effects (Zhong Yao Yao Li Yu Ying Yong 1983). It has been shown to inhibit the proliferation of several types of viruses and bacteria in vitro (Zhu 1996, Zhong Yao Zhi 1993).

Morus bark (Sang bai pi): Stops coughing (Zhong Yao Xue 1998).

Mulberry leaves (Sang ye): Has demonstrated antibacterial activity against several types of bacteria (Zhong Yao Yao Li Yu Ying Yong 1983).

Ophiopogon (Mai men dong): Enhances mucociliary transport velocity in quails and decreases respiratory tract mucus secretion (Tai 2002). It has antibacterial activity against several species of bacteria (Zhong Yao Xue 1998).

Pseudotellaria root (Tai zi shen): Has been used to treat pneumonia in children (Zhong Yao Lin Zheng Ying Yong 1980).

Poria (Fu ling): Enhances immunity. It increases the phagocytic abilities of macrophages (Lu 1990). It has antibiotic action against several types of bacteria (Zhong Yao Cai 1985).

Rhubarb (Da huang): Has been shown to be very effective against various bacteria and viruses (Zhao Man Jing 1999, Yang Shu Zhi 1997, Xie Yan Ying 1996). It has a protective effect on lung tissue. It has been shown to decrease lung damages caused by the excessive secretion of TNF- α , IL-1, and IL-6 (Miao 1998).

Trichosanthes (Tian hua feng): Has been shown to inhibit the growth of multiple bacteria and viruses (Zhong Yao Yao Li Yu Ying Yong 1983).

Appropriate Chinese herbs for gastrointestinal disease

Ash bark (Qin pi): An effective antibacterial herb (Zhong Yao Xue 1998).

Coptis (Huang lian): Has been used to stop vomiting induced by copper sulfate in a pigeon (Qin Cai Ling 1994). It also has antidiarrheal effects (Zhong Yao Xue 1998).

Pulsatilla root (Bai tou weng): Has activity against various bacteria (CA, 1948).

Appropriate Chinese herbs for neurological manifestations

Centipede (Wu gong): Has strong antiseizure effects. It has been shown to be effective in controlling seizures caused by various drugs (Zhong Yao Xue 1998).

Forsythia (Lian qiao): Has been demonstrated to have antiviral effects (Zhang 2002).

Grass-leaf sweet-flag root (Shi chang pu): Has demonstrated both sedative and antiseizure effects (Zhong Yao Xue 1998). One of the components of grass-leaf sweet-flag root, alpha-asarone, demonstrated an efficacy of approximately 85% in treating seizures in a group of 90 people (Yao Xue Tong Bao 1982).

Licorice (Gan cao): Helps to deal with the viral etiology of the neurological disease. Glycyrrhizin, an active component of licorice, has been shown to inhibit the proliferation of several viruses in vitro (Zhu 1996).

Red peony (Chi shao): One of the major active components of Chi shao, paeoniflorin, has demonstrated anticonvulsive and sedative effects in animals (Zhong Yao Xue 1998).

Scorpion (Quan xie): Has demonstrated usefulness in treating seizure disorders in several experiments and clinical studies. Seizures in mice induced by caffeine or megimide were controlled by scorpion (Shen Yang Yi Xue Yuan Xue Bao 1988). In rats with experimentally induced seizures, scorpion decreased the severity, duration, and recurrence rate of seizures (Shen Yang Yi Xue Yuan Xue Bao 1989). Seventy-five percent of humans with epilepsy had very good response when treated with scorpion, while another 16% had moderate response (Si Chuan Zhong Yi 1991).

Silkworm (Jiang can): Has been shown in multiple experiments to have antiseizure activity. It has been proven effective at decreasing seizure activity in mice with experimentally induced seizures (Zhong Cao Yao Xue 1980). In addition, it has synergistic effects with phenobarbital (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Uncaria (Gou teng): Has been proven to prevent seizures in animals (Hsieh 1999). In mice, one compound isolated from uncaria was shown to decrease spontaneous central nervous system activity, act synergistically with phenobarbital to enhance phenobarbital's sedative effect, and increase the content of 5-HT in the hypothalamus and the amygdaloid nucleus (Shi 1993).

Homotoxicology

General considerations/rationale

All viral infections constitute Impregnation Phase homotoxicoses in their initial stages. Canine distemper is a particularly vicious viral infection that quickly progresses to a Degeneration Phase disorder. Due to the author's practice location in an inner city area near a dog shelter,

this disease is seen more frequently than in many U.S. veterinary practices, and many clients opt for treatment. Two of the employees in our practice have pets that have survived neurological canine distemper virus infection (Palmquist 2002).

Regressive vicariation is the goal in these cases. It is vital to understand that many symptoms and signs are actually the body's attempt to remove homotoxins—including impregnated viral particles—and these efforts need to be supported and not suppressed if a full recovery is to occur. Patients often suffer severe excretory or inflammatory dermatitis, gastroenteritis, and even urogenital inflammation (straining and discharge of mucus) during recovery. These signs can easily be missed and mistakenly treated with drugs that can cause progressive vicariation and worsening of the condition because they frequently occur several weeks to months after the primary clinical syndrome. Steroid medications should be avoided. Mild tics and seizures may be best handled homeopathically with reservation of anticonvulsants for only the most life-threatening manifestations.

A final word is in order regarding an antidistemper serum used by Alson Sears, DVM, of Lancaster, California. One of the authors worked with Dr. Sears in the early 1980s and has personally witnessed many cases of canine distemper that were treated with Dr. Sears' antidistemper serum. There appears to be strong correlation between this serum and survival in naturally infected dogs. Parties interested in this serum and its method of production can visit the web site and learn more about the serum's method of production and utilization. It should be noted that this product must be applied early in the viral infection (first 4 days) to be effective (Sears 1999). Because this product requires handling and caring for live donor dogs, which may experience anaphylaxis during serum production, it is hoped that one day the serum will be commercially available from a blood laboratory or pharmaceutical company with an interest in helping these dogs.

Appropriate homotoxicology formulas

These cases may involve multiple systems, and as such, the practitioner must be able to monitor the entire case for current physical manifestations. Outpatient treatment is desirable in most cases. Therapeutic plans may need to be varied suddenly. See also protocols for epilepsy, dermatitis, pneumonia, bronchitis, and diarrhea for further recommendations. The authors treat all such cases with autosanguis therapy customized to the presenting state of the patient. Useful remedies include:

Aconitum homaccord: Treats early febrile phases. Aconitum is one of the most important homeopathic fever remedies, especially when the patient displays hot skin; great anxiety; rapid, tense pulse; strong and possibly irregular heartbeat; alternating fever and chills; possible

hyperthermia with sudden onset of symptoms; and violence of the complaints. The restlessness and anguish are always seen, as are the redness of the mucosa and the sensation of distension, heaviness, pressure, and tension in the gastrointestinal tract. Stools contain mucus and bile. There is flatulent distension with small, frequent stools, and an urging to defecate, all of which are characteristic of the remedy. Low potencies are normally given in pyrexia and organic complaints, catarrhs, neuralgic symptoms with paresthesia, hyperthermia, and encephalitis with very high temperatures (e.g., post-vaccinal encephalitis or meningo-encephalitis) (Reckeweg 2002).

Atropinum compositum: Treats seizure and spasm and gastrointestinal cramping and upset.

Arsuraneel: Used intermittently in advanced cases that seem hopeless.

Belladonna homaccord: Indicated for seizures and screaming out at night. Violent delirium is characteristic of Belladonna, above all in fever. Belladonna's typical action on the eyes is also well-known, with cramps in the muscles of the eyes and eyelids, enlargement of the pupils, and, in particular, an inflammatory or irritative condition of the conjunctiva with great photophobia, lachrymation, and pain. Belladonna is indicated in incipient boils, tonsillitis, and surface inflammations such as erysipelas, conjunctivitis, scarlet fever, otitis, cholangitis, meningitis, and other inflammatory affectations. A delirious state occurs with a violent rise in temperature. There is considerably raised sensitivity of all the senses and a disproportionate sensitivity to touch, noises, light, and cold air, especially draughts and jarring as can be the case in meningitis. Along with nasal catarrhs, there may be catarrhs of the larynx and trachea with slight mucus, accompanied by a typical dry, rough, and barking cough with hoarseness. In the digestive organs, Belladonna affects acute gastric catarrhs (Reckeweg 2002).

Cerebrum compositum: Supports and detoxifies the brain. The component Hyoscyamus is indicated for symptoms of cerebral irritation with convulsions; muscle twitching; catalepsy; epileptiform spasms; eye conditions; conjunctivitis; spasmodic nocturnal attacks of cough with expectoration of green mucus on coughing; dryness in the throat, larynx, and lungs; stomach pains; and inflammation of the gastric mucosa and intestines with retching, vomiting, colic, and diarrhea (Reckeweg 2002).

Coenzyma compositum: The component Beta vulgaris reactivates cell respiration and can regenerate blocked respiratory enzymes, and is therefore indicated in all cellular phases (Impregnation, Degeneration, and Dedifferentiation). It is also indicated in viral diseases, viral influenza, and poliomyelitis (Reckeweg 2002).

Discus compositum: Used for the spinal, meningeal, and paralytic forms of canine distemper. It contains Ranunculus bulbosus to treat rheumatic and neuralgic

symptoms. It also treats skin eruptions, particularly closely grouped crops of vesicles, coryza with a discharge of viscid mucus, and possibly ulceration of the nasal mucosa accompanied by the characteristic chest complaints with shortness of breath and a sense of constriction. These may be accompanied by gastric symptoms with purging, eructations, nausea, burning in the stomach, abdominal rumbling, and bleeding hemorrhoids. The skin eruptions are frequently present on the palms of the hands in the form of desquamating vesicular eruptions (Reckeweg 2002).

Distemper nosode: Given later to assist in recovery in all cases of known distemper. **Note:** Some advocate the use of distemper nosode to provide continuing immunity against the Distemper virus. At this time there is insufficient evidence to recommend this over routine puppy vaccination. While boosting intervals may be controversial, the authors cannot recommend Distemper nosode as an alternative option to vaccination. In the authors' opinion the use of vaccine titers is a far better way to evaluate the need for revaccination and is superior to automatic revaccination for this disease. Strong clinical evidence supports this opinion (Palmquist 2003).

Dulcamara homaccord: Symptoms are diarrhea, vomiting, colic, skin rash, convulsions, and paralysis. The complaints that indicate Dulcamara are aggravated by cold, damp weather as well as weather changes, especially in rainy weather. They are worse during hot days and cold nights. Increased mucosal secretions are also typical of Dulcamara. The nose is usually blocked as well (sinusitis), and the discharge being more copious in the warmth. The saliva is tough and soap-like. Additional indications: acute gastritis and enteritis, dysentery with violent stomach pains, colic, mucous, sour or dysenteric watery stools, pains persisting even after the stool, and associated with colic and rheumatic complaints (Reckeweg 2002).

Echinacea compositum: Stimulate host defenses, particularly against bacterial invaders. It contains many useful remedies, including Rhus toxicodendron, which is useful in a wide variety of inflammations. In the eyes there may be violent conjunctivitis with severe photophobia and a greenish-yellow, offensive nasal discharge. There may be gastroenteritis with watery, bloody, mucous stools and tenesmus; a tormenting, dry cough with bloody, purulent sputum; an eruption like measles all over the body or a vesicular eruption, and disturbances of consciousness such as occur in febrile conditions, e.g., dysentery, peritonitis, pneumonia, scarlatina, rheumatism, or diphtheria. Rhus toxicodendron is also indicated in myelitis with paresis (Reckeweg 2002).

Engystol N: Used in the early stages to improve defenses against viral infections.

Euphorbium compositum: Has antiviral properties and treats upper respiratory congestion.

Galium-Heel: Provides immune support and cellular detoxification in cellular phases. Assists in repair after survival of acute disease and damage from drugs that were administered to save the patient's life.

Gastricumeel: Treats vomiting early in the course of the disease (Heel 2003). Contains Antimonium crudum (Day 1990).

Gelsemium homaccord: Treats headache and neuralgia. Gelsemium is particularly indicated in states of paralysis, e.g., after apoplexy also in post-diphtheritic paralysis. The stools are copious and yellow, and influenzal catarrhs may be seen when there is thin, fluent nasal discharge and bloody mucus is blown out. A brief summary of symptoms includes nervous disorders, infectious diseases, paralysis, and spasmodic conditions (Reckeweg 2002). Gelsemium is common to *Echinacea compositum*.

Graphites homaccord: Treats nasal thickness and hard pad following acute phases.

Gripp-Heel: Used in early stages when upper respiratory and cold-like signs predominate. Also used for the characteristic persistent fevers. Contains Aconitum (see above).

Lymphomyosot: Provides immune support and lymph drainage. Myosotis arvensis particularly acts on the respiratory organs and the lungs. Characteristic symptoms include a cough with profuse mucopurulent expectoration, retching and vomiting while coughing, and aggravation during meals or immediately afterward.

Mucosa compositum: Supports mucous membranes throughout the body and the urogenital, respiratory, and gastrointestinal systems, especially during recovery after acute infection has waned.

Naso-Heel S: Treats nasal discharge.

Spascupreel: Treats tics, spasms, and headache.

Tonsilla compositum: Provides Impregnation Phase and Degeneration Phase support of the immune organs, particularly the spleen and bone marrow. Includes Mercurius Solubilis Hahnemanni for mucosal inflammations of the respiratory passages, the gastrointestinal tract, and the urinary and reproductive organs; skin diseases; inflammation of the tonsils, lymph glands, liver, and kidneys; inflammation of other glandular organs; ostealgia and rheumatism; enervating diseases; and cerebral angiosclerosis (Reckeweg 2002).

Ubichinon compositum: Used in Degeneration Phase disorders and after long courses of antibiotic therapy. Contains benzochinon. Another constituent, Parabenzochinon, is a powerful remedy with certain protective functions against viral infections. One should always think of parabenzochinon in almost incurable, unremitting dyspnea that may evolve into respiratory paralysis. It can also help with paresis occurring after poliomyelitis,

meningeal irritation, encephalitis or vaccinations, where there is disturbance in neuromuscular coordination (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Immune, brain/nerve, intestinal/IBD, and bronchus/lung support formulas: 1 tablet for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Chinese herbal medicine

For pulmonary manifestations, the authors recommend H23 Pneumonia at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, H23Pneumonia also contains trichosanthes seeds (Gua Luo Ren), bamboo leaves (Zhu Ye), gypsum (Shi Gao), glehnia root (Sha Shen), and perilla seeds (Su Zi) to increase the efficacy of the formula.

For viral enteritis signs, the authors use the patent formula Bai Tou Weng Tang at the dose recommended by the manufacturer. In addition to the herbs listed above, Bai Tou Weng Tang contains Phellodendron (Huang Bai).

For the manifestation of central nervous system disease, the authors recommend H90 Encephalitis at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs listed above, Encephalitis also contains bile treated arisaema (Dan Nan Xing), saussurea (Mu Xiang), orange peel (Ju Hong), pinellia (Ban Xia), curcuma root (Yu Jin), salvia (Dan Shen), lophatherum (Zhu Ye), lonicera flower (Jin Yin Hua), isatis leaves (Da Qing Ye), and gypsum (Shi Gao). The additional herbs help support the functions of the herbs mentioned above.

Homotoxicology (Dose: 10 drops PO for 50-pound dog, 5 drops PO for small dog)

The authors treat all such cases with autosanguis therapy. Consider the following protocol for early cases:

Autosanguis (Give half of this orally or by injection as allowed by law, then place the other half into a cocktail of the symptom remedy): Gripp-Heel plus Euphorbium compositum, Engystol plus Lymphomyosot, Hepar compositum plus Tonsilla compositum OR Echinacea compositum, Coenzyme compositum.

Symptom remedy: Lymphomyosot, Galium-Heel, Aconitum homaccord plus relevant current symptom remedies (See pneumonia, bronchitis, seizures, etc.), QID initially to BID (chronic use) orally.

CANINE PARVOVIRUS

Definition and cause

Caused by CPV-2 virus, canine parvovirus is characterized as a systemic disease in puppies that overwhelms the immune system and causes hemorrhagic enteritis (Carmichael 2003). Young puppies without proper maternal or vaccinal protection are the most likely to be infected with parvovirus. After the virus gains access to the alimentary canal, it rapidly infects gastrointestinal epithelial cells. Mucosa cells die after virus replication and the mucosal border becomes compromised, allowing virus particles to enter the submucosa and bloodstream. The virus gains access to the general circulation and replicates in the bone marrow and heart muscle as well. Immune suppression results as bacteria and bacterial toxins enter the systemic circulation.

Severe dehydration and electrolyte imbalance exacerbate this immune compromise in the infected puppy. In immuno-incompetent individuals this infection can progress to death, which occurs as a result of dehydration, electrolyte imbalance, secondary bacteria invasion, endotoxemia, sepsis, and systemic inflammatory response syndrome (Prittie 2004). In rare cases primary cardiac disease results from viral infection of the heart and these patients can suffer sudden death syndrome.

Properly vaccinating puppies can greatly reduce the risk of infection and is therefore recommended. Immune response is sufficient enough that most dogs establish sterile immunity as a result of vaccination. Certain breeds, however, such as Rottweilers and Doberman pinschers, may have an altered genetic ability to defend against this

virus, and they may respond later or not at all to vaccination. Vaccination protection for most dogs is long term, and may last 3 to 10 years or longer in individual dogs; however, antibody levels may fall. In one author's practice fewer than 1% of dogs lose their protective vaccine titers in less than 2 years (Palmquist 2005).

In another study surveying vaccine practices, no clinical cases of parvovirus were reported in U.S. clinics that properly vaccinated puppies and then boosted immunity only as indicated by annual vaccine titers (Palmquist 2003, Twark 2000).

Twark and Dodds (2000) have reported similar data regarding immunity with 93.7% of dogs surveyed holding adequate vaccine titers for more than 2 years. Surviving natural infection generally gives long-term (potentially lifetime) immunity.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Standard medical therapy consists of supportive aggressive fluid and electrolyte therapy, antibiotics, and antiemetics as needed for patient comfort. Antiemetics have been associated with prolonged hospitalizations in this condition and their use should be carefully considered before they are administered (Carmichael 2003, Mantione, 2005).

Parasites can increase mortality, so treatment with antiparasitic drugs may increase survival. One author routinely gives parvovirus puppies ivermectin (where breed tolerance is acceptable) and since instituting this has observed greatly reduced mortality (Palmquist 1986).

Anticipated prognosis

Proper vaccination protocols and prompt therapy are the best for increasing survival as well as preventing parvovirus disease. Prognosis can be good with intensive medical therapy, but is guarded in severely affected animals (Carmichael 2003).

Integrative veterinary therapies

Integrative modalities often improve patient survival rates for parvovirus infection. Integrative therapies can help reduce inflammation in the target organs such as the intestines and help to control diarrhea and bleeding. In many instances, adding therapeutic nutritional support and appropriate selected herbal and biological remedies helps with the viral infection.

Nutrition

General considerations/rationale

The addition of therapeutic nutrition takes into consideration support and protection of the gastrointestinal tract,

the immune system, and the viral-induced inflammation and destruction of tissue. The nutritional approach is multifaceted and consists of reduction of intestinal inflammation, nutrient support of the intestines, thymus, adrenal, lymph, and bone marrow, and enhancement of the elimination of toxins and metabolic wastes.

Appropriate nutrients

Nutrition/gland therapy: Glandular adrenal, thymus, bone marrow, lymph, and intestines help neutralize viral-induced inflammation, spare involved organs, and nourish the glands of a compromised immune system (see Chapter 2, Gland Therapy, for additional information).

Note: Because canine parvovirus is a serious, systemic disease, it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease. This can help clinicians to specifically formulate nutritional support based upon the animal's individual needs (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Sterols and sterolins: Animal studies have demonstrated that phytosterols have anti-inflammatory and antipyretic effects (Gupta 1980). Pegel (1997) feels that sterols are essential for a properly functioning immune system. In studies on cats with FIV, sterols are believed to have an immune-modulating effect and help to maintain proper lymphocyte levels (Bouic 1997). Treated cats showed a 20% mortality rate as compared to nontreated cats' mortality rate of 75%. It was further reported that there were no deaths in these cats after a 3-year period with treatment with the sterols. While the sterols have no direct antiviral properties, the balancing and stimulation of the immune system is enough to control the spread and effects of the virus.

N,N-Dimethylglycine (DMG): DMG has been shown to support immune function and improve toxin removal (Verdova 1965). DMG has immune-modulating ability and has been clinically proven to increase both tumor necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988).

Maitake mushrooms: Studies with maitake mushrooms have shown that they help enhance immune function and the ability to handle stressful conditions while helping organ systems maintain balance and homeostasis (Nanba 1987).

Vitamin C: has been clinically proven as a potent antioxidant and immune-enhancing agent specifically against infectious agents (Pauling 1976). Vitamin C given parentally in large doses may help these puppies, but no controlled studies exist. Preservative-free vitamin C should be used if this is part of the treatment plan.

Glutamine: Glutamine is a nonessential and the most abundant amino acid present in dogs and cats. While

glutamine is readily available in food and can be manufactured by the body, it has been discovered that during chronic periods of stress or disease, glutamine levels become depleted, negatively impacting health (O'Dwyer 1989). It is during these times of stress that glutamine becomes so important. It has also been shown that both low intracellular and plasma levels of glutamine can have adverse health consequences (Askanazi 1980, Souba 1992).

Besides improving immune function, glutamine is beneficial for the intestinal tract and can improve cellular integrity as well as permeability. This is especially important in immune-mediated disease conditions such as inflammatory bowel disease (Souba 1985, Windmueller 1982, Yoshimura 1993).

Chinese herbal medicine

General considerations/rationale

According to TCM, this type of diarrhea is caused by Heat, Dampness, and Toxins in the Blood. Heat refers to Blood in the diarrhea and Dampness to any pus. The toxins translate into the viral particles in modern terminology.

Appropriate Chinese herbs

Ash bark (Qin pi): Had an 80% success rate in treating people with bacterial dysentery (Zhong Yao Xue 1998).

Coptis root (Huang lian): Caused marked improvement in all participants in a study of 100 people with acute gastroenteritis (Si Chuan Yi Xue Yuan Xue Bao 1959).

Phellodendron bark (Huang bai): Has been used for chronic bacterial diarrhea (Zhong Yi Za Zhi 1959).

Homotoxicology

General considerations/rationale

Canine parvovirus, like all viral infections, initially constitutes an Impregnation Phase disorder that can rapidly lead to a Degeneration Phase condition. Parvovirus can cause vasculitis that negates the protective mechanisms of the blood-brain barrier, as well as concurrent infection with other viruses, particularly the canine distemper virus which can yield encephalitis. Such infections carry guarded prognoses and may cause increased medical problems later in life in dogs that survive. Once clinically recovered, puppies can shed parvovirus from the stool for several weeks. It is rare to see clinical cases in dogs older than 3 to 4 months. Another syndrome deserves mention here: accidental ingestion of modified live vaccine particles may cause gastrointestinal disease.

Biological therapeutic theory considers vomiting and diarrhea as effective methods for eliminating excess viral particles and other homotoxins. Many veterinarians are surprised to learn that antiemetics, which are considered a standard of care for parvovirus emesis, actually have

not been studied adequately to recommend their use in this situation. Intestinal stasis from ileus is quite common and allows for much greater absorption of homotoxins from dead cells as well as bacterial toxins.

Antibiotics can increase endotoxin levels: as intestinal bacterial masses perish and release endotoxins, they may contribute to the pathogenesis of systemic inflammatory response syndrome. Use of aggressive fluid and colloidal fluids and even enemas with electrolyte solution can assist some severely ill puppies by reducing homotoxin levels and promoting gastrointestinal motility. Many puppies become quite ill from ileus and a rapid improvement in their condition usually follows a large passing of toxic, malodorous stool as the bowel repairs and normal peristalsis returns.

Drugs that decrease intestinal motility should be strictly avoided because they aggravate this ileus condition. Prokinetic drugs may be associated with increased risk of intussusception. Parasites can increase mortality and treatment with antipruritic drugs may increase survival.

Patients that survive parvovirus can undergo regressive vicariation immediately following infection, or they can rest physiologically and then have regressive vicariation at some future date. The clinician should be aware of the illness history for any patient undergoing biological therapy, so such regressive vicariations are recognized and treated biologically if possible. Use of antihomotoxic medications can help these patients to recover and can help handle signs which may occur from latent healing which manifests as regressive vicariation.

Appropriate homotoxicology formulas

BHI-Bleeding: Treats severe intestinal hemorrhage.

Cactus compositum: Used for coronary insufficiency, endocarditis, and myocarditis, and to improve circulation in febrile or septic conditions.

Coenzyme compositum: Provides metabolic assistance. Particularly useful in conjunction with *Engystol* to support mitochondrial function in viral diseases.

Cor compositum: Excellent for cardiac support in cases of collapse. Contains Carbo for shocky states, weakness, and collapse, as well as blood support.

Cor compositum: Provides cardiac support after injury.

Cralonin: Supports cardiac function.

Diarrheel: Used for profound diarrhea as a symptomatic agent. Not used in most cases.

Duodenoheel: Treats vomiting later in the course as the virus damages the duodenum and lower gastrointestinal tract. Used when the patient does not respond to *Gastricumel*.

Echinacea compositum: Used against bacterial invasion.

Engystol N: Stimulates white blood cell activity through Vincetoxicum. This remedy is commonly used in viral infections to activate the host immune response. It is not specifically antiviral.

Gastricumheel: Used in cases of vomiting early in infection, especially when *Veratrum homaccord* has not been successful.

Mercurius-Heel: Treats ulcerative, erosive colitis. Has antibacterial activity, as compared to Vancomycin (Vestweber, et al. 1995).

Mucosa compositum: Helps the bowel to heal following trauma and Degeneration Phase disorders. Helps with leaky gut and may reduce sensitization to food items that can occur following parvovirus infection.

Nux vomica homaccord: Treats intestinal complaints.

Podophyllum compositum: Treats colitis. Contains mercurius.

Tanacet-Heel: Used for dysentery, nervous irritation during removal of nematodes, and gastrointestinal spasms associated with parasite removal.

Tonsilla compositum: Provides immune support in Impregnation and Degeneration phase conditions. Supports the spleen and bone marrow.

Ubichinon compositum: Provides mitochondrial resuscitation following antibiotics and is used as a phase remedy in Degeneration Phase homotoxicoses.

Veratrum homaccord: Indicated for bloody vomitus, rapid depression, collapse, and shock.

Authors' suggested protocols

Nutrition

Intestine and immune support formulas: 1 tablet for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight daily.

Vitamin C: 100 mgs per 10 pounds of body weight BID. Care should be taken because oral vitamin C may cause diarrhea in some animals and a lower dose adjustment may be required (see Chapter 2 for more information on the therapeutic use of vitamin C given intravenously).

Chinese herbal medicine

The authors recommend the patent formula Bai Tou Weng Tang, which contains pulsatilla (Bai tou weng), phellodendron bark (Huang bai), coptis root (Huang lian), and ash bark (Qin pi). This formula has strong antibacterial, antiviral, and antiparasitic effects. It also helps to control diarrhea and abdominal pain. It is available

through many herbal companies. It is dosed according to the label on the bottle.

Homotoxicology (Dose: 10 drops PO for 50-pound dog, 5 drops PO for small dog)

Symptom formula: Veratrum homaccord, Engystol N plus Coenzyme compositum, Echinacea homaccord, Cactus compositum, Cralonin, Podophyllum compositum, Mercurius-Heel, 6 to 8 times daily as needed, and then tapered to TID.

Detoxification following improvement: Galium-Heel, Mucosa compositum, Coenzyme compositum, Ubichinon compositum every 3 days for 2 to 3 weeks.

INFECTIOUS HEPATITIS

Definition and cause

Canine infectious hepatitis is caused by an adenovirus (canine adenovirus type 1; CAV-1), which initially attacks specialized hepatic macrophages (Kupffer cells) that distribute the infection widely. Endothelial cells are also actively infected and this combination leads to massive viral release and damage to hepatocytes. The virus also targets other parenchymal organs and ocular tissues (resulting in classic anterior uveitis lesions known as “blue eye”) (Center 2003, Greene 1998, Hoskins 2000, Swango 1989, Webster 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy is supportive and includes fluid replacement plus dextrose, oral alimentation with a highly bio-

available diet, potassium supplementation, antimicrobial therapy, and antiemetics (Center 2003, Greene 1998, Hoskin 2000).

Anticipated prognosis

The prognosis is generally poor to guarded. Recovery is possible with a good antibody response against the virus; however, the animals can develop chronic liver conditions (Webster 2003).

Integrative veterinary therapies

Vaccination is recommended and is highly effective in preventing canine infectious hepatitis. The duration of immunity for canine adenovirus vaccination is not known; however, in the authors' practices no clinical cases have been seen in dogs that have received proper vaccination schedules as puppies, indicating that revaccination may not be required. At this time insufficient evidence exists to recommend nosodes for canine adenovirus type 1.

The integrative approach to infectious hepatitis focuses upon the inflammatory process and cellular destruction in the liver as well as the general immune function in relation to the viral infection. The addition of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, cellular, and organ-sparing properties may enhance liver cell regeneration. Immune system organs such as the thymus, adrenal, and spleen should also be supported and protected.

Nutrition

General considerations/rationale

Improving immune function against the virus, reducing inflammation, and eliminating toxins and metabolic wastes—along with appropriate medical therapy—can improve the prognosis. Glutathione binds and neutralizes various chemicals, toxins, herbicides, pesticides, heavy metals, etc. so they can pass through the liver and be excreted via the bile into the intestines or passed to the kidneys to be excreted in the urine (Sen 1997). Body glutathione levels can be raised by other nutrients such as vitamin C, whey protein, glutamine, methionine, S-adenosyl-L-methionine (S-AdoMet), and alpha-lipoic acid (Amores-Sanchez 1999, Bounous 1989, Vendemia 1989, Wang 1997). See chronic active hepatitis and cholangiohepatitis for more detailed information.

Antioxidants and phytonutrients can help reduce inflammation and neutralize compounds that the liver must deal with in its role as the body's filter and detoxifier.

Appropriate nutrients

Nutrition/gland therapy: Glandular liver helps to neutralize a cellular immune response and helps spare liver cells (see Gland Therapy in Chapter 2). Clinical trials using

thymus extract have shown that it is beneficial in people with hepatitis B (Skotnicki 1989). Additional clinical studies with oral thymus extract showed that blood values related to liver function as well as the blood immune markers all improved (Galli 1985, Bortolotti 1988). Civeira (1989) showed similar results with hepatitis C.

Note: Infectious hepatitis can affect multiple organ systems, and therefore medical and physiological blood evaluations are recommended to assess general glandular health. This helps clinicians to formulate therapeutic nutritional protocols that address gland function and organ disease that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Lecithin/phosphatidylcholine: Lecithin/phosphatidylcholine has been shown to help prevent scar tissue from forming in inflammatory processes of the liver (Ma 1996).

Alpha-lipoic acid: Alpha-lipoic acid is an antioxidant that has been shown to reduce oxidation and inflammation. It increases the effectiveness of other antioxidants, such as vitamins C and E, Coenzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Lykkesfeldt 1998, Scholich 1989). In a study with people with liver disease who received an antioxidant-rich supplement containing 300 mg of alpha-lipoic acid, there was significant improvement of liver function (Berkson 1999).

S-adenosylmethionine (S-AdoMet): S-AdoMet is an antioxidant and has anti-inflammatory effects on the liver (Center 2000). S-AdoMet has been shown to significantly improve survival and decrease the need for liver transplantation in people with liver disease. It has also been shown to improve liver function in less severe cases of cirrhosis (Gorbakov 1998, Mato 1999, Miglio 1975).

Vitamin B₁₂ and folic acid: Vitamin B₁₂ and folic acid have been shown to help people with hepatitis (Campbell 1952, 1955; Wallace 2001).

Chinese herbal medicine/acupuncture

General considerations/rationale

Infectious hepatitis is usually due to either Damp or Heat invading the Liver and Gallbladder, or infectious pathogens. This leads to Qi and Blood stagnation.

Infectious pathogens are of course any bacteria, virus, or fungus that attacks the liver or gallbladder. In the present case we are discussing canine adenovirus I. Damp and Heat can refer to inflammation and purulent debris. Qi and Blood stagnation refer to the abdominal pain that the patient experiences.

Appropriate Chinese herbs

Alisma (Ze xie): Enhances immunity and has anti-inflammatory effects (Dai 1991). It may decrease inflammation in the liver while avoiding immunosuppression.

Atractylodes (Bai zhu): Has been used for ascites from cirrhosis, infectious hepatitis, and cancer with good results (An Hui Zhong Yi Xue Yuan Xue Bao 1984). Although ascites is not commonly seen in CAV-I, it does indicate that this herb has a protective effect on the liver.

Cinnamon twigs (Gui zhi): Have shown antiviral effects against coxsackie virus B-1 and influenza (Zhong Yao Xue 1998; Chu 1998). It may have efficacy against other viruses, although more studies must be completed.

Crataegus (Shan zha): Enhances immunity. It seems to stimulate both the cellular and humoral immune system (Jin 1992). It also helps to control nausea (Zhong Xi Yi Jie He Za Zhi 1984).

Ginger (Gan jiang): Has been shown to decrease experimentally induced vomiting in dogs (Zhong Yao Xue 1998). It may help decrease vomiting in infectious hepatitis.

Licorice (Gan cao): Contains glycyrrhizin, which has demonstrated antiviral activity against multiple viruses, including human adenovirus II (Zhu 1996). It was 77% effective in treating 330 human patients with hepatitis B. It reduced inflammation, increased regeneration of hepatic cells, and decreased hepatic necrosis and cirrhosis (Zhong Yao Tong Bao 1987).

Malt (Mai ya): Has been used in patients with hepatitis. Symptoms improved in 85% of the cases of acute hepatitis and 57% of the cases of chronic hepatitis. Positive effects were defined as improved appetite, decreased pain, and decreased serum liver enzymes (Xin Yi Yao Tong Xun 1972).

Oriental wormwood (Yin chen hao): Reduces fevers. In rats with experimentally induced pyrexia, the duration of effect was 3 to 4 hours (Planta Med 1984). It has been shown to enhance phagocytosis in liver macrophages (Hu 1999). In one trial, 32 people with acute hepatitis were treated with yin chen hao for up to 2 weeks. In these patients, there was a significant decrease in hepatomegaly, icterus, and pyrexia (Fu Jian Zhong Yi Yao 1959).

Pinellia (Ban xia): Seems to have a centrally mediated antiemetic effect (Zhong Yao Yao Li Yu Ying Yong 1983). It may help control vomiting associated with infection.

Polyporus (Zhu ling): An immunostimulant (Zhong Guo Mian Yi Xue Za Zhi 1991). It also has hepatoprotective effects as demonstrated in rat experiments using CCL4 (Zhong Guo Yao Li Xue Tong Bao 1988).

Poria (Fu ling): Has hepatoprotective effects. In one experiment it protected hamster livers from carbon tetrachloride damage (Han 1977). It contains pachman, which has been shown to enhance the phagocytic function of macrophages in mice (Lu 1990). This indicates that it enhances the immune system.

Acupuncture

Acupuncture may help protect the liver. In one experiment 36 rats were treated with CCl₄. The efficacy of acupuncture at St 36 and LI3 for hepatoprotection was investigated. The rats treated after exposure to CCl₄ had lower AST and ALT levels, suggesting that acupuncture can protect the liver (Liu 2001). In one trial, 90 patients with hepatitis B were studied. Thirty received vitamin therapy, 30 received acupuncture at ST36, and 30 had electro-acupuncture at ST36. Hepatitis B surface antigen levels decreased in the acupuncture groups but not the vitamin group. IgG and C3 levels were increased in those patients receiving acupuncture (Chen 1999), which suggests that acupuncture may stimulate immunity and help clear viral hepatic infections.

Homotoxicology

General considerations/rationale

Viral diseases represent Impregnation Phase disorders and proper attention to phase remedy selections is helpful in such cases.

Due to the damage to tissue and endothelial barriers, both pathogenic and nonpathogenic bacteria may cause opportunistic infections and further tissue damage. This results in a Degeneration Phase in fairly rapid time. Compositae category antihomotoxic formulas may prove helpful in establishing cellular repair, organ drainage, and detoxification following recovery from infection.

The liver plays a critical role in the normal functioning of the body. Care should be taken to avoid strong detoxification remedies in early stages of hepatitis. Remedies that cause massive offload of toxins into the blood may overwhelm and further damage the compromised liver. Examples of strong detoxifiers/drainers are Thyroidea compositum, Testes compositum, and Ovarium compositum. Galium-Heel is useful but should be used intermittently to avoid excessive detoxification. For initial therapy concentrate on protecting the organ from further inflammation and free radical damage and providing adequate fluid and nutrient supplies for tissue repair to proceed.

Appropriate homotoxicology formulas

See also cholangiohepatitis and chronic active hepatitis protocols.

Coenzyme compositum: Supports the metabolism, and is helpful in cases of exhaustion from stress or disease.

Chelidonium homaccord: Supports the gallbladder.

Echinacea compositum: Supports immune function against bacteria and viral infections. Phase remedy for Inflammation and Impregnation phase homotoxicoses.

Engystol N: Supports nonspecific defenses against viral infection. The effect appears to be dose dependent.

Galium-Heel: Treats all cellular phases, hemorrhoids, and anal fissures, and is a detoxicant.

Gripp-Heel: An antiviral that also treats muscle aches and exhaustion.

Hepeel: Provides liver detoxification and drainage following infection. Can be combined with *Coenzyme compositum* and used every 3 days as needed until enzymes return to normal. Can be used concurrently with *Hepar compositum*, which is also given intermittently 1 to 3 times weekly.

Hepar compositum: Widely supports the liver (Hepar suis) and immune system (thymus suis) through detoxification, hepatocyte protection (Milk thistle), and metabolism (malic acid, fumaric acid, thiocctic acid, lactic acid, alpha-ketoglutaric acid, and sodium oxalacetate). Sulfur and histamine in homeopathic dilution assist enzyme function and detoxification (Reckeweg 2000).

Lymphomyosot: Provides drainage and immune support.

Phosphor homaccord: Used in chronic cases or in those with petechial hemorrhages or frank bleeding.

Ubichinon compositum: Provides deeper support of metabolism than *Coenzyme compositum* and helps activate mitochondrial function after iatrogenic damage from antibiotics and other medicants.

Tonsilla compositum: Supports immunity broadly through the bone marrow, spleen, and tonsils.

Authors' suggested protocols

Nutrition

Liver and immune support formulas (thymus-enriched): 1 tablet for each 25 pounds of body weight BID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

SAME: 10 to 20 mg/kg SID or follow manufacturer's dosing directions.

Lecithin/phosphatidylcholine: One-fourth teaspoon for each 25 pounds of body weight BID.

Folic acid: 50 micrograms for every 35 pounds of body weight (maximum, 200 micrograms).

Vitamin B₁₂: 50 micrograms for every 25 pounds.

Chinese herbal medicine

Formula H77 Cholangiohepatitis: 1 capsule per 10 to 20 pounds twice daily. For acute cases it may be necessary to use this supplement in conjunction with conventional supportive care, including antibiotics, fluid therapy, antiemetics, and so on. In addition to the herbs discussed above, H77 Cholangiohepatitis contains aconite (Fu zi) and leaven (Shen qu) to help increase the efficacy of the formula.

Acupuncture points that may help include BL18, BL19, BL20, GB34, LI3, PC6, ST36, and CV12.

Homotoxicology

See also cholangiohepatitis and chronic active hepatitis protocols.

Consider autotransfusion therapy in these patients. In addition to excellent conventional Western medical support with nutritional support, fluids, antibiotics as needed, antiemetics only as needed, intestinal protectants (sucralfate), urodeoxycholic acid, and S-adenosylmethionine and vitamin E in most cases, consider the following: Phosphor homaccord, Chelidonium homaccord, Nux homaccord, Duodenoheel mixed together and given BID. Alternate Hepeel and BHI-Enzyme BID PO. Give Gastricumeel if vomiting and Engystol N for viral hepatitis. Galium-Heel, Lymphomyosot, Hepar compositum, and Solidago compositum should be given every 3 days. If there is diarrhea, consider adding *Coenzyme compositum* and *Ubichinon compositum* twice weekly.

INFECTIOUS TRACHEOBRONCHITIS (PARAINFLUENZA)

Definition and cause

Infectious tracheobronchitis is a contagious, upper respiratory infection of dogs caused by a number of different viruses and bacteria such as *Bordetella bronchiseptica*. The underlying process is inflammatory. Depending upon the viral infectious agents, parainfluenza is usually self-limiting (Ford 1990, Hoskins 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Rest and isolation is recommended. If therapy is chosen it is usually antibiotics, cough suppressants, and bronchodilators (Hoskins 1994).

Anticipated prognosis

Infectious bronchitis is generally self-limiting, with healing occurring in 10 to 14 days. With more severe disease, the course may be 4 to 6 weeks and severely immune suppressed animals can die of complications such as pneumonia (Hoskins 2003).

Integrative veterinary therapies

While the target tissue is the upper respiratory system, the integrative approach also takes into consideration the immune system and its response to the invading organism. In addition, if medications are chosen, nutritional and biological therapies help minimize side effects.

Nutrition

General considerations/rationale

The nutritional approach to infectious tracheobronchitis consists of nutrient support of the upper respiratory and immune systems, as well as helping to decrease the inflammatory process that incites the coughing.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, lung, and bronchus help to neutralize viral-induced inflammation (see Chapter 2, Gland Therapy, for additional information).

Quercetin: Quercetin is a potent antioxidant that helps to reduce cellular inflammation (Knekt 2002). Quercetin

also functions like an antihistamine, by inhibiting cells from releasing histamines (Middleton 1986, Ogasawara 1985). Therefore, quercetin is beneficial in the treatment of inflammation of the upper respiratory system.

Sterols and sterolins: Animal studies have demonstrated that phytosterols have anti-inflammatory and antipyretic effects (Gupta 1980). Pegel (1997) feels that sterols are essential for a properly functioning immune system.

Vitamin C: Vitamin C has been clinically proven as a potent antioxidant and immune enhancing agent, specifically against infectious agents (Pauling 1976).

Chinese herbal medicine/acupuncture

General considerations/rationale

Parainfluenza is an infectious pathogen that invades the body and attacks the Lung. It is most likely to occur during the change of seasons or under stressful conditions.

As in Western understanding, parainfluenza is an infectious pathogen. The presenting signs are respiratory as it attacks the Lungs. Both schools of thought recognize the importance of stress on repelling the virus. Therapy is aimed at repelling the virus, strengthening the immune system, preventing secondary infections, and controlling signs of disease.

Appropriate Chinese herbs

Apricot (Xing ren): An effective expectorant and cough suppressant (Zhang 1991).

Codonopsis (Dang shen): An immunostimulant. It can increase the leukocyte count (Huang 1994), which may help the patient clear infection faster.

Forsythia fruit (Lian qiao): Contains rengynic acid, which inhibits viruses (Zhang 2002). In addition, it has antibacterial properties that may help prevent secondary bacterial infections (Ma 1982).

Gypsum (Shi gao): Increases the phagocytic activity of macrophages (Zhong Yao Xue 1998), which may help stimulate immunity to help the patient recover more quickly.

Honeysuckle (Jin yin hua): Has antibacterial activity (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). This may help prevent secondary bacterial infections.

Isatis root (Ban lan gen): Has antiviral effects. Its effects are similar to that of ribavirin (Jiang 1992, Zhu 1999, Li 2000).

Licorice (Gan cao): Contains glycyrrhizin, which has antiviral properties (Zhu 1996).

Mint (Bo he): Inhibits viruses and bacteria (Wang 1983).

Pinellia (Ban xia): Has antitussive activity (Gui 1998).

Platycodon root (Jie geng): Decreases coughing (Zhong Yao Li Yu Ying Yong 1983).

Poria (Fu ling): Inhibits bacterial growth (Nanjing College of Pharmacy 1976).

Scutellaria (Huang qin): Contains baicalin, which has antibiotic activity against multiple bacteria (Zhong Yao Xue 1988).

White atractyloides (Bai zhu): Increases the T helper cell count (Xu 1994). It may help stimulate the immune system to help clear the virus.

Acupuncture

Sinusitis, rhinitis, and the common cold are all on the World Health Organization's list of disorders responsive to acupuncture (World Health Organization 10/15/2006). Although parainfluenza virus was not specifically studied by the WHO, the inclusion of viral upper respiratory diseases on the list indicates that acupuncture may be effective in treating viral conditions such as parainfluenza.

Homotoxicology

General considerations/rationale

This is an Impregnation homotoxicosis. Caused by many different viral agents, these infections are often self-limiting and no therapy may be needed in many cases. Secondary bacterial infections can occur and may assist the patient in the removal of homotoxins by bacterial action. Treating with antibiotics is common, but some biological therapists feel that such treatment may predispose the patient to a worsening of the homotoxicosis. Use of antibiotics should be carefully considered. With homotoxicology, herbal medicines, nutritional therapy, and classical homeopathy, many cases can be successfully treated without antibiotic or other drug therapy.

Patients frequently have a deep and productive cough following recovery from the acute viral state. This is actually a cleansing effect as the mucosal border repairs itself and leads to discharge of dead cellular debris and homotoxins trapped within the lungs and bronchial areas. Drinking adequate water, taking antioxidants, and getting gentle exercise are beneficial in assisting this natural detoxification and repair cycle. Suppressing such symptoms with cough medication, decongestants, and other pharmaceutical agents traps the material in the lung and leads to progressive vicariation. If at all possible the veterinarian should attempt to assist this natural and desirable cleansing process.

Appropriate homotoxicology formulas

For more in-depth descriptions of these formulas, see the protocols for other respiratory diseases such as bronchitis, pneumonia, and feline upper respiratory disease.

Aconitum homaccord: Used in the early stages of catarrhal infections and for influenza-like conditions.

Belladonna homaccord: Treats bronchitis and sinusitis.

BHI-Bronchitis: Treats both extremely wet and dry coughs; rattling mucus; and cough after wet, cold weather that worsens in warm rooms.

BHI-Chest: Treats deep cough.

BHI-CoughFree: A natural, lemon flavored cough syrup and expectorant.

BHI-Sinus: Treats sinusitis and otitis media.

Bronchalis-Heel: Treats coughing upon entering a warm room, bronchitis, smoker's lung, barking cough, laryngopharyngitis, and cough with nausea.

Bryaconeel: Treats influenzal infections, bronchopneumonia, bronchitis caused by chill, and rheumatism. The symptoms are worse after exercise or motion, and better when the patient lies still or holds its head up.

Droperteel: Used for congestive bronchitis, globus hystericus, spasmodic cough, asthma, and bluish red tonsillar swelling, and as a cardiac tonic (especially in older pets).

Drosera: Treats bronchogenic asthma, whooping cough, bronchitis, dyspnea and difficult respiration, and hay-fever-like signs.

Dulcamara homaccord: Used for productive coughs aggravated by damp, cold weather and vomiting white tenacious mucus after activity.

Echinacea compositum: Supports immunity in bacterial infections. Can be used instead of antibiotics in some cases, such as influenza-like conditions.

Engystol N: An antiviral that increases white blood cell numbers.

Euphorbium compositum: Treats rhinitis, sinusitis, catarrh of ear passages, otitis media, and mostly upper respiratory membranes. An antiviral agent that helps with respiratory signs and limits viral numbers in initial exposures (Glatthaar-Saalmüller 2001).

Galium-Heel: Activates the immune system in several phases, and provides cellular detoxification and drainage.

Gripp-Heel: An antiviral used for cold and flu-like symptoms (Rabe, Weiser, Klein 2004).

Husteel: Treats dry coughs, bronchopneumonia, deep coughs that worsen at night, coughs when lying down, and catarrh of the respiratory tract.

Lymphmyosot: Provides immune support and lymph drainage.

Mucosa compositum: Rehabilitates the mucosa following disease.

Phosphor homaccord: Used with friendly dispositioned dogs for vomiting and coughing, laryngitis with or without possible hemorrhages, ecchymoses, or when petechiae is noted.

Tartephadreel: Treats catarrh of the respiratory tract, asthmatic complaints, deep "whooping cough-like" affections, and cough with nausea and vomiting.

Tonsilla compositum: Supports endocrine and reticuloendothelial defenses.

Authors' suggested protocols

Nutrition

Immune and bronchus/lung support formulas: 1 tablet for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Quercetin tablets: 35 mg for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Ban Lan Gen Tang Jia Wei, a patent formula, at the manufacturer's recommended dose.

The traditional formula contains the herbs in the following ratio: isatis root 20 g, honeysuckle 10 g, chrysanthemum flower 7 g, forsythia fruit 10 g, codonopsis 10 g, poria 10 g, mint 7 g, platycodon root 7 g, bitter apricot 7 g, pinellia 7 g, scutellaria 7 g, white atractylodes 7 g, licorice root 7 g, gypsum 40 g (Modern Complete Works of Traditional Chinese Veterinary Medicine 2000).

Commonly used acupuncture points include LI4, GV14, LI11, and LU7 (Handbook of TCM Practitioners 1987).

FELINE UPPER RESPIRATORY DISEASES

Definition and cause

Feline upper respiratory diseases are common upper respiratory viral infections in cats that result in sneezing, sinusitis, rhinitis, conjunctivitis, fever, and potentially pneumonia. The cause is feline herpes virus (FHV-1) (Ford 1994, Gaskell 1998, Norsworthy 2003, Pederson 1988, Scott 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Antiviral drugs are generally ineffective. Broad-spectrum antibiotics are recommended for secondary bacterial infection along with topical eye ointments (Norsworthy 2003, Scott 2003).

Anticipated prognosis

Generally the prognosis for recovery is good; however, chronic tearing or rhinitis is possible. The prognosis is more guarded if the disease progresses to pneumonia. Some animals become carriers for the virus (Norsworthy 2003, Scott 2003).

Integrative veterinary therapies

An integrative approach to feline upper respiratory viral infections takes into consideration the target respiratory system as well as supporting general immune function against the virus. The use of therapeutic nutrients, medicinal herbs, and combination homeopathics that are anti-

inflammatory, tissue-protective and immune enhancing can help speed recovery and prevent recurrences.

Nutrition

General considerations/rationale

While medical therapy is focused upon secondary bacterial infection, therapeutic nutrition adds glandular support for the tissue and organs of the respiratory and immune systems.

Appropriate nutrients

Nutritional/gland therapy: Glandular lung, adrenal, thymus, and bone marrow supply intrinsic nutrients that help to reduce cellular inflammation and improve immune organ function (see Gland Therapy in Chapter 2 for a more detailed explanation).

N,N-Dimethylglycine (DMG): N,N-Dimethylglycine has been widely researched in both humans and animals. It has been found to increase energy and enhance immune function (Barnes 1979, Graber 1981, Kendall 2000, Reap 1990, Walker 1988). In a double-blind study, Graber (1981) showed that DMG has a protective and therapeutic effect in people with pneumonia. Also, DMG can help the body to eliminate toxins that may predispose and cause the upper respiratory infections (Kendall 2003).

Betasitosterol: Plant-derived sterols have been shown to have anti-inflammatory and antipyretic properties which appear to be similar to corticosteroids and aspirin (Gupta 1980). In addition, sterols have been proven to enhance immune function (Bouic 1996). Sterols have been found to be able to enhance T- lymphocyte production and moderate B cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Bouic 1996).

Studies on cats with FIV indicate that sterols are believed to have an immune-modulating effect and help to maintain proper lymphocyte levels (Bouic 1997). Treated cats showed 20% mortality as compared to the nontreated cats' mortality of 75%. While the sterols have no direct antiviral properties, the balancing and stimulation of the immune system is enough to control the spread and effects of the virus.

Maitake mushrooms: Studies have shown that maitake mushrooms help enhance immune function and help organ systems maintain balance and homeostasis, and they improve the ability to handle stressful conditions (Nanba 1987).

L-Lysine: The herpes virus requires arginine to replicate. Lysine, which is an arginine antagonist, can reduce viral access and replication. It has been shown that l-lysine, taken orally, may be helpful in early treatment for FHV-1 infection and can reduce the severity of the disease. It is also thought that lysine can reduce viral shedding,

especially in cats in stressful conditions such as a change in housing (Maggs 2003, Stiles 2002).

Chinese herbal medicine/acupuncture

General considerations/rationale

Feline upper respiratory disease is caused by infectious pathogens invading the body, especially during seasonal changes or under stressful conditions. The primary organ involved is the Lung. Because the Lung controls the Throat and Respiratory Tract, major signs seen in this condition include wheezing, pneumonia, and nasal discharge. The pathogen and immune system battle on the surface of the body, producing ocular and nasal discharges and fever. Treatment is aimed at decreasing nasal and ocular discharge, reducing fever, and combating the pathogen.

Appropriate Chinese herbs

Anemarrhena (Zhi mu): Possesses antibacterial properties (Yao Xue Qing Bao Tong Xun 1987). It also decreases fevers (Zhong Yao Xue, 1998).

Basket fern (Guan Zhong): A very effective antiviral herb (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Has both antiviral and antibiotic properties (Wang Sheng Chun 1998, Zhong Yao Xue 1988). It stimulates both humoral and cellular immunity in mice (Shang Hai Yi Ke Da Xue Xue Bao 1986), which suggests it may help affected cats control the pathogen. Finally it was shown to be effective at decreasing fevers caused by 2, 4-dinitrophenol, yeast, or illness (Zhang Qing Ye 1997).

Chrysanthemum (Ju hua): Has demonstrated antibacterial effects (Yi Xue Ji Shu Zi Liao 1974).

Forsythia (Lian qiao): Contains rengynic acid, which has shown antiviral effects (Zhang 2002). Forsythia also inhibits the growth of bacteria (Ma 1982).

Gypsum (Shi gao): Has antipyretic effects. In one study of 200 patients with fevers, 90% experienced significant reduction of temperature (Xin Zhong Yi 1980). It increases the phagocytic activity of macrophages (Zhong Yao Xue 1998), which may help the patients fight off infection.

Honeysuckle (Jin yin hua): Has chlorogenic acid and isochlorogenic acid. These compounds have demonstrated the ability to inhibit the growth of various bacteria (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). It has shown anti-inflammatory and antipyretic effects (Shan Xi Yi Kan 1960).

Isatis leaves (Da qing ye): Have antiviral and antibiotic properties (Zhong Yao Xue 1998, Fu Jian Zhong Yi Yao 1998). Furthermore, they stimulate immunity by increasing the phagocytic activity of macrophages (Li 1996).

Pueraria (Ge gen): Reduces fevers. Pueraria decreased body temperature in rabbits with typhoparatyphoid vaccine-induced fever (Modern TCM Pharmacology 1997).

Acupuncture

Sinusitis, rhinitis and the common cold are all on the World Health Organization's list of disorders that respond to acupuncture (World Health Organization 2006).

Homotoxicology

General considerations/rationale

Viral infections all fall into the Impregnation Phase. Full recovery can occur if the immune system can defeat the virus and eliminate the associated homotoxins. Many feline viruses cause persistent carrier state infections, and an active infection can occur following immunosuppressive events (stress, pregnancy, medications, etc.). Chronic viral infections can activate chronic, recurrent inflammatory conditions, which are a hallmark of Impregnation Phase diseases. Conditions such as chronic stomatitis, pharyngitis, asthma, and dental cervical neck lesions may have roots in Impregnation Phase homotoxicoses. As the circumstances progress, they can lead to Degeneration Phase and Dedifferentiation Phase conditions. Antibiotics may disturb the immune system and lead to progressive vicariation. Therefore, clinicians should attempt to handle such conditions naturally wherever possible, and should be aware of signs of regressive vicariation following recovery from these infections. L-lysine is particularly helpful in the treatment of feline herpes virus infections and recurrences (Norsworthy 2004). Properly handling regressive vicariation may prevent or delay the development of other chronic diseases in these patients.

Vaccination is a helpful tool in avoiding respiratory infections in cats, but it is advisable to avoid overvaccination because vaccinations lead directly to Impregnation Phase homotoxicoses. Many practitioners routinely administer booster vaccinations for feline upper respiratory diseases every three years instead of annually, as recommended by most pharmaceutical vaccine manufacturers.

Appropriate homotoxicology formulas

There is no specific research with feline viral infections, but extrapolation of human data makes this theoretically useful data. The authors have used these remedies frequently, especially in hard-to-control sinus and upper respiratory cases. The clinical results indicate that further research is desirable. For treatment plans in which biological therapy is desired, consider the following formulas:

Aconitum homaccord: Use in early febrile phases. This remedy is common to *Barijodeel*, *Bryaconeel*, *Echinacea compositum*, *Gripp-Heel*, *Rhododendroneel*, *Spascupreel*, *Strophanthus compositum*, *Traumeel*, *BHI-Chamomilla Complex*, and *BHI-FluPlus*, among others. Aconitum is one of the most important homeopathic fever remedies, especially when the patient displays hot skin; great anxiety;

rapid, tense pulse; strong and possibly irregular heartbeat; alternating fever and chills; possible hyperthermia with sudden onset of symptoms; and violence of the complaints. The restlessness and anguish are always seen, as are redness of the mucosa, and the sensation of distension, heaviness, pressure, and tension in the gastrointestinal tract. Stools contain mucus and bile. There is flatulent distension with small, frequent stools, and an urging to defecate, all of which are characteristic of the remedy. Low potencies are normally given in pyrexia and organic complaints, catarrhs, neuralgic symptoms with paraesthesia, hyperthermia, and encephalitis with very high temperatures (e.g., post-vaccinal encephalitis or meningo-encephalitis (Reckeweg 2002).

***Apis homaccord*:** Helps to remove excess fluid accumulations such as edema and ascites when combined with *Lymphomyosot*.

***Belladonna homaccord*:** Treats seizures and screaming out at night. Violent delirium is characteristic of Belladonna, above all in fever. Belladonna's typical action on the eyes is also well-known, with cramps in the muscles of the eyes and eyelids, enlargement of the pupils, and, in particular, an inflammatory or irritative condition of the conjunctiva with great photophobia, lachrymation, and pain. Belladonna is indicated in incipient boils; tonsillitis; and surface inflammations such as erysipelas, conjunctivitis, and scarlet fever. It is also indicated in otitis, cholangitis, meningitis, and other inflammatory affections. A delirious state occurs with a violent rise in temperature with considerably raised sensitivity of all the senses and a disproportionate sensitivity to touch, noises, light, and cold air—especially draughts and jarring—as can be the case in meningitis. Along with nasal catarrhs, there may be catarrhs of the larynx and trachea with slight mucus, accompanied a typical dry, rough, and barking cough with hoarseness.

In the digestive organs, Belladonna affects acute gastric catarrhs (Reckeweg 2002). The classical remedy, *Dulcamara*, is used for cases manifesting symptoms of diarrhea, vomiting, colic, skin rash, convulsions, and paralysis; death is a possible outcome. The complaints of *Dulcamara*-type cases are aggravated by cold, damp weather and weather changes, especially rainy weather. Increased mucosal secretions are also typical of *Dulcamara*-type symptoms. The nose is usually blocked (sinusitis), and the discharge is more copious in the warmth. The saliva is tough and soap-like. Acute gastritis and enteritis; dysentery with violent stomach pains; colic; mucous, sour, or dysenteric watery stools; pains persisting even after the stool that are associated with colic; and rheumatic complaints signal the possible need for this remedy (Reckeweg 2002).

***BHI-Sinus*:** Used for sinusitis, this remedy contains *Echinacea angustifolia*, *Aconitum*, *Sanguinaria*, *Baptisia*,

Eupatorium perfoliatum, *Pulsatilla*, *Thuja*, *Phytolacca*, *Rhus toxicodendron*, *Arnica*, *Bryonia*, *Gelsemium*, and *Euphorbium*.

***Bronchalis*:** Treats bronchial complaints.

***Causticum compositum*:** *Causticum* (also in *Barijodeel*, *Husteel*, *BHI-Throat*, etc.) symptoms are often brought on by dry cold, e.g., cases with hoarseness and laryngitis, dryness and rawness in the throat, and pain on coughing. Typical symptoms include tiredness, painful/battered sensations, and pain in the chest; thus *Causticum* is an excellent remedy in influenza along with *Eupatorium perfoliatum*, *Rhus toxicodendron*, *Aconitum*, and others (Reckeweg 2002). This remedy also contains *Aconitum* (see *Aconitum homaccord*) and *Fumaricum acidum* (common to *Coenzyme compositum*, *Cor compositum*, *Hepar compositum*, *Thyroidea compositum*, *BHI-Enzyme*, etc.). Symptoms from this proving are noted for their effect on the upper respiratory system. Hoarseness, dry cough, sore and raw throat, sneezing, catarrh, head heaviness, difficulty breathing, sneezing, and catarrh extending to the frontal sinuses and associated with a post-nasal drip from allergies are noted. Histamine is used for its obvious signs in various allergic and inflammatory conditions (it is contained in *Hepar compositum*, *Histamin-Heel*, *Luffa compositum-Heel nasal spray*, and *Ubi-chinon compositum*).

***Cerebrum compositum*:** Supports and detoxifies the brain. *Hyoscyamus* is included for symptoms of cerebral irritation with convulsions, muscle twitching; catalepsy; epileptiform spasms; eye conditions; conjunctivitis; spasmodic nocturnal attacks of cough; with expectoration of green mucus on coughing; dryness in the throat, larynx, and lungs; stomach pains; and inflammation of the gastric mucosa and intestines with retching, vomiting, colic, and diarrhea (Reckeweg 2002).

***Coenzyme compositum*:** Provides energy metabolism support for exhausted tissues and helps to reverse some effects of antibiotic therapy. The component *Beta vulgaris* reactivates cell respiration and can regenerate blocked respiratory enzymes, and is therefore indicated in all cellular phases (Impregnation, Degeneration, and Neoplasm), and in viral diseases, viral influenza, and poliomyelitis in humans (Reckeweg 2002). *Beta vulgaris* has been the subject of research concerning mitochondrial elements, and while the mechanism of action is not known, plant extracts contain many mitochondrial enzymes and energy production catalysts, which may be involved in its observed action.

Alpha-ketoglutaricum acidum, which is also contained in *Cor compositum*, *Cutis compositum*, *Hepar compositum*, *Syzygium compositum*, *Thyroidea compositum*, and *BHI-Enzyme*, is an active factor in the citric acid cycle and in redox systems. It is used in all kinds of impregnation phases, and to improve cell respiration.

Alpha-ketoglutaric acid, among all the catalysts of the citric acid cycle, has a particularly prominent symptom: the patient always gets too little air, both in asthma and in emphysema, as well as in such conditions as allergic rhinitis and influenza.

Natrium oxalaceticum (contained in *BHI-Enzyme*, *Cor compositum*, *Ginseng compositum*, *Hepar compositum*, *Mucosa compositum*, *Thyroidea compositum*, *Ubichinon compositum*, etc.) is another active factor of the citric acid cycle and redox systems. It is used in Impregnation Phases of all kinds and to improve cell respiration. Special indications for this component include asthmatic bronchitis; sinusitis; otitis media; and all acute and chronic inflammations of the nasopharynx, lungs, and bronchi. In many cases Natrum oxalaceticum can cut short the acute common cold.

This remedy contains the following minerals: Mercurius sublimatus corrosivus, Phosphorus, Zincum metallicum, Hepar sulfuris, Arsenicum album, Argentum nitricum, and Sulphur. It contains the following nosodes: Grippe-nosode, Streptococcinum, Staphylococcinum, and Pyrogenium. It contains the zoological component Lachesis (snake venom) and the homeopathically prepared allopathic drug Cortison acetate.

Discus compositum: Used for the spinal, meningeal, and paralytic forms of this disease. It contains Ranunculus rulbosus to treat rheumatic and neuralgic symptoms, skin eruptions—particularly closely grouped crops of vesicles—coryza with a discharge of viscid mucus, and possibly ulceration of the nasal mucosa that is accompanied by the characteristic chest complaints with shortness of breath and a sense of constriction. These may be accompanied by gastric symptoms with purging, eructations and nausea, burning in the stomach, abdominal rumbling, and bleeding hemorrhoids. The skin eruptions are frequently present on the palms of the hands in the form of desquamating vesicular eruptions (Reckeweg 2002).

Droperiteel: Treats bronchitis, deep cough, and asthma.

Drosera homaccord: Treats bronchiolitis, “whooping” cough-like disorders, and asthma.

Echinacea compositum: This terribly important formula deserves more extensive consideration because it can stimulate host defenses, particularly against bacterial invaders. It is the homotoxicologist’s “antibiotic,” and while it provides no antibacterial activity, its action stimulates host defenses against bacterial infections. It contains, among many other useful remedies, Echinacea angustifolia (also in *Belladonna homaccord*, *Euphorbium compositum*, *Mercurius-Heel*, *Tonsilla compositum*, and *Traumeel*) and Rhus toxicodendron (also in *Aesculus compositum*, *Arnica-Heel*, *Echinacea compositum*, *Gelsemium homaccord*, *NeuralgoRheum*, *BHI-Headache*, *BHI-Inflammation*, and many others). It is characteristically used in a

wide variety of inflammations, e.g., violent conjunctivitis with severe photophobia; greenish-yellow, offensive nasal discharge; gastroenteritis with watery, bloody, mucous stools and tenesmus; a tormenting, dry cough with bloody, purulent sputum; skin eruptions like measles or vesicular eruptions all over the body; and disturbances of consciousness in febrile conditions (Reckeweg 2002).

It contains Hepar sulphuris calcareum (also in *Belladonna homaccord*, *Cantharis compositum*, *Coenzyme compositum*, *Euphorbium compositum*, *Mercurius-Heel*, *Solidago compositum*, *Traumeel*, *BHI-Chamomilla Complex*, *BHI-Enzyme*, *BHI-Infection*, *BHI-Inflammation*, and others). Hepar sulph is the remedy for chronic catarrhs of the respiratory organs with expectoration of purulent sputum, croupy cough with rattling mucus but difficulty in expectorating. Here, Hepar sulph is more frequently indicated after Aconitum or Spongia. Because of its action in suppurations, Hepar sulph (along with *Graphites homaccord* and other remedies) is the main remedy in protracted pneumonia with the risk of abscess formation, abscesses of the tonsils, and purulent, offensive discharge from the ears. Hepar sulph also may help where there is a chronic tendency to catch cold (cf. Thuja). The component Argentum nitricum (also common to *Atropinum compositum*, *Euphorbium compositum*, *Mucosa compositum*, *Pectus-Heel*, *Phosphor homaccord*, *BHI-Inflammation*, and *BHI-Throat*) is indicated in hoarseness with roughness and scratching in the throat; polyps of the vocal cords; and catarrh of the pharynx, ears, and conjunctiva.

Echinacea compositum includes Arnica (common to *Aesculus compositum*, *Arnica-Heel*, *Aurumheel*, *Barijodeel*, *Belladonna compositum*, *Causticum compositum*, *Pectus-Heel*, *Traumeel*, *BHI-Allergy*, *BHI-Inflammation*, *BHI-Throat*, and many others), which has indications for septic states and coughing with chest pain. It also contains Arsenicum album (also in *BHI-Chest*, *BHI-Cough*, *Arsuraneel*, *Atropinum compositum*, *Causticum compositum*, *Pectus-Heel*, *Traumeel*, etc.) for asthma—particularly at night—excoriating discharges, burning coryza, and conjunctivitis with burning secretion. Cortisone (common to *Pulsatilla compositum*, *Thyroidea compositum*, *Tonsilla compositum*, etc.) treats inflammation of the mucosae of the eye and of the respiratory organs, as well as asthma. Influenzinum (also in *Ginseng compositum*) treats hoarseness, bronchial asthma, chronic polysinusitis and other sequelae of influenza, iatrogenic damage, and parainfluenzal diseases. Lachesis (also in *Gripp-Heel*, *Klimakteel*, *Mercurius-Heel*, *Mucosa compositum*, and *BHI-Inflammation*) is suited to septic illnesses and decomposition of the blood, as well as thrombocytopaenic purpura, asthma, influenza, laryngitis, sore throat, uveitis, nasal catarrh with discharge, otitis media, etc.

Phosphorus (also in *Apis homaccord*, *Galium-Heel*, *Gripp-Heel*, *Mucosa compositum*, *Nasheel*, *Pectus-Heel*, *Phosphor homaccord*, *Secale compositum*, *BHI-FluPlus*, *BHI-Sinus*, *BHI-Throat*, etc.) is an effective hemorrhage remedy; it is indicated in purpura, bruises, petechiae, and hematoma. It is also indicated in inflammation of the respiratory organs, severe infectious diseases, disorders in convalescence, conditions of exhaustion, in bronchial pneumonia, colds which proceed from the nose downward into the trachea and bronchi, and pneumonia. Phosphorus is given orally or injected, in the potencies 10 X, 30 X, 200 X, and 1,000 X. The component Sanguinaria is a routine remedy for coryza and colds, because of its relationship to chest complaints and colds. There is pain and burning in the mouth, chest, larynx, and trachea when coughing and breathing, that is worse at night. It is used against pharyngitis, tracheitis, and nasal polypi, along with a constitutional remedy such as Calcium carbonicum. It is excellent in influenzal, feverish, and catarrhal conditions when combined with Aconitum, Bryonia, Eupatorium perfoliatum and others. The typical descending, burning sensation in all the mucosa of the respiratory tract should bring Causticum to mind (see *Causticum compositum*, above.) Sanguinaria can be used in pneumonia, particularly in the lower lobes, where it rivals Chelidonium sanguinaria (in the 30 X potency). It has been used in many cases of bronchiectasis with tough, thick, offensive expectoration.

Thuja (common to *Atropinum compositum*, *Galium-Heel*, *Psorinoheel*, *BHI-Allergy*, *BHI-Inflammation*, and *BHI-Sinus*) treats asthmatic bronchitis with copious expectoration at night, and vaccination reactions (Reckeweg 2002). This also contains Gelsemium (see *Gelsemium homaccord*), Aconitum (see *Aconitum homaccord*), Euphorbium (see *Euphorbium compositum*), Pulsatilla, Sulphur (see *Causticum compositum*), Mercurius corrosives, and Eupatorium (see *BHI-FluPlus*).

Echinacea compositum also contains Euphorbium (also in *BHI-Sinus*), with indications for inflammation of the respiratory passages and irritation of mucous membranes leading to catarrhs of the eyes, nose, larynx. It is also indicated for eustachian catarrh with swelling of the middle ear and a sensation of complete deafness in the affected ear. It is a supporting remedy in nasal ulceration, and it is indicated for pharyngitis, sinusitis, and catarrhs of various sinuses.

Mucosa nasalis suis (also in *Mucosa compositum*) treats the nasal mucous membrane. The main indications are chronic sinusitis, polysinusitis—often with offensive nasal discharges along with nasal polypi—and mucus in the throat. Sinusitis nosode is used in acute and chronic suppuration of the sinuses or bloody discharge. Other symptoms include itching and tickling of the internal sinuses with obstruction and sneezing; lymphadenopathy;

nasal ulcers; asthma; rough, scratchy throat associated with mucus and expectoration of phlegm; and illnesses which may be influenced from the nasal mucosa, e.g. (experimentally) in duodenal and gastric ulcer, etc. It is also used for conjunctivitis with sticky mucus and pus and burning irritation with tear formation (Reckeweg 2002). This remedy also contains Hepar sulph, Argentum, (see *Echinacea comp*), and Pulsatilla (see *Causticum compositum*).

Engystol N: Stimulates the immune system (Ben-Yakir 2004). This remedy has been used for viral infections for many years (Fimiani 2000, Oberbaun 2005); It is a combination preparation containing Vincetoxicum hyrundinaria in 6X, 10X, and 30X potencies. Vincetoxicum (*Asclepias vincetoxicum*) has the main indications of acute febrile reaction phases, glandular fever, lymphadenitis, and viral diseases (Reckeweg 2002). *Engystol N* also has Sulphur (see *Causticum compositum*) in 4 X and 10 X potencies, which has been studied extensively. It has been used to treat bronchitis, sinusitis, pharyngitis, herpes, sore throat, laryngitis, and other infections. It was studied in 1,479 patients in Europe with very good results and excellent tolerance in flu and febrile conditions (Herzberger, Weiser 1997). Another study assessing *Engystol* as a prophylactic remedy indicated that it appeared to affect only the humoral phase of immunodefense, and the authors theorized that 1 injection per week would be best suited for prophylactic immunostimulation (Heilman 1994).

Euphorbium compositum: An antiviral agent that helps with respiratory signs and limiting viral numbers in initial exposures. It has demonstrated in vitro viral inhibition for the following viruses: influenza A, respiratory syncytial virus, and type I herpes simplex virus (HSV1) (Glatthaar-Saalmüller 2001).

FluPlus: Contains the ingredient *Anas barabariae*, hepatitis et cordis extractum, a nosode made from duck liver, which is a source of flu virus (also known as *Oscillococcinum*). Use at the onset of a flu-like illness. The component Eupatorium perfoliatum (common to *Echinacea compositum* and *Gripp-Heel*) is said to complement *Anas barabariae* and hepatitis et cordis extractum (Chavanon 1935, Schmid et al.) It is indicated for headache with a chill; aversion to light; coryza with aching in every bone; dry throat so the patient can hardly talk; difficult breathing; perspiration; hard, dry cough; soreness in the chest; intense ache in the back and limbs; stiffness of the arms and fingers; sleeplessness with fever; chill with thirst; fever preceded by thirst; remittent fever; dengue fever (Hering 1983); catarrhal fevers; influenza with pains in the limbs; influenza; parainfluenzal feverish diseases; and rheumatism (Reckeweg 2002).

Mercurius sublimatus corrosivus (common to *Echinacea compositum*, et al.) has characteristic mercurial action

in tonsillitis, affections of the mucosa, salivation, fluent coryza, keratitis, iritis, gingivitis, and influenza, i.e. highly acute inflammations of the mucosae of the eyes, oral cavity, and tonsils (Reckeweg 2002). Zincum metallicum is indicated in classical homeopathy for the treatment of fever and chills (Clarke). Zinc deficiency has been found in immunodeficiencies (Yoffe 1986), including those in which zinc decreases in a parallel fashion to the evolution of the disease (Dousset et al. 1994). Zinc gluconate in homeopathic dilution appeared beneficial in a randomized, double-blind, placebo-controlled study to control viral flu (Nossas et al. 1996). Zinc chloride associated with Sanguinaria has demonstrated antimicrobial properties in vitro (Gomez 1987). Also contains Lachesis, Phosphorus (see *Echinacea compositum*), Pulsatilla, Sulphur (see *Causticum compositum*), and Aconitum (see *Aconitum Homaccord*).

Galium-Heel: Provides cellular detoxification and repair, activation of the nonspecific host defenses, support in vaccine reactions, and renal tubular support. Phase remedy in Deposition, Degeneration, and Dedifferentiation phase conditions.

Gelsemium homaccord: Treats headache and neuralgia. Gelsemium is quite particularly indicated in states of paralysis, e.g., after apoplexy and also in post-diphtheritic paralysis. The stools are copious and yellow, and influenzal catarrhs may be seen when thin, fluent nasal discharge and bloody mucus is blown out. A brief summary includes nervous disorders, infectious diseases, paralysis, and spasmodic conditions (Reckeweg 2002). Gelsemium is common to *Echinacea compositum*.

Ginseng compositum: See *Causticum compositum* for common remedies.

Ginseng compositum: Provides constitutional improvement during chronic disease (Reckeweg 2000).

Gripp-Heel: An antiviral for cold and flu-like symptoms (Rabe 2004). Aconitum acts in *Gripp-Heel* (in D4) specifically against colds (also see *Aconitum homaccord*); also contains Eupatorium perfoliatum (see *FluPlus*), Lachesis (see *Echinacea compositum*) for hot flushes, sore throat, septic course); Bryonia for pleuritis, dry cough, and thirst; and Phosphorus (see *Echinacea compositum*) when there is a risk of pneumonia or bronchopneumonia. One of 170 German soldiers compared acetylsalicylic acid to *Gripp-Heel* and found that the homeopathic preparation was comparable to acetylsalicylic acid in the beneficial changes in the clinical findings and in the length of time the patients were unable to work (Maiwald et al. 1993).

Gripp-Heel is most effective if given early in the disease process. Endogenous immunity can no longer be adequately activated once the illness has advanced. In uncomplicated cases the viral infection lasts only a few days, unless secondary infections arise, which may result in

persistence, particularly with immunosuppressed patients. Antiphlogistic and antipyretic medicines repress the symptoms but delay healing, because they interfere with normal biological functions. *Gripp-Heel* is mentioned in medical literature as early as 1954; it has been said that the total effect corresponds to an acceleration of mesenchymal immune reaction (Till 1986).

Hepar compositum: Provides liver drainage and detoxification.

Husteel: Treats dry, hacking coughs.

Lymphomyosot: Provides lymph drainage and detoxification, hormonal support, and immune support. Myosotis arvensis acts particularly on the respiratory organs and the lungs. Characteristic symptoms include a cough with profuse mucopurulent expectoration, retching and vomiting while coughing, and aggravation during meals or immediately afterward.

Mercurius-Heel: Has antiviral elements and treats stomatitis and peritonsillar inflammation.

Mezereum homaccord: Treats vesicular lesions associated with herpes infections in humans and itching associated with herpes virus impregnation. Feline herpes virus type 1 infections can cause ulcerations near the nasal openings; and *Mezereum homaccord* and *Lamioflur* may help these cats.

Molybdan compositum: Can supply trace minerals that may prove helpful in supporting recovery due to the poor nutritional state that is often characteristic of this disease (Reckeweg 2000).

Mucosa compositum: Provides repair, detoxification, and drainage of mucosal tissues throughout the body in the Degeneration Phase and in recovery periods following other illnesses or iatrogenic damage such as that which follows antibiotic or NSAID therapy. Supports mucous membranes throughout the body, including the urogenital, respiratory, and gastrointestinal systems, and especially during recovery after the acute infection has waned.

Nasobee: Treats acute and chronic rhinitis and sinusitis (Reckeweg 2000). Contains Ammonium carbonicum for chronic and acute colds, mucus in chest with coughs but no expectoration and infectious diseases with circulatory insufficiency and inflammations of the oral cavity and of the respiratory passages. Cistus canadensis is indicated in dryness of the oral and pharyngeal mucosa, colds that settle in the throat, lymphadenitis, and pulmonary diseases. Kali bichromicum (also in *Mucosa compositum*, *BHI-Sinus*, etc.) can be helpful in a few characteristic symptoms, e.g., catarrhal conditions of the mucosa of the respiratory passages and migratory pains with possible alternation of catarrhal and rheumatic complaints. Especially characteristic of Kali bichromicum are the tough, stringy mucous secretions that occur with catarrhs of the sinuses, nose, bronchi, etc. Inflammations of the eyelids

and conjunctivitis also occur, sometimes with corneal ulcers with a punched-out appearance. These ulcerations may be found on the gums, tongue, and lips, and in gastric and duodenal tissues.

Lemna minor is included for anosmia (a symptom that is hard to identify in cats but may manifest as anorexia); scabby, purulent, offensive, and bloody nasal catarrhs; that sometimes appear with polyps and pharyngeal catarrh; and chronic sniffles. *Melilotus officinalis* is included for blood congestion, not only of the brain, but also of the lungs and rectum; that symptom is associated with epistaxis and hemoptysis. The component *Natrum nitricum* is mainly indicated for asthma, dyspnea with hemorrhagic tendencies, infections, rheumatism, and conditions of weakness (Reckeweg 2002). This remedy also contains *Phosphorus* (see *Echinacea compositum*).

***Natrium homaccord*:** Treats catarrh of the mucous membranes, sudden chills, and croupy inflammation with a tendency toward hemorrhage.

***Phosphor homaccord*:** Treats laryngitis, pharyngitis, hemorrhages or petechial bleeding, and bruising.

***Pulsatilla compositum*:** Used for chronic, nonresponsive cases with regulation rigidity. *Pulsatilla* (common to *Abropernol*, *Coenzyme compositum*, *Cruroheel*, *Echinacea compositum*, *Euphorbium compositum*, *Ginseng compositum*, *Mucosa compositum*, *Pulsatilla compositum*, *Rhododendroneel*, *Thyroidia compositum*, *Tonsilla compositum*, *Viburcol*, *BHI-Chamomilla Complex*, *BHI-Cold*, *BHI-Enzyme*, *BHI-FluPlus*, *BHI-Inflammation*, and *BHI-Sinus*) is indicated for yellowish-green secretions, particularly in the mornings and in the evenings. Often the discharges are thin and runny. There is catarrh in the larynx and air passages, coughing with tenacious mucus, and bronchitis and broncho-pneumonia.

***Solidago compositum*:** Provides drainage and support of the urogenital tract.

***Spascupreel*:** Treats spasmodic cough.

***Tartephedreel*:** Used for bronchial catarrh and severe, unrelenting coughs, as well as catarrhal respiratory tract involvement.

***Thyroidia compositum*:** Used in recovery phases to normalize the hormonal axis and cleanse the deep matrix. Provides hormonal support and detoxification of matrix elements.

***Tonsilla compositum*:** Provides Impregnation Phase and Degeneration Phase support of immune organs, particularly the spleen and bone marrow. Activates reticulo-endothelial elements in deeper homotoxicoses. Contains *Mercurius solubilis Hahnemanni* for mucosal inflammations of the respiratory passages, gastrointestinal tract, and urinary and reproductive organs; skin diseases; inflammation of the tonsils, lymph glands, liver, and kidneys; inflammation of other glandular organs; osteal-

gia and rheumatism; enervating diseases; and cerebral angiosclerosis (Reckeweg 2002).

***Traumeel S*:** Used for gingivitis, stomatitis, modulation of inflammation, and in regulation rigidity cases to activate sulfur-containing enzyme systems. *Traumeel S* treats Impregnation Phases and retoxifications of all kinds, as well as allergic illnesses, bronchial asthma, and vasomotor rhinitis. Histamine, which is common to *Hepar compositum* and *BHI-Allergy*, is used in Inflammation phases. Histamine is decisively important for the initial phase of Inflammation. It widens the capillaries to allow an infusion of plasma into the tissues, resulting in the consecutive symptoms of pain, swelling, heat, and redness. Histamine becomes especially biologically dangerous if such inflammations are suppressed.

***Ubichinon compositum*:** Used for mitochondrial energy metabolism, in Degeneration Phase disorders, and after long courses of antibiotic therapy. *Ubichinon compositum* provides deeper support of metabolism than *Coenzyme compositum* and helps activate mitochondrial function after iatrogenic damage from antibiotics and other medicants. Benzochinon parabenzoquinone is a powerful remedy in this combination, with certain protective functions against viral infections and other chronic disease. One should always think of parabenzoquinone in almost an incurable, unremitting dyspnea that has the possibility of transition into respiratory paralysis. It can also help with a state of paresis occurring after poliomyelitis, meningeal irritation, encephalitis or vaccinations, and where there is disturbance in neuromuscular coordination (Reckeweg 2002).

The important component, Sulphur, is successful in acute and chronic cases. It reactivates enzyme-based detoxifying procedures, particularly when well-indicated remedies are not working. Suppression of eliminations—whether they are an Excretion Phase or some inflammation, which cleanse the body of homotoxins—occurs when enzyme systems are entrusted with this detoxifying function and are inhibited or destroyed. Enzyme damage creates an Impregnation Phase or deeper phase. Because Sulphur is one of the most important components of tissue in the body, the basic substance of the mesenchyme in all cases which do not respond to well-indicated biotherapeutic or antihomotoxic remedies, Sulphur-containing formulas (also in *Cerebrum compositum*, *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Psorinoheel*, *Pulsatilla compositum*, *Spigelon*, *Sulfur-Heel*, *Thyroidia compositum*, *Tonsilla compositum*, *Ubichinon compositum*, *BHI-Allergy*, *BHI-Asthma*, *BHI-Chest*, *BHI-Cold*, *BHI-Enzyme*, *BHI-FluPlus*, *BHI-Hayfever*, and many others) should be given intercurrently, e.g. as an intravenous injection, e.g. in acute pneumonia, tuberculosis in its

various forms, or any one of numerous cellular phases, and in acute and chronic inflammations of the respiratory organs (Reckeweg 2002). Also contains Arnica and Arsenicum album (see *Echinacea compositum*).

Authors' suggested protocols

Nutrition

Bronchus/lung and immune support formulas: 1 to 2 tablets BID.

Betathyme: One-half capsule BID.

Maitake DMG: One-half to 1 ml BID.

L-lysine: 250 mgs SID.

Chinese herbal medicine/acupuncture

Formula H40 Antiviral/Papillomas: 1 capsule per 10 pounds twice daily. In addition to the herbs discussed above, H40 Antiviral/Papillomas contains phragmites (Lu gen) and sweet wormwood (Qing hao) to help increase the efficacy of the formula.

Commonly recommended acupuncture points are LI4, GV14, LI11, and LU7 (Handbook of TCM Practitioners 1987).

Homotoxicology (Dose: 5 to 7 drops PO for cats)

Echinacea compositum IV, if possible, to start, combined with **Coenzyme compositum**. Lymphomysot, Engystol N, Gripp-Heel, and Echinacea compositum, combined and given orally 4 to 5 times daily the first 24 hours and then BID. Some cases may respond to Natrium homaccord as a single agent.

Broadfoot uses Nasoheel plus Euphorbium compositum BID-TID, with Engystol plus Gripp Heel or Echinacea compositum, as needed. Causticum and Ginseng also may be powerful adjuncts if indicated by symptoms.

Product sources

Nutrition

Bronchus/lung and immune support formulas: Animal Nutrition Technologies. **Alternatives:** Immune System Support—Standard Process Veterinary Formulas; Immuno Support—Rx Vitamins for Pets; Immugen—Thorne Veterinary Products.

Betathyme: Best for Your Pet. **Alternative:** Moducare—Thorne Veterinary Products.

Maitake DMG: Vetri Science.

L-lysine: Over the counter.

FELV, FIV, AND FIP**Definition and cause**

Feline Immunodeficiency virus (FIV) is caused by a retrovirus from the same subfamily of viruses that causes HIV in people (lentiviruses). The virus is most commonly passed via a bite wound. The virus directly compromises

the immune system, eventually leading to secondary infections and disease. The animal's immune function (both humoral and cellular) directly controls the activation of the virus and the inherent secondary infections such as persistent elevated fever, loss of appetite, anemia, respiratory infections, chronic gingivitis, chronic diarrhea, periodontal disease, loss of weight, neurological disorders, upper respiratory and lower urinary infections, and cancer (Barr 1993, 1995, 1997; English 1992; Hopper 1994; Macy 1994; Sherding 1994; Sparger 1991).

Feline leukemia (FeLV) is caused by a retrovirus. FeLV is spread by contact with infected cats and is similar to FIV in that it causes an immune suppression disease (See Section 5 Cancer, for more detailed information about cancer protocols) (Barr 2003, Rojko 1994).

Feline infectious peritonitis (FIP) is caused by a coronavirus that can incubate within the cat for years. Activation of the virus causes immune suppression resulting in a systemic disease with multiple secondary infections. Symptoms can include persistent fevers, infections in various organ systems such as lymphadenopathy, vomiting, diarrhea, fluid accumulation in the chest and/or abdomen, and pyogranulomas. The cause is feline coronavirus 1 and 2 (FCoV 1 and 2). Vaccinations for FIP are unreliable (McReynolds 1997, Norsworthy 1998, Scott 1997, Stoddart 1994, Weiss 1994).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy for FIV is directed toward the secondary infections and diseases. Antibiotics, corticosteroids, fluid therapy and immunomodulatory drugs such as immunoregulan, acemannan, and alpha interferon are normally recommended for therapy (Barr 1997, Hooper 1994, Macy 1994, Sherding 1994).

Medical therapy for FeLV includes immunomodulatory drugs such as alpha interferon. If neoplasia (lymphoma) is present, chemotherapy and immune-suppressing drugs such as corticosteroids are recommended (Barr 2003).

Medical therapy for FIP includes supportive care, fluid therapy, antibiotics, cortisone, immune-modulating drugs such as alpha interferon, and high-quality nutrition and vitamins (Norsworthy 1997, Scott 1997).

Anticipated prognosis

It is estimated that 20% of cats with FIV will die within 1 to 2 years of exposure and infection. Cats with a stronger immune system can live a normal life and remain free of symptoms of other secondary diseases (Barr 1997, Hooper 1994, Sparger 1991). Patients may convert to negative status, but this is rare. It is estimated that 50% of FeLV-positive cats die within 1 to 2 years (Barr 2003).

Both the wet and dry forms of FIP are most often fatal (McReynolds 1997, Scott 1997).

Integrative veterinary therapies

Conventional treatment offers supportive care along with immunomodulating drugs. The addition of integrative modalities can often improve immune competence and day-to-day quality of life. The addition of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory and immune enhancing effects on the cells and organ systems can often improve clinical signs and further modulate immune function and the ability to control the spread of the virus.

Nutrition

General considerations/rationale

The nutritional approach adds glandular support for the organs of the immune system as well as nutrients to help decrease cellular inflammation.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, bone marrow, and spleen supply intrinsic nutrients that help to improve immune organ function (see Gland Therapy in Chapter 2 for a more detailed explanation).

Because feline viral diseases are systemic, it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease. This helps clinicians to formulate therapeutic nutritional protocols that are specific for the cat (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Betasitosterol: Plant-derived sterols have been shown to have anti-inflammatory and antipyretic properties (Gupta 1980). Sterols have been proven to enhance immune function and T- lymphocyte production, and moderate B cell activity, thereby helping to balance the immune response (Bouic 1996). In studies on cats with FIV, sterols are believed to have an immune-modulating effect and help to maintain proper lymphocyte levels (Bouic 1997). Treated cats showed a 20% mortality rate as compared to the nontreated cats' mortality rate of 75%. While the sterols have no direct antiviral properties, the balancing and stimulation of the immune system is enough to control the spread and effects of the virus.

Maitake mushrooms: Studies with maitake mushrooms have shown that they enhance immune function and the ability to handle stressful conditions, while helping organ systems maintain balance and homeostasis (Nanba 1987).

N,N-Dimethylglycine (DMG): DMG has been widely researched in both humans and animals. It has been found to increase energy and enhance immune function (Barnes

1979, Graber 1981, Kendall 2000, Reap 1990, Walker 1988). In a double-blind study, Graber (1981) showed that DMG has a protective and therapeutic effect in people. Also, DMG can help the body to eliminate toxins that may predispose and cause infections (Kendall 2003).

Vitamin C: Numerous papers, clinical trials, and books have been written about vitamin C's effects as an antioxidant, general stimulant for the immune system as well as its properties such as stimulating interferon production, activating natural killer cells (NK), and improving day-to-day quality of life. de la Fuente (1998) and Penn (1991) showed that vitamin C in combination with other vitamins significantly improved immune function as compared with placebos.

Chinese herbal medicine

General considerations/rationale

Both TCM and Western etiologies are similar. According to Traditional Chinese Medicine, these 3 diseases are external infectious pathogens. In addition to treating the cause (the external pathogen, or the virus), doctors recommend treating symptoms caused by the virus such as fever. In the cases of FeLV and FIV, immunodeficiency (Wei Qi deficiency) is a component of the diseases; therefore, stimulation of the immune system is beneficial.

Appropriate Chinese herbs

Anemarrhena (Zhi mu): Reduces fever (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Well suited for use with viral illnesses. It is an immune stimulant. In experiments it has been shown to enhance the both humoral and cellular immunity in mice (Shang Hai Yi Ke Da Xue Xue Bao 1986). It has also demonstrated antiviral effects against several viruses. One investigation found activity against chick embryo flu virus and pneumonia virus in mice (Wang 1998). In humans it has an inhibitory effect on respiratory syncytial virus (RSV) (Liao 1999). Another study found antiviral effects against some influenza viruses, poliomyelitis virus, and hepatitis virus (Zhong Yao Xue 1988).

Dryopteris root (Guan zhong): Has demonstrated antiviral effects against influenza, adenovirus, encephalitis, and herpes B (Zhong Yao Xue 1998, Zhong Cao Yao Tong Xun, 1973).

Forsythia (Lian qiao): Contains reingenic acid, which has antiviral effects. It has been shown to inhibit RSV in vitro (Zhang 2002).

Gypsum (Shi gao): Rapidly decreases fevers. In one study of 200 patients with fevers, 90% experienced significant reduction of temperature (Xin Zhong Yi 1980). In addition it has immunostimulatory effects. It increases

the phagocytic activity of macrophages (Zhong Yao Xue 1998).

Honeysuckle (Jin yin hua): Has been shown to decrease the body temperature in rabbits with endotoxin-induced fever (Yang Lin 1998).

Isatis leaves (Da Qing ye): Enhance immunity. In mice they have been shown to enhance the phagocytic ability of macrophages and increase the content of serum lysozyme (Li 1996). In addition they have antiviral activity. They have been shown to have efficacy against influenza, measles, and encephalitis B (Fu Jian Zhong Yi Yao, 1998, Shang Hai Zhong Yi Yao Za Zhi 1963, Fu Jian Zhong Yi Yao, 1965).

Pueraria (Ge gen): Has antipyretic effects (Modern TCM Pharmacology, 1997).

Homotoxicology

General considerations/rationale

All viral infections constitute Impregnation Phase disorders. Because of the actual damage done to tissues, these 3 conditions frequently develop into Degeneration Phase homotoxicoses. In FeLV and FIV, progressive vicariation can lead to Dedifferentiation Phase disease.

FIV retrovirus infects local tissues and then spreads via lymphocytes and macrophages. Both CD4 and CD8 T-lymphocytes are infected. A gradual decrease in CD 4 T-cells occurs as the disease advances. FIV can further infect astrocytes and microglial cells in the brain. Drug therapy exists to slow advancement of the virus.

The FIP coronavirus attacks epithelial cells directly, is picked up by macrophages, and is carried to all parts of the body. Diseased cats develop a pyogranulomatous lesion, which destabilizes normal tissue leading to the 2 forms of the disease (dry and wet). There is no effective therapy for this condition once the chronic form develops.

FeLV retrovirus initially infects the tonsils and regional lymph nodes. Infection of B-lymphocytes spreads the disease systemically. FeLV is an RNA-containing virus with reverse transcriptase. This allows the RNA to encode DNA, which can be inserted into the host cat's genome. Altered DNA results in the development of lymphoid neoplasia and allows the virus to be transmitted genetically to offspring. The chronic forms of these diseases are treated symptomatically; homotoxicology attempts to normalize immune function, reduce homotoxin levels, promote repair of damaged tissues, and assist in managing symptoms of disease.

Appropriate homotoxicology formulas

Little feline-specific antihomotoxic research has been conducted; therefore, practitioners considering use biological therapy on these patients should inform clients of its unproven nature and then proceed as indicated. Remedy formulas to consider include:

Aconitum compositum: Used for fever and aches and flu-like symptoms.

Apis homaccord: When combined with Lymphomyosot is helpful in removing excess fluid accumulations such as edema and ascites.

Coenzyme compositum: Assists energy metabolism.

Echinacea compositum: Treats fever and bacterial infections.

Engystol N: Stimulates the immune system, although it is not directly antiviral (Ben-Yakir 2004). This remedy has been used for viral infections for many years (Fimiani 2000, Oberbaun 2005). There is a simple published protocol for regularly administering *Engystol N* and *Echinacea compositum* for FeLV-infected cats, but no there is no data regarding its efficacy (Serrentino 2002).

Euphorbium compositum: An antiviral agent that helps with respiratory signs and limits viral numbers in initial exposures (Glatthaar-Saalmüller 2001). There is no specific research with FeLV, FIV, or FIP, but extrapolation of human data makes this theoretically useful data. The authors have used this remedy frequently, especially in hard-to-control sinus and upper respiratory cases with the appearance of clinical result, making further research desirable.

Galium-Heel: Provides cellular detoxification and repair, activation of the nonspecific host defenses, support in vaccine reactions, and renal tubular support. Phase remedy in Deposition, Degeneration, and Dedifferentiation phase conditions.

Gripp-Heel: Antiviral for cold and flu-like symptoms (Rabe 2004).

Hepar compositum: Provides liver drainage and detoxification.

Lymphomyosot: Provides lymph drainage and detoxification.

Solidago compositum: Drains and supports the urogenital tract.

Thyroidea compositum: Provides hormonal support and detoxification of matrix elements.

Tonsilla compositum: Activates reticuloendothelial elements in deeper homotoxicoses.

Ubichinon compositum: Used for mitochondrial energy metabolism.

Viburcol: Useful in febrile stages, to moderate the patient, and improve the comfort level.

Authors' suggested protocols

Nutrition

Immune and blood/bone marrow support formulas: One-half to 1 tablet BID.

Betathyme: One-half capsule BID.

Maitake DMG: One-half ml BID.

Vitamin C: 250 mgs BID.

Chinese herbal medicine

H40 Antiviral/Papilloma: 1 capsule per 10 to 20 pounds twice daily to effect. In addition to the herbs listed above, H40 Antiviral/Papilloma contains chrysanthemum (Ju hua), phragmites (Lu gen), and sweet wormwood (Qing hao). In general, cats with FeLV and FIV respond better than those with FIP. Cats with FIP usually do not show marked or prolonged response.

Homotoxicology (Dose: 5 drops PO for cat)

Autosanguis therapy can prove helpful in these cases.

FeLV and FIV protocol: Engystol N, Gripp-Heel, AND/OR Euphorbium compositum, Lymphomyosot, Galium-Heel, mixed together and given orally BID. Tonsilla compositum, Coenzyme compositum, Ubichinon compositum mixed together and given orally every 3 days.

FIP protocol: Engystol N, Euphorbium compositum, Lymphomyosot, Galium-Heel, Mucosa compositum, Ranunculus homaccord, Merezeum Homaccord, and Ginseng compositum mixed together and given orally BID. In wet FIP add Apis homaccord to the BID mixture. For tissue support, give the following formula orally every 3 days: Tonsilla compositum, Coenzyme compositum, and Ubichinon compositum mixed together.

HERPES STOMATITIS

Definition and cause

Feline herpes virus causes upper respiratory infections in cats that include the eyes, oral cavity, sinuses, bronchus, and lungs. This section covers stomatitis. For recommendations for upper respiratory infections, corneal ulcers, or sinusitis/rhinitis, see the appropriate disease protocols.

It is possible that this virus is a cofactor or predisposing causal agent in other chronic diseases. No cure is known. Vaccination prevents clinical infections in many patients, but immunity is short lived (3 years or less). Support of

the patient's native immunity through immunosupportive therapy may be helpful in shortening the disease.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment of viral stomatitis focuses upon inflammation and secondary infection. Broad spectrum antibiotics are commonly prescribed in combination with prednisone (Baker 2003).

L-lysine interferes with arginine absorption, which is essential for herpes viral replication. Use of l-lysine has been shown to assist cats in recovery from clinical disease, lessen the severity, and reduce shedding of the virus after a stressful episode such as rehousing (Maggs 2003, Stiles 2002).

Anticipated prognosis

Prognosis is generally good when there are no secondary infections of complicating diseases. Stomatitis can become recurrent and chronic and require ongoing medication (Norsworthy 2003).

Integrative veterinary therapies

Other concurrent issues may be present in these cats such as genetic defects, nutritional issues, emotional stressors, toxin exposure, iatrogenic factors, concurrent dental disease, allergies, and infectious diseases (FeLV, FIV, Bartonella). Attempts should be made to identify these and eliminate or improve them where possible. These cases can be extremely frustrating to manage.

The integrative approach to viral stomatitis is to focus both locally and systemically on the virus. The use of therapeutic nutrition, medicinal herbs, and homotoxicology remedies either alone or in combination with medications such as antibiotics and cortisone may be required. These combination therapies give the clinician the opportunity to not only control local disease but also to prevent and control secondary disease and autoimmune processes that result from the inflammatory process in the mouth.

Nutrition

General considerations/rationale

Therapeutic nutrition should address the inflammatory process in the mouth along with immune system support to help control viral replication.

Appropriate nutrients

Nutrition/gland therapy: Glandular adrenal, thymus, and bone marrow help to balance immune system organs, provide antioxidants and nutrients to help reduce inflammation, and prevent or control infection (see Gland

Therapy in Chapter 2 for more details). The addition of L-Lysine can also be beneficial for the treatment and control of herpes infection (Maggs 2003, Stiles 2002).

Note: Because viral infections are systemic in that they are allowed to progress based upon the competence of the immune system, it is recommended that the clinician evaluate the blood both medically and physiologically to determine other organ weaknesses and disease (Cima 2000, Goldstein 2000)(see Chapter 2, Nutritional Blood Testing, for additional information).

Coenzyme Q10: CoQ10 is a strong antioxidant that helps to reduce the associated inflammation that is the precursor to many chronic diseases. It has indications in the prevention and treatment of common diseases such as gingivitis and periodontal disease, heart disease, arthritis, diabetes, and many types of cancer (Gaby 1998, Shigeta 1966).

With regards to periodontal disease, double-blind clinical trials shows that people who supplemented with CoEnzyme Q10 had improved results as compared to those taking only a placebo (Gaby 1998). Research suggests that periodontal disease is directly linked to a Coenzyme Q10 deficiency (Nakamura 1973). In addition, double-blind studies show that administering 50 mgs daily for 3 weeks led to a significant reduction in the symptoms of periodontal disease (Wilkinson 1976).

Vitamin C: Vaananen (1993) showed that people who are deficient in vitamin C are more prone to periodontal disease. Aurer-Kozelj (1982) showed that increasing the daily dose of vitamin C from 20 to 35 mg to 70 mgs showed a significant improvement in periodontal disease.

Folic acid: Folic acid, both as a topical rinse and taken systemically, has been clinically proven to be beneficial in reducing inflammation and helping to stop bleeding in people with gingivitis and periodontal disease (Pack 1984; Vogel 1976, 1978).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties that appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune-suppressing effects is beneficial in immune-mediated conditions (Bouic 1996).

Colostrum: Colostrum has been shown to improve intestinal health and digestion and help balance intestinal flora. In addition, colostrum can improve the immune status of the intestinal tract, which can, via intestinal production of globulins, help the overall immune competency of the body (Blake 1999).

Chinese herbal medicine/acupuncture

General considerations/rationale

Herpes stomatitis is due to Wind, Heat, and Toxin accumulation, with Stomach Fire rising up.

Wind blows the pathogen into the body. This causes Heat and Toxin accumulation, which translates into severe inflammation. Because the Stomach opens to the Mouth, Fire in the Stomach can sear the oral mucous membranes. This leads to ulceration. Treatment is aimed at controlling the inflammation, minimizing the ability of the virus to cause pathology, and treating bacterial overgrowth.

Appropriate Chinese herbs

Alisma (Ze xie): Has dual functions of enhancing immunity and decreasing inflammation (Dai 1991). The increased immune defense may help to control the virus as well as decrease secondary infections by oral bacteria.

Anemarrhena (Zhi mu): Increases the corticosterone level in serum and decreases inflammation (Chen 1999). Cortisols are often used to control the inflammation of the gingiva.

Angelica (Dang gui): Has anti-inflammatory action (Yao Xue Za Zhi 1971) yet does not cause immunosuppression. In fact, it increases phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978). This is ideal for a condition wherein inflammation must be addressed but the primary pathogen is a virus and immunosuppression may increase viral replication.

Cinnamon (Rou gui): Normalizes the immune system. It decreases production of nonspecific antibodies (Zeng 1984). At the same time it increases the reticuloendothelial system's ability to phagocytize foreign material (You 1990). It has been proven to have anti-inflammatory effects on both acute and chronic inflammatory conditions (Li 1989).

Crataegus (Shan zha): Enhances immunity. It increases serum lysozyme levels, serum antibody levels, and T cell activity (Jin 1992). In addition to its effects on immunity it has direct antibiotic activity on some bacteria (Guang Xi Zhong Yi Yao 1990, Hao 1991).

Forsythia (Lian qiao): Reduces edema and inflammation by decreasing capillary permeability (Ke 1982). It has demonstrated antiviral and antibacterial effects (Zhang 2002, Ma 1982). This is especially useful in the case of a viral etiology.

Honeysuckle (Jin yin hua): Has antibacterial activity, mainly due to chlorogenic acid and isochlorogenic acid (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). Anti-inflammatory effects have been demonstrated experimentally in rabbits and mice (Shan Xi Yi Kan 1960).

Isatis root (Ban lan gen): Has antiviral activity (Wang 1997, Jiang Xi Yi Yao 1989, Li 2000). In some cases it is as effective as ribavirin (Jiang 1992). It also has antibacterial efficacy (Zhong Cheng Yao Yan Jiu 1987). In addition to direct effects on pathogens, isatis root also stimulates the immune system. It seems to affect both humoral and cellular immunity (Xu 1991).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid. These chemicals have approximately 10% of the steroid effects of cortisone (Zhong Cao Yao 1991). In addition, glycyrrhizin has shown activity against several viruses and therefore may be useful in viral-mediated stomatitis (Zhu 1996).

Ophiopogon (Mai dong): Has demonstrated the ability to inhibit several types of bacteria (Zhong Yao Xue 1998). This may decrease the role of bacteria in the pathology of the disease.

Oriental wormwood (Yin chen): Contains capillarin, which has anti-inflammatory properties (Wan 1987, Shan 1982).

Phellodendron (Huang bai): Has antibacterial actions against a variety of bacteria (Zhong Yao Xue 1998, Zhong Yao Da Ci Dien 1977, Zhong Cao Yao 1985). This may control the secondary bacterial infections.

Plantain seeds (Che qian zi): Decrease inflammation by decreasing capillary permeability (Zhang 1996).

Red peony (Chi shao): Stimulates cellular immunity by enhancing proliferation of T cells (Fan 1992). This may help the body control the herpes virus.

Rehmannia (Sheng di huang): Increases the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998). This may increase the amount of cortisol in circulation, and corticosteroids are commonly used to treat stomatitis by Western practitioners. Rehmannia has been shown to reduce swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Scrophularia (Xuan shen): Inhibits many strains of bacteria (Chen 1986, Zheng 1952). This may control secondary infections.

Sophora root (Shan dou gen): Stimulates the humoral immune system, resulting in increased levels of IgM and IgG (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1989). It also has activity against several types of bacteria (Xian Dai Shi Yong Yao Xue 1988). This may help cover secondary bacterial infections as well as control the viral etiology.

Acupuncture

Gingivitis is on the World Health Organization's list of conditions responsive to acupuncture (World Health Organization 10/15/2006). Many studies demonstrate acupuncture's efficacy in treating dental pain (Rosted 1998, Sung 1977). Other studies have demonstrated the ability of acupuncture to stimulate the immune system and help treat infections (Xu 1986).

Homotoxicology

General considerations/rationale

As a viral infection, herpes virus is an Impregnation Phase disorder. Acute exacerbations can represent regressive vicariation to the Inflammation Phase or progressive

vicariation and deterioration of the case (often associated with stress or other homotoxin damage).

Appropriate homotoxicology formulas

See also feline upper respiratory disease, bronchitis, pneumonia, parainfluenza, stomatitis, and corneal ulcer protocols for more in-depth discussions of these pathologies and therapeutic agents.

Belladonna homaccord: Treats focal, intense inflammatory reactions and intensely red and swollen eyes or gums.

BHI-Sinus: Treats sinusitis.

Echinacea compositum: Provides immune support during infections.

Engystol N: Supports natural defenses in viral infections.

Euphorbium compositum: Antiviral agent. Helps with respiratory signs and limiting viral numbers in initial exposures (Glatthaar-Saalmüller 2001).

Lamioflur: Treats chronic rhinitis and sinusitis and diseases involving mucous membranes and skin.

Mercurius Heel: An antiviral that is useful in some cases of stomatitis.

Mezereum homaccord: Treats vesicular eczema, herpetic skin lesions, and itching and irritated skin (Reckeweg 2000).

Mucosa compositum: Supports mucosal elements in Degeneration Phase disorders and in periods of repair following infection and allopathic therapy.

Nux vomica homaccord: Used for gastrointestinal support, stomatitis, and following antibiotic damage to the mucosal elements and flora of the bowel.

Oculoheel: Supports ocular tissues.

Ranunculus homaccord: Used in human medicine for *Herpes zoster* and shingles signs, intercostals pain, and neuralgia.

Tonsilla compositum: Provides immune and endocrine support in Impregnation and Dedifferentiation phase disorders.

Traumeel S: Has anti-inflammatory and antiviral effects, activates sulfur-containing enzyme systems, and assists in regulation rigidity in chronic diseases.

Authors' suggested protocols

Nutrition

Immune and gingival/mouth support formulas: One-half to 1 tablet BID.

Betathyme: One-half capsule BID.

Coenzyme Q10: 25 mgs for every 10 pounds of body weight BID.

Additional vitamin C: 50 mgs for each 10 pounds of body weight BID.

Folic acid: 25 to 50 micrograms SID.

Colostrum: One-third teaspoon of powdered formula BID.

L-Lysine: 250 mgs SID.

Chinese herbal medicine/acupuncture

Formula H80, Gingival Stomatitis/Chronic: 1 capsule per 10 to 20 pounds twice daily. This formula is useful for acute or chronic gingival stomatitis of bacterial, viral, or immune-mediated etiology. In addition to the herbs cited above, H80 Gingival Stomatitis/Chronic contains aurantium fruit (Zhi qiao), dendrobium (Shi hu), imperata (Bai mou gen), malt (Mai ya), melia (Chuan lian zi), polyphorus (Zhu ling), and sweet wormwood (Qing hao). These additional herbs increase the efficacy of the formulation.

The acupuncture points used include LI4, ST6, and ST7 (Handbook of TCM Practitioners 1987).

Homotoxicology (Dose: 5 to 7 drops PO for cats)

The following combinations are used commonly but have not been evaluated for efficacy. They are offered as a starting point for therapy in these cats:

General herpes infections in cats: Traumeel S, Engystol N, Ranunculus homaccord, Lamioflur, and Mezereum homaccord mixed together and given TID to BID. Euphorbium nasal spray used topically BID. Consider Tonsilla compositum every 3 days.

Stomatitis: Echinacea compositum and Mucosa compositum mixed together and given every 3 days. Traumeel S and Engystol N given BID to TID PO. Consider Belladonna homaccord given BID in acute cases. Nux vomica may help due to its draining effects and is worthy of consideration in the Detox Kit (Lymphomyosot, Nux vomica homaccord, and Berberis homaccord) given for 30 to 60 days 2 to 3 times yearly (Heel 2003).

Corneal ulcers: Traumeel S, Engystol N, Ranunculus homaccord, Lamioflur, Mezereum Homaccord, and Oculheel mixed together and given TID to BID. Ubichinon BID. Also consider Mercurius-Heel for corneal ulceration. Tonsilla compositum and Mucosa compositum given every 3 to 7 days. Euphorbium nasal spray used topically (nasally) BID. Consider Tonsilla compositum every 3 days.

TICK-BORNE DISEASES: LYME, EHRLICHIA, ROCKY MOUNTAIN SPOTTED FEVER

Definition and cause

Rickettsial organisms enter the body following a tick bite. They adhere to cell surfaces and then gain access into various target cells. Once inside, the pathogen multiplies and escapes through one of several mechanisms, which ultimately damage cell integrity.

Autoimmune pathology can develop as antigen-antibody complexes are deposited in tissues such as kidney, joints, and eyes, where they can contribute to more chronic forms of disease pathology (Impregnation and Degeneration phases) (Harrus 1997). *Borrelia* organisms in Lyme disease replicate in endothelial cells, whereas *Ehrlichia* organisms also target macrophages. The organisms replicate in mononuclear cells within the lymph nodes, spleen, bone marrow, and liver, which leads to hyperplasia of the cell lines and organomegaly of the affected organs (Paddock, et al. 2003).

Typical bloodwork shows nonregenerative anemia and thrombocytopenia due to peripheral destruction of red blood cells and platelets. Also seen is leukopenia or pancytopenia due to hypoplastic bone marrow, particularly in German Shepherds. This finding carries a grave prognosis in affected dogs. Also seen are monoclonal gammopathies or lymphocytosis, hyperproteinemia, hyperglobulinemia, hypoalbuminemia, increases in serum alanine transaminase (ALT) and serum alkaline phosphatase (SAP), proteinuria, hematuria, increased bleeding times (even with normal platelet counts), and cerebrospinal fluid in dogs and humans with CNS signs manifesting in similar fashion to a viral infection, e.g., lymphocytic pleocytosis, and increased proteins. Though not commonly reported, Broadfoot has seen some consistent elevations in the eosinophilic fraction of the white cell lines.

The acute phase may last 1 to 4 weeks and either results in complete recovery, or the dog enters an asymptomatic phase that can persist for months to years. In some cases, the only clue that may be present is a permanent mild thrombocytopenia. The factors responsible for the induction of the chronic phase of the disease remain unknown, since dogs can remain healthy for several years following exposure, and there may be some specific breed predilections. The common manifestations of the chronic phase are due to mononuclear phagocytic system hyperplasia and encompass mild to severe clinical signs: weight loss, fever, bleeding, pale mucous membranes, generalized lymphadenopathy, hepatosplenomegaly, uveitis (anterior or posterior, particularly associated with *E. platys*), changes in eye color, blindness, retinal disease (papill-

edema, chorioretinitis, retinal hemorrhage, retinal detachment), neurological signs due to meningoencephalomyelitis, and peripheral limb edema (Paddock 2003).

Other disease processes may be involved and signs of thrombocytopenia, coagulation defects, electrolyte disturbances, encephalitis, hypotension, hypoalbuminemia, anterior uveitis, and other osmotic injuries may require other supportive therapies (Oria 2004). Further complications may manifest in other organ systems, e.g., in splenomegaly, and conditions of rapidly developing icterus. For these cases, refer to the chapters on liver therapies. A central set of symptoms includes lymphadenopathy, conjunctivitis, anemia, critical thrombocytopenia, autoaggression, appetite dyscrasias, rheumatic and joint pains, and neurological deficits to the point of paresis/paralysis. These complications must be addressed. This is a “mimic” disease, and can easily be missed, because it has a myriad of presentations (Appel 2003, Barr 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Conventional therapy consists of suppressing the organism with antibiotics such as doxycycline or chloramphenicol. These are rickettsiostatic and not rickettsiacidal; therefore, full recovery depends upon a properly functioning host defense system. *Ehrlichia* species are susceptible to tetracyclines and their derivatives; many other pathogens, including rickettsiae, chlamydiae, borreliae, mycoplasmas, *Actinomyces* spp., *Vibrio* spp., *Bartonella* spp., and some *Mycobacterium* spp. and protozoa, are also susceptible to tetracyclines. These drugs, particularly doxycycline, represent the treatment of choice for many clinicians. As an alternative or supplement to doxycycline, imidocarb dipropionate (5 mg/kg IM, 2 injections at 14-day intervals) may be used. As with all pharmaceuticals, astute clinicians should be well versed in potential adverse reactions associated with doxycycline and other tetracycline drugs. This is particularly important because some of these adverse reactions are similar to those encountered from the primary rickettsial diseases discussed here (Appel 2003, Barr 2003, Green 1998, Breitschwerdt 1991).

The following serious adverse reactions to doxycycline are reported in humans: “tooth discoloration (pediatric), photosensitivity, superinfection, anaphylaxis, angioedema, lupus-like syndrome, serum sickness-like reaction, vasculitis, pericarditis, hepatitis, autoimmune hepatotoxicity (rare) nephrotoxicity, pseudomembranous colitis (rare) esophagitis (rare, with capsule forms), esophageal ulcer (rare, with capsule forms), pancreatitis, erythema multiforme, exfoliative dermatitis (rare), Stevens-Johnson syndrome (rare), thrombocytopenia, neutropenia, hemolytic anemia, pseudotumor cerebri, bulging fontanels (infants), Jarisch-Herxheimer reaction (brucellosis/spiro-

chetal infections), and fetal harm (in utero exposure)” (Epocrates.com 2006).

Anticipated prognosis

Tick-borne diseases that are diagnosed early and receive appropriate antibiotic therapy respond well and the patients return to health. Recurrences are common, however. The prognosis is poor when there is secondary disease such as autoimmune reactions, arthritis, CNS disease, and bone marrow suppression (Appel 2003, Barr 2003, Green 1998).

Integrative veterinary therapies

The literature specifically links tick-borne diseases to specific rickettsial causes and describes specific antimicrobial agents as the therapy. Symptoms in Lyme disease, for example, can range from mild lameness to immune-mediated glomerular nephritis. What is most often left out of the literature is the immune system’s role in the development of tick-borne diseases. Littman (1997), in her “Why I Don’t Use Lyme Disease Vaccine” discussion, states that in endemic areas, that less than 5% of those animals who are positive for Lyme show any joint disease, fever, lethargy, etc. Similarly, the same percentage of seronegative dogs also demonstrated the same symptoms. That means that approximately 95% of those exposed have immune systems that stop the development of the disease or the associated symptoms.

Integrative therapies therefore should work along with medical therapies to enhance immune function and not only improve healing of current diseases but also prevent future recurrences.

Nutrition

General considerations/rationale

The nutritional approach to tick-borne diseases should be threefold: nutritionally support the target organ (for example, joints, eyes, kidneys); help reduce cellular inflammation; and reduce free radical production and support general immune function and organ integrity.

Appropriate nutrients

Nutrition/gland therapy: Glandular kidney, adrenal, thymus, eye, and bone marrow are often recommended when treating tick-borne disease.

Note: Because tick-borne disease can range in severity from simple limping to serious organ failure it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease, such as glomerular nephritis, and to more specifically formulate the nutritional support

protocol (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Quercetin: Quercetin is a potent antioxidant that helps to reduce cellular inflammation (Knekt 2002).

Vitamin C: Vitamin C has been clinically proven as a potent antioxidant and immune-enhancing agent; it works specifically against infectious agents (Pauling 1976).

Plant sterols: Betasitosterol is a plant sterol and immune modulating agent that has immune-enhancing and anti-inflammatory effects (Bouic 1996, 1999; Gupta 1980; Vanderhaeghe 1999).

N,N-Dimethylglycine: DMG has been shown to support immune function and improve toxin removal (Verdova 1965). DMG has immune modulating ability and has been clinically proven to increase both tumor necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988).

Chinese herbal medicine/acupuncture

General considerations/rationale

In TCM theory, tick-borne illnesses are due to infectious pathogens that allow Wind, Heat and Damp to invade the body. Wind blows the pathogen into the body. If the Wind blows the pathogen into the joint, it causes Heat (inflammation) and Damp (stiffness). The Wind may also blow the pathogen into the Kidney, resulting in renal disease.

Treatment varies depending upon which organ is affected by the pathogen. If it is a musculoskeletal presentation, controlling the pathogen, decreasing pain, and increasing mobility are the goals. If the Kidney is affected, the objectives include repelling the pathogen and supporting renal function as well as treating anemia and/or hypertension secondary to renal pathology. The treatment varies depending upon whether it is an acute infection with much heat and swelling and possibly fever or a more chronic manifestation with more stiffness and dull pain.

Appropriate Chinese herbs for musculoskeletal manifestations

Aconite (Fu zi): Decreases pain (Zhong Guo Zhong Yao Za Zhi 1992). It has been shown to reduce swelling and inflammation in joints (Zhong Yao Tong Bao 1988).

Allium (Cong bai): Has antipyretic effects (Zhong Yao Xue 1998). This may be useful during pyretic phases of the disease process.

Anemarrhena (Zhi mu): Decreases inflammation. The polysaccharides in anemarrhena can raise the plasma corticosterone level in rats (Chen 1999).

Angelica (Bai zhi): Has shown anti-inflammatory, analgesic, and antipyretic effects (Zhong Guo Zhong Yao Za Zhi 1991).

Atractylodes (Bai zhu): Regulates the immune system. It can increase the T helper cell count and the TH/TS ratio

(Xu 1994). This action may help the body to control the pathogen.

Bupleurum (Chai hu): Has dual actions. It contains saikosaponin, which has analgesic and antipyretic properties (Shen Yang Yi Xue Yuan Bao 1984). In addition, it stimulates both humoral and cellular immunity (Shang Hai Yi Ke Da Xue Xue Bao 1986). Finally, it has demonstrated antibiotic effects (Zhong Yao Xue 1988).

Cinnamon twigs (Gui zhi): Have analgesic effects (Zhong Yao Xue 1998). Thirty people with arthritis were treated with a formula containing gui zhi and other herbs. There was complete recovery in 50%, marked improvement in 20%, and some improvement in 17%. Thirteen percent did not respond (Shi Zhen Gua Yao Yan Jiu 1991).

Cnidium (Chuan xiong): Can increase the phagocytic function of macrophages (Lang 1991, Zhao 1993).

Ginger (Sheng jiang): Has anti-inflammatory effects. It can inhibit dimethylbenzene-induced ear swelling in mice and egg-white-induced swelling in rats (Zhang 1989). It has been used effectively to treat arthritis (He Bai Xin Yi Yao 1972, Chi Jiao Yi Shi Za Zhi 1077).

Licorice (Gan cao): Can help to control pain (Zhong Yao Xue 1998). It also has antibacterial efficacy (Zhong Yao Zhi 1993).

Jujube fruit (Da zao): An anti-inflammatory. It decreases dimethylbenzene-induced ear swelling in mice and egg-white-induced toe swelling in rats (Li 1997).

Notopterygium (Qiang huo): Has anti-inflammatory and analgesic effects. It decreases xylol-induced ear swelling and carrageenin- and dextran-induced foot swelling in mice. It also increases the thermal pain threshold. Experimentally, it was shown to decrease pyrexia in rats with induced hyperthermia (Xu 1991). Notopterygium also inhibits the growth of various bacteria (Jin 1981).

Peucedanum (Qian hu): Has demonstrated antibiotic efficacy (Zhong Yao Xue 1998).

Platycodon (Jie geng): Contains platycodin, which counteracts temperature rise in rats (Li 1984, Zhang 1984).

Poria (Fu ling): Inhibits the growth of various bacteria (Nanjing College of Pharmacy 1976). It also increases the phagocytic function of macrophages (Lu 1990).

Pubescent angelica root (Du huo): Has analgesic and anti-inflammatory effects (Zhong Yao Yao Li Yu Ying Yong 1983).

Siler (Fang feng): Decreases fever (Zhong Yi Yao Xin Xi 1990). It also possesses antibiotic properties (Zhong Yao Tong Bao 1988).

White peony: Contains paeoniflorin, which is a strong antipyretic and anti-inflammatory (Zhong Yao Zhi 1993).

Appropriate Chinese herbs for renal manifestations

Achyranthes (Niu xi): Has anti-inflammatory effects. It decreases egg-white-induced foot swelling in rats (Xong 1963).

Angelica root (Dang gui): As strong as aspirin at decreasing inflammation (Yao Xue Za Zhi 1971). In addition it has antibacterial properties (Hou Xue Hua Yu Yan Jia 1981). This may be useful in infection.

Astragalus (Huang qi): Can increase serum albumin and decrease proteinuria, which in turn helps to preserve amino acids, and improves the dysfunctional protein metabolism in glomerulopathies (Zhou 1999). It has demonstrated the ability to lower the blood pressure of animals under anesthesia (Xu 1999, Luo 1999). It may help control renal hypertension.

Cnidium (Chuan xiong): Dilates blood vessels and reduces blood pressure (Zhong Yao Yao Li Yu Ying Yong 1989).

Codonopsis (Dang shen): Can increase the hematocrit and lowers blood pressure (Zhong Yao Xue 1998). This herb may counteract the anemia and hypertension that often accompany renal pathology.

Corn silk (Yu mi xu): Has been shown to lower blood pressure in dogs (Zhong Yao Da Chi Dien 1037). In a trial involving 9 people with chronic nephritis, 3 recovered completely and 2 improved after 2 weeks to 6 months. Kidney function improved, edema was reduced, and proteinuria decreased (Zhong Hua Yi Xue Za Zhi 1956).

Eucommia bark (Du Zhong): Lowers blood pressure. In humans, the zinc:copper ratio in RBC is elevated in hypertensive people as compared to individuals with normal blood pressure. Eucommia can lower the zinc:copper ratio and the blood pressure (Wang 1997). One component, chlorogenic acid, has antibacterial effects (Wang 1993).

Fleece flower root (He shou wu): Has antibacterial properties (Zhen 1986).

Giant knotweed root (Hu zhang): Lowers blood pressure (Xi An Yi Ke Da Xue Xue Bao 1982) and has anti-inflammatory properties (Zhong Guo Yi Yuan Yao Xue Za Zhi 1988).

Honeysuckle (Jin yin hua): Contains chlorogenic acid and isochlorogenic acid. These compounds have antibacterial functions (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). It has demonstrated anti-inflammatory effects in mice and rabbits (Shan Xi Yi Kan 1960).

Imperata (Bai mao gen): Has been used to treat renal inflammation. In one trial 11 children with acute nephritis were treated with imperata. Nine recovered completely and 2 showed moderate improvement. Edema and hypertension resolved and hematuria and proteinuria cleared (Guang Dong Yi Xue 1965).

Isatis root (Ban lan gen): Has demonstrated antibacterial properties in numerous studies (Xu 1987, Li 1994).

Leonurus (Yi mu cao): Protects the kidneys. In one experiment it was shown to decrease renal damage in gentamicin-induced acute renal failure in rats (Xia 1997).

Moutan (Mu dan pi): Inhibits bacterial proliferation (Zhong Yao Cai 1991). It also possesses anti-inflammatory properties. In mice, it can prevent dimethylbenzene-induced ear inflammation and carrageenin-, formaldehyde-, or egg-white-induced foot swelling (Wu 1990). Moutan can decrease blood pressure (Yao Xue Xue 8).

Ophiopogon (Mai dong): Has antibiotic properties (Zhong Yao Xue 1998).

Phellodendron (Huang bai): Has antibacterial effects (Zhong Yao Da Ci Dien 1977, Zhong Cao Yao 1985). It also decreases blood pressure (Zhong Guo Yao Li Xue Tong Bao 1989).

Poria (Fu ling): Has antibacterial effects (Nanjing College of Pharmacy 1976).

Rehmannia (Sheng di huang): Lowers blood pressure (Zhong Yao Xue 1998).

Salvia (Dan shen): Controlled the signs of 70% of 48 patients with chronic nephritis in one study (Shang Hai Yi Yao Za Zhi 1981). It also reduces blood pressure (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1991).

Scrophularia (Xuan shen): Can lower blood pressure (Zhang 1959, Gong 1981). It also inhibits bacteria (Chen 1986, Zheng 1960).

White atractylodes (Bai zhu): Can increase the proliferation rate of CFU-E and BFU-E colonies (Hou 1999). This may make it useful for treating the anemia associated with renal disease. It also decreases the degeneration rate of the kidney (Jing 1997). This effect may help protect the kidney from damage from the immune complex deposition.

Wolfberry (Gou qi zi): Has several functions in an herbal supplement designed for renal disease. It increases the production of red blood (Zhong Yao Xue 1998), decreases blood pressure (Zhong Yao Zhi 1984), and has antibacterial effects (Jin 1995).

Appropriate Chinese herbs for chronic Lyme disease

Angelica root (Dang gui): Increases the phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978).

Astragalus (Huang qi): Stimulates the cellular and humoral immune systems. It contains astragalin, which enhances phagocytic activity of macrophages and antibody synthesis (Jiao 1999).

Codonopsis (Dang shen): Enhances the immune system by increasing the weight of the spleen and thymus and the total number of white blood cells and lymphocytes (Huang 1994).

Dioscorea (Shan yao): Enhances both the cellular and humoral immune systems (Miao 1996).

Fleece flower root (He shou wu): Increases the total white cell count, especially the T cells, and increases the phagocytic activity of macrophages (Zhong Yao Yao Li Yu Lin Chuang 1989).

Licorice (Gan cao): Can enhance the phagocytic activity of macrophages (Zhong Yao Xue 1998).

Lotus seed (Lian zi): Was shown to increase the number of T cells in the thymuses in mice (Ma 1995). This implies that it may be useful in treating immunosuppression.

Poria (Fu ling): Contains pachman, which increases the phagocytic function of macrophages (Lu 1990).

Psoralea (Bu gu zhi): Stimulates the phagocytic actions of macrophages (Wang 1990).

Rehmannia (Shu di huang): Increases the phagocytic activity of macrophages (Cao 1989).

Schizandra (Wu wei zi): Can prevent cyclophosphamide-induced decrease in the white blood count (Li 1995, Qu 1996). It seems to support the production of leukocytes, which may help to strengthen the immune system.

White atractylodes (Bai zhu): Increases the TH cell count and the TH:TS ratio (Xu 1994). It increases the phagocytic function of macrophages (Tang 1998).

Wolfberry (Gou qi zi): Increases the phagocytic activity of macrophage and raises the total T cell count (Zhong Cao Yao 1977).

Zizyphus (Suan zao ren): Enhances cellular and humoral immunity (Lang 1991).

Acupuncture

The World Health Organization has listed pain as a condition that is responsive to acupuncture (World Health Organization 2006). Acupuncture has also been reported to help treat joint inflammation and immune system dysregulation (Ruchkin 1987, Xiao 1992).

Homotoxicology

General considerations/rationale

Localized infection leads to small eschars. Infection of endothelial cells leads to vasculitis, sepsis (Inflammation Phase), and thrombosis (Deposition and Impregnation phases).

Subsequent development of endovasculitis and blockage of vessels can cause gangrenous changes in various tissues (Degeneration Phase) and secondary disease processes. Inflammation Phase symptoms occur as the body attempts to eliminate homotoxins associated with these diseases. The goal of biological therapy in these conditions is to improve immune function, support cellular healing, and excrete homotoxins.

Symptoms often disappear within 3 days of beginning antibiotic therapy in acute cases, but autoaggressive and

other damage in more chronic forms may result in slower recovery rates.

Prevention is through avoidance of tick bites and vaccination. Several vaccinations exist for protection against *Borrelia* in Lyme disease, and as with all such products, adverse reactions to vaccination can occur and no vaccine is protective of 100% of vaccinates. The clinician should carefully weigh the patient's risk of disease and risk of adverse effect prior to selecting a vaccination. Biological therapy can also be used to assist with management of adverse reactions to vaccination such as pain at the site of injection, arthritis, dermatitis, fever of unknown origin, headache, numbness, inappetence, and dizziness.

There are no controlled studies regarding antihomotoxic agents for dogs suffering from tick-borne diseases. The following protocols are theoretical and have been used in the management of patients suffering from these diseases (Broadfoot 2005).

Appropriate homotoxicology formulas

See also anemia, arthritis, autoimmune arthritis, autoimmune anemia/TTP, and other related disorders.

Aconitum homaccord: Treats polyarthritis, particularly when combined with *Rhododendroneel S* and *Bryaconeel*.

Apis compositum: Formerly known as *Albumoheel*, this is a major remedy for renal disease (especially albuminuria and edema). It is also used for glomerulonephritis (acute and chronic), nephrosis, and bleeding from the kidney and bladder (*Nux moschata*). This agent may modify mast cell activity; if so, that might be a theoretical explanation of its mechanism of action.

BHI-Arthritis: Treats swollen, painful joints and muscle stiffness. Particularly useful for those patients that are more affected in cold, wet weather (Heel 2002). This is often the remedy of first choice, because it contains *Bryonia* (common to many other arthritis remedies such as *Arnica-heel*, *Atropinum compositum*, *Bryaconeel*, *Echinacea compositum*, *Rheuma-Heel*, *BHI-Inflammation*, and *BHI-Spasm-Pain*). *Bryonia* is good for acute inflammation of the temporo-mandibular joint, acute rheumatic inflammatory illness—e.g., rheumatic pains in the elbow, wrists, and intercostal muscles—pain in the sacrum and loins, arthritis of the knee joint, and inflammatory pains in the ankle and toe joints, as well as when the synovial membrane and fibrous tissue are also involved. It is an important remedy in acute polyarthritis and acute muscular rheumatism, particularly when ameliorated by pressure.

Ferrum phosphoricum is included for exhaustion, rheumatic conditions, acute rheumatism (which makes its presence felt particularly at night) and especially rheumatic diseases of the spine and shoulder joints (Reckeweg

2002). Also contains *Berberis* (see *Aesculus compositum*), *Arnica* (see *BHI-Injury*), *Causticum* (see *Causticum compositum*), *Colchicum* (see *Aesculus compositum*), *Colocynthis* (see *Colocynthis homaccord*), *Dulcamara* (see *Dulcamara homaccord*), *Ledum* (see *Discus compositum*), *Ranunculus bulbosus* (see *Discus compositum*), *Rhododendron* (see *Rhododendroneel*), *Rhus toxicodendron* (also in *BHI-Back*, *BHI-Inflammation* and *BHI-Injury*), and *Sulphur* (see *BHI-Injury*).

BHI-Bleeding: Contains *Bursa pastoris*, which has specific indications for hemorrhages, hematuria, and epistaxis. The component *Crotalus horridus* is indicated for hemorrhages of dark, fluid blood from the eyes, ears, nose, and any other organ; yellow fever; typhus; viral hepatitis; inflammations with gangrene and sepsis; weak heart; toxic icterus; acute yellow atrophy of the liver; rectal hemorrhage; possibly hemophilia; a tendency to general blood poisoning; and paralysis.

Erigeron canadensis (also in *Hormeel*) is used for bright red spurting hemorrhages, hemoptysis, burning and pain in the eyes, increased mucous secretion from the nose, epistaxis (of bright red blood), hemorrhages in the gums, and rheumatic type pains. Another valuable component of this combination is *Hamamelis* (also in *Aesculus compositum*, *Cinnamomum compositum*, *Cruroheel*, *Hamamelis homaccord*, *Traumeel*, and *BHI-Injury*, etc.). *Hamamelis* is particularly suited for the veins, and is used in venous stasis, varicose veins, and passive hemorrhages of dark blood. There is often pain, as if bruised, in both venous stasis and rheumatism. It can be used for hematemesis with vomiting of dark blood. If there is hematuria, it is usually accompanied by a dull pain in the renal area. Epistaxis, hemoptysis, and bleeding of the skin and mucosae are additional indications.

Ipecacuanha (also in *Aconitum homaccord*, *Mucosa compositum*, *BHI-FluPlus*, *BHI-Nausea*, and others.) is suggested in bright red, gushing hemorrhages that occur both acutely and profusely from the rectum, lungs, nose, bladder, or any other orifice. It is also used for mucosal bleeding and circulatory disorders. *Phosphorus* (also contained in *Echinacea compositum*, *Galium-Heel*, *Gripp-Heel*, *Hepeel*, *Leptandra compositum*, *Molybdan compositum*, *Mucosa compositum*, *Phosphor homaccord*, *Secale compositum*, *BHI-Exhaustion*, *BHI-FluPlus*, etc.) is indicated for visual and hearing difficulties; exhaustion after acute illness; loss of vital fluids; lobar pneumonia; coughing with mucus; blood-streaked, rusty-colored, and possibly salty sputum; purpura; bruises; petechiae; thrombocytopenia; and hematomas. Higher potencies must be used where there is a hemorrhagic tendency. *Phosphorus* is indicated in hepatitis with jaundice and in other kinds of Impregnation and Degeneration phases (e.g., myocardial damage, endocarditis, fatty degeneration of the heart, typhoid anemia, and suppurations of connective tissues

and glands. Clear states of exhaustion require Phosphorus in low potency. Phosphorus is useful in pneumonia, (orally or injected, in the potencies 10 X, 30 X, 200 X and 1,000X). Damage to the parenchyma of the kidneys can occur with albuminuria and nephrosis, and thus, should be considered in these tick diseases with their constellation of damage.

BHI-Infection: Contains *Echinacea angustifolia* (see *Echinacea compositum* and *Echinacea purpurea*). The indications are as for *Echinacea angustifolia*. Used as adjuvant therapy for serious and feverish infections.

Bryaconeel: Treats polyarthritis, particularly when combined with *Rhododendroneel S* and *Aconitum homaccord*.

Coenzyme compositum: Provides metabolic support and energy. It is used in cases of exhaustion, and it may assist in reversing antibiotic-induced damage to mitochondrial elements by activating blocked enzymes.

Colnadul: Used for arthritis worsened by cold, wet weather (*Solanum dulcamara*). Treats stabbing pains and neuralgia (*Citrullus colocynthis*).

Colocynthis homaccord: Useful for pain in the lumbosacral and hip area. Also treats stabbing pains and neuralgia (*Citrullus colocynthis*).

Echinacea compositum: Supports immune function against bacteria and viral infections. Phase remedy for Inflammation and Impregnation phase homotoxicoses. It is named primarily for *Echinacea angustifolia* (common to *Aesculus compositum*, *Arnica homaccord*, *Belladonna compositum*, *Galium-Heel*, *Mercurius-Heel*, *Tonsilla compositum*, *Traumeel*, *BHI-Infection*, and *BHI-Injury*). This useful component is indicated in fever, sepsis, and inflammations of every kind. It is considered an “internal antiseptic” that acts on the lymphatic system, and thus may be useful in diseases whose symptom pictures include lymphadenopathy. There may be fever-type symptoms with a sensation of fullness in the head, a red face, and rapid pulse. Many patients also complained of weakness and sharp, neuralgic pains moving here and there, which fits the migrating pain that is sometimes seen. In addition, a decrease in the red blood corpuscles may occur. This remedy is broadly used for many other symptoms, including adynamic feverish states and blood poisoning. The duration of Lyme disease was reduced when this agent was used (Baselga, 1998). *Echinacea* is also used for the negative consequences of vaccination or when a malignant degeneration begins in the course of acute or subacute illnesses.

Eupatorium perfoliatum (also found in *Echinacea compositum*, *Gripp-Heel*, *BHI-FluPlus*) is included for catarrhal fevers, influenza with pain in the limbs (especially the shin-bones), vomiting of bile, remittent fevers, feverish diseases of the hepatobiliary system; and rheumatism (Reckeweg 2002). Finally, this remedy also includes

Lachesis (see *Klimakteel*) and *Phosphorus* (see *BHI-Bleeding*).

Engystol N: Stimulates cellular immunity. When used in combination with *Gripp-Heel*, there is a demonstrable synergistic increase in phagocytic activity of the immune system, in addition to subjective improvements in the course of the disease (Wagner, et al. 1993).

Ferrum homaccord: Contains *Phosphorus* (see *Klimakteel*) for fever, inflammatory conditions with shoulder pain, patients that seek heat and worsen when cold, and anemia.

Galium-Heel: Provides support of chronic disease states and is a cellular phase remedy.

Ginseng compositum: Increases energy and awareness in geriatric pets, or any others suffering great fatigue. Contains *China* (also in *China homaccord*, another good remedy for exhaustion). *Cinchona succirubra* is well-known as one of the most important remedies from which quinine is obtained. It was formerly used as a specific against malaria. It was also used for fever, particularly undulating fever, and states of exhaustion. In homeopathy, *China* is used less as a fever remedy and more in states of weakness and anemia after losses of vital fluids of all kinds. Substantial loss of blood is a common indication. *China* symptoms are characterized by a pale, yellowish face with sunken eyes. There is also a tendency to profuse hemorrhage of dark blood from various organs; however, it is often expedient to initially treat the hemorrhage symptomatically (e.g. with preparations of *Cinnamomum*) and only to use *China* later on to remove the secondary anemia. Additional indications are disturbances of liver function with loss of appetite, emaciation, sensation of a lump beneath the sternum, abdominal distension, loss of appetite after a few mouthfuls, and icterus. Whereas the episodes of fever, such as those that periodically occur in malaria, may be cured in rare cases by *China* tincture, a suppression of the fever can possibly be achieved with *Chininum sulphuricum* in allopathic dosage. Symptoms that progressively worsen from day to day are characteristic not only of the fever, but also of other conditions that occur in a daily-changing rhythm. There may also be sensitivity in the left hypogastrium, corresponding roughly to the position of the spleen with hepatomegaly and splenomegaly, possibly with icterus (Reckeweg 2002). This also contains *Hydrastis* (see *Mucosa compositum*) and a number of other components to improve body energetics. Clinically, this is a valuable adjunctive remedy (Broadfoot 2005).

Glyoxal compositum: Supports the metabolism and unblocks receptors and enzymes.

Hormeel: Contains several bleeding remedies that are profiled in *BHI-Bleeding*, including *Bursa pastoris*, *Erigeron canadensis*, and *Ignatia*.

***Kalmia compositum*:** Treats right-sided neuralgia and joint pain; red, hot joints; pain in the index finger, and long bone pain.

***Klimakteel*:** Contains Cedron for neuralgias and intermittent fevers, malaria with tumor of the spleen, anemia and dropsical symptoms, neuralgic complaints that accompany iritis and glaucoma, and particularly fevers which recur daily between 13:00 and 18:00. It has Ignatia for intermittent fever, articular pains, possibly weakness in the lower limbs as in incipient primary chronic polyarthritis, jaundice, and febrile attacks similar to malaria.

The constituent Lachesis (also in *Ceanothus homaccord*, *Echinacea compositum*, *Gripp-Heel*, *Mucosa compositum*, *BHI-Inflammation*, *BHI-Pancreas*, and *BHI-Recovery*) is suitable in widely varying illnesses, both functional and organic. Above all, it is suited to septic illnesses and decomposition of the blood, but it is also indicated for thrombocytopenic purpura or hemorrhagic diathesis, stroke, uveitis, nasal catarrh with discharge, malaria, and kidney diseases with edematous swellings. Lachesis is often indicated not only in serious blood dyscrasias but also in disorders of hormonal function. It usually works particularly well in the form of injections, since this is most similar to the natural toxic action of snake venoms. It also treats malignant infectious diseases, acute infections, kidney disorders with albuminuria and dysuria, and skin diseases with exfoliation and hemorrhagic tendency (Reckeweg 2002).

***Lymphomyosot*:** Provides lymph drainage. Aranea diadema, also known as Diadem spider (also present in *Dulcamara homaccord*, *Osteoheel*, *BHI-Bone*, *BHI-Lymphatic*, and *BHI-Migraine*) is indicated in lack of vital heat, chilliness, complaints aggravated by wet and cold, neuralgia of the upper jaw, feeling of ice in bones, hemorrhagic tendency, and colitis with bleeding. It is useful for periodic neuralgia, intermittent fever, paralgnesia, and painful articular disease. Aranea is also said to be indicated in malarial cachexia with considerable enlargement of the spleen, periodically occurring neuralgia, intermittent episodes of fever, paralgnesia, and painful articular disease (Reckeweg 2002).

***Mucosa compositum*:** Normalizes mucosal elements. *Ceanothus americanus* (also in *BHI-Pancreas*) is indicated for complaints of the spleen and a tangled sensation in the left hypochondrium with airhunger. Also has Hydrastis for epistaxis, great weakness, gastrointestinal ulceration, liver conditions with jaundice, cystitis, general physical weakness and exhaustion, and rheumatic muscular and nervous pains. Also contains Ipecacuanha (see *BHI-Bleeding*), Lachesis, and phosphorus (see *Klimakteel*).

***Osteoheel*:** Treats ankle pain. Contains Hekla lava (also in *BHI-Bone*) for a wide variety of bone diseases includ-

ing osteosarcoma, tubercular and syphilitic osteitis, and exostosis. Thus, it is useful in inflammation of bones and periosteum and exostosis. Also contains Calcium phosphoricum (see *Discus compositum*), Kali iodatum for nightly pains in the bones and soft-tissue rheumatism, and Mercurius praecipitatus ruber (see *Discus compositum*) (Reckeweg 2002).

***Phosphor homaccord*:** Treats petechial bleeding and diseases of the liver, kidney, and spleen. Its primary remedy is Phosphorus (see *BHI-Bleeding*).

***Psorinoheel*:** Used for syphilitic miasm and constitutional and miasmatic considerations. A miasm is a particular term signifying a cluster of signs and symptoms that fit a particular disease presentation, which in this case is that of syphilis (Vermulen 1992). Syphilinum has a symptom picture that is often associated with patients suffering from Lyme disease. Hahnemann (1997) called this symptom group the “syphilitic miasm.” Natrum muriaticum is used for edema, hypertension, and possibly a state of anemia. Natrum muriaticum has been found to be a great remedy for intermittent fever, malaria, complaints of the alimentary tract and the skin, and sensations of intense weakness. According to Reckeweg (2002), Nash describes Natrum muriaticum as one of the best remedies for anemia, no matter whether it is a result of loss of vital fluids or other physical influences. Pallor and emaciation are usually present, although the patient eats well. *Natrum muriaticum* can be a very good remedy in intermittent fever, and it works better in high potencies. It also is indicated in rheumatic complaints with coldness of the legs, giving-way of the joints, and nervous twitching during sleep. Natrum muriaticum should also be tried in neuralgias, if other symptoms agree (e.g., emaciation, anemia, long-standing rheumatism, gouty or rheumatic arthritis). *Natrum muriaticum* is also indicated in infiltration of cellular tissue and the glands, where there are exudates and transudates that are not easily reabsorbed, and palpitations with arrhythmias, especially at rest (Reckeweg 2002).

***Rheuma-Heel*:** Treats left sided arthritis of the shoulder or knee.

***Rhododendroneel S*:** Treats polyarthritis, particularly when combined with *Bryaconeel* and *Aconitum homaccord*. Contains Rhododendron, which is said to be used for pains in bones, muscles, and joints, as well as heart complaints (the heart beat often becoming stronger). In many cases these symptoms are typified by an aggravation of complaints before a change occurs in the weather. Because the nervous system is also affected, Rhododendron may also be used in sleeplessness when it has a rheumatic cause. In general, Rhododendron is an anti-rheumatic, but it can be used where there are gouty deposits, particularly in primary chronic arthritis. It is a chief remedy for arthritis, especially when there is deformity

of the small interphalangeal joints. It also has amelioration from movement (cf. *Rhus toxicodendron*), but the pains associated with *Rhododendron* are deeper and localized in the periosteum. Other components of this wonderful combination are *Benzoicum acidum resina* (see *Aesculus compositum*), *Dulcamara* (see *Dulcamara homaccord*), *Ledum* and *Pulsatilla* (see *Discus compositum*), *Spiraea ulmaria* (also in *Ferrum homaccord* and *Neuralgo-Rheum*) for shifting rheumatism, epicondylitis for local infiltration, and *stellaria media* that is called for in gout and rheumatism of the joints of the feet (possibly in psoriasis) and hepatic disorders (Reckeweg 2002).

***Thyroidea compositum*:** Provides matrix drainage and support of endocrine and immune function. Phase remedy for Impregnation Phase diseases.

***Tonsilla compositum*:** Stimulates function of the spleen and immune elements, and is a Degeneration Phase remedy. This remarkable remedy contains *Echinacea angustifolia* (see *Echinacea compositum*) and *Splen suis* (also in *Thyroidea* and *Cutis compositum*) for leukemia, anemia, or agranulocytosis (Reckeweg 2002). It has a wide ranging set of components for revitalization and system support, and is often used in an *autosanguis* (Broadfoot 2005).

***Traumeel*:** An inflammatory mediator and nonsteroidal anti-inflammatory agent. It activates blocked enzymes. *Traumeel* contains *Aconitum napellus* for inflammatory rheumatic complaints, chills, and fever; *Arnica Montana* for soft tissue and joint pain, analgesia, and hemostasis; *Belladonna* for hot, red lesions; *Echinacea angustifolia* to activate mesenchymal defenses, inhibit hyaluronidase, and serve as an anti-inflammatory; and *Echinacea purpurea* to activate the immune response.

***Ubichinon compositum*:** Provides support of deep metabolism and cytochrome oxidase system. Also provides mitochondrial support. Contains *para benzochinonum* (p-benzoquinone), which is indicated in all cellular phases, leukemia, asthma, organic diseases of the nerves, pre-cancerous states, neoplastic phases, hepatitis and other conditions such as in damage to the spleen with changes in the blood composition or states arising from splenectomy, and in pancreatic insufficiency with enzyme disturbance and consequent respiratory problems.

Used in combination with *Malicum acidum*, *Fumaricum acidum*, and *Natrum oxalaceticum*, it is helpful in serious toxic states and in reaction phases. *Para-benzoquinone* may well have an effect in albumin poisoning in which auto-antigens (wild peptides) are involved; auto-immune diseases (e.g. primary chronic polyarthritis, endocarditis, and other auto-immune diseases); and after blood transfusions. *Hydroquinone* is also indicated in right-sided epistaxis, toxicity of the liver (e.g. in jaundice

from various causes) and visual disturbances such as photophobia that causes squinting, foggy vision, and incoordination. A leading symptom in these tick diseases is decreased appetite, sensation of fullness, or loss of appetite after only a few bites. Also contains *Hydrastis* (see *Mucosa compositum*).

Authors' suggested protocols

Nutrition

Immune support formula: 1 tablet for each 25 pounds of body weight BID.

Eye and kidney support formulas: One-half tablet for each 25 pounds of body weight BID.

DMG: 5 mg/pound of body weight daily.

Quercetin: 35 mgs for each 10 pounds of body weight SID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Chinese herbal medicine/acupuncture

Depending upon the presentation, tick-borne illnesses are treated differently. The following formulas can be combined if the patient's condition warrants such therapy.

For musculoskeletal manifestations, the authors use H78 JointGuard at a dose of 1 capsule per 10 to 20 pounds twice daily in conjunction with antibiotics. In addition to the herbs cited above, H78 JointGuard contains *aurantium fruit* (Zhi qiao) to help increase efficacy of the formula.

The authors use the following points for joint pain: GB20, LI11, GV14, ST36, GB34, LI4, Baihui, SP6, and SP9.

For renal disease, the authors recommend H87 Shar pei Fever at a dose of 1 capsule per 10 to 20 pounds twice daily. This supplement is designed for renal disease with an immune component. In addition to the herbs above, H87 also contains *areca peel* (Da fu pi), *ciborium* (Gou ji), *fossil bones* (Long gu), *oldenlandia* (Bai hua she cao), *oyster shell* (Mu li), *pyrola* (Lu xian cao), and *tortoise plastron* (Gui ban) and *carapace* (Bie jia). The additional herbs improve the function of the formula.

For chronic disease, the authors recommend H7 ImmuneStimulator at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, ImmuneStimulator also contains *euryale* (Qian shi), *longan fruit* (Long yan rou), *saussurea* (Mu xiang), and *white peony* (Bai shao). These herbs increase the efficacy of the formula.

Homotoxicology

Due to the wide variety of clinical symptoms associated with rickettsial infections, the following represent starting

points only, and must be adjusted to the clinical syndromes present in the particular patient being evaluated.

Autosanguis according to Broadfoot: Traumeel plus Lymphomyosot; Engystol-N plus Galium-Heel; Mucosa compositum; Tonsilla compositum; and Coenzyme compositum plus Ubichinon compositum. Inject half the material into the patient subcutaneously or into relative acupuncture points, and place the remaining solution into the symptom remedy below.

Symptom remedy: Gingseng compositum, Rhododendroneel, Kalmia compositum, Apis homaccord, and Psorinoheel mixed together and given BID to TID. Consider Phosphor homaccord and Ferrum homaccord for anemia, and BHI-Arthritis for arthritic signs.

Symptom remedy for Lyme arthritis: Rhododendroneel and Bryaconeel given TID. Add the following depending upon location of affected joints: Ferrum homaccord (shoulder), Rheuma-Heel (left stifle), Colnadul (right stifle), Colocynthis homaccord (hip), and Osteoheel (ankle). Echinacea compositum and Traumeel should be given at rate of 1 vial 3 times weekly. Traumeel ointment or gel can be used topically for overnight wraps. Although at first glance an unlikely candidate for this cluster of diseases, the remedy Klimakteel may prove to be a valuable adjunct in patient care.

Detoxification therapy: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum mixed together and given twice weekly for 3 to 4 months. Also give Glyoxal compositum (1 tablet per week) to jump start regulatory functions.

SECTION 4

Western Herbal Disease Protocols

INTRODUCTION

This section addresses some of the veterinary conditions that are sometimes problematic for conventional medicine. Either they are poorly responsive, treatment options are limited, or the medications have undesirable side effects. The list of conditions is not exhaustive, and it is designed to show the breadth and depth of Western herbal medicine. Veterinarians who are seriously interested in treating with herbal medicine are urged to study the subject because it takes dedicated study and several years to master the complexity of the medicines. Herbal medicine can be reduced to biomedical action, which is largely what this section is about, but it has infinitely more power to restore health when combined with a knowledge of individual herbs, their energetics, and breadth of activity, as well as combinations of herbs.

The following section outlines herbs that are supported by science or traditions for particular conditions. The formulas and products suggested are based on diagnoses and are only starting points. However, the patient prescription should ideally NOT be formulated on the basis of the diagnosis, but on the underlying pathophysiology, constitution, and predisposing and perpetuating factors of the individual patient. In this way chronic disease can be treated effectively.

Note that the most effective herbal formula is not based on a shotgun approach but by formulating a synergistic combination of herbs according to presenting signs, pathophysiology of the condition, and energetics of the patient.

See Table 31.1 at the end of this section for a list of herbal products (including ingredients) as well as their suppliers and the conditions that they treat.

Diseases of the Blood and Lymph

HERBS FOR DISEASES OF THE BLOOD AND LYMPH: ANEMIA AND CHYLOTHORAX

When herbalists think of chronic disease they often think of blood cleansers and blood purifiers; however, veterinarians and doctors immediately argue there is no such thing (apart from dialysis and chelation). Nevertheless, alteratives and depuratives are terms that were common in the early veterinary literature until the mid 1900s, and were defined as drugs that effected “gradual change and corrected the morbid condition of organs” (Banham 1935). Herbalists still know them as blood cleansers and blood purifiers. These herbs improve metabolic processes and waste elimination, so they are often mild in action and may have laxative, cholagogue, or diuretic action. This is how they improve general health and it illustrates how these herbs may be thought of as cleansing or purifying.

Herbs that have traditionally been used as alteratives include Burdock, Neem, Oregon grape, Barberry, Gotu kola, Fumitory, Cleavers, Blue flag, Yellow dock, Sarsaparilla, Red clover, and Heartsease. Alteratives should be considered in a formula for any chronic condition as a means of improving overall health from a traditional perspective.

Blood tonics are another traditional category of herbs; they treat anemia or constitutional weakness. Traditional blood tonics include Codonopsis, Polygonum, Dandelion, Alfalfa, Parsley, Nettle, Yellow dock, and others. A number of herbs have demonstrated hematinic effects on erythrocytes and hemoglobin counts. *Angelica sinensis* is a Chinese herb that improves integrity and deformability of erythrocytes (Wang 2001). Human volunteers given *Withania* (*Withania somnifera*) (3 g/day) showed increases in hemoglobin and red blood cell counts (Kuppurajan 1980). In a double-blind study of 60 healthy children, after 30 days the *Withania*-treated group had a significant increase in hemoglobin (Venkataraghavan 1980). A double-blind, placebo-controlled, crossover trial in horses showed that *Echinacea* supplementation for 42 days

increased the size and concentration of peripheral red blood cells, hemoglobin, and packed cell volume (O'Neill 2002). *Rehmannia glutinosa* was shown in one study to improve symptoms and recovery of people with aplastic anemia (Yuan 1998).

“Lymphatic” herbs are also frequently used in chronic disease as well as for conditions affecting the lymphatic system. These include Wild Indigo, Poke root, Cleavers and Calendula. In lymphatic disorders, plants high in rutin may help improve capillary fragility and help prevent edema. These include St. John’s wort, Meadowsweet, Hawthorn, Buchu, Calendula, Cornsilk, Golden Rod, and Sheep sorrel. Edema can be treated with Bilberry, Cleavers, Cornsilk, Dandelion, Echinacea, Feverfew, Gotu kola, Grape seed, and Horsetail. A Bilberry (*V. myrtillus*) preparation (25% anthocyanidins) in rabbits demonstrated significant vasoprotective and anti-edema properties, and it was more active and longer lasting than preparations of rutin or mepiramine (Lietti 1976). Animal models suggest *Echinacea* may reduce inflammation and edema, possibly by inhibiting cyclo-oxygenase and lipoxygenase (Muller-Jakic 1994). Gotu kola (*Centella asiatica*) appears to improve microcirculation and reduce capillary fragility, and it helps prevent microangiopathy in people with hypertension or diabetes (De Sanctis 2001). Grape seed proanthocyanidins (PAs) have demonstrated anti-inflammatory effects on experimental studies in rats and mice (Li 2001) and stabilized capillary walls and prevented the increase in capillary permeability caused by induced toxicity (Zafirov 1990). They significantly increased the rate of disappearance of postoperative edema (Baruch 1984).

Prescription for anemia

The underlying pathophysiology of the anemia must be addressed. Anemia is caused by blood loss (external such as trauma; internal such as tumor, ruptured spleen, anticoagulant toxicity), reduced production of red blood cells (primary bone marrow disease, chronic renal failure, infectious disease, chronic disease), or hemolysis (blood-borne parasites, immune disease, drug-induced).

Therefore, herbal therapy is secondary to diagnosis and treatment of the underlying cause.

Strategy

Blood tonics may be useful to stimulate hematopoiesis and support the patient, particularly in patients with mild anemia secondary to chronic disease. The use of adaptogens (such as *Withania*) assists the patient in coping with physical stress. Mineral-rich herbs can enhance nutrition. Herbs that address the cause are important (for example, anticancer herbs or herbal support for renal disease).

Herbal anemia support formula

The following herbs provide the best results when used in alcohol or glyceract tinctures. Alternatively, teas can be used.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 2 parts.

Codonopsis: Adaptogen, immune enhancer, blood tonic, mild vasodilator; 1 part.

Nettle: Nutritive, hemostatic, circulatory stimulant; 1 part.

Dong quai, rehmannia, or parsley: Blood tonics; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Prescription for chylothorax

Chylothorax is a frustrating and potentially devastating condition. The clinician should attempt to determine the etiology. Often a cause cannot be found and the clinician is left with a diagnosis of idiopathic chylothorax. An herbal formula does not treat chylothorax per se; however, it can be very useful to treat the debility associated with loss of chyle following pleural drainage. Drainage often results in losses of protein, fat, fat-soluble vitamins, antibodies, and lymphocytes into the pleural cavity as well as dehydration and electrolyte imbalances. Along with aggressive nutritional support (low-fat diet and supplementation with fat-soluble vitamins) an herbal prescription might support the patient during treatment and recovery. Surgical management may also be necessary. Other appropriate herbs can be chosen if the underlying cause is known. Potential complications include plueritis.

Strategy

Give Rutin (50 to 100 mg/kg, PO, TID) and consider herbs that contain Rutin. Add immune-supporting herbs and supply adaptogens to assist with physical stress. Consider nervines if the patient is hospitalized and stressed.

If the underlying etiology is known, give herbs that treat that condition. Herbs that are high in proanthocyanidins such as Hawthorn or Grapeseed should be given. Finally, anti-inflammatory herbs and those that support the respiratory system may help.

Herbal chylothorax support formula

The following herbs provide the best results when used in alcohol or glyceract tinctures. Alternatively, teas can be used.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 2 parts.

Hawthorn: Cardiotonic, antioxidant, vasodilator, hypotensive; 1 part.

Echinacea: Immunostimulant, anti-inflammatory, antiviral, vulnerary, antibacterial; 1 part.

Bilberry: Vasoprotective, anti-edema, anti-inflammatory, antioxidant, astringent; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Chapter Twenty

Emotional and Behavioral Conditions

HERBS FOR BEHAVIORAL CONDITIONS

Most behavioral conditions in small animals arise from stress and anxiety. These include aggression, inappropriate urination, lick granuloma, separation anxiety, and storm and other phobias. Herbal medicines provide a number of interesting alternatives to conventional veterinary mood-modifying drugs. The approach depends upon the nature of the behavioral disturbance and the severity and duration of the condition. Other perpetuating factors and health issues such as pain or endocrine disturbances, which can contribute to aggression and anxiety, must be considered.

Nervines are the traditional class of herbs employed for emotional conditions in humans, and they have applications in veterinary medicine, too. Nervines can be further classified. Nervine relaxants have anxiolytic, sedating, or hypnotic activity. They include herbs such as Valerian, Hops, Lavender, Lemon balm, and Passion flower, and may be prescribed for anxiety, hyperactivity, restlessness, and irritability. Nervine stimulants are perhaps the least used group in veterinary medicine, but they may be beneficial for a depressed or hypoactive nervous system. They may be used extensively by veterinary staff in the form of tea and coffee. Others, such as Kola nut and Guarana, can induce anxiety and tension. Perhaps the most useful one in practice is St. John's wort (*Hypericum perforatum*), which can be helpful in mild depression. Adaptogens should also be considered for animals where stress is a cause or outcome of the condition.

What is most surprising about herbal medicine is the fact that herbs have actives that just happen to bind to and interact with neurotransmitter receptors in animals (and humans). For example, American ginseng extracts may regulate GABA-ergic neurotransmission (Yuan 1998). Withania extract contains a constituent with GABA-mimetic activity (Mehta 1991). Chamomile oil also affects GABA-ergic activity (Yamada 2000). In Chinese medicine, Dan Shen is used to "Nourish the Heart and Calm the Spirit" and has been shown to bind to the same sites as benzodiazepines on the γ -

aminobutyric acid (GABA) receptor complex (Lee 1991). Baicalin and Baicalein in Baical skullcap (*Scutellaria baicalensis*) and Skullcap (*Scutellaria lateriflora*) are also known to bind to the benzodiazepine site of GABA-A (Awad 2003).

The lignan hydroxypinoresinol, a constituent of Valerian, binds benzodiazepine receptors and Valerenic acid inhibits the breakdown of GABA (Houghton 1999). Aqueous extracts of valerian root contain significant amounts of GABA, though oral bioavailability of this neurotransmitter is unknown. St. John's wort has a number of constituents thought to be active neurochemicals. Hypericum extract is theorized to indirectly activate sigma receptors (Mennini 2004). Hyperforin leads to non-selective inhibition of uptake of many neurotransmitters, as well as interaction with dopamine and opioid receptors (Butterweck 2003, Simmen 2001).

In addition to appropriate behavioral modification, the following herbs can help address behavioral conditions in veterinary practice.

Ashwaganda (*Withania somnifera*)

Withania is a very useful adaptogen for animals suffering from stress of any kind. The species name *somnifera* refers to the Latin word for sleep; it is a relaxing nervine. Several studies support the use of Withania in nervous exhaustion due to stress and in cachexia to increased body weight (Mishra 2000). The use of withania as a mood stabilizer in clinical conditions of anxiety and depression has been supported by studies (Bhattacharya 2000). Withania alkaloids have exhibited a taming effect and a mild depressant (tranquilizer) effect on the central nervous system in cats, dogs, monkeys, rats, and mice (Malhotra 1965b, Bhattacharya 1997).

Bacopa (*Bacopa monniera*)

Bacopa reduces anxiety, pain, and depression in laboratory animals. In rats, a standardized extract of bacopa (5, 10, and 20 mg/kg) was found to be comparable to the

anxiolytic activity of lorazepam at 0.5 mg/kg IP (Bhattacharya 1998). It was also comparable to the antidepressant activity of imipramine in a rat model of depression using a standardized methanolic extract of bacopa (bacoside A) at 20 and 40 mg/kg PO once daily for 5 days (Sairam 2002). Significant improvements in visual information processing, learning rate, anxiety, and memory consolidation were found following bacopa administration in a double-blind, placebo-controlled clinical trial of people. They were tested after 5 and 12 weeks of administration of 300 mg of bacopa or placebo daily (Stough 2001).

Skullcap (*Scutellaria lateriflora*) and Baical skullcap (*Scutellaria baicalensis*)

Traditionally, Skullcap has been used to treat epilepsy and nervousness. Both species of Skullcap have the constituents baicalin and baicalein. *S. lateriflora* demonstrated anxiolytic effects in rats in an observation study in which they spent more time in the center of an “open-field arena” in a maze test, indicating reduced anxiety (Awad 2003). A double-blind, placebo-controlled study of healthy human subjects showed that the effect of Skullcap on anxiety was pronounced, and results were superior to the placebo (Wolfson 2003). The flavonoids Baicalein, Baicalin, and Wogonin (in Baical skullcap) have anxiolytic effects similar to diazepam but without the typical adverse effects (sedative and myorelaxant) of benzodiazepines (Hui 2002).

Chamomile (*Matricaria recutita*)

In mice, the constituent Apigenin showed anxiolytic activity without sedation, muscle relaxant effects, or anticonvulsant action. A mild sedative effect was gained with a 10-fold increase in dosage (Viola 1995). The oil had significant sedative effects in mice (Wakame 2003), and inhaling Chamomile oil vapor decreased stress-induced increases in the plasma adrenocorticotrophic hormone (ACTH) level in rats (Yamada 1996).

Lemon balm (*Melissa officinalis*)

A randomized, placebo-controlled, double-blind, balanced crossover study in healthy, young human subjects using a high dose (1,600 mg) suggests that Lemon balm can improve cognitive performance and mood; the most notable effects were improved memory and increased calmness (Kennedy 2003). 42 patients with mild to moderate Alzheimer's disease in a 4-month, parallel-group, placebo-controlled trial were given 60 drops daily (equivalent to 1,500 mg per mL) of an extract in 45% alcohol. Compared to the placebo, the Lemon balm extract pro-

duced a significantly better outcome in terms of cognitive function, and agitation was more common in the placebo group (Akhondzadeh 2003). The essential oil of Lemon balm was investigated for agitation in people with severe dementia in a placebo-controlled trial. Seventy-two people with clinically significant agitation with severe dementia were randomly assigned to aromatherapy with Melissa essential oil or placebo (sunflower oil). Sixty percent of the active treatment group and 14% of the placebo-treated group experienced a 30% reduction in agitation, and quality of life indices were significantly greater in the treatment group (Ballard 2003).

Passion flower (*Passiflora incarnata*)

Passion flower is a traditional herb used to treat patients with nervous disorders. The methanol leaf extract of *P. incarnata* exhibited significant sedative, anticonvulsant, and CNS-depressant activities at 200 mg/kg, as well as analgesic and anti-inflammatory activities in mice (Kamaldeep 2003). Anxiolytic effects were demonstrated with methanol extracts of leaves, stems, flowers, and whole plants at 100, 125, 200, and 300 mg/kg, respectively. Roots were practically devoid of anxiolytic effects (Dhawan 2001). Passion flower (45 drops per day) had comparable anxiolytic effects to oxazepam (30 mg/day) in a double-blind, randomized trial of 36 humans with generalized anxiety disorder. Oxazepam provided a more rapid onset of action but a significantly greater number of adverse effects related to impaired job performance. This study suggests that Passion flower is an effective treatment for the management of generalized anxiety disorder (Akhondzadeh 2001).

Kava kava (*Piper methysticum*)

In the Pacific Islands there is a long tradition of Kava consumption for its mind-altering effects. A meta-analysis reviewing the effectiveness and safety of Kava extract for treating anxiety suggested a significant reduction in anxiety in patients receiving Kava extract compared with placebo. Adverse events were mild, transient, and infrequent. It was concluded that Kava extract is an effective symptomatic treatment option for anxiety and is relatively safe for short-term treatment (Pittler 2003). In 50 patients with nonpsychotic anxiety, a placebo-controlled double-blind outpatient trial showed Kava at 50 mg 3 times daily was a safe and effective treatment and was well tolerated (Geier 2004). A randomized, reference-controlled, double-blind, multicenter clinical trial concluded that Kava kava is as effective as buspirone and opipramol in the acute treatment of generalized anxiety disorder and is well tolerated (Boerner 2003). In mice,

Kava extract demonstrated anxiolytic-like activity and a reduced locomotor activity (Garrett 2003).

St. John's wort (*Hypericum perforatum*)

St. John's wort was found to produce significant positive responses for mild to moderate depression in a meta-analysis that reviewed 37 randomized, double-blind, controlled trials. St. John's wort was more effective than a placebo but not for severe depression. However, it was as effective as conventional antidepressants for mild to moderate depression (Linde 2005). In another review of 38 trials, representing 34,804 patients, adverse events were mild and transient in almost all cases (Schulz 2006). In a study of 12 people with obsessive compulsive disorder, treatment with 450 mg of 0.3% hypericin twice daily for 12 weeks, 5 of 12 patients were much or very much improved, 6 were minimally improved, and 1 exhibited no change. Significant change was noted at 1 week and continued to increase in the responsive patients (Taylor 2000).

Valerian (*Valeriana officinalis*)

Valerian has traditionally been used for insomnia, anxiety, maniacal and aggressive behavior, and seizures. A constituent of Valerian binds the 5-hydroxy tryptamine receptor area of the brain implicated in the sleep-wake cycle (Dietz 2005). A review of Valerian for insomnia concluded that studies were inconsistent and that Valerian needs further study (Stevinson 2000). One trial showed equal efficacy for Valerian (600 mg/day) when compared to oxazepam for the treatment of insomnia (Dorn 2000). When Valerian is used for insomnia, it does not work immediately. The onset of action is generally 2 to 3 weeks after beginning supplementation (Wheatley 2005). In a double-blind trial, adults who were given Valerian in laboratory social stress tests reported reduced symptoms of anxiety (Kohnen 1988). In another randomized, double-blind study, 270 mg daily of a standardized Valerian extract was as effective and well tolerated as clobazepam in people with various anxiety syndromes (Sousa 1992). Cats administered Valerian extract (10 mg/kg) by gastric lavage showed significant decreases in restless, fearful, and aggressive behaviors (von Eickstedt 1969).

California poppy (*Eschscholzia californica*)

California poppy has anxiolytic effects in mice at doses of 25 mg/kg (Rolland 1991) and has an affinity for benzodiazepine receptors and peripheral analgesic effects (Rolland 2001).

PRESCRIPTIONS FOR BEHAVIORAL CONDITIONS

Prescriptions for conditions with anxiety as an underlying feature such as aggression, inappropriate urination, separation anxiety, storm and other phobias, and psychogenic self trauma (lick granulomas and overgrooming) may benefit from the following prescriptions.

Strategy

Consider early, appropriate conventional medication if necessary. Implement appropriate behavioral modification, stress reduction, consistent routine, quality play time, and client education (avoid punishment). Consider pheromones and dietary manipulation. Use adaptogens to reduce the impact of stress and use nervines to reduce nervous tension. Also use herbs with anxiolytic activity. Finally, consider the influence of other health issues such as pain on anxiety.

Chamomile tea (carminative, bitter, spasmolytic, anti-anxiety, anti-inflammatory, spasmolytic) should be given for mild anxiety. One-fourth cup per 10 pounds twice daily in food is an easy first choice as adjunctive therapy for mild conditions.

For separation anxiety, give Kava kava (anxiolytic, sedative, antispasmodic). The dried herb should be given at 25 to 75 mg/kg, divided daily (optimally TID). The tincture (60% ethanol) should be given at a ratio of 1:2 to 1:3 : 0.5 to 1.5 mL per 10 kg (20 pounds) divided daily (optimally TID) and diluted or combined with other herbs.

Cats may be given Valerian (sedative, hypnotic, carminative, hypotensive, antispasmodic). The dried herb should be given at a dose of 25 to 75 mg/kg divided daily (optimally TID) if extracted and dried; the dose should be tripled or quadrupled if an unprocessed herb is used. The tincture is difficult to give on its own. The tincture usually is made up of 45% to 55% ethanol. It should be given at a ratio of 1:2 to 1:3 : 0.25 to 0.75 mL per 5 kg (10 pounds) divided daily (optimally TID) and diluted or combined with other herbs.

Herbal anxiety support

Use alcohol or glycerol tinctures for best results. Alternatively, teas may be given.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 2 parts.

Chamomile: Carminative, bitter, spasmolytic, anti-anxiety, anti-inflammatory; 1 part.

Lemon balm: Anxiolytic, sedative, carminative, antispasmodic; 1 part.

Passion flower: Anxiolytic, sedative, hypnotic, antispasmodic, anodyne; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

OR use the following herbs in alcohol or glyceextract tinctures for best results; alternatively, teas may be given.

Elutherococcus: Adaptogenic, immunomodulatory; 1 part.

Chamomile: Carminative, bitter, spasmolytic, anti-anxiety, anti-inflammatory; 1 part.

Lemon balm: Anxiolytic, sedative, carminative, antispasmodic; 1 part.

St. John's wort: Antidepressant, nervine tonic, anti-inflammatory; 1 part.

Passion flower: Anxiolytic, sedative, hypnotic, antispasmodic, anodyne; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Prescription for compulsive disorder

Use alcohol or glyceextract tinctures for best results; alternatively, teas may be given.

Elutherococcus: Adaptogenic, immunomodulatory; 1 part.

St. John's wort: Antidepressant, nervine tonic, anti-inflammatory; 2 parts.

Lemon balm: Anxiolytic, sedative, carminative, antispasmodic; 1 part.

Chamomile: Carminative, bitter, spasmolytic, anti-anxiety, anti-inflammatory; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Diseases of the Cardiovascular System

HERBS FOR DISEASES OF THE CARDIOVASCULAR SYSTEM

Herbs considered important for the cardiovascular system are classified according to traditional actions of cardioactive, cardioprotective, cardiotonic, and circulatory stimulants. Anticoagulants are a more modern application of herbs to cardiovascular disease and nervines and diuretic herbs are traditionally included in formulas. The diseases that are indicated for these herbs include cardiomyopathy (dilatative and hypertrophic), congestive heart failure/valvular disease, heartworm disease, and hypertension.

Cardioactive herbs

Cardioactive herbs are some of the most potentially toxic herbs. Many of these contain cardioactive glycosides such as Foxglove (*Digitalis purpurea*) and Lily of the Valley (*Convallaria majalis*), which are ionotropic and lead to a more efficient and coordinated cardiac contraction. Perhaps the most useful from a veterinary perspective is Bugleweed (*Lycopus europaeus*, *L. virginicus*). It does not contain cardiac glycosides but is still cardioactive. *L. virginicus* was recognized by the early Eclectics as an excellent sedative with properties similar to digitalis but without adverse side effects. *L. europaeus* may have applications in feline hyperthyroidism as well as cardiovascular disease. *L. europaeus* was compared to atenolol in hyperthyroid rats (induced with thyroxine). *Lycopus* extract and atenolol reduced the increased heart rate and blood pressure. The cardiac hypertrophy was alleviated significantly by both treatment regimes. The *Lycopus* extract or the beta-blocking agent showed an almost equal efficacy in terms of significantly reduced beta-adrenoceptor density in heart tissue. Although the mode of action remains unclear, these organo-specific antithyroid effects may help patients with latent hyperthyroidism (Vonhoff 2006).

Cardioprotective herbs

Cardioprotective herbs are used by herbalists to reduce the risk of damage due to ischemia or toxins. Potential actions include increasing cardiac blood flow, raising intracellular levels of cAMP, reducing capillary fragility, reducing peripheral vascular resistance through vasorelaxant activity, reducing cholesterol, and reducing hypertension. These herbs are generally rich in flavonoids, providing antioxidant benefits for systems undergoing oxidative stress. Perhaps the best known and used cardioprotective herb is Hawthorn (*Crataegus* spp), although it is also mildly cardiotonic and possibly even mildly cardioactive. Its activity has been attributed to the flavonoid components, particularly the procyanidins. The beta-adrenoceptor blocking activity of flower, leaf, and fruit extracts (standardized for their procyanidin content) have been demonstrated in vivo in the dog and in vitro in the frog heart (Rácz 1980). Hawthorn has demonstrated hypotensive activity due to a vasodilation action rather than via adrenergic, muscarinic, or histaminergic receptors (Abdul-Ghani 1987). Extracts increased coronary blood flow in vivo (in the dog, cat, and rabbit), reduced blood pressure in vivo (in the dog, cat, rabbit, and rat), increased (skeletal muscle, kidney, head) and reduced (gastrointestinal tract, skin) peripheral blood flow in vivo (in the dog), and reduced peripheral resistance in vivo (in the dog) (Rácz 1980; Abdul-Ghani 1987; Ammon 1981a,b,c; Lièvre 1985; Petkov 1979).

A crude extract of *Crataegus* has been reported to exert a protective action on experimental ischemic myocardium in anesthetized dogs (Lianda 1984a). It was shown to decrease left ventricular work, decrease the consumption of oxygen index, and increase coronary sinus blood oxygen concentrations, resulting in a decrease in oxygen consumption and balance of oxygen metabolism. An increase in coronary blood flow was not observed, in contrast to other studies. The opposing results were attributed by the authors to variation in concentrations of active constituents in different plant parts.

Several clinical studies in humans support the use of Hawthorn. In mildly hypertensive humans, 500 mg daily of Hawthorn extract led to a reduction in diastolic blood pressure (Walker 2002). In a randomized, double-blind, placebo-controlled trial involving 40 patients with chronic heart failure, a commercial Hawthorn/Passion flower extract (standardized on flavone and proanthocyanidin content) given at a dose of 6 mL daily for 42 days demonstrated significant improvements for the treatment group, compared with the placebo with regards to exercise capacity, heart rate at rest, diastolic blood pressure at rest, and concentrations of total plasma cholesterol and low-density lipids (von Eiff 1994). In a randomized, double-blind, controlled trial in 60 patients with stable angina, 60 mg of Hawthorn 3 times daily was reported to increase coronary perfusion and reduce myocardial oxygen consumption (Hanak 1983). Thirty mg of Hawthorn extract (standardized to 1 mg procyanidin) was assessed in a double-blind, placebo-controlled study involving 80 patients. Compared to the placebo, treated patients showed greater overall improvement of cardiac function and symptoms such as dyspnea and palpitations, although there was no significant difference in ECG between the 2 groups (Iwamoto 1981). Most trials demonstrate the greatest effect after 6 to 8 weeks of use, and it may enhance the effects of cardiac glycosides (Jellin 1999).

Arjun tree (*Terminalia arjuna*) also reduced blood pressure and demonstrated positive inotropic activity and β -2-adrenergic activity in an uncontrolled study in dogs (Nammi 2003). Astragalus (*Astragalus membranaceus*) can control a rise in blood pressure and lower the blood pressure of cats, dogs, and rats under anesthesia, and can increase coronary blood flow and decrease coronary circulation resistance (Modern TCM Pharmacology 1997). Garlic (*Allium sativum*) has mild antihypertensive properties in humans, rats, and dogs (Wilburn 2004, Sharifi 2003a,b, Pantoja 1991, Malik 1981). Garlic reduced diastolic blood pressure and heart rate in a study in dogs (Martin 1992, Nagourney 1998).

Valerian (*Valeriana officinalis*), which is better known for its mild sedating properties, dilated pulmonary vascular smooth muscle in cats, probably via nonselective γ -aminobutyric acid (GABA)-mediated mechanism (Fields 2003). Dan Shen (*Salvia miltiorrhiza*) has traditionally been used in China for cardiovascular and cerebrovascular disease; and is contemporarily used in Chinese hospitals to treat angina, acute heart attacks, and hypertension and to assist in recovery from stroke (Chang 1986). It improves coronary blood flow in dogs with experimental acute myocardial infarction. This may be a result of it improving the opening and formation of coronary collateral circulation, thereby protecting myocardia from ischemia (Liu 1999). Korean ginseng (*Panax ginseng*) saponins

have different actions on cardiac hemodynamics, including increasing and decreasing cardiac performance. They also have calcium antagonist activity and a protective effect on experimental myocardial infarction in rabbits (Manren 1987). Tienchi ginseng (*Panax notoginseng*) increased coronary blood flow and had a positive inotropic effect in vitro (Lei 1986).

Cardiotonic herbs

Cardiotonic herbs, like cardioprotective herbs, have a gentle action on the heart compared to the cardioactive herbs which have a much more profound action. Withania (*Withania somnifera*) is a very useful cardiotonic and general tonic for geriatric animals. The effect of Withania was studied on the cardiovascular and respiratory systems in dogs. The alkaloids had a prolonged hypotensive, bradycardiac activity and stimulated the vasomotor and respiratory centers in the brainstem of dogs. The cardio-inhibitory action in dogs appeared to be due to ganglion blocking and direct cardiodepressant actions (Malhotra 1981). Withania extract induced a significant decrease in arterial and diastolic blood pressure in normotensive pentobarbital-anesthetized dogs (Ahumada 1991); 5 mg/kg of Withania extract caused a blood pressure drop in dogs (blocked by atropine, not by mepyramine or propranolol) (Budhiraja 1983). Motherwort (*Leonurus cardiaca*) is traditionally used for palpitations, arrhythmias, and anxiety. One of its constituents, lavandulifolioside, causes decreased blood pressure, significant negative chronotropism, and prolongation of the P-Q and Q-T intervals and the QRS complex (Milkowska-Leyck 2002).

Circulatory stimulants

Circulatory stimulants are traditionally used to “warm” the circulation when there is stagnation of circulation or where blood flow is compromised. Ginkgo leaf extract (*Ginkgo biloba*) has been studied in normal rats and those with ischemic brain damage, and Ginkgo extract given at a dose of 100 mg/kg orally was reported to increase cerebral blood flow in normal rats. The increase was less marked in rats with cerebral artery occlusion, however (Zhang 2000). Dong guai (Angelica sinensis) (2 g/kg body weight) given intravenously to anesthetized dogs increased coronary blood flow from 88 ml before administration to 128 ml (per 100 g cardiac muscle/minute post-injection). Both coronary vascular resistance and myocardial oxygen consumption were reduced, while the heart rate decreased or remained unchanged (Chou 1979). Dong guai injection also has a therapeutic effect in treating acute cerebral infarction in people (Liu 2004b). In rabbits with peripheral circulatory disturbances, Dan Shen (*Salvia*

multiorrhiza) tanshinone derivatives improved blood flow, de-aggregated red blood cells, and inhibited platelet activity (Chang 1986). Dan Shen also provided good results in disseminated intravascular coagulation (Chang 1986).

Nervines may be useful in animals with restlessness, insomnia, and anxiety associated with cardiovascular disease. Valerian (*Valeriana officinalis*), when compared to a placebo, significantly attenuated heart rate and blood pressure changes in people (Cropley 2002). Others include Lemon balm (*Melissa officinalis*), Motherwort (*Leonurus cardiaca*), and Linden (*Tilia platyphyllos*).

Many herbs, including the cardioactive herbs, have traditionally been used to treat “dropsy;” there are too many to list here. Herbs such as Parsley (*Petroselinum crispum*) and Dandelion are frequently included in formulas for heart disease. Dandelion leaf (*Taraxacum officinale*) extracts given orally had a diuretic effect in rats and mice, and the effect was assessed as equal to that of furosemide and stronger than Juniper berry and Horsetail (Bisset 1994). However, diuretic activity was not observed in another study after oral or intraperitoneal administration (Tita 1993).

Anticoagulant herbs are a more modern application and probably have more use in human medicine; however, their use may be important in conditions associated with thrombosis. Garlic (*Allium sativum*) inhibits platelet aggregation (Rahman 2000); however, its potential for red blood cell toxicity in cats and dogs may limit its use. In this author’s experience, the tincture does not appear to cause this problem. Ginkgo extract (*Ginkgo biloba*) containing ginkgolides inhibits platelet aggregating factors (PAF); this may have additive effects for human patients or cats taking anticoagulants to prevent thrombosis (Wynn 2006). Dan Shen (*Salvia miltiorrhiza*) inhibits platelet activity, has antithrombin III-like activity, and promotes fibrinolysis (Chan 2001). In rats fed a high-cholesterol diet, Korean ginseng (*Panax ginseng*) reduced serum cholesterol and triglycerides, decreased platelet adhesiveness, and decreased fatty changes to the liver (Yamamoto 1982). Ginseng has also been shown to reduce blood coagulation and enhance fibrinolysis (Kuo 1990).

FORMULAS FOR CARDIOVASCULAR CONDITIONS

Strategy

Implement appropriate lifestyle changes and appropriate diet. Monitor patients regularly, particularly if herbs are used as the sole treatment for early cases or if the patients are on conventional medication. Doses can be adjusted upwards if changes of less than 20% have been observed per week. The doses of conventional medicines may need

to be reviewed 1 to 2 weeks after beginning treatment with herbs. It is assumed that conventional medicines will be used for diagnosed cardiac disease, whenever good evidence exists for efficacy. In most cases these formulas provide adjunctive care. The formulas below can be made as per the recipe or adapted from other recipes according to patient needs. They are formulated to allow substitution.

Hypertrophic cardiomyopathy

Astragalus: Immune-enhancing, tonic, cardiogenic, nephroprotective, diuretic, hypotensive; 1 part.

Bugleweed: Cardioactive, diuretic, reduced heart rate, sedative, thyroxine antagonist; 1 part.

Motherwort: Sedative, antispasmodic, cardiac tonic; 1 part.

Ginkgo: PAF inhibitor, antioxidant, circulatory stimulant, cognitive enhancer; 1 part.

Dandelion leaf: Diuretic, laxative, cholagogue, anti-rheumatic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Dilated cardiomyopathy

Hawthorn: Cardiogenic, coronary vasodilator, hypotensive, antioxidant; 1 part.

Panax ginseng: Adaptogen, anti-arrhythmic, cardioprotective, circulatory stimulant; 1 part.

Dan Shen: Cardioprotective, hypotensive, anticoagulant, antiplatelet, hepatoprotective; 1 part.

Ginkgo: PAF inhibitor, antioxidant, circulatory stimulant, cognitive enhancer; 1 part.

Lemon balm: Carminative, antispasmodic, sedative; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Mild congestive heart failure

Hawthorn: Cardiogenic, coronary vasodilator, hypotensive, antioxidant; 2 parts.

Korean ginseng: Adaptogen, anti-arrhythmic, cardioprotective, circulatory stimulant; 1 part.

Dandelion leaf: Diuretic, laxative, cholagogue, anti-rheumatic; 1 part.

Lemon balm: Carminative, antispasmodic, sedative; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Heartworm disease

Black walnut hull is commonly advocated for the prevention and treatment of heartworm in dogs; however, there is no traditional or scientific basis for this use to date. In 1 study dogs naturally infected with *Dirofilaria immitis* were treated with alcoholic extracts of Ginger. Ginger at 100 mg/kg administered by 12 subcutaneous injections reduced microfilarial concentration in blood by a maximum of 98%. After the last injection (day 55), an 83% reduction in microfilarial concentration was recorded, suggesting that partial destruction of adult worms had occurred (Datta 1987). A decoction of *Andrographis paniculata* leaves killed the microfilaria of *Dipetalonema reconditum* in 40 minutes in an in vitro study. Infected dogs were given 3 subcutaneous injections of the extract (0.06 mL per kg), which reduced microfilariae by more than 85%. While further injections did not eliminate the infection, the reduced level of microfilaria persisted. Lethargy was observed for 1 week following treatment (Dutta 1982).

Heartworm disease support is indicated during treatment and post treatment. Conventional monthly preventatives are recommended during transmission risk periods. Support protocols include:

Hawthorn: Cardiotonic, coronary vasodilator, hypotensive, antioxidant; 2 parts.

Korean ginseng: Adaptogen, anti-arrhythmic, cardioprotective, circulatory stimulant; 1 part.

Andrographis: Immunostimulant, bitter, anti-inflammatory, hepatoprotective; 1 part.

Ginger: Carminative, antispasmodic, antiplatelet, anti-inflammatory; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Hypertension

Hawthorn: Cardiotonic, coronary vasodilator, hypotensive, antioxidant; 1 part.

Yarrow: Antispasmodic, mild vasodilator, hypotensive, bitter; 1 part.

Astragalus: Immune-enhancing, tonic, cardiotonic, nephroprotective, diuretic, hypotensive; 1 part.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 2 parts.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Feline hypertension

Lemon balm: Carminative, antispasmodic, sedative; 1 part.

Bugleweed: Cardioactive, diuretic, reduces heart rate, sedative, thyroxine antagonist; 1 part.

Motherwort: Sedative, antispasmodic, cardiac tonic; 1 part.

Hawthorn: Cardiotonic, coronary vasodilator, hypotensive, antioxidant; 2 parts.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Chapter Twenty-Two

Diseases of the Skin

HERBS FOR DISEASES OF THE SKIN

Herbal treatment of skin disorders—allergic dermatitis/atopy/flea bite dermatitis, alopecia, chronic pyoderma, and mange (demodectic/sarcoptic)—draws on some traditional concepts that need explanation. The skin is considered to be an outer manifestation of internal health; therefore, skin disease is considered to be a sign of a deeper disease process. Topical herbs are a superficial approach (but can be very useful) and as in conventional medicine, a diagnosis is imperative. There is no point treating a flea allergy dermatitis just with herbs! In most chronic skin conditions the skin lesion is thought to be an effort by the body to release, discharge, or remove toxic substances; therefore, medications that suppress signs (such as corticosteroids) are thought to drive the process deeper over time.

Consideration must be given to the organs of detoxification, and hence in human herbal medicine it is common to hear at least the principle of “detoxification” in order to “cleanse” skin. Even in veterinary medicine, in the early part of the 20th century there were references to Aloes for horses and Jalap for dogs for eczema, as well as alteratives for urticaria. Barbadoes aloe, Aniseed, Ginger, Gentian, Fenugreek, Fennel, and Linseed meal were common ingredients in alterative “physick” balls to improve general condition, including coat condition in horses (Leeney 1921).

When eliminative organs are impaired, toxemia, or the accumulation of toxic metabolites, occurs. In chronic skin disease, the digestive system is the eliminative process most likely to be impaired. The goals of herbal therapy are to remove toxins by enhancing and supporting the eliminatory functions of the body, and alteratives are considered to be fundamental. This group of herbs is thought to effect a change in metabolic processes through mild laxative, diuretic, or cholagogue activity, thus aiding elimination. While the theory of toxemia is a traditional one, there is some scientific support for it. We know that incomplete digestion, inflammation, and a failure of the

local immune response (for systemic tolerance) facilitate the absorption of macromolecules with high antigenicity in animals (Halliwell 1995), leading to the development of food sensitivities and allergies.

There is also increasing evidence to suggest that a leaky gut or a more permeable bowel wall may lead to translocation of bacteria and/or endotoxins, which may be an important stimulus for inflammatory cytokine activation (Krack 2005), as well as increased toxic insult to the liver. Permeability is increased in a number of gastrointestinal diseases (parasitical, infection, inflammation) and by trauma, burns, and nonsteroidal anti-inflammatory drugs (Hollander 1999). Gastrointestinal herbs may correct the leaky gut and can improve overall health and reduce allergies and chronic disease.

Dysbiosis is also thought to be a major contributing factor to chronic disease, including skin disorders and food allergies (Fratkin 1996). It follows the use of antibiotics, other medications, or diets that adversely alter the normal flora; or conditions that allow pathogenic microbes to multiply, producing endotoxins that challenge and deplete the immune system and increase gut permeability (thus predisposing to food allergies and sensitivities). Attention to correcting a suspected dysbiosis is worthwhile and relatively straightforward.

The key principle in addressing chronic skin disease, whether autoimmune, atopic, pyodermic, or simply chronic, is to consider the perpetuating factors such as leaky gut syndrome, dysbiosis, and toxemia, as well as the diet, stress levels, drug use, etc. Emphasis is placed on improving systemic health, not just skin health.

ALTERATIVES OR DEPURATIVES

Alteratives or depuratives, otherwise known as blood cleansers, are used to effect a gradual change in chronic disease states, including skin diseases, and are the foundation of any skin formula. There is a dearth of scientific research to support the use of alteratives; however, traditional use and indications are based on empirical

observations in people and may have application in animals.

Cleavers (*Galium aparine*) are used for dry skin conditions, eczema, seborrhea, and psoriasis. The iridoid glycoside constituents are mildly laxative. Burdock root (*Articum lappa*) is one of the best known alternatives for eczema and chronic inflammatory states. One of its constituents, inulin, works as a gentle laxative. It is traditionally recommended for dry, red, scaly skin with hair loss (Wood 2004). Oregon grape (*Mahonia aquifolium*) is used for rough, dry, scaly skin and dandruff. Red clover flowers (*Trifolium pratense*) and Yellow dock root (*Rumex crispus*) are used for chronic skin disease. Cholaretic herbs are also considered to have depurative activity. These include Dandelion (*Taraxacum officinale*), Fumitory (*Fumaria officinalis*), Barberry (*Berberis vulgaris*), and Globe artichoke (*Cynara scolymus*). Similarly diuretic herbs that increase detoxification through the urinary tract might be useful; these include Dandelion leaf (*Taraxacum officinale*), Cleavers (*Galium aparine*), Burdock (*Articum lappa*), and Red clover (*Trifolium pratense*). Herbs with activity on the immune system are also regarded as possessing depurative activity and include Echinacea (*Echinacea purpurea*), which is indicated in bacterial and viral infections, mild septicemia, furunculosis, boils, carbuncles, abscesses (Bradley 1992, BHP 1983), and poke root (*Phytolacca decandra*), a toxic herb.

It is sensible to use anti-inflammatory herbs while longer-term alternative strategies take effect. Chamomile (*Matricaria recutita*) and its antipuritic effects were tested in mice fed a diet containing 1.2 w/w% of ethyl acetate extract of dried flower of German chamomile for 11 days. Induced scratching behavior was significantly suppressed without affecting body weight. The inhibitory effects of the dietary intake of the German chamomile extracts were comparable to those of an anti-allergic agent (Kobayashi 2003). Green tea (*Camellia sinensis*) catechin may be useful in the treatment of atopic dermatitis (Hisano 2003). Others include Rehmannia (*Rehmannia glutinosa*); evening primrose oil (*Oenothera biennis*); turmeric (*Curcuma longa*)—which, at low levels the constituent curcumin is a prostaglandin inhibitor and at higher levels it stimulates the adrenal glands to secrete cortisone—(Srivastava 1985); and Bupleurum (*Bupleurum falcatum*)—which inhibits arachidonic acid metabolism (Bermejo 1998) and the potency of the anti-inflammatory saikosaponins and is similar to that of prednisolone (Chang 1987).

Gotu kola (*Centella asiatica*) triterpenoids are reported to possess wound-healing ability and its constituents Asiaticoside and Madecassoside are documented to be anti-inflammatory (Jacker 1982). Oregon grape (*Berberis aquifolium*) alkaloids were tested in vitro and found to inhibit lipid peroxide substrate accumulation, either by

direct reaction with peroxide or by scavenging lipid-derived radicals (Bezakova 1996). Licorice (*Glycyrrhiza glabra*) contains saponins with anti-inflammatory activity; it is shown to inhibit the activity of proinflammatory prostaglandins and leukotrienes and appears to have a cortisone-like effect, making it useful as an anti-inflammatory (Okimasu 1983).

Other anti-allergy herbs also have a role to play. An ethanol extract of Astragalus (*Astragalus membranaceus*) was tested on both in vitro and in vivo murine CD4 T cells and their differentiation into Th1 and Th2 subsets. The data indicated that Astragalus selectively alters Th1/Th2 cytokine secretion patterns and provides the pharmacological basis for its clinical applications (Kang 2004).

Astragalus was given to 106 people with herpes virus keratitis; it modulated the imbalance state of Th1/Th2 in these patients and improved their immune function disturbance (Mao 2004). Other anti-allergy herbs include nettles (*Urtica dioica*), Albizzia (*Albizzia lebeck*), and *Albizzia kalkora*, also known as mimosa. Studies on a bark extract of Albizzia showed anti-allergy activity against anaphylaxis and atopic allergy (Tripathi 1979). Albizzia has been shown to stabilize mast cell degranulation, depress levels of anti-allergy antibodies, and decrease the overaggressive action of T and B lymphocytes (Bone 1996).

Baical skullcap root (*Scutellaria baicalensis*) contains the flavonoids baicalin and wogonin (similar to quercetin in mechanism of action), both of which have anti-allergy and free radical scavenging activity (Bochorakova 2003, Lin 1996). Another constituent, baicalein, is also anti-inflammatory and anti-allergy; it reduces leukotriene B4 and C4 production by inhibiting lipooxygenase (Chang 1987). Quercetin is an active flavonoid found abundantly in many plants. Degranulation of mast cells is an active process that requires the influx of calcium. Quercetin prevents this influx into the cell (Nishino 1984). Quercetin also inhibits many steps along the eicosanoid membrane pathway, including phospholipase A2 and lipooxygenase (Yoshimoto 1983). It is a strong inhibitor of basophil and mast cell degranulation (Amellal 1985).

Quercetin is found in *Ginkgo biloba*, Evening primrose leaf (*Oenothera biennis*), Green tea (*Camellia sinensis*), Neem (*Azadirachta indica*), Oats (*Avena sativa*), Apple (*Malus domestic*), Cranberry (*Vaccinium macrocarpon*), Nettle (*Urtica dioica*), and Brassica vegetables. Licorice (*Glycyrrhiza glabra*) is anti-allergic (Baltina 2003) and Rehmannia (*Rehmannia glutinosa*) demonstrated anti-allergic effects on induced allergic reactions in vivo and in vitro by reducing plasma histamine levels in a dose-dependent manner. It also dose-dependently inhibited the histamine release from the rat peritoneal mast cells (Kim 1998).

Licorice helps to reduce oxidative damage associated with inflammation. Other herbs to consider include Ginger (*Zingiber officinale*), Ginkgo biloba, Grape seed (*Vitis vinifera*), Green tea (*Camellia sinensis*), Reishi (*Ganoderma lucidum*), Rosemary (*Rosmarinus officinale*), Skullcap (*Scutellaria lateriflora*), Milk thistle (*Silybum marianum*), and Turmeric (*Curcuma longa*).

Adaptogens should be considered if the patient is stressed, anxious, or depressed, and for convalescence. This type of adaptogens includes Ashwaganda (*Withania somnifera*), Bupleurum (*Bupleurum falcatum*), Licorice (*Glycyrrhiza glabra*), Rehmannia (*Rehmannia glutinosa*), Siberian ginseng (*Eleutherococcus senticosus*), and Gotu kola (*Centella asiatica*). Likewise, nervine herbs can be beneficial. Consider Skullcap (*Scutellaria lateriflora*), Oats (*Avena sativa*), and St. John's wort (*Hypericum perforatum*).

PRESCRIPTIONS FOR SKIN DISEASES

The following prescriptions are suggested as a starting point. Herb selection depends on pathophysiology, the patient, the herbs most suited to the individual, and the actions of the herbs.

General strategies

Consider regulating or enhancing specific body systems, organs, or tissues, and using alteratives to correct imbalances. The gut-skin connection is a central consideration. While the action of alteratives is unclear, they are invaluable in the treatment of chronic allergic skin disease. Optimize nutrition, and improve vitality by using tonics and adaptogens. Concurrent conventional therapy may be required initially, and doses may need to be reduced after 4 to 6 weeks. Continue herbal therapy for a minimum of 3 months.

Atopy and skin allergies

Reduce exposure to known allergens. Consider an elimination diet, as well as herbs that modulate immunity (those that down regulate TH2 cells). Use herbs to reduce allergic pruritis and those with anti-inflammatory action. Also consider herbs that inhibit mast cell release of histamine.

For allergic dermatitis with either dry or moist skin lesions, give:

Burdock: Depurative, mildly laxative, nutritive; 1 part.

Red clover: Alterative; 1 part.

Cleavers: Diuretic, astringent; 1 part.

Nettle leaf: Nutritive, circulatory stimulant, anti-inflammatory, diuretic; 1 part.

Astragalus: Immune modulating, tonic, diuretic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

For atopic dermatitis, give:

Baical skullcap: Anti-allergy, anti-inflammatory, antibacterial, mild sedative, diuretic, bitter; 1 part.

Nettle leaf: Nutritive, circulatory stimulant, anti-inflammatory, diuretic; 1 part.

Burdock: Depurative, mildly laxative, nutritive; 1 part.

Licorice: Anti-inflammatory, adaptogen, laxative, taste improver; 1 part.

Astragalus: Immune modulating, tonic, diuretic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

For alopecia, dry skin, dry or coarse coat, and brittle nails, give:

Horsetail: Contains minerals, including silica; 1 part.

Bladderwrack: Contains iodine, may be useful in sub-clinical hypothyroid; 1 part.

Red clover: Alterative; 1 part.

Burdock: Alterative, mildly laxative, contains linoleic acid; 1 part.

Rehmannia: Adaptogen, blood tonic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food,

For alopecia, substitute Panax ginseng for Red clover. A methanol extract of Panax red ginseng promoted hair growth on mouse vibrissal follicles in organ culture. This indicated that Ginseng radix possesses hair-growth-promoting activity and its bioactive components are partially attributable to the Ginseng saponin components (Matsuda 2003).

Chronic pyoderma

Improve systemic health. Use herbs that improve immunity, reduce bacterial load, and support the lymphatic system. Use alteratives to improve metabolism. The following are suggested:

Echinacea: Immune modulating, anti-inflammatory, antibacterial, antiviral, vulnerary; 1 part.

Cleavers: Diuretic, astringent, lymphatic; 1 part.

Astragalus: Immune modulating, tonic, diuretic; 1 part.

Calendula: Lymphatic, anti-inflammatory, astringent, vulnerary, cholagogue; 1 part.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 1 part.

Poke root: Immune enhancing, lymphatic; add 1/20th of volume of formula.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Chronic demodex

Consider using conventional treatment, which may relieve suffering much faster than herbal treatment. If these treatments are ineffective or inappropriate for the patient, however, consider herbs to improve immunity, reduce secondary bacterial load, improve systemic health (especially GIT health), and nourish skin.

Echinacea: Immune modulating, anti-inflammatory, antibacterial, antiviral, vulnerary; 1 part.

Burdock: Depurative, mildly laxative, nutritive; 1 part.

Panax ginseng: Adaptogen, thymoleptic, tonic, immunostimulant, hepatoprotective; 1 part.

Baptisia: Antimicrobial, antipyretic, antiseptic; 1 part.

Calendula: Lymphatic, anti-inflammatory, astringent, vulnerary, cholagogue 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Consider adding poke root at 5% of the formula for sarcoptic mange. It has been suggested that sarcoptic mange in dogs is susceptible to local application of crude extracts of Garlic, Neem, and Sitaphalas, 1:10 (v/w), resulting in recovery rates of 54%, 67%, and 44%, respectively. The average numbers of days required for complete cure were 22 ± 0.6 , 27 ± 1.7 , and 28 ± 1.9 days. All treatments were ineffective in treating *Demodex* species infection (Dakshinkar 1997).

Chapter Twenty-Three

Diseases of the Digestive System

HERBS FOR GASTROINTESTINAL DISORDERS

In herbal medicine, there is a recognized fundamental linkage between the gut and systemic health in conditions as widely ranging as asthma, atopy, autoimmune disease, and even arthritis. This is important, considering that the gut plays a significant role in immune function. Herbalists emphasize the health of the digestive system, bowel movements, and any symptoms related to gut function—even mild digestive disturbances such as burping, mild constipation, inconsistent stools, or excessive flatulence are always considered significant, even if not the reason for presentation for consultation.

The herbs outlined below are useful in gastrointestinal health and disease management and are supported by traditional use or research. The lists are by no means complete, and there are differences in the potency of the actions of the individual herbs. However, by knowing the particulars of the patient, an herb might be chosen for its breadth of action when more than 1 system is involved or for a particularly strong action that is needed. Sometimes only a gentle stimulation, triggering an appropriate reflex response or dampening a response, may be all that's needed to reach equilibrium again. The beauty and art of herbal medicine is in the selection of herbs that have appropriate action and yet are tailored for the whole health of the individual patient.

Bitters

Bitters, sialogogues, and stomachics refer to herbs that improve digestive function either by increasing saliva production (sialogogue) or increasing gastric secretion (stomachic). They are frequently bitter tasting, hence “bitters.” Some early work carried out in cachectic dogs showed that a tincture of Gentian (*Gentiana lutea*) given by mouth increased appetite, gastric secretion and acid, and pepsin content. It is suggested that the bitter taste has a priming effect on upper digestive function, particularly when

digestion is suboptimal (Moorhead 1915). This is possibly mediated via a reflex vagal stimulation from bitter taste buds, causing increases in gastric acid secretion, gastrin, and gallbladder motility, and priming the pancreas (ACP 1999).

Traditionally, bitters have been an essential component of any digestive tract formula in which upper digestive tract function is impaired. Many herbs have bitter principals, including many of the alteratives, depuratives, and cholaretics. They include Oregon grape (*Berberis aquifolium*), Barberry (*Berberis vulgaris*), Bupleurum (*Bupleurum falcatum*), Golden seal (*Hydrastis canadensis*), Chamomile (*Matricaria recutita*), Picrorrhiza (*Picrorrhiza kurroa*), Baical skullcap (*Scutellaria baicalensis*), Dandelion (*Taraxacum officinale*), Thyme (*Thymus vulgaris*), and Ginger (*Zingiber officinale*).

Carminatives

Carminatives help reduce and dispel gas, and they are a feature of herbs that contain mainly volatile compounds or essential oils. Fennel (*Foeniculum vulgare*) has long been used to relieve the pain of intestinal spasm and gas and is an ingredient of “gripe water” that is used in infant colic. Fennel and other carminatives are thought to relax smooth muscle spasms that occur in response to gaseous distension, leading to relief of intestinal cramping. A fennel infusion in animals reduced peristalsis tone and amplitude 2 to 30 minutes after administration. In vitro studies and animal models indicate that fennel extracts modulate calcium availability and metabolism. In a multicenter, randomized, placebo-controlled trial, Fennel significantly relieved symptoms of infant colic (defined as a decrease in the number of hours spent crying weekly) compared with a placebo (Alexandrovich 2003). Other carminatives include Ginger (*Zingiber officinale*), Peppermint oil (*Mentha x piperita*), Chamomile (*Matricaria recutita*), Thyme (*Thymus vulgaris*), Cinnamon (*Cinnamomum zeylanicum*), Lavender (*Lavendula officinalis*), Lemon balm (*Melissa officinalis*), Catnip (*Nepeta cataria*),

Rosemary (*Rosmarinus officinalis*), Valerian (*Valeriana* spp.), Parsley (*Petroselinum crispum*), and Aniseed (*Pimpinella anisum*).

Spasmolytics

Most of the carminative herbs have spasmolytic activity. They act in various ways; for example, Chamomile's (*Matricaria recutita*) activity has been attributed to apigenin, apigenin-7-O-glucoside, and α -bisabolol, which act similarly to papaverine (Bruneton 1995, Della Loggia 1990). Peppermint oil has been shown to decrease the gut contractile response to histamine, serotonin, acetylcholine, and substance P (Hills 1991) and was shown to suppress gastric spasms in people during upper gastrointestinal endoscopy (Hiki 2003). *Corydalis ambigua* is a traditional anodyne for visceral pain. Others include Cramp bark (*Viburnum opulus*), Wild yam (*Dioscorea villosa*), and Calendula (*Calendula officinalis*).

Antacid, anti-ulcerogenic, and anti-inflammatory herbs

Several plants help protect gastric mucosa and heal ulcers. Meadowsweet (*Filipendula ulmaria*), which contains salicylates administered at rates of 0.7 and 1.25 ml/kg, was shown to reduce ulceration (induced by aspirin) in an in vivo study by 25.4% and 26.2%, respectively (Gorbacheva 2002). Licorice given orally for 3 days protected rats against induced duodenal ulcers but was ineffective against acute aspirin-induced gastric ulcers. The effect of Licorice may be due to inhibition of acid-pepsin secretion and augmentation of mucosal defensive factors. These mucosal defense factors may include enhanced mucin secretion and decreased cell shedding or acceleration of mucin excretion via Licorice increasing the synthesis of glycoprotein at the gastric mucosa, prolonging the life of the epithelial cells and antipepsin activity (Dehpour 1995). Oral administration of deglycyrrhizinated Licorice (380 mg, 3 times daily) to 169 patients with chronic duodenal ulcers was as effective as antacid or cimetidine treatments, indicating that constituents other than glycyrrhetic acid contribute to its anti-ulcer activity (Kassir 1985).

Turmeric extracts (water or ethanol) reduced gastric secretion in rabbits (Sakai 1989) and increased the mucin content of gastric juice (Rafatullah 1990). Extracts from Lemon balm (*Melissa officinalis*), Chamomile (*Matricaria recutita*), Peppermint (*Mentha x piperita*), Licorice (*Glycyrrhiza glabra*), Angelica root (*Angelica archangelica*), Milk thistle (*Silybum marianum*), and greater Celadine (*Chelidonium majus*), singly and combined, produced a dose-dependent anti-ulcerogenic activity associated with reduced acid output and increased mucin secretion,

increased prostaglandin E₂ release, and decreased leukotrienes (Khayyal 2001). An ethanolic extract of Parsley (*Petroselinum crispum*) protected gastric mucosa against induced ulcers in rats (Al-Howiriny 2003). Other anti-ulcerogenic herbs include Gotu kola (*Centella asiatica*) and Chamomile (*Matricaria recutita*), and anti-inflammatory herbs include Dong guai (*Angelica sinensis*), Baical skullcap (*Scutellaria baicalensis*), Calendula (*Calendula officinalis*), Wild yam (*Dioscorea villosa*), Slippery elm (*Ulmus rubra*), and Marshmallow (*Althaea officinalis*).

Demulcents and mucilages

Demulcents are used to soothe and protect an alimentary mucous membrane (buccal, pharyngeal, oesophageal, and gastric mucosa), whereas mucilages refer to plants that contain mucilaginous substances, which cause demulcency. Marshmallow (*Althaea officinalis*) is a mucilage and has a demulcent action due to its high content of polysaccharide hydrocolloids, which form a protective coating on the oral and pharyngeal mucosa, soothing local irritation and inflammation (Franz 1989).

Adhesion of constituents varies between plants. Polysaccharides from *Althaea officinalis*, *Plantago lanceolata*, *Malva moschata*, or *Tilia cordata* showed moderate bioadhesion to epithelial tissue compared to polysaccharides from *Fucus vesiculosus* and *Calendula officinalis*, which were concentration-dependent. Histological studies of membranes indicated the presence of distinct polysaccharide layers on the apical membrane surface, which account (in part) for the therapeutic effects of mucilage-containing plants in the treatment of irritated membranes (Schmidgall 2000). Demulcent action is found in Marshmallow (*Althaea officinalis*), Slippery elm (*Ulmus fulva*), Sarsaparilla (*Smilax ornate*), Licorice (*Glycyrrhiza glabra*), Bladderwrack (*Fucus vesiculosus*), Fenugreek (*Trigonella foenum-graecum*), Mullein (*Verbascum thapsus*), Calendula (*Calendula officinalis*), and Corn silk (*Zea May*).

Intestinal astringents

Intestinal astringents are most useful in acute diarrhea. Most of these herbs contain tannic acid, which precipitates protein on the mucosal surface. This acts as a barrier between tissue and irritant, and the protecting and soothing effect is enhanced by an astringent action on any exposed nerve endings so that pain is lessened. Herbs that are high in tannins are ideally used for short periods only, and they can interact with or limit absorption of some alkaline drugs. Intestinal astringents including Agrimony (*Agrimonia eupatoria*), Tormetil (*Potentilla tormentilla*), Blackberry (*Rubus fructosis*), and stewed Tea (*Camellia sinensis*).

Laxatives

Herbs with laxative action contain aperients, which promote a natural movement of the bowels rather than provoking them forcibly. These safe-to-use laxatives include Psyllium, Linseed, and dietary fibers, as well as Burdock (*Articum lappa*), Oregon grape (*Berberis aquifolium*), Barberry (*Berberis vulgaris*), Licorice (*Glycyrrhiza glabra*), Rehmannia (*Rehmannia glutinosa*), and Dandelion (*Taraxacum officinalis*).

Aloe (*Aloe barbadensis*) was a popular anthracene purgative until synthetic anthraquinones were introduced in veterinary medicine. Cascara (*Rhamnus purshiana*) was also used in cats and dogs. It has been suggested that Cascara and Buckthorn (*Rhamnus frangulara*) may be the preferred herbs of choice for constipation in cats (Wynn 2003). Senna pod (*Cassia angustifolia*) produces sublaxative effects at low doses, whereby the bowel motions are made comfortable, normal, and soft. Other laxatives include Fringe tree (*Chionanthus virginicus*), Fumitory (*Fumaria officinalis*), Licorice (*Glycyrrhiza glabra*), Butternut (*Juglans cinerea*), Yellow dock (*Rumex crispus*), and Fenugreek (*Trigonella foenum-graecum*).

Anti-emetics

When emesis is centrally initiated, the cause must be diagnosed. Conventional medications should be considered, although herbs can be given via enema. Administering herbs to a vomiting animal is not recommended; However, for chronic gastritis, demulcents (which coat, protect, lubricate, and soothe the gastric mucosa) and local gastric sedatives (antacids and stomachics) might be helpful to suppress the vomiting reflex.

Ginger (*Zingiber officinale*) significantly reduced the number of vomiting episodes in healthy dogs with cisplatin-induced emesis (3 mg/kg IV), at doses as low as 25 mg/kg per os. The highest dose tested for both ethanol and acetate extracts was 200 mg/kg, which led to the fewest vomiting episodes but a shorter latency in minutes to the first episode. These doses were comparable with the anti-emetic efficacy of granisetron. Because Ginger was ineffective in inhibiting apomorphine-induced emesis (which was mediated through a dopaminergic mechanism), the authors hypothesized that 5-HT₃ receptors may be involved in the activity of ginger (Sharma 1997). The emetic action of the peripherally acting agent copper sulfate was also inhibited in dogs given an intragastric dose of Ginger extract (Zhou 1960). Ginger's anti-emetic activity is peripheral (it does not involve the central nervous system) and has been attributed to the combined action of zingerones and shogaols (Ghazanfar 1994).

Antimicrobials

Many herbs have direct antimicrobial activity in the gastrointestinal tract. Berberine (in several herbs) and hydrastine (in golden seal) are some of the best studied for GIT infections. The isolated alkaloid berberine has been shown to inhibit intestinal fluid accumulation and smooth muscle contraction, reduce inflammation, and suppress bacterial enterotoxin formation. Tormetill root (*Potentilla erecta*) extract in controlled doses shortened the duration of rotavirus diarrhea and decreased the requirement for rehydration solutions in children suffering from rotavirus diarrhea (Subbotina 2003). It also may be useful in rotaviral infections in animals.

Consider immune-modulating herbs such as Echinacea, Astragalus, Andrographis, and Picrorrhiza in microbial infections. Most herbs with antimicrobial activity have other properties, which should be considered, depending on the nature of the condition. Just some of the herbs to consider include Chamomile (*Matricaria recutita*), Thyme (*Thymus vulgaris*)—especially against helicobacter—Picrorrhiza (*Picrorrhiza kurroa*), Oregon Grape (*Berberis aquifolium*), Barberry (*Berberis vulgaris*), Golden seal (*Hydrastis sinensis*), Fennel (*Foeniculum vulgare*), and Citrus seed extract (*citrus spp.*).

Parasitides

Many herbs have well researched activity against parasites. The traditional approach in veterinary medicine prior to modern anthelmintics was to use fairly toxic herbs and to purge parasites, often leading to cramping and diarrhea. Current anthelmintics pose little risk and work well; however, some people prefer not to use drugs and desire herbal options. Garlic is frequently mentioned as an effective worming agent. It has some activity against roundworm (*Ascaris strongyloides*) and hookworm (*Ancylostoma caninum* and *Necator americanus*). Allicin appears to be an anthelmintic constituent, but diallyl disulphide was not effective (Kempinski 1967, Soh 1960). However, garlic (whole clove) efficacy has not been well documented and may in fact be ineffective for parasite control (Abells 1999).

The alkaloid berberine (in Barberry and Oregon grape, among others) showed strong nematocidal activity against *Toxocara canis* in vitro (Satou 2002). Hydrastine (in Golden seal) has been studied on the protoscolices of the tapeworm (*Echinococcus granulosus*) in vitro and in vivo. Hydrastine at 0.3% concentration produced 70% mortality of the larvae in both experiments (Chen 1991). Cucurbitine contained in crushed pumpkin seeds is 55% efficacious against *Taenia saginata* (Pawlowski 1970).

Herbs that have been traditionally used for their anthelmintic activity in humans and animals include

Wormwood (*Artemisia absinthium*), Butternut (*Juglans cinerea*), Thyme (*Thymus vulgaris*), and Ginger (*Zingiber officinale*). A number of herbs have shown antiprotozoal activity; they include Oregano (*Oreganum vulgare*), Propolis, Sweet Annie (*Artemisia annua*), and berberine-containing herbs. Essential oils may also be effective, preventive, or curative treatments against several flagellated parasites; however, efficacy is not well documented and conventional treatment is more likely to be curative.

Liver and gallbladder herbs

Cholagogues, which stimulate the release and flow of bile already formed in the liver, and choleretics, which stimulate bile production by hepatocytes, are often found in bitter herbs. Cholagogues are used to improve the “cleansing of the liver” by improving bile excretion. Cholagogues include Agrimony (*Agrimonia eupatoria*), Oregon grape (*Berberis aquifolium*), Calendula (*Calendula officinalis*), Greater celandine (*Chelidonium majus*), Fringe tree (*Chionanthus virginicus*), Turmeric (*Curcuma longa*), Globe artichoke (*Cynara scolymus*), Wormwood (*Artemisia absinthium*), Picrorrhiza (*Picrorrhiza kurroa*), Yam (*Dioscorea spp*), Gentian (*Gentiana lutea*), Chamomile (*Matricaria recutita*), Yellow dock (*Rumex crispus*), Milk thistle (*Silybum marianum*), and Dandelion (*Taraxacum officinale*). They are often combined with laxatives in the treatment of liver disease and wider liver dysfunction (Mills 1989).

Choleretic herbs improve liver function and are particularly indicated if digestive symptoms are predominant. Most of the hepatoprotective herbs have choleretic activity. Contraindications for choleretic and cholagogues include obstructed bile ducts (e.g., bile duct or pancreas cancer), jaundice following hemolytic diseases, acute or severe hepatocellular disease (e.g., viral hepatitis, septic cholecystitis, intestinal spasm or ileus), or liver cancer. Strongly choleretic herbs include Hydrastis (*golden seal*), *Berberis vulgaris* (*Barberry*), and *Bhelidonium* (*greater celandine*). Bitter herbs can cause nausea in patients with liver damage so they should be avoided after hepatic restoratives have been used. Choleretics include *Artemisia absinthium*, *Berberis vulgaris*, *Calendula officinalis*, *Chelidonium majus*, *Glycyrrhiza glabra*, *Hydrastis canadensis*, *Mentha x piperita*, *Silybum marianum*, and *Zingiber officinale*.

Hepatotonic herbs include those with choleretic, cholagogue, hepatoprotective, or hepatorestorative properties. They include *Andrographis* (*Andrographis paniculata*), Oregon grape (*Berberis aquifolium*), Barberry (*Berberis vulgaris*), Bupleurum (*Bupleurum falcatum*), Fringe tree (*Chionanthus virginicus*), Globe artichoke (*Cynara scolymus*), *Panax ginseng*, *Phyllanthus*

(*Phyllanthus amarus*), Picrorrhiza (*Picrorrhiza kurroa*), Dan Shen (*Salvia multirrhiza*), Schisandra (*Schisandra chinensis*), Milk thistle (*Silybum marianum*), and Dandelion (*Taraxacum officinale*). Hepatorestorative herbs restore liver parenchyma. *Panax ginseng* (250–500 mg/kg) accelerates liver regeneration and ameliorates liver injury after hepatectomy in dogs (Kwon 2003). In studies relating to regeneration of livers of rats subjected to partial hepatectomy, silybin from Milk thistle (*Silybum marianum*) increased mitotic activity of Kupffer’s cells (Magliulo 1979). Globe artichoke (*Cynara scolymus*) is also considered to be regenerative.

The hepatoprotective herb Milk thistle (*Silybum marianum*) is one of the best known liver herbs. It protected against *Amanita phalloides* poisoning in Beagles and prevented deaths in all of the silibinin-treated dogs compared to controls (Vogel 1984). Silymarin was tested in dogs suffering from CCl₄ intoxication of the liver and treated dogs had significantly lower AST and ALT compared with the control CCl₄-intoxicated group (Paulova 1990). Other herbs with hepatoprotective properties include Burdock (*Articum lappa*), *Andrographis* (*Andrographis paniculata*), Bupleurum (*Bupleurum falcatum*), Turmeric (*Curcuma longa*), Globe artichoke (*Cynara scolymus*), Asian Ginseng (*Panax ginseng*), *Phyllanthus* (*Phyllanthus amarus*), Picrorrhiza (*Picrorrhiza kurroa*), Dan Shen (*Salvia multirrhiza*), Schisandra (*Schisandra chinensis*), and Dandelion (*Taraxacum radix*).

Pancreatic herbs

A number of herbs have traditional indications for pancreatic disorders; some have been supported by research. Fringe tree (*Chionanthus virginicus*) is one of the best known traditional herbs advocated for pancreatic disease, inflammatory or otherwise, and for diabetes (Felter 1898). Gymnema (*Gymnema silvestre*) doubled the number of islet cells and beta cells in diabetic rats after 60 days of administration. It was suggested that it could bring about blood glucose homeostasis through increased serum insulin levels provided by repair/regeneration of the endocrine pancreas (Shanmugasundaram 1990).

Emodin (in *Aloe vera* and other herbs) is a potent agent in the management of clinical and experimental acute pancreatitis. In experiments of induced pancreatitis in rats, the emodin-treated group had significantly lower serum amylase levels compared to controls. Emodin might upregulate gene expression, which subsequently increases DNA synthesis and protein content and then accelerates pancreatic repair and regeneration (Gong 2002). Emodin in combination with baicalein has significant therapeutic benefits in severe acute pancreatitis in rats (Zhang 2005). Dandelion (*Taraxacum officinale*) showed insulin secretagogue activity (Hussain 2004), and in a study of induced

pancreatitis in rats, it (10 mg/kg PO) reduced IL-6, a principal mediator of acute phase response, and TNF- α production during cholecystokinin-induced acute pancreatitis (Seo 2005).

FORMULAS FOR GASTROINTESTINAL CONDITIONS

The formulas below are indicated for gingivitis, stomatitis, and periodontal disease; food allergy gastritis and enteritis; gastritis and vomiting; immune-mediated inflammatory bowel disease; internal parasites (coccidia, giardia, roundworms, hookworms, whipworms, and tapeworms); chronic active hepatitis and cholangiohepatitis; and acute and chronic pancreatitis.

Strategy

Implement appropriate lifestyle changes and appropriate diet. Monitor patients regularly, particularly if herbs are used as the sole treatment for early cases or if the animals are on conventional medication. Doses can be adjusted upwards if no changes of 20% per week have been observed. Doses of conventional medicines may need to be reviewed 1 to 2 weeks after commencing treatment with herbs.

These formulas can be made as per the recipe or adapted from other recipes according to patient needs. They are formulated to allow substitution.

Gingivitis and periodontal disease and stomatitis

Implement dental prophylaxis and teeth cleaning. Use vulnerary (wound healing), anti-inflammatory, and antimicrobial herbs, and consider immune-supporting herbs. Improve peripheral circulation and control pain. Use Coenzyme Q10 (30 to 100 mg).

There is some research to support the use of the following herbs for gingivitis and periodontal disease: Calendula (*Calendula officinalis*) (Krazhan 2001), Green tea (*Camellia sinensis*) (Yun 2004), Gotu kola (*Centella asiatica*), and Pomegranate (*Punica granatum*) (Sastravaha 2003). Others include Chinese basil (*Perilla frutescens*), Witch hazel (*Hamamelis virginiana*), Marshmallow (*Althaea officinalis*), Propolis, and berberine-containing herbs and *Aloe vera* gel. Other classics include Myrrh (*Commiphora myrrha*), Golden seal (*Hydrastis canadensis*), Coptis (*Coptis chinensis*), and Sage (*Salvia officinalis*). If gums are bleeding consider Bilberry (*Vaccinium myrtillus*) or Yunnan pai yao.

Calendula: Antiseptic, anti-inflammatory, astringent, vulnerary; 1 part.

Echinacea: Immunostimulant, anti-inflammatory, antimicrobial, vulnerary; 1 part.

Baptisia: Antimicrobial, antiseptic, antipyretic; 1 part.

Gotu kola: Adaptogen, connective tissue regenerator, nerve tonic, alterative; 1 part.

Bilberry: Anti-edema, antioxidant, anti-inflammatory, astringent; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Food allergy, gastritis, vomiting, and enteritis

Identify the cause by using a food elimination trial or single protein source diet or by giving frequent small meals. Use conventional medications as necessary for symptomatic relief of pain and discomfort. Use demulcent herbs and anti-inflammatory herbs, and consider carminative and spasmolytic herbs.

Chamomile: Carminative, anti-inflammatory, bitter tonic, cholagogue, anti-allergic, mild sedative, spasmolytic; 2 parts.

Milk thistle: Antioxidant, hepatoprotective, hepatonic; 1 part.

Globe artichoke: Bitter tonic, cholagogue, choleric, hepatoprotective; 1 part.

Marshmallow: Demulcent, vulnerary, diuretic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Inflammatory bowel disease

Identify the cause. Address possible food sensitivity and allergy, as well as stress. Use conventional medications as necessary for symptomatic relief of pain and discomfort. Use demulcent herbs and anti-inflammatory herbs, and consider carminative and spasmolytic herbs.

Oral aloe vera gel was assessed in vitro on the production of reactive oxygen metabolites, eicosanoids, and interleukin-8, all of which may be pathogenic in inflammatory bowel disease. The results indicated that it may have a therapeutic effect in inflammatory bowel disease (Langmead 2004a,b).

Chamomile: Carminative, anti-inflammatory, bitter tonic, cholagogue, anti-allergic, mild sedative, spasmolytic; 1 part.

Calendula: Antiseptic, anti-inflammatory, astringent, spasmolytic, vulnerary, cholagogue; 1 part.

Meadowsweet: Anti-ulcerogenic, antacid, anti-inflammatory, astringent; 1 part.

Marshmallow: Demulcent, vulnerary, diuretic; 1 part.

Astragalus: Immune modulating; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Parasites

Conventional treatment is safe and effective. When considering herbal treatment, fecal floats prior to and post herbal treatment are useful to monitor efficacy. Long-term use of herbal formulas is generally required for treatment. If animals are predisposed to parasites, consider improving the diet and use herbs to improve digestive function and immunity.

Calendula: Antiseptic, anti-inflammatory, astringent, spasmolytic, vulnerary, cholagogue; 1 part.

Astragalus: Immune modulating; 1 part.

Oregon grape: Cholagogue, mild laxative, bitter tonic, alterative, 1 part.

Thyme: Carminative, antispasmodic, anthelmintic, astringent; 1 part.

Wormwood: Bitter tonic, anthelmintic, cholaretic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food.

Chronic active hepatitis and cholangiohepatitis

It is important to determine the underlying pathophysiology of particular hepatic disorders to tailor treatment for the individual case. Antimicrobial, antiviral, and immune-enhancing herbs may be necessary. Where fibrosis is a concern, hepatotrophorestorative herbs are an important part of the strategic treatment. Consider hepatoprotective herbs to minimize liver damage and consider using silybum and schisandra in more concentrated forms, perhaps by adding tablet forms alongside a formula. Consider immune-enhancing herbs such as *Astragalus* (*Astragalus membranaceus*) for chronic infection, as well as *Picrorrhiza*. For more acute infections consider *Echinacea* or *Andrographis*. In acute infections and viral infections consider St. John's wort (*Hypericum perforatum*) and *Phyllanthus* (*Phyllanthus amarus*). Consider hepatic trophorestoratives such as *Panax ginseng*. For toxic insults to the liver consider Milk thistle (*Schisandra chinensis*) and *Silybum* (*Silybum marianum*).

Bupluerum: Hepatoprotective, anti-inflammatory, tonic; 1 part.

Schisandra: Hepatoprotective, nervine tonic, adaptogen; 1 part.

Milk thistle: Hepatotonic, hepatoprotective, antioxidant; 1 part.

Panax ginseng: Adaptogen, anti-inflammatory, anti-allergic, immune enhancing, hepatorestorative; 1 part.

Astragalus: Immune modulating; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Pancreatic disease

Conventional treatment of acute pancreatitis is needed while vomiting is occurring (alternatively, administer herbs via enema). Use herbs that improve pancreatic function and protect against possible sequelae. Improve overall digestive function using bitters and anti-inflammatory herbs. Use immune modulation when autoimmune disease is present. Consider lipid-lowering herbs.

Fringe tree: Laxative, anti-emetic, liver tonic, cholagogue; 1 part.

Gymnema: Pancreatic trophorestorative, mildly diuretic, hypoglycemic; 1 part.

Dandelion: Diuretic, laxative, pancreatic secretagogue, cholagogue; 1 part.

Chamomile: Carminative, anti-inflammatory, bitter tonic, cholagogue, anti-allergic, mild sedative, spasmolytic; 1 part.

Astragalus: Immune modulating; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Chapter Twenty-Four

Diseases of the Eye and Ear

HERBS FOR DISEASES OF THE EYE AND EAR

A number of eye and ear diseases may be treated with herbal therapy. They include cataracts, conjunctivitis, corneal ulcers, glaucoma, keratoconjunctivitis sicca, and otitis (chronic and acute).

Many of today's ophthalmic preparations have origins in ethnobotanical history. Atropine has been derived from solanaceous plants, physostigmine was used as a poison, and pilocarpine was used by Amazonians as a panacea (Packer 1992). For chronic or serious eye problems, referral to an ophthalmologist is always recommended. For mild conditions or as adjunctive therapy herbs can be used as eye washes or eye drops. Fresh herbal tea should be made fresh daily and kept refrigerated when not in use. Sterile saline can be used to infuse the herb.

Consider the systemic implications or associations of eye conditions and consider herbal treatment for pain relief, immune modulation, vulnerary (healing) action, anti-inflammatory effects, and health support.

CATARACTS

Strategy

Cataracts can be caused by toxic insult (chemotherapy), nutritional deficiencies, heredity, genetic predisposition, or diabetes, as well as endogenous causes such as uveitis, retinal degeneration (PRA), and glaucoma. Referral to a veterinary ophthalmologist and possible surgical treatment is warranted, but if that is not possible then herbal support may be beneficial.

Use herbs that are high in antioxidants and that improve circulation. Botanicals such as Bilberry (*Vaccinium myrtillus*) may be helpful. In diabetic cataracts, flavonoids, particularly Quercetin, are potent inhibitors of aldose reductase (Head 2001). In a study of people with senile cataracts, a combination of Bilberry (standardized to 25% anthocyanosides; given at a dose of 180 mg twice daily) and vitamin E (100 mg twice daily) that was given for 4 months halted progression in 96% of patients com-

pared to 76% of the control group (Bravetti 1989). In a study in rats with early senile cataract and macular degeneration, the effect of Bilberry was investigated over 1.5 to 3 months. The treatment group was given a diet supplemented with 25% Bilberry extract (20 mg/kg, including 4.5 mg of antocianidin) or vitamin E (40 mg/kg). At the end of the study, more than 70% of the control rats (unsupplemented) had cataracts and macular degeneration compared to the treated group, which completely prevented impairments in the lenses and retina. The vitamin E had no significant effects but both antioxidants decreased lipid peroxides in the retina and serum of the rats. This suggests that long-term supplementation with Bilberry is effective in prevention of macular degeneration and cataracts (Fursova 2005).

Oral dose: Aqueous extract standardized to 25% anthocyanosides, 2 to 4 mg/kg TID; tincture, 1:2 to 1:3 : 0.5 to 1.5 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Turmeric and Curcumin were investigated on streptozotocin-induced diabetic cataracts in rats in a placebo-controlled study. The treatment groups received 0.002% and 0.01% curcumin and 0.5% turmeric in their diets, respectively, for 8 weeks. Although neither Curcumin nor Turmeric prevented streptozotocin-induced hyperglycemia, slit lamp microscope observations indicated that these supplements delayed the progression and maturation of cataracts and the results indicate that Turmeric and Curcumin might prevent or delay the development of cataracts (Suryanarayana 2005).

Curcumin dose: Canine, 0 to 250 mg TID; feline, 50 to 100 mg SID (Silver 1997); dried herb, 50 to 150 mg/kg divided daily if extracted and dried; triple or quadruple dose for unprocessed herb (to maximum palatability tolerance); tincture, 1:2 to 1:3 : 1 to 3 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Ginkgo biloba was investigated in a placebo-controlled study in preventing radiation-induced cataracts in the lens after total-cranium irradiation of rats with a single radiation dose of 5 Gy. The results suggested that Ginkgo biloba is an antioxidant that protects the rat lens from radiation-induced cataracts (Ertekin 2004).

Dose: Standardized extract, (50:1) 10 to 50 mg per 10 kg divided BID or TID; tincture, 1:2 to 1:3 : 0.5 to 1 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

The anticataract activity of a Grapeseed extract (containing 38.5% procyanidins) was investigated in hereditary cataractous rats. The rats were fed a standard diet that contained 0% or 0.213% GSE (0.082% procyanidins in the diet (w/w)) for 27 days. Results suggested that procyanidins and their antioxidative metabolites prevented the progression of cataract formation by their antioxidative action (Yamakoshi 2002).

Canine dose: 1 to 2 mg per kg of extract daily (Wynn 2006).

In rats with cataracts induced by subcutaneous injection of selenite, administration of aqueous extracts of green and black tea led to a retardation of the progression of lens opacity, suggesting the potential cataractostatic ability of tea (Thiagarajan 2001).

Dose: Standardized extract containing 80% polyphenols, 25 to 75 mg/kg divided daily. Green tea can be added easily to moist food and in water (one-half to 1 cup per 10 kg per day) (Wynn 2006).

Other herbs have been investigated for their protective action. In streptozotocin-induced diabetic rats, dried leaf powder of Mulberry (*Morus indica* L.) given at a dose of 25% of the diet for 8 weeks resulted in controlled hyperglycemia, glycosuria, and albuminuria, and it retarded the onset of retinopathy. The control rats showed the hallmarks of diabetes and developed lenticular opacity after 8 weeks of study (Andallu 2002). Evidence suggests that lutein consumption is inversely related to eye diseases such as age-related macular degeneration and cataracts in people (Alves-Rodrigues 2004). Lutein can be obtained from the diet in several different ways, including supplements, and some pet foods.

A crude extract of *Corydalis* inhibited aldose reductase, which may help prevent cataracts associated with diabetes (Kubo 1994a). Oral Wheat sprout extract (dose not provided) was investigated for its effect on cataracts in dogs. Older dogs were treated for a month and the lens opacity was analyzed before and after the treatment. Results showed a reduction of 25% to 40% of lens opacity. The efficacy of Wheat sprouts in the recovery of age-related alterations and in treating age-associated pathologies is possibly due to the presence of small regulatory acid peptides, phosphoric radicals, and antioxidants (Basso 2005).

CORNEAL ULCERS

Strategy

Trauma to the cornea must occur for microbial colonization to occur. Consider herpes virus infection in cats with

corneal ulcers. Topical Aloe gel (*Aloe vera*) has been advocated for the treatment of corneal ulcers and keratitis (de Bairacli Levy 1963).

A study using pig cornea showed that biologically active Aloe substances could not penetrate this biological barrier. Therefore, eye drops that contain Aloe and neomycin sulfate may be useful for the treatment of inflammation and infection of external parts of the eye, such as the conjunctiva, eyelid edges, lacrimal sac, and cornea (Kodym 2002).

Consider herbs that reduce anxiety and relieve pain (conventional pain relief may be necessary).

GLAUCOMA

Strategy

Glaucoma is characterized by increased intraocular pressure (IOP) in most cases. Some patients have normal IOP but poor circulation with damage to the optic nerve. Therapy is either medical or surgical. An immediate referral to a veterinary ophthalmologist is recommended if the clinician is not completely comfortable managing a case, because marked increases in IOP may result in irreversible damage to the retina and optic nerve in 24 to 48 hours. For controlled glaucoma, herbal medicine may be supportive and therapeutic, but should not be used as the sole treatment. Consider herbal treatment post surgery or as supportive care for conventional treatment.

Ginkgo biloba increases circulation to the optic nerve and has been linked with improvements in pre-existing field damage in some patients with normal tension glaucoma (Head 2001, Bartlett 2004). It is claimed that *Ginkgo biloba* extract has numerous properties that theoretically should be beneficial in treating non-IOP-dependent mechanisms in glaucoma. The actions of relevance include increased ocular blood flow, antioxidant activity, platelet activating factor inhibitory activity, nitric oxide inhibition, and neuroprotective activity. Together, these suggest that *Ginkgo biloba* could be valuable in the treatment of glaucoma (Ritch 2005).

Dose: Standardized extract (50:1), 10 to 50 mg per 10 kg (20 pounds) divided BID or TID; tincture, 1:2 to 1:3 : 0.5 to 1 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Other herbs and constituents have been studied. Forskolin (an extract from *Coleus forskohlii*) has been used successfully as a topical agent to lower intraocular pressure.

Dose: 4 to 8 drops 1:1 extract in an eye bath (Bone 1996). Eye baths should be sterile and well filtered.

Salvia miltiorrhiza (by IM injection) has shown benefits in improving visual acuity and peripheral vision in people with glaucoma (Head 2001). Cannabinoids effectively

lower IOP and have neuroprotective actions, so they could potentially be useful in the treatment of glaucoma (Tomida 2004).

CONJUNCTIVITIS

Strategy

Diagnosis and appropriate treatment is important. For example, if the cause is allergic, use herbs that treat the allergy. Conjunctivitis in cats is nearly always caused by a primary pathogen—Chlamydia and feline herpes virus are common causes. Consider antiviral herbs for herpes virus infections and L-lysine administration.

Herbal teas are useful for noncomplicated conjunctivitis. The potential for contamination by bacteria that can colonize the eye should be considered. Herbal teas traditionally used for conjunctivitis include Chamomile, Comfrey, Coptis, Fennel, and Golden seal. *Aloe vera* gel has also been used.

An uncontrolled trial investigated the efficacy and tolerability of *Euphrasia* eye drops in humans with conjunctivitis. It yielded positive results in all but 1 of 65 patients. The authors recommend 1 drop TID in the affected eyes (Stoss 2000).

KERATOCONJUNCTIVITIS SICCA

Strategy

Treatment is directed toward stimulating tear production, replacing tears, and correcting any underlying cause. Consider herbs if immune-mediated disease is the cause. Also consider anti-inflammatory herbs.

In a randomized study of 80 dry eye patients, a Chinese herb formula, Chi-Ju-Di-Huang-Wan, was shown to be an effective stabilizer of tear film and it decreased the abnormality of corneal epithelium, providing an alternative choice for dry eye treatment (Chang 2005).

HERBAL EYE TONIC FORMULA

Use alcohol or glyceract tinctures for best results; alternatively, use teas. This formula is taken orally.

Bilberry: Asoprotective, anti-edema, antioxidant, anti-inflammatory; 2 parts.

Ginkgo: Antioxidant, circulatory stimulant; 1 part.

Eyebright: Anticatarhal, anti-inflammatory, astringent; 1 part.

Adaptogen: Withania, eluethero, or *Panax ginseng*; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food for 3 weeks. For teas, give 1 dessert spoon full twice daily in food for 3 weeks. Repeat if necessary.

Otitis

Strategy

Consider ear cytology to identify disease processes and type of disease organisms present. Diagnosis of underlying etiology is important; the herbal strategy usually requires attention to the immune system (allergies, infections) and overall health. Consider products that flush exudates and disinfect the ear canal prior to instilling herbal products. Consider the primary causes of ear disease, such as foreign bodies, hypothyroidism, seboreic diseases, and underlying pruritic disease (atopy, food hypersensitivity, parasites), as well as other dermatological conditions that affect the ear canal, such as autoimmune diseases, keratinization disorders, and drug reactions. Consider predisposing causes of ear disease such as breed predilection for more cerumen glands that result in yeast, as well as excess moisture from bathing or swimming and trauma from overzealous cleaning or plucking. Consider perpetuating factors that keep the process going, such as contact allergies to otic preparations and overtreatment with cleaners or inappropriate therapy.

In a randomized study, an herbal formula (*Allium sativum*, *Verbascum thapsus*, *Calendula flores*, and *Hypericum perforatum* in olive oil) was compared with a commercial ear preparation (ametocaine and phenazone in glycerin) for the management of ear pain associated with acute otitis media in 103 children. The formula was shown to be as effective as the commercial preparation and was proven appropriate for the management of ear pain associated with acute otitis media (Sarrell 2001).

In humans, fungal ear infections represent a small percentage of clinical external otitis. One in vitro study examined the efficacy of garlic extracts against aspergillus, which is the most common cause of this infection. Aqueous Garlic extract (AGE) and concentrated Garlic oil (CGO) were found to have antifungal activity with similar or better inhibitory effects than the pharmaceutical preparations and with similar minimum inhibitory concentrations (Pai 1995).

Borneol walnut oil was investigated against neomycin in a controlled study for the treatment of purulent otitis media. One hundred seventy patients were treated with Borneol walnut oil of various concentrations, and controls (108 patients) were treated with neomycin compound. The total effective rates were 98.06% and 84.26%, respectively (Liu 1990).

Andrographis paniculata extract is traditionally used as a medicine to treat otitis media (WHO 1999). Other herbs used topically include Bloodroot, Goldenseal, Mullein, Neem, and Thuja.

HERBAL EAR ORAL FORMULA

Use alcohol or glyceract tinctures for best results; alternatively, use teas. This formula is taken orally.

Burdock: Alterative, mild laxative, mildly antiseptic, diuretic; 1 part.

Echinacea: Immune stimulating, anti-inflammatory, antibacterial, vulnerary; 1 part.

Calendula: Antiseptic, lymphatic, anti-inflammatory, astringent, vulnerary, cholagogue, spasmolytic; 1 part.

Pau d'aco: Antibacterial, antifungal, antiviral; 1 part.

St. John's wort: Vulnerary, anti-inflammatory, antidepressant, nervine; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food for 3 weeks. For teas, give 1 dessert spoon full twice daily in food for 3 weeks. Repeat if necessary.

Chapter Twenty-Five

Diseases of the Musculoskeletal System

HERBS FOR DISEASES OF THE MUSCULOSKELETAL SYSTEM

Disorders of the musculoskeletal system—including arthritis, hip and elbow dysplasia, ligament conditions such as anterior cruciate/luxating patellas, and spinal arthritis/spondylosis—generally present as altered gait or lameness caused by pain. These conditions benefit from physical therapies including acupuncture, chiropractics, physiotherapy, and massage, as well as weight reduction where appropriate. Chondroprotective agents should always be considered and conventional anti-inflammatory agents should be considered for acute injuries. Alternatives to nonsteroidal anti-inflammatories are often sought because of concerns over side effects of medications including continued degeneration of joints and gastrointestinal, hepatic, or renal effects.

Musculoskeletal conditions affect the whole body. Pain in one area leads to biomechanical changes elsewhere due to shifts in weight bearing and movement. The whole body must be evaluated, not just the affected limb or back. Frequently, muscle spasm, trigger points, myofascial pain, and joint pain are detected elsewhere in the body. Similarly, herbalists take a systemic approach to treating musculoskeletal disorders. The goal is to treat the condition, as well as the pain, possible depression, muscular spasms, and joint disease, as well as overall health of the patient.

One of the possible underlying conditions thought to contribute to inflammatory changes anywhere in the body is leaky gut. Animals that have been administered nonsteroidal drugs for long periods frequently have disordered digestive function, so questions about appetite; gastrointestinal symptoms; and feces quality, quantity, and frequency should be asked. Hence, herbalists frequently recommend a change in diet, treat the digestive tract, and use alteratives as part of the protocol. Herbs that may be beneficial in treating chronic musculoskeletal conditions include Burdock (*Arctium lappa*), Blue flag (*Iris versicolor*), Dandelion (*Taraxacum officinale*), Oregon grape

(*Mahonia aquifolium*), Yellow dock (*Rumex crispus*), and Sarsaparilla (*Smilax spp.*).

The main herbs of interest are those that are anti-inflammatory or provide analgesic, antispasmodic action and those that improve circulatory function. Some of these herbs have already been discussed, so the emphasis here is on herbs with specific benefits in musculoskeletal disease.

ANTI-INFLAMMATORY HERBS

Withania (*Withania somnifera*)

Withania is a useful component of any musculoskeletal formula as both an adaptogen and an herb. It was traditionally recognized in Ayurvedic medicine for musculoskeletal disorders. Although the mechanism of action is not fully understood, it appears that Withania may involve cyclo-oxygenase inhibition (Mishra 2000, Somasundaram 1983) and a direct musculotropic action that accounts for the antispasmodic effects of Withania (Malhotra 1965a).

Devil's claw (*Harpagophytum procumbens*)

Devil's claw is a threatened plant species used in traditional African medicine for arthritis. In humans it has been investigated for the treatment of nonspecific lower back pain, arthritis, and rheumatism, and has been shown to be effective for pain relief when the extract provides more than 50 mg of harpagoside daily (Gagnier 2006, Chrubasik 2004, Wegener 2003). However, the effects of Devil's claw are not just due to the constituent harpagoside. In one in vitro study it was shown to suppress prostaglandin (PG)E₂ synthesis and nitric oxide production by inhibiting lipopolysaccharide-stimulated enhancement of cox2 and inducible nitric oxide synthase mRNA expression (Jang 2003). It has been included in a formula with Black currant (*Ribes nigrum*), Horsetail (*Equisetum arvense*), and White willow (*Salix alba*) and compared to phenylbutazone in a study conducted on 20 horses with

bone spavin. The formula showed significant benefit for horses with bone spavin and scores for improvement were better for the formula over phenylbutazone (Montavon, 1994).

Withania dose: Dried herb, 50 to 125 mg/kg divided daily if extracted and dried; triple or quadruple dose for unprocessed herb; tincture, 1:2 to 1:3 : 1 to 2.5 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Boswellia (*Boswellia serrata*)

Boswellia may act as an anti-inflammatory and as an inhibitor of lipoxygenase activity (Ammon 1993). However, one study of 37 patients with rheumatoid arthritis showed no difference between treatment with Boswellia extract and the placebo in terms of reduced use of nonsteroidal anti-inflammatory drugs and in subjective, clinical, or laboratory measures (Sander 1998). In a prospective, open, multicenter clinical trial (not placebo-controlled), 24 dogs with osteoarthritis of the joints or spine were treated with a standardized Boswellia resin extract (50% triterpenic acids) at a dose of 400 mg/10 kg once daily in food for 6 weeks. Overall, 71% of the dogs were assessed with good or very good results at 2 and 6 weeks of treatment. The study claimed that 40% to 70% of the dogs were symptom-free after 6 weeks. While 11 of 29 dogs experienced adverse effects during the study, Boswellia was thought to be causative in only 1 dog (Reichling 2004).

Boswellia dose: Dried herb, 25 to 125 mg/kg divided daily if extracted and dried; triple or quadruple dose for unprocessed herb; tincture, 1:2 to 1:3 : 1.5 to 2.5 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Ginger (*Zingiber officinalis*)

Ginger is a common ingredient in natural anti-arthritis products for humans. It has anti-inflammatory effects as both a mild cyclo-oxygenase and lipoxygenase inhibitor and thromboxane synthase inhibitor (Sharma 1994). The potency was comparable to that of acetylsalicylic acid (Kawakishi 1994). A study of 113 patients with chronic lower back and rheumatic pain responded positively with full or partial relief of pain, reduced joint swelling, and improved joint function when injected with 5% to 10% Ginger extract into the painful areas (Ghazanfar 1994). Powdered Ginger administered to patients with rheumatism and musculoskeletal disorders has been shown to provide varying degrees of relief from pain and swelling (Srivastava 1992).

Ginger dose: Dried herb, 15 to 50 mg/kg divided daily if extracted and dried; triple or quadruple dose for unprocessed herb; tincture, 1:2 to 1:3 : 0.25 to 0.5 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Turmeric (*Curcuma longa*)

Turmeric may be beneficial in canine arthritis, although in a randomized, double-blind, placebo-controlled, parallel-group clinical trial using an extract of related species of Turmeric (*Curcuma domestica* and *Curcuma xanthorrhiza*), owners saw no difference from a placebo as a treatment for osteoarthritis of the canine elbow or hip. The investigators' assessment, however, showed a statistically significant treatment effect (Innes 2003). In a short-term double-blind, crossover study of 18 human patients with rheumatoid arthritis, treatment with Curcumin (1,200 mg/day) or phenylbutazone (30 mg/day) both produced significant improvement in morning stiffness, walking time, and joint swelling (Deodhar 1980). Turmeric can be added to food daily to palatability tolerance.

Turmeric dose: Dried herb, 50 to 150 mg/kg divided daily; OR curcumin, canine—50 to 250 mg TID, feline—50 to 100 mg SID (Silver 1997); OR tincture, 1:2 to 1:3 : 1 to 3 mL per 10 kg (20 pounds) divided daily (Wynn 2006).

Other herbs with activity that supports their use as anti-inflammatory agents include Celery (*Apium graveolens*), a traditional remedy for gout; Meadowsweet (*Filipendula ulmaria*); Birch (*Betula* sp.); Willow bark (*Salix alba* and other *salix* sp.), which contains nonselective cox1 and cox2 inhibitor constituents; and Nettle (*Urtica dioica*) extracts, which were shown to suppress matrix metalloproteinase activity, thus reducing degradation of the extracellular matrix in joint cartilage (Schulze-Tanzil 2002). Other herbs used for musculoskeletal conditions include Angelica (*Angelica archangelica*), Boneset (*Eupatorium perfoliatum*), Celery (*Apium graveolens*), Blue cohosh (*Caulophyllum thalictroides*), Black cohosh (*Actea racemosa*), Gaiacum (*Guaiaicum officinale*), Wintergreen (*Gaultheria procumbens*), Bogbean (*Menyanthes trifoliata*), Quaking aspen (*Populus tremuloides*), Yarrow (*Achillea millefolium*), and Arnica (*Arnica Montana*) topically.

SPASM-RELIEVING AND ANALGESIC (ANTIRHEUMATIC) HERBS

Skeletal muscle spasm may be relieved by spasmolytic herbs. Most of these herbs have demonstrated effects on smooth muscle, but rarely have they been investigated for their effects on skeletal muscle. Valerian (*Valeriana officinalis*) contains valerenic acid, which is spasmolytic and relaxes muscles (Wagner 1979, Bissett 1994) and may be useful for back pain associated with muscular spasm. Black cohosh (*Cimicifuga racemosa*) is a relaxing nerve, and is considered to be antirheumatic with the active cimicifugoside, which has been shown to inhibit N-

acetylcholine receptor-mediated responses in vitro (Woo 2004). Wild yam (*Dioscorea villosa*) is also considered to be a traditional antirheumatic, anti-inflammatory, and spasmolytic. Cramp bark (*Viburnum opulus*) and other viburnum species have demonstrated antispasmodic activity in smooth muscle spasm (Cometa 1998, Calle 1999) and are useful for spasmodic muscular cramps.

More direct analgesia can be gained from using Corydalis (*Corydalis ambigua*), which is used in Traditional Chinese Medicine to invigorate the blood and alleviate pain, including back, abdominal, and arthritic pain (Bensky 1993). Tetrahydropalmatine (THP) is the most studied constituent, with demonstrated analgesic and sedative effects (Zhu 1998). In people with nerve pain, 75 mg THP daily was effective in 78% of patients tested (Lin 1990). Antidepressants are often used in human pain control. St. John's wort (*Hypericum perforatum*) has demonstrated analgesic and anti-inflammatory activity in laboratory animals (Viana 2003) and may be particularly helpful in neuralgia and post amputation conditions. Californian poppy (*Eschscholtzia californica*) has demonstrated peripheral analgesic effects (Rolland 1991, 2001). Passion flower (*Passiflora incarnate*) methanol leaf extract in mice (200 mg/kg) exhibited sedative analgesic and anti-inflammatory activities against induced pain and induced edema (Kamaldeep 2003).

Other traditional antirheumatic herbs include Blue cohosh (*Caulophyllum thalictroides*), Bladder wrack (*Fucus vesiculosus*) for rheumatoid arthritis, Lavender (*Lavendula officinalis*) topically, Parsley (*Petroselinum crispum*) for myalgia (orally and topically), and Poke root (*Phytolacca decandra*).

CIRCULATORY STIMULANTS

Another herbal strategy for treating arthritis is to enhance peripheral circulation. Two of the most commonly used circulatory stimulants for arthritis in animals are Ginger (*Zingiber officinalis*) and Prickly ash (*Zanthoxylum americanum*).

PRESCRIPTION FOR DEGENERATIVE JOINT DISEASES/ARTHRITIS

Strategy

Consider anti-inflammatory herbs to help reduce the dose of conventional anti-inflammatories or as an alternative to traditional drugs. Treat associated leaky gut with long-term NSAIDs or steroids. Reduce pain using spasmodic, antirheumatic, and analgesic herbs, improve circulation to joint and muscle tissues, and treat neuralgia if present. Consider adaptogens for chronic stress associated with pain.

Musculoskeletal

Use alcohol or glyceract tinctures for best results; alternatively, use teas.

Devil's claw: Anti-inflammatory, analgesic, bitter; 1 part.

Valerian: Antispasmodic, carminative, sedative; 1 part.

St. John's wort: Antidepressant, nervine tonic, anti-inflammatory, vulnerary; 1 part.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 1 part.

Turmeric: Anti-inflammatory, antioxidant, antiplatelet, hepatoprotective, anticancer, cholagogue; one-half part.

Prickly ash: Antirheumatic, circulatory stimulant, carminative; one-half part.

For tinctures, give 1 ml per 10 pounds twice daily in food for 3 weeks. For teas, give 1 dessert spoon full twice daily in food for 3 weeks.

Diseases of the Respiratory System

HERBS FOR DISEASES OF THE RESPIRATORY SYSTEM

Herbs provide a number of actions that benefit both upper and lower respiratory diseases, including bronchitis (acute, allergic, and chronic), feline bronchial asthma, and sinusitis/rhinitis. Interestingly, some of the respiratory herbs are in the most commonly used, mass produced cough medicines available through pharmacies. These include cherry bark, Irish moss, and Licorice.

Several groups of herbal actions are useful in the treatment of chronic respiratory disorders, and many traditional respiratory herbs fall into more than 1 group. In terms of respiratory therapy, the major actions are as follows.

Antitussives

Antitussives reduce coughing either through demulcent action, by removing the irritation (expectorant) action, or by depressing the cough reflex. This group therefore includes expectorants, demulcents, and anticatarrhals. The best known antitussive herbs are Irish moss (*Chondrus crispus*), Wild cherry (*Prunus serotina*), and Licorice (*Glycyrrhiza glabra*). Licorice root contains a potent antitussive compound, liquiritin apioside, the antitussive effects of which may depend on both peripheral and central mechanisms. A 50% methanol extract of licorice (100 mg/kg PO) reduced by more than 60% the number of capsaicin-induced coughs (Kamei 2003).

Marshmallow (*Althaea officinalis*) and Burdock (*Articum lappa*) may also be useful. The antitussive capacity of marshmallow extract and its isolated polysaccharide were compared with the nonnarcotic drugs prenoxidiazine and dropropizine in cats. Unanesthetized cats were stimulated to cough through nylon fiber irritation of laryngopharyngeal and tracheobronchial mucus. Tracheal pressure was measured to determine the number of cough efforts. At 50 mg/kg PO, the polysaccharide inhibited the cough; and the cough was inhibited with 1,000 mg/kg PO of

althaea syrup. The whole plant extract was less effective than the polysaccharide (Nosal'ova 1992). Burdock was also tested for antitussive activity in cats. An inulin isolate (fructan) from *A. lappa* roots was found to be equally active as some nonnarcotic, synthetic preparations used in clinical practice to treat cough (Kardosova 2003).

Expectorants

Tenacious mucus can act as an airway irritant and invoke a cough reflex. Clearing mucus is a fundamental herbal principle for any respiratory disease characterized by excessive mucus production. Herbalists use expectorants to facilitate removal of secretions, either by reducing the tenacity of the mucus (catarrh), which can irritate airways, or by increasing expulsion. Expectorants are not indicated with a pharyngitis causing a cough; they are used when there is tracheal or lung involvement. They are best used for subacute or chronic inflammatory conditions. Depending on the constituents, expectorants can work by acting directly on goblet cells—these include the essential-oil-containing herbs such as Fennel (*Foeniculum vulgare*) and Aniseed (*Pimpinella anisum*)—which might be useful if secretions are scant; by stimulating the vagus nerve and making secretions more watery—these include Lobelia (*Lobelia inflata*)—and by herbs that stimulate mucociliary transport, such as thyme (*Thymus vulgaris*).

There have been very few clinical studies on the benefits of expectorants; however, some studies show that saponin-containing herbs administered orally enhance production of respiratory tract fluid. In one study Senega root (*Polygala senega*) increased fluid output by 173% in cats in 3 to 4 hours (Boyd 1946). In another study the same herb caused a 10-fold increase in fluid output in dogs after 5 to 30 minutes when compared with a saline control (Misawa 1980). It should be noted that the doses used were extremely high.

Syrup of Thyme was compared to bromhexine in a double-blind, randomized study of 60 patients with productive cough, and there were no significant differences

between the self-reported symptom relief (Leung 1996). Other commonly used expectorants include Licorice (*Glycyrrhiza glabra*), Grindelia (*Grindelia camporum*), White horehound (*Marrubium vulgare*), Elecampane (*Inula helenium*), and Malabar nut tree (*Adhatoda vasica*). Adhatoda is a source of vasicine from which the drug Bisolvon was developed. Expectorants are commonly prescribed with spasmolytic, anticatarrhal, and immune-stimulating herbs.

Demulcents

This group of herbs contains mucilage constituents, which have anti-inflammatory and soothing effects on the lower respiratory mucosa. They are ideal for acute coughs with very acute catarrh with inflammation and irritation. They include Marshmallow (*Althaea officinalis*), Irish moss (*Chondrus crispus*), and Slippery elm (*Ulmus flava*). Plantain (*Plantago major*), Mullein (*Verbascum thapsus*), Fenugreek (*Trigonella foenum-graecum*), and Coltsfoot (*Tussilago farara*) are other traditional demulcents.

Anticatarrhals

Anticatarrhals reduce excessive discharge from mucous membranes. They are particularly useful for nasal and sinus congestion and mucosal edema, and they can reduce airway hypersensitivity. Anticatarrhal herbs for the upper respiratory tract include Eyebright (*Euphrasia rostkoviana*), Elder flower (*Sambucus nigra*), Ribwort (*Plantago lanceolata*), Peppermint (*Mentha piperita*), Fenugreek (*Trigonella foenum-graecum*), Golden rod (*Solidago spp*), and Golden seal (*Hydrastis canadensis*). The latter two are particularly indicated for copious yellow to green discharge of a chronic nature. Sage (*Salvia officinalis*) has a drying effect that can be useful for copious watery discharges. Anticatarrhal herbs for the lower respiratory tract include Mullein (*Verbascum thapsus*) and Ribwort (*Plantago lanceolata*).

Antispasmodics

Respiratory spasmolytics help relax the bronchioles. These include Elecampane (*Inula helenium*), Lobelia (*Lobelia inflata*), Grindelia (*Grindelia camporum*), Thyme (*Thymus vulgaris*), Licorice (*Glycyrrhiza glabra*), Euphorbia (*Euphorbia hirta*), Celadine (*Chelodidium majus*), and Ephedra. Lobeline, a constituent of Lobelia, induced hyperpnea due to both an increase in tidal volume and respiratory rate in ponies (Art 1991). Lobeline is also considered a Beta-adrenergic bronchodilator (Tyler 1994). Thymol, Carvacrol, and the essential oil from Thyme (Van den Broucke 1982, Reiter 1985), in sufficient doses, have tracheal relaxant activity.

Respiratory antiseptics

Most respiratory antiseptics have mild antimicrobial activity. This activity is usually related to volatile oil constituents. Steam inhalation of teas could be considered for small animals. These herbs include Thyme (*Thymus vulgaris*), Elecampane (*Inula helenium*), Garlic (*Allium sativum*), Hyssop (*Hyssopus officinalis*), Lavender (*Lavandula officinalis*), and Rosemary (*Rosmarinus officinalis*).

Anti-allergic herbs

The main herbs for respiratory tract allergies are Albizzia (*Albizzia lebbek*), Baical skullcap (*Scutellaria baicalensis*), Boswellia (*Boswellia serrata*), Ginkgo (*Ginkgo biloba*), Malabar nut tree (*Adhatoda vasica*), and Nettles (*Urtica spp*) for allergic rhinitis. Albizzia provided excellent responses in an uncontrolled trial of patients with asthma of recent onset (less than 2 years), but the response was less predictable for chronic asthma (Tripathi 1979). Baicalin and Baicalein have demonstrated anti-allergic and anti-asthmatic activity in several animal models (Chang 1987).

Along with this classification of herbs, also consider the use of immune-regulating herbs such as Echinacea and Astragalus or antiviral herbs (see infectious diseases).

PRESCRIPTION FOR BRONCHITIS (ACUTE, ALLERGIC, AND CHRONIC)

Strategy

Warming tonics such as Astragalus or Panax ginseng are contraindicated in acute infection. In acute conditions consider antiseptic, antitussive, demulcent, expectorant, and immune-stimulating herbs. Consider perpetuating factors in chronic bronchitis such as pollution and airborne irritants. There is usually overactivity of secretory glands and goblet cells, so expectorant herbs are emphasized. Treat any chronic infection, and consider Ginger in cold patients to help diffuse the formula (circulatory stimulant). Antispasmodics, antimicrobials, expectorants, demulcents, and pulmonary tonics are indicated in chronic conditions. Bronchodilating herbs such as Lobelia may be helpful; also consider anti-inflammatory herbs such as Licorice. In chronic conditions, also consider cardiotonics such as Hawthorn and nervines such as Motherwort. Also consider immune stimulants such as Echinacea and Astragalus.

Herbal acute bronchitis support formula

Echinacea: Immunostimulant, anti-inflammatory, vulnerary, antimicrobial; 1 part.

Marshmallow: Demulcent, vulnerary, diuretic, antitussive; 1 part.

Elecampane: Expectorant, antitussive, antibacterial, diaphoretic; 1 part.

Licorice: Antispasmodic, antitussive, anti-inflammatory, adaptogen, expectorant; 1 part.

Thyme: Carminative, antitussive, antispasmodic, expectorant, antibacterial, astringent; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Herbal allergic bronchitis support formula

Polygala or Euphorbia: Expectorant, anti-asthmatic; 1 part.

Elecampane: Expectorant, antitussive, antibacterial, diaphoretic; 1 part.

Lobelia inflata: Respiratory stimulant, antispasmodic, anti-asthmatic, expectorant; 1 part.

Marshmallow: Demulcent, vulnerary, diuretic, antitussive; 1 part.

Thyme: Carminative, antitussive, antispasmodic, expectorant, antibacterial, astringent; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Herbal chronic bronchitis support formula

Elecampane: Expectorant, antitussive, antibacterial, diaphoretic; 1 part.

Adhatoda: Expectorant, anti-asthmatic, bronchodilator; 1 part.

Astragalus: Immune-enhancing, tonic, cardiogenic; 1 part.

Mullein: Expectorant, demulcent, vulnerary, mild sedative, mild diuretic; 1 part.

Thyme: Carminative, antitussive, antispasmodic, expectorant, antibacterial, astringent; 1 part.

Ribwort: Expectorant, vulnerary, anti-inflammatory, astringent; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

OR

Elecampane: Expectorant, antitussive, antibacterial, diaphoretic; 1 part.

Licorice: Antispasmodic, antitussive, anti-inflammatory, adaptogen, expectorant; 1 part.

Thyme: Carminative, antitussive, antispasmodic, expectorant, antibacterial, astringent; 1 part.

Lobelia inflata: Respiratory stimulant, antispasmodic, anti-asthmatic, expectorant; 1 part.

Grindelia: Anticatarrhal, antispasmodic, expectorant; 1 part.

Ginger: Antispasmodic, warming, circulatory stimulant, anti-inflammatory, diaphoretic, carminative; add 1/20 of total volume of rest of formula.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR FELINE BRONCHIAL ASTHMA

Strategy

Treatment depends on the severity and concurrent conventional treatment. For example, if the patient is on steroids, consider hepatoprotection and immune support. Inhalant drugs (bronchodilators and steroids) may be necessary for some patients. Consider inhalation therapy of inhaled steam from herbal teas. Avoid stressing cats if administering herbs is difficult. Consider herbs that stabilize mast cells and the herbs for allergic bronchitis.

The following simple formula for feline asthma support is easy to give and well tolerated (use glycyrrhizin).

Marshmallow: Demulcent, vulnerary, diuretic, antitussive; 1 part.

Give one-half to 1 ml per 10 pounds 2 to 3 times daily in food or diluted and by mouth.

PRESCRIPTION FOR SINUSITIS/RHINITIS

Strategy

Determine whether inhaled allergens are involved (board the patient in a different environment for a few days might improve the condition) and reduce exposure to inhaled allergens (such as dust mites). Consider environmental irritants such as cigarette smoke, dust, and pollution, and consider elimination diets. Inhalation therapy may be useful. Consider immune-stimulating herbs such as Echinacea and Astragalus and anti-allergy herbs such as Albizzia and Baical skullcap. Nervines and adaptogens may be important if stress is a factor. Use anticatarrhal herbs such as Euprasia and Golden seal. Pain-relieving herbs might be helpful. Consider antimicrobial herbs. In chronic conditions consider alteratives and depuratives such as Poke root and Cleavers. In chronic rhinitis consider a T cell modulator such as Astragalus. For acute conditions, give more frequently and at higher doses.

Herbal allergic rhinitis support formula

Echinacea: Immunostimulant, anti-inflammatory, vulnerary, antimicrobial; 1 part.

Baical skullcap: Anti-inflammatory, anti-allergy, antibacterial, bitter, mild sedative; 1 part.

Albizzia: Anti-allergic, antimicrobial; 1 part.

Eyebright: Anticatarrrhal, astringent, anti-inflammatory; 2 parts.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Herbal acute rhinitis/sinusitis support formula

Eyebright: Anticatarrrhal, astringent, anti-inflammatory; 2 parts.

Golden seal: Mucous membrane trophorestorative, antimicrobial; 1 part.

Echinacea: Immunostimulant, anti-inflammatory, vulnerary, antimicrobial; 1 part.

Golden rod: Anticatarrrhal, anti-inflammatory, antiseptic, carminative; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Herbal chronic rhinitis/sinusitis support formula

Astragalus: Immune enhancing, tonic, cardiogenic; 1 part.

Albizzia: Anti-allergic, antimicrobial; 1 part.

Golden seal: Mucous membrane trophorestorative, antimicrobial; 1 part.

Eyebright: Anticatarrrhal, astringent, anti-inflammatory; 2 parts.

Poke root: Anticatarrrhal, immune-enhancing, lymphatic, alterative: 1/20th (5%) of formula. **Note:** Poke root is potentially toxic; use in small percentage of formula.

For tinctures, give 1 ml per 10 pounds twice daily in food.

Diseases of the Urogenital System

HERBS FOR DISEASES OF THE UROGENITAL SYSTEM

Herbs can treat a number of diseases of the urogenital system, including acute and chronic nephritis, cystitis, FLUTD, urinary incontinence, prostate and ovarian conditions, and urolithiasis (calcium oxalate, struvite, and urate). Herbal actions of interest include the renal protective herbs that aid chronic renal disease, diuretics, urinary antiseptics, bladder tonics, antilithic herbs, and demulcents. Herbs that benefit prostate health are also discussed.

Renal-tonic and protective herbs

Several herbs may be beneficial for nephropathies. Astragalus (*Astragalus membranaceus*) has been shown to increase plasma and muscle protein and reduce urinary output of protein by improving dysfunctional protein metabolism in glomerulopathy. It can also prevent glomerular sclerosis (Zhou 1999). In rats with experimental nephritis, large doses of oral astragalus improved renal function, thus supporting the traditional use of large doses for the treatment of chronic nephritis in people (Chang 1987). In China, another species of Astragalus (*Astragalus mongholicus*) and Dong guai (*Angelica sinensis*) have been used to treat nephrotic syndrome. Both herbs together or enalapril were administered to rats with chronic induced nephrosis and compared with control rats. The treatment groups had significantly reduced deterioration of renal function and reduced histologic damage. The two herbs together retarded the progression of renal fibrosis and deterioration of renal function and were comparable to enalapril (Wang 2004).

Cordyceps (*Cordyceps sinensis*) is renal protective against gentamicin-induced nephrotoxicity in animals (Tian 1991). In a comparative, controlled clinical study, 28 of 51 patients with chronic renal failure received Cordyceps (3 to 5 g/day) and showed a significant improvement in renal function compared to the control

group (Guan 1992). Nettle seed (*Urtica dioica*) may also be useful because it may lower creatinine, as reported in a case series of 2 human patients by North American herbalist David Winston. A hydroethanolic (1:5) tincture of Nettle seed, 5 ml TID, reduced serum creatinine in both patients (Treasure 2003).

Bladder tonics

Crataeva (*Crataeva nurvala*) has been shown to improve bladder tone in dogs (Deshpande 1982). In human studies, 50 ml decoction given twice daily for 3 months reduced incontinence, pain, and urine retention in prostatic hypertrophy with hypotonic bladder (Deshpande 1982).

Diuretic/aquaretic activity

Traditionally, conditions affecting the urogenital tract were treated with urinary diuretics, herbs given as teas and consumed in large volumes. The diuresis that was observed was thought to flush the tract and therefore aid in recovery. Diuretic action was also seen as alternative, aiding in the elimination of wastes and therefore improving overall health. Such herbs included Red clover (*Trifolium pratense*), Dandelion leaf (*Taraxacum officinale*), Cleavers (*Gallium aparine*), Burdock (*Arctium lappa*), and Celery (*Apium graveolens*).

On the other hand, some herbs have aquaretic activity, which is more closely aligned with our conventional view of diuretics. These herbs produce diuresis by acting directly on the glomerulus to increase urine production without impacting electrolytes (Werk 1994).

The diuretic and aquaretic herbs Nettle (*Urtica dioica*) and Cornsilk (*Zea Mays*) both have a high potassium content. Juniper (*Juniperus communis*) contains an essential oil that is reported to increase the glomerular filtration rate (Tyler 1993, Stanic 1998). Parsley (*Petroselinum crispum*) can inhibit the Na⁺-K⁺ pump, leading to an osmotic diuresis (Kreydiyyeh 2002). Couchgrass (*Agropyron repens*), which contains the constituent mannitol, also

leads to osmotic diuresis. Lavender (*Lavendula officinalis*) contains the aqueous extract that can produce diuresis (Elhajili 2001). Dandelion (*Taraxacum officinalis*) leaf at a dose of 50 mL (equivalent to 2 g dried herb/kg body weight) in one study produced a comparable effect to furosemide (80 mg/kg) (Hook 1993); however, an ethanolic extract of the root did not produce a diuretic effect (Tita 1993). Pharmacological evaluation of Bearberry (*Arctostaphylos uva-ursi*) showed that it increases urine flow (Beaux 1999). Others include Celery (*Apium graveolens*) and Buchu (*Agathosma betulina*).

Urinary antiseptics

Urinary antiseptic herbs are perhaps most valuable for chronic infections, in those with resistant strains of bacteria, and for preventing infection in vulnerable patients. Some produce antiseptic metabolites which are excreted in urine. Others may improve the mucopolysaccharide layer produced by transitional cells coating the bladder wall (demulcents fall into this category as well). Yet others prevent adhesion of bacteria to the bladder wall.

Carbenoxolone derived from Licorice (*Glycyrrhiza glabra*) was shown to protect against laboratory-induced lower urinary tract infections in the rabbit model by influencing the mucopolysaccharide layer (Mooreville 1983). Cranberry (*Vaccinium macrocarpa*) inhibits bacterial adherence due to anti-adhesion agents in Cranberry juice (Reid 1987). This is most likely due to proanthocyanidins, which are shown to inhibit the adherence of P-fimbriated *E. coli* to uroepithelial cell surfaces (Howell 1998) and provide anti-adherence activity toward gram-negative rods including *Klebsiella*, *Enterobacter*, *Pseudomonas*, and *Proteus* (Schmidt 1988). Bearberry (*Arctostaphylos uva-ursi*) has the constituent arbutin, which is hydrolyzed to hydroquinone during excretion in urine. This metabolite is both antiseptic and astringent in action (Matsuda 1992). Arbutin works best in alkaline urine, and urinary acidifiers inhibit conversion of arbutin to active hydroquinone (De Smet 1993), so it can also modify bacterial adhesion. Others include Golden rod (*Solidago virgaurea*); Buchu (*Barosma betulina*), which has very low activity against *Escherichia coli*; *Saccharomyces cerevisiae* and *Staphylococcus aureus* (Lis-Balchin 2001), Couchgrass (*Agropyron repens*), Crataeva (*Crataeva nurvala*), and Saw palmetto (*Serenoa serrulata*).

Antilithics

Traditional antilithic herbs include Cornsilk (*Zea Mays*), Couchgrass (*Agropyron repens*), Stone root (*Collinsonia canadensis*), Gravel root (*Eupatorium purpureum*), and Hydrangea (*Hydrangea arborescens*). Uric stones have

benefited from the antiseptic action (tentatively to saponins) and possibly some solvent action by herbal infusions of Vervain (*Verbena officinalis*), Lithospermum (*Lithospermum officinale*), Dandelion (*Taraxacum officinale*), Horsetail (*Equisetum arvense*), Bearberry (*Arctostaphylos uva-ursi*), Burdock (*Arctium lappa*), and *Silene saxifrage*. In oxalate urolithiasis, Fenugreek seeds (*Trigonella foenum-graecum*) significantly decreased the quantity of calcium oxalate deposited in the kidneys in induced urolithiasis in rats (Ahsan 1989).

Crataeva (*Crataeva nurvala*) on calcium oxalate lithiasis has been studied in rats. A crude extract at 100 mg/kg PO in rats significantly reduced stone formation (81%) (Prabhakar 1997). It showed a regulatory action on endogenous oxalate synthesis and the decoction lowered stone-forming constituents in the kidneys of calculogenic rats (Varalakshmi 1990). Also in calcium oxalate kidney stones, Cranberry (*Vaccinium macrocarpa*) juice decreased oxalate and phosphate excretion, increased citrate excretion, and decreased the relative supersaturation of calcium oxalate. It was concluded that Cranberry juice has antilithogenic properties and may help manage calcium oxalate urolithiasis (McHarg 2003). On the other hand, cranberry juice contains oxalate and 5 healthy volunteers had significant increases in urinary oxalate while receiving cranberry tablets. However, inhibitors of stone formation, magnesium, and potassium, rose as well (Terris 2001).

Others

Traditional demulcents used to reduce pain and dysuria associated with mucosal inflammation include Marshmallow (*Althaea officinalis*), Cornsilk (*Zea mays*), Couchgrass (*Agropyron repens*), and Licorice (*Glycyrrhiza glabra*).

Spasmolytic herbs may be considered for urinary tract disorders. These include Saw palmetto (*Serenoa serrulata*), Cramp bark (*Viburnum opulus*), and Pumpkin seed (*Curcubita pepo*). A formula consisting of uva-ursi, Hops, and Peppermint, administered for 6 weeks, improved symptoms in 70% of patients (915) suffering from compulsive strangury, enuresis, and painful micturition (Lenau 1984).

Astringents may be useful in hemorrhagic conditions. Two herbs traditionally used for this include Plantain (*Plantago major*) and Horsetail (*Equisetum arvense*).

PRESCRIPTION FOR NEPHRITIS

Strategy

Treat conventionally until the patient is stable in acute conditions. Treat the underlying etiology if known

(infectious, immune complexes, etc.). Consider ACE inhibitors and conventional renal support, appropriate diet therapy, and thromboxane and PAF inhibitors.

Use alcohol or glyctract tinctures for best results; alternatively, use teas.

Astragalus: Immune enhancing, cardiogenic, diuretic, hypotensive; 1 part.

Dong quai: Blood tonic, circulatory stimulant, vasodilator; 1 part.

Siberian ginseng: Immune modulating, adaptogen; 1 part.

Hawthorn: Hypotensive, vasodilator, antioxidant, cardiogenic; 1 part.

Ginkgo: Inhibits platelet activating factor, antioxidant, circulatory stimulant; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Consider using Cordyceps as well: Dried herb, 25 to 100 mg/kg divided daily if extracted and dried; triple or quadruple dose for unprocessed herb; tincture, 1:2 to 1:3: 0.5 to 2 mL per 10 kg (20 pounds) divided daily and diluted or combined with other herbs (Wynn 2006).

Chinese herbal formulas including Rehmannia 6 and Rehmannia 8 are also useful.

PRESCRIPTION FOR CYSTITIS

Strategy

Treat conventionally until the patient is stable in acute conditions. Treat the underlying etiology if known (infectious, immune complexes, etc.). Consider ACE inhibitors and conventional renal support, appropriate diet therapy, and thromboxane and PAF inhibitors.

Use alcohol or glyctract tinctures for best results; alternatively, use teas.

Crataeva: Bladder tonic, anti-inflammatory, antilithic; 1 part.

Licorice: Anti-inflammatory, adaptogen, antispasmodic, taste improver, demulcent; 1 part.

Corn silk: Diuretic, demulcent, antilithic; 1 part.

Golden rod: Anti-inflammatory, antiseptic, diuretic, carminative; 1 part.

Echinacea: Immune stimulant, anti-inflammatory, vulnery, antimicrobial; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Add Bearberry (*Archostaphylos uva-ursi*) (urinary antiseptic, astringent). Treat for 3 weeks, then take 1 week off, and repeat. Dose: Infusion, 5 to 30 gm per cup of water, administered at a rate of one-fourth to one-half

cup per 10 kg (20 pounds) divided daily; tincture, 1:2 to 1:3 : 1 to 2 mL per 10 kg (20 pounds) divided daily or combined with other herbs.

PRESCRIPTION FOR FLUTD/IC SUPPORT

Strategy

Consider treatment adjunctive to or instead of conventional treatment, depending on the severity and recurrence rate. Give moist diets only to increase water turnover. Consider a source of glycosaminoglycans and consider feline pheromones to reduce stress and ensure litter box hygiene. Anti-inflammatory herbs may be beneficial in treating cats with chronic interstitial cystitis; pain-relieving herbs may also help. Consider anxiolytic herbs or amitriptyline. Demulcents may be beneficial. Use alcohol or glyctract tinctures for best results; alternatively, use teas.

Marshmallow: Demulcent, vulnery, diuretic; 1 part.

Saw palmetto: Diuretic, spasmolytic, anabolic; 1 part.

Bilberry: Antioxidant, astringent, anti-inflammatory; 1 part.

Crataeva: Bladder tonic, anti-inflammatory, antilithic; 1 part.

St. John's wort or Kava kava: Nervine tonic, anti-inflammatory, vulnery; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR URINARY INCONTINENCE SUPPORT

Strategy

Treat the underlying etiology if known (chiropractic, acupuncture may help). Improve bladder and sphincter tone. Prevent infection and urolithiasis. Consider Cranberry capsules to help deodorize urine and help prevent infection. Use alcohol or glyctract tinctures for best results; alternatively, use teas.

Crataeva: Bladder tonic, anti-inflammatory, antilithic; 2 parts.

Chaste tree: Regulates female hormonal activity, dopaminergic; 1 part.

OR

Saw palmetto: Diuretic, spasmolytic, anabolic; 1 part.

Marshmallow: Demulcent, vulnery, diuretic; 1 part.

Bilberry: Antioxidant, astringent, anti-inflammatory; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR PROSTATE SUPPORT

Strategy

Treat the underlying etiology if known (chiropractic, acupuncture may help). Improve bladder and sphincter tone and prevent infection and urolithiasis. Consider Cranberry capsules to help deodorize urine and help prevent infection. Use alcohol or glyceextract tinctures for best results; alternatively, use teas.

Crataeva: Bladder tonic, anti-inflammatory, antilithic; 2 parts.

Saw palmetto: Diuretic, spasmolytic, anabolic; 1 part.

Nettle root: Antihyperprostatic; 1 part.

Hydrangea: Diuretic, antihyperprostatic, antilithic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR PROSTATITIS SUPPORT

Echinacea: Anti-inflammatory, vulnerary, immune stimulant, antimicrobial; 1 part.

Cornsilk: Diuretic, demulcent, antilithic; 1 part.

Bearberry: Urinary antiseptic, astringent; 1 part.

Corydalis: Analgesic, sedative, cardioprotective; 1 part.

Meadowsweet: Mild urinary antiseptic, anti-inflammatory, mildly diuretic, anti-ulcerogenic, astringent; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR UROLITHIASIS SUPPORT

Strategy

Identify composition of uroliths and implement appropriate conventional treatment if needed (surgical removal may be required). Increase water intake, using broths and moist food. Implement an appropriate diet if needed. Struvite can be managed medically; initiate herbs to prevent cystitis. Consider the underlying metabolic disorder or infection. The goal of herbal therapy is to minimize recurrence by minimizing infection or urolith formation. Use alcohol or glyceextract tinctures for best results; alternatively, use teas.

Calcium oxalate

Crataeva: Bladder tonic, anti-inflammatory, antilithic; 1 part.

Fenugreek: Demulcent, laxative, contains saponins; 1 part.

Cornsilk: Diuretic, demulcent, antilithic; 1 part.

Marshmallow: Demulcent, vulnerary, diuretic; 1 part.

Echinacea: Immune stimulant, vulnerary, anti-inflammatory, antimicrobial; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Urate

Crataeva: Bladder tonic, anti-inflammatory, antilithic; 1 part.

Bearberry: Urinary antiseptic, astringent; 1 part.

Burdock: Alterative, diuretic, mild laxative, mild antiseptic; 1 part.

Dandelion: Diuretic, laxative, chologogue; 1 part.

Echinacea: Immune stimulant, vulnerary, anti-inflammatory, antimicrobial; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Chapter Twenty-Eight

Metabolic and Endocrine Diseases

HERBS FOR METABOLIC AND ENDOCRINE DISEASES

Herbal medicine can play an important role in veterinary endocrine medicine. The metabolic and endocrine diseases that can be treated with herbs include Cushing's disease, diabetes mellitus, and hypothyroid and hyperthyroid diseases. While herbs do not replace the hormones that are frequently used to treat endocrine diseases, they can treat the metabolic derangements that can occur as a result of these disorders. The adaptogens are an important group of herbs that have a direct impact on the endocrine system, and they should be considered for any patient in which stress is a contributing or perpetuating factor in the pathogenesis.

HERBS THAT INFLUENCE ADRENAL ACTIVITY

Some of the key herbs that influence adrenal activity are the adaptogens, which act directly on the adrenal gland or on the pituitary hypothalamic adrenal axis. *Panax ginseng* is a classic adaptogen and the activity of the ginsenosides has been attributed to an indirect action on the pituitary, leading to an augmentation of adrenal steroidogenesis (Ng 1987). Animal studies have shown that Ginseng increases resistance to irradiation, temperature stress, hyperbaric stress, physical exercise, and viral and tumor load (Nocerino 2000). Licorice (*Glycyrrhiza glabra*) is considered to have steroid-type action, and 2 of its constituents, glycyrrhizin and glycyrrhetic acid (GA), are reported to bind to glucocorticoid and mineralocorticoid receptors with moderate affinity, and weakly to corticosteroid-binding globulin (Tamaya 1986; Armanini 1983, 1985).

One recent case study on the treatment of a hyperkalemic dog with Addison's disease reported that Licorice use normalized potassium after administration (Jarrett 2005). Cordyceps (*Cordyceps sinensis*) induced a dose-dependent increase in corticosterone production in vitro

in rat adrenal cells, and the effect was different from that of adrenocorticotrophic hormone (Wang 1998). In stressed mice, *Withania* (*Withania somnifera*) extract has been shown to increase levels of corticoids (Singh 2000). *Ginkgo biloba* is not considered to be a classic adaptogen; however, constituents of Ginkgo inhibit stress-induced cortisone hypersecretion and at the hypothalamic level appear to reduce corticotrophic-releasing hormone expression and secretion (Marcilhac 1998). It has been suggested that Ginkgo could help control excess glucocorticoid production (Amri 2003). Eluethero or Siberian ginseng (*Eleutherococcus senticosus*) showed a protein anabolic effect (Kaemmerer 1980) and attenuated the rise on blood corticosterone in stressed rats (Kimura 2004).

PRESCRIPTION FOR HYPERADRENOCORTICISM

Strategy

Reduce endogenous production of cortisol and improve adrenal function and systemic health. Treat symptoms and improve immunity. If using concurrent mitotane, ketoconazole, or L-deprenyl, minimize side effects.

Use alcohol or glycerectract tinctures for best results; alternatively, use teas.

Milk thistle: Hepatotonic, antioxidant, hepatoprotective; 1 part.

Ginkgo: Antioxidant, circulatory stimulant, cognition enhancer, may reduce corticosteroid production; 1 part.

Panax ginseng: Adaptogen, anti-inflammatory, anti-allergic, immune enhancing, hepatorestorative; 1 part.

Withania: Tonic, antitumor, adaptogen, nervine, sedative, anti-inflammatory; 1 part.

Astragalus: Immune modulating, tonic, cardiogenic, diuretic, hypotensive, antitumor; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR HYPOADRENOCORTICISM

Strategy

Improve adrenal and systemic health and signs of Addison's disease. Supply corticosteroid activity and correct electrolyte abnormalities.

Siberian ginseng: Adaptogenic, immunomodulatory; 1 part.

Astragalus: Immune modulating, tonic, cardiogenic, diuretic, hypotensive, antitumor; 1 part.

Licorice: Anti-inflammatory, adaptogen, mineralocorticoid- and corticoid-like activity; 1 part.

Withania: Tonic, adaptogen, nervine, anti-inflammatory, antitumor; 2 parts.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

HERBS FOR DIABETES

Many herbs affect blood glucose, and a few herbs have been studied for their effects on diabetes per se. One of the most useful herbs is Gymnema (*Gymnema sylvestre*), which has been shown in (induced) diabetic animal studies to double the number of insulin-secreting beta cells in the pancreas and normalize blood sugar (Prakash 1986, Shanmugasundaram 1990). Ginseng (*Panax ginseng*) has been shown to increase insulin receptors in bone marrow (Yushu 1988) and ginsenosides promote an insulin release that uses a different mechanism than that of glucose (Goudong 1987), both of which contribute to Ginseng's antidiabetic action.

Cordyceps (*Cordyceps sinensis*) attenuated diabetes-induced weight loss, polydipsia, and hyperglycemia in an animal study (Lo 2004). Ginger (*Zingiber officinalis*) juice (4 ml/kg PO daily) given for 6 weeks to rats with induced diabetes increased insulin levels and decreased fasting glucose levels. It also reduced serum cholesterol, serum triglyceride, and blood pressure in diabetic rats (Akhani 2004).

Herbs that reduced blood sugar in induced-diabetic rabbit studies include Fenugreek (*Trigonella foenum-graceum*), Damania (*Turnera diffusa*), and Prostrate spurge (*Euphorbia prostrata*) (Alarcon-Aguilara 1998); Madagascar periwinkle leaf juice (*Catharanthus roseus*), and seed powder of Fenugreek (*Trigonella foenum-graceum*) (Satyanarayana 2003). Fenugreek (*Trigonella foenum-graceum*) and its constituents reduce both blood glucose and cholesterol; it is thought that this is mainly due to its dietary fiber and high saponin content (Madar 2002). Seed fractions were given to normal and diabetic dogs (treated with insulin) for 8 days. The defatted frac-

tion reduced hyperglycemia and glycosuria in the diabetic dogs (Ribes 1986).

Bilberry (*Vaccinium myrtillus*) (bilberry leaf tea) also reduced hyperglycemia in normal and diabetic dogs when given concurrent intravenous glucose (Allen 1927). Other herbs that reduce blood sugar include Agrimony (*Agrimonia eupatoria*), Alfalfa (*Medicago sativa*), Bugleweed (*Lycopus virginicus*), Burdock (*Arctium lappa*), Celery (*Apium graveolens*), Corn silk (*Zea mays*), Dandelion (*Taraxacum officinalis*), Garlic (*Allium sativa*), Goats rue (*Galega officinalis*), Java tea (*Orthosiphon stamineus*), Marshmallow (*Althaea officinalis*), Nettle (*Urtica dioica*), Sage (*Salvia officinalis*), and Siberian ginseng (*Eleutherococcus senticosus*) (Brinker 1997), as well as Aloe and Rehmannia.

Other herbs have little effect on insulin or blood glucose, yet they may help treat diabetes. Bearberry (*Arctostaphylos uva ursi*), Golden seal (*Hydrastis canadensis*), Mistletoe (*Viscum album*), and Tarragon (*Artemisia dracuncululus*) reduced hyperphagia and polydipsia associated with induced diabetes in mice but did not affect insulin or glucose (Swanston-Flatt 1989).

PRESCRIPTION FOR DIABETES MELLITUS

Strategy

Adapt diet appropriately. Insulin doses or oral hypoglycemic drugs may need to be reduced; monitoring is important. Improve systemic health and pancreatic health and prevent complications.

Gymnema: Hypoglycemic, pancreatic trophorestorative, astringent, mildly diuretic; 2 parts.

Panax ginseng: Adaptogenic, tonic, hypoglycemic, immunostimulant, hepatoprotective, cardioprotective; 1 part.

Rehmannia: Hypoglycemic, renal protective, adaptogen; 1 part.

Bilberry: Vasoprotective, antioxidant, anti-inflammatory, astringent; 1 part.

Use alcohol tinctures for best results; alternatively, use teas. Glycetracts may be used but careful monitoring is required. If the glycetract is only a small part of the formula, then the effect is negligible.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

HERBS FOR HYPOTHYROID FUNCTION

Because hypothyroid disease can be immune-mediated, degenerative, or caused by neoplastic processes, the underlying disease process should be treated. One of the

first herbs many people think of for an underactive thyroid is kelp. However, neither kelp nor bladder wrack (*Fucus vesiculosus*) has research to support this use. It may be used as a source of iodine in iodine-deficient states, which are rare in dogs. Increased iodine intake is associated with initiation of autoimmune thyroiditis in genetically predisposed people (Lorini 2003, Ruwhof 2001). Because immune-mediated thyroiditis is a common form of hypothyroidism in dogs, kelp supplementation may be detrimental in some dogs.

Some herbs have been shown to stimulate thyroid production, including Withania, Bacopa, and Licorice. Withania (*Withania somnifera*) has been shown to increase thyroxine (T4) in rats (Panda 1999). Brahmi (*Bacopa monniera*) (200 mg/kg) leaf extracts also have a thyroid-stimulating effect; in mice they increased T4 concentration by 41%. They also may be beneficial in hypothyroidism (Kar 2002). Rats given Licorice (*Glycyrrhiza glabra*) for 15 days had dose-dependent increases of thyroxine, triiodothyronine, and thyrotrophic hormone (Al-Qarawi 2000).

PRESCRIPTION FOR HYPOTHYROIDISM

Strategy

Use thyroxine replacement, but monitor because the doses that are needed may be lower than expected. Consider herbs that stimulate the thyroid, but also consider herbs that modulate the immune system if thyroiditis plays a role. Treat the symptoms; use tonics, bitters, and circulatory stimulants; and consider whether alteratives and nervines may be beneficial.

Withania: Tonic, adaptogen, nervine, anti-inflammatory, antitumor; 2 parts.

Milk thistle: Hepatotonic, antioxidant, hepatoprotective; 1 part.

Bupleurum: Anti-inflammatory, hepatoprotective, renal protective, tonic; 1 part.

Bacopa: Nervine, mild sedative, spasmolytic, mental tonic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

HERBS FOR HYPERTHYROID FUNCTION

Aloe vera inhibited both T(3) and T(4) in mice and may be useful in the regulation of hyperthyroidism (Kar 2002). Bugleweed (*Lycopus virginicus*) is perhaps the most extensively studied herb for its effects on thyroid function. It reduced both thyroid-stimulating hormone and thyroxine (T4) (Wagner 1970) and inhibited both the extra-

thyroidal enzymic T4-5'-deiodination to T3 and the T4-5'-deiodination (Aufmkolk 1984). *Lycopus europaeus* caused a long-lasting T3 reduction in rats and a reduction in T4 and thyroid-stimulating hormone (TSH) 24 hours after administration (Winterhoff 1994). However, administration of *Lycopus europaeus* did not affect thyroid hormone levels in rats in a more recent study but did reduce heart rate (Vonhoff 2006).

PRESCRIPTION FOR HYPERTHYROIDISM

Strategy

Conventional radioactive iodine, surgery or chemical ablation may be preferred. Oral agents may be effective and herbs may be used to minimize side effects. Herbs may assist in management in early cases. Consider using nervines, adaptogens, and cardioprotective herbs.

Bugleweed: Cardioactive, diuretic, reduces heart rate, sedative, thyroxine antagonist; 1 part.

Motherwort: Sedative, cardiotonic; 1 part.

Hawthorn: Cardiotonic, hypotensive, antioxidant; 1 part.

Passion flower: Sedative, nervine, antispasmodic; 1 part.

Rehmannia: Adaptogen, renal protective; 1 part.

Use glycefracts if available. Give 1 ml per 10 pounds twice daily in food or diluted and given by mouth.

For teas, give one-fourth cup per 10 pounds twice daily in food.

Chapter Twenty-Nine

Neurological Disorders

HERBS FOR NEUROLOGICAL DISORDERS

Traditional herbalists employ nervine herbs to treat disorders of the nervous system, including cognitive dysfunction, degenerative myelopathy, epilepsy, and paresis/paralysis (IV disc disease). Any plant that affects the nervous system is called a nervine. Perhaps one of the most useful classes of traditional nervines are the nerve tonics. These include the adaptogens (for example, *Panax ginseng*, *Withania somnifera*, and *Elutherococcus senticosus*), which can reduce the impact of stress on the body; nervine trophorestoratives, which can directly improve the functioning of nerve tissue (such as *Ginkgo biloba*, *Bacopa monniera*, *Centella asiatica*, *Hypericum perforatum*, and *Scutellaria lateriflora*); and most of the herbs that reduce anxiety and stress discussed in the herbs for behavioral conditions section.

Cognitive enhancers

Several herbs have been investigated for their potential as cognition enhancers. Ginkgo (*Ginkgo biloba*) is perhaps one of the most commonly prescribed in human herbal medicine. Note that 2 case reports in humans suggest a possible role of Ginkgo in precipitating seizures in previously controlled epileptic patients (Granger 2001). Ginkgo improves peripheral and central circulation and protects the brain from oxidative damage. A Cochrane meta analysis showed that despite some methodological issues with earlier studies, overall Ginkgo is beneficial for treating dementia and cognitive decline in people; it benefits cognition, activities of daily living, mood, and emotional function with no difference from placebo in terms of adverse effects (Birks 2002).

Lemon balm (*Melissa officinalis*) was investigated for the treatment of Alzheimer's disease. Sixty drops of an extract/day was administered to patients with mild to moderate Alzheimer's disease for 4 months. Compared to the placebo, the Melissa extract significantly improved

cognitive function (Akhondzadeh 2003). *Withania somnifera*, an important adaptogen, has shown memory-improving and cognition-enhancing effects in animals and humans (Schliebs 1997). Gotu kola (*Centella asiatica*) has also been used as a cognitive enhancer. In rat models of human Alzheimer's disease and epilepsy, it decreased the markers of oxidative stress and improved cognitive measures (Veerendra 2002, Veerendra 2003, Gupta 2003).

Bacopa (*Bacopa monniera*) was traditionally used in Ayurvedic medicine as a brain tonic to improve learning, concentration, and memory development, and was used to treat seizure and anxiety (Chopra 1958). It also has adaptogenic activity in stressed rats (Rai 2003). It may play a role in the treatment of epilepsy; in rats, it reduced cognitive impairment associated with phenytoin treatment (Vohora 2000).

Nervine trophorestoratives

Herbs that are considered to have an affinity for neurological tissue and are used for neuralgias and nerve trauma include Ginkgo (*Ginkgo biloba*), Bacopa (*Bacopa monniera*), Gotu kola (*Centella asiatica*), St. John's wort (*Hypericum perforatum*), Dan shen (*Salvia miltiorrhiza*), and Skullcap (*Scutellaria lateriflora*). One interesting herb, Dan shen (*Salvia miltiorrhiza*), has been used in China for cerebrovascular disease, including stroke in people. One constituent, tanshinone I, has demonstrated in vivo anti-inflammatory activity (Kim 2002). The tanshinones penetrated the blood-brain barrier readily and reduced brain infarct volume by one-third 24 hours following treatment. The reduction in brain infarct volume was associated with improvements in observed neurologic deficit (Lam 2003). Rabbits with induced spinal cord injury and impacted vertebrae were injected with Dan Shen and showed histologically less serious damage compared with controls. The study concluded that Dan shen has a protective effect on spinal cord injury in the early stages (Ni 2002). Anti-inflammatory, antistress, immunomodulatory, and antioxidant activity explains how

trophorestoratives probably exert their effects on neurological disorders.

Anticonvulsants

Many herbs have traditionally been used to treat epilepsy and seizure disorders, and more have been investigated to ascertain their activity. For example, *Gastrodia* (*Gastrodia elata*) and *Uncaria* (*Uncaria rhynchophylla*) are both commonly incorporated into Chinese formulas for epilepsy. Both reduced seizure activity in induced epilepsy rats (Hsieh 2001, 1999). *Corydalis* (*Corydalis ambigua*) contains an active THP (tetrahydropalmatine), which is an effective anti-epileptogenic and anticonvulsant agent (Lin 2002). It may act by inhibiting amygdaloid dopamine release during an epileptic attack (Chang 2001).

Epilepsy was induced in rats, which were then given 1 of 3 herbs in their water supply for 30 days. Compared to controls, which were not seizure free, rats that received either Skullcap (*Scutellaria lateriflora*), Gelsemium (*Gelsemium sempervirens*), or Jimson weed (*Datura stramonium*) did not display any seizures during treatment. Once the herbal treatment was removed the rats displayed equivalent seizure activity to the nontreated rats, suggesting that herbal compounds may be helpful (Peredery 2004). Chinese skullcap (*Scutellaria baicalensis*) may also have anticonvulsant effects. Most recently, Devil's claw (*Harpagophytum procumbens*), which has traditionally been used for childhood convulsions, has been shown to have anticonvulsant activity in mice. AH procumbens secondary root aqueous extract (HPE, 100–800 mg/kg IP) delayed the onset of and antagonized induced seizures, possibly by enhancing GABA-ergic neurotransmission and/or facilitating GABA-ergic action in the brain (Mahomed 2006).

It is important to note that nervine relaxants (such as Kava, Valerian, Chamomile, and Passion flower) may potentiate the effects of anti-epileptic drugs, and nervine stimulants (such as ephedra or ma huang and caffeine in tea, for example) have the potential to exacerbate seizures in epileptics. Ginkgo and Ginseng may also exacerbate seizures (although the evidence for this is uncertain). St. John's wort also has the potential to affect the seizure threshold (Spinella 2001).

Analgesics

A number of herbs have demonstrated analgesic activity from mild to moderate activity. Also consider the herbs with anti-inflammatory activity in the musculoskeletal section such as Willow (*Salix alba*), Boswellia (*Boswellia serrata*), Devil's claw (*Harpagophytum procumbens*), Prickly ash (*Zanthoxylum spp*), Ginger, and others. The needs of the patient must be considered, and conventional pain relief, where needed, may be more effective and

predictable. However, for long-term pain minimization herbs may help reduce the dosage or need for conventional analgesia. *Corydalis* reduced pain from inflammation in a rat model (Wei 1999) and has demonstrated dose-related analgesic effects in a clinical trial in people (Yuan 2004). California Poppy (*Eschscholtzia californica*) has a long history of use for pain relief in people. St. John's wort has shown analgesic effects in laboratory animal studies (Kumar 2001, Trovato 2001, Viana 2003, Rieli 2002).

PRESCRIPTION FOR COGNITIVE DYSFUNCTION

Strategy

Address any underlying primary medical diseases and discuss behavioral management with the owner. Recommend a balanced diet with fresh vegetables. Consider drug therapy as well as herbs to improve circulation and herbs with antioxidant activity. Also consider herbs to improve cognitive function and adaptogenic herbs for stress reduction.

Use alcohol or glyceract tinctures for best results; alternatively, use teas.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 1 part.

Hawthorn: Cardiotonic, antioxidant, vasodilator, hypotensive; 1 part.

Ginkgo: Antioxidant, circulatory stimulant, cognitive enhancer; 1 part.

Lemon balm: Anxiolytic, sedative, carminative, antispasmodic; 1 part.

Bacopa: Nervine tonic, mild sedative, mental tonic, spasmolytic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

DEGENERATIVE MYELOPATHY

Degenerative myelopathy is a slowly progressive disease of the spinal cord. Acupuncture and chiropractic are the treatments of choice, and ongoing physical therapy and maintaining mobility are critical to patient wellbeing.

Strategy

A balanced diet rich in antioxidants and supplementation with essential fatty acids may be beneficial. The underlying pathogenesis is still unknown; however, immunosuppressive treatment does not seem to be beneficial. Despite this, herbs that are beneficial in autoimmune disease such as Dan shen, Albizzia, Baical skullcap, and Bupleurum may be useful. Herbs rich in antioxidants may help delay

the degenerative process. Reduce stress and possible inflammation and improve circulation with appropriate herbs.

Use alcohol or glycertracts for best results; alternatively, use teas.

Withania: Tonic, adaptogen, nervine, sedative, anti-inflammatory; 1 part.

Hawthorn: Cardiotonic, antioxidant, vasodilator, hypotensive; 1 part.

Ginkgo: Antioxidant, circulatory stimulant, cognitive enhancer; 1 part.

Dan shen: Neuroprotective; 1 part.

Bilberry: Vasoprotective, antioxidant, anti-edema, astringent, anti-inflammatory; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

EPILEPSY

Seizure disorders are common in dogs, and despite several possible etiologies, most are idiopathic epilepsy. Many animals can be managed with conventional treatment, but a quarter to a third of cases can be challenging when they either don't respond or are refractory. Herbs can augment conventional treatment and reduce medication use. Conventional treatment should always be tried; however, in cases where only 1 seizure has been observed or the intra-seizure period is extended, herbs might be used as an alternative.

Strategy

Rule out food hypersensitivity by using an elimination diet. If using conventional drugs, consider adding hepatoprotective herbs. Also consider antioxidant herbs.

Skullcap: Anxiolytic; 1 part.

Baical skullcap: Anxiolytic; 1 part.

Milk thistle: Antioxidant, hepatoprotective, hepatonic; 1 part.

Bilberry: Anti-inflammatory, antioxidant, astringent; 1 part.

Bacopa: Nervine tonic, mild sedative, mental tonic, spasmolytic; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

PRESCRIPTION FOR INTERVERTEBRAL DISK DISEASE (CERVICAL AND THORACOLUMBAR)

Where conservative treatment is the treatment of choice, rest and physical therapy are essential. Chiropractics and acupuncture can be very helpful when applied

appropriately. Nonsteroidal drugs and analgesics may be necessary. Corticosteroid treatment, while common, is controversial. Pain relief may result in increased exercise and further damage. Surgical intervention may result in clinical improvement; however, some dogs deteriorate, possibly because of the inflammatory cascade that may occur following decompression. The main goals are to relieve pain and inflammation.

Strategy

Support the animal with adaptogens to reduce the impact of stress. Use herbal antioxidants to reduce free radical damage. Use circulatory herbs to improve blood flow and oxygenation of inflamed tissues. Use herbal anti-inflammatory and analgesic herbs. Bladder support herbs may be important to reduce the risk of cystitis and improve bladder tone.

Dan shen: Neuroprotective; 2 parts.

Corydalis: Reduces visceral and back pain; 1 part.

Kava kava or Cramp bark: Anxiolytic, sedative, antispasmodic; 1 part.

Ashwaganda: Nervine, sedative, anti-inflammatory; 1 part.

Prickly ash: Antirheumatic, carminative; 1 part.

For tinctures, give 1 ml per 10 pounds twice daily in food. For teas, give one-fourth cup per 10 pounds twice daily in food.

Chapter Thirty

Infectious Diseases

HERBS FOR INFECTIOUS DISEASES

Herbs can deactivate viruses, bacteria, or fungi directly (this may involve altering membranes or enzyme systems) and are considered to be antimicrobial or to have antiseptic action. Others act indirectly via stimulation of phagocytosis, natural killer cells, lymphocytes, or other immune cells. For example, *Andrographis* (*Andrographis paniculata*) was originally thought to have direct antibacterial activity but was later found to exert its effect through immune stimulation. On the whole, treatment for infectious diseases is symptomatic. Apart from feline interferon-omega, there are currently no antiviral medications registered for veterinary use. Human antiviral drugs are available but are largely uneconomical or untested and complete elimination of virus is also not usually achieved. Herbal medicine management offers great potential to provide strategic immune modulatory action for infectious diseases. Herbs can also provide antiviral, antibacterial, antifungal, and antiprotozoal activity as well as symptom support for various infections.

Some general principles apply with any infectious disease. Provide conventional therapy as required and according to the severity of the symptoms. Support the immune system with immune-enhancing herbs. Provide systemic support. Focus particularly on the digestive system, which aids immune regulation via gut activated lymphoid tissue (GALT). Consider bitter herbs and alteratives that support elimination. Use adaptogens, particularly because stress can be a contributing or compounding problem associated with infectious diseases. Support the particular organs or systems affected by the infection. For example, Milk thistle is an obvious choice as a hepatoprotective herb in liver infections. Consider Golden seal (*Hydrastis canadensis*) for the gastrointestinal system and Uva ursi (*Arctostaphylos uva-ursi*) for the bladder. Use organ-specific antimicrobial, antiseptic, antifungal, antiprotozoal, or antiviral herbs.

HERBS WITH IMMUNE-MODULATING ACTIVITY

A key strategy when dealing with any infection is to support inherent immunity by incorporating immune-modulating herbs into any formula. These include medicinal mushrooms, Astragalus (*Astragalus membranaceus*), Cat's claw (*Uncaria tomentosa*), Echinacea spp, Pau D'arco (*Tabebuia avellanedae*), and Siberian ginseng (*Eleutherococcus senticosus*), among others. Because most acute infections are accompanied by fever, warming tonic herbs such as Astragalus (*Astragalus membranaceus*), Asian ginseng (*Panax ginseng*), and Siberian ginseng (*Eleutherococcus senticosus*) are contraindicated. They are suitable for chronic infections. For recurrent or persistent infections, immune-enhancing herbs are fundamental to any prescription.

Medicinal fungi include Reishi (*Ganoderma lucidum*), Maitake (*Grifola frondosa*), Cordyceps (*Cordyceps sinensis*), Shitake (*Lentinula edode*), Turkey tail (*Trametes versicolor*), and others. Most of the medicinal fungi contain polysaccharide complexes and sterols that appear to enhance cell-mediated immune functions (Ooi 2000, Wasser 1999, Zhu 1998). Astragalus (*Astragalus membranaceus*) has antiviral, antineoplastic, and anti-inflammatory effects and has been shown to improve the immunity of mice with solid tumors (Kurashige 1999). It increases T-cell-mediated immune functions, increases macrophage numbers, and enhances phagocytosis (Zhao 1990, Yoshida 1997), and raises the levels of antibodies, activity of natural killer cells, and possibly interferon. It is ideal for prevention of infection during epidemics or for chronic immune incompetence.

Echinacea (*Echinacea spp*) has nonspecific immune-modulating activity, mainly by improving phagocytosis and therefore immune surveillance. It takes about 3 days for Echinacea to reach peak activity in people. Constituents have been shown to stimulate natural killer cell,

neutrophil, and B-lymphocyte activity and macrophage cytokine production in vitro; to inhibit hyaluronidase activity; and to have anti-inflammatory, antibacterial, antiviral, and mild local anesthetic activity (Wynn 2006). Cat's claw (*Uncaria tomentosa*) or Una de Gato contains alkaloid constituents that have anti-inflammatory and immune stimulant activity and antimicrobial and antiviral properties (Williams 2001).

Panax ginseng polysaccharides and saponins have shown immunostimulating activity (Kitts 2000). In one study, rats with *Pseudomonas aeruginosa* had chronic lung infections. Rats treated with *Panax ginseng* showed higher bacterial clearance and lower serum immunoglobulin levels than those treated with the placebo, suggesting that cell-mediated immunity was enhanced (Song 1998).

Other herbs used to support immunity include Siberian ginseng (*Eleutherococcus senticosus*), Andrographis (*Andrographis paniculata*), Poke root (*Phytolacca decandra*), Picrorrhiza (*Picrorrhiza kurroa*), and Thuja (*Thuja occidentalis*). Picrorrhiza is ideal for acute febrile states and works well with Echinacea. It also works well with Milk thistle (*Silybum marianum*) for infectious liver disease. Thuja (*Thuja occidentalis*) is a particularly interesting herb. It demonstrates activity against several viruses, including enveloped and nonenveloped viruses with DNA and RNA nucleic acids from the following families: Papovaviridae (responsible for warts), poxviridae and picornaviridae, and herpes virus. With activity on this range of virus structures, it is likely the antiviral action of Thuja can be extended to other viral diseases. St. John's wort (*Hypericum perforatum*) is another antiviral herb against enveloped viruses such as herpes viruses, poxviruses, paramyxoviruses (*Morbillivirus*), retroviruses, and coronaviruses. Many other herbs and constituents have been reported to have strong antiviral activity and some of them have already been used to treat animals and people who suffer from viral infection (Jassim 2003).

When prescribing a formula for an individual patient with an infectious disease, it is most important to treat the patient, not the diagnosis. Provide immune support, adaptogens, and herbs to support the systems affected by the disease. In addition, biomedical actions of herbs can be exploited, and particular herbs can be incorporated for particular infectious agents.

CORONAVIRUS INFECTIONS

Coronavirus infections are most often associated with acute, self-limiting, enteric, and respiratory infections, but they can become chronic in infected animals. The low virulence enteric coronaviruses in cats and disease-causing feline infectious peritonitis are closely related and may represent differences in virulence. Coronaviruses do not usually cause disease in adult dogs but can cause mild

gastrointestinal disease in puppies unless there is concurrent infection with parvovirus occurs.

Strategy

Use immune-supporting herbs such as Echinacea (*Echinacea spp.*) or Astragalus (*Astragalus membranaceus*). Use adaptogenic herbs such as Withania (*Withania somnifera*), which also assists gastrointestinal function. For mild gastrointestinal disease consider the gastrointestinal herbs that can be used to alleviate symptoms; alternatively, consider the respiratory herbs if that system is affected. St. John's wort (*Hypericum perforatum*) has activity against coronaviruses.

CANINE DISTEMPER

Canine distemper virus (CDV) is a morbillivirus, which induces multifocal demyelination in the central nervous system in dogs. Part of the pathogenesis includes noninflammatory demyelination and viral-induced immunosuppression.

Strategy

Use immune-supporting herbs such as Echinacea (*Echinacea spp.*) and Picrorrhiza (*Picrorrhiza kurroa*). Use adaptogenic herbs such as Withania (*Withania somnifera*), which is also a relaxing nervine. For neurological disease consider the neurological herbs that can alleviate symptoms and neurorestorative herbs such as Dan shen (*Salvia miltiorrhiza*). St. John's wort (*Hypericum perforatum*) also has activity against morbillivirus. Also consider Thuja (*Thuja occidentalis*) for immune stimulation and antiviral effects.

Distemper in dogs is considered to be a model for multiple sclerosis. Medical cannabis is often used by patients with multiple sclerosis (MS) for muscle spasm and pain, and in an experimental model of MS low doses of cannabinoids alleviated tremor (Williamson 2000).

FELINE UPPER RESPIRATORY TRACT INFECTIONS

Feline upper respiratory disease (FURD) complex may be caused by viral or bacterial organisms, or concurrent infections of calicivirus, herpes virus, chlamydia, bordetella, and mycoplasma. Treatment is mainly supportive (a high level of nutrition, adequate hydration, and good nursing care). Herpes virus 1 (rhinotracheitis) and calicivirus are the most common viral causes of upper respiratory tract infection in cats, and can be recurrent and chronic with or without secondary bacterial infection. There are no consistently effective treatments in conven-

tional medicine. Lysine at 250 mg PO BID may be beneficial but is unproven, and interferon may help some cats with suspected herpes virus 1 infection, but neither are likely to cure the disease. Anti-inflammatory medications such as piroxicam can assist with chronic lymphocytic-plasmacytic rhinitis but side effects are possible. Herbal medicine rarely cures chronic disease but can reduce severity and increase disease-free periods, in the author's experience.

Strategy

In cats, use medicinal mushrooms, particularly Reishi (*Ganoderma lucidum*), Maitake (*Grifola frondosa*), Cordyceps (*Cordyceps sinensis*), and Shitake (*Lentinula edode*) combinations, to support immunity and help treat respiratory infection. Echinacea (*Echinacea* spp.) is ideal for respiratory tract infections. For nonsymptom periods consider Astragalus (*Astragalus membranaceus*) as a preventative. For herpes, consider herbal steam nebulizers to deliver St. John's wort (*Hypericum perforatum*), or for calicivirus use Astragalus or both as teas to deliver direct activity to the nares and mucosal membranes. Consider the respiratory demulcents to reduce inflammation in the mucous membranes; Marshmallow (*Althaea officinalis*) is ideal in cats. If using conventional anti-inflammatory medications consider herbs that reduce the potential for side effects such as renal protective herbs (Astragalus is ideal).

Carrier status is common and stress induces disease; therefore, adaptogens play an important role in prevention.

FELV, FIV, FIP

These feline diseases present with different signs and severity and cats should be treated individually based on their needs. Immune-modulating herbs are a strategic part of therapy. With appropriate care, FeLV- or FIV-infected cats can live well with retroviruses. Reducing stress and providing a high level of nutrition are essential.

Use the medicinal mushrooms, in particular Reishi (*Ganoderma lucidum*), Maitake (*Grifola frondosa*), Cordyceps (*Cordyceps sinensis*) and Shitake (*Lentinula edode*) combinations, to support immunity.

Feline leukemia

Echinacea purpurea was given to mice with induced leukemia (powdered leaves, 7.5 mg/mouse/week). Survival was significantly prolonged and enlargement of thymic lymphoma was significantly suppressed compared with controls. The suppressive effects on the leukemia may depend on enhancement of nonspecific immune or cellular

immune systems (or both) by Echinacea (Hayashi 2001).

Compared to the control mice, of which none survived past 3 months after induction of leukemia, all of the *E. purpurea*-treated mice were alive 3 months after tumor onset. The survival advantage provided by *E. purpurea* to these leukemic mice vs. untreated mice was highly significant (Currier 2001).

In an uncontrolled study of leukemic cats, acemannan from *Aloe vera* gel was given for 6 weeks intraperitoneally to clinically symptomatic cats. It significantly improved both quality of life and survival rate. It was noted that 12 weeks after initiation of treatment, 71% of the treated cats were alive and in good health (Sheets 1991). This trial included historical controls because participating clients refused to allow placebo treatment in their sick cats. Treated cats showed nonsignificant rises in hematocrit and hemoglobin concentrations, and leukocyte and lymphocyte counts tended to normalize over the course of the trial.

FIV

In South Africa, the effects of betasterol (BSS), a major phytosterol in plants, along with Betasitosterolin (BSSG) on FIV in cats and HIV in humans were studied. Domestic cats infected with the retrovirus FIV (which induces the same pathogenic mechanisms of CD4 cell loss, immunosuppression, and opportunistic infections) were examined. A group of 33 infected cats was divided into a treatment group ($n = 16$) or a placebo group ($n = 17$) (Bouic 1997). The results of the study revealed that the treated cats maintained stable CD4 immune cell numbers, had a reduction of CD4 lymphocyte apoptosis, had decreased IL-6 levels, had possibly decreasing viral replication rates and viral load over a period of 168 weeks, compared to the placebo group, which showed disease progression with the typical CD4 cell loss over the same period of time. At the end of the study, the treated cats exhibited 20% mortality compared to 75% in the nontreated group. This combination of sterols is patented in a product called Moducare, and the plant sterols are considered to be very safe to use.

Acemannan, an extract of *Aloe vera*, was investigated by Yates (1992) in 49 FIV-infected symptomatic cats; 23 had severe lymphopenia. Cats were given acemannan by oral, subcutaneous, or intravenous routes, once weekly for 12 weeks. Over the treatment time there was a significant increase in lymphocytes and a decrease in neutrophils and infections. The route of administration was not significant. Cats that had lymphopenia had a 235% increase in lymphocytes compared to nonlymphopenic cats (42%). In this uncontrolled trial, the rates of survival for all 3 groups was 75% up to 19 months after the trial began,

which is to be expected because FIV-infected cats are expected to live 8 years or more without treatment (Wynn 2006).

In a study reported by Jones (1995), Cat's claw (*Uncaria tomentosa*) as a proprietary root extract called Krallendorn was given by injection (0.3 mg IM on days 1, 3, 5) to FIV-infected cats. Eighty-five percent of symptomatic cats were reported to improve and 44% of cats "with leukemia" were aviremic by 20 weeks.

Herbs and constituents that have demonstrated activity against human immunodeficiency virus include various sulphated polysaccharide groups extracted from seaweed, Baicalein from Skullcap (*Scutellaria baicalensis*), anti-HIV flavonoids such as quercetin, and myricetin and andrographolide extracted from *Andrographis paniculata* (Jassim 2003).

St. John's wort (*Hypericum perforatum*) has activity against HIV retrovirus.

FIP

FIP is associated with vascular and perivascular inflammation, possibly immune-mediated. The inflammation leads to leakage of fluid and accumulation of thoracic and abdominal exudate.

Strategy

In addition to appropriate symptomatic care, the overall goal is to modulate rather than stimulate the immune system. To improve blood vessel integrity, consider rutin-containing herbs and herbs such as Bilberry (*Vaccinium myrtillus*). Herbs that have activity against coronavirus are also suggested.

CANINE INFECTIOUS HEPATITIS

Acute canine infectious hepatitis has been associated with canine hepatitis virus (canine adenovirus type-1), *Helicobacter canis* infection, leptospirosis, Rocky Mountain spotted fever, and other agents. Infections can lead to chronic liver disease.

Strategy

Use immune-stimulating herbs. *Andrographis paniculata* is immune stimulating and has been used to treat leptospirosis (Chang 1987). In people with infective hepatitis a majority of 20 patients showed marked improvement after the equivalent of 40 grams of andrographis were given each day for an average of 24 days. Overall, 80% were cured and 20% improved (Chaturvedi 1983). *Picrorrhiza kurroa* may be valuable in viral hepatitis. In clinical trials using *Picrorrhiza* to

treat infectious hepatitis, rapid decreases in bilirubin and quick clinical recoveries were observed (Chaturvedi 1966). Echinacea is another good choice. Use adaptogens. If the patient is not excessive, consider *Panax ginseng*, which aids liver regeneration and hepatic function. Herbs that support liver function, including Milk thistle (*Silymarin marianum*), and in combination with *Picrorrhiza* are particularly well suited to the treatment of infectious or immune-mediated liver damage.

FELINE HERPES: STOMATITIS, KERATITIS, CORNEAL ULCERS

The ocular syndromes caused by herpes in cats include ophthalmia neonatorum in the newborn, bilateral keratoconjunctivitis in young cats, and ulcerative keratoconjunctivitis in young and adult cats. Topical medications with specific antiviral activity such as Trifluridine may be beneficial. L-Lysine (500 mg twice daily) may also help.

Strategy

Consider the options under Feline Upper Respiratory Tract Infections. Consider the options under herbs for eye and ear disorders. Use immune-supporting, adaptogenic, antiviral, and symptom-alleviating herbs. Topical herbal teas may be helpful. Teas should be made daily with boiled water to which 2 teaspoons of herb and 1 teaspoon of salt have been added. The tea should be filtered through a coffee filter to remove impurities that could irritate the eye. Lemon balm (*Melissa officinalis*) is the tea of choice for cats. It has topical efficacy against human herpes virus (Gaby 2006). Consider adjunctive care and pain-relieving herbs if blepharospasm is evident.

PARAINFLUENZA/INFECTIOUS TRACHEOBRONCHITIS

Infectious tracheobronchitis (ITB) is often a mixed infection (viral, bacterial, mycoplasma). Canine parainfluenza virus, canine adenovirus-2, and *Bordetella bronchiseptica* are considered to be primary pathogens. Other bacteria and *Mycoplasma spp.* may be primary or secondary. Paroxysmal coughing can be hacking, dry, or productive, but is usually self-limiting. Complicated cases may benefit from antibiotic therapy to treat or prevent secondary infections.

Strategy

Uncomplicated ITB can be treated symptomatically using respiratory herbs, mainly antitussives. Use preventative measures for dogs that are in contact with one another;

for example, oral doses or nose drops of *Astragalus* (*Astragalus membranaceus*) decoction protected mice from parainfluenza virus type 1 infection (Chang 1987). Use immune-supporting herbs such as Echinacea (*Echinacea spp.*), *Astragalus* (*Astragalus membranaceus*), or Holy basil (*Ocimum sanctum*). Chronic upper respiratory infection in dogs may benefit from Echinacea. In an open, multicenter trial, 41 dogs not previously treated that had various conditions including kennel cough, bronchitis, pharyngitis, and tonsillitis were given powdered *Echinacea purpurea* root extract (1:3). Although there was no proof of diagnosis or control in this trial, 92% of the dogs had a good or very good improvement at 4 weeks and 95% showed the same results at 8 weeks (Reichling 2003). Use adaptogenic herbs such as Siberian ginseng (*Eleutherococcus senticosus*), which is particularly indicated for infections due to stress that may occur in boarding situations. Note that it should not be used in acute infections. Use respiratory herbs such as demulcents, antitussives, and respiratory antimicrobials.

CANINE PARVOVIRUS AND FELINE PANLEUKOPENIA

These infectious diseases lead to hemorrhagic diarrhea and mucosal sloughing with breakdown of the gastrointestinal mucosal barrier. This in turn can lead to bacterial translocation and endotoxemia, as well as sepsis, which is made worse by a concurrent neutropenia. Antibiotics are indicated in these patients, along with fluid therapy, pain relief, and supportive nursing. Vomiting may preclude treatment with herbal medicine but gastrointestinal herbs should be used when recovering, or administered via enema using teas in the hospital. During the acute phase, if possible administer Slippery elm (*Ulmus rubra*) powder, which acts as a mucilage and demulcent and nutritive herb.

Herbs such as Agrimony (*Agrimonia eupatoria*) and Tormentil (*Potentilla erecta*) contain tannins, which can denature surface proteins and lead to reduced pain and bleeding. However, they must be given orally, which may be counterproductive in the acute phase. Berberine-containing herbs such as Golden seal (*Hydrastis canadensis*) can reduce endotoxemia.

In the recovery phase, probiotics are important to help gastrointestinal repair. Also consider glucosamine, glutamine, and fructooligosaccharides. Once vomiting has stopped consider formulas presented under gastrointestinal herbs. Three to 4 weeks of gastrointestinal repair should be expected. Herbs such as Meadowsweet, Marshmallow, Dandelion, and Withania (*Withania somnifera*) may be helpful.

In one report by Jones (1995), 2 veterinarians treated 15 dogs with parvovirus using Cat's claw (*Uncaria tomen-*

tosa) as a distilled preparation (1 mL/kg twice daily). They reported that 10 of the 15 dogs recovered.

TICK-BORNE DISEASES: LYME, EHRLICHIOSIS, ROCKY MOUNTAIN SPOTTED FEVER

Tick-borne diseases should be treated conventionally with appropriate antibiotics and supportive therapy. Depending on the diagnosis and signs, more than 1 disease-causing agent may be present at the same time. The spirochete *Borrelia burgdorferi* is responsible for the clinical syndromes of Lyme disease, which include arthritis, nephritis, carditis, and neurological changes. Canine ehrlichiosis is an acute to chronic disease characterized by infection of monocytes and lymphocytes, with anemia, leukopenia, and thrombocytopenia as common sequelae. Secondary immune-mediated hemolytic anemia may also be triggered by infection. In the chronic stage, pancytopenia and lymphocytosis may occur. Rocky Mountain spotted fever is caused by *Rickettsia rickettsii*, which invade vascular endothelium and cause necrotizing vasculitis and petechiae, ecchymoses, and edema. Respiratory and neurological signs and lymphadenopathy may be seen. Conventional therapy may also include whole blood transfusions, fluid therapy, and sometimes corticosteroids. Herbs can be used to support the patient during the acute stages but are more strongly indicated for convalescence and for chronic disease. Herbal treatment is based on the individual patients and their symptoms.

Strategy

Fundamentally immune-enhancing herbs are the most important part of treating these infections, acute or chronic. Prescribe herbs to support the organs and tissues affected by the infection; herbs that treat anemia may be useful. Provide herbs that alleviate symptoms such as nervines and musculoskeletal or respiratory herbs as needed. Consider restoring bowel flora following antibiotic therapy, particularly if extended treatment is needed.

Traditionally, spirochete infections (syphilis) in people were treated with Sarsaparilla (*Smilax ornata*), Stillingia (*Stillingia sylvatica*), and Guaiacum resin (*Guaiacum officinalis*), and may have applications in the treatment of persistent Lyme disease.

Western Herbal Cancer Treatment

WESTERN HERBAL CANCER PROTOCOLS

The herbal protocols discussed in this chapter can be used in the treatment of the following cancers:

- Adenocarcinoma
- Chondrosarcoma
- Fibrosarcoma
- Hemangiosarcoma
- Histiocytoma
- Leiomyosarcoma
- Lymphoma/lymphosarcoma
- Mammary cancer
- Mast cell formula
- Melanoma
- Meningioma
- Osteosarcoma
- Pheochromocytoma
- Spindle cell sarcoma
- Transitional cell carcinoma
- Thyroid carcinoma

Herbal medicine offers veterinary patients a variety of benefits in the integrative treatment of cancer. It can reduce toxicity of treatment; support the patient through surgery, chemotherapy, or radiation; or provide a palliative option when conventional treatment is declined. Many chemotherapeutic drugs currently in use in human (and some in veterinary) medicine were first identified in plants, including taxol, vinblastine and vincristine, and etoposide and teniposide (Boik 1996).

The use of herbal medicine for the treatment of cancer depends on a growing understanding of the biological mechanisms by which cancer cells proliferate, maintain life, and die. These include differentiation, angiogenesis, apoptosis, invasion, metastasis, mitosis, and evasion of the immune system. As these mechanisms have become elucidated, their weak points have been identified and have become the targets of research (Boik 1996).

An extremely comprehensive review of anticancer plants and natural compounds is provided in John Boik's book, *Natural Compounds in Cancer Therapy* (2001). This book reviews published literature and explains the mechanisms of actions for many plants and their constituents and their activity based on in vitro and in vivo research. The medicine is likely to inhibit pro-cancer events by selecting compounds that have direct-acting, indirect-acting, and immune-stimulating activities (Boik 2001).

A number of strategies are available for the treatment and management of cancer when clients elect to use herbal medicine. When treating potentially life-threatening disease it behooves us as practitioners to either refer these cases to qualified veterinary herbalists or undertake additional study to gain an in-depth knowledge of herbal medicine for cancer treatment. Ideally, herbs are prescribed according to the patient's vitality, energetics, symptoms, concurrent treatment, prognosis, and diagnosis. The diagnosis is possibly the least important factor from an herbal medicine perspective, although it is useful from a prognostic point of view. Supporting the patient and improving vitality and immunity as well as incorporating herbs with anticancer activity are the fundamental principle.

Strategy

The primary goal of treatment is to improve systemic health. The nearer the patient's vitality is restored to normal, the better the expected outcome. Despite the poorest prognoses based on diagnosis, wellness and vitality are still achievable in some patients. In the author's experience, clients often remark on their pet being "more well" than they have been in years, despite the presence of cancer. Patients can go into remission; but more frequently, they can live with the chronic disease of cancer in a well state. It is important to normalize weight, provide a low-carbohydrate diet, reduce stress, ensure normal elimination processes, and provide exercise opportunities.

If the patient has an acute condition such as diarrhea, give that priority and treat it accordingly. Be strategic about herb selection; the more knowledge one has, the fewer herbs are needed to improve health.

ANTICANCER ACTION

Though research most often focuses on the activity of a given herb, a fraction of the herb, or a single chemical constituent, most herbs are actually used as part of a larger formula. When herbs are combined in moderate, nontoxic doses, targeting specific mechanisms, they have an additive or synergistic effect. The following list is just a sample of herbs with documented activity (Boik 2001).

Induce apoptosis: Greater celandine (*Chelidonium majus*), Baical skullcap (*Scutellaria baicalensis*), *Bupleurum spp.*

Induce differentiation: Burdock (*Articum lappa*), berberine-containing herbs, St. John's wort (*Hypericum perforatum*).

Cytotoxic: Mistletoe (*Viscum album*).

Inhibit angiogenesis: Horsetail (*Aesculus hippocastanum*), Garlic (*Allium sativum*).

Inhibit local invasion: *Crataegus spp.*, Nilberry (*Vaccinium myrtillus*).

Inhibit metastasis: Tea (*Camellia sinensis*), Dong guai (*Angelica sinensis*), Feverfew (*Tanacetum parthenium*).

Enhance vitality by using adaptogens: Herbs with adaptogens such as *Astragalus membranaceus*, *Withania somnifera*, Siberian ginseng (*Eleutherococcus senticosus*), and *Panax ginseng* can strengthen body resistance and enhance vitality, particularly in debilitated animals. These herbs also have anticancer properties.

Enhance immune function: Most conventional veterinary chemotherapeutic agents (as well as radiation therapy) are immune-suppressing and cytotoxic in nature and are associated with short- and long-term side effects (McEntee 2006, McKnight 2003). Immune-modulating and immune-stimulating herbs may prevent or minimize the undesired adverse effects of these agents by strengthening resistance to the treatment's side effects or to the cancer, and they may have anti-neoplastic activity.

The two most important classes of herbs in the anticancer group are the immunomodulating medicinal fungi and immune herbs and the adaptogens.

It is important to focus on improving gut function, which impacts innate immunity, with appropriate diet and support (probiotics, Marshmallow, Licorice, Glutamine, fiber, antioxidants, or antioxidant herbs). Among the recommended medicinal fungi or other immune-

supporting herbs are Cat's claw, phytosterols, *Astragalus*, *Echinacea*, *Cordyceps sinensis*, and *Withania*.

Daily dietary administration of *E. purpurea* root extract to normal mice for as little as 1 week also resulted in significant elevations in natural killer cells. Such boosting of this fundamental immune cell population suggests a prophylactic role for this herb in normal animals (Currier 2001).

ALTERATIVES

Detoxification is an herbal medicine principle in cancer treatment because cancer is thought to be the end result of accumulated toxins in the body. While some may argue with this theory, the use of alteratives may be useful nonetheless, particularly in the early stages of cancer when vitality is still good. Essiac is a commonly used formula that consists of 4 herbs, 3 of which are considered to be mild alteratives. This formula is beneficial in palliative care of end-stage cancer patients. Other alteratives to consider include: Dandelion root (*Taraxacum radix*); Yellow dock (*Rumex crispus*); Poke root (*Phytolacca decandra*), which is toxic and should only be used by experienced herbalists; Burdock (*Articum lappa*), Red clover (*Trifolium pretense*), and Sheep sorrel.

ANTIOXIDANTS

Antioxidants are important to treatment and palliation. Often the patient is subjected to free radical damage through treatment, and herbs with antioxidant activity can reduce the side effects of both chemotherapy and radiation, as well as the oxidative stress of general anesthesia. The literature includes several promising herbs whose antioxidant activity has been demonstrated in relation to anticancer properties, cancer prevention, and treatment.

These antioxidants include green tea (*Camellia sinensis*), which is an effective chemopreventive agent against the initiation, promotion, and progression of multistage carcinogenesis (Katiyar 1997); Milk thistle (*Silybum marianum*); and both Silymarin and Silibinin (silybin) with demonstrated anticancer effects (Gazak, et al. 2007). The cancer chemoprevention and anticarcinogenic effects of silymarin have been shown to be caused by silibinin, its major constituent (Bhatia 1999). Its antitumor effect occurs primarily at stage I tumor promotion; silymarin acts by inhibiting cyclo-oxygenase (cox-2) and interleukin (IL-1 α) (Zhao 1999). Such effects may involve inhibition of promoter-induced edema, hyperplasia, the proliferation index, and the oxidant state (Lahiri-Chatterjee 1999). Turmeric (*Curcuma longa*) scavenges free radicals (Tilak 2004) and Curcumin halts carcinogen-

esis by inhibiting cytochrome P450 enzyme activity and increasing levels of glutathione-S-transferase (Chauhan 2002).

Dan shen (*Salvia miltiorrhiza*) is another potent antioxidant herb that demonstrates free-radical scavenging activity (Xia 2003). One of its tanshinone constituents possesses cytotoxic activity against many kinds of human carcinoma cell lines; it induces differentiation and apoptosis, and inhibits invasion and metastasis of cancer cells. Its mechanisms are believed to be inhibition of DNA synthesis and proliferation of cancer cells; regulation of the expression of genes related to proliferation, differentiation, and apoptosis; inhibition of the telomerase activity of cancer cells; and change in the expression of cellular surface antigen (Yuan 2003). Schisandra (*Schisandra chinensis*) lignans act as free radical scavengers (Lu 1992), and geranylgeranoic acid, a constituent of Schisandra, has been shown to induce apoptosis in a human hepatoma-derived cell line (Shidoji 2004).

Ginkgo biloba leaf extract has significant antioxidant activity because of its flavonoid and terpenoid components, and the anticancer properties of Ginkgo are related to its antioxidant, antiangiogenic, and gene-regulatory actions. For example, bladder cancer cells exposed to Ginkgo produce an adaptive transcriptional response that augments antioxidant status and inhibits DNA damage (DeFeudis 2003). Rosemary (*Rosmarinus officinalis*) has antioxidant activity (ESCP 1999); in rats, dietary supplementation with 1% Rosemary extract for 21 weeks reduced the development of induced mammary carcinoma in the treated group, compared with the control group (40% vs. 75%, respectively) (Singletary 1991).

SPECIFIC ORGAN SUPPORT

When a particular organ or system is impacted by cancer, consider herbs that support the functioning of that organ or the organs that detoxify metabolic wastes in the body. For example, consider Milk thistle and *Panax ginseng* for liver cancer; *Gynema slyvestre* and Feverfew for pancreatic cancer; St. John's wort (*Hypericum perforatum*) (Martarelli 2004) and Pau d'arco (*Tabebuia avellanedae*) for prostate cancer; and Black cumin (*Nigella sativa*) (Khan 2005), *Astragalus membranaceus*, and *Ligustrum lucidum* (Lau 1994) for kidney cancer. Refer to the individual herbs for different systems for herb choices.

SPECIFIC SYMPTOM SUPPORT

Alleviating symptoms is important to improving the patient's well being. Consider conventional treatment when analgesia is needed. Palliation can also be helped

with analgesic herbs such as Devil's claw (*Harpagophytum procumbens*), Corydalis (*Corydalis ambigua*), Valerian (*Valeriana officinalis*), and Cramp bark (*Viburnum opulus*). Depression might be helped with St. John's wort (*Hypericum perforatum*), Lavender (*Lavendula officinalis*), or *Panax ginseng*. Nausea may be alleviated with Ginger (*Zingiber officinalis*) (Sharma, et al. 1997) or Chamomile (*Chamomilla recutita*).

EVIDENCE FOR EFFICACY OF HERBS AS ADJUNCTIVE THERAPY

Withania somnifera has direct anticancer properties. It possesses cell cycle disruption and anti-angiogenic activity, which has been confirmed in vitro and in vivo and which may be a critical mediator for its anti-cancer action (Mathur 2006). It also protects against side effects of chemotherapy. Significant increases in hemoglobin, red blood cell, white blood cell, and platelet count as well as body weight were observed in cyclophosphamide-, azathioprine-, and prednisolone-treated mice that were given *Withania* (Ziauddin 1996). The antitumor and radiosensitizing effects of *Withania* have also been studied. The growth of induced carcinoma in mice was inhibited and survival increased with *Withania* treatment, especially when it was combined with radiation (Sharada 1996, Devi 1995). Complete regression of sarcoma in mice was observed with treatment by *Withania* root extract in another trial (Devi 1992). Likewise, it demonstrated antitumor properties in mice and protected against induced carcinogenic effects. It reversed the adverse effects of a carcinogen (urethane) on total leukocyte count, lymphocyte count, body weight, and mortality (Singh 1986).

Controlled, open-label clinical studies have shown that *Cordyceps* (*Cordyceps sinensis*) appeared to restore immune cell function in patients with advanced cancer who were given conventional cancer therapies (Zhou 1995, Zhu 1998a). Of 59 patients with advanced lung cancer, 95% were able to complete chemotherapy and radiotherapy with the use of *Cordyceps* compared with 64% of the control group. More than 85% of *Cordyceps*-treated patients showed more normal blood cell counts vs. 59% of the control group (Zhu 1998a). A study in patients with various types of tumors found that a cultured mycelium extract of *cordyceps* (6 g/d for more than 2 months) improved subjective symptoms in most patients. White blood cell counts were maintained and tumor size was significantly reduced in approximately half of the patients (Zhu 1998b).

The efficacy of *Astragalus* (*Astragalus membranaceus*) was investigated for its effects in enhancing quality of life

and reducing the toxicity of chemotherapy in human patients with malignant tumors. One hundred twenty patients were randomly assigned to a control or treatment group; both groups received chemotherapy, and the treatment group received intravenously administered Astragalus. Astragalus was noted to inhibit the development of tumors, reduce the side effects of chemotherapy, improve immune function, and improve the quality of life of patients (Duan and Wang 2002).

POSSIBLE CONTRAINDICATIONS FOR ADJUNCTIVE USE OF HERBS IN CANCER TREATMENT

Despite evidence that shows the benefit of using adjunctive herbs with chemotherapy, concern has been raised about the concurrent use of antioxidants (plant-derived or nutritionally derived) with chemotherapy or radiotherapy. Chemotherapy and radiotherapy damage the DNA of both normal cells and cancer cells by causing free radical damage. Therefore, the theoretical concern is that antioxidants block free radical generation and reduce the efficacy of the treatment (Conklin 2004). Labriola and Livingston (1999), discussed at length the possible theoretical negative interactions between cancer chemotherapy drugs and concurrent use of antioxidants. However, the experimental evidence for such a hypothesis is lacking, and actually, in the majority of cases, shows the opposite. Block and Evans (2001) reviewed all of the English articles related to antioxidants and interactions with anticancer drugs or radiation that were listed in Index Medicus between the years 1990 and 2000. Their review concluded that “there is a rational basis for the continued use of antioxidant agents as a therapeutic adjunct in cancer therapy” (Block 2001).

HERBS AND CANCER AND METASTASES PREVENTION

Herbs may have a profound role in protecting some animals from developing cancer. Mice that received daily Echinacea (*Echinacea purpurea*) in their diets throughout their lives, from an early age until late middle age, had significant longevity/survival differences compared to controls, as well as differences in various populations of immune/hematopoietic cells. Treated mice had significantly higher numbers of key immune cells, those that are the first line of defense against developing neoplasms as well as natural killer (NK) cells. It appeared in this study that regular dietary intake of Echinacea may be beneficial or prophylactic because it maintained elevated levels of NK cells, which are involved in immunosurveillance against spontaneously developing tumors (Brousseau 2005).

Consumption of green or black tea (*Camellia sinensis*) has been suggested to prevent cancer. Animal studies have shown that tea and its constituents inhibit carcinogenesis of the skin, lung, oral cavity, esophagus, stomach, liver, prostate, and other organs (Lambert 2003). For example, mice were given decaffeinated green or decaffeinated black tea in their drinking water before, during, and after treatment with a carcinogen. Mice that received 0.63% or 1.25% green tea or 1.25% black tea exhibited a reduction in liver tumors of 54%, 50%, and 63%, respectively, and a decrease in the mean number of lung tumors of 40%, 46%, and 34%, respectively (Cao 1996). Reduced tumor numbers and tumor size were also observed in other experiments employing tea (Yang 2005). Black tea preparations were noted to inhibit the progression of lung adenoma to adenocarcinoma. In many of these experiments, tea consumption resulted in reduced body fat and body weight; these factors may also contribute to the inhibition of tumor genesis (Yang 2005).

Flaxseed (*Linum usitatissimum*) is the richest source of lignans and α -linolenic acid and has been investigated regarding its effects on the growth and metastasis of established human breast cancer in a mouse model. Compared with controls, those mice supplemented with 10% Flaxseed showed a significant reduction in tumor growth rate and a 45% reduction in total incidence of metastasis. Lung metastasis incidence was 55.6% in the control group and 22.2% in the Flaxseed group and lymph node metastasis was 88.9% in controls and 33.3% in the Flaxseed group. The metastatic lung tumor number was reduced by 82% in the Flaxseed group. It was concluded that Flaxseed inhibits human breast cancer growth and metastasis in a mouse model, and that this effect is due in part to the down regulation of insulin-like growth factor I and epidermal growth factor receptor expression (Chen 2002).

HERBS AND THEIR EFFECTS ON SPECIFIC TYPES OF CANCER

A search for herbs with effects on particular cancers common in veterinary medicine revealed some interesting possibilities and applications. Many were based on in vitro cell line studies, but several were based on laboratory animals and cats and dogs. It is important to note, however, that herbal treatment of cancer is ideally prescribed for the individual patient and not the diagnosis per se.

Fibrosarcoma

Fibrosarcomas have been inhibited by Wormwood (*Artemisia annua*). The constituent artemisinin selectively kills cancer cells by inducing apoptosis in vitro and inhibits

the growth of implanted fibrosarcoma tumors in rats (Singh 2004). Injection of acemannan from *Aloe vera* gel increased immune protection against implanted malignant tumor cells (Merriam 1995) and induced apoptosis in cancer cells (Ramamoorthy 1998). Acemannan is conditionally licensed by the U.S. Department of Agriculture (USDA) for the treatment of fibrosarcoma in cats and dogs (King 1995). In one uncontrolled study in 8 cats and dogs with confirmed fibrosarcoma, the researchers suggested that acemannan may be an effective adjunct to surgery and radiation therapy (King 1995). In another uncontrolled study, acemannan was administered by intraperitoneal and intralesional routes to 43 animals with various tumors. Five of 7 animals with fibrosarcoma had clinical improvement, as assessed by tumor shrinkage, tumor necrosis, or prolonged survival. It was suggested that acemannan activates macrophages and the release of tumor necrosis factor, interleukin (IL-1), and interferon (Harris 1991).

Lymphoma/Lymphosarcoma

Injections (subcutaneous) of Mistletoe (*Viscum album*) extract protected against metastasis of introduced lymphosarcoma and sarcoma cells in mice when given 3 times per week for 14 consecutive days. Doses greater than 20 µg reduced tumor weight and tumor volume (Braun 2002). Non-Hodgkin's lymphoma was induced in mice. Compared to controls, no evidence of a viable tumor was apparent in 4 of 15 mice fed a Mistletoe-supplemented diet (10 mg lectin daily) for 11 days. Results show that lectin exerts powerful antitumor effects when provided by the oral route (Pryme, et al. 2004).

Oral administration of crude extract of Gotu kola (*Centella asiatica* L.) retarded the development of solid and lymphoma ascites tumors and increased the life span of tumor-bearing mice (Babu 1995). Cordyceps (*Cordyceps sinensis*) extract was given orally to mice implanted with lymphoma cells; it reduced tumor size and prolonged mouse survival time. Mice treated with cyclophosphamide (100 mg/kg) 3 and 5 days after tumor transplantation had their immune suppression restored through treatment (Yamaguchi 1990). Ashwaganda (*Withania somnifera*), an ethanolic root extract, provided a significant increase in life span and a decrease in cancer cell numbers and tumor weight in lymphoma tumor-induced mice. Hematologic parameters were also corrected by *Withania* in tumor-induced mice (Christina 2004).

Mammary cancer

Following infusion of mammary tumor cells into the mammary glands, mice were fed a diet containing a

Calendula (*Calendula officinalis*) extract (high in the carotenoid lutein) for 3 weeks. Tumor latency increased and tumor growth was inhibited in a dose-dependent manner by dietary lutein. In addition, dietary lutein was reported to enhance lymphocyte proliferation (Chew 1996). In an in vitro study, organosulphur compounds from Garlic (*Allium sativum*) markedly inhibited growth of canine mammary cells in culture (Sundaram 1993).

Melanoma

Grapeseed extract, given orally, reduced the number of pulmonary metastatic melanoma nodules induced in mice by 26.07% compared with a control group treated with ethanol (Martinez 2005). Flaxseed was fed to mice as a supplement (0%, 2.5%, 5%, or 10% Flaxseed) for 2 weeks before and after an intravenous injection of melanoma cells. The median number of tumors in mice fed the 2.5%, 5%, and 10% Flaxseed-supplemented diets was 32%, 54%, and 63% lower, respectively, than that in controls (0%). The addition of Flaxseed to the diet also caused a dose-dependent decrease in tumor cross-sectional area and tumor volume. It was concluded that Flaxseed reduces metastasis and inhibits the growth of metastatic secondary tumors in animals (Yan 1998).

A pilot study of Poke weed (*Phytolacca americana*) mitogen immunotherapy in animals was conducted. One case reported a 3-year remission and an apparent cure of gum melanoma that was metastatic to regional and hilar lymph nodes and to the lungs in an aged dog following Poke weed mitogen therapy. A small total dose of 300 µg induced the remission. However, the authors state that it is possible that melanoma may be a uniquely responsive tumor (Wimer and Mann 2000).

Meningioma

Since brain tumors are rarely definitively identified in veterinary medicine, herbs that may benefit generic "brain tumors" are discussed. Two observational reports of patients undergoing treatment for brain tumor suggest that Boswellia (*Boswellia serrata*) extract may help reduce cerebral edema (Streffer 2001, Janssen 2000). Boswellia extract may slow growth and increase apoptosis of tumor cells in brain cells (Hostanska 2002). Several studies have shown that cannabinoids from *Cannabis sativa* and their derivatives slow the growth of gliomas. Cannabis induced apoptosis of glioma cells in culture and inhibited angiogenesis in vivo. Velasco, et al. (2004) remarkably claim that cannabinoids kill glioma cells selectively and can protect nontransformed glial cells from death. In another

study, patients with malignant glioma were prospectively enrolled in a clinical trial and the treatment group received a galactoside-specific lectin from Mistletoe (*Viscum album*). Analyses of all patients revealed prolongation of relapse-free intervals and overall survival time for the treatment group as compared with the control group (Lenartz 2000).

Osteosarcoma

Extracts of Red clover (*Trifolium pretense* L.) were tested for their ability to stimulate the activity of osteoblastic osteosarcoma cells. Based on the in vitro study results, data suggest a role for Red clover isoflavonoids (chloroform extract) in the stimulation of osteoblastic cell activity and cellular differentiation (Wende 2004). Diosgenin (found in Trillium, Fenugreek, and Wild yam) was also investigated in vitro to determine its effects on proliferation rate, cell cycle distribution, and apoptosis in the human osteosarcoma cell line. Diosgenin treatment resulted in inhibition of cell growth, with a cycle arrest in G1 phase, apoptosis induction, and induced cyclooxygenase activity (Moalic 2001).

An antiviral protein was conjugated to Poke weed (*Phytolacca americana*) extract to produce an immunotoxin that was highly active against osteosarcoma. In vitro studies suggest that it may be useful in the treatment of patients with osteosarcoma and some soft tissue sarcomas (Anderson 1995). In vivo, the same immunotoxin elicits potent antitumor activity in a hamster cheek pouch model of human osteosarcoma. At nontoxic dose levels, it significantly delays the emergence and progression of leg tumors and markedly improves tumor-free survival in immunodeficient mice challenged with human osteosarcoma cells. Thus, it may be useful in the treatment of patients with osteosarcoma (Ek 1998).

Transitional cell carcinoma

Flavokawains identified in Kava (*Piper methysticum*) cause strong antiproliferative and apoptotic effects in human bladder cancer cells. The anticarcinogenic effects of flavokawain A were evident in the inhibiting of 57% of the bladder tumor cells in a nude mice model in vivo (Zi 2005). Garlic (*Allium sativum*) was investigated in induced transitional cell carcinoma in mice. Orally administered Garlic was tested at doses of 5 mg, 50 mg, and 500 mg per 100 mL of drinking water. Mice that received 50 mg oral Garlic demonstrated significant reductions in tumor volume when compared with the controls, and mice that received 500 mg oral Garlic exhibited signifi-

cant reductions in both tumor volume and mortality (Riggs 1997).

HERBS WITH NONSPECIFIC ACTIVITY FOR OTHER CANCERS

An aqueous extract of Mistletoe (*Viscum album*) was investigated in vivo for its effects on renal cell carcinoma, colon carcinoma, and testicular carcinoma. Significant tumor growth inhibition was observed with all 3 carcinomas at 30 and 300 ng mL/kg/d (Burger 2001).

Aloe vera may enhance the therapeutic results of melatonin in patients with advanced solid tumors (when conventional cancer treatment is not possible). Fifty patients with lung cancer, gastrointestinal tract tumors, breast cancer, or brain glioblastoma received melatonin alone (20 mg/d orally in the dark period) or melatonin plus *Aloe vera* tincture (1 mL twice/d). The percentage of non-progressing patients was significantly higher in the group treated with melatonin plus *Aloe* than in the melatonin group (14 of 24 vs. 7 of 26). The 1-year survival percentage was significantly higher in patients treated with melatonin plus *Aloe* (9 of 24 vs. 4 of 26). The combination may help in the stabilization of disease and survival in patients with advanced solid tumor, for whom no other standard effective therapy is available (Lissoni 1998).

Korean ginseng (*Panax ginseng*) consumption may play an important role in the prevention and treatment of cancers of the lip, oral cavity and pharynx, larynx, lung, esophagus, stomach, liver, pancreas, ovary, and colorectum. It did not seem to matter what the form of Ginseng was because cancer was reduced in users of fresh Ginseng extract, White ginseng extract, White ginseng powder, and Red ginseng. *Panax ginseng* has non-organ specific cancer preventive effects against various cancers primarily because of its ginsenosides (Yun 2003).

In hamsters with induced squamous cell carcinoma (SCC), 0.6% green tea (*Camellia sinensis*) powder added to drinking fluid or 10 μ mol Curcumin from Turmeric or a combination or nothing (control) was applied topically to lesions 3 times weekly for 18 weeks. The combination decreased the incidence, number, and size of SCC and precursor tumors. This activity may be related to suppression of cell proliferation, induction of apoptosis, and inhibition of angiogenesis (Li 2002). Another study showed that Turmeric or Curcumin in the diet or applied as paint may have a chemopreventive effect on oral precancerous lesions (Krishnaswamy 1998).

Please see Table 31.1 for a list of the herbs, as well as their ingredients, suppliers, and conditions treated.

Table 31.1. Western herbs by condition.

Condition	Supplier	Product	Herbal ingredients
Anemia	Genesis Resources D'Arcy Naturals World Herbs	Blood and Energy Formula Green Powder	Angelica sinensis, alfalfa powder, yellow dock, chlorella, lycium berry, ligusticum, red raspberry, red clover 100% organic, 20:1 concentrated juice powders: kamut, barley, oat, spirulina, spinach, carrot, powdered broccoli, parsley dandelion greens, sea kelp, sea dulse, oxyphyte
Emotional issues	Rx Vitamins	Nutricalm	Valerian, ashwaganda
	NaturVet	Quiet Moments	Chamomile, passion flower, ginger
	Herbalist and Alchemist	Serenity Compound	Eleuthero root, skullcap, chamomile flower, oat milky seed, linden flower
	D'Arcy Naturals World Herbs	Pet Calm	Zizyphus seed, poria sclerotium (hoelen), cnidium seed, licorice root, anemarrhena rhizome, valerian rhizome, chamomile flower, fo-ti root, biota seed, polygala root
		Separate Herbs	Chamomile, ginkgo, kava kava, passion flower, valerian in separate.
Cardiovascular issues	Rx Vitamins	CV Formula	Hawthorn berry
	D'Arcy Naturals World Herbs	Cardio Support	Asian ginseng root, polygala root, astragalus root, atractlodes root, poris, zizyphus seed, logan fruit, saussurea root, licorice root, Chinese angelica root, coleus rhizome, hawthorn berry, garlic bulb, ginkgo leaf, stevia
	Standard Process	Canine or Feline Cardiac Support	Hawthorn berry
	Herbalist and Alchemist	Healthy Heart Compound	Hawthorn fruit, leaf, flower; night blooming cereus stem; ginkgo leaf; prickly ash bark; tienchi ginseng root
Dermatological issues	Standard Process	Canine or Feline Dermal Support	Silymarin, alfalfa juice, carrot, black currant juice
	D'Arcy Naturals World Herbs	Hoxsey Formula	Oregon grape root, burdock root, red clover flower, alfalfa leaf, prickly ash bark, stillingia root, cascara sagrada bark, poke root, licorice root.
	Vetri-Science	Oli-Vet Olive Leaf Extract	Olive leaf extract
	D'Arcy Naturals World Herbs	Healthy Coat	Fo-ti root, horsetail herb, nettle leaf, dong quai root, kelp thalus, stevia leaf
	Designing Health Inc.	Missing Link Professional Strength Veterinary Formula	Flaxseed, barley grass, alfalfa, parsley, milk thistle, grapeseed, spirulina, kelp, burdock root, dandelion root, yucca schidigera
	NSA	Juice Plus+ for dogs	Beet root, flaxseed, garlic, alfalfa, barley juice, safflower petals, wheat grass
Topical for skin	D'Arcy Naturals World Herbs	Hot Spot	Gotu kola herb, eucalyptus leaf, barberry root, aloe, golden seal root
	Aveeno		Colloidal oatmeal
	Herbal Answers	Herbal Aloe Force® Skin Gel	Aloe, sheep sorrel, burdock root, slippery elm bark, rhubarb root, cat's claw, pau d'arco, hawthorn berry, chamomile, green tea
Gastritis/GI issues	Rx Vitamins	Nutrigest	Aloe extract, cat's claw, ginger root extract, fructooligosaccharide, Oregon grape root, garlic, psyllium seed, DGL (deglycerrhized licorice)
	Animal Essentials	Animals' Apawthecary Phytomucil	Marshmallow root (<i>Althaea officinalis</i>), Slippery elm inner bark (<i>Ulmus fulva</i>), Plantain (<i>Plantago major</i>), land licorice (<i>Glycyrrhiza glabra</i>)
	Standard Process	Canine or Feline Enteric Support™	Defatted wheat germ, alfalfa juice, mushroom, nutritional yeast, pea vine juice, carrot, rice bran, licorice, wheat germ oil, beet leaf juice, beet root, chlorophyll extract

Table 31.1. *Continued*

Condition	Supplier	Product	Herbal ingredients
Gastritis/GI issues (<i>continued</i>)	D'Arcy Naturals World Herbs	Pet Digest Tonic	Alfalfa leaf, Asian ginseng root, astragalus root, stevia leaf
	D'Arcy Naturals World Herbs	Dia-Relief	Plantain leaf, marshmallow root, fennel seed, bilberry leaf, golden seal root, barberry root, stevia
Hepatitis	D'Arcy Naturals World Herbs	Hoxsey Formula	Oregon grape root, burdock root, red clover flower, alfalfa leaf, prickly ash bark, stillingia root, cascara sagrada bark, poke root, licorice root.
	Natural Path Herb Company	Hoxsey Formula	Oregon grape root, burdock root, red clover flower, alfalfa leaf, prickly ash bark, stillingia root, cascara sagrada bark, poke root, licorice root
	Rx Vitamins	Hepato Support	Milk thistle
	Thorne Research	Hepagen C or Hepagen D	Milk thistle, tumeric
	Standard Process	Canine or Feline Hepatic Support	Embllica officinalis, buckwheat leaf, milk thistle, beet leaf, alfalfa, Rhizopus oryzae, beet root
	D'Arcy Naturals World Herbs	Liver Protect	Milk thistle seed, nettle leaf, bupleurum root, pinellia rhizome, baical skullcap root, Asian ginseng root, licorice root, ginger rhizome, zizyphus fruit, schisandra fruit, stevia leaf
	Animal Essentials	Animals' Apawthecary Senior Blend	Alfalfa, dandelion, milk thistle seed, oat tops, garlic, marshmallow, ethically wildcrafted Ginkgo biloba, hawthorn berries
Eye issues	Animal Essentials	Animals' Apawthecary Dandelion/Milk Thistle	Dandelion, milk thistle seed
	D'Arcy Naturals World Herbs	Eyebright Vision	Rehmannia root, dioscorea rhizome, alisma rhizome, cornus fruit, moutan root, bupleurum root, poria sclerotium (hoelen), dong quai root, lycii fruit, chrysanthemum flower, eyebright herb, bilberry leaf and fruit, nettles herb, schisandra fruit, ginkgo leaf
	Rx Vitamins	The Ocular Formula	Bilberry, grapeseed extract
Otitis	Animal Essentials	Animals' Apawthecary Eye and Nose Drops	Golden seal, eyebright herb, ethically wildcrafted Usnea barbata lichen
	NaturVet	Ear Wash with Tea Tree Oil	Witch hazel, tea tree oil, echinacea extract
	D'Arcy Naturals World Herbs	Ear Clear	Gentian root, bupleurum root, alisma rhizome, plantago leaf, clematis, rehmannia root, dong quai root, gardenia fruit, baical scutellaria root, licorice root, fo-ti root, eyebright herb, echinacea purpurea root, stevia leaf
	Animal Essentials	Animals' Apawthecary Herbal Ear Rinse	Cider vinegar, aloe vera, witch hazel extract, golden seal root, calendula and olive leaf
		Green tea in a 3 times concentration	Green tea
Musculoskeletal issues	Animal Essentials	Echinacea purpurea or angustifolia orally or as a rinse	
	Rx Vitamins	NutriFlex for Dogs and Cats	Sea cucumber, boswellian, yucca, bromelain, ginger, turmeric
	Standard Process	Canine Musculoskeletal Support™	Boswellia serrata, Perna canaliculus, Eleutherococcus senticosus, wheat germ, pea vine juice, oat flour, black currant juice, carrot
	Genesis Resources	Pain Plus	Yucca, boswellia, meadowsweet, cornus, licorice, ginger
	Genesis Resources	Joint Support Plus	Sea cucumber, angelica sinensis, rehmannia, alfalfa powder

Table 31.1. *Continued*

Condition	Supplier	Product	Herbal ingredients
Respiratory issues	D'Arcy Naturals World Herbs	First Defense	Honeysuckle flower, forsythia fruit, balloon flower root, burdock root, field mint, lophatherum stem and leaf, schizonepeta stem, licorice root, perilla seed, chrysanthemum flower, echinacea purpurea root, barberry bark, elderberry fruit and leaf, goldenseal root, stevia
	Source Naturals	Wellness Formula	Garlic clove powder, propolis powder, boneset leaf, polygonum odoratum rhizome, echinacea root and extract, isatis root and leaf, horehound stems, bioflavonoids, astragalus root, angelica root, mullein leaf, golden seal root, eleutherococcus senticosus root, hawthorn berry, Oregon grape root, pau d'arco bark extract, cayenne fruit
	D'Arcy Naturals World Herbs	Lung Sooth	Prepared rehmannia root, cornus fruit, dioscorea root, moutan bark, poria sclerotium, alisma rhizome, zizyphus seed, ophiopogonum tuber, wild cherry bark, eucalyptus leaf, schisandra fruit, stevia leaf
	D'Arcy Naturals World Herbs	Immune Prep	Asian ginseng root, atractylodes rhizome, poria sclerotium (hoelen), licorice root, ginger root, zizyphus fruit, astragalus root, Siberian ginseng root, baical skullcap root, schisandra fruit, dong quai root
	Vetriscience	Antiox	Grapeseed extract
Feline asthma	Vetriscience	Antiox	Grapeseed extract
Renal failure	Herbalist and Alchemist	Kidney Support Compound	Stinging nettle seed and leaf, rehmannia, pellitory of the wall, cordyceps
	Vetriscience	Renal Essentials	Astragalus root, rehmannia, nettle, cordyceps
Cystitis	NaturaVet	Cranberry Relief®	Cranberry extract, marshmallow root, echinacea, Oregon grape root
	Genesis Resources	Urinary Tract Support	Uva ursi, cranberry juice extract, marshmallow root powder, juniper berry, poria, kochia; polyporous extract feline formula has poria, corn silk, dandelion
	Vetriscience	UT Strength for Cats/Dogs	Uva ursi, chanca piedra, cranberry juice extract, marshmallow, corn silk, dandelion, olive leaf
Urinary incontinence	Genesis Resources	Incontinence	Wild yam root, bee pollen, rehmannia, angelica sinensis, psoralea, glandalai, licorice
	Vetriscience	Bladder Strength for Cats/Dogs	Wild yam, pumpkin seed, rehmannia, soy protein, corn silk, saw palmetto, olive leaf
Diabetes mellitus	Rx Vitamins	DB-7	Gymnema sylvestre
	Standard Process	Diaplex	Alfalfa, buckwheat, flaxseed oil extract
Hypothyroid	Standard Process	Canine Thyroid Support	Eleutherococcus senticosus, kelp, Tillandsia usneoides, mushroom, buckwheat leaf juice and seed, flaxseed oil
	D'Arcy Naturals World Herbs	Hypo-Thyro	Siberian ginseng root, kelp thalus, cayenne, Irish moss, gentian root
	D'Arcy Naturals World Herbs	Hyper-Thyirin	Prepared rehmannia root, cornus fruit, dioscorea root, poria sclerotium (hoelen), moutan bark, alisma rhizome, anemarrhena rhizome, phellodendron bark, kelp thalus, vervain rhizome, bugleweed leaf
Cognitive dysfunction	Animal Essentials	Animals' Apawthecary Senior Blend	Alfalfa, dandelion, milk thistle seed, oat tops, garlic, marshmallow; ethically wildcrafted Ginkgo biloba, hawthorn berries
	D'Arcy Naturals World Herbs	Alert	Ginseng root, ginkgo leaf, fo-ti root, astragalus root, codonopsis root, gotu kola herb, stevia leaf

Table 31.1. *Continued*

Condition	Supplier	Product	Herbal ingredients
Cancer	D'Arcy Naturals World Herbs	Hoxsey Formula	Oregon grape root, burdock root, red clover flower, alfalfa leaf, prickly ash bark, stillingia root, cascara sagrada bark, poke root, licorice root.
	Natural Path Herb Company	Hoxsey Formula	Oregon grape root, burdock root, red clover flower, alfalfa leaf, prickly ash bark, stillingia root, cascara sagrada bark, poke root, licorice root
	Genesis Resources	Canine CAS Options	Reishi, maitake, and shitake mushrooms; green tea
	D'Arcy Naturals World Herbs	Power Mushrooms	Organic maitake mushroom, organic reishi mushroom, organic shitake mushroom
	D'Arcy Naturals World Herbs	Green Powder	100% organic, 20:1 concentrated juice powders: kamut, barley, oat, spirulina, spinach, carrot, broccoli, parsley, dandelion greens, sea kelp, sea dulse, oxyphyte
	D'Arcy Naturals World Herbs	Petsiac	Burdock root, sheep sorrel herb, red clover aerial parts, reishi mushroom, slippery elm bark, turkey rhubarb root, stevia leaf
	Rx Vitamins	Immuno Support	Arabinogalactan, shitake, lutein

The chapters on Western herbal medicine address the treatment of various diseases with specific herbs that have been clinically proven to benefit those conditions. The above chart was compiled by Margo Roman, DVM. It lists specific products that contain Western herbs that are used as a component of her treatment protocols in her veterinary clinic for the listed conditions. It is intended as a product guide for the practitioner and is based solely upon Dr. Roman's experience with these products and their efficacy. This chart also was included at the request of the veterinarians who reviewed the initial manuscript of this book. There are many other reputable companies that are not included in this chart, some of which are listed in Section 8, the resources portion of this book.

SECTION 5

Integrative Cancer Therapy Protocols: Therapeutic Nutrition, Chinese Herbal Medicine, and Homotoxicology

Integrative Cancer Therapy Protocols

DEFINITION AND CAUSE

The veterinary literature reports that the underlying cause and mechanism of cancer development in animals is unknown. What is known about cancer is that cells undergo a genetic change whereby they begin to divide and multiply in an uncontrolled manner, resulting in the cancerous growth. It is believed that one underlying cause for the uncontrolled cellular division is exposure to outside influences such as pesticides, herbicides, chemical toxins and pollutants, prolonged exposure to radiation, certain drugs or hormones, viruses (such as feline leukemia virus), prolonged nutritional deficiencies, and adverse reaction to vaccinations (see Chapter 35, Vaccinations). The literature also reports that the cumulative effects of these external factors over the life of the animal play a role and, therefore, age is considered one of the main factors in the development of cancer.

Also known about the development of cancer is that these aberrant cells have escaped the immune system's detection and can grow out of control and invade surrounding tissues. However, the specific reasons why the immune surveillance mechanism has failed to identify and destroy these cancer cells are unknown.

Breed susceptibility and genetic predisposition to cancer are well known by veterinarians. Breeds more at risk for developing cancer are Golden Retrievers, Rottweilers, Labrador Retrievers, Boxers, and German Shepherd dogs.

Surgically altering pets can affect their risk for cancer, but in many cases the relationship is not clear. For example, early surgical alteration is associated with lower risks for mammary neoplasia in both dogs and cats, but is associated with higher risks of hemangiosarcoma in female dogs (Ware and Hopper 1999). Neutering decreased the risk of leukemia in female cats by half, but was not associated with decreased risk in dogs (Schneider 1983). Neutering nearly doubled the risk of osteosarcoma in one study (Ru 1998).

The AVMA web site lists the 10 most common signs of cancer. This list is designed to give clients the ability

of early detection thereby allowing for prompt therapy and an increased chance for remission or prolonged survival times (www.avma.org). These signs are:

- Abnormal swellings that persist or continue to grow
- Sores that do not heal
- Weight loss
- Loss of appetite
- Bleeding or discharge from any body opening
- Offensive odor
- Difficulty eating or swallowing
- Hesitation to exercise or loss of stamina
- Persistent lameness or stiffness
- Difficulty breathing, urinating, or defecating

Early diagnosis of cancer is extremely important for the effective treatment and longer remission time. Educating clients about the common signs and symptoms as listed by the AVMA is important for early diagnosis and greater effectiveness of the therapy.

CONVENTIONAL THERAPY RATIONALE

The accepted, conventional approach to cancer is entrenched in the use of chemotherapy, radiation therapy, surgery, and immunotherapies. This is based upon the underlying belief that cancers are made up of aggressively growing cells that the body can no longer control nor regulate in terms of normal cellular division. Conventional medical theory acknowledges that these cancer cells have been able to separate themselves from the body's immune regulatory system, allowing them to both grow and multiply out of control as well as invade and damage adjacent cells, tissues, and organs. However, the current literature clearly states that there is no evidence for this loss of control, nor is it known why or how this loss of control occurs.

As a result of this underlying belief system, the developed approach to treat cancer is to (1) surgically remove the cancer, (2) chemically destroy the cancer, (3) destroy the cancer cells with ionizing radiation, or (4) medically and nonspecifically stimulate the general immune system

against the aberrant cancer cells. More recent research has expanded the approach into novel areas such as anti-angiogenesis (preventing blood supply to rapidly growing tumors) and genetic reprogramming of the cancer cells. These approaches hold much promise.

While exciting research is leading to alternative approaches to cancer treatment, the best strategy that is currently available to veterinarians is a multifaceted approach of surgery (removal or debulking), chemotherapy, and radiation therapy, depending upon the cancer type and the clinical condition of the animal.

At the North American Veterinary Conference in January 2006, the Iams Company published and distributed a booklet entitled *Nutrition and Cancer Regulation*. In that booklet Karen Cornell, DVM, (2006) stated:

“Traditional therapeutic strategies for cancer of animals and people have been focused in three areas: surgery, radiation therapy and chemotherapy. When complete surgical resection is not possible, chemotherapy and radiation therapy are utilized to inhibit proliferating cancer cells of the primary tumor. Unfortunately these modalities are non-specific and inhibit normal proliferating cells as well. This general antiproliferative approach results in the normal tissue toxicity observed in cancer patients and limits the delivery of sufficient therapeutic doses to eradicate the tumor. Recently however, clinicians and researchers have shifted the focus away from the traditional plan of attack and have started to investigate novel anticancer strategies. . . . An example of these anticancer strategies is the use of chemoprevention compounds such as resveratrol from grapes and sulforaphane from broccoli.”

ANTICIPATED PROGNOSIS

Each of the following cancer protocols consists of a brief discussion of the anticipated prognosis when the patient is treated by conventional therapies such as surgery, chemotherapy, and/or radiation therapy. Knowing the anticipated prognosis gives veterinarians a point of reference for integrative therapies when discussing an animal's cancer with the client. While there currently are few published, evidenced-based studies on alternative therapies, this section gives clinicians not only treatment protocols, but also confirmation that their colleagues are using these therapies in the prevention and treatment of various cancer types. Further research is needed to validate these protocols and determine their worth in regard to increased survival times, improved clinical condition, and general efficacy so that clinicians can better answer client's questions.

INTEGRATIVE VETERINARY THERAPIES

Throughout the introductory section of this book we repeatedly referred to free radicals and antioxidants and

their effects on aging and degeneration. This free radical/antioxidant theory was introduced by Harman in 1955. It states that free radicals, which are formed daily by the metabolic process or exposure to exogenous foreign substances, cause an expanding inflammatory process which, if left unchecked, will damage cells, tissues, and organs. This damage will lead to premature aging and degenerative diseases, particularly in the target organs. This theory is being proven by clinical trials in people and animals, confirming the direct effect on the aging process and the formation of chronic degenerative diseases and neoplasia (Harman 1992). In addition, this theory also integrates with modern research, which is demonstrating that these free radicals can alter DNA and cause mutations, which ultimately leads to neoplasia and other chronic degenerative diseases (Opara 1997, Harman 1992, Masoro 1993).

Degenerative diseases and neoplasia play a dominant role in modern veterinary practice, as confirmed by the 1998 survey by the Morris Animal Foundation, which found that cancer is a major concern for people and the leading cause of death in animals. For this reason it is important that veterinarians fully understand this theory of aging and neoplasia development so they can educate their clients in the methodology of cancer prevention and the maintenance of wellness.

As mentioned above in the introductory section, we as veterinary students have been taught how to treat disease when it is diagnosed. As practitioners, when dealing with chronic degenerative diseases, we mostly focus our attention upon the signs and symptoms of the disease and the alleviation of pain and suffering of our animals without doing any harm. The inherent problem with this approach is that many of the drugs we commonly use have adverse side effects that are counterproductive for the long-term wellness of our patients.

An important benefit of integrative veterinary medicine as it relates to cancer is offering patients nutritional, herbal, and homeopathic remedies that work with and help to reduce the reliance upon the chronic administration of medications. Besides reducing the need for medication, these natural remedies also help minimize free-radical-induced inflammation and the associated cellular damage.

What effects do these nutrients, herbs, and homeopathics have on the prevention of degenerative disease and the prevention of neoplasia? The important, often overlooked point is the oxidative damage and cellular inflammation caused by unencumbered free radicals that can alter cellular integrity and metabolism and weaken or destroy cells. This inflammatory process can cascade through tissues and organs, setting the stage for chronic degeneration, weakened organ function, and the development of cancer. The therapies outlined in this chapter can help to

alleviate, by biological methods, this cellular and organ damage.

While many of the cancers that are addressed in this chapter are associated with “proven cause unknown,” there is a mechanism, be it known or unknown, that starts the neoplastic process and many veterinarians and researchers believe that the basic underlying initiating process is related to an oxidative process involved with excessive free radicals.

Cancer and nutraceutical medicine and nutrition

General considerations/rationale

The list below includes the more common nutraceuticals and antioxidants that are recommended as part of cancer therapy protocols. For a complete list of all nutraceuticals please refer to the therapeutic nutraceuticals in Chapter 2. Specific therapeutic nutrients are recommended in each of the following cancer therapy protocols. However, because the treatment protocols also include Chinese herbs and biological remedies, therapeutic nutrition in these cancer protocols is (1) dosed at lower levels, (2) recommended in a support rather than therapeutic role, and (3) focused upon immune function support, and reduction of inflammation, while not interfering with the specific activity of the Chinese herbal formulations.

Appropriate nutrients

Vitamin A/beta carotene: Vitamin A is a retinoid and a potent antioxidant that is required for proper cell division and growth. It has also been shown to increase immune function and help to minimize chemotherapy side effects (Ehrenpreis 2005, McCullough 1999, Michels 2001, Russell 2000, Semba 1998, Thurnham 1999). Beta-carotene is a pigmented phytonutrient and a member of the carotenoid family. Carotenoids are potent antioxidants that have been associated with the reduction of the adverse side effects of chemotherapy and the cancer itself. While there is some indication that high levels of antioxidants can decrease the effectiveness of chemotherapy, the protocols presented in this book take the dosage consideration of antioxidants into consideration (Anon 1994, Baron 2003, Bohlke 1999, Greenberg 1994, Heinonen 1998, Keefe 2001, Lee 2002, Michaud 2002, Omenn 1996, Toma 2003, Zhang 1999).

Vitamin E (alpha-tocopherol): Vitamin E is one of the body's main antioxidants, and as a fat-soluble vitamin it is a protector of lipids and fats. Vitamin E has also been found to block the protein activity of kinase C, which is involved in the cell behaviors of the entire organism. In addition, vitamin E reduces inflammation and improves circulation by helping vessels to dilate and reduce the agglutination of blood platelets. In cancer, vitamin E has

been shown to induce apoptosis (Yu 2003, You 2002). It is also suggested that vitamin E inhibits tumor growth (Bohlke 1999; Helzlsouer 2000; Malafa 2000, 2002; Neuzil 2001; Weber 2002).

Vitamin C: Vitamin C is the most studied of all vitamins and their effects on cancer (Bendich 1995, Golde 2003, Hunter 1993, Jacobs 2002, Lee 2002, Moertel 1985). Early studies conducted by Linus Pauling stated that vitamin C, in high doses and given intravenously, helped to extend remission time and improved the day-to-day quality of life (Cameron, Pauling 1976). While many medical researchers have challenged Pauling's work stating it failed to prove conclusively that vitamin C has any effect whatsoever (Creagan, et al. 1979, Moertel et al. 1985), the American Cancer Society has recently claimed that vitamin C may enhance cancer cell growth by protecting cancer cells from free radical cells' killing effects produced by chemotherapy and radiation therapies (Golde 2003).

Recent research has shown that vitamin C inhibits the growth of a least 7 types of cancer and appears to be cytotoxic (Feiz 2002, Leung 1993). In a more recent study, Gonzales (2005) indicates that this anticancer effect is due to the antioxidant effects of vitamin C.

Intravenous vitamin C is also being studied for its cytotoxic effects (Riordan 1995). In one study, Riordan et al. (1995) used high dose IV vitamin C in a person with pancreatic cancer. CT scans 6 months post surgery did not show any tumor progression. However, the cancer did recur when the IV dose of vitamin C was reduced. These studies are encouraging; however, they do indicate that more good quality research is necessary.

Glandular therapy: Raw extracts of adrenal, lymph, spleen, bone marrow, and thymus tissue have been shown to be anti-inflammatory and tissue sparing on these gland systems (Craveri 1971, Hartleb 1997, Kang 1985, Kouttab 1989, Schulof 1985, Singh 1998, Volk 1991).

Maitake mushrooms: Maitake mushrooms have been used in Eastern herbal medicine for centuries. Studies have shown that properly extracted mushrooms, which are rich in beta-glucans, help support and enhance immune function, help the body to handle stressful conditions, and metabolically and physiologically help the organ systems maintain balance and homeostasis.

Numerous studies carried out in Japan and the United States confirm the health benefits and immune-enhancing abilities of maitake mushrooms. In addition, some recent studies indicate that maitake extracts may also be helpful as an adjunct to chemotherapy by not only enhancing the drugs' effectiveness but also in the ameliorization of the drugs' potential side effects (Adachi 1987, Nariba 1993, Wagner 1985).

Maitake mushroom are rich in beta-glucans, which help support and enhance immune function and can

stimulate the production of natural killer (NK) cells (Kodama 2003, Nanba 1987).

Arginine: Studies on dogs with cancer determined that they had lower plasma levels of arginine and other amino acids, which did not change after the tumor was surgically removed, suggesting that protein metabolism changes in these dogs. It is also believed that the same is true for cats. Research indicates that the addition of arginine and essential fatty acids to the daily diet of dogs with cancer can improve the prognosis and remission times (Anderson 1997, Ogilvie 2000).

Glutamine: Glutamine is often depleted when cancer cachexia is occurring. It has been suggested that supplementation with glutamine decreases tumor growth and improves immune function (Klimberg 1996). In addition to being the preferred nutrient of the intestinal cells, research has shown that glutamine is also tissue sparing and cellular regenerative. It is an intermediary for the antioxidant glutathione in its role of protecting against the adverse effects of radiation therapy (Klimberg 1996). When chemotherapy is being administered, glutamine helps reduce drug-induced inflammation in the bowel (Rombeau 1990, Fox 1988). In patients receiving chemotherapy, the addition of dietary glutamine has been shown to enhance the effectiveness of certain chemotherapeutics as well as increase patient survival times (Klimberg 1991, 1992).

Selenium: Selenium is an important antioxidant, functioning in this capacity along with the enzyme glutathione peroxidase. It is involved in the proper functioning of the pancreas and it helps the cells to absorb glucose. It is beneficial in animals with cancer. Selenium is an essential trace mineral (Burk 1999). There are many evidence-based studies demonstrating that the addition of selenium to the diet helps reduce the incidence of cancer in animals (Rayman 2000).

Fatty acids: Eicosapentaenoic acid (EPA) is an omega-3 fatty acid that helps to maintain the proper levels of eicosinoids, which in turn help mediate the body's immune response to cancer cells. EPAs are found in fish, flax, hemp, borage, and primrose oils. Research has shown that EPA can slow tumor growth and prevent metastasis. The addition of EPA to the diet can improve the response of cells to therapy such as chemotherapeutics (Sagaguchi 1990, Reich 1989) (see the diet restriction section for the recommended sources of fatty acids and EPA).

Phytonutrients or phytochemicals: New and growing research is proving that these nutrients, while not classified as essential nutrients nor required like foods and vitamins, can act as antioxidants and prevent oxidative damage and exert a positive and often dramatic effect on wellness, health, prevention, and treatment of disease and longevity (Broadhurst 2001, Duke 1992, Gaziano 1995, Shils 1994).

Categories of phytonutrients are now being discussed and are becoming more accepted according to their health benefits; these categories include: amines, bioflavonoids, carotenoids, lignans, organosulfurs, phenols, phytosterols, sterols, sterolins, and terpenes, which are being clinically proven to exert a positive effect on health and well-being, reduce inflammation, and prevent degenerative diseases and can play a critical role in cancer treatment (Ames 1993, Block 1992, Carlton 2000, Duthie 1996).

Carotenoids: Besides helping to reduce inflammation as antioxidants do, research shows that carotenoids enhance immunity and regulate cellular communications and division (Agarwal 2000, Burri 2000, Gaziano 1995, Ito 1999, Nishino, 2000, Slattery, 2000, Zeegers 2001).

Flavonoids: Several studies have indicated that flavonoids can help regulate the immune response and help control overactivity of immune-mediated cells such as T- and B-lymphocytes, mast cells, and neutrophils (Middleton 1986, 1992, 1993; Myhrstad 2002; Panthong 1994; Roger 1988).

Lignans: Lignans are found in flax seed, fruits, and vegetables. Breast cancer research shows that these plant-derived compounds compete with the body's hormonal estrogen and help prevent hormonally influenced mammary cancers (Brooks 2005, Kleinsmith 2004, Wang 2002, Serraino 1992, Sung 1998, Thompson 1996, 1998).

Sterols and phytosterols: The most commonly known and well studied is betasitosterol. Pegel (1997) and Bouic (1996, 1999) feel that sterols are essential for a properly functioning immune system. In cancer patients, he feels that sterols can directly reduce the adverse immune-suppressing effects of both chemotherapy and radiation therapy.

Awad (1999a) proved that in the laboratory, sterols reduced the number of breast cancer cells as compared to the controls. In another study, Awad (1999b) proved that the sterols also enhanced intracellular communications, inhibiting cell growth and thus preventing the formation of cancer.

Coenzyme Q10: Coenzyme Q10, also known as CoQ10 or ubiquinone, helps reduce inflammation, strengthen cardiac function and output, and improve circulation (Folkers 1985, Gaby 1998, Shigeta 1966, Traber 2001). In cancer patients, CoQ10 has been proven to enhance immune function, is a potent antioxidant, and improves available metabolic energy required by the body to heal and prevent disease (Folkers 1982, Lockwood 1995).

N,N-Dimethylglycine (DMG): DMG, which is naturally produced by the body, enhances and modulates immune function and helps with cancer treatment protocols (Balch 1997, Mani 1999). DMG improves cellular oxygenation, which is important in the treatment of anaerobic cancer cells. DMG has been found to increase both tumor necrosis factor (TNF) and interferon produc-

tion (Graber 1986; Mani 1999; Kendall 2000, 2003; Reap 1990; Wang 1988). In addition, DMG helps prevent metastasis to other organs (Reap 1988, Kendall 1991), repair DNA, regulate gene expression, and control cell division.

Kendall (2003) reports on research that suggests DMG can be cellular protective in animals that are receiving radiation therapy. Also, DMG is indicated as part of an overall therapy program for the prevention and potential treatment of cancer in animals (Balch 1997, Mani 1999). Recent work has shown that DMG is a potent antioxidant and anti-inflammatory agent (Yanez 2007).

Quercetin: Quercetin is in the flavonoid family (see phytonutrients in Chapter 2). Quercetin is also a phytoestrogen, which is a plant-derived compound that has estrogenic effects on the body. Miodini (1999) and Shoskes (1999) have demonstrated quercetin's positive effects in inhibiting breast cancer and reducing inflammation in men with prostatitis. Knekt (1997, 2002) has reported that quercetin has been proven to be beneficial in the inhibition of lung and other cancers.

Note: Because cancer can affect multiple organ systems and is often a systemic disease, a metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This information can help clinicians to formulate therapeutic nutritional protocols that address not only the cancer but associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Cancer and Chinese herbal medicine/acupuncture

General considerations/rationale

According to Traditional Chinese Medicine, a patient with cancer is considered to be in an overall deficient state. There is Qi and Blood stagnation. There may also be an accumulation of Phlegm, and there are excess pathological factors and toxin buildup.

The deficient state indicates that the body is simply not strong enough to overcome the disease process. The excess pathological factor is the tumor itself, or the viruses, toxin, radiation or other etiology of the cancer. The Qi and Blood stagnation can explain the mass lesions and the pain and inflammation associated with them. Phlegm accumulation is also a description of the mass lesions. Toxin buildup may be translated into paraneoplastic syndromes, tumor lysis syndromes, and any biochemical imbalance caused by the tumor.

Chinese herbal therapy

There are numerous benefits of herbal therapy for cancer. First, they can be combined with chemotherapy or surgery

to decrease chemotherapy side effects or enhance the action of the chemotherapeutic agent. Often, the chemotherapy dose can be increased for greater efficacy without increasing the side effects. For example, when using Western agents alone, the chemotherapy dose must be decreased or treatment delayed due to neutropenia. If herbal therapy can be used to maintain the white blood cell count, the full course of Western chemotherapy can be administered.

An alternative approach to combining Western and Eastern protocols is to decrease the amount of chemotherapy given because the herbal therapy has an effect of its own. This allows for fewer side effects from chemotherapy simply due to decreased dose of the agent.

Herbal supplements can be used alone to ameliorate signs of neoplasia, prevent or slow progression, and in some instances induce remission. In some cases, notably osteosarcoma (AHVMA 2006) and hemangiosarcoma (unpublished data), life expectancy when herbs are given alone can be similar to that achieved by chemotherapeutic agents. In the author's experience, pathological fractures secondary to osteosarcoma can heal using herbal therapy, support bandages, and analgesics (AHVMA 2006). Human patients with lymphosarcoma treated with chemotherapy or radiation in conjunction with herbal therapy have fewer side effects from the chemotherapy or radiation. They also have longer remission times (Liu 2000).

There are 2 main criteria for selecting herbal preparations. Some supplements are organ- or location-based, while others are based on the type of cancer. Those based on organ or location are designed for any tumor type, be it sarcoma, carcinoma, etc., in a given location. Cancer-type herbs treat a specific cancer regardless of location. For example, mast cell tumors are treated with a cancer-type formula. The same formula is used regardless of the tumor's location on the body. For lymphosarcoma, however, the formula for nodal disease is different from that of nasal lymphoma. This is an example of a location-based formula. This explains why several formulas may be listed for one type of cancer. Years of study and practice allow a practitioner to formulate his or her own supplements. It is not possible to learn this from one book, or even one course.

Dosing

Capsules come in standard sizes from multiple manufacturers in the United States. The size "0" capsule holds approximately 0.5 g of powder. There is slight variation because some powders are finer than others. A coarse granule may not pack into the capsule as well as a fine powder will.

In this book, all doses are based upon a 1:5 extract powder. In other countries 1:10 and 1:15 extracts are available for some herbs. These are 2 and 3 times more

concentrated, respectively. If the FDA does allow these powders into the country, the volume of the more concentrated herb required will decrease appropriately.

In general, the dose of herbal supplements for patients with neoplasia is 1 capsule per 8 to 10 pounds 3 times daily. Toy breeds and cats tend to use higher doses, i.e. 1 capsule per 8 pounds 3 times daily and the giant breeds use 1 capsule per 10 pounds 3 times daily. In less aggressive cancers, such as low-grade mast cell tumors or soft tissue cancers with complete excision and a tendency to recur locally rather than metastasize, twice daily dosing may be acceptable. Patients are treated as long as the cancer is present. If a patient has complete remission, in many cases herbal supplements may be discontinued after 2 years of treatment. Some clients elect to remain on the supplement for the rest of the animal's life for added protection. While rare, it is possible to see a recurrence once the herb is discontinued, even after 2 years.

Dietary restrictions are very important for optimal efficacy for almost all cancer patients. The protein portion of the diet can consist of beef, pork, venison, rabbit, buffalo, and cheese. Seafood, poultry (chicken, turkey, eggs, duck), and lamb should be avoided. These food items tend to interfere with the actions of the herbal supplements on the cancer cells. There is no restriction on vegetables.

Carbohydrates should make up less than 20% of the daily intake on a dry matter basis (Ming 1999). It is important not to oversupplement with antioxidants and vitamins when using traditional Chinese herbal medicine. Antioxidants (see above) may protect cancer cells from apoptosis induced by chemotherapy, herbal therapy, and radiation (Robinson 2006).

Appropriate Chinese herbs

Many herbs have been shown to have anti-neoplastic effects. Studies have shown tumor shrinkage, increased survival times, and enhanced well-being in terms of appetite and activity levels in cancer patients. Some herbs have been shown to increase immune function while simultaneously decreasing the side effects of chemotherapy. Other herbs have been shown to decrease leukocyte counts. Rather than using books, which only discuss TCM theory and herbs, the authors have tried to cite evidence of efficacy based upon modern scientific reports. The herbs mentioned below have shown anti-neoplastic effects in the laboratory or in animal or human studies.

Agrimony (Xian he cao): May have anti-neoplastic effects in mice (Shen Yang Yi Xue Yuan Xue Bao 1980).

Antler powder (Lu jiao shuang): Used as an adjunctive therapy to increase the immune functions in patients with cancer. It increases the phagocytic abilities of macrophages (Du 1981).

Apricot seed (Xing ren): Contains amygdalin, which increases the activity of NK cells (Zhao 1993).

Asparagus (Tian men dong): Has been used in a variety of tumors. It has demonstrated efficacy against sarcoma in mice (Yao Li Shi Yan Fang Fa Xue 1982) and breast cancer and lymphoma in humans (Jiang Su Yi Yao 1976, Xin Yi Xue 1975).

Astragalus (Huang qi): Improves the immunity of mice with tumors (Ying 1999). Furthermore, Huang Qi has an anti-neoplastic effect on GNM cells, which are a cell line derived from human oral squamous cell carcinoma (Liu 1999). Additionally, it inhibits S180 solid tumors (Shi 1999). Given the effect of astragalus on these tumors, it is possible it may have inhibitory effects on other solid tumors, such as fibrosarcomas.

Atractylodes (Bai zhu): Has demonstrated anti-neoplastic effects against esophageal cancer in in vitro studies (Zhong Liu Yu Zhi Tong Xun 1976). Atractylodes may have activity against other tumors as well.

Barbat skullcap (Ban zhi lian): Increases the phagocytic functions of macrophages and may inhibit tumor growth (Ren Min Wei Sheng Chu Ban She 1988).

Brucea seed (Ya dan zi): 388 patients with various cancers were treated with brucea seed (Yan dan zi). It prolonged life spans in 71% of the participants (Zhong Guo Yi Yao Bao 1985).

Bupleurum (Chai hu): Contains saikosaponin d (SSd), which has been shown to induce apoptosis in HL-60 (human leukemia) cells (Sun 1999). It may have similar effects on other neoplastic cells.

Burreed tuber (San leng): Has demonstrated some ability to inhibit neoplastic cells. In one study 31 patients with various terminal cancers were treated with a supplement containing burreed tuber (San leng) along with other herbs. Five improved significantly, 19 showed some improvement, and 7 did not respond (Zhe Jiang Zhong Yi Xue Yuan Xue Bao 1983). In a separate study, 30 patients with hepatic carcinoma were given burreed tuber as part of an herbal supplement. Three had significant improvement, 10 had some improvement, and 17 did not improve at all (Zhong Liu Yu Fang Yan Jiu 1973).

Centipede (Wu gong): Has demonstrated anti-neoplastic effects in vitro (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Cinnamon bark (Rou gui): Contains cinnamaldehyde, which can completely inhibit SV40-virus-induced tumors in mice (Higashikaze 1981). It may have anti-neoplastic activity against other tumors.

Codonopsis (Dang shen): Decreases lymphocyte counts (Zhong Yao Xue 1998), which may make this useful in cancers involving elevated leukocyte counts, such as lymphosarcoma.

Coix (Yi yi ren): Has been shown to inhibit the growth of hepatocarcinoma and S180 sarcomas in mice. It

can also enhance the activity of NK cells in mice (Lu 1999).

Coptis (Huang lian): Inhibits human nasopharyngeal carcinoma cells (Tang 1995). Other studies have shown that coptis (Huang lian) has in vitro efficacy against hepatoma, gastric, colon, and breast cancer cells (Clin Exp Pharmacol Physiol. 2004).

Crataegus (Shan zha): Seems to protect the body from neoplastic transformations induced by chemicals. In one experiment, erinitrit and methyl phentolamine solution, which cause proliferative pathological changes in the lining of the esophagus, were given to rats and mice. The pathological changes did not occur when the animals were also given crataegus (Liu 1991). Crataegus seems to be able to prevent the proliferation of neoplastic cells without causing significant damage to normal cells (Liu 1994).

Cremastra (Shan ci gu): Has shown some anti-neoplastic efficacy in experiments involving mice (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995).

Curcuma root (Yu jin): Contains curcumin A, which has antioxidant effects and can induce apoptosis and suppress cellular proliferation. It may prevent angiogenesis, thereby decreasing a tumor's blood supply (Singh 2006).

Dioscorea bulbifera bulb (Huang yao zi): Was used to treat 25 patients with thyroid tumors with an 80% efficacy rate (Fu Jian Yi Xue Yuan Xue Bao 1964).

Dittany bark (Bai xian pi): Contains obacunone, which potentiates chemotherapeutic agents such as vincristine, vinblastine, and paclitaxel (Planta Med 2000).

Earthworm (Di long): Has demonstrated the ability to inhibit the growth of various transplanted tumors in mice. It may do this either by improving the immune system or by scavenging free radicals (Wang 1991).

Ganoderma (Ling zhi): Has been shown to have antioxidant effects and can scavenge free radicals. It also increases the function of T cells, macrophages, and natural killer cells. It may induce apoptosis and may also have anti-angiogenic capabilities (Gao 2004).

Hornet's nest (Feng fang): Has been shown to inhibit the growth of S180 sarcomas and enhance the phagocytic activity of macrophages (Li Li 1999).

Kelp (Kun bu): Prevents the formulation of blood vessels and prevents the growth of RIF-1 tumors in rats (Xu 1999). It may inhibit the growth of other tumors by restricting angiogenesis.

Mastic (Ru xiang): Contains boswellic acids, which cause apoptosis in leukemia and meningioma cell lines in vitro (Shao 1998, Park 2002). These acids may also inhibit other cancer cells.

Milettia (Ji xue teng): Can help destroy tumor cells. When peripheral blood mononuclear cells are cultured with interleukin 2, they develop the ability to destroy

tumor cells. This is termed lymphokine-activated killer or LAK activity. Milettia can increase LAK and NK cell activity in mice (Hu 1997, Xu 1996). It also helps to reduce the side effects of chemotherapy and radiation, both of which tend to cause decreases in red and white blood counts. Milettia can help prevent this unwanted side effect of Western therapy (Bo 1997, Chen 1999, Liu 1998).

Oldenlandia (Bai hua she cao): Has been shown to inhibit cellular proliferation of 8 types of cancer cell lines in vitro, and decreased the size of lung metastases in mice by approximately 70% (Gupta 2004).

Oyster shell (Mu li): Was administered to mice with hepatocarcinoma. The activity of NK cells was increased and the tumor size decreased as compared to a control group. The mice that received the oyster shell also lived longer (Wang 1997).

Pinellia (Ban xia): Pinellia, when processed with ginger, prevents the growth of tumor cell strain K₅₆₂ (Wu 1996).

Polyporus (Zhu ling): Inhibits the growth of liver tumors in mice (Yao Xue Tong Bao 1985). In addition, it inhibited the tumor growth and enhanced the immune system in 200 people with lung cancer and 40 patients with leukemia (Zhong Xi Yi Jie He Za Zhi 1984).

Poria (Fu ling): Has anti-neoplastic properties. Experimentally, it was shown to significantly inhibit S180 cancers, which are normally very aggressive tumors in mice (Chen 1986). In addition, it can increase the phagocytic ability of macrophages in mice with cancer (Lu 1990). Poria decreases the side effects of chemotherapy and strengthens the immune system in patients with cancer. These patients then have better appetites and increased physical activity (Zhong Xi Yi Jia He Za Zhi 1985).

Pueraria (Ge gen): Can inhibit human leukemia 60 tumor cells (Modern TCM Pharmacology 1997).

Red peony (Chi shao): Inhibits local growth of Lewis pulmonary tumors and melanoma B16, and prevents hematogenous metastasis of those tumors in mice. In addition, it has synergistic activity with cyclophosphamide (Hu 1990).

Salvia (Dan shen): Has been shown to inhibit K562 and BCaP-37 tumor cells in vitro (Li Xu Fen 1999).

Scorpion (Quan xie): Inhibits sarcoma in mice (Jiang Su Yi Yao 1990).

Scutellaria (Huang qin): Contains baicalein, which has demonstrated the ability to cause apoptosis of human myeloma cells in vitro (Zi 2005).

Siler (Fang feng): Can prevent the growth of S180 tumors in mice and increase the phagocytic abilities of macrophages (Li Li 1999).

Subprostrata sophora root (Shan dou gen): Has anti-neoplastic effects, which are mediated by matrine, oxy-matrine, and sophcarpine. It is especially effective in

treating abdominal cancers (Zhong Guo Yi Xue Ke Xue Xue Bao 1988).

Wolfberry (Gou qi zi): Has been shown to inhibit the growth of cancer cells and enhance the immune system in mice (Zhong Guo Yao Li Xue Za Zhi 1985).

Wormwood (Yin chen): Can kill gastric carcinoma cells BGC-823 and can enhance the production of serum tumor necrosis factors (Zhang 1998, Du 1990).

Zedoaria (E zhu): Inhibits a range of cancers. Of 19 patients with various solid tumors who were treated with zedoaria, 1 patient recovered completely, 4 improved significantly, 3 improved somewhat, and 11 did not respond (Shan Dong Zhong Yi Xue Yuan Xue Bao 1980).

Acupuncture

Acupuncture can be used in cancer patients to relieve pain and inflammation. However, it is not routinely used for cancer treatment due to lack of response. In general, acupuncture points are chosen based upon the location of tumor, the etiology of the cancer (Cold, Heat, Phlegm, Stagnation, etc.), and the organ involved (Liver, Kidney, Heart, etc.). By convention, any patient with opened or infected tumors or septicemia should not receive acupuncture because this may promote the spread of the infection. Practitioners who are familiar with TCM pattern differentiation may find acupuncture to be beneficial. In general, practitioners who have not had this training are better off not administering acupuncture therapy.

Cancer and homotoxicology (as part of a combined integrative protocol with nutrition and Chinese herbal medicine)

Please refer to Chapter 34 for advanced homotoxicology and autosanguis treatment of cancer.

General considerations/rationale

Neoplastic, preneoplastic, and chronic diseases are commonly seen in veterinary practice. Due to the complex nature of these conditions, cure is often not possible, and a multimodality approach is often most successful in handling these conditions. The number of veterinarians practicing homotoxicology has increased substantially in the last 5 years, as clinicians become attracted to homotoxicology out of general interest and then usually continue after seeing a series of surprisingly good results. Research into mechanisms of action of low dose pharmacology is beginning to increase, and the results are interesting indeed. Because homotoxicology can be practiced at many different levels of sophistication, this section is intended to introduce veterinarians to the basic practices and techniques used in homotoxicology and its inclusion as a multimodality approach with therapeutic nutrients and Chinese herbal medicine. See Chapter 34 for advanced

homotoxicology and autosanguis protocols for the treatment of cancer.

As we have seen earlier in this text (Chapters 1 and 4), homotoxicology contains many useful agents for improving patient well being. Due to the low risks of serious side effects encountered with antihomotoxic therapy, clients readily accept and continue biological therapies that support organ function, drain toxins from the body, and improve patient condition and comfort. Antihomotoxic agents integrate nicely with many other forms of therapy commonly used to treat patients suffering from cancer or other chronic diseases. They are also environmentally friendly because patients using biological therapy excrete very few toxic metabolites into the environment.

A homotoxicologist's view of cancer

The scope of this introductory text is insufficient to address, other than very superficially, the topic of oncogenesis and biological oncologic therapies. Due to spatial constraints, we have divided this book's cancer section into a basic or introductory approach to cancer using antihomotoxic agents, in combination with therapeutic nutrition and Chinese herbal medicine (which follows here in this chapter). More data and protocols can be applied to patients in the Dedifferentiation Phase by use of autosanguis, and a deeper understanding of homotoxicology agents greatly facilitates that process. These areas are discussed in Chapter 34. The reader is also referred to the earlier discussion of the greater defense mechanisms in the homotoxicology (chapter 4), because this is the foundational material involved.

In homotoxicology, cancer is viewed simply as the body's expression of accumulated homotoxins and the damage that has been done to normally functioning systems. This represents the outcome of Dedifferentiation Phase disease. Very little data is formally published on the use of homotoxicology for cancer treatment in human or veterinary patients. However, a large body of anecdotal data and theories are available for investigation by those interested in the topic. Current efforts are beginning to correlate this data and present it in more useful form. Of particular interest is fundamental clinical research by Jarir Nakouzi, MD, who claims to have developed a new clinical approach to human patients suffering from Dedifferentiation Phase disease. Clinical impressions and approaches to human patients with chronic disease and cancer were presented in a seminar sponsored by Heel USA (Nakouzi, Smit, Shelton 2004). Interested parties should consider obtaining a copy of these lectures, which are available on CD from Heel.

Alterations in these defense mechanisms allow neoplastic cells to manifest. Heine (2006) of Germany has written extensively on this subject and is currently working on a new text. These theories seem to predict specific activities

and give clinicians tools to address patients with disease in this phase, and the authors have found them intensely useful. Additional research is warranted. Several others are actively finding support for these applied theories, as well. Goldstein (1999, 2000) has assisted oncology and chronically diseased patients for years and routinely includes antihomotoxic medicines in the treatment plans of many of his patients. Joseph Demers (2005a, 2005b) has reported his approach to neoplasia and continues clinical work. Robert Goldstein (2006), the editing author of this text, is undertaking research projects in the United States involving homotoxicology and other integrative modalities in conjunction with a boarded oncologist on the subject of both canine lymphosarcoma and osteosarcoma. The results of these studies should prove intensely interesting.

The protocols that follow can be readily used in conjunction with other therapies, both conventional and complementary. Integration is the watchword of this new age in veterinary medicine. These therapies can be adjusted and customized into a nearly infinite set of possibilities as the clinician becomes more familiar and astute with biological therapy. The authors suggest that the reader simply begin by trying them on a few difficult cases, especially those that seem “hopeless.” They are not intended to cure cancer in any case, but seeing pets respond with brighter eyes and higher energy makes both owner and veterinarian happier and makes these worth pursuing. As the clinician becomes more facile, and as cases presented become more difficult, the data in the latter chapters will be helpful. In the meanwhile, enjoy your journey into the new and exciting realm of biological therapy.

Appropriate homotoxicology remedies

Most protocols use a mixture of Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Tonsilla compositum and/or Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum. This combination covers many aspects of selecting phase remedies and establishing drainage and organ support in chronic disease cases. Commonly referred to as the modified deep detoxification formula, this combination generally assists cases in the Dedifferentiation Phase by supporting cellular repair of organelles and draining toxins from the cells into the matrix (Galium-Heel and Lymphomyosot). Once there, agents in the formula (Lymphomyosot and Thyroidea compositum) activate the clearing of the matrix and lymphatic system, support endocrine function, and strengthen the excretion and detoxification organs (liver, kidney, and bowel) (Hepar compositum and Solidago compositum).

Constant attention to cellular energy production is key to success in treating any chronic disease, and cancer is no exception. Catalysts, especially Coenzyme composi-

tum, Ubichinon compositum, and Glyoxal compositum, are critical to success, and they make patients feel better very quickly. Start this formula out slowly, using it twice weekly for 2 weeks. If the patient feels better and is doing well, it can be continued at this level or given orally every other day. If excessive signs of homotoxin off-loading occur (diarrhea, vomiting, nasal discharge, aural discharge, ocular discharge, or coughing), then simply cut back on this formula or stop entirely for several days. Most patients recover quickly and feel better from the removal of their harmful homotoxins. This is usually not a problem if clients are properly prepared.

Alta Smit, MD, has recently recommended that Berberis homaccord be used daily in cancer patients. The system is bombarded daily by homotoxins, and Berberis homaccord helps support the adrenal glands, liver, gallbladder, renal tubules, and colon. Berberis homaccord contains Viscum album to support the Dedifferentiation Phase condition. This agent can be added to all of the cancer protocols in this book with good effect. This formula can also assist with rheumatic complaints and spasms that can accompany many chronic disease states.

Symptom remedies are used to manage signs that arise during therapy. The simplest approach is to note the main symptoms and look them up in the Biotherapeutic Index or in the medical protocol of this text. Then select agents that assist that problem and recheck the patient after a period of time. The clinician should always practice good medicine and ensure that patients have been adequately and properly diagnosed so that the patient's actual medical condition is known. In many cases it will be found that patients not responding to treatment have other undiscovered issues such as abscessed teeth, infected kidneys, allergies, food intolerances, or hidden viral conditions. Complementary medicine in no way replaces good diagnostic and proper conventional medicine. In fact, by properly integrating conventional practice and complementary modalities, the clinician will discover a whole host of new tools with which patient care can be improved.

Cancer treatment protocols

The protocols that follow can be readily used in conjunction with other therapies, both conventional and complementary. Integration is the watchword of this new age in veterinary medicine. These therapies can be adjusted and customized into a nearly infinite set of possibilities as the clinician becomes more familiar and astute with nutritional, herbal, and biological therapies. The authors suggest that the reader simply begin by trying them on a few difficult cases, especially those that seem “hopeless.” They do not claim to cure cancer, but seeing pets respond with clear and brighter eyes, higher energy levels, and dramatically improved quality of life pleases animal

guardians and veterinarians and confirms the benefits of pursuing this integrative approach.

The following section lists treatment protocols for specific types of cancer. Each cancer treatment protocol will contain the following:

- General Western medical information, treatment options, and prognoses.
- General therapeutic nutritional information and the author's suggested treatment.
- General Chinese herbal information and the author's suggested treatment.
- General homotoxicology information and the author's suggested treatment (in abbreviated form).

Immediately following the above cancer treatment protocols are 2 additional chapters covering autotransfusion therapy and advanced homotoxicology oncology protocols for practitioners who choose a more in-depth homotoxicology approach.

Diet and cancer

These dietary recommendations and restrictions apply to ALL of the following cancer protocols, which recommend using combinations of therapeutic nutrition, Chinese herbal medicine, and homotoxicology remedies.

It is important to address the matter of diet when using traditional Chinese herbal supplements for the treatment of neoplasia. Through years of study, it has been shown that the supplements are much more effective when the diet includes beef, pork, venison, rabbit, and/or cheese as the protein source. Lamb, poultry (chicken, turkey, eggs), and seafood (including fish oil) interfere with the action of the herbs. There are no restrictions on vegetables (Ming 1999).

Furthermore, *excessive* supplementation with vitamins, minerals, antioxidants, and herbs that have a strong tonifying or immune-stimulating effect can decrease the antineoplastic action of traditional Chinese herbal formulations. It is for this reason, in the following protocols, that nutrient doses have been reduced to levels that do not interfere with the effectiveness of the herbs but still supply important beneficial antioxidants. These antioxidants have the important function of supporting gland function and helping to reduce free radical load and inflammation. In cancer patients, free-radical-induced inflammation is increased due to the following factors:

- Chemotherapeutics or ionizing radiation
- Immune-suppressing drugs such as corticosteroids
- Toxic load from cellular debris (healthy and cancerous cells break down) and metabolites
- Inefficient metabolism due to weakened or diseased organ systems

Note: Fixed formula nutritional recommendations are listed in all of the following cancer treatment protocols.

Cancer is a systemic, immune-deficient disease, and therefore can affect all organ systems, even though the specific cancer is localized. It is for this reason that the authors recommend that when possible, as part of the medical work-up, a physiological blood analysis be performed to identify associated organ weaknesses. This is more important when dealing with systemic cancers such as lymphosarcoma or those that affect vital organs such as the liver, kidney, or heart. This analysis helps the clinician to match the nutritional support program specifically to the organ system, while still meeting the restrictions required for the use of the Chinese herbal remedies (see Nutritional Blood Testing in Chapter 2 for more details).

The typical sample diet shown below gives animal companions the ability to prepare food at home or use commercially prepared foods that meet the above criteria. The guidelines for the ratio of protein, fat, and carbohydrates generally follow those representative of the research carried out by the Hills Company for the formulation of their N/D® diet for cancer patients. Studies on feeding dogs with cancer have shown that adding essential amino and fatty acids improved not only the prognosis but also the remission times (Davenport 2000) (see fatty acids in Chapter 2 for more details). In addition to the elevated fatty acid content, it also has been shown that a low-carbohydrate diet is also beneficial for treatment cancer (Ming 1999).

For presentation purposes, a few brands with wide distribution are listed in each category. For a complete list of suppliers that formulate foods that meet the restrictive guidelines of these cancer protocols, please refer to Section 8.

Dietary restrictions

Do not use fish oil. Instead, use flax, hemp, evening primrose, and borage oils or AFA Algae (*Aphanizomenon Flos Aquae*). Do not use chicken, turkey, lamb, fish or eggs. Instead, use beef, venison, pork, or tofu.

Commercial choices

Sample raw food sources: Nature's Variety, Bravo, Primal, Northwest Naturals, Steve's Real Food, Farmore, Raw Advantage, Natural Balance, Earth Animal, and Wild Kitty Cat Food.

Sample canned choices: Natural Balance Canned Beef, Evangers Beef 100% Beef, Blue Buffalo Canned Beef, Wysong Canned Beef, and Evo 95% Beef or Venison.

Sample dry or premixes: Natural Balance Vegetarian, Dr. Harvey's Premix, Soujourner Farms Premix, Wysong Vegan, and Pet Guard Organic Vegetarian.

Guidelines for home cooking

Meat protein: 50% to 75%; complex carbohydrates: 10% to 20%; and fat (rich in omega-3 and 6; no chicken or fish oil): 20%.

Sample home-prepared diet

- 1 pound organic or free-range beef, tofu, venison, rabbit, or buffalo
- One-half to 1 cup Dr. Harvey's or organic brown rice or oatmeal
- 2 tablespoons organic yogurt
- 1 tablespoon organic flaxseed oil (evening primrose, hemp, or borage oil OK)
- One-half cup organic carrots or chopped greens
- 1 to 3 teaspoons chopped organic parsley
- 1 clove organic garlic

Chapter Thirty-Three

IVM Cancer Treatment Protocols Presented by Cancer Type

ANAL GLAND TUMOR

General comments

Anal gland adenocarcinomas arise from the apocrine glands of the anal sacs and can be locally invasive and can spread to the lymph glands, particularly the sublumbar lymph nodes. These tumors are also often associated with hypercalcemia and can affect renal function (Meuten 1981). The recommended therapy is surgical excision along with chemotherapy. Adjunctive radiation therapy is recommended when there is metastasis to the regional lymph nodes. The average survival time is 6 to 15 months, depending upon whether or not there is metastasis (Thomas 1998, Richardson 2003, Williams 1997).

Nutrition

Apocrine tumors of the anal gland are both locally invasive and can spread to the regional lymph glands. Nutritional therapy focuses on reducing inflammation in the rectum, improving stool formation with added fiber, and supporting lymph drainage and circulation.

Homotoxicology

Anal gland tumors represent the Dedifferentiation Phase. Adenocarcinoma is a common malignancy and is often associated with paraneoplastic syndromes involving elevated calcium levels. These tumors often spread to the regional lymph node and can remain silent for long periods of time.

They are generally best treated when detected early and by broad surgical excision with attention to the patient's homotoxin load. Radiation may be needed. If it is used, see the oncology section in Chapter 34. When complete excision is not possible, where metastasis has occurred, or in the event that caregivers do not desire surgery or more invasive therapies, then homotoxicology can be used to improve quality of life. See the additional data in Chapter 34.

Authors' suggested protocols

Nutritional/gland therapy

Intestines and lymph support formulas: One-half tablet for 25 pounds of body weight BID.

Probiotic MPF: One-half capsule per 25 pounds of body weight with food.

Glutamine: Supports intestinal health. The authors recommend Glutimmune® at one-fourth scoop per 25 pounds of body weight SID.

Chinese herbal medicine

Uro-G Plus: Can be used if the tumor is nonresectable, but is more effective if the tumor has been removed or debulked. The dose is 1 capsule per 10 pounds TID regardless of whether or not the mass has been debulked.

The authors recommend Uro-G Plus along with appropriate analgesics such as opioids or NSAIDs. Uro-G Plus contains apricot seed (Xing ren), asparagus (Tian men dong), astragalus (Huang qi), atracylodes (Bai zhu), barbat skullcap (Ban zhi lian), centipede (Wu gong), cremastra (Shan ci gu), hornet's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), milettia (Ji xue teng), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), and subprostrata sophora root (Shan dou gen).

In addition to the herbs mentioned above, Uro-G Plus also contains angelica root (Dang gui), arisaema/bile (Dan nan xing), Chinese sage (Shi jian chuan), codonopsis (Dang shen), corydalis (Yan hu suo), eupolyphaga (Tu bie cong), glehnia root (Sha shen), houttuynia (Yu xing cao), licorice (Gan cao), lily bulb (Bai he), myrrh (Mo yao), ophiopogon (Mai men dong), panicked swallowwort root (Xu chang qing), prunella (Xia ku cao), pseudodanum (Qian hu), pseudotellaria (Tai zi shen), rehmannia cooked (Shu di huang) and raw (Sheng di huang), sargassum (Hai zao), scrophularia (Xuan shen), selaginellae doederleini (Shi shang bai), stemoma (Bai bu), tortoise shell (Bie jia), and trichosanthes (Gua lou). These additional herbs increase the efficacy of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, BHI-Hemorrhoid: PO BID. In addition, hemorrhoid suppositories may help to alleviate local pain and irritation.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, BHI-Hemorrhoid: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

FIBROSARCOMA (NATURALLY OCCURRING AND VACCINE-INDUCED)

General comments

Fibrosarcoma occurs in both dogs and cats; the common sites are the gums, lips, nasal sinuses, and skin. These tumors are usually slow growing and locally invasive, and tend not to metastasize. In cats, vaccine-induced sarcomas are now the more common form. They are usually much more aggressive and often metastasize. These tumors are found at the site of the vaccine and are more common after repeated vaccinations. The vaccine-induced tumors are believed to be an inflammatory process at the vaccination site (Kass 1996, Thompson 2003). Therapy is usually wide excision surgery along with radiation therapy (Evans 1989, Hahn 2003). Chemotherapy is palliative for fibrosarcomas (Hahn 2003). Survival times are approximately 1 year or longer; however, nasal and vaccine-induced tumors often carry a more guarded prognosis of 3 to 9 months (Evans 1989, Hahn 2003).

Nutrition

Fibrosarcoma is a dense, fairly avascular tumor. A combination of biological therapies and surgery results in the best prognosis. The nutritional therapy focuses on the immune system. With vaccine-induced tumors it is important to remove and neutralize the effects of prior vaccinations (see Section 6, Vaccinations, for more detailed information).

Note: Fibrosarcomas are often resistant and recurrent, and require a balanced immune effort for control. A metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This can help clinicians to formulate therapeutic nutritional protocols that address not only the cancer but associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Fibrosarcomas represent Dedifferentiation Phase disease. They are generally best treated by early detection and broad surgical excision (amputation may be advised). Radiation and chemotherapy are often recommended.

If radiation is used, see the oncology section of Chapter 34. In cases where complete excision is not possible

or where metastasis has occurred, or in the event that caregivers do not desire surgery or more invasive therapies, then homotoxicology can be used to improve quality of life. Injections in the region of the tumor should be avoided. In cases of vaccine-related fibrosarcoma, carefully evaluate the need for injections before proceeding.

Authors' suggested protocols

Nutritional/gland therapy

Immune and lymph support formulas: One-half tablet for 25 pounds of body weight BID.

Betathyme: 1 capsule for each 25 pounds of body weight BID (maximum, 2 capsules BID).

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H85 Sarcoma: 1 capsule per 10 pounds of body weight TID. H85 Sarcoma contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), bupleurum (Chai hu), burreed tuber (San leng), centipede (Wu gong), Kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). It also contains buttercup roots (Mao zao cao), citrus (Chen pi), codonopsis (Dang shen), fritillary bulb (Zhe bei mu), prunella (Xia ku cao), sargassum (Hai zao), uncaria (Gou teng), and white peony (Bai shao) to increase efficacy. It is more effective after surgical debulking.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Zeel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Zeel: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum, Discus compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

GASTRIC ADENOCARCINOMA

General comments

Gastric adenocarcinoma is a tumor of glandular origin that arises from the epithelial lining of the stomach.

Treatment is usually surgical excision; chemotherapy is ineffective. The prognosis is poor, with most survival times less than 1 year (Morrison 1998, Richardson 2003).

Nutrition

Gastric adenocarcinomas are aggressive, and biological therapies should be done in combination with surgical excision if at all possible. Therapeutic nutrition focuses upon reducing pain and inflammation as well as providing general support and enhancing immune function.

Note: Gastric adenocarcinoma is an aggressive tumor that often affects digestion and assimilation and promotes wasting. It is recommended that a metabolic blood analysis be performed to confirm or rule out organ involvement and to add additional appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

This is a Dedifferentiation Phase disorder. Homotoxicology does not cure this condition, but patients may benefit from support of their biological processes through drainage, detoxification, and cellular support. Also see the protocol for adenocarcinoma.

Authors' suggested protocols

Nutritional/gland therapy

Immune and esophageal/stomach support formulas: One-half tablet for each 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight SID.

Betathyme: 1 capsule for each 25 pounds of body weight BID (maximum, 2 capsules BID).

Gluta-DMG: 3 level scoops per 25 pounds of body weight, divided BID.

Chinese herbal medicine/acupuncture

Gastric tumor formula: 1 capsule per 10 pounds TID. Gastric tumor formula contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), crataegus (Shan zha), curcuma root (Yu jin), kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), salvia (Dan shen), scorpion (Quan xie) and zedoaria (E zhu). It also contains aconite root/chuan (Chuan wu), ark shell (Wa leng zi), bletilla tuber (Bai ji), chicken gizzard lining (Ji nei jin), citrus (Chen pi), codonopsis (Dang shen), corydalis tuber (Yan hu suo), cuttlebone (Hai piao xiao), fleece flower root (He shou wu), haematite (Dai zhe shi), inula (Xuan fu hua), laminaria (Hai dai), leaven (Shen qu), malt (Mai ya), melia (Chuan lian zi), prunella (Xia ku cao), pteropus (Wu ling zhi), rehmannia (Shu di huang), sargassum (Hai zao), and saussurea (Mu xiang). These herbs increase the potency of the supplement.

annia (Shu di huang), sargassum (Hai zao), and saussurea (Mu xiang). These herbs increase the potency of the supplement.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Gastricumeel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Gastricumeel: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

HEART BASE TUMOR (CHEMODECTOMA)

General comments

One of the common causes of pericardial effusion is heart base tumors and hemangiosarcoma (See hemangiosarcoma). Surgery can be beneficial, especially if there is associated pericardial effusion. Chemotherapy is not recommended (Hamilton 2003, Morrison 1998).

Nutrition

Heart base tumors respond best to surgery in combination with nutritional therapies. Surgery is directed at the tumor and the pericardial effusion. Nutritional therapy focuses upon the improvement of circulation and cardiac output as well as general support of immune function.

Note: Because heart base tumors can affect multiple organ systems, a medical and physiological blood evaluation is recommended to assess general glandular health. This helps clinicians to formulate therapeutic nutritional protocols that address the pituitary and thyroid glands as well as organ disease that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

These tumors respond poorly to surgery and chemotherapy. There is no literature documenting the use of homotoxicology for these tumors.

Authors' suggested protocols

Nutritional/gland therapy

Cardiac and immune support formulas: Contain taurine and L-carnitine. One-half tablet for each 25 pounds of body weight BID.

Vitamin E: 50 IU for each 15 pounds of body weight SID.

Coenzyme Q10: 25 mgs for each 25 pounds of body weight SID.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Beyond essential fats: One-half teaspoon for every 35 pounds of body weight with food or

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID or

Hemp oil: 1 teaspoon for every 25 pounds of body weight with food BID.

Chinese herbal medicine/acupuncture

H60 Anticancer/generic and H38 Pleural effusion/cardiac tumor: 1 capsule of each formula per 10 pounds BID. This condition is unique in that there are no dietary restrictions.

H60 Anticancer/generic contains antler powder (Lu jiao shuang), astragalus (Huang qi), barbat skullcap (Ban zhi lian), centipede (Wu gong), coix (Yi yi ren), hornet's nest (Lu feng fang), poria (Fu ling), Reishi mushroom (Ling zhi), salvia (Dan shen), and scorpion (Quan xie). H60 Anticancer/generic also contains arisaema (Dan nan xing), cornus (Shan zhu yu), dandelion (Pu gong ying), dioscoria (Shan yao), ginseng (Ren shen), honey-suckle (Jin yin hua), licorice (Gan cao), mugwort (Liu ji nu), rehmannia (Shu di huang), and tortoise shell (Bie jia).

H38 Pleural effusion/cardiac tumor contains astragalus (Huang qi) and scutellaria (Huang qin). It also contains angelica root (Dang gui), codonopsis (Dang shen), dianthus (Qu mai), fritillaria (Bei mu), lily bulb (Bai he), ophiopogon (Mai men dong), pharbitis (Qian niu zi), platycodon root (Jie geng), talc (Hua shi), trichosanthes root (Tian hua feng), and white peony (Bai shao). These additional components improve the function of the formula.

Homotoxicology

For chemodectoma, add *Berberis homaccord* and appropriate cardiac and blood pressure agents based upon clinical status. See hemangiosarcoma and use those treatment recommendations as a starting place.

HEMANGIOSARCOMA

General comments

Hemangiosarcoma is a malignancy of the cellular lining of blood vessels; the most common sites are the spleen, liver, heart, and skin. It is more common in dogs than cats (Morrison 1988, Scavelli 1985). Surgery alone or in combination with chemotherapy is the recommended therapy (Hamilton 2003, Johnson 1989, Ward 1994). The prognosis for heart, spleen, and liver is poor, with estimated survival times of 1 to 9 months. For skin tumors treated with surgery, the prognosis is much better and is often 1 to 2 years (Elmslie 2003).

Nutrition

Because hemangiosarcoma is a vascular, endothelial tumor, nutritional therapy focuses on reducing inflammation in the blood vessel system, providing nourishment, and enhancing immune function. Nutritional remedies that are anti-angiogenic are also included.

Note: Hemangiosarcoma is an aggressive tumor that originates in blood vessels and can initiate or metastasize to any organ. Therefore, it is recommended that a metabolic blood analysis be performed to confirm or rule out organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Hemangiosarcoma represents Dedifferentiation Phase disease. Metastasis at the time of diagnosis is common.

Surgery, radiation, and chemotherapy may be needed. If radiation is used, see the oncology section of Chapter 34. Homotoxicology can be used to improve the quality of life in cases in which complete excision is not possible, metastasis has occurred, or the caregivers do not desire surgery or more invasive therapies.

Authors' suggested protocols

Nutritional/gland therapy

Splenic and liver:—Liver and immune support formulas: One-half tablet for every 25 pounds of body weight BID.

Skin—Skin and immune support formulas: One-half tablet for each 25 pounds of body weight BID.

Heart—Cardiac and immune support formulas: One-half tablet for each 25 pounds of body weight BID.

Vascustatin (anti-angiogenic): 1 capsule (250 mgs) per 20 pounds of body weight divided BID.

Imm Kine (immune enhancement): 50 mgs for each 25 pounds of body weight SID.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

For splenic hemangiosarcoma, the authors recommend H83 Abdominal tumor. It can be started before surgery and continued afterward. If the patient is not capable of surviving the surgery it may be used as a sole therapeutic option. The dose is 1 capsule per 10 pounds TID.

Formula H83 Abdominal tumor contains agrimony (Xian he cao), astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), cinnamon bark (Rou gui), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition, it contains achyranthes (Niu xi), amber (Hu po), angelica root (Dang gui), Chinese sage (Shi jian chuan), cnidium (Chuang xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), licorice (Gan cao), myrrh (Mo yao), notoginseng (San qi), peach kernel (Tao ren), pteropus (Wu ling zi), rehmannia (Sheng di huang), and rhubarb (Da huang) to increase efficacy.

For cutaneous hemangiosarcoma, the authors recommend Lymph “K.” The dose is 1 capsule per 10 pounds TID. Lymph “K” contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), hornet’s nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), wolfberry (Gou qi zi), and zedoaria (E zhu). In addition to the herbs mentioned above, Lymph “K” contains arisaema pulvis

(Dan nan xing), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), eupolyphaga (Tu bie cong), forsythia (Lian qiao), fritillaria (Bei mu), house lizard (Bi hu, Tian long, or Shou gong), myrrh (Mo yao), prunella (Xia ku cao), rehmannia (Shu di huang), sargassum (Hai zao), Selaginellae doederleini (Shi shang bai), silkworm (Jiang can), Typhonium gigantium rhizome (Bai fu zi), and white peony (Bai shao). These additional herbs increase the efficacy of the formula.

For cardiac hemangiosarcoma, the authors recommend H60 Anticancer/generic and H38 Pleural effusion/cardiac tumor (see Heart-Based Tumors). The dose is 1 capsule of each for every 10 pounds twice daily.

H60 Anticancer/generic contains antler powder (Lu jiao shuang), astragalus (Huang qi), barbat skullcap (Ban zhi lian), centipede (Wu gong), coix (Yi yi ren), hornet's nest (Lu feng fang), poria (Fu ling), Reishi mushroom (Ling zhi), salvia (Dan shen), and scorpion (Quan xie).

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Phosphor homaccord (if bleeding or liver involvement): PO BID.

BHI-Bleeding: Every 15 minutes in acute hemorrhage and then BID to QID PRN.

Tonsilla compositum, Placenta compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Phosphor homaccord (if bleeding or liver involvement): PO BID.

BHI-Bleeding: PRN.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Placenta compositum: Give at intervals (every 2 to 4 weeks).

HEPATIC ADENOCARCINOMA

General comments

While the cause is not known, it is believed that hepatocellular adenocarcinomas are related to chronic inflammation or toxicity. Viral disease may predispose to neoplastic changes, too. Surgery is recommended if the cancer is not diffuse and throughout all lobes. Chemo-

therapy is generally ineffective. Antioxidant vitamins such as E and C along, with omega-3 fatty acids, are recommended. Prognosis is generally considered to be guarded and survival is about 1 year (Morrison 2003).

Nutrition

Surgery in combination with nutritional therapies is recommended for the best prognosis for hepatocellular tumors that are confined to a lobe. The therapeutic nutrition focuses on reducing inflammation, protecting and nourishing liver cells, and enhancing immune and detoxification functions.

Note: Because the liver is so vital to many of the bodily functions, it is recommended that a metabolic blood analysis be performed to confirm or rule out other organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Hepatic adenocarcinomas represent the Dedifferentiation Phase. Chemotherapy is often not terribly helpful in these cases because the neoplastic cells contain detoxification systems, which render the chemotherapy drugs less effective. Such cases are generally best treated by early detection and broad surgical excision with attention to the patient's homotoxin load. These cases can do surprisingly well. In cases where complete excision is not possible, where metastasis has occurred, or if caregivers do not desire surgery or more invasive therapies, then homotoxicology can be used to improve the quality of life. See the additional data under the adenocarcinoma protocol in the advanced homotoxicology chapter in this section.

Authors' suggested protocols

Nutrition

Liver and immune support formulas: One-half tablet for each 25 pounds of body weight BID.

Lecithin/phosphatidylcholine: One-fourth teaspoon for each 25 pounds of body weight BID.

Vitamin E: 50 IU for every 25 pounds of body weight SID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight SID.

SAMe: 20 mg/kg SID.

Chinese herbal medicine/acupuncture

H8 Hepatic tumor and H83 Abdominal tumor: 1 capsule of each formula per 10 to 20 pounds of body weight TID.

H8 Hepatic tumor contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), bupleurum (Chai hu), burreed tuber (San leng), centipede

(Wu gong), cremastra (Shan ci gu), curcuma root (Yu jin), ganoderma (Ling zhi), kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), salvia (Dan shen), scorpion (Quan xie), wormwood (Yin chen), and zedoaria (E zhu). In addition to the herbs mentioned above, H8 Hepatic tumor contains alisma (Ze xie), blue citrus (Qing pi), corydalis (Yan hu suo), ginseng (Ren shen), leaven (Shen qu), licorice (Gan cao), malt (Mai ya), melia (Chuan lian zi), notoginseng (San qi), prunella (Xia ku cao), tortoise plastron (Gui ban), tortoise shell (Bie jia), and white peony (Bai shao). These herbs increase the efficacy of the formula.

H83 Abdominal tumor contains agrimony (Xian he cao), astragalus (Huang qi), atractylodes (bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), cinnamon bark (Rou gui), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition, it contains achyranthes (Niu xi), amber (Hu po), angelica root (Dang gui), Chinese sage (Shi jian chuan), cnidium (Chuang xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), licorice (Gan cao), myrrh (Mo yao), notoginseng (San qi), peach kernel (Tao ren), pteropus (Wu ling zi), rehmannia (Sheng di huang), and rhubarb (Da huang) to increase efficacy.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Chelidonium homaccord, Phosphor homaccord, Lymphomyosot, Ginseng compositum: PO BID.

Galium-Heel, Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Chelidonium homaccord, Phosphor homaccord, Lymphomyosot, Ginseng compositum: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

LEIOMYOSARCOMA

General comments

Leiomyosarcoma is classified as a malignancy of the smooth muscle of the stomach or intestinal tract. This cancer may be locally invasive but it is a slow-growing malignancy. The treatment of choice is surgical excision.

Nutrition

Surgical excision along with nutritional therapy gives the best results for leiomyosarcomas. Nutritional therapy focuses on reducing inflammation, providing cellular protection, and enhancing immune function.

Note: Because cancer can affect multiple organ systems and is often a systemic disease, a metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This can help clinicians to formulate therapeutic nutritional protocols that address not only the cancer but associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Leiomyosarcomas represent the Dedifferentiation Phase. They are generally best treated by early detection and broad surgical excision.

Authors' suggested protocols

Nutritional/gland therapy

Immune, esophageal/stomach, or intestinal support formulas: One-half tablet for each 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight SID.

Betasitosterol: 1 capsule for each 25 pounds of body weight BID (maximum, 2 capsules BID).

Gluta-DMG: 3 level scoops per 25 pounds of body weight, divided BID.

Chinese herbal medicine/acupuncture

Lymph "K": 1 capsule per 10 pounds of body weight TID. If the patient cannot tolerate surgery, Lymph "K" can be used as the sole therapy. The prognosis is better with surgical debulking.

Lymph "K" contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), horner's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), wolfberry (Gou qi zi), and zedoaria (E zhu). In addition to the herbs mentioned above, Lymph "K" contains arisaema pulvis (Dan nan xing), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), eupolyphaga (Tu bie cong), forsythia (Lian qiao), fritillaria (Bei mu), house lizard (Bi hu, Tian long, or Shou gong), myrrh (Mo yao), prunella (Xia ku cao), rehmannia (Shu di huang), sargassum (Hai zao), Selaginellae doederleini (Shi shang bai), silkworm (Jiang can), Typhonium gigantium rhizome (Bai fu zi), and white peony (Bai shao). These additional herbs increase the efficacy of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum: PO BID to TID. Add Gastricumeel, Duodenoheel, or Nux vomica homaccord if gastrointestinal upset is present.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum: PO BID to TID. Add Gastricumeel, Duodenoheel, or Nux vomica homaccord if gastrointestinal upset is present.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

LYMPHOMA/LYMPHOSARCOMA

General comments

Lymphosarcoma is one of the most common cancers of dogs and cats. Commonly affected breeds are Golden Retrievers, German Shepherds, Boxers, Scottish Terriers, and West Highland Whites. Suspected causes include genetic predisposition, viral, radiation, herbicides, and compromised immune function. Scientific references list lymphosarcoma as cause unknown.

The rationale for medical therapy is to achieve remission via a combination of cytotoxic chemotherapeutics and anti-inflammatory drugs such as cortisone. The goal is to kill off the cancer cells, thereby allowing normal,

healthy cells to grow and repopulate the lymph system and tissues. Dietary recommendations include a low-carbohydrate diet with adequate and appropriate amounts of protein, essential n-3 fatty acid, and specific amino acids such as arginine (Anderson, Ogilvie 1997; Davenport, Ogilvie 1998). Hills has since introduced their Prescription Diet N/D, which follows the guidelines for protein, fat, carbohydrates, and amino acids described in this study (Hills Pet).

Remission is defined as the elimination of all detectable cancer. Most dogs that receive chemotherapy achieve a remission; the average remission time is reported to be 9 months and the average survival time is 1 year (Morrison 2002, 2004; Mutsaers 2002; Ogilvie 2000).

Integrative veterinary therapies

The lymph system, by definition, is a system of cells, tissue, and organs that protects the body from foreign invasion, and therefore is continually functioning in this capacity for the body. As the front line of protection, this system is often overworked and continually exposed to infectious organisms and toxins that can lead to continual inflammation, degeneration, and ultimately loss of control of cellular division.

While chemotherapeutics and cortisone are the recommended treatment, they are intended to destroy the cancer cells; they do not support the assimilation of nutrients, cellular metabolism, or the elimination of chemical and metabolic wastes and detoxification, nor are they intended to. These are the areas in which integrative veterinary therapies help improve the response to medication, protect the cells from chemicals and toxins, improve the day-to-day quality of life, and enhance remission probability and time.

Nutrition

Nutrition, antioxidants, and phytonutrients often are afterthoughts when it comes to the treatment of lymphoma. Lymphoma is a systemic cancer whereby the immune system is overwhelmed and loses its ability to control cell division. The supply of vital nutrients, replenishment of the antioxidants reserves, and proper diet are critical for long-term survival and improved quality of life. Lymphoma responds to chemotherapy and prednisone; therefore, offsetting and minimizing the side effects of chemotherapy and immune suppression helps with long-term remission and improved quality of life.

Note: Because lymphoma is systemic and can affect multiple organ systems, a metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This information helps clinicians to formulate therapeutic nutritional protocols that

address not only the cancer but associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information). Currently a clinical trial is being conducted to evaluate the benefits (day-to-day quality of life and longevity) of adding nutritional, biological, and herbal support to chemotherapy protocols for lymphoma (Goldstein, Post 2006).

Homotoxicology

Lymphosarcoma is a Dedifferentiation Phase disorder. Because this condition is right of the biological division, therapy is generally palliative. In lymphosarcoma, homotoxins have accumulated and damaged the cellular regulation processes sufficiently that neoplastic alterations manifest (Reckeweg 2000). Therapy is directed at removing cancer cells, reconditioning cellular organelles (especially energy production systems), draining toxic materials away from the diseased area, improving the microenvironment of the matrix, and improving detoxification and repair capabilities. Detoxification should not take place while a patient is receiving chemotherapy because this can reduce chemotherapy agent blood levels, and thus reduce killing of the targeted cancer cells (Smit 2004). Caution should be exercised when considering administration of agents, which could cause progressive vicariation. Overvaccination of these patients is not advised because it can cause the immune system to be overwhelmed, resulting in a sudden worsening of the patient's condition.

Authors' suggested protocols

Nutritional/gland therapy

Diet: See the dietary restrictions associated with the Chinese herbal medicine protocols in Chapter 32.

Lymph and blood/bone marrow support formulas: One-half tablet for each 25 pounds of body weight BID.

Maitake-DMG: 1 ml per 25 pounds of body weight, BID. For animals 15 pounds or less, one-half ml BID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum, 2 capsules BID).

Selenium: 20 micrograms for each 20 pounds of body weight SID (maximum, 100 mcg).

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine

The authors use Lymphoma "AA" for nodal lymphoma. The dose is 1 capsule per 10 pounds of body weight TID. Lymphoma "AA" contains astragalus (Huang qi), atractylodes (Bai zhu), codonopsis (Dan shen), oyster shell (Mu li), poria (Fu ling), and wolfberry (Gou qi zi). It also contains alisma (Ze xie), angelica root (Dang gui), chry-

santhemum (Ju hua), cnidium (Chuan xiong), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), lycium bark (Di gu pi), moutan (Mu dan pi), prunella (Xia ku cao), rehmannia/cooked (Shu di huang), rehmannia/raw (Sheng di huang), tortoise plastron (Bie jia), and white peony (Bai shao) to increase the efficacy of the formula.

For cutaneous, gastrointestinal, or ocular lymphosarcoma, the authors use Lymph "K." The dose is 1 capsule per 10 pounds of body weight TID. Lymph "K" contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), hornet's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), wolfberry (Gou qi zi), and zedoaria (E zhu). It also contains arisaema pulvis (Dan nan xing), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), eupolyphaga (Tu bie cong), forsythia (Lian qiao), fritillaria (Bei mu), house lizard (Bi hu, Tian long, or Shou gong), myrrh (Mo yao), prunella (Xia ku cao), rehmannia (Shu di huang), sargassum (Hai zao), Selaginellae doederleini (Shi shang bai), silkworm (Jiang can), Typhonium gigantum rhizome (Bai fu zi), and white peony (Bai shao) to increase the efficacy of the formula.

For nasal lymphosarcoma, the authors use H112 Nasal tumor. The dose is 1 capsule per 10 pounds of body weight TID. H112 Nasal tumor contains atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), Dioscorea bulbifera bulb (Huang yao zi), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), and poria (Fu ling). In addition to the herbs listed above, H112 Nasal tumor includes buttercup herb (Mao zao cao), citrus (Chen pi), codonopsis (Dang shen), fritillary bulb (Bei mu), globe thistle (Lou lu), peach kernel (Tao ren), and prunella (Xia ku cao). These herbs increase the efficacy of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO BID every 3 days.

MAMMARY ADENOCARCINOMA

General comments

Mammary adenocarcinoma is a common tumor of both dogs and cats; its cause is unknown. Hormonal influence

may be causally involved because the incidence is lower in spayed females (Downing 2003; Hahn 1992; MacEwen 1996; Morrison 1998, 2003). The treatment of choice is wide surgical excision. Metastasis to the lungs should be ruled out in advance. Chemotherapy is more commonly recommended in cats than dogs (Jeglum 1985). The prognosis is often good with surgery; however, recurrences are common, especially in cats (Allen 1989).

Nutrition

Mammary adenocarcinoma (ductal and glandular) should be approached with a combination of surgical excision and nutritional support. Therapeutic nutrition focuses on reducing inflammation, helping to balance gland and hormonal function, and enhancing the immune system.

Mammary cancer frequently metastasizes to the lungs, making such animals poor surgical candidates. If this is the case and surgery is not an option, nutritional and biological therapies are still indicated.

Note: It is recommended that a metabolic blood analysis be performed to confirm or rule out organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Mammary adenocarcinomas represent the Dedifferentiation Phase. They are generally best treated by early detection and broad surgical excision. Early ovariectomy has been linked to reduced incidence of this tumor in dogs and cats. Ovariohysterectomy is commonly recommended by clinicians to reduce the number of cases encountered. Radiation may be needed; if so, see the oncology section of Chapter 34. In cases where complete excision is not possible, where metastasis has occurred, or when caregivers do not desire surgery or more invasive therapies, then homotoxicology can be used to improve quality of life.

Authors' suggested protocols

Nutritional/gland therapy

Lymphatic and female support formulas: One-half tablet for each 25 pounds of body weight BID.

Bronchus/lung support formula: One-half tablet for each 25 pounds of body weight SID.

Coenzyme Q10: 25 mgs for each 25 pounds of body weight SID.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

H86 Mammosol: 1 capsule per 10 pounds of body weight TID. This formula may be used alone if the tumor is

nonresectable, but it is more effective if the tumor has been debulked. Mammosol contains astragalus (Huang qi), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), crataegus (Shan zha), cremastra (Shan ci gu), kelp (Kun bu), mastic (Ru xiang), milettia (Ji xue teng), oldenlandia (Bai hua she cao), oyster shell (Mu li), scorpion (Quan xie), wolfberry (Gou qi zi), and zedoaria (E zhu). In addition to the herbs mentioned above, H86 Mammosol contains angelica root (Dang gui), buffalo horn shavings (Shui niu jiao), citron fruit (Xiang yuan), epimedium (Yin yang huo), fleece flower root (He shou wu), leaven (Shen qu), malt (Mai ya), myrrh (Mo yao), notoginseng (San qi), prunella (Xia ku cao), pseudotellaria root (Tai zi shen), sargassum (Hai zao), and viola (Zi hua di ding). These herbs help improve the actions of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Horneel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

See additional data in the oncology section of Chapter 34.

Galium-Heel, Lymphomyosot, Ginseng compositum, Horneel: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

MAST CELL TUMOR

General comments

Mast cell tumor is a malignancy that can occur in multiple locations in the body; the common sites are the skin, spleen, and gastrointestinal tract (Elmslie 2003, Molander-McCray 1998). The treatment of choice is wide surgical excision, chemotherapy, radiation therapy, and prednisone (McCaw 1984). The prognosis is always guarded with grade III tumors. Grade I and II tumors often respond well to the above therapies (Elmslie 2003, Fox 1998, Patnaik 1984).

Nutrition

Grade I and II mast cell tumors respond well to integrative therapies and surgical excision. Grade III tumors require a much more intensive integrative program. Because mast cell tumors are made up of one of the body's normal cellular components, nutritional therapies focus on the immune system and reducing inflammation.

Note: Mast cell tumors, and particularly grade III tumors, can be locally aggressive and can spread both

locally around the primary site as well as to other organs and tissues. Therefore, it is recommended that a metabolic blood analysis be performed to confirm or rule out organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Mast cell tumors represent the Dedifferentiation Phase. They are generally best treated by early detection and broad surgical excision. Radiation may be needed; if so, see the section on biotherapeutics and remedies in radiotherapy in the oncology section of Chapter 34. Homotoxicology can be used to improve quality of life when complete excision is not possible, where metastasis has occurred, or if caregivers do not desire surgery or more invasive therapies.

A single case is reported to have gone into remission on simple, single injections of Ubichinon compositum (Boynes 1991). Palmquist had a case of canine multiple cutaneous mastocytoma that resolved on combination therapy, and another that responded favorably to combination therapy and repeated cryosurgery. Interestingly, these cases involve brachycephalic breeds (English Bulldog and Pug).

Authors' suggested protocols

Nutritional/gland therapy

Immune and blood/bone marrow support formulas: One-half tablet for each 25 pounds of body weight BID.

Maitake-DMG: 1 ml per 25 pounds of body weight, BID. For animals 15 pounds or less, give one-half ml SID.

Betasitosterol: Betathyme—1 capsule for each 25 pounds of body weight BID.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Lymph "K": 1 capsule per 10 pounds of body weight BID for grade II mast cell tumors and TID for grade III tumors. It can be used after surgical debulking or as a sole therapy; however, it is more effective after surgical excision of the tumor.

Lymph "K" contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), hornet's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), wolfberry (Gou qi zi), and zedoaria (E zhu). In addition to the herbs mentioned above, Lymph "K" contains arisaema pulvis

(Dan nan xing), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), eupolyphaga (Tu bie cong), forsythia (Lian qiao), fritillaria (Bei mu), house lizard (Bi hu, Tian long, or Shou gong), myrrh (Mo yao), prunella (Xia ku cao), rehmannia (Shu di huang), sargassum (Hai zao), Selaginellae doederleini (Shi shang bai), silkworm (Jiang can), Typhonium gigantium rhizome (Bai fu zi), and white peony (Bai shao). These additional herbs increase the efficacy of the formula.

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Also see Chapter 34 for more advanced treatment ideas.

Psorinoheel, Apis compositum, BHI-Allergy, Cutis compositum: Orally BID.

Traumeel: Indicated at intervals.

Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: Orally 3 to 7 times weekly.

MELANOMA

General comments

Malignant melanomas commonly occur in the mouth, skin, and digits and have no reported cause. Oral melanomas are common to both dogs and cats, are locally invasive to the bone and surrounding lymph nodes, and can cause considerable pain (Hahn 2003). Melanomas of the skin and digit are also locally invasive and can spread to local and regional lymph nodes (Graham 2003, Miller 1993). Surgery is recommended, with wide margins on the skin or amputation of the affected digit. In oral tumors, removal of one side of the mandible or maxilla is advised. In addition, radiation and chemotherapy are often recommended, especially if the surgical excision is incomplete (Bateman 1994). The prognosis for skin and digit melanoma is good with surgery and can be 1 to 2 years. The prognosis is usually poor with cats, especially with the oral form (Bostick 1979, Thomas 1998).

Nutrition

Melanoma is an aggressive and invasive tumor that can cause considerable pain and inflammation, especially in the mouth. Nutritional therapy focuses on reducing inflammation and pain, providing general nourishment, and enhancing immune function.

Note: Because they are aggressive and can spread via the lymph system, melanomas can cause tissue and organ damage. It is recommended that a metabolic blood analysis be performed to confirm or rule out additional organ involvement and damage and add specific and appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Malignant melanomas represent the Dedifferentiation Phase. These tumors spread rapidly when located in the oral or other mucocutaneous areas. Cutaneous melanomas may be less aggressive. Early and aggressive surgery is advised. See the additional data for this disease in the oncology section of Chapter 34.

Authors' suggested protocols

Nutritional/gland therapy

Immune support formula: One-half tablet for each 25 pounds of body weight BID.

Maitake-DMG: 1 ml per 25 pounds of body weight BID. For animals 15 pounds or less, one-half ml BID.

Betathyme: 1 capsule for each 25 pounds of body weight BID.

Evening primrose, hemp, and flax oils: 1 teaspoon per 25 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Lymph “K”: 1 capsule per 10 pounds of body weight TID. This is more effective after surgical debulking of the tumor.

Lymph “K” contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), hornet’s nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), wolfberry (Gou qi zi), and zedoaria (E zhu). In addition to the herbs mentioned above, Lymph “K” contains Arisaema pulvis (Dan nan xing), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), eupolyphaga (Tu bie cong), forsythia (Lian qiao), fritillaria (Bei mu), house lizard (Bi hu, Tian long, or Shou gong), myrrh (Mo yao), prunella (Xia ku cao), rehmannia (Shu di huang), sargassum (Hai zao), Selaginellae doederleini (Shi shang bai), silkworm (Jiang can), Typhonium gigantium rhizome (Bai fu zi), and white peony (Bai shao). These additional herbs increase the efficacy of the formula.

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Also see Chapter 34 for more advanced treatment ideas.

Cutis compositum: Alternated every week with Glyoxal compositum.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO BID every 3 days.

MENINGIOMA**General comments**

The cause of meningioma is unknown. It generally causes slow-growing tumors in both dogs and cats. They are space-occupying masses that cause local inflammation and compression of surrounding healthy brain tissue (Braund 1986, Joseph 2003). Therefore, the clinical picture is often related to the compression; it includes seizures, circling, neurological deficits, and personality changes (Morrison 1998). Depending on the location, surgical removal is recommended along with radiation therapy. Medical management of the inflammation with corticosteroids and the seizures with anticonvulsants is beneficial. Chemotherapy is generally not recommended. The prognosis with surgery can be 1 to 2 years (Joseph 2003, Morrison 1998).

Nutrition

Meningiomas generally cause clinical signs of personality changes or neurological deficits; and therefore, surgery, if

it can be done, often offers an improved prognosis. Nutritional therapy focuses upon reducing inflammation and swelling, improving mental function, and providing basic support for the immune system. Nutritional therapies also can offset the side effects of corticosteroids if they are used to control symptoms. Nutritional support also may be added to help reduce and control seizures.

Note: Meningiomas can affect multiple organ systems. It is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This allows for a more specific gland and nutritional support protocol (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for more information).

Homotoxicology

Meningioma is a Dedifferentiation Phase disorder. No specific references to successful management of this tumor exist in the veterinary literature. Because this condition is right of the biological division, therapy is generally palliative. In this disorder, homotoxins accumulate and damage the cellular regulation processes sufficiently that neoplastic alterations manifest (Reckeweg 2000). Therapy is directed at removing cancer cells, reconditioning cellular organelles (especially energy production systems), draining toxic materials away from the diseased area, improving the microenvironment of the matrix, and improving detoxification and repair capabilities. Detoxification should not be done while a patient is receiving chemotherapy because this can reduce chemotherapy agent blood levels, and thus reduce killing of the targeted cancer cells (Smit 2004). Caution should be exercised when considering administration of agents that could cause progressive vicariation. Overvaccination of these patients is not advised because it can cause the immune system to be overwhelmed, resulting in a sudden worsening of the patient's condition.

Authors' suggested protocols**Nutritional/gland therapy**

Brain/nerve and immune support formulas: $\frac{1}{2}$ tablet for each 25 pounds of body weight BID.

Coenzyme Q10: 25 mgs for each 15 pounds of body weight SID.

Phosphatidyl serine: 20 mgs for each 15 pounds of body weight SID.

Phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

H5 Brain tumor: 1 capsule per 10 pounds of body weight TID. Occasionally, a patient may also need a low dose of

steroid to control the signs. H5 Brain tumor contains astragalus (Huang qi), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), earthworm (Di long), kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), polyporus (Zhu ling), poria (Fu ling), scorpion (Quan xie), and zedoaria (E zhu). It also contains angelica root (Dang gui), arisaema (Dan nan xing), Chinese sage (Shi jian chuan), chrysanthemum (Ju hua), eupolyphaga (Tu bie chong), gastrodia (Tian ma), grass-leave sweet-flag root (Shi chang pu), peach kernel (Tao ren), polygala root (Yuan zhi), prunella (Xia ku cao), safflower (Hong hua), sargassum (Hai zao), silkworm (Jiang can), and uncaria (Gou teng). These additional herbs increase the efficacy of the formula.

Homotoxicology

In cases of brain swelling and brain tumors, begin with Apis homaccord, Galium-Heel, Lymphomyosot, Thalamus compositum, Cerebrum compositum, Viscum compositum, Ginseng compositum, and Molybdenum compositum.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

See the additional data for this disease in Chapter 34.

Galium-Heel, Lymphomyosot: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Testis compositum, Ubichinon compositum: PO BID every 3 days. Remove the Testis compositum from the formula if strong detoxification reactions occur.

NASAL TUMORS

General comments

The most common tumors of the nasal and paranasal sinuses are fibrosarcoma, squamous cell carcinoma, chondrosarcoma, and adenocarcinoma. Nasal tumors are common in dogs and cats (Cox 1991). In most instances these are slowly progressive and sometimes locally invasive, and they usually begin unilaterally and spread to both cavities. The cause for nasal tumors is unknown; however, there is a belief that exposure to environmental pollutants may incite tumor growth (Hahn 2003, Patnaik 1989). Surgical removal of the tumor alone often results in recurrences. The addition of radiation or chemotherapy can improve the prognosis (Adams 1987, Frazier 1995, Hahn 2003, Theon 1994). The prognosis is guarded, and if left untreated usually results in survival times of 3 to 5 months. With surgery, radiation, and/or chemotherapy, the prognosis improves to 1 to 2 years (Evans 1989, Hahn 2003).

Nutrition

These tumors are confined to the sinus and are often painful and/or infected. The authors recommend surgical debulking of the tumor in combination with nutritional and biological therapies, resulting in a better prognosis. In addition, the use of controlled cryosurgery after the

tumor has been debulked and before surgical closure appears to further improve the prognosis (DeAngelis, Goldstein 2006, Goldstein 1974).

Note: A metabolic blood analysis is recommended because nasal tumors have an inherent ability to cause discomfort, loss of appetite, and general health decline. This nutritional evaluation can confirm or rule out organ involvement and serve as the basis for adding specific and appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Nasal tumors represent the Dedifferentiation Phase. Adenocarcinomas are most common, but other forms exist. Most conventional and alternative therapy is considered palliative. Palmquist has treated several of these cases with integrative programs of homotoxicology and nutritional therapy and has seen longer survival times than expected. High-dose intravenous vitamin C can cause apparent sudden tumor shrinkage and resulting epistaxis. Tumor growth seemed to slow following regular use of this treatment. While such cases are generally best treated following early detection, the nature of this disease means that many cases are very advanced before they are properly diagnosed. Surgical removal is not successful in most circumstances. Radiation may be very useful; if it is used, see the oncology section in Chapter 34. Homotoxicology can be used to improve the quality of life when complete excision is not possible, metastasis has occurred, or if the caregivers do not desire surgery or more invasive therapies. See the additional data in the adenocarcinoma protocol in the advanced homotoxicology chapter.

Authors' suggested protocols

Nutritional/gland therapy

Immune and bronchus/lung support formulas: 1 tablet for each 25 pounds of body weight BID.

Probiotic MPF: One-half capsule per 25 pounds of body weight with food.

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Bee propolis: 1 capsule for each 25 pounds of body weight, divided.

Chinese herbal medicine/acupuncture

H112 Nasal tumor: 1 capsule per 10 pounds of body weight TID. H112 Nasal tumor contains atracylodes (Bai zhu), barbat skullcap (Ban zhi lian), Dioscorea bulbifera bulb (Huang yao zi), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), and poria (Fu ling). It also includes buttercup herb (Mao zao cao), citrus (Chen pi), codonopsis (Dang shen), fritillary bulb (Bei mu), globe

thistle (Lou lu), peach kernel (Tao ren), and prunella (Xia ku cao) to increase the efficacy of the formula. This formula is more effective after surgical debulking of the tumor.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, BHI-Sinus, BHI-Infection, Echinacea compositum forte: PO BID.

BHI-Bleeding: PRN.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, BHI-Sinus, BHI-Infection, Echinacea compositum forte: PO BID.

BHI-Bleeding: PRN.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

NERVE SHEATH TUMOR (SCHWANNOMA/NEUROFIBROSARCOMAS)

General comments

Nerve sheath tumors arise from Schwann cells. They grow slowly and can cause inflammation, neuropathy, neurological deficits, and muscle wasting, particularly of the limbs. These tumors can occur in dogs but less commonly in cats; the cause is not known. Therapy is most often surgical excision. In some cases amputation or laminectomy is required based upon the location of the tumor. Chemotherapy is generally not effective. Anti-inflammatories and corticosteroids can help to reduce

inflammation. Prognosis is about 8 months to 1 year because recurrences are common and pain and neurological deficits can be serious (Morrison 1998, Rhodes 2003).

Nutrition

Pain and discomfort are often the primary concern with nerve sheath tumors. Combined with motor nerve deficits, often the clinical picture outweighs the fact that this is a malignancy. Surgery to relieve pain and inflammation is recommended when possible. Nutritional and biological therapies focus on reducing pain and inflammation, minimizing the potential side effects of pain medication and corticosteroids, and enhancing immune function.

Note: Nerve sheath tumors can be painful and involve multiple organs of the immune system. It is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This allows for a more specific gland and nutritional support protocol to be developed (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Nerve sheath tumors are frustrating entities. Homotoxicology does not cure them. Therapy is aimed at the patient's Dedifferentiation Phase condition. Early aggressive surgery and radiation therapy are useful in managing this condition. No reports of cure of from biological therapy can be located in the literature.

Authors' suggested protocols

Nutritional/gland therapy

Brain/nerve and immune support formulas: One-half tablet for each 25 pounds of body weight BID.

Phosphatidyl serine: 20 mgs for each 10 pounds of body weight SID.

Phosphatidyl choline: One-fourth teaspoon for each 25 pounds of body weight BID.

Betathyme: 1 capsule for each 25 pounds of body weight BID.

Essential fatty acids (hemp or flax oil): 1 teaspoon for every 25 pounds of body weight with food.

Chinese herbal medicine/acupuncture

H85 Sarcoma: 1 capsule per 10 pounds of body weight TID. H85 Sarcoma contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), bupleurum (Chai hu), burreed tuber (San leng), centipede (Wu gong), kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition to the herbs mentioned above, it

contains buttercup roots (Mao zao cao), citrus (Chen pi), codonopsis (Dang shen), fritillary bulb (Zhe bei mu), prunella (Xia ku cao), sargassum (Hai zao), uncaria (Gou teng), and white peony (Bai shao) to increase efficacy. It is more effective after surgical debulking. It may be used as the sole therapy or as an adjunctive treatment after surgical removal of the mass.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Zeel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Zeel: PO BID.

Neuralgo-rheum, Neuroheel, and/or Spigelia, Discus compositum, Mezereum homaccord: BID to TID as indicated.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum, Discus compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

ORAL TUMORS

General comments

Oral tumors are common in both dogs and cats. The more common oral tumors are osteosarcoma, melanoma, squamous cell carcinoma, and fibrosarcoma (see these specific tumor types for more detailed protocol information). In this section we present a general protocol for oral tumors. Please review other sections for more specific protocols based upon biopsy results and the tumor type.

Nutrition

Oral tumors, depending upon the type, are usually invasive and painful, and they become infected and often negatively affect the appetite. Surgical debulking or removal or cryosurgical ablation is always indicated along with nutritional and biological therapies (Goldstein 1974).

Note: Because oral tumors are often painful, can affect appetite, can spread to local lymph nodes, and affect multiple organ systems, a metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This can help clinicians to formulate therapeutic nutritional protocols that address not only the cancer but also associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

See the remarks for specific malignant tumor types such as melanoma, squamous cell carcinoma, osteosarcoma, and fibrosarcoma. These Dedifferentiation Phase disorders represent end-stage homotoxicoses and can progress very rapidly. In the case of fibrosarcoma, Palmquist and Goldstein have used early cryosurgery in conjunction with biological therapy to control tumors of moderate aggressive character. In one unpublished instance, an aged feline

has survived more than 4 years with repeated cryosurgery. More benign oral tumors such as epulis can be addressed surgically and with radiation. Good dental hygiene is an important part of prevention and therapy in these cases, because unattended poor oral health leads to massive invasion of the body by homotoxins, which can lead to weakening of the host's greater defenses.

Authors' suggested protocols

Nutritional/gland therapy

Immune support formula: One-half tablet for each 25 pounds of body weight BID.

Maitake-DMG: 1 ml per 25 pounds of body weight twice daily. For animals 15 pounds or less, one-half ml BID.

Betasitosterol: 1 capsule for each 25 pounds of body weight BID.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight SID.

Corydalis PIS (botanical cox2 inhibitor): 1 tablet for each 25 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Tumor "K": 1 capsule per 10 pounds of body weight TID. Tumor "K" contains barbat skullcap (Ban zhi lian), burreed tuber (San leng), coptis (Huang lian), dittany bark (Bai xian pi), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), siler (Fang feng), and zedoaria (E zhu). In addition, Tumor K contains angelica (Bai zhi), angelica root (Dang gui), belamcanda (She gan), citrus (Chen pi), cicada (Chan tui), Dioscorea bulbifera root (Huang yao zi), forsythia (Lian qiao), fritillaria (Bei mu), kochia (Di fu zi), licorice (Gan cao), magnolia (Hou po), prunella (Xia ku cao), and white mustard seed (Bai jie zi) to improve the formula's efficacy.

Homotoxicology

See the protocols for specific tumor types (osteosarcoma, fibrosarcoma, melanoma, squamous cell carcinoma).

OSTEOSARCOMA

General comments

Osteosarcoma is a common bone tumor seen most frequently in dogs and less commonly in cats (Botettp 1987). The underlying cause is unknown; however, chronic inflammation is suspected. Osteosarcoma can affect any limb, and the primary recommended therapy is surgical amputation followed by chemotherapy (Chun 2003, Morrison 1998, Waters 1989). When the client chooses against amputation or when tumors are inoperable, radiation therapy can be helpful in controlling the pain (Chun 2003). Metastasis to the chest is common. The prognosis without any therapy is guarded at about 4 months. With surgery and amputation the prognosis is about 9 months to 1 year. In cats the prognosis is up to 2 years because the tumor is less aggressive (Chun 2003, Waters 1989).

Nutrition

Therapeutic nutrition focuses on reducing pain and inflammation, providing general nourishment, and enhancing immune function.

Note: Osteosarcoma is an aggressive, often painful tumor that spreads to regional lymph nodes and metastasizes to the lungs. A metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This can help clinicians to formulate therapeutic nutritional protocols that address not only the cancer but also associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information). Currently a clinical trial is being conducted to evaluate the benefits (day-to-day quality of life and longevity) of adding nutritional, biological, and herbal support to chemotherapy protocols for osteosarcoma (Goldstein, Post 2006).

Homotoxicology

Osteosarcoma is a commonly encountered Dedifferentiation Phase disorder. Because this condition is to the right of the biological division, therapy is generally palliative. Metastasis has usually occurred by the time the tumor is diagnosed. Amputation does not prolong survival time, but it does increase patient comfort and is commonly discussed for extremity tumors. In osteosarcoma, homotoxins have accumulated and damaged the cellular regulation processes sufficiently that neoplastic alterations manifest (Reckeweg 2000). Therapy is directed at removing cancer cells, reconditioning cellular organelles (especially energy production systems), draining toxic materials away from the diseased area, improving the microenvironment of the matrix, and improving detoxification and repair capabilities. Pain management is important in these patients because they frequently have severe pain. Detoxification should not be done while a patient is receiving chemotherapy because this can reduce chemotherapy agent blood levels, and thus reduce killing of the targeted cancer cells (Smit 2004). Caution should be exercised when considering administration of agents that could cause progressive vicariation. Overvaccination of these patients is not advised because it can cause the immune system to be overwhelmed, resulting in a sudden worsening of their condition.

Authors' suggested protocols

Nutritional/gland therapy

Immune and cartilage/ligament/muscle/skeletal support formulas: One-half tablet for 25 pounds of body weight BID.

Bronchus/lung/sinus support formula: One-half tablet for 25 pounds of body weight SID.

Betathyme: 1 capsule for each 25 pounds of body weight BID (maximum, 2 capsules BID.)

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Evening primrose oil: 1 capsule (500 mgs) per 25 pounds of body weight SID.

Corydalis PIS (botanical cox2 inhibitor): 1 tablet for each 25 pounds of body weight SID.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Uro-G Plus: 1 capsule per 10 pounds of body weight TID, along with appropriate analgesics such as opioids or NSAIDs. In some cases the patient lives longer without amputation of the limb. Pathological fracture may heal with proper support bandages, exercise restriction, and analgesics.

Uro-G-Plus contains apricot seed (Xing ren), asparagus (Tian men dong), astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), centipede (Wu gong), cremastra (Shan ci gu), hornet's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), milettia (Ji xue teng), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), and subprostrata sophora root (Shan dou gen). In addition to the herbs mentioned above, Uro-G Plus also contains angelica root (Dang gui), arisaema/bile (Dan nan xing), Chinese sage (Shi jian chuan), codonopsis (Dang shen), corydalis (Yan hu suo), eupolyphaga (Tu bie cong), glehnia root (Sha shen), houttuynia (Yu xing cao), licorice (Gan cao), lily bulb (Bai he), myrrh (Mo yao), ophiopogon (Mai men dong), panicled swallowwort root (Xu chang qing), prunella (Xia ku cao), pseudodanum (Qian hu), pseudotellaria (Tai zi shen), rehmannia/cooked (Shu di huang) and raw (Sheng di huang), sargassum (Hai zao), scrophularia (Xuan shen), Selaginellae doederleini (Shi shang bai), stemoma (Bai bu), tortoise shell (Bie jia), and trichosanthes (Gua lou). These additional herbs increase the efficacy of the formula.

Homotoxicology

Autosanguis therapy is advised, due to the aggressive and difficult nature of this disease. See the autosanguis section of Chapter 34.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, and Osteoheel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Glyoxal compositum: 1 vial orally every 2 weeks.

Osteoheel: TID PO.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO BID every 3 days.

For pain: There are many alternative handlings for pain in biological therapy. Discus compositum, Zeel, Osteoheel, and Traumeel are commonly used. Catalysts such as Coenzyme compositum, Glyoxal compositum, and Ubichinon compositum can bring relief in some instances. Apis compositum, Aconitum homaccord, Euphorbium compositum, Neuralgo-Rheum-Injeel, and Ferrum homaccord are also useful. Mixing herbal formulas with

mainstay homotoxicology remedies can give surprising results in some patients, and dismally ineffective results in others. The authors feel that narcotics are superior to nonsteroidal anti-inflammatory agents if drugs are needed for pain management.

PANCREATIC ADENOCARCINOMA

General comments

Pancreatic adenocarcinomas arise in the duct or acinar cells and are often aggressive and can metastasize. The cause of these tumors is unknown. Treatment is limited and a subtotal pancreatectomy is the best option. The prognosis is guarded and it is fatal because no therapies are available (Harari 1993; Morrison 1998, 2003).

Nutrition

Pancreatic adenocarcinomas are locally aggressive and can spread. These tumors can cause considerable pain and inflammation. Nutritional therapy focuses on the reducing inflammation and pain, providing general nourishment, and enhancing immune function. Surgery may be beneficial if diagnosed early.

Note: Because they are aggressive and can spread, pancreatic adenocarcinomas can cause tissue and organ damage. It is recommended that a metabolic blood analysis be performed to confirm or rule out additional organ involvement and damage and add specific and appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Pancreatic tumors represent the Dedifferentiation Phase. This aggressive form of neoplasia carries a very poor long-term prognosis with current therapy. Homotoxicology can be used to improve quality of life when complete excision is not possible, metastasis has occurred, or if caregivers do not desire surgery or more invasive therapies. See the oncology section of Chapter 34.

These patients seem easily unbalanced, and a very gentle approach with all orally administered agents is recommended, because they seem very prone to sudden progressive vicariation reactions.

Authors' suggested protocols

Nutritional/gland therapy

Immune and pancreas support formulas: One-half tablet for 25 pounds of body weight BID.

Betathyme: 1 capsule for each 25 pounds of body weight BID.

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Corydalis PIS (botanical cox2 inhibitor): 1 tablet for each 25 pounds of body weight SID.

Chinese herbal medicine/acupuncture

H83 Abdominal tumor: 1 capsule per 10 pounds of body weight TID. H83 Abdominal tumor contains agrimony

(Xian he cao), astragalus (Huang qi), atractylodes (bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), cinnamon bark (Rou gui), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition, it contains achyranthes (Niu xi), amber (Hu po), angelica root (Dang gui), Chinese sage (Shi jian chuan), cnidium (Chuang xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), licorice (Gan cao), myrrh (Mo yao), notoginseng (San qi), peach kernel (Tao ren), pteropus (Wu ling zi), rehmannia (Sheng di huang), and rhubarb (Da huang) to increase efficacy.

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

See Chapter 34 for more advanced treatment ideas.

Ginseng compositum, BHI-Enzyme, Momordica compositum, BHI-Pain-Spasm: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 to 7 days PRN.

If stable, consider Glyoxal compositum and do not repeat until case further stabilizes.

PHEOCHROMOCYTOMA

General comments

Pheochromocytomas arise from the chromaffin cells of the adrenal gland and are malignant in about 50% of the cases. Common side effects are local invasion of adjacent structures such as the vena cava or those secondary to increased production of epinephrine and norepinephrine. Metastasis to other parts of the body can occur. The treatment of choice is surgical removal, and medical therapy is used for side effects such as hypertension and arrhythmias (Gilson 1994). Survival times postoperatively are more than 2 years; however, the prognosis becomes more guarded when there are complicating side effects (Gilson 1994, Maher 1997, Tyler 2003).

Nutrition

If diagnostic testing reveals invasion of the vena cava or there are complicating side effects such as hypertension, then surgery in combination with nutritional and biological therapies can offer an improved prognosis. Nutritional therapy focuses upon reducing inflammation and hyperactivity as well as enhancing the immune system.

Note: With pheochromocytomas that cause secondary effects such as local invasion and hypertension and arrhythmias, a metabolic blood analysis is recommended to identify and help support other organ function such as the heart (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Pheochromocytoma is a Dedifferentiation Phase disorder. No cases in the veterinary literature are known to have been successfully handled, so therapy must be supportive and viewed as experimental. Adrenal constituents of the basic support program of Thyroidea compositum and Tonsilla compositum indicate their use in these cases as part of the usual therapy for most Dedifferentiation Phase cases.

Authors' suggested protocols

Nutritional/gland therapy

Adrenal support formula: One-half tablet for each 25 pounds of body weight BID.

Heart and immune support formulas: One-half tablet for every 25 pounds of body weight SID.

Phosphatidyl serine: 25 mgs for each 25 pounds of body weight BID.

Coenzyme Q10: 25 mgs for each 15 pounds of body weight SID.

Vetri DMG: Liquid—one-half ml per 25 pounds of body weight (maximum, 2 mls); tablets—125 mg—1 tablet for every 40 pounds of body weight (maximum, 3 tablets).

Chinese herbal medicine/acupuncture

H83 Abdominal tumor: 1 capsule per 10 pounds of body weight TID. It is more effective after surgical debulking, but can be used as the sole therapy when surgery is not possible.

H83 Abdominal tumor contains agrimony (Xian he cao), astragalus (Huang qi), atractylodes (bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), cinnamon bark (Rou gui), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition, it contains achyranthes (Niu xi), amber (Hu po), angelica root (Dang gui), Chinese sage (Shi jian chuan), cnidium (Chuang xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), licorice (Gan cao), myrrh (Mo yao), notoginseng (San qi), peach kernel (Tao ren), pteropus (Wu ling zi), rehmannia (Sheng di huang), and rhubarb (Da huang) to increase efficacy.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Ypsiloheel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Ypsiloheel: BID as needed.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO BID every 3 days.

RENAL ADENOCARCINOMA

General comments

Renal adenocarcinomas are common in dogs. They usually affect both kidneys, are highly aggressive, and tend to metastasize. The cause is unknown. When unilateral, the treatment of choice is surgical removal of the affected kidney because chemotherapy use has not been reported to be effective. The prognosis is poor, with survival estimated at 6 to 9 months (Chun 2003, Morrison 1998).

Nutrition

Renal tumors, which are highly aggressive, should be approached with a combination of surgical excision and nutritional and biological support. The therapeutic nutritional focus is on reducing inflammation and enhancing the immune system.

Note: Renal adenocarcinoma often metastasizes to the lungs and other organs, making the animal less of a candidate for surgery. If this is the case and surgery is not an option, nutritional and biological therapies are still

indicated. It is recommended that a metabolic blood analysis be performed to confirm or rule out other organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Renal tumors represent end-stage homotoxicoses in the Dedifferentiation Phase. Therapy is not anticipated to reverse diseases in this phase; however, these patients can be positively influenced by gentle support of metabolism, detoxification, drainage, and organ support. Such tumors are not commonly seen in clinical practice and no papers could be located involving their treatment by homotoxicology.

Authors' suggested protocols

Kidney and immune support formulas: 1 tablet for 25 pounds of body weight BID.

Bronchus/lung formula: 1 tablet for each 25 pounds SID.

Essential fatty acids (hemp or flax oil): 1 teaspoon for every 25 pounds of body weight with food.

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula Kidney tumor: 1 capsule per 10 pounds of body weight TID. This formula can be used with or without surgical removal of the affected kidney.

Formula Kidney tumor contains apricot seed (Xing ren), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), red peony (Chi shao), salvia (Dan shen), scorpion (Quan xie), and zedaria (E zhu). In addition, Kidney tumor also contains angelica root (Dang gui), areca peel (Da fu pi), blue citrus (Qing pi), bulrush (Pu huang), carthamus (Hong hua), cirsium (Da xiao jie), melia (Chuan lian zi), peach kernel (Tao ren), pteropus (Wu ling zhi), rehmannia (Sheng di huang), sargassum (Hai zao), saussurea (Mu xiang), and tortoise shell (Bie jia). These additional herbs increase the efficacy of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Berberis homaccord: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Berberis homaccord: PO BID.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

If normotensive or hypertensive: Consider Rauwolfia compositum twice weekly for its glandular content and ability to control blood pressure, and the Ren suis, which is a kidney supportive suis organ preparation.

SQUAMOUS CELL CARCINOMA (CUTANEOUS)

General comments

Squamous cell carcinoma (SCC) is a common malignancy in cats and dogs. Oral SCC is described under oral tumors,

above. In this section we present general protocols for SCC of the skin, digits, and genital area.

Cutaneous SCC is commonly found on the skin, digit, and ear. It is usually locally invasive but it does not usually metastasize. The reported cause is unknown; however, an inciting cause is believed to be exposure to sunlight. The treatment for an affected digit is amputation (O'Brien 1992). Surgery is also recommended for SCC of the skin and ear pinnae. Vitamin E is recommended for the ear pinnae to slow progression of precancerous lesions. Chemotherapy is recommended when there is metastasis (Graham 2003, Elmslie 2003). The prognosis is generally good unless there is metastasis. Survival times are 1 to 2 years (Graham 2003, Elmslie 2003).

Nutrition

Squamous cell carcinoma should be approached with a combination of surgical excision and nutritional support. Therapeutic nutrition focuses on reducing inflammation and enhancing the immune system.

Note: Squamous cell carcinomas can be locally invasive, spread to regional lymph glands, and affect multiple organ systems. A metabolic and physiological blood evaluation is recommended to assess general glandular and immune health. This can help clinicians to formulate therapeutic nutritional protocols that address not only the cancer but associated organ disease and weaknesses that may be present (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Squamous cell carcinoma represents the Dedifferentiation Phase because malignant transformation occurs following damage to the patient's greater defenses. Ultraviolet exposure from solar radiation is a common predisposing cause, and these tumors are frequently seen in white or light pigmented areas with solar exposure—ear tips, face, and the ventrum of dogs that sleep on their backs in sunlight. An oral form is particularly common and aggressive in cats. The tumor can involve other sites such as nail beds and nasal tissue as well.

As with most tumors, they are generally best treated by early detection and broad surgical excision, with attention to the patient's homotoxin load. Radiation is helpful; if it is used, see the oncology section in Chapter 34. Palmquist has published case reports involving the use of photoacupuncture in these cases and has seen some limited but startlingly good results in a few cases. These cases were all extremely aged cats and had remissions that lasted longer than expected (Palmquist 2000). One was suspicious for squamous cell carcinoma and the other was confirmed by incomplete surgical biopsy. This may represent a new modality for use in these cases. Homotoxicol-

ogy can be used to improve quality of life when complete excision is not possible, metastasis has occurred, or if caregivers do not desire surgery or more invasive therapies. A large amount of data exists in classical homeopathic literature about these tumors. See the additional data in Chapter 34.

Authors' suggested protocols

Nutritional/gland therapy

Skin and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Vitamin E: 50 IU for each 20 pounds of body weight SID.

Chinese herbal medicine/acupuncture

For squamous cell carcinoma of the skin and digital area, the authors use Lymph "K." The dose is 1 capsule per 10 pounds of body weight TID. Lymph "K" contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), coix (Yi yi ren), hornet's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), wolfberry (Gou qi zi) and zedoaria (E zhu). In addition to the herbs mentioned above, Lymph "K" contains arisaema pulvis (Dan nan xing), codonopsis (Dang shen), cornus (Shan zhu yu), dioscorea (Shan yao), eupolyphaga (Tu bie cong), forsythia (Lian qiao), fritillaria (Bei mu), house lizard (Bi hu, Tian long, or Shou gong), myrrh (Mo yao), prunella (Xia ku cao), rehmannia (Shu di huang), sargassum (Hai zao), Selaginella doederleini (Shi shang bai), silkworm (Jiang can), Typhonium gigantum rhizome (Bai fu zi), and white peony (Bai shao). These additional herbs increase efficacy of the formula.

The authors recommend Tumor "K" for oral squamous cell carcinoma. See Oral Tumors, above.

For genital areas the authors use H 83 Abdominal tumor. The dose is 1 capsule per 10 pounds of body weight TID. H83 Abdominal tumor contains agrimony (Xian he cao), astragalus (Huang qi), atractylodes (bai zhu), barbat skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), cinnamon bark (Rou gui), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition it contains achyranthes (Niu xi), amber (Hu po), angelica root (Dang gui), Chinese sage (Shi jian chuan), cnidium (Chuang xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), licorice (Gan cao), myrrh (Mo yao), notoginseng (San qi), peach kernel (Tao ren), pteropus (Wu ling zi), rehmannia (Sheng di huang), and rhubarb (Da huang) to increase efficacy.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Causticum compositum: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Cutis compositum and Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology if no chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum, Causticum compositum: PO BID.

BHI-Body Pure: BID for detoxification of environmental factors.

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Cutis compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

THYMOMA

General comments

Thymoma is a tumor of thymic epithelial origins that is generally locally invasive and can occur in dogs and cats. If possible, surgical excision is the preferred treatment. Radiation therapy may be beneficial, especially if the mass is nonresectable. Corticosteroids may also help shrink the mass. Surgically removed masses offer the best prognosis; nonresectable masses offer a guarded prognosis (Arwater 1994, Morrison 1998, Hamilton 2003).

Nutrition

There are few reported results for thymoma with medical management alone; therefore, chemotherapy or radiation therapy and surgery remains the best option. Nutritional therapy has been used in combination with medicinal Chinese herbal therapy to support and enhance immune function, reduce inflammation and swelling, and improve the process of elimination of toxins via the lymph system. In addition, nutraceuticals protect the cells from medication of radiation therapy and help to improve the day-to-day quality of life and extend remission time.

Note: In thymomas that are not surgical candidates and that are locally invasive to surrounding organs, it is recommended that a metabolic blood analysis be performed to confirm or rule out organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Biologically, this is a frustrating tumor to deal with. Therapy is usually unrewarding in the author's experience. Damage to the foundation of the immune system is too severe to reverse; therefore, therapy is directed at general support of defenses and organs. As with most Dedifferentiation Phase diseases, no established protocols exist and the practitioner should note the patient's response to select appropriate remedies. The foundational therapy is based upon the approach to lymphosarcoma.

Authors' suggested protocols

Nutritional/gland therapy

Immune and lymph support formulas: One-half tablet for each 25 pounds of body weight BID.

Maitake-DMG: 1 ml per 25 pounds of body weight BID. For animals 15 pounds or less, one-half ml BID.

Betastosterol: Betathyme—1 capsule for each 25 pounds of body weight BID.

Selenium: 20 micrograms for each 20 pounds of body weight SID.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Formula Thymoma: 1 capsule per 10 pounds of body weight TID. Thymoma contains astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), bupleurum (Chai hu), burreed tuber (San leng), centipede (Wu gong), cremastra (Shan ci gu), earthworm (Di long), kelp (Kun bu), oldenlandia (Bai hua she cao), oyster shell (Mu li), pinellia (Ban xia), pueraria (Ge gen), red peony (Chi shao), salvia (Dan shen), scorpion (Quan xie), and zedoaria (E zhu). In addition, it contains carthamus (Hong hua), cuttlebone (Hai piao xiao), codonopsis (Dang shen), dioscorea (Shan yao), platycodon root (Jie geng), sargassum (Hai zao), and white peony (Bai shao) to improve the efficacy of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO BID every 3 days.

Glyoxal compositum: Every 2 weeks.

TRANSITIONAL CELL CARCINOMA

General comments

Transitional cell carcinoma is a malignant tumor of the epithelial of the urogenital system, most commonly in the bladder and ureters. One of the possible underlying causes is believed to be adverse reactions to flea control products and cyclophosphamide in dogs. This form of cancer rarely occurs in cats. Surgical excision, when possible, is the treatment of choice. The associated medical therapy is piroxicam and sometimes chemotherapy. The prognosis is guarded. With surgery and piroxicam, the average survival time is 6 to 12 months.

Nutrition

Transitional cell tumors that can be removed surgically respond to integrative therapies. For those that are inoperable (trigone and ureter infiltration), aggressive nutritional and biological therapies are indicated. Because of the potential underlying cause of exposure to pesticides, chemicals, and drugs that increase free radical production and secondary inflammation which propagate the disease,

nutritional and biological therapies should address underlying inflammation as well as immune system enhancement. In addition, botanically based cox2 inhibiting supplements are added at a level that supports additional inflammation reduction (usually in combination with piroxicam) without adding additional chemicals.

Note: Because of the potential for associated kidney involvement, a metabolic blood analysis is recommended to confirm or rule out not only kidney, but also other organ involvement. This helps clinicians to more specifically add appropriate nutritional, gland, and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Transitional cell carcinoma is an aggressive and difficult to treat Dedifferentiation Phase disorder. Because this condition is right of the biological division, therapy is generally palliative. Tumors may be excised if found early, but surgery frequently fails. In this type of cancer, homotoxins have accumulated and damaged the cellular regulation processes sufficiently that neoplastic alterations manifest (Reckeweg 2000). Therapy is directed at removing cancer cells, reconditioning cellular organelles (especially energy production systems), draining toxic materials away from the diseased area, improving the microenvironment of the matrix, and improving detoxification and repair capabilities. Detoxification should not be done while a patient is receiving chemotherapy because this can reduce chemotherapy agent blood levels, and thus reduce killing of the targeted cancer cells (Smit 2004). Caution should be exercised when considering administration of agents that could cause progressive vicariation. Overvaccination of these patients is not advised because it can overwhelm the immune system, resulting in a sudden worsening of their condition.

Authors' suggested protocols

Nutritional/gland therapy

Urinary support formula: 1 tablet for each 25 pounds of body weight BID.

Kidney and immune support formulas: One-half tablet for each 25 pounds of body weight SID.

Zyflamend: One-half dropper for each 25 pounds of body weight BID.

Note: Botanical cox2 inhibitors have been shown to induce apoptosis, as well as having anti-oxidative and anti-inflammatory effects (Bemis 2005).

Chinese herbal medicine/acupuncture

H58 Uro-G Plus: 1 capsule per 10 pounds of body weight TID, with or without surgery. The authors recommend

Uro-G Plus along with appropriate analgesics such as opioids or NSAIDs.

Uro-G Plus contains apricot seed (Xing ren), asparagus (Tian men dong), astragalus (Huang qi), atractylodes (Bai zhu), barbat skullcap (Ban zhi lian), centipede (Wu gong), cremastra (Shan ci gu), hornet's nest (Feng fang), kelp (Kun bu), mastic (Ru xiang), milettia (Ji xue teng), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), salvia (Dan shen), scorpion (Quan xie), and subprostrata sophora root (Shan dou gen). In addition to the herbs mentioned above, it contains angelica root (Dang gui), arisaema bile (Dan nan xing), Chinese sage (Shi jian chuan), codonopsis (Dang shen), corydalis (Yan hu suo), eupolyphaga (Tu bie cong), glehnia root (Sha shen), houttuynia (Yu xing cao), licorice (Gan cao), lily bulb (Bai he), myrrh (Mo yao), ophiopogon (Mai men dong), panicled swallowwort root (Xu chang qing), prunella (Xia ku cao), pseudodanum (Qian hu), pseudotellaria (Tai zi shen), rehmannia/cooked (Shu di huang) and raw (Sheng di huang), sargassum (Hai zao), scrophularia (Xuan shen), Selaginellae doederleini (Shi shang bai), stemoma (Bai bu), tortoise shell (Bie jia), and trichosanthes (Gua lou). These additional herbs increase the efficacy of the formula.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Engystol N, Ginseng compositum, Reneel: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum: 10 drops PO every 3 days.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum, Mucosa compositum: 10 drops PO BID every 3 days.

Reneel: PRN for symptomatic relief.

BHI-Body Pure: BID for detoxification of environmental factors.

Glyoxal compositum: 1 vial orally every 2 weeks.

THYROID CARCINOMA

General comments

Thyroid carcinoma is a malignant growth of the thyroid gland that is locally aggressive and invasive and can metastasize to the lymph nodes and the lungs (Fineman 2003, Waters 1998). The treatment of choice is surgical excision, either alone or in combination with chemotherapy (Fineman 1998, 2003; Jeglum 1983; Klein 1995). Radiotherapy with activated iodine may shrink the tumor, and thyroid hormone replacement therapy may be indicated. The prognosis depends upon the local and metastatic picture. The prognosis is poor when the cancer has spread to the regional lymph nodes and lungs (Fineman 2003, Waters 1998).

Nutrition

Thyroid carcinoma is most often locally aggressive and therefore should be approached with a combination of surgical excision and nutritional support. The therapeutic

nutritional focus is on reducing inflammation, helping to balance gland and hormonal function, and enhancing the immune system.

Note: Thyroid carcinoma can metastasize, making the animal a poor candidate for surgery. If this is the case and surgery is not an option, nutritional and biological therapies are still indicated. It is recommended that a metabolic blood analysis be performed to confirm or rule out organ involvement and to add appropriate gland and organ support when indicated (Cima 2000, Goldstein 2000) (see Chapter 2, Nutritional Blood Testing, for additional information).

Homotoxicology

Thyroid carcinoma is a Dedifferentiation Phase disorder of the thyroid tissue. Because this condition is to the right of the biological division, therapy is generally palliative. Homotoxins have accumulated and damaged the cellular regulation processes sufficiently that neoplastic alterations manifest (Reckeweg 2000). Surgical or radioisotope therapy is commonly recommended. Therapy is directed at removing cancer cells, reconditioning cellular organelles (especially energy production systems), draining toxic materials away from the diseased area, improving the microenvironment of the matrix, and improving detoxification and repair capabilities. Caution should be exercised when considering administration of agents that could cause progressive vicariation. Overvaccination of these patients is not advised because it can cause the immune system to be overwhelmed, resulting in a sudden worsening of their condition.

Authors' suggested protocols

Nutritional/gland therapy

Thyroid and immune support formulas: One-half tablet for each 25 pounds of body weight BID.

Pituitary/hypothalamus/pineal support formula: One-half tablet for each 25 pounds of body weight SID.

Coenzyme Q10: 25 mgs for each 15 pounds of body weight SID.

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Hemp oil: 1 tsp for each 20 pounds of body weight with food.

Quercetin tablets: 50 mgs for each 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

H83 Abdominal tumor: 1 capsule per 10 pounds of body weight TID, with or without surgery, regardless of whether it is metastatic or localized.

H83 Abdominal tumor contains agrimony (Xian he cao), astragalus (Huang qi), atracylodes (bai zhu), barbat

skullcap (Ban zhi lian), burreed tuber (San leng), centipede (Wu gong), cinnamon bark (Rou gui), kelp (Kun bu), mastic (Ru xiang), oldenlandia (Bai hua she cao), oyster shell (Mu li), poria (Fu ling), red peony (Chi shao), scorpion (Quan xie), and zedoaria (E zhu). In addition, it contains achyranthes (Niu xi), amber (Hu po), angelica root (Dang gui), Chinese sage (Shi jian chuan), cnidium (Chuang xiong), codonopsis (Dang shen), corydalis tuber (Yan hu suo), licorice (Gan cao), myrrh (Mo yao), notoginseng (San qi), peach kernel (Tao ren), pteropus (Wu ling zi), rehmannia (Sheng di huang), and rhubarb (Da huang) to increase the formula's efficacy.

Homotoxicology during chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Ginseng compositum: PO BID.

Tonsilla compositum, Pulsatilla compositum, Coenzyme compositum, Ubichinon compositum, Strumeel: 10 drops PO every 3 days.

Thyroidea compositum: Weekly.

Glyoxal compositum: 1 vial orally every 2 weeks.

Homotoxicology after chemotherapy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Tonsilla compositum, Coenzyme compositum, Ubichinon compositum: PO BID every 3 days.

Strumeel: PRN for symptomatic control.

Glyoxal compositum: 1 vial orally every 2 weeks.

Advanced Homotoxicology: Autosanguis Therapy, Oncology, and Cancer Protocols

AUTOSANGUIS THERAPY

Therapy using the patient's own blood, which has received special treatment for the purpose of activating specific and nonspecific immunity, is the basis of autosanguis therapy. The term literally means "auto" (self) and "sanguis" (blood). It represents a powerful tool for healthcare professionals in addressing both acute and chronic diseases.

Medical practitioners have been interested in blood therapy for centuries, and modern medicine continues to recognize the importance of blood elements in normal healing. A related procedure, autohemotherapy, has long been used in human medicine, and has a very good safety record. It involves the use of one's own blood, which is often treated by radiation with ultraviolet light or ozone infusion and then reinfused. It is commonly practiced in human clinics in central Europe (Klemparskaya, et al. 1986).

It has only been in the last few decades that data has emerged to explain the precise mechanisms at work in the simple but powerful tool of autosanguis therapy. Blood therapies have historically been associated with superstitious practices and the occult, and have not been favored by conventional medicine in the United States. However, as physicians and veterinarians begin to understand the actual mechanisms of action of blood therapy, they are becoming more interested in its use in clinical practice (Broadfoot 2005).

Immunology for the homotoxicologist

Although veterinarians graduate from veterinary school with a basic understanding of immune mechanisms and inflammation, the understanding of immunology is advancing so rapidly that many healthcare professionals cannot be expected to stay current in this fascinating arena of scientific enquiry. One need not be an immunologist to do autosanguis therapy, but it is helpful to have a basic understanding of immune events when discussing this with medical professionals or clients.

Immune cellular elements such as macrophages, neutrophils, and monocytes phagocytize foreign material and present it to the lymphatic system for processing. Plasma proteins also coat foreign invaders with plasma proteins, which promote adhesion of the opsonized bacteria and the macrophage (McHeyzer-Williams, Malherbe, McHeyzer-Williams 2006). Inflammatory reactions are regulated by a wide variety of cytokines, such as interleukins (IL-1, IL-2, IL-6, etc.) and tumor necrosis factor (TNF-alpha). These cytokines act as biochemical mediators and provide information and cellular instruction for regulating immune cell function.

Macrophages present larger proteins to the lymphatic system, and, as demonstrated in the homotoxicology chapter, they participate in the immunological bystander reaction (see Figure 34.1).

A specialized type of macrophage called the dendritic cell (DC) has recently provided much exciting information about how the immune system regulates and controls its functions (Kumar, Jack 2006). DCs appear in low frequency in tissues that contact the environment (skin, nasal, pulmonary, and gastrointestinal mucosae). They also circulate in the blood in the immature state. There are two types of dendritic cells:

MDC: Myeloid dendritic cells, which are most similar to monocytes.

PDC: Plasmacytoid dendritic cells, which look like plasma cells but have characteristics similar to myeloid dendritic cells. These are interferon-producing cells (IPC) and they can produce high amounts of interferon-alpha.

MDC probably form from monocytes and, depending on the right biological signal, can transform into either dendritic cells or macrophages. They have a lifespan of only a few days. Activated dendritic cells, with some variation with type and origin, also have a lifespan that is usually only a few days in length. However, immature dendritic cells seem to be able to exist in an inactivated state for much longer.

Once activated, these cells migrate to lymphoid tissues (spleen, lymph node, Peyer's patches, skin, mucosal

Figure 34.1. The immunological bystander reaction and its relationship to low-dose antihomotoxic formulas (A). Macrophages are stimulated by low-potency homeopathic dilutions in the D1 to D14 dilution range. These agents can be presented by administration via several routes including subcutaneous (SC), intravenous (IV), intramuscular (IM), and across respiratory mucosal membranes (aerosol). Upon uptake of these antihomotoxic agents, the macrophages form antigen motifs, which are prerequisites for the response by lymphocytes (Th3). These Th3 lymphocytes find chemotactically phlogogenic lymphocytes (T4, Th1, Th2) with similar antigen motifs and suppress these by releasing cytokines. (Image used courtesy of Prof Heine, all rights reserved 1997).

tissues, and bone marrow), where they interact with T-cells and B-cells to initiate and shape immune responses. In doing so they regulate both the cell-mediated and humoral immune responses. DCs have large cellular processes—dendrites—that extend from the central cell body. These dendrites provide the cell with a high surface-to-volume ratio, which allows for a single cell to contact many other cells at one time.

Lymphocytes literally migrate in and through a complex interdigitating network and receive instruction that leads

them to differentiate appropriately to maintain immune integrity. In the gut, the bulk of this instruction appears to be to convey tolerance to foreign antigens that have gained access to the gut as products of digestion (Xiao, Huang, Link 2006). This process is only marginally understood (the surface antigens that characterize DCs were only identified in 2000), but the discovery of these cells explains many immune functions. It also supports the work by Heine (1997, 1998) that explains the primary mode of operation seen in patients experiencing rapid

recovery following autogenous blood therapy, a procedure that has been actively used in alternative medicine since 1951 (Broadfoot 2005).

Dendritic cells also have a role in cancer (Woo, et al. 2006; Kim, Emi, Tanabe 2006; Shurin, et al. 2006). Cytotoxic T-lymphocyte (CTL) soldiers come in contact with neoplastic cells that have the same surface antigens as the original cancer cell and bind to it. They then release a chemical that destroys the cell membrane of the tumor cell, which deflates and dies, releasing further antigen for immune processing.

The principal function of dendritic cells is to act as the generals of the immune response, instructing the adaptive arms to respond to invading pathogens and directing the most effective type of response. Altered intestinal mucosal permeability, also known as leaky gut syndrome, is a factor of immune function. There are three layers of defense in the GI tract:

- The outermost layer, furthest from the bloodstream, contains about 400 species of bacteria. Some are beneficial; others are dangerous. They compete for dominance, and chemicals produced by the bacteria can make the environment antagonistic for the competing species or enable another species to proliferate.
- The next layer is made up of epithelial cells with Toll receptors on their surface. These receptors pick up chemical signals from the battle zone to help the immune system stay prepared to respond to potential transgressors.
- Behind the epithelial layer, directly protecting the bloodstream, is a compact layer of immune cells (lymphocytes, microphages, monocytes, and dendritic cells), some of which bear Toll receptors themselves.

The primary mechanism for immune activation is signaling through the Toll receptors. The proximity of the compact immune cell layer to the bloodstream implies a potentially global response. Oral antibiotics profoundly influence the enteric population dynamics, and therefore have a comparably profound influence on the signaling system (Kabelitz, Wesch, Oberg 2006). Some of the effects of antibiotics on the immune system are well understood. Many more remain insufficiently investigated. One effect that is fairly well understood is a form of malnutrition resulting from an overstimulated signaling system. Overstimulation of signaling can cause a hypersensitivity of the intestinal tract's immune response.

This hypersensitivity can result in an allergic-type response to certain foods and the nutrients they contain. Generally speaking, the more hyperactive this immune cell layer, the fewer nutrients will be properly absorbed. Suppression of this immune response is critical to avoid malnutrition.

Dendritic cell dysfunction, then, can play a major role in allergy and autoimmune diseases such as systemic lupus erythematosus and others. Allergy is a pathologically overblown reaction to an outside allergen, and autoimmune diseases are erroneous immune reactions to self-antigen (Broadfoot 2005, Howard 2006).

Progressive autosanguis therapy according to Reckeweg

Dr. Hans-Heinrich Reckeweg coined the term “progressive autosanguis therapy” and theorized that using a patient's blood assisted the autocontrol mechanisms of the patient's greater defense mechanisms. Reckeweg felt that because the blood is actually an intercellular matrix (mesenchymal connective tissue), it would contain elements of immune recognition as well as homotoxins involved in the patient's specific disease process. He theorized that healing could be initiated in accordance with basic homeopathic theory and the Arndt-Schultz principle of dilution, through serially diluting and homeopathically potentizing a patient's blood while mixing it with certain antihomotoxic agents. This process of removing some blood from the patient, mixing it with antihomotoxic drugs, potentizing it homeopathically, and then readministering it in a series of injections is the basis of Reckeweg's progressive autosanguis therapy. Researchers later began to theorize how this phenomenon works, and today macrophages and lymphocytes explain and support the theory (Heel 2000).

Homotoxicologists use many procedures when performing autosanguis (Broadfoot, Demers, Palmquist 2004). Each clinician has slight differences in technique, and no controlled studies have evaluated differences in results. From a practical, clinical basis, at this time, all commonly performed procedures seem to give good results. It is probably more important to perform this procedure in chronically weakened patients than to argue over precise procedural theories. Diluting homotoxins, presenting diluted homotoxins to immune elements in conjunction with appropriate antihomotoxic drugs, and allowing for initiation of normal immune functions are the key actions in all of the commonly used techniques. The following procedural technique is commonly used by Broadfoot, including demonstrations. It is relatively simple.

Progressive Autosanguis Therapy According to Reckeweg

- ✓ Exploitation of the immunomodulatory capabilities.
- ✓ Addition of appropriate antihomotoxic preparations at each stage.
- ✓ Used mainly in patients with weakened immune responses.

Progressive autosanguis procedure and protocols

Remedies are selected according to the illness/disease process that is clinically presented, and arranged in accordance with the principles set forth in the *Biotherapeutic Index* and elsewhere. Strict sterility is maintained and new materials are used in each patient. Because of the possibility of bloodborne diseases and zoonoses, operators must strictly follow personal and patient protection advisories. When these advisories are followed, the procedure is exceptionally safe and simple to perform (Webster, et al. 2000).

Antihomotoxic agents are generally administered in this order:

1. Symptom therapy
2. Drainage remedy
3. Organ (suis) remedy
4. Nosodes
5. Enzyme (catalyst) therapy

To prepare for the procedure, arrange the antihomotoxic agents in order, and set up a corresponding number of sterile vials to mix and store the therapies (e.g., the sterile water vials left over from vaccine diluents, which the authors save for this purpose). Number these according to the number of dilutions that will be used. Obtain blood from the patient using a 3-cc syringe, and then depress the plunger to empty the syringe of all but the traces of blood that are left coating the syringe and needle. The first dilution antihomotoxic agent is drawn into this blood-coated syringe, succussed (strike the mixture against the palm of your hand to activate it homeopathically) 10 to 20 times, and then injected into the sterile vial labeled #1.

Using the same syringe, draw up the second remedy, succuss it thoroughly, and inject it into sterile vial #2.

Note: The authors frequently put more than 1 remedy in the vial, to make a total volume of 2.2 ml per vial (i.e., some remedies are 1.1 ml, others are 2.2 ml). This process is repeated with all of the dilutions, using the same syringe for all of the remedies.

When all of the dilutions are mixed, then injection therapy can be given to the patient. Generally 0.5 to 1 ml of each vial is administered by subcutaneous injection. Depending on the size and tolerance of the animal (and owners!), the authors may use the acupuncture points at the lateral crease of the elbows (LI11) for the first 2 dilutions. When injecting acupuncture points, do not give more than 0.1 ml per point, or the volume may overwhelm the acupuncture point and cause discomfort for several days after therapy.

If the injections are met with patient resistance, simply use the subcutaneous tissue over the dorsal and lateral neck, where larger injections will be well tolerated. For

those not trained in acupuncture, Joseph Demers, a well known American veterinary homotoxicologist and clinical instructor, recommends the use of acupuncture belts, which simply means injecting the material in the area near the target organ. Starting with vial #1, draw up the dose and inject it. Repeat this, in order, for the remaining vials. This is all done in one sitting and takes only a few minutes.

The vials that have remaining blood dilutions can be used in 2 ways. In some cases, the authors have drawn up all of the remaining vials and put them into a Heel formula or combination of formulas, which are referred to as a “cocktail”—e.g., a combination of the *Detox Kit Lymphomyosot*, *Nux vomica homaccord*, and *Berberis homaccord* in chronic disease states, or a combination of *Lymphomyosot* and *Galium-Heel* in cancer cases. This cocktail is simply mixed together in a glass dropper bottle of approximately 1 to 2 ounces. When treating animals it is recommended that one choose dropper bottles with plastic droppers to prevent accidental injury from broken glass if the patient bites the dropper. There are also some very nice “drip lip” bottles on the market, similar to the Heel tincture bottles, and of course, the authors recycle the Heel glass bottles as well.

Dosing varies according to the patient’s medical diagnosis, constitutional strength, and biological response. This procedure can be readily modified as needed. The possibilities are endless, and are left to the discretion of the practitioner. Demers prefers to separate the symptom remedies and drainage/detoxification agents into separate oral cocktails. This allows the clinician to adjust the therapy without having to dispense another bottle of antihomotoxic medicines. This is especially useful when patients begin detoxification that is too aggressive and suffer from diarrhea, vomiting, or depression. If separate bottles have been dispensed, then the clinician can simply stop the detoxification remedy for several days and then restart it at a lower dose and frequency.

After the remedies have been added to the tinctures in the oral cocktail, the entire mixture is succussed 10 to 20 times and sent home with the client as an oral support formula. Formulas containing autogenous blood should be refrigerated and discarded if an off-color develops. Because Heel oral formulas are stabilized in 60% alcohol, most of these mixtures are stable for 30 days when refrigerated properly.

The second option, which is used clinically more frequently by Broadfoot, is to have the owners administer the remedies at home, starting with vial #1, giving a decreased dose on a daily basis, until the remedy is finished. Approximately 0.4 ml is administered per day. Specifically, administer 0.4 ml of remedy #1 daily until it is gone, then administer vial #2 at a dose of 0.4 ml a day until gone, etc. This generally takes a few weeks to finish. The remedies may be given by injection or orally, depend-

ing on the expertise of the caregiver. The therapy may be repeated several times, but it is advised that the practitioner give a break between therapies to allow the patient's system a chance to respond. Broadfoot often interposes Glyoxal compositum administration between rounds of therapy, and this appears to improve the patient's energetics in a majority of cases. Clients in these cases often report obvious improvement in vitality.

When treating horses, obtain the drop of blood in a syringe, draw up the first vial as in the above protocol, succuss it, and inject it subcutaneously. Then, using the same syringe, draw up the second remedy, succuss it, and inject. Repeat this down the lineup of remaining antihomotoxic formulas being used. If a send home therapy is desired, then prepare a tincture, or so-called "oral cocktail," for maintenance therapy. The procedure is to simply draw some of the oral tincture into the autosanguis syringe when finished with the injections, empty the contents of the syringe back into the tincture bottle, succuss it, and send it home to be given at the rate of 1 to 2 ml, 2 to 6 times per day, as needed. Broadfoot frequently puts a daily dose into the horse's water bucket.

Palmquist follows a simpler procedure for performing progressive autosanguis therapy. He simply selects the agents desired for injection, arranges them in order of administration, and then draws a blood sample from the patient. The appropriate amount of blood is left in the syringe (see below for discussion of large blood and small blood autosanguis therapy). The entire vial of antihomotoxic agent is drawn into the syringe, succussed, and then HALF the amount is injected into the patient and the other half goes into a bottle for an oral cocktail. This is repeated for each remedy stage in the autosanguis procedure. The oral cocktail is mixed and the resulting combination is succussed and dispensed for oral administration. Palmquist generally places the autosanguis solutions in the detoxification cocktail and dispenses this every 3 days to the patient. In acutely ill, very sick animals, it can be placed in the symptom cocktail and given 2 to 5 times daily.

General therapeutics used in autosanguis therapy

Drainage:

Galium-Heel: Provides cellular drainage and supports greater defenses.

Hepar compositum: Provides liver drainage and supports hepatic tissues.

Lymphomyosot: Provides lymph drainage and immune and endocrine support.

Nux vomica homaccord: Provides hepatic and gastrointestinal drainage.

Solidago compositum: Provides urinary tract drainage and supports urinary tissues.

Strengthening organ function:

Suis organ preparations: Tissue extracts of specific organs.

Compositae preparations: Combinations of animal, mineral, and plant agents.

Catalysts: Agents that support metabolism. *Coenzyme compositum* supports cytoplasmic energy production; *Ubichinon compositum* supports mitochondrial functions; and *Glyoxal compositum* depolymerizes trapped homotoxins.

Immunostimulation/immunomodulation:

Nosodes: Disease-causing agents in dilution (i.e., influenza virus, Staph aureus).

Heteronosodes

Autonosodes: Autologous blood, urine, autovaccines; immunostimulant homeopathic remedies.

Echinacea compositum: Used for bacterial infections.

Euphorbium compositum: Used for viral infections.

Engystol: Stimulates immune responses in viral and allergic cases. It is often combined with *Gripp-Heel* for phagocytic synergism.

The following examples illustrate how homotoxicologists can address commonly encountered pathologies using progressive autosanguis therapy.

Disorders of the immune system: possible remedies

Supportive agents: *Engystol*, *Gripp-Heel*.

Treatment of immune dysfunction: *Galium-Heel*; *Ton-silla compositum*.

Treatment of metabolism—catalyst: *Coenzyme compositum*.

Treatment of the constitution: *Tonico-Injeel Neuro-Injeel* ampules.

Stage 1: Symptom remedies

Cutis compositum: Treats chronic skin problems.

Echinacea compositum: Treats chronic bacterial disease.

Engystol: Treats viral diseases, cancer, and allergies.

Euphorbium compositum: Treats recurrent respiratory disease.

Gripp-Heel: Used for fevers.

Traumeel: Used for inflammation.

Viscum compositum: Treats neoplastic conditions.

Stage 2: Drainage remedies

Galium-Heel: Drains cellular debris.

Hepar compositum and Hepeel: Drain the liver.

Lymphomyosot: Drains the matrix.

Phosphor homaccord: Drains the liver, lungs, and parenchymous organs, and is used in bleeding issues.

Psorinoheel: Drains the cutaneous structures and central nervous system.

Solidago compositum, *Reneel*, and *Berberis homaccord*: Drain the kidneys and urinary tract.

Stage 3: Organ (suis) remedies

Cerebrum compositum: Used for the cerebral cortex, embryo, liver, and placenta.

Cor compositum: Treats the heart and liver.

Discus compositum: Treats the intervertebral disc, cartilage, bone marrow, embryo, and adrenal cortex.

Hepar compositum: Used for the liver, duodenum, thymus, colon, gallbladder, and pancreas.

Mucosa compositum: Used for the mucosa (respiratory, gastrointestinal, gall bladder, urinary, and conjunctival) and pancreas.

Ovarium compositum: Treats the ovary, placenta, uterus, fallopian tube, and pituitary gland.

Placenta compositum: Used for vascular elements, the placenta, vein, artery, embryo, umbilicus, and pituitary gland.

Solidago compositum: Treats kidneys, ureter, and bladder.

Testis compositum: Used for testicle, embryo, and adrenal.

Thalamus compositum: Treats thalamus, pineal gland, and adrenal gland.

Thyroides compositum: Used for thyroid, adrenal, thymus, spleen, bone marrow, liver, and umbilicus.

Tonsilla compositum: Treats tonsil, lymph node, bone marrow, umbilicus, spleen, hypothalamus, liver, and adrenal gland.

Zeel: Used for cartilage, umbilicus, and placenta.

Stage 4: Nosode therapy

Atropinum compositum: Contains Medorrhinum-nosode. Not currently available in the injectable form, but a marvelous remedy nonetheless, which can be used in tablet oral form in combined remedy formulas. The tablet form cannot be injected for autosanguis therapy, however.

Cerebrum compositum: Contains Medorrhinum-nosode.

Cutis compositum: Contains Pyrogenium-nosode.

Echinacea compositum: Contains Influenza-nosode, Streptococcus-nosode, Staphylococcus-nosode.

Galium-Heel: Contains Pyrogenium-nosode.

Mucosa compositum: Contains E. coli bacterium-nosode.

Psorinoheel: Contains Vaccinium-nosode.

Solidago compositum: Contains E. coli-nosode, Coxsackie virus-A9-nosode, Pyrogenium-nosode.

Tartepedreel: Contains Medorrhinum-nosode.

Tonsilla compositum: Contains Pyrogenium-nosode, Psorinum-nosode.

Stage 5: Catalysts

Coenzyme compositum: Works with superficial cytosol metabolism receptors.

Ubichinon compositum: Has mitochondrial elements and helps with energy production.

Glyoxal compositum: Depolymerizes homotoxins, unblocking enzymes and receptors. Helpful in viral conditions and many chronic diseases, but is used less frequently than other catalysts.

Catalysts are also in the following compositae products from Heel: *Cor compositum*, *Cutis compositum*, *Discus compositum*, *Hepar compositum*, *Placenta compositum*, *Tonsilla compositum*, and *Zeel*.

Protocols for specific disease types

Chronic musculoskeletal pain

Stage 1: Traumeel.

Stage 2: Spascupreel plus Lymphomyosot.

Stage 3: Discus compositum or Zeel.

Stage 4: Psorinoheel or Tonsilla Compositum.

Stage 5: Coenzyme compositum plus Ubichinon compositum (Galium-Heel can be used intermittently between cycles).

Chronic skin diseases

Stage 1: Echinacea compositum or Tonsilla compositum.

Stage 2: Lymphomyosot plus Engystol N.

Stage 3: Hepar compositum with or without Solidago compositum.

Stage 4: Cutis compositum or Psorinoheel.

Stage 5: Coenzyme compositum plus Ubichinon compositum (Galium compositum can be used intermittently between cycles).

Chronic vaccinosis—neuro form

Stage 1: Traumeel.

Stage 2: Spigelon plus Gelsemium homaccord.

Stage 3: Cerebrum compositum plus Lymphomyosot.

Stage 4: Thalamus compositum plus Galium-Heel.

Stage 5: Coenzyme compositum plus Ubichinon compositum (Galium compositum can be used intermittently between cycles).

Small blood autosanguis versus large blood autosanguis therapy

Large blood autosanguis may be helpful in acute cases. This is a simple procedure involving drawing a larger blood sample from the patient. Draw up the first antihomotoxic drug into a new syringe of adequate capacity. Inject half the quantity intravenously, where allowed by law, and then draw 1 to 5 ml of blood back into the syringe, mixing it with the remaining antihomotoxic drug. Succuss the mixture 10 to 20 times against the palm of

the hand, and then inject this mixture subcutaneously or intramuscularly if possible in several sites.

Large blood autosanguis may engage a larger number of matrix elements, and it seems to bring about better results in many cases. This procedure can be very helpful in managing allergy patients that are undergoing acute flare-ups of their symptoms. The usual procedure for Reckeweg's progressive autosanguis therapy is a small blood technique, meaning that a small amount of blood is serially diluted and given to the patient in multiple sites, which may include acupuncture points. By administering the remedies intravenously, subcutaneously, and intramuscularly, a maximum surface area of the matrix is stimulated. The remaining amounts from the last dose go into the oral cocktail remedy to be sent home with the client, and this mixture is used to stimulate the mucosa-associated lymphoid tissue (MALT)/gut-associated lymphoid tissue (GALT) system of the gastrointestinal tract's immune system. Recall that macrophages respond better to agents presented in dilution, a fact that according to Immune Bystander Theory may explain why autosanguis serves to activate macrophages that are complacent in the blood of patients with much higher levels of homotoxins (Heine 1998). Agitation occurring in the process of succussion may serve to further this process but this data is not known at this time and is only speculation on the part of the authors.

A compelling observation is that patients receiving autosanguis report similar experiences. First, they often experience a sudden brightening immediately upon injection. This is an instantaneous response similar to Di Chi seen in acupuncture therapy. They next experience cell-mediated phenomena as the local lymph node is recruited and responds over the next 18 to 24 hours. Such responses are compatible with known data about the function of inflammation and other immune processes. Discharges and off-loading of homotoxins often occur within 24 to 48 hours of autosanguis therapy. Such discharge may involve soft stools, mucus discharge, sinus congestion, epiphora, or rhinitis, and occasionally, vomiting. All of these commonly fade rapidly if properly handled and they usually cause little discomfort. Human patients usually report feeling more alive and vital, even in the face of such discharges. If patients experience such effects, especially when they are observed to appear brighter, the symptoms/signs usually fade within 72 hours, and should not be much cause for alarm if all parties have been properly educated prior to undergoing therapy.

Autosanguis therapy provides clinicians with a wonderful, simple tool to assist patients in recovering from illness and feeling better more quickly. As further research is done, this form of therapy will no doubt be seen as quite advanced immunotherapy.

Autosanguis therapy is very rewarding in chronic disease patients, and treating cancer without autosanguis is not nearly as beneficial, based upon patient response rates. The reader is referred to the introductory and advanced homotoxicology chapters for further discussion of autosanguis and its application in treating neoplasia.

ONCOLOGY

Approaching the patient

When approaching a patient with neoplasia, the clinician must clarify the purpose and goals of therapy for that specific patient's disease process. While clients presenting their pets to integrative veterinarians frequently seek a cure, it is inappropriate at this time to promise that in more advanced cases. Instead, the discussion should center on quality of life and support of the systemic organs and immune systems that are under stress from the primary disease and in response to the iatrogenic pressures of cancer treatment.

An integrative approach is often much appreciated by clients as they navigate the confusions of neoplastic disorders. Such patients require a wide variety of modalities to properly assist them in their pursuit of improved health and well being. Simply excising or destroying the primary tumor mass (i.e., laser and cryosurgery) may not lead to cure, but early and aggressive surgery is an important part of therapy in nearly all cases of neoplasia. Counseling, allopathic medications and chemotherapeutics, radiation, and the gamut of natural therapies such as those discussed herein are also used as needed in conjunction with surgery.

Integrative veterinarians must work with the client and possibly other specialists such as internists, surgeons, and oncologists. Every effort is made to coordinate the therapy so that maximum survival and quality of life are obtained within the client's budget. Frank discussions need to occur about the expectancy of results of various types of therapies available.

A proper diagnosis is essential in selecting therapy for Dedifferentiation Phase patients. Tumor type, location, and grade are all critical factors needed to properly program these cases. Consultation and use of specialists can greatly improve outcomes.

According to Reckeweg, the clinician is concerned with: "(1) the location and extent of the tumor; (2) the growth velocity of the tumor; and (3) the metastatic ability of the tumor" (Reckeweg 2000).

All Dedifferentiation Phase patients suffer from damage to cellular and genetic components. Homotoxins may be bound to elements such as receptors and enzymes, and can actually block or activate oncogenes and their expression. Damage to enzymes and receptors can prevent proper cellular aging and apoptosis, as well as hinder repair of DNA. When the matrix is damaged in content and constituency, it cannot properly allow for diffusion

of waste products, oxygen, and nutrients. Cellular damage results when homotoxins accumulate, and vicious cycles ensue favoring the development of neoplastic cell populations. A diseased matrix blocks proper cellular immunity and further favors tumor development. The presence of tumor elements anywhere in the body affects a wide sphere of health, and a tumor's location cannot be viewed to be the sum total of a patient's disease.

Successful management depends utterly on the treatment of the Dedifferentiation Phase as a systemic disease process. Reckeweg and others have emphasized that neoplasia develops as the immune system fails and free radicals do further cellular damage. As tissue acidosis increases, leading to a host of negative cellular events, proteolytic enzyme activity is increased, and tissue regulation fails. All elements must be addressed in a balanced fashion to improve the conditions of patients with this category of pathology; however, this is not always possible (Reckeweg 2000).

Dedifferentiation Phase remedies

As in all forms of biological therapy, the clinician must treat the patient for the correct phase of homotoxicosis for maximum benefit. Phase remedies allow for appropriate repair and drainage to occur so that the patient can move to the left on the Six-Phase Table of Homotoxicology (see Chapter 4, Homotoxicology—The Modern Approach to Homeopathy for further data on the Six-Phase Table). An examination of the ingredients in antihomotoxic agents used as phase remedies in Dedifferentiation Phase cases reveals that many of the factors discussed in prior paragraphs may be addressed with gentle stimulatory therapy of low-dose antihomotoxic drugs. The Dedifferentiation Phase remedies are summarized below:

***Galium-Heel*:** An incredible compositum remedy and useful drainage and cellular support formula for all cellular phase cases. It is also useful in viral issues. Its 18 balanced constituents are indicated for glomerular and renal tubular disorders, mucosal catarrh, gastritis, vomiting, diarrhea, chronic otitis, allergy, polyp formation, eczema, itching, sneezing, exhaustion, nosebleeds, hemorrhage, otitis media, swelling and redness, cystitis, joint pain, and urticaria. It is commonly used in geriatric cases and is part of the Deep Detoxification formula (Heel 2005). Among *Galium-Heel*'s constituents are Galium aparine (common to *Cutis compositum*, *Ginseng compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Ubichinon compositum*, *BHI-Gastro-Cleanse*, et al.), which has been used both internally and externally against cancer and glandular swellings and ulcers. It is said to be able to suspend or modify the further development of a carcinoma.

Its use in cancerous ulcers and nodular tumors of the tongue has been clinically verified, and it has a powerful effect in favor of regressive vicariation. When suppression into cellular phases and in Degeneration and incipient neoplasm phases has occurred, it can reverse them in a biologically correct way. Galium-Heel has proven itself to be extremely important in geriatrics, and in precancerous states, where it regulates numerous basic autonomic functions.

It also contains Calcium fluoratum (*Abropernol*, *Cutis compositum*, and *Thyroides compositum*, et al.) for swelling and fistulae of bones and glandular swellings that are stony-hard and suggest carcinoma. The main action is on connective structures, such as elastic tissue and the periosteum. It promotes the resorption of indurated exudates and also is used in mammary tumors. Nitricum acidum (*Abropernol*, *Galium-Heel*, *Hormeel*, *Lamioflur*, *Reneel*, et al.) is potentized nitric acid, which is one of the most important polychrests in classical homeopathy. It has a wide therapeutic range, especially in chronic Impregnation Phases that are brought about by deficiencies or retoxifications. It is used for hypertrophy of the prostate, benign and malignant proliferation of tissue (hyperblastosis), and illness associated with excessive loss of weight, such as is seen in cases of tumor cachexia.

Sedum acre (also in *Thyroides compositum*) is used in pre-cancerous states. *Sempervivum tectorum* (also in *Ginseng compositum*, *Thyroides compositum*) is mainly indicated for preneoplastic and Dedifferentiation (formally known as Neoplasm phases) conditions, and it has a particular affinity for nodular hardening in the skin, tongue, and breast, as well as warts. *Thuja* (also in *Cerebrum compositum*, *Cutis compositum*, *Echinacea compositum*, *Psorinoheel*, *Thuja compositum*, and others) is a remedy for the most varied range of retoxic Impregnation Phases, and is indicated in vaccination reactions. The *Thuja* patient gives an impression of being ill, particularly in the emaciation of cancer, with a yellowish or often pale, cachectic complexion. It is also used in skin diseases within the context of Deposition or Inflammation phases, developing out of Impregnation phases, especially warts, condylomata, papilloma, and other excrescences. The constituent *Caltha palustris* is said to have been useful in uterine cancer. *Echinacea angustifolia* (*Aesculus compositum*, *Arnica homaccord*, *Belladonna homaccord*, *Echinacea compositum*, *Tonsilla compositum*, *Traumeel*, et al.) was used as for complications of vaccination or when a malignant degeneration began in the course of acute or subacute illnesses (Reckeweg 2002). Phytotherapy represents a beneficial form of adjuvant therapy for cancer patients. *Echinacea* will be covered in more detail, later in this section. In sarcomas, *Galium-Heel*, orally and parenterally, has sometimes proved effective in slowing the advance of the disease.

Glyoxal compositum: This remedy's main ingredients are Glyoxal and Methylglyoxal, which stimulate the general defenses through uncoupling of homotoxins that have become bound to receptors and enzymes (Heel 2005). Patients with neoplasia who receive this agent may become very sleepy and rest thoroughly for 24 to 48 hours after administration. Discharge of mucus or other signs of regressive vicariation may then follow this deep restfulness. Owners need to be advised of this effect in advance, so that it is understood as desirable healing. The agent should not be repeated until recovery has waned. The process of enzyme damage creates the Impregnation Phase, and in serious cases or in repeated retoxifications it may even result in progressive vicariation to the Degeneration or Neoplasm phases. The body seeks to compensate for damage by means of a regressive vicariation, in which the retoxins (particularly histamine) are conducted away through reaction phases, which, in severe iatrogenic damage—particularly in Degeneration or even Neoplasm phases—may possibly take on the nature of evasive phases, e.g., suppurative fistulae, chronic skin conditions, etc. These evasive phases allow intermediate homotoxins to be eliminated, thus relieving the toxic state that corresponds to the cellular phase.

Glyoxal has a catalytic effect on damaged respiratory enzymes and unblocks toxin-loaded processes, making it useful in cellular phases, especially in Neoplasm phases. Glyoxal and Methylglyoxal, according to W. Frederik Koch, have deep-reaching actions on a wide variety of degenerative diseases. They contain carbonyl groups, which free blocked energy-producing systems of the cells, and they dissolve cancerous tissue that is in the process of formation by depolymerization of homotoxins and carcinotoxins. This can be influenced by quinones and by free carbonyl groups, provided that they are suitably diluted in homeopathic potency. In their nonpotentized form, they are carcinogenic homotoxins (Reckeweg 2002). The Impregnation Phase is to a certain extent broken up by their free carbonyl groups and quinones, which remove hydrogen (Reckeweg 1967).

Methylglyoxal is produced in small quantities during metabolic processes, and it has a carbonyl group and an aldehyde group. It is suited for transfer of hydrogen and catabolism of toxic amino groups from azomethine compounds, and it is indicated in cellular phases, and particularly in Degeneration and Neoplasm phases (Reckeweg 2002). Methylglyoxal has been studied as a potential treatment for cancer since 1958. Doctors in India recently concluded a 10-year study, including clinical trials, which proved that Methylglyoxal kills cancer tumors in human beings. Methylglyoxal inhibits both mitochondrial respiration and glycolysis in malignant cells, which critically reduces their ATP levels and starves them to death. Methylglyoxal was effective against a wide variety of cancers.

The subjects who returned to excellent health included patients in very advanced stages of colon cancer; acute myeloid leukemia; non-Hodkin's lymphoma; and cancers of the ovary, breast, liver, lung, bone, gall bladder, pancreas, and oral cavity. The researchers noted that concern in some quarters about the safety of Methylglyoxal were not borne out from the clinical trials, which showed that when it was administered in combination with protective agents such as ascorbic acid and vitamins, the drug had no major toxic effects (Ray 2001).

Methylglyoxal is a normal metabolite (Ray and Ray 1981, 1987, 1998; Cooper 1984; Murata et al. 1986). It has the potential to act specifically against malignant cells (Szent-Gyorgyi 1979). Recent research has indicated that Methylglyoxal is tumoricidal (Biswas, et al. 1997). It inhibits both glyceraldehyde-3-phosphate dehydrogenase and mitochondrial complex I of specifically malignant cells. Due to the catalytic activities of these 2 enzymes, nearly 85% of the cellular ATP is generated. The inhibitory effect of Methylglyoxal on these enzymes of malignant cells depletes their ATP pool, rendering these cells nonviable. In contrast, Methylglyoxal has no inhibitory effect on these enzymes of normal cells (Biswas, et al. 1997; Ray, Biswas, Ray 1997). These findings also suggest the possibility of alternation of these 2 enzymes in malignant cells.

Methylglyoxal in combination with ascorbic acid is quite effective in arresting tumor growth, and in some cases could completely eliminate the malignant tissues. Previous in vitro research from Ray's laboratory using human tissue had shown that the anticancer effect of methylglyoxal was significantly augmented in the presence of ascorbic acid (Ray et al. 1991). There is a strong similarity between the mitochondria of malignant and cardiac cells, which poses a serious challenge for the development of an effective anti-cancer drug. This is because the drug in question that will effectively kill cancerous cells by its selective ability to attack mitochondria of malignant cells will also have a deleterious effect on cardiac mitochondria and hence on cardiac functions. However, experimental results suggest that in intact cardiac cells the mitochondria's outer coating acts as a protective device that counteracts the inhibitory effect of methylglyoxal.

It was observed that GSH [N-(N-L-gamma-glutamyl-L-cysteinyl)glycine], commonly called Glutathione, also has a protective function. The results presented in Ray's paper show clearly that this post-mitochondrial supernatant of cardiac cells could almost completely protect the cardiac mitochondria from the potential deleterious effect of methylglyoxal (Ray, et al. 1991). Moreover, it appears that creatine present in high amounts in cardiac cells is mainly responsible for this protective effect. Glutathione is a tripeptide formed from the amino acids cysteine,

glycine, and glutamic acid. Reduced levels are always found in cancer patients, as well as those affected by other oxidative stress-induced diseases such as AIDS. GSH also has some protective effect. There may be other unidentified compounds that have some protective ability.

Lymphomyosot: Provides lymph drainage and supports endocrine function (thyroid) and the immune system. May assist with pain by reducing edematous swelling (particularly in combination with antihomotoxic complexes containing Apis, such as *Apis homaccord* and *Traumeel S*). *Scrophularia nodosa*, one of the main components, has specific indications for breast tumors and is a supporting remedy in neoplasm phases, for general weakness and debilitation, hardening of the glands, and rectal inflammation (Reckeweg 2002).

Procainum compositum: This remedy is not available in the United States at this time. It assists with membrane potentials associated with loss of autoregulatory controls, particularly the pituitary, adrenal cortex, and sympathetic nervous system. It is used in precancerous and neoplastic states. It contains *Viscum album*, which is useful in headache, dizziness, and hypertonia. Ginseng and China are included for weakness and disability. *Artemisia abrotanum* addresses emaciation, *Berberis vulgaris* supports joints and urogenital organs and assists in detoxification, and *Procainum hydrochloricum* assists peripheral circulation and neuralgia/pain issues (Reckeweg 2000).

Tonsilla compositum: A major phase remedy that is used in all cancer patients and deeply supports immune constituents, endocrine, and central neural controls. It assists with passage of mucus and clearance of homotoxins through mucosal elements (*Conium maculatum*, *Dulcamara*, *Aesculus hippocastanum*, *Antimonium tartaricum*, *Coccus cacti*, and *Gentiana lutea*). *Sarcocolla acidum* assists in elements of pharyngeal irritation. *Calcarea phosphorica* and *Ferrum phosphoricum* both assist with issues involving the chest. Cellular, matrix, and lymphatic drainage is provided through *Galium aparine* and *Glandula lymphatica suis*. Ascorbic acid in dilution supports enzyme function as a cofactor. Sulfur activates blocked enzymes, *Pulsatilla* assists in regulation rigidity cases, and *Baryta carbonica* assists in glandular swelling. *Tonsilla suis*, *Hepar suis*, *Funiculus umbilicus suis*, *Hypothalamus suis*, *Medulla ossis suis*, *Splen suis*, *Adrenal cortex suis*, and *Embryo suis* all support organs that are critical to immune response (Heel 2005).

Glandula lymphaticas suis is included for lymphadenopathy, exudative diathesis, malignant lymphoma, and agranulocytosis, and as a supporting remedy in lymphosarcoma and reticulosos (in company with *Galium* and *Psorinum*). *Conium* (also in *Cerebrum compositum*, *Cocculus compositum*, *Ginseng compositum*, *Rauwolfia compositum*, *Testis compositum*, *Thyroidea compositum*, *Ubichinon compositum*, *BHI-Prostate*, et al.) addresses

glandular swelling and induration that is stony-hard to the touch, which occurs especially after contusions and bruises, sometimes starting as a lump in the breast. Thus, Conium is also given in cancerous conditions of the breasts and the womb, as well as in hypertrophy of the prostate and stomach pains with vomiting, thirst, and craving for sour things, such as is often found in cancer of the stomach. It is considered to be a constitutional treatment in neoplasm phases, and is used for tissue neoformation in various organs.

Funiculus umbilicalis suis (also in *Cutis compositum*, *Discus compositum*, *Placenta compositum*, *Thyroidea compositum*, and *Zeel*) is a connective tissue remedy indicated in almost all chronic diseases, particularly those with damage to connective tissue, such as collagen diseases, scleroderma, and fibromas. It can be used for conditions that result from radiation damage, e.g., sarcomas and carcinomas. It is also useful in auto-immune and general iatrogenic damage. This remedy should always be given in combination with suitable biotherapeutic remedies and other sarcodes (such as pituitary and adrenal gland, particularly with suitable catalysts and combination remedies).

L(+)-lacticum acidum (*Ginseng compositum*, *Placenta compositum*, *Thyroidea compositum*, *Ubichinon compositum*, *BHI-Rendimax*, et al.) is included for disturbed cell respiration, pre-cancerous conditions, and neoplasm phases. Splen suis (*Cutis compositum* and *Thyroidea compositum*) is used for leukemia, anemia, and agranulocytosis, and in carcinoma for general revitalization. Sulphur (also in *Causticum compositum*, *Cerebrum compositum*, *Coenzyme compositum*, *Cutis compositum*, *Discus compositum*, *Echinacea compositum*, *Engystol N*, *Ginseng compositum*, *Hepar compositum*, *Molybden compositum*, *Mucosa compositum*, *Psorinoheel*, *Pulsatilla compositum*, *Sulfur-Heel*, *Thyroidea compositum*, *Ubichinon compositum*, *Zeel*, *BHI-Enzyme*, *BHI-Gastro-Cleanse*, *BHI-Intestine*, *BHI-Skin*, and many others) achieves its effects by reactivating enzyme-based detoxification. Sulphur is the major remedy in practically all cellular phases. Numerous enzymes become active through sulphide groups, such as Coenzyme A, the cytochromes, and others, and synthetic drugs and heavy metals easily block SH-groups, resulting in subclinical, iatrogenic damage. Thus, Sulphur, which is contained in many compositae-class remedies in a suitable attenuation appropriate to the biological milieu, may reverse damage in many cases. It should always be given intercurrently in high potencies if well-indicated remedies do not act, even in Degeneration or Neoplasm phases (i.e., the further to the right of the Biological Divide, the higher the potency).

Thyroxine has particular importance for the functioning of the interstitial mesenchyme, which is generally accelerated and activated by Thyroxine, Thyroidinum, or

other thyroid hormones. Doses of the hormone are given not in substitutive dosage, but in excitative dosage (higher homeopathic potencies, which are lower dosages in milligrams), and are used to activate the mesenchyme to help purge the terrain of homotoxins (Reckeweg 2002). This remedy also contains Galium aparine and Echinacea (see *Galium homaccord*, above).

Viscum compositum: Functions best when given by injection due to digestion of active ingredients by the gastrointestinal system. Viscum album (mistletoe) is a semi-parasitic botanical, native to Europe and Asia, that is found on almost all deciduous trees. It contains several lectins, which are cytotoxic (mouse ascites tumor; human tumor cells). Several parenteral preparations of mistletoe exist such as Iscador, Plenisol, Helixor, and others. Mistletoe extract in a mother tincture and is available in 10 X, 28 X, and 198 X dilutions. Viscum album is an herb that has been used safely by herbalists, holistic doctors, and veterinarians for more than 80 years. It lowers blood pressure and heart rate (through altered nitrogen oxide levels) and may slow the growth of certain neoplastic elements (Tenorio Lopez, et al. 2006).

This agent has been determined to have immunomodulatory and antiangiogenesis effects, and active research is currently under way to determine its method of action (Huber, et al. 2005, Yance and Sagar 2006). The exact tumor-inhibiting action of the extract of Viscum is controversial. The mechanism of action on tumor cells by mistletoe may be due to enhanced cytokine release (Interleukin-1, Interleukin-6, and Tumor Necrosis Factor-alpha), which affect fibroblastic activity in the matrix, amongst other actions. Its effect may be due to the lectins contained in plant extracts (Hostanska 1993) or carbohydrates (Schink 1997). Mistletoe lectin has been reported to induce apoptosis in different cancer cell lines in vitro and has shown antitumor activity against a variety of tumors in animal models by inhibiting telomerase activity and inducing apoptosis that resulted from dephosphorylation of Akt in the survival signaling pathways. Viscum album triggers molecular changes that inhibit cell growth and induce apoptotic cell death of cancer cells (Choi, et al. 2004).

A recent PubMed search under this agent resulted in more than 400 hits, indicating the quantity of work currently under way (Hajto, et al. 2006). Viscum has been found to reduce ascites accumulation in advanced cancer patients in humans (Bar-Sela, et al. 2006, Harmsma, et al. 2006). Viscum album is also a key ingredient in *Aesculus compositum*, *Ginseng compositum*, *Thalamus compositum*, and *Thyroidea compositum*. The main indications are Impregnation Phases, precancerous states, and neoplastic phases (Reckeweg 2002). The ingredient cyclic AMP (cAMP), which is also in *Thalamus compositum*, stimulates cellular enzyme and regulatory systems (Heel

2005). cAMP has become known as a significant intracellular regulating factor that is produced in the cell membrane as the result of stimuli, which are generated in the surrounding connective tissue and engender cell differentiation. It is antagonistic toward cGMP (cyclic guanosine monophosphate), through which undifferentiated cell growth is promoted, i.e., cancerous growths, which are distinguished by disturbances in respiration and mutation and unlimited growth of undifferentiated cells. cAMP is used principally for stimulative reactivation in enzyme blocks in cellular phases and in iatrogenic damage. It may be tried experimentally in virus diseases and as a supportive treatment in cancer; it can be given in higher potencies in cancer, e.g., 12 X to 20 X dilution (Reckeweg 2002).

Extracts of mistletoe combined with homeopathic treatment also seem to help small cell lung carcinoma (Bradley 1999). Palmquist has used *Viscum compositum* to lower chronically elevated serum calcium levels associated with paraneoplastic syndrome in an aged dog suffering from advanced, metastatic anal gland carcinoma. Giving *Viscum compositum forte* subcutaneously 4 days weekly resulted in a marked decline of serum calcium levels, and an interruption in therapy resulted in a return of hypercalcemic states, which regressed upon resumption of the injection series. This application deserves much deeper investigation, and will be published once survival data is available (Palmquist 2005).

Activation of cell metabolism (catalyst therapy)

Cancer is a disorder of deranged metabolic function. Catalysts improve cellular metabolism by activating enzymes. Several remedies are specifically designed for metabolic support:

Coenzyme compositum: Contains *cis-Aconiticum acidum* (also in *BHI-Enzyme*). As with all catalysts of the citric acid cycle, aconitic acid shows an affinity for internal respiration. It is very effective when combined with Succinicum acidum and Natrum oxalaceticum, and can be used for pain in the bones, in the spine between T3 and T4, in C7, and in the sacrum. It is also indicated in disturbances of the citric acid cycle, Impregnation Phases, precancerous states, and in Dedifferentiation Phases (especially in the early stages) to improve cell respiration. It also contains Baryta oxalsuccinica (*BHI-Enzyme*). This compound has an affinity for mesenchymal structures and it improves the function of the citric acid cycle and redox systems. It has a regenerative effect on cell respiration and is useful in debilitated patients. It works well in combination with the sarcodes (pituitary, testis, oophorinum, and brain) and with Hydrastis, Lachesis, Kali carbonicum, Calcium carbonicum, Agaricus, petroleum, and Thuja. It is recommended for lung cancer with congestion extend-

ing to the head and nasal polyps, prostate and bladder cancer, kidney diseases, and uremia.

The constituent *Beta vulgaris rubra* reactivates cell respiration and can regenerate blocked respiratory enzymes, and is therefore indicated in all cellular phases. This remedy also includes Cerium oxalicum, which is common to *Molybdan compositum* and *BHI-Enzyme*. It should also be tried as an anti-emetic in cancer patients that can no longer keep down any food. Cerium salts promote the use of oxygen in the tissues, and thus may be used as an intercurrent remedy in the treatment of neoplasms and precancerous states, and in Degeneration Phases.

Citricum acidum (common to *BHI-Enzyme*, *BHI-Exhaustion*, *BHI-UriCleanse*) is also included. Citric acid has a close affinity for respiratory disturbances when there are tumors, and is also indicated for cancer pain (Boericke 1927). Citric acid is also helpful in certain complaints arising from vitamin C deficiency. As noted in the section on *Glyoxal compositum*, vitamin C has a protective effect on normal cells. Cysteinum, an SH-group-containing factor of redox potentials (e.g., glutathione), is used in re toxic and iatrogenic damage of all kinds, and used intercurrently in all cellular phases, especially in liver damage, leukemia, pre-cancerous states, and neoplastic phases. Fumaricum acidum (*Causticum compositum*, *Hepar compositum*, *Thyroidea compositum*, *BHI-Enzyme*, et al.) is very similar in indications to the aforementioned citric acid cycle catalysts. Malic acid and fumaric acid should always be injected together to avoid disturbances in the chain of the citric acid cycle. Alpha-Ketoglutaricum acidum (also in *Causticum compositum*, *Hepar compositum*, *Thyroidea compositum*, *BHI-Enzyme*, et al.) has the same indications as other catalysts in this remedy, along with the feeling of utter exhaustion, general glandular hypofunction, after excision of tumors, stomach atony, prostate patients, and post-amputation pain (causalgia). DL-Malicum acidum (*Hepar compositum*, *Thyroidea compositum*, *BHI-Enzyme*, et al.) is used as above, and has a diuretic action.

This is one of the main remedies for general detoxification as well as for oxygenation of glandular and muscular tissues. It also plays a dominant role in neoplastic processes. It is indicated in fevers of unknown origin, serious infectious diseases, chronic respiratory disease, intestinal cancers, and cancer of the bladder, and as a supporting remedy in bronchial cancer. Natrum oxalaceticum (*Causticum compositum*, *Ginseng compositum*, *Hepar compositum*, *Mucosa compositum*, *Thyroidea compositum*, *Ubichinon compositum*, *Zeel*, *BHI-Enzyme*, et al.) is another component. Like all catalysts of the citric acid cycle, oxaloacetic acid—a product of the dehydration of malic acid—has an affinity for the internal respiration of the tissues and is useful in Dedifferentiation Phase homotoxicoses (especially initially) to improve cell respiration.

When used as a supporting remedy with Fumaricum acidum, Natrum oxalaceticum can accelerate patient response considerably; the 6 X should be given in acute cases, and the 12 X should be given in chronic cases. Consider its use in acute and chronic inflammations of the naso-pharynx, lungs and bronchi, duodenal ulcer and other inflammatory illnesses of the stomach and intestinal tract, prostatitis, and neoplasms.

Natrum pyruvicum (*Placenta compositum*, *Solidago compositum*, *BHI-Enzyme*) has certain similarities to the indications for Sulphur because pyruvic acid is situated at a focal point in the citric acid cycle and Sulphur-like symptoms occur when there is an accumulation of pyruvates, e.g., in iatrogenic damage. Natrum pyruvicum can be advantageously combined with *Engystol*, *Sulphur-Heel*, and possibly *Hepar compositum*; with all sarcodes and numerous nosodes, particularly in cellular phases of all kinds; and in pre-cancerous states and neoplasm phases. The homotoxins that require Natrum pyruvicum do not depend so much on disorders of the direct energy extraction and use, as they do in respiratory disorders, but rather they concern an integral part of the energy extraction, which precedes the introduction of the decomposing carbohydrates into the citric acid cycle. Alpha-lipoic acid can be useful in combination with sodium pyruvate. Pyruvic acid stands at the dividing line between respiration and fermentation, and a study of Warburg's oxygen deprivation theories of cancer gives a glimpse into the critical aspect of these processes.

Succinicum acidum (*BHI-Enzyme*, *BHI-Prostate*) is another active factor in the citric acid cycle and in redox systems. It is used from the Impregnation Phase throughout the Neoplasm Phases, particularly early in the pathological process. Succinic acid is related to blood formation and should therefore be used in cases of anemia and leukemia, duodenal ulcers which do not heal, enteritis and colitis with a sensation of weakness in the whole abdomen, and carcinoma of the colon (Reckeweg 2002). Recent work at the University of Glasgow has highlighted the critical importance of succinic acid. This work discovered how mitochondria can sustain and even create a cancerous state. Mitochondria are complex structures that exist in cells to generate energy for growth and activity. It was recently discovered that the excessive build-up of a simple metabolic molecule in mitochondria can trigger a sequence of events that leads to tumor growth. The study looked at one of the known tumor suppressor genes, SDH, which codes for succinate dehydrogenase. When the SDH gene is damaged, succinic acid accumulates in cells. This then causes the levels of a protein called HIF-1 to rise, which is activated in response to low oxygenation because it encourages the growth of blood vessels to help cells get more oxygen. If the SDH gene mutates, the succinic acid blocks the degradation of HIF-1, and blood vessel pro-

duction goes unchecked, thereby feeding the tumor. Mutations in SDH can predispose to cancer of the kidney, adrenal gland, and thyroid gland, as well as stomach and bowel cancer. This study is the first to find a molecular mechanism that links mitochondrial mutations to tumor formation (Thompson, Gottlieb 2005).

Sulphur (common to *Causticum compositum*, *Cerebrum compositum*, *Echinacea compositum*, *Engystol N*, *Ginseng compositum*, *Hepar compositum*, *Molybden compositum*, *Mucosa compositum*, *Psorinoheel*, *Pulsatilla compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Ubichinon compositum*, *Zeel*, *BHI-Gastro-Cleanse*, and many, many others) is also a component. For more data on this component, see *Tonsilla compositum*, above.

Glyoxal compositum: See above.

Pulsatilla compositum: A fairly simple remedy for activation of the host defensive system—particularly the function of detoxicating connective tissues containing Pulsatilla for catarrhs of the mucosa—and general support in regulation rigidity type II, wherein the body seems to be incapable of mounting an adequate or appropriate response. Sulfur is included for chronic diseases (see *Tonsilla compositum*, above) and cortisone acetate is included for damage to the adrenal cortex, pituitary gland, and connective tissue. This combination stimulates the defensive system, especially connective tissue function. It is synergistic with nosodes for the treatment of cancer, as well as for the therapy of cellular phases in general. It can help to reactivate damaged defensive systems, e.g., bone marrow, interior lobe of the pituitary gland, and adrenal, and help with liver damage. It can also be considered in reotoxic/iatrogenic damage from antibiotics, phenylbutazone, etc.

Pulsatilla compositum can be used to try to achieve regressive vicariation or to convert Degenerative Phases into Inflammation Phases. Because inflammation is a biologically advantageous defensive process against toxins, any defensive reactions that are increased by *Pulsatilla compositum* should not be suppressed with antibiotics or chemotherapeutics unless they are critical to the patient's survival. Most feverish conditions that arise in the course of the biological treatment of neoplasia must not be treated with any anti-inflammatory or antipyretic measures. These measures would interfere with the vegetative organization's attempts to bring about the degradation and decomposition of defective cell groups or cellularly fixed Degeneration phases through immune reactions and subsequent connective tissue reactions with inflammation and fever.

Fresh cell therapy with the most damaged organs of the defensive system (thymus, liver, spleen, bone marrow, thalamus, and pineal gland) should also be tried. Antibiotics should be reserved for life-threatening circumstances.

Pulsatilla compositum, for all its simplicity, has a great scope of action and diverse applications from the aspect of activating the defensive function, especially that of the connective tissue (Reckeweg 2000).

***Thyroidea compositum*:** Contains *Glandula thymi suis* (also in *Hepar compositum*) for disorders of growth and development as well as for neoplasm phases. *Glandula thyroidea suis* is indicated in thyroid tumors, neoplastic phases, adiposity, and liver and kidney diseases. *Fucus vesiculosus* is indicated for enlarged lymph glands and benign tumors. In addition, there are many other components that are common to previously mentioned combinations, including *Colchicum*, *Conium*, *L(+)-lacticum acidum* (see *Ubichinon compositum*), *Corpus pineale suis* (see *Thalamus compositum*), *Calcium fluoratum*, *Galium aparine*, *Sempervivum tectorum*, *Sedum acre* (see *Galium-Heel*), *Graphites*, *Funiculus umbilicalis suis*, *Splen suis*, *Sulphur* (see *Tonsilla compositum*), *DL-Malicum acidum*, *Natrum oxalaceticum*, *alpha-Ketoglutaricum acidum*, and *Fumaricum acidum* (see *Coenzyme compositum*).

***Tonsilla compositum*:** See above.

***Ubichinon compositum*:** This combination resembles *Coenzyme compositum*, and shares many remedies. It is considered to be a deeper acting remedy and it has strong indications in Dedifferentiation Phases. Anthrachinon is one of its many useful components. According to W. F. Koch, it regenerates blocked cell respiration by burning away accumulated toxins (amines and others), and is therefore indicated in cellular phases, e.g., Impregnation, Degeneration, and neoplastic disease (Reckeweg 2000). It acts on the regulation of the respiratory chain function. It is particularly indicated in cancer of the prostate and in cancer of the uterus when there is watery, brown discharge with great tiredness and possibly ascites.

The component para-Benzochinonum has a comprehensively regenerative action on cell respiration in many cases (citric acid cycle) because it diminishes the effect of free radicals and mutative damage. It is indicated in all cellular phases, especially leukemia, asthma, organic diseases of the nerves, precancerous states, neoplasias, hepatitis, et al. It is similar to Hydroquinone in its structure and action; however, it is substantially more specific and deeper-acting. para-Benzochinonum has been used for cancer patients with almost hopeless cachexia and totally wrecked metabolism. The most important indications for para-Benzochinonum are cancers of the lower sections of the intestines, papilloma of the bladder, condylomata on the penis—which are often hard and strongly pigmented—and faulty hormone function (pituitary or adrenals). It is essential to cleanse the body of its whole homotoxic state by using nosodes, and especially remedies that stimulate elimination. Otherwise, the homotoxic material which is set in motion by the para-Benzochinonum may give rise to

considerable extension of reaction phases, e.g., to abscess-formation which, under the circumstances, must be seen as a biologically favorable channel of elimination. It is expedient to give it in combination with whichever of the other remedies is also indicated, especially with the corresponding nosodes and sarcodes of the tissues or organs in question. For expediency in parenteral treatment it should always be given singly, with the other remedies being given alongside it.

Colchicum (common to *Aesculus compositum*, *Arnica-Heel*, *Ginseng compositum*, *Thyroidea compositum*, et al.) acts on individual areas of the mucosa (stomach and small intestine), serous membranes (pleura, peritoneum and pericardium), fibrous tissues (ligaments and tendons, especially of the smaller joints), and muscle fibers (especially the intercostal muscles and the diaphragm), where inflammatory processes predominate. *Colchicum* has also proved effective in neoplasm phases, especially when there is lack of appetite. This has been supported by the results of pharmacological trials which have shown that colchicine, the active principle of the meadow saffron, is a typical mitosis poison. It has a blocking effect that prevents cancer cells from further division.

Conium (also in *Cerebrum compositum*, *Ginseng compositum*, *Testis compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *BHI-Prostate*, et al.) is a component; see *Tonsilla compositum*, above. *Galium aparine* (see *Galium-Heel*, above) is another constituent. *Hydrastis canadensis* (also in *Ginseng compositum*, *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, *Ubichinon compositum*, et al.) is used principally in serious disorders of the autonomic nervous system. It is also used in cancer and septic states, gastrointestinal ulceration, liver conditions with jaundice, cystitis, illnesses of the uterus with vaginal discharge, breast lumps, and when there is great weakness. The clinical picture includes cachexia with suspected neoplasm, especially where there is complete failure of the stomach, resulting in emaciation. It is useful in acrid, raw, excoriating discharges when a general deterioration of energy is present, e.g., in cancer and cancerous degeneration and tumors in various organs and parts of the body, including the mammary tissue.

Hydrochinon is included for disturbances in oxygen utilization from Impregnation Phases with a characteristic disturbance in the respiratory chain. It is used alongside alpha-ketoglutaric acid and Benzoquinone to compensate for side effects of allopathic drugs on the respiratory center. It may be useful in progressive dyspnea and cardiac weakness of lung cancer. Hydroquinone obviously has a similar action on the vascular system to that of rutin, and can be used in cases of hemorrhage. In the course of relapses of cancer in the breast or abdomen, and if hemorrhages of short duration which improve the general state of health are observed, then Hydroquinone must be given

at short intervals—approximately every 2 days—to cleanse the toxicity of the body. L(+)-lacticum acidum and sarcos-lactic acid (see *Tonsilla compositum*) are also components of this remedy. The component Myrtillus exerts a catalytic action on cell respiration; thus it is indicated in neoplasm phases and viral diseases, which are, by definition, cellular phase diseases.

Naphthoquinone has carbonyl group functions, and thus, according to Koch, can metabolize toxic amino groups from azomethine compounds. It should be used in all cellular phases, viral diseases, and toxic infections (reaction phases), and particularly in neoplasms. Serious forms of carcinoma in the areas of the intestines and genitalia are the main indications, especially when radiotherapy follows surgical removal of the carcinoma. It is particularly useful in carcinoma of the uterus and the prostate, and it helps with the pain associated with these cancers. It is also recommended for rapidly growing brain tumors that occur with no premonitory signs. Other indications are diseases of the air passages and from severe sinusitis associated with intestinal sluggishness, laryngeal cancer with very hard nodes, lung cancer, and cancer of the oral cavity. Naphthoquinone is indicated in stomach cancer with complete emaciation, degenerative kidney diseases, chronic nephritis with albumen excretion and increasing residual nitrogen, and cancer of the bladder with agonizing pain and suppurating inflammations of the renal pelvis. In severe cases of cancer, lymphatic congestion may also be present. The deficient adrenalin function is suited to the cachectic patient, whose whole vital activity is exclusively directed to the rapidly multiplying cancer cells; thus, Naphthoquinone should be tried. Because it has particular affinities for the tonsils and the appendix, i.e., for the secondary defenses of the lymphatic mechanism, Naphthoquinone should also be used after tonsillectomy or appendectomy, and in adenoma of the pancreas.

Podophyllum (*Leptandra*, *Momordica compositum*, *Podophyllum compositum*, *BHI-Pancreas*, et al.) may be used in a wide range of potencies in the treatment of pancreatic problems. In recent years it has been found to be important in cancer treatment, particularly in the colitis that occurs after radiotherapy. Podophyllum's characteristic conditions can affect the entire gastrointestinal tract, from the mouth (dental caries) to the anus. Podophyllum is a remedy of limited therapeutic range, but of great importance in gastrointestinal and biliary illnesses, particularly in pancreatic conditions and cancer. Because it is very likely that the pancreas plays a part—the exact nature of which is not yet known—in the genesis of neoplasms, Podophyllum may well have relationships to cancer therapy (Reckeweg 2002). For more data on the pancreatic role in cancer, study John Beard's work, and the *Trophoblastic Theory of Cancer*.

General support remedies and viral implications of cancer

Viral infection can predispose patients to secondary local and systemic bacterial and fungal diseases. Progressive vicariation is linked to a direct effect of viruses on the tissues, as well as alterations in cells involved in immune surveillance. A number of viruses have been shown to suppress various functions of polymorphonuclear leukocytes, which are critical for controlling bacterial and viral infections and can predispose toward some cancers, particularly when we interfere with normal body defense mechanisms by suppressing defense symptoms. The alteration in functions of polymorphonuclear leukocytes includes abnormalities of adherence, chemotaxis, phagocytosis, oxidation, secretion, and bactericidal activities (Abramson 1988).

Molecular analysis of viruses associated with cancer has revealed that they function in part by encoding proteins with which they can associate and subvert the function of the host-cell-encoded tumor suppressor proteins, which regulate pathways of growth arrest and apoptosis (Morris 1995). Infections such as gastritis, hepatitis, and colitis are recognized risk factors for human cancer. The progression of conditions from viral infection to bacterial infection to neoplastic processes follows the chart of homotoxicology. A large number of complementary methods have been proposed, such as mistletoe preparations, organotherapeutics (cell cytoplasmic, and thymus therapy), and enzyme therapy (Malafronte 1996). Chronic viral infections have been documented in mice that become carriers for life-harboring viruses in many tissues such as the thymus, kidney, testes, and brain. However, the thymus retains the ability to restore immunocompetence to the host and protect against re-infestation (Jamieson 1991).

The following remedies can help improve the patient's condition by supporting organs, improving immune status, and providing drainage therapy:

BHI-Chelidonium complex: Also known as *Gall Bladder*, this remedy contains Chelidonium majus, Belladonna, and Lycopodium. According to Reckeweg (2002), Lycopodium and Belladonna complement Chelidonium for improving the liver function and reducing spastic and inflammatory symptoms. Cholesterinum (also in Hepar compositum and BHI-Body-pure) have indications for experimental use in liver cancer and hepatomegaly (Reckeweg 2002).

Causticum compositum: An excellent combination for exhaustion and debility. It is particularly indicated in cases that are undergoing radiotherapy, because it is specifically protective in radiation burns. It contains many useful components, including Embryo suis as a regenerative therapy, Arsenicum album (see the above protocols

section), Fumaricum acidum, alpha-Ketoglutaricum acidum, Natrum oxalaceticum (see *Coenzyme compositum*), and Sulphur (see *Tonsilla compositum*).

Chelidonium homaccord: Contains the remedy Chelidonium majus (also in *Hepar compositum*, *Hepeel*, and others). This remedy helps to promote the discharge of toxins, much like the similar remedies. Celandine has a healing action in liver and biliary conditions, and is indicated when the stools are clay-colored or golden yellow, or when the urine is lemon-yellow or dark brown, because of the presence of biliary coloring. Crude extracts, as well as purified compounds of Chelidonium majus, have been reported to exhibit antiviral, anti-inflammatory, antitumor, and antimicrobial properties both in vitro and in vivo. Chelidonium is a homeopathic drug that is routinely used against various liver disorders, including cancer in humans. The homeopathic dilutions exhibited antitumor and antigenotoxic activities and also favorably modulated activities of several marker enzymes. Thus, nanopharmacological doses of Chelidonium may be effectively used in cancer of the liver (Biswas 2002).

Echinacea compositum forte: Stimulates the general defense mechanisms, and is a complementary treatment for system immune surveillance. Phytotherapy represents a beneficial form of adjuvant therapy for cancer patients; evidence proves that Echinacea is effective in this context. Polysaccharide extracts from Echinacea purpurea activate macrophages against tumor cells and microbes (Luettig 1989), with the primary action directed toward the non-specific cellular immune system (Bauer 1996).

Engystol: This remedy, particularly when combined with *Gripp-Heel*, must be used along with conventional methods of treatment such as chemotherapy or immunotherapy, because there are no controlled studies on the exclusive use of these complex homeopathic preparations. Because of the association of lymphoma with viral diseases such as Epstein-Barr in humans and feline leukemia in cats, a complex homeopathic formula with demonstrated anti-infectious activity, such as *Engystol*, can be selected. *Engystol* is a combination preparation containing Vincetoxicum hyrundinaria (swallowwort) and Sulphur, which has other effects that stimulate a mesenchymal purge. It has been the subject of extensive studies, including a few on the efficacy and mode of action in immunoprophylaxis in cancer patients with neoplastic disease. The primary focus of these particular studies was the use of the remedies to reduce complications of infection peri-operatively in cancer patients, and they demonstrated an increase in both cellular defense numbers and phagocytic activity. This is critically important in immunosuppressed individuals, bacterial and viral defense, and oncotic recognition (Siewerska 1999).

Ginseng compositum: Indicated in exhaustion cases and used for general revitalization. Extracts of Panax

ginseng enhance cellular immune function of peripheral blood mononuclear cells from healthy individuals as well as from patients with depressed cellular immunity (Broumand 1997). Kreosotum (also in *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, *Populus compositum SR*, *BHI-Skin*, and others) is a component. Creosote is a carcinogen, and has effects that are similar to those of pure phenol (carbolic acid), with an excoriating effect on the skin and mucosa, followed by deeper destruction of the tissue. Thus, it should engender significant curative action by reversal effect. Excoriating, fetid, and burning discharges are characteristic indications, as are hemorrhages and ulcers.

This remedy is useful in mammary tumors, catarrhs of the lungs, cachexia, and weakness. It is said to complement Arsenicum album, Phosphorus, and Sulphur in malignant illnesses. Can be used in hypertrophy of the prostate gland and carcinoma of the uterus. This remedy also contains Colchicum, Conium, Hydrastis, L(+)-lacticum Acidum (see *Ubichinon compositum*), Galium aparine and Sempervivum tectorum (see *Galium Heel*), Natrum oxalaceticum (see *Coenzyme compositum*), and Sulphur (see *Tonsilla compositum*). ATP is contained for critical mitochondrial support of the energy-consuming systems, along with Nadidum (NAD), a biocatalyst that stimulates end oxidation in the respiratory chain. *Ginseng compositum* is useful when serious endogenous toxin levels are present in degenerative diseases, particularly cancer, which cannot be overcome without medical aid. Ginseng acts by strengthening the anterior lobe of the hypophysis cortex of the suprarenal gland system, and Acidum L(+)-lacticum, particularly in neoplasia, counteracts the pronounced acidosis of the affected tissue by the reversal effect. Sulphur, Psorinum, and Pulsatilla all possess a constitutional action to mobilize and eliminate toxins, while Hydrastis, Conium, Colchicum, Kreosotum, Viscum album, Galium aparine, and Sempervivum tectorum reduce the tendency toward neoplasia.

The enzyme systems, always deranged in the cellular phases, are stimulated by the intermediary catalysts Natrium oxalaceticum, Coenzyme A, adenosine triphosphate, and NAD, particularly when combined with compositae formulas such as the catalysts *Coenzyme compositum* and *Ubichinon compositum* the *suis*-containing remedies such as *Hepar compositum* and *Mucosa compositum*, or specific organ compounds. *Engystol* and *Pulsatilla compositum* are also good adjuncts, along with *Galium-Heel* and *Thalamus compositum* for faulty neural control. *Ginseng compositum* is an auxiliary therapeutic agent in neoplasia, leukemia, lymphogranulomatosis, precancerous states, adrenal exhaustion, and cases of toxic overload. In addition, *Molybdan compositum* should always be administered concurrently, as a trace element donor-regulator (Reckeweg 2000).

Gripp-Heel: This is a useful antiviral formula used traditionally for cold and flu-like symptoms (Rabe, Weiser, Klein 2004). *Gripp-Heel* is mentioned in medical literature as early as 1954. The total effect theoretically corresponds to an acceleration of mesenchymal immune reaction (Till 1986). *Gripp-Heel* combines nicely with *Engystol* N; they appear to work synergistically to enhance immune function. In vitro tests have demonstrated that *Engystol* stimulates the phagocytic activity of human granulocytes up to 33%. This effect was further enhanced to 41% by combining *Engystol* and *Gripp-Heel* (Wagner, et al. 1993).

Patients suffering from Dedifferentiation homotoxicoses often harbor virus particles in their tissues, and as they undergo regressive vicariation, these viruses may emerge and manifest clinical symptoms. Such viruses may be oncogenic or simply just be present in affected tissues. *Gripp-Heel* is useful in management of these symptoms (particularly upper respiratory, sinus, and pulmonary signs with or without fever and myalgia).

Another phenomenon frequently noted in responsive cancer patients is the accumulation of so-called toxic fluids. These congest the matrix as the homotoxins move out of cells and into the intercellular space, where they are diluted and processed. Because these patients often have thickened lymph and reduced lymphatic function, not to mention reduced nutrition and physical activity, such accumulations often cause clinical distress, febrile response, discomfort, pain, and even dyspnea or coughing. Using adequate drainage (*Lymphomyosot*, *Apis compositum* or *homaccord*, and *Galium-Heel*) greatly assists these individuals through their discomfort.

There is some evidence that *Gripp-Heel* may function to reduce pain (most likely not by suppression but by reducing homotoxins associated with the genesis of discomfort). People frequently report reduction in myalgia from influenza in response to *Gripp-Heel*, and the authors have experienced this directly. Placebo effect could be a factor because no larger studies have been conducted; however, one study carried out on 170 German soldiers compared acetylsalicylic acid to a combination preparation, *Gripp-Heel*, and found that the homeopathic preparation was comparable to acetylsalicylic acid with respect to the beneficial changes in the clinical findings and in the length of time the patients were unable to work (Maiwald 1993).

The ingredients of *Gripp-Heel* address a wide number of symptoms commonly associated with influenza in humans. The *Aconitum* fraction acts specifically against cold symptoms (see *Aconitum homaccord*), while *Eupatorium perfoliatum* (see *FluPlus*) assists with symptoms of cough, pain in the extremities and chest, as well as headaches. *Lachesis* (see *Echinacea compositum*) is useful for hot flushes, sore throat, and sepsis; *Bryonia* is useful for pleuritis, dry cough and thirst; and *Phosphorus* (see

Echinacea compositum) is helpful when there is a risk of pneumonia or bronchopneumonia. *Phosphorus* also is supportive of hepatic function, a fact that makes this useful for patients suffering from toxicity related to neoplastic disorders as well as cytotoxic therapy.

Gripp-Heel is most effective if given early in the disease process. Endogenous immunity can no longer be adequately activated once the illness has advanced. In uncomplicated cases the viral infection lasts only a few days, unless secondary infections arise, which may result in persistence, particularly with immunosuppressed patients. These viremia periods can be longer in patients with neoplastic disease, due to their immunosuppressed status, and longer periods of *Gripp-Heel* therapy are often indicated.

Palmquist recently treated a difficult feline lymphosarcoma case which developed long-term upper respiratory signs, and *Gripp-Heel* was needed to control the symptoms. This cat had suffered from extensive upper respiratory viral problems earlier in its life, supporting Hering's Law of Cure (disease signs appear in reverse order of occurrence when natural healing is progressing in a desirable fashion). It is advantageous to handle fevers and other signs that occur in these patients through biological therapy as opposed to suppressive pharmaceuticals. Healing will be found to be deeper and more long lasting. Antiphlogistic and antipyretic medicines repress the symptoms but delay healing, because they interfere with normal biological functions.

Hepar compositum: Contains *Glandula thymi suis* (see *Thyroidea compositum* and other *suis* organs, such as *Hepar*, *Duodenum*, *Colon*, and *Vesica fellea*). Also contains *Pancreas suis*, which is useful in cachectic states. Additional support comes from *Lycopodium*, *Chelidonium*, *Carduus marianus*, and catalysts in the form of *Natrium oxalaceticum*, *Acidum a-ketoglutaricum*, *Acidum DL-malicum*, (see *Coenzyme compositum* and *Ubichinon compositum* in the catalysts section below). These remedies also stimulate the functions of the liver cells and the gall bladder. The action of *Hepar compositum* can be increased by the intermediate administration of *Ubichinon compositum* ampules, *Coenzyme compositum* ampules, and possibly *Thyroidea compositum* (antineoplastic action). In addition, consider the concomitant use of *Podophyllum compositum* as well as *Viscum compositum* (mite, medium, and forte concentrations) (Reckeweg 2000).

Molybden compositum: Serves as a mineral and catalyst donor. It has a broad range of potentized remedies, some of which have specific notations in neoplastic phases. Dietary deficiency of trace metals is becoming a health problem, due to consumption of highly refined and heavily processed foods and soil deficiencies. The higher trace element requirements of chronic disease further

contribute to states of marginal trace metal deficits, which can lead to altered immunologic function. Furthermore, trace metal deficits have been implicated in initiation and progression of a large variety of neoplasias. Studies on the effect of trace metal deficiency and cancer are inconsistent in methodology and quantification of host alterations in response to neoplastic challenge (Beach, et al. 1982).

Molybdaenium compositum helps to moderate these deficits, contributing a number of known and as yet unknown co-factors to metabolic function. The component *Natrum molybdaenicum*-molybdenum is an important trace element and co-factor in enzyme functions. It is found in xanthine oxidase as an active factor, and used for long-term treatment of neoplasms, in which there is almost always a deficit in *molybdenum* level. Nitrate reductase, a flavoprotein enzyme, also contains molybdenum in a complex compound and many bacterial and fungal forms, e.g., *Escherichia coli*, *Clostridium*, *Neurospora*, and *Aspergillus*. It has been suggested that this is valuable in dysbiosis, especially when combined with Sulphur.

Zincum gluconicum (zinc gluconate) is a constituent of cells and tissue fluids; it is important for the normal course of numerous metabolic processes. Zinc has many trace element functions, and after iron, is the trace element present in the largest quantities in the body. Zinc deficiency has many influences upon the process of neoplasias, e.g., in the blood supply of neoplasms there is practically always a zinc deficiency, resulting in faulty enzyme function. The deaminases of the lymphocytes only work in the presence of zinc; therefore, zinc is critical to immune function. Thus, zinc compounds can influence important enzyme functions, e.g., in anemia, liver damage, kidney diseases, degeneration phases, and particularly neoplastic phases. Zincum metallicum showed a 55% increase in the life span of female tumor-bearing Swiss albino mice at the 200 X potency (Thobias 1987).

Magnesium asparaginicum, next to potassium, is the most important intracellular cation and it is critical to the activation of a wide variety of enzyme systems, ossification processes, muscle metabolism, membrane permeability, and erythropoiesis. The component Cerium oxalicum (see *Coenzyme compositum*) is useful in stages of cancer in which undigested food is vomited. The cerium salts promote oxygen utilization in the tissues, and are therefore valuable in neoplastic states. The component Manganum gluconicum has particular influence on the respiration of the epidermal cells. Sulphur (covered extensively elsewhere in this chapter) acts as a reagent in all chronic diseases. Phosphorus is a remedy for affections of the parenchyma, particularly of the liver.

Molybdaenium compositum can regulate the mineral balance and augment body stores when there are deficiencies (including in degenerative diseases and neoplasia). The effect is intensified by the synergism of the individual

constituents according to Burgi's principle, i.e., through the combination effect of the contained minerals when coupled to organic acids (aspartic acid, gluconic acid, fumaric acid, etc.). This favors the transfer into the cells or into the region of the enzymes. The use of catalysts, such as *Coenzyme compositum* and *Ubichinon compositum*, and the *compositae*, which are directed toward similar dysfunctions, intensify the effects of this remedy (Reckeweg 2000).

***Thyroidea compositum*:** See the remedies listed in the Activation of Cell Metabolism section, above.

Approaching the patient's specific case

Dedifferentiation Phase patients are usually treated in stages according to specific goals. Many of these patients are in advanced states of weakness and their excretion and elimination systems are overloaded by homotoxins. If detoxification therapy is begun suddenly in such patients, they may become easily overloaded by the release of homotoxins into the peripheral circulation. Therefore, the first stage of therapy often concerns support of cellular function, particularly the main organs of excretion (bowel, liver, and kidney). Dedifferentiation Phase cases generally suffer from mitochondrial damage, and neoplastic cells function on anaerobic metabolism. Anaerobic metabolism yields far fewer ATP molecules and generates larger quantities of metabolic toxins, which then must be handled by the surrounding cells of the body. Assisting aerobic metabolism through catalyst therapy provides for improved cellular energetics.

The initial holistic and conventional treatment is usually surgery or tumor ablation by direct surgical removal (cold knife, laser surgery, cryosurgery, or irritant herbal substances). Because of the possibility of tumor cells surviving elsewhere in the body, or the induction and development of further tumor by aberrant stem cells affected by neoplastic processes, Dedifferentiation Phase patients may require chemotherapy and/or radiation therapy in addition to surgical ablation of primary tumor. Surgery that is done properly, with wide margins and gentle tissue handling, is critical to success because most tumors are best treated by complete resection at the primary surgical approach.

The next step involves complementary therapy, which supports the immune system, drains the matrix, improves circulation and energetics, and assists with cellular repairs. This step can be quite extensive in scope and varies from case to case depending upon the specific aspects of the particular case. While most cases are treated as part of a larger, more integrative approach to neoplasia, a few have gone into remission in the author's practice (multiple mast cell tumor) with only biological therapy. This aspect of medicine needs investigation to determine the circum-

stances that lead to such improvements, and which are simply spontaneous remissions.

In human medicine, the final stage deals with psychological/spiritual factors. While this is often not addressed in veterinary medicine, it must be remembered that homotoxins can include psychical and emotional elements. The immune system in its entirety cannot be removed from the psychoneuroendocrine influences that surround it. An entire area of specialized study is arising around psychoneuroendocrine-immune (PNEI) physiological and regulation medicine. Psychological aspects of veterinary cases involve both the afflicted pet as well as the mental states of all people in the pet's environment. The collective state of mind of the owner and the environment where the pet is housed can be very influential in the outcome of the case. In many instances this is as simple as emotional states and attitudes determining whether an animal caregiver will continue to seek treatment or simply let the pet go through euthanasia or hospice. Effective clinicians address this on a regular basis, whether they be conventional or CAVM practitioners.

Biological therapy deals with excretion and detoxification, drainage, diet, and improved immune system function. Establishing improved autoregulation of the patient is highly desirable, and the clinician and owner will observe that the patient cycles through Inflammation Phases when improving. In fact, a significant goal of the biological therapist is to re-establish normal physiological oscillations, as discussed in the greater defense section of homotoxicology chapter. The low pH period necessary for collagen removal and matrix liquefaction, and corresponding cleansing, must give way to the higher pH period and its gelification of the matrix, which marks repair and healing. This regular diurnal cycle of action, which has been significantly inactivated or inhibited in chronic disease states, must be respected and re-initiated if healing is to occur.

Pharmaceutical drugs such as corticosteroids fix the patient in the gel state and block regular matrix cleansing. Other drugs block the enzymes needed for the inflammatory pH cycle and thus prevent homotoxin removal, creating regulation rigidity and poorly responding cases. In both circumstances, before a patient can begin to respond to biological therapy, it is necessary to unblock enzymes, re-establish energy production, and allow for the normal oscillations of pH to be regained. Initial efforts by the body to do this may be extreme, and it takes some time and management for these conditions to stabilize.

Generally speaking, the normal control systems of the body do this in a fashion that does not present serious danger to the patient. Mild diarrhea, productive coughing, nausea, vomiting, and mucus discharges are commonly encountered and they signal desirable regressive vicariation. However, sometimes acute medical care is

required to stabilize patients suffering from chronic diseases. During life-threatening emergencies, any and all conventional and alternative agents should be used.

Because of the deeper state of degeneration that is present in many chronic disease cases, it is impossible to stop using allopathic drugs and still preserve patient comfort and even life. Therefore, the biological therapy program is usually begun without changing the existing drug therapy. As improvement occurs these drugs may be minimized or removed under the guidance of an experienced veterinarian. It may be necessary for the biological therapist to coordinate the treatment with an internist/oncologist. This coordination is encouraged so that a cooperative and supportive professional environment be promoted and maintained at all times. Suddenly removing a necessary drug, or one that has led to substantial suppression of the natural defenses, can seriously destabilize a patient and cause undesirable progressive vicariation.

While detoxification and much of the excretion of homotoxins occur as a result of physiologic inflammation reactions, they may lead to damage and pathology if they are carried to excess. Chronic inflammation is strongly associated with certain types of cancer (Dalglish, O'Byrne 2006; Moss, Blaser 2005). One of the best methods for down-regulating chronic, excessive inflammation is to re-establish naturally occurring bioregulation. A properly functioning PNEI system is vital to healing any chronic disease. Heel phase remedies, such as *Tonsilla compositum*, address this area. In addition, an Italian company called GUNA, known for their physiological regulating medicine (PRM), produces complex homeopathic medicines that contain inflammatory mediators such as homeopathically diluted cytokines, hormones, and homeopathic neurotransmitters, which may help to manage patients in any phase, including Dedifferentiation (GUNA 2006a). The authors have just begun to use these agents and can make no major claims or offer any advice at this time. However, GUNA is conducting several excellent university studies and appears to be quite serious in its approach to biological therapy (GUNA 2006b).

To reach the goal of down-regulating chronic inflammation, a number of biological agents can and should be integrated as is appropriate for each case. Biological therapies often supplement each other, but the clinician must be aware of interactions between herbs and drugs. Such interactions are not usually an issue in selecting antihomotoxic agents, but certain homeopathic agents are thought to be inimical to one another, and so it is theoretically possible to decrease the efficacy of a protocol if such agents are given simultaneously or in succession. This topic is controversial, and there is little science to guide the practitioner (Boericke 1927). Surely, future work will bring clarity to this subject, but from practical experience it does not seem to be a major concern for those using

balanced combination homeopathic remedies, and it may be a larger issue in the classical practice of homeopathy.

Approach to cases not on chemotherapy

Providing gentle detoxification and elimination is the first step in cases in which chemotherapy is not used. Support begins with the organs of elimination (liver, kidney, and gastrointestinal). Adequate clean air and water are important, and a clean and toxin-free diet that is easily digested and absorbed is essential. Patients with neoplasia require special attention to the nutritional aspects of their care. It is important to avoid unnecessary chemical additives and preservatives, because these substances can readily cause further damage to an already compromised system. For example, in human medicine the consumption of cured luncheon meats has recently been shown to raise the risk of chronic obstructive pulmonary disease (COPD) by 71%, perhaps from nitric-oxide-mediated damage to the lungs (Daniells 2006). Peters, et al. (1994) studied the relationship between the intake of certain foods and the risk of leukemia in children and found that children who eat more than 12 hot dogs per month have 9 times the normal risk of developing childhood leukemia. Children born to mothers who consumed hot dogs once or more per week during pregnancy have almost double the risk of developing brain tumors. Children who ate hot dogs once or more per week also have a higher risk of brain cancer (Sarasua 1994).

Preservatives can disrupt metabolism, but it has not been adequately determined whether or not this is a significant risk to pets with cancer. Ethoxyquin, a common preservative in pet foods, has been shown to damage human lymphocytes and inhibit the electron transport chain in mitochondria, particularly those in cells of the renal cortex (Reyes 1995, Blaszczyk 2006). Ogilvie (1998) and others have demonstrated clear benefits to survival in certain types of cancer associated with feeding proper levels of dietary protein and fatty acids. For many years holistic veterinarians have routinely encouraged clients to feed patients in the Dedifferentiation Phase higher protein diets, and there appears to be scientific support of this practice. The Hills Company produces a unique prescription diet, N/D, which has been shown to increase the survival times of canine patients with mammary gland neoplasia and lymphosarcoma. Other toxins such as aflatoxins, heavy metals, pesticides, and even drug residues may lie hidden in food and cause progressive vicariation in patients already overwhelmed by homotoxins.

Numerous antihomotoxic drugs are applicable in treating patients in the Dedifferentiation Phase. *Galium-Heel* is indicated as a cellular agent in all cases of neoplasia. This remedy is quite complex and contains many agents that help with cellular repair and matrix drainage. *Sem-pervivum tectorium* (also in *Ginseng compositum* and

Thyroidea compositum) is a classical remedy with a long use in neoplasia cases (Boericke 1927).

The antihomotoxic drug *Lymphomyosot* drains and supports the immune and lymphatic system, allowing for the movement of homotoxins. Exercise and massage can move vast quantities of toxins, but it must be done gently, or signs of illness such as depression can occur as these toxins gain access to the peripheral blood. *Nux vomica homaccord* drains the liver and gastrointestinal system, while *Berberis homaccord* (or *Hepeel* and *Reneel* tablets) drains the liver, gallbladder, and kidney. *Berberis homaccord* also supports weakened adrenal glands and assists with the stress of chronic disease. Use of the aforementioned agents for 30 days or more begins the process of tissue cleansing.

Another approach, according to Leimbach, involves giving *Galium-Heel* (6 times daily for 8 weeks) and then *Lymphomyosot* (QID), *Psorinoheel* (once daily), and *Phosphor homaccord* (TID) (Reckeweg 2000). Mitochondrial dysfunction is associated with defects in neuronal oxidative phosphorylation within the central nervous system. A trigger of impressive potency is phosphorylation, because only one phosphate molecule is needed for every 300 molecules of kinase in a cell, resulting in massive reaction (Pollack 2001). Phosphorylation is constitutionally indicated for phosphorus deficiency and for too rapid growth (*Calcoheel*, *Cruroheel* and *Osteoheel* are auxiliary remedies), precancerous dermatitis, and neoplasm phases.

Hepar compositum supports and drains the liver and gallbladder, while *Solidago compositum* supports and drains the kidney and can be readily given by injection or orally.

BHI-Body Pure has many components in the sphere of environmental toxicities, which often serve as a trigger for neoplastic cell changes. *Coenzyme compositum* and *Ubichinon compositum*, as well as *Glyoxal compositum*, support metabolic energy production and they activate enzyme systems and receptors. Para-Benzochinon-Injeel D30 and cAMP D30 are also useful in this area and are often alternated. Standard therapy involves detoxification for approximately 1 month, at which time the patient's progress is evaluated and other treatment can ensue to improve immune function, repair organ systems, and target tumor cells for removal (Reckeweg 2000). Carefully controlled studies must be conducted to determine which protocols are best in each case, but to date none have been performed.

Thalamus compositum is an interesting therapeutic adjunct in neoplasias. To some degree it maintains central regulatory control because it controls arousal and excitatory states. A brief search of the Internet reveals many scientific articles concerning the use of thalamic function to moderate the pain caused by cancer. It also contains

cAMP, a significant intracellular regulating factor produced in the cell membrane that is antagonistic toward cGMP (cyclic guanosine monophosphate), through which undifferentiated cell growth is promoted (i.e., cancerous tumors).

Corpus pineale suis (also contained in *Thyroidea compositum*) slows down neoplasm phases, and it has some specific indications for papilloma of the bladder (Reckeweg 2002). The pineal gland and the major hormone it produces, melatonin, seem to play a role in immune modulation, and it has been described as an “oncostatic gland.” Melatonin in physiologic concentrations suppresses the growth of some breast cancer cell lines, and conversely pinealectomy increases the growth and proliferation of certain cancers. In some studies, melatonin has shown oncostimulatory activity, but the oncostatic or oncostimulation appears to be diurnal in nature. Melatonin antagonizes the immunosuppressive effects of corticosteroids, increases the cytotoxic activity of natural killer (NK) cells, and stimulates T-lymphocytic responses by acting on opioid receptors. Melatonin is reportedly cytotoxic as well as oncostatic for in vitro cultures of breast, ovary, and bladder cancer cells. The circadian rhythm of melatonin secretion is altered in some human cancer patients. In those with prostate cancer, the amplitude of the melatonin circadian rhythm is significantly lower than is found in healthy men. Patients with primary breast cancer have a decreased melatonin level, inversely correlated with tumor size and increased pineal gland calcification with age may partially account for the increase in breast cancer with age. Electromagnetic fields can affect pineal gland function if they act below the threshold of perception as “synchronizers” or “stimuli.” The greatest amount of energy absorption occurs in the hypothalamus and thalamus regions, near the pineal gland. The selective absorption of energy in this region could functionally disturb the pineal-hypothalamus network (Ronco 1996). *Thalamus compositum* also contains *Viscum album* (see above).

Besides the Heel remedies, there are other possible biological therapies, e.g., large-dose, long-term therapy with enzyme preparations. High doses of vitamin C (ascorbic acid) have been shown to be very useful in many types of cancer. For more information, see the pioneering work by Dr. Hugh Riordan (Gonzalez, et al. 2005) on vitamins A and E (vitamin E must not be administered in cases of hormonally active tumors, such as ovarian cancer, certain kinds of carcinomas of the breast, testicular carcinomas, etc.). Restoration of an intact and functioning intestinal tract, with attention to repopulation of the microbial flora, should be attempted. Selenium ampules or Selenium homaccord is indicated for daily oral use as a long-term therapy, along with routine detoxification as detailed elsewhere in this text. Enzyme therapies are also interesting,

and can be very valuable as an adjunctive treatment. Enzymes are given between meals so that they can be absorbed and used outside the gastrointestinal tract. The rationale for this approach can be more appreciated by a detailed study of the work of John Beard, William Donald Kelley, and more recently Nicholas Gonzales, who have studied the use of enzymes in a variety of cancers (Gonzalez 2005).

Case programming for patients on chemotherapy

When chemotherapy is used, the clinician must avoid detoxification therapy because it may remove levels of the chemotherapeutic needed to kill aberrant neoplastic cells. In these cases, *Galium-Heel* can be used for cellular support, and *Hepar compositum*, *Solidago compositum*, and catalysts (*Glyoxal compositum*, *Ubichinon compositum*, and *Coenzyme compositum*) can be used intermittently (Hu, Kit 2005). These agents can be given 2 to 7 times weekly, orally or by injection. Each case must be tailored to the particular patient and the specific therapy. Treatments that supplement chemotherapy include mistletoe formulas such as *Viscum compositum*; digestive enzymes (proteolytic enzymes); *Molybden compositum* (trace minerals); and nutraceutical agents such as selenium, vitamin C, vitamin E, and beta-carotene.

In cases of radiation therapy, the catalysts (*Coenzyme compositum*, *Ubichinon compositum*, and *Glyoxal compositum*) and especially *Causticum compositum* (1 to 3 times weekly) are supportive and helpful. As discussed earlier in this text, *Traumeel S* has been shown to reduce radiation-induced stomatitis in children and should be considered in radiation-induced mucositis in animals as well (Oberbaum 2001).

Broadfoot's general Dedifferentiation Phase protocol

All cancer patients may receive this autosanguis as a first step of therapy. There are many protocols for treating neoplastic conditions. For the sake of brevity, this text only presents one such technique. As research progresses it may be that other successful protocols surface, and the reader is instructed to actively search for such information as it becomes available. Broadfoot recommends the following general protocol in approaching Dedifferentiation Phase patients:

Initial therapy

Week 1

- Day 1: *Lymphomyosot* plus *Engystol*, one-half to 1 ampule each, mixed together and given IV.
- Days 2 through 5: One-fourth to one-half vial daily PO.

Week 2

- Day 1: *Galium-Heel* plus *Lymphomyosot* plus *Engystol*, one-half to 1 ampule each, mixed together and given IV.
- Days 2 through 5: *Lymphomyosot* plus *Engystol*, one-fourth to 1 vial daily PO.

Autosanguis**Weeks 3 through 5**

- Day 1: Perform a full-run autosanguis, in this order, at one-half cc per injection, saving the remaining vials for oral support:
 1. *Viscum compositum* medium
 2. *Galium-Heel* plus *Engystol* N
 3. *Psorinoheel* plus *Lymphomyosot*
 4. *Tonsilla compositum*
 5. *Coenzyme compositum*
 6. *Ubichinon compositum*
- Day 2: *Viscum compositum medium*, one-fourth to 1 vial by subcutaneous injection where legally allowed. Where not legal, give PO.
- Day 3: *Galium-Heel* plus *Engystol* N, one-fourth to 1 vial each by subcutaneous injection or PO.
- Day 4: *Lymphomyosot* and *Psorinoheel*, one-fourth to 1 vial each by subcutaneous injection or PO.
- Day 5: *Tonsilla compositum*, one-fourth to 1 vial each by subcutaneous injection or PO.
- Day 7: *Coenzyme compositum*, one-fourth to 1 vial each by subcutaneous injection or PO.
- Day 8: *Ubichinon compositum*, one-fourth to 1 vial each by subcutaneous injection or PO.
- Days 9 through 11: Rest; no remedies given.
- Day 12: *Glyoxal compositum*, one-half vial each by subcutaneous injection or PO.
- Days 13 through 15: Rest; no remedies given.
- Day 16: Repeat the protocols for Days 3 through 15 until the remaining vials from Week 3/Day 1 are gone.

Continued therapy

This therapy continues as long as necessary through the use of tinctures and/or tablets. There are a number of possible therapeutic strategies, including liver repair/regeneration with *Hepar compositum* and *Hepeel*; continued catalyst support of mitochondrial function with *Coenzyme compositum*, *Ubichinon compositum*, and *Glyoxal compositum*; *Detox Kit* (*Nux vomica homaccord*, *Lymphomyosot*, and *Berberis homaccord*); and *Galium-Heel* for ongoing cellular support. *Ginseng compositum* can be tremendously valuable for exhaustion phases. Also consider *Solidago compositum* to reduce stress on the renal system and help patients that move into regressive vicariation.

Active biotherapeutics specific to organ conditions

Therapy can be individualized to address specific organ conditions. Previously published texts from Heel have suggested the following general therapeutics, in a simplified form:

***Apis compositum*:** Hypernephroma.

***Bronchalis-Heel*:** Carcinoma of the lung (also *Droperteel*, *Phosphor homaccord*, *Husteel*, and *Tartephedreel*).

***Chelidonium homaccord*:** Liver and gallbladder conditions (see general support remedies).

***Duodenoheel* and *Spascupreel*:** Duodenum and pancreas conditions.

***Graphites homaccord*:** Pylorus.

***Gynacoheel*, *Lamioflur*, *Hormeel*:** Uterine cancer, cancer of the adnexa, etc.

***Hormeel*:** Carcinoma of the glands and genitals.

***Lamioflur*:** Carcinoma of the nose, mouth, and genitals.

***Mezereum homaccord*:** Carcinoma of the mucous membranes in general.

***Mucosa compositum*:** Cancer of mucosal tissues.

***Nux vomica homaccord*, *Veratrum homaccord*:** Cancer of the intestine.

***Veratrum homaccord*:** Contains aloe vera, which, when used in low potency, increased the life span of induced cancer (Dalton's lymphoma ascites) in mice by 21% (Thobias 1990).

***Phosphor homaccord*:** Laryngeal neoplasia.

***Reneel*, *Spascupreel*:** Urinary passage conditions.

***Schwef-Heel*:** Epithelioma.

***Ubichinon compositum*:** Neoplasias of the lower intestinal tract (via para-Benzochinon).

Continual attack by intermediary homotoxins (oncogenic agents, tumor antigens, lactic acid, chemotherapeutic agents, etc.) occurs in neoplasias and cancer therapies, engendering a chronic state of stress exhaustion of the adrenal cortex. *Berberis homaccord* and possibly *Strumeel* and *Thyroidea compositum* may be used to stimulate the functions of the thyroid gland. They should be given once daily.

Preparations indicated according to symptoms

Just as specific organs can be addressed, individual symptoms can be addressed as well. Patients suffering from neoplasia may have a wide variety of concurrent signs, and use of symptom formulas can provide tremendous relief. The readers should also refer to individual protocols for medical conditions in this text.

***Arsuraneel*:** Has a generally calming action on the toxin level; likewise, *Cruroheel* calms the connective tissue

structures. These preparations should be interpolated daily in frequent doses.

***Colocynthis homaccord*:** Used in neuralgiform disorders, ischialgia.

***Drosera homaccord, Husteel, Droperteel, Bronchalis-Heel, Tartephedreel*:** Used for coughs.

***Gelsemium homaccord, Spigelon*:** Used for headaches and neuralgiform disorders.

***Ginseng compositum, Molybdan compositum*:** Used for weakness and exhaustion at the start of the treatment. Give 1 to 2 tablets 3 times daily for 2 to 3 weeks, then once daily, and subsequently 1 tablet 2 to 3 times weekly (every second or third day).

***Mercurius-Heel, Traumeel* tablets:** Used for ulcerating carcinomas. *Traumeel* ointment also can be used.

***Nux vomica homaccord, Veratrum homaccord*:** Used in tenesmus (cancer of the rectum).

***Rendimax*:** Used for latent acidosis that is characteristic of neoplasias (cancer thrives in an acidic environment).

***Spascupreel, Atropinum compositum*:** Used for shooting pains and spasms.

Biotherapeutics and remedies in radiotherapy

The following protocol has been designed for patients undergoing radiotherapy. This protocol must be completed 4 days before the start of radiotherapy treatment when it is used as a protective adjunctive therapy:

- Day 1: Ubichinon compositum with Traumeel, Engystol, and Hepeel.
- Day 2: Galium-Heel, Traumeel, Engystol, and Hepeel.

The reader should be aware of several issues related to the use of antihomotoxic drugs during radiotherapy. *Reneel* tablets are alternated with *Causticum compositum* on the day of the radiation to prevent disorders of the bladder (cystitis) after radiation. They should be given every 15 to 30 minutes. Opiates may be given to ease the pain. *Ubichinon compositum* is indicated, possibly daily, and particularly after each application of radiotherapy. It can assist with the side effects (depressed breathing) and should possibly be given at the dose of 1 vial daily. *Ubichinon compositum* helps with the pain that result from the cancerous condition. It has been used with some success in painful cancers such as osteosarcomas. *Traumeel* ointment has proved effective in the treatment of skin damage from radiotherapy (Heel).

PROTOCOLS FOR SPECIFIC TUMORS

These treatment protocols supplement proper surgical, radiation, and necessary medical therapies. They should not be represented as curative of cancer, but rather as supportive of patient defenses. Owners should be fully informed of the experimental nature of alternative approaches in handling Dedifferentiation Phase patients.

A general 3-point format for therapy is followed for each cancer type. All cancer patients require the first step, which includes Broadfoot's general Dedifferentiation Phase protocol (see above). Because oncologic patients are all individual, the general protocol for cancer must be adjusted to the particular cancer tissue type, as well as the patient's particular biological type. Steps 2 and 3 of the program involve the specific antihomotoxic agents. Use Table 5.1 to locate tissue-specific remedies.

Adenocarcinoma

Step 1: Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2: Select at least 1 agent representing the tissue of origin from Table 34.1. As an example, in the case of jejunal adenocarcinoma, one could select *Mucosa com-*

Table 34.1. Summary of glandular- and epithelial-containing tissues and antihomotoxic medications containing suis organ glandular elements. Identify a carcinoma's tissue of origin and select at least 1 organ preparation.

Organ/tissue	Suis organ preparation
Adrenal cortex	<i>Tonsilla compositum</i>
Adrenal gland	<i>Cutis compositum, Discus compositum</i> <i>Testis compositum, Thalamus compositum</i>
Bladder	<i>Solidago compositum</i>
Brain	<i>Cerebrum compositum, Thalamus compositum</i>
Colon	<i>Hepar compositum</i>
Duodenum	<i>Hepar compositum</i>
Embryo	<i>Causticum compositum, Cerebrum compositum, Discus compositum, Placenta compositum, Testis compositum, Tonsilla compositum, Zeel</i>
Epidermis	<i>Cutis compositum</i>
Fallopian tube	<i>Ovarium compositum</i>
Gallbladder	<i>Hepar compositum</i>
GI mucosa	<i>Mucosa compositum</i>
Kidney	<i>Solidago compositum, Rauwolfia compositum</i>
Liver	<i>Hepar compositum</i>
Nasal mucosa	<i>Mucosa compositum</i>
Ocular mucosa	<i>Mucosa compositum</i>
Ovary	<i>Ovarium compositum</i>
Pancreas	<i>Hepar compositum, Mucosa compositum</i> <i>Syzygium compositum</i>
Pituitary gland	<i>Ovarium compositum, Placenta compositum</i>
Teste	<i>Testis compositum</i>
Thyroid gland	<i>Thyroidea compositum</i>
Umbilicus	<i>Cutis compositum, Discus compositum</i> <i>Placenta compositum, Thyroidea compositum, Tonsilla compositum, Zeel</i>
Ureter, urethra	<i>Solidago compositum</i>
Urinary mucosa	<i>Mucosa compositum</i>

positum and/or *Hepar compositum* or *Duodenoheel* as part of the treatment plan. Note that because this is a Degeneration Phase disorder, *Mucosa compositum* is an excellent selection because it is a phase remedy, as well.

Step 3: Consider special single remedies based upon the location of the neoplasm and the patient's individual symptoms. The clinician should attempt to identify any single remedies which seem appropriate and make an effort to include a combination remedy that contains these:

Acidum aceticum: Contained in *Arsuraneel*; classically indicated for consideration in epithelial cancers. This remedy is very valuable in cases of chronic disease, and has particular use in cancer of the stomach.

Arsenicum iodatum: Contained in *Tartepheedel*, et al.; treats skin cancer and mammary tumors.

Asterias rubens: In *Lamioflur*; used in mammary tumors (particularly those with tendency toward ulceration) and uterine diseases.

Baryta oxalsuccinica: In *Coenzyme compositum* and *BHI-Enzyme*. Treats lung cancer with congestion, cancer of the prostate, cancer of the bladder.

Calcium fluoratum: In *Galium-Heel*, *Thyroidea compositum*, et al. Has indications for swelling or fistula and glandular swellings. Is suggestive of carcinoma, and has action on connective structures (including elastic tissue) and the periosteum. These aforementioned qualities make it worth considering in cases of osteosarcoma, chondrosarcoma, and other connective tissue neoplasias.

Caltha palustris: In *Galium-Heel*; used for uterine cancer.

Cartilago suis: In *Discus compositum*, *Zeel*; used for muscle, bone and joint diseases, and cartilaginous degenerations.

Chelidonium: In *BHI-Chelidonium complex*, *Hepar compositum*, *Hepeel*, *BHI-Gallbladder*. Used for liver cancer.

Cholesterinum: In *Hepar compositum*, *BHI-Body pure*, *BHI-Chelidonium complex*. Used in gallbladder and liver cancer.

Colchicum: In *Aesculus compositum*, *Diarrheel*, *Ginseng compositum*, *Thyroidea compositum*, *Ubichinon compositum*, *Vomitushell*. Used for stomach cancer.

Condurango (Marsdenia condurango): In *Arsuraneel*, *Mucosa compositum*, and *BHI-Headache II*. Useful in stomach issues and cancer of the stomach as well as other forms of cancer, such as epitheliomas, mucocutaneous fissures, ulcerative cancers.

Conium: In *Cerebrum compositum*, *Ginseng compositum*, *Testis compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Ubichinon compositum*, *BHI-Prostate*, *BHI-Saw palmetto*. Used for mammary and uterine neoplasias.

DL-Malicum acidum (malic acid): In *Coenzyme compositum*, *Cor compositum*, *Hepar compositum*, *Thyroidea compositum*, *BHI-Enzyme*. Should always be considered in intestinal cancers, cancer of the bladder, bronchial cancer.

Euphorbium: In *Euphorbium compositum*, *Echinacea compositum*, *BHI-Sinus*. In high concentrations has been shown to be an irritant of skin and mucosa, with possible carcinogenic effects (Zayed 2001). Homeopathic dilutions appear to be safe for long-term use. Protein kinase C enzymes represent the receptor for various xenobiotics, and some phorbol esters are tumor promoters in the mouse, whereas others are anticarcinogenic by stimulating the differentiation of leukemic cells (Nakao 1982). There is epidemiologic evidence to suggest that exposure

to diterpene esters may be a risk factor for the development of esophageal cancers in humans (Szallasi 1999). Several species of *Euphorbium* have been shown to be of value in multidrug resistance in mouse lymphoma (Hohmann 2002). *Euphorbium compositum* is a remedy that can be used as a pain management agent in many forms of neoplasia. This agent commonly assists with intense pain in limbs, paralytic pain in joints, and irritant problems and pain and ulceration of the skin. *Galium-Heel*, *Lymphomyosot*, *Apis homaccord*, *Traumeel S*, and *Zeel* are also helpful for pain management and are commonly used in elderly pets with Dedifferentiation Phase disease. Because pain is a sign of homotoxin presence and/or damage, properly handling the homotoxins in a patient may give surprisingly good results in pain management. In advanced cases use narcotic agents as needed and avoid nonsteroidal anti-inflammatory drugs if possible because they interfere with intestinal function and damage organs of elimination such as kidney and liver.

Fuligo ligni: Not contained in any Heel or BHI formulas, but historically recommended by classical homeopaths when signs match. Used for rectal adenocarcinoma.

Funiculus umbilicalis suis: In *Cutis compositum*, *Discus compositum*, *Placenta compositum*, *Thyroidea compositum*, *Tonsilla compositum*, and *Zeel*. Generally used in carcinomas and sarcomas. May be of particular value in osteosarcomas with attendant bone pain.

Germanium robertianum: In *Lymphomyosot* and *Tonsilla compositum*, which are part of the therapy for all cancer patients. Indicated for gastric tumors.

Glandula thyroidea suis: In *Thyroidea compositum*. Treats thyroid tumors and liver and kidney diseases.

Graphites: In *BHI-Skin*, *Cutis compositum*, *Placenta compositum*, *Discus compositum*, *Thyroidea compositum*, *Tonsilla compositum*, and *Zeel*; used for precancerous conditions in the pyloric region.

Hekla lava: In *Osteoheel*, *BHI-Bone*. Treats osteosarcoma, osteitis, and exostosis.

Hydrastis canadensis: In *Ginseng compositum*, *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, and *Ubichinon compositum*. Used for tumors in the breasts and other organs, especially mucosal pathology.

Kali cyanatum: Not contained in any Heel or BHI remedies, but may be obtained from other suppliers of homeopathic medicines. Classically indicated for cancer of the rectum and tumors of the tongue if signs align with the agent's proving.

Kreosotum: In *Bronchialis*, *Ginseng compositum*, *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, *Populus compositum*, *BHI-Prostate*, *BHI-Saw palmetto*, *BHI-Skin*; used for mucosal masses, uterine carcinoma, and prostatic hypertrophy.

Naphthoquinone: In *Ubichinon compositum*. For serious forms of carcinoma in the areas of the intestines and genitalia, particularly in carcinoma of the uterus and the prostate. Also used for rapidly growing brain tumors, laryngeal cancer with very hard nodes, lung cancer, cancer of the oral cavity, stomach cancer with complete emaciation, cancer of the bladder with agonizing pain, and adenoma of the pancreas and adrenals.

Natrum oxalacticum: In *Causticum compositum*, *Coenzyme compositum*, *Cutis compositum*, *Discus compositum*, *Ginseng compositum*, *Hepar compositum*, *Mucosa compositum*, *Thyroidea compositum*, *Ubichinon*, *BHI-Enzyme*; treats prostatic neoplasms.

Podophyllum: In *Diarrheel*, *Leptandra compositum*, *Momordica compositum*, *Podophyllum compositum*, *Ubichinon compositum*, *BHI-Diarrhea*, *BHI-Pancreas*; used for pancreatic cancer.

Ranunculus bulbosus: In *Discus compositum*, *Ranunculus homaccord*; treats epithelioma and skin cancer.

Rectum suis: In *Mucosa recti* and *Mucosa compositum*; treats carcinoma of the rectum.

Ruta graveolens: In *Aesculus compositum* and *Cerebrum compositum*. Indicated for rectal adenocarcinoma.

Scrophularia Nodosa: In *Lymphomyosot*, *Populus compositum*. Used for mammary tumors.

Selenium: In *Cerebrum compositum*, *Cutis compositum*, *Selenium homaccord*, *Testes compositum*, and *Tonico-Injeel*. Protects colon tissue (Jacobs, et al. 2004) and is used in prostatic adenoma and many other neoplasms. The trace mineral selenium inhibits cancer development in a variety of experimental animal models. In a study on DNA damage in prostate tissue and on apoptosis in prostate epithelial cells, the extent of DNA damage in prostate cells and in peripheral blood lymphocytes was lower among the selenium-supplemented dogs than control dogs (Waters, et al. 2003).

Sempervivum tectorum: *Galium Heel*, *Ginseng compositum*, *Thyroidea compositum*; used for nodular hardening in the skin, tongue, and breast; warts.

Splen suis: In *Cutis compositum*, *Thyroidea compositum*, *Tonsilla compositum*. Treats leukemia, anemia, agranulocytosis. Should be used in carcinoma for general support and revitalization.

Ubiquinone: In *Ubichinon compositum*. Used for cancer of the genitalia, breast cancer with ulceration, and after cancer surgery if healing is delayed.

Ventriculus suis (stomach): In *Mucosa compositum*. Used for precancerous state of the stomach, with ulcers and gastric achylia.

Chondrosarcoma

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Select at least 1 agent representing cartilaginous tissue (*Discus compositum* or *Zeel*) and include this in the individualized health program.

Step 3. Consider special single remedies based upon location and symptoms:

Conium maculatum: In *Ginseng compositum*. A powerful detoxicating agent that may strengthen the anterior lobe of the pituitary. Conium maculatum in dilution is historically used for glandular swellings and cancerous conditions. It is also contained in several other agents commonly used in neoplasia including *Cerebrum compositum*, *Colchicum compositum*, *Rauwolfia compositum*, *Testis compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Vertigoheel*, and *Ubichinon compositum*. When used concurrently with catalysts, this gives a powerful boost to patients that are weakened and tired.

Pain: In *BHI-Inflammation*, *BHI-Bone*, *BHI-Injury*, *BHI-Spasm-Pain*, *Spascupreel*, *Atropinum compositum*, *Bryaconeel*, and *Cruroheel*. All are excellent for localized pain. *Belladonna homaccord* may assist with throbbing pain. *Euphorbium compositum* is a remedy that can be used as a pain management agent in many forms of neoplastic related pain management. Commonly assists with intense pain in limbs, paralytic pain in joints, irritant problems, and pain and ulceration of the skin. *Galium-Heel*, *Lymphomyosot*, *Apis homaccord*, *Traumeel S*, and *Zeel* are also helpful for pain management and are commonly used in elderly pets with Dedifferentiation Phase disease. Because pain is a sign of homotoxin presence and/or damage, properly handling the homotoxins in a patient may give surprisingly good results in pain management. Pain may suddenly appear in a Degeneration Phase case that is undergoing desirable regressive vicariation. This requires skillful biological therapy to move the disease process toward healing (inflammation and excretion) rather than forcing it back into progressive vicariation by suppressive pharmaceutical agents. Use narcotic agents as needed in advanced cases and avoid nonsteroidal anti-inflammatory drugs if possible because they interfere with intestinal function and damage organs of elimination such as kidney and liver.

Hemangiosarcoma

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Select at least 1 agent representing splenic tissue (*Tonsilla compositum*, *Cutis compositum*—for cutaneous hemangiosarcoma—*Thyroidea compositum*) and include this in the individualized health program. Note that these are part of the basic autosanguis and deep detoxification formulas that are so commonly used in advanced diseases such as neoplasia. Because of the vascular nature of these tumors it may prove helpful to include vein and artery

tissues as well; these are contained in *Aesculus compositum* (artery only) and *Placenta compositum* (both artery and vein).

Step 3. Consider special single remedies based upon location and symptoms:

Aurumheel N: Treats hypotension and circulatory arrhythmias.

Berberis homaccord: Provides adrenal cortex support in stressful conditions.

BHI-Bleeding: In *Crotalis horridus*. Helps control hemorrhages. Very useful due to its complement of agents; a favorite remedy used by the authors for acute hemorrhage as well as maintenance therapy of hemangiosarcoma patients.

Carbo compositum: Supports circulatory failure during shock.

China homaccord: Used for debility and weakness following blood loss. Useful in treating shock from blood loss.

Cinnamomum compositum: Used for active bleeding cases. Not currently available but a very useful remedy during acute hemorrhagic crises. In the absence of this formula consider **BHI-Bleeding**.

Crotalis-Injeel: Used for dark hemorrhages from viscous organs. Not readily available in the United States.

Ginseng compositum: A powerful detoxicating agent that may strengthen the anterior lobe of the pituitary. *Conium maculatum* in dilution is historically used for glandular swellings and cancerous conditions. It is also contained in several other agents commonly used in neoplasia including *Cerebrum compositum*, *Colchicum compositum*, *Rauwolfia compositum*, *Testis compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Vertigoheel*, and *Ubichinon compositum*. Used concurrently with catalysts, this gives a powerful boost to patients that are weakened and tired.

Hamamelis homaccord: Used for venous stasis and varicosities of extremities (cutaneous hemangiosarcomas may fit this picture).

Phosphor homaccord: Used for hemorrhages that are typically more petechial in nature.

Veratrum homaccord: Treats shock.

Leiomyosarcoma

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Use *Jejunum-suis-Injeel* (if available) for jejunal tumors, *Uterus suis-Injeel* for uterine diseases, or *Myoma-Uteri-Injeel* (if available) for uterine myoma. In the United States, *Mucosa compositum* is presently available and will suffice in most issues for this purpose.

Step 3. Consider special single remedies based upon location and symptoms:

Condurango: In *BHI-Headache II* and *BHI-Migraine Rx*, but in no Heel formulas. Used for stomach issues and cancer of the stomach, other forms of cancer, mucocutaneous fissures, and ulcerative cancers.

Duodenohel: Treats vomiting, nausea, and disease of the duodenum.

Gastricumeel: Treats nausea stemming from gastric diseases.

Gynacohel: Treats myomas, uterine inflammation, ovarian diseases, ovarian pain.

Klimakt-Heel: Treats uterine polyps, debility.

Metro-Adnex-Injeel: Treats uterine diseases.

Nux vomica homaccord: Supports entire gastrointestinal tract.

Mammary cancer (also see adenocarcinoma)

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Consider *Mamma-suis-Injeel* (if available) or *Carcinosin* (see below).

Step 3. Consider special single remedies, or combination formulas containing these agents, based upon location and symptoms:

Acidum aceticum: In *Arsuraneel*. Classically indicated for epithelial cancers; very valuable in chronic diseases.

Arsenicum album: In many Heel products commonly used for advanced homotoxicoses, such as *Arsuraneel*, *Atropinum compositum*, *Cantharsis compositum*, *Cor compositum*, *Cerebrum compositum*, *Diarrheel S*, *Echinacea compositum*, *Gastricumeel*, *Leptandra compositum*, *Mezereum homaccord*, *Solidago compositum*, *Strophanthus compositum*, *Sulfur-Heel*, and *Syzygium compositum*. Used for mammary tumors; discharges that are putrid and/or green in color; fear, fright, and worry; and when symptoms are worse at night with debility and weakness.

Asterias rubens: In *Lamioflur*; contains another commonly indicated remedy for mammary cancer. Used for ulceration with sharp pain (worst in the left), mammary swelling, indurated swelling. History may include epilepsy and skin may have ulcers with fetid discharge.

Calcarea fluorica: In *Galium-Heel*, *Cutis compositum*, *Thyroidea compositum*, *Abropernol*. Used for hard, stony glands; knots in the breast; induration that appears in transition to suppuration; and indolent ulcerations that weep thick, yellow pus.

Calcarea idodata: In *Strumeel* and *Barijodeel*. Used for its association with enlarged glands. Classically indicated for thyroid masses near puberty and enlarged tonsils with cryptic formation.

Carcinosin: Not contained in any Heel or BHI products but can be obtained from reputable homeopathic compa-

nies. Classically used for mammary cancer (Macleod 1983).

Chimaphilia umbellata: Not contained in any Heel remedies, but contained in *BHI-Prostate Rx* and *BHI-Saw palmetto complex*. Used for inflamed labia, painful mammary tumors that are not ulcerated but may secrete milk, and sharp pain in the tumor (Heel 2002).

Conium maculatum: In *Cerebrum compositum*, *Colchicum compositum*, *Ginseng compositum*, *Rauwolfia compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Ubichinon compositum* and *Vertigoheel*. Used for mammary cancer. Conium is a classical remedy that can be used singly at appropriate intervals.

Hydrastis: In *Ginseng compositum*, *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, and *Ubichinon compositum*. Cases are often typified with yellowish, ropey discharges from mucous membranes and aged, weak, easily tired, cachectic patients. Treats cancer states before ulceration and painfulness, vulvar pruritus, mammary tumors. Most cancer patients receive this agent because of the frequency of use of the particular combination remedies.

Phosphorus: In a wide variety of antihomotoxic formulas, including some that are commonly used in Degeneration Phase cases such as *Bryaconeel*, *Echinacea compositum*, *Galium-Heel*, *Hepeel*, *Molybdan compositum*, *Mucosa compositum*, *Phosphor homaccord*, and *Testis compositum*. It is a constitutional remedy of great importance. Patients may have thinner body types and be prone to hemorrhagic disorders in their health history. Treats suppurative mammary tumors.

Phytolacca: In *Echinacea compositum* and *Mercurius-Heel S*. Used for mammary swellings with abscess formation, and possibly mastitis history cases. Useful if given early in the course of tumor development (Macleod 1983).

Plumbum iodatum: In *Placenta compositum*. Used for breast tumors.

Thuja occidentalis: In many remedies, including *Cutis compositum*, *Echinacea compositum*, *Galium-Heel*, and *Psorinoheel*. Used for warty masses and cutaneous protuberances and spongy tumors; warts on vulva and perineum; and polyps and fleshy growths. May help reverse some undesirable side effects stemming from vaccinosis.

Melanoma

Melanoma is a neoplasm with typical history of rapid and aggressive metastasis. Immunotherapy with a vaccination may prove very helpful in the future management of melanoma. Such success indicates that techniques that manage the patient's immune system may be advantageous in this disease. Autosanguis, through its action of macrophages,

dendritic cells, and lymphocytes, may prove particularly useful in this disease.

Palmquist and Broadfoot have 3 cases of canine oral melanosarcoma, one which metastasized rapidly following oral surgery (lumpectomy and biopsy). The owners of all cases declined advanced oncologic handling and elected only homotoxicology (as outlined above) and nutraceutical support. One dog has lived more than 2 years with overt metastasis to regional lymph nodes being resolved. This case series has been accepted for publication in the Journal of the American Holistic Veterinary Medical Association. Palmquist feels higher dose, preservative-free IV ascorbic acid plays an important part in the therapy of this disease. The basic protocol:

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Specific immunotherapy for melanoma has been administered to several thousand patients since 1972, using an irradiated whole-cell preparation (Slingsuff 1992). Hersey (1993) performed immunotherapy with a vaccine made from vaccinia lysates of an allogenic melanoma cell following surgical removal of lymph node metastases. Modern variants of this medical approach have used buffy coat (a layer of the blood cells) to treat melanoma, creating an artificial hematoma to reactivate the immune system, as well as other strategies for treatment. A homotoxicological variation of these procedures is to use a large blood autosanguis in combination with appropriate remedies, and given as a series of injections.

Step 3. Consider special single remedies, or combination formulas containing these agents, based upon location and symptoms:

Arsenicum album: In many Heel products commonly used for advanced homotoxicoses, such as *Arsuraneel*, *Atropinum compositum*, *Cantharsis compositum*, *Cor compositum*, *Cerebrum compositum*, *Diarrheel S*, *Echinacea compositum*, *Gastricumeel*, *Leptandra compositum*, *Mezereum homaccord*, *Solidago compositum*, *Strophanthus compositum*, *Sulfur-Heel*, and *Syzygium compositum*. Helpful in cases manifesting signs including discharges that are putrid and/or green in color; fear, fright, and worry; and symptoms that are worse at night with debility and weakness. A related remedy, *Arsenicum iodatum*, is indicated for skin cancers and mammary tumors, and is found in several respiratory remedies including *Tartephedreel*, *Husteel*, and *BHI-Chest* (Reckeweg 2002). A recent study, broadcasted by the BBC, revealed that an Iranian research team suggested arsenic trioxide as a first-line treatment for acute promyelocytic leukemia; the survival rate in their study was 88.5% of patients after 34 months. Multiple myeloma may also be a candidate for this therapy. Arsenic trioxide works by causing changes in cancer cells, which induce apoptosis (programmed cell death). It appears to correct the gene

responsible for making a flawed protein that causes leukemia. It may be particularly valuable for treating the elderly, who often die earlier in the treatment process due to cumulative toxicity from standard forms of chemotherapy (BBC 2004). A homeopathic trial showed a 33% increase in the survival rate in induced cancer (Dalton's lymphoma ascites) in mice treated with *Arsenicum album* 30 X (Thobias 1991).

Asterias rubens: In *Lamioflur*. Used to treat cancer.

Carbo animalis: Contained in no Heel or BHI remedy formulas. Used in elderly patients with lowered vitality. Used for indurated glands, offensive secretions, vaginal dermatitis with painful indurations in the breast of females, uterine cancer, and flatulence.

Curare: In *Arsuraneel*, *Circulo-Injeel*, *Syzygium compositum*, *Testis compositum*, *BHI-Headache*, and *BHI-Migraine Rx*. Used in human melanoma cases (Reckeweg 2002).

Chimaphilla umbellate: In *BHI-Prostate Rx* and *BHI-Saw palmetto complex*. Used in cases with a history of catarrhal bladder issues, glandular enlargements, vaginitis, and diabetes mellitus.

Clematis erecta: In *Galium-Heel* and *Atropinum compositum*. Treats swollen meibomian glands, iritis, blepharospasm, submaxillary gland swelling, and mammary tumors.

Condurango: Found in no Heel formulas but is in *BHI-Headache II* and *BHI-Migraine Rx*. Used in stomach issues and cancer of the stomach as well as other forms of cancer, mucocutaneous fissures, and ulcerative cancers.

Fuligo: Is in no Heel or BHI formulas; comes from soot. Classically used for many forms of cancer.

Galium aparine: In *Galium-Heel*. A powerful agent for suspending or modifying cancerous processes. Useful for general cancers and nodules of the tongue.

Hydrastis: In *Ginseng compositum*, *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, and *Ubichinon compositum*. Cases are often typified with yellowish, ropery discharges from mucous membranes and aged, weak, easily tired, cachectic patients. Treats cancer before ulceration that is painful, vulvar pruritus, and mammary tumors. Most cancer patients receive this agent because of its frequency of use of the particular combination remedies.

Kreosotum: In *Mucosa compositum*, *Ginseng compositum*, *Lamioflur*, and *Ovarium compositum*. Due to the phenolic compounds, this is a potent carcinogen in larger amounts and is associated with a wide variety of neoplasms. It is used for many forms of neoplastic phase disease.

Lachesis: In a large number of formulas, most notably *Gripp-Heel*, *Mucosa compositum*, and *Ovarium compositum*. This remedy is useful for management of symptoms

associated with several types of tumors. These include masses or precancerous conditions of the mammary gland (with purplish coloration), larynx, ovary, uterus, vagina, skin, and thyroid. Gangrenous paraneoplastic situations and draining tracts may be indications as well.

Tarentula cubensis: Not in any Heel or BHI formulas but available from homeopathic pharmacies. Should be considered in melanoma. Indications are malignant suppuration and purplish hue. Also used for genital pruritus.

Thuja occidentalis: In many remedies, including *Cutis compositum*, *Echinacea compositum*, *Galium-Heel*, and *Psorinoheel*. Used for a wide variety of deep homotoxicoses. Used for warty masses, cutaneous protuberances, spongy tumors, warts on vulva and perineum, polyps, and fleshy growths. May help reverse some undesirable side effects stemming from vaccinosis.

Viscum album: In *Aesculus compositum*, *Arteria-Heel*, *Ginseng compositum*, *Procainum compositum* (not available in the USA), *Rauwolfia compositum*, and *Viscum compositum* (mite, medium, forte). It has been studied in Europe as a potential therapy for melanoma.

Meningioma

No reports of resolution of meningioma can be found in the literature. The goal of therapy in such cases is improving immune function and removing homotoxins, with the goals of slowing the growth of the existing mass and reducing the swelling of the tissue surrounding the tumor. A very small reduction in swelling can lead to markedly improved clinical status in patients suffering from intracranial masses. The basic protocol:

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Brain tissue is contained in *Cerebrum compositum* (*Cerebrum suis*), *Testes compositum* (*Diencephalon suis*), and *Thalamus compositum* (*Thalamus opticus suis* and *Corpus pineale suis*). No Heel products available in the USA contain meningeal tissue; however, there are specific injeel remedies available in Europe: Meningeoma-Injeel, Glioma-Injeel, and Neurofibroma-Injeel. As a basic protocol for brain tumors and cerebral compression, consider *Apis homaccord*, *Galium-Heel*, *Lymphomyosot*, *Thalamus compositum*, *Cerebrum compositum*, *Viscum compositum*, *Ginseng compositum*, and *Molybdenum compositum*.

Step 3. Consider special single remedies, or combination formulas containing these agents, based upon location and symptoms:

Apomorphia: No homotoxicology remedies contain this agent, which is best known for its emetic qualities. It is listed as a remedy for brain tumors in humans by Boericke (1927).

Baryta carbonica: In *BHI-Ginko complex*. Commonly used in degenerative conditions involving elderly people. Treats cerebral issues, senile dementia, vertigo, bashful personality; tonsillar swelling may have been common in juvenile periods.

Calcarea carbonicum: In *Hepar compositum*, *Hormeel*, and *Graphites homaccord*. Used for pituitary and thyroid disorders.

Conium maculatum: In *Cerebrum compositum*, *Colchicum compositum*, *Ginseng compositum*, *Rauwolfia compositum*, *Thyroidea compositum*, *Tonsilla compositum*, *Ubichinon compositum*, and *Vertigoheel*. Treats geriatric pets with ascending paralysis or weakness with accompanying urinary problems. Conium is a classical remedy that can be used singly at appropriate intervals.

Glonoinum: In *Ypsiloheel* and several other cardiac remedies such as *Cactus compositum*, *Cardiacum-Heel*, and *Cor compositum*. Used for high blood pressure, headache, angiospastic neuralgia, and vertigo. Ypsiloheel is used to rekindle central autoregulation.

Graphites: In *Graphites homaccord* and *Paeonia homaccord*. Used in overweight patients and those with excessive cicatrixal formation; dry, flaky skin; brittle nails; perianal fissures; and constipation.

Hydrastis: In *Ginseng compositum*, *Lamioflur*, *Mucosa compositum*, *Ovarium compositum*, and *Ubichinon compositum*. Cases are often typified by yellowish, ropery discharges from mucous membranes and aged, weak, easily tired, cachectic patients. Used for cancer before ulceration and that is painful, vulvar pruritus, and mammary tumors. Because of the frequency of use of the particular combination remedies, most cancer patients receive this agent.

Kali iodatum: In *Osteoheel* and *BHI-Sinus*. Used for bone inflammation, periosteal disease, or bone pain.

Plumbum metallicum: In *Syzygium compositum*. Used for a wide variety of neurological disorders, including paresis.

Sepia: In several formulas, including *China homaccord*, *Discus compositum*, *Hormeel*, *Nervoheel*, and *Ovarium compositum*. A classical female remedy that is associated with sadness, anxiety, and vertigo.

Traumeel S: Reduces inflammation and activates blocked enzyme systems. Contains Apis for swelling and Belladonna for inflammation and seizures. *Traumeel* solution was studied in a randomized, controlled clinical trial for the treatment of chemotherapy-induced stomatitis in children undergoing stem cell transplantation. This study indicated that *Traumeel* may significantly reduce the severity and duration of stomatitis in children undergoing bone marrow transplantation (Oberbaum 2001).

Pheochromocytoma

Broadfoot's general Dedifferentiation Phase protocol, above, can be used for these cases, because its normal

constituents include the adrenal components that support patients with this disease.

Spindle cell sarcoma

See Fibrosarcoma, above.

Transitional cell carcinoma

See Adenocarcinoma, above.

Step 1. Follow Broadfoot's general Dedifferentiation Phase protocol, above.

Step 2. Include *Solidago compositum* and *Mucosa compositum* in the individualized health program.

Step 3. Select remedies for symptom relief as for other bladder issues (see the cystitis section). Consider special single remedies based upon location and symptoms:

Taraxacum officinale: In *Hepar compositum* and *Injeel-Chol*. Relieves some signs in cases of bladder cancer.

Berberis homaccord: Relieves stress and supports urinary tissues. Useful for most cancer patients for purpose of adrenal support.

SECTION 6

Vaccinations

Chapter Thirty-Five

Vaccinations

VACCINATION ISSUES

Any veterinarian who administers vaccinations knows the difficulties encountered when a puppy or kitten suddenly collapses due to an acute hypersensitivity reaction resulting from the administration of a routine vaccination given with the intention of increasing its health and well being. A feline practitioner presented with a persistent mass at the site of prior vaccination is acutely aware of the despair and regret that can come from finding and diagnosing a feline vaccine-related fibrosarcoma.

Immunization is an important tool used to protect these young animals from the ongoing presence of devastating viral diseases, such as canine parvovirus, canine distemper virus, feline panleukopenia, feline viral rhinotracheitis, feline leukemia virus, and rabies virus, as well as other diseases that may threaten human and animal health. Veterinarians across the nation are beginning to give careful consideration to their routine vaccination recommendations due to the possibility of adverse events (AE) associated with vaccination. Despite this reduction in the number of vaccinations recommended for veterinary patients, AEs still occur, and some diseases, like leptospirosis, create difficult issues for patient, client, and clinician when they make honest efforts to decide upon a best and safest course of prevention for a particular pet. Our ability to predict AEs is poor, and our understanding of more complex interactions between patient, environment, and vaccination content leaves much room for investigation and improvement.

Since the 1950s, veterinary medicine has done an excellent job of educating pet owners on the importance of vaccination. There is no doubt that millions of dogs and cats have been protected against life-threatening infections. Human health has also been improved thanks to the development and widespread use of rabies vaccination. Decades ago, the American Veterinary Medical Association (AVMA) recommended annual revaccination of all dogs, a practice still common today. This recommendation was based on the assumption that immunity would dwindle in some pets, so that frequent revaccina-

tion was required to ensure immunity in the population. Recommendation for annual revaccination of all canine and feline patients with multivalent or “combo” vaccines assumes that every pet is at significant risk for exposure to every infectious agent in the vaccine, and that each agent in the vaccine will stimulate the same degree of immunity that lasts the same amount of time (Greene 2001). Today, we know that these assumptions are neither rational nor scientifically justified.

Vaccination should not be a regimented, one-size-fits-all procedure. The objective of vaccination is simply to give the right vaccine at the right time to the right individual to protect that individual from an infectious disease. To accomplish this objective, each patient should be evaluated with regard to age, lifestyle, disease prevalence in the community, potential for exposure to infected animals and environments, and the severity of clinical disease, if any, after infection (Ford 2001). Vaccination is a medical procedure and deserves the same level of consideration and concern as any other serious healthcare decision.

There are 3 types of vaccines: killed vaccines, modified live vaccines, and recombinant vaccines (Greene 2001, Van Kampen 2001). Vaccines that contain killed viruses or bacteria are usually adjuvanted with agents such as aluminum hydroxide, which function as nonspecific immune boosters, thus improving patient response to the vaccination. Because the vaccine is killed, there is no replication or reversion to virulence, and these are considered safer in breeding bitches and the immunosuppressed. However, there is a higher incidence of adverse reactions to the killed organisms suspended in adjuvant (Tater 2005), and killed vaccines confer lower immunity and shorter duration of protection. Leptospirosis, bordetella, Lyme, giardia, and rabies vaccines can all be found in killed form.

Modified live vaccines (MLV) contain live viruses that have been attenuated to allow replication in the host without causing clinical disease, and they stimulate a more long-lasting, physiological type of humoral and cell-mediated immune response. Some of these can be given at the site where the pathogen normally invades, e.g.,

intranasal vaccinations for bordetella, parainfluenza, and feline viral rhinotracheitis, which induce a localized immune response. Distemper, parvovirus, hepatitis, parainfluenza, and bordetella are available as MLV vaccines.

Recombinant vaccines are genetically engineered by inserting selected genes from an infectious agent into a nonpathogenic carrier agent that serves as a production factory. The proteins then produced are critical in stimulating specific immunity to the infectious agent, and thus focus the immune response. Lyme vaccine now comes as a recombinant, and there are a number of newer vaccines in this genre, e.g., distemper vaccine (Crawford 2002).

The clinician must consider the proper timing for vaccination administration in order that optimum immunity results. High levels of maternal antibodies acquired from ingestion of colostrums protect puppies and kittens from disease for the first 6 to 8 weeks of life. Thereafter a window of susceptibility to infection is created because maternal antibodies are high enough to interfere with the vaccine-induced response, but not high enough to protect the pup from infection and disease. This is the most common cause of vaccine failure in puppies. Therefore, immunizations are repeated at timed intervals to ensure development of a protective immune response. The pediatric series includes the core vaccines for distemper, parvovirus, and infectious canine hepatitis starting with an initial immunization at 6 to 8 weeks of age, followed by boosters every 3 to 4 weeks until 12 to 14 weeks old. Improved vaccine technology as is present in Recombitek® canine distemper vaccination helps to overcome this issue. This advance makes such vaccines highly desirable for use in shelters and other high-risk environments.

Concurrent environmental or medical factors may affect patient response to vaccination. Many vaccines carry the statement in their packaging "for use in healthy animals only." This is sage advice, as vaccination during periods of illness may negatively affect patient response. It is not known if administration of vaccines during illness increases the risk of other adverse events, such as immune imbalance, but basic homotoxicology phase theory would predict that administration of homotoxins to biological systems under duress would be more likely to lead to progressive vicariation. Bearing in mind that MLV vaccines create an Impregnation Phase (already to the right of the biological divide), it would be sensible to be as certain as possible that the patient's health was good before administering any vaccine (see Chapter 4 for an in-depth discussion of homotoxicology).

The use of steroids concurrently with vaccination has long been discussed in our profession. Newer drugs such as cyclosporin should be evaluated as well. Nonsteroidal anti-inflammatory drugs (NSAIDs) are commonly used agents in veterinary medicine. They are common in geriatric patients and also commonly used by veterinarians as

post-operative pain management. They are known to decrease healing and may cause other negative effects on the host's greater defenses. A recent study involving mice seems to indicate that concurrent drug therapy with cox2-inhibiting NSAIDs can negatively affect immune response. Mice were pretreated with a cox2 inhibitor and then vaccinated with a model vaccine against human papillomavirus (HPV). The mice in the control group responded well to this new product recently released for human protection against HPV, an agent responsible for early-onset cervical cancer in women. The cox2 inhibitor group responded poorly. This group showed 70% less anti-HPV 16 immunoglobulin, 50% fewer antibody-secreting cells, and one-tenth of the neutralizing antibodies to HPV 16 than the control group (Ryan 2006). This powerful data may explain in part why elderly human patients respond more poorly than younger ones to influenza vaccination, and this information gives veterinarians cause to consider routine use of NSAIDs on yet another level. Further study of this issue is warranted in our profession.

Recent challenge studies performed by independent research groups have demonstrated that modified live virus vaccines for distemper, parvo, canine infectious hepatitis, and parainfluenza induced immunity for 5 to 7 years. Considering that annual revaccination in these challenge studies did not provide any increased strength in the humoral immune response elicited or duration of immunity, nor did it improve resistance to disease (Ford 2001, Greene 2002), the practice of annual revaccination needs to be seriously reconsidered, especially given that the incidence of clinical disease from distemper, hepatitis, and parvovirus in dogs older than 1 year of age is virtually nil.

Dr. R.D. Schultz at the University of Wisconsin proposed an ideal canine vaccination program to consist of 1 booster vaccination given 1 year after completion of the pediatric series, with subsequent vaccinations given at 3-year intervals thereafter (Greene 2002). This recommendation is consistent with that of the American Animal Hospital Association. In a recent survey of holistic veterinarians attending the annual meeting of the American Holistic Veterinary Medical Association, the majority of survey respondents were currently following this protocol (Palmquist 2007).

For some diseases, such as canine distemper and canine parvovirus, it may be possible to assess the adequacy of protection through use of vaccination titers. Practitioners using this method report a high success in prevention of these diseases and have reported that they feel they are encountering a reduced incidence of other autoimmune diseases, such as immune hemolytic anemia and idiopathic thrombocytopenia. No formal studies have been published comparing rates of these diseases before and

after adopting titering and reducing dependency upon yearly boosters. Such a study would shed light on this area and would be welcomed data. Such practitioners reported this observed trend seemed to follow their decision to reduce vaccination by use of vaccine titers. In human medicine, vaccine titers are routinely used in evaluating patients for their need of rabies revaccination. It may be possible to do something similar with veterinary patients, but at this time most states do not recognize rabies vaccine titers as a legal substitution for required rabies vaccination boosters.

Use of canine vaccine titers is still a controversial subject among veterinarians. Researchers have reported that canine distemper and canine parvovirus antibody titers may not always correspond to protection against disease (Ford 2001, Greene 2002). A high-antibody titer does not guarantee immune protection, and a low or negative-antibody titer does not indicate guaranteed susceptibility to infection. There is a breed predisposition for low titering among the Rottweiler, Doberman Pinscher, Labrador Retriever, Alaskan sled dog, Pomeranian, and American Staffordshire Terriers. These dogs may remain healthy, presumably via vaccine stimulation of other important immune system arms, such as cell-mediated immunity, mucosal immunity, and immune memory cells.

In a recent study, serum antibody titers to distemper and parvovirus were measured in 1,441 dogs of various ages and breeds located across the U.S. and Canada, with more than 95% showing adequate titers to distemper and parvo. In the study, 468 dogs with known vaccination histories had a vaccine 1 to 2 years before the testing (60%), 2 to 7 years before (30%), and less than 1 year (10%) (Twark 2000).

Palmquist has routinely titered for canine distemper and parvo viruses in his inner-city practice population of 15,000 pets. He surveyed U.S. veterinarians responsible for more than 136,000 dogs. In this study no clinical cases of canine parvovirus or distemper were reported in dogs properly vaccinated as puppies and then booster vaccinated only when they were determined to have inadequate antibody levels on vaccine titer testing (Palmquist 2003). This study indicates that titering patients can be used as a tool to reduce unnecessary vaccinations, and although not all diseases lend themselves to this practice, it is useful to consider when developing preventive medicine programs for the companion animal veterinarian. Palmquist feels that the incidence of autoimmune diseases such as AIHA and ITP have decreased dramatically in his practice since implementing such protocols. In 2006 only 2 cases of AIHA and only 1 case of ITP were reported to occur in his practice of 15,000 dogs and cats. More study is indicated.

In cats, vaccination titers may not be that useful. Lappin has shown that cats vaccinated for the feline herpes virus,

type 1 (FHV-1), are protected by vaccination against clinical infections, even though their vaccine titer levels have declined over time. This makes titering less useful in determining need of revaccination in cats, but also establishes that we may be administering unnecessary vaccination for FHV-1. Lappin states, "Because most client-owned cats had detectable serum antibodies suggestive of resistance to infection, use of arbitrary booster vaccination intervals is likely to lead to unnecessary vaccination of some cats" (Lappin 2002). Veterinarians are just beginning to appreciate the relationship of herpes virus and its implication in difficult to diagnose and treat feline dermatoses. The possibility of impregnation by vaccine strain herpes virus in cats would be predicted to cause chronic, refractory inflammatory conditions by basic homotoxicology phase theory, and it is compatible with what we already know about the biological behavior of feline herpes virus.

Just as no vaccine confers 100% immunity, no vaccine is 100% free of adverse events, which consist of any undesirable consequence, including illness or a reaction, whether or not a cause-and-effect relationship can be established. The most commonly recognized AEs are non-specific: fever, anorexia, and stiffness for 24 to 36 hours after vaccination. The most frequently reported AE associated with killed vaccines is immediate hypersensitivity or anaphylaxis, indicated by urticaria (hives), pruritus of the face and ears, and possibly vomiting and/or diarrhea in some dogs (Meyer 2001). These may occur immediately after vaccination or several hours later. Vaccines containing killed coronavirus combined with killed leptospirosis bacteria targeted for use in puppies should not be used due to increased frequency of hypersensitivity reactions. Canine leptospirosis is a bacterial infection that causes kidney and liver failure in dogs of all ages. There are several different serovars, which are antigenically distinct from each other, and strains may not be cross protective. The killed bacteria suspended in adjuvant are responsible for many hypersensitivity reactions, particularly in Dachshunds and other small breeds, and only induce a short-lived immunity of 6 to 8 months (Greene 2002).

Type-1 (immediate) hypersensitivity reactions involve antigen-specific IgE or IgG on the surface of a mast cell or basophil, resulting in degranulation and release of vasoactive substances. These can be seen within minutes in most cases or can be delayed up to 24 hours post exposure. In some cases these reactions are generalized and in others they are localized. In dogs, the primary manifestations are facial pruritus and edema, hives, and urticarial lesions. More severe cases can show hypotension, dyspnea, diarrhea, and collapse. Cats suffer more respiratory signs, including dyspnea, shock, salivation, and pulmonary edema. Miniature Dachshunds are

overrepresented in the literature. Death can occur quickly in such situations, and emergency care is warranted.

The authors report a disproportionate number of young canines that react, represented by Dachshunds, Pugs, and Boston Terriers, with a smattering of other breeds. Interestingly, we also see a fair number of these breeds presented for atopic issues as well. Vaccination has been found to exacerbate the immune response of dogs with preexisting inhalant allergies. Vaccine antigens may potentially exceed the immunologic tolerance threshold of some animals with atopy. The more antigens administered in a vaccine, the greater the chance of inducing hypersensitivity. Often it is difficult to link this kind of tissue damage to vaccination, but this may be due to the fact that damage tends to be caused by the accumulation of many antigens from many vaccines over years of a dog's life, rather than from any one given vaccine. We most assuredly see a link between worsening of allergy symptoms within 2 to 4 weeks post vaccination in sensitized dogs.

A more minor reaction, yet one of concern to owners, is a very localized reaction, in the form of a subcutaneous mass at the injection site. These swellings may be occasionally painful and tend to be transient in nature. We have considered the possibility that the development of such lesions may suggest increased sensitivity in the affected patients, but no proof of this exists at this time. The granuloma may not appear for several weeks post vaccination, and it is thought that this is a local reaction to the adjuvants in vaccine. Such swellings that persist for more than 6 to 8 weeks should be examined by cytology or biopsy for neoplasia. Other reactions can be local swelling, pain, and alopecia at the injection site (Broadfoot 2006). Alopecia at the site of rabies vaccination is a well-known and frustrating complaint seen by veterinary dermatologists, and although not life threatening, such lesions can cause extremely disgruntled clients, especially when occurring on show dogs.

Other less-recognized AEs include abortions, stillbirths, and birth defects due to vaccination of pregnant dogs, and illness in neonates (Crawford 2002). There are approximately 12,000 reports of AEs annually for human vaccines, all of which must be forwarded to the FDA. In contrast, animal vaccine manufacturers are neither required to list possible adverse reactions on vaccine labels, nor keep records of adverse events reported directly to them, nor forward reports to the USDA or FDA. There are approximately 10,000 reports of adverse events associated with animal vaccines annually in the U.S., communicated directly to the manufacturers (Meyer 2001).

Because reporting of AEs is not required, this most likely represents a markedly low figure, as most veterinarians do not take time to file AE reports. One of the best-developed surveillance schemes in the world for monitoring

veterinary vaccine AEs is in the United Kingdom, where vaccine manufacturers are legally required to record reports of adverse reactions and submit the reports to a regulatory agency (Gaskill 2002). Veterinarians in the United States interested in practicing evidence-based medicine would welcome such data.

There is a growing awareness of health problems that may be associated with vaccine administration, both in the short term, and in the prevalence of chronic "vaccinosis." This term was created in holistic medical circles to describe disease states that may arise from vaccination. There is increasing evidence suggesting that vaccination, particularly overvaccination, meaning the administration of unnecessary vaccinations, is associated with development or aggravation of immune-mediated disorders and chronic diseases in individuals that are genetically predisposed.

There appears to be a breed predisposition for developing adverse reactions and immune-mediated diseases, including the Old English Sheepdog, Akita, American Cocker Spaniel, Standard Poodle, Scottish Terrier, Shetland Sheepdog, Shih Tzu, Vizsla, Weimaraner, Irish Setter, Doberman Pinscher, and Dachshund (Dodds 2001). There are 2 published studies that linked vaccination and development of immune-mediated hemolytic anemia (David 1996, Hogenesch 1999). More recent reports have suggested vaccine-induced development of hypertrophic osteodystrophy in Weimaraner puppies that were genetically predisposed to the disease (Dodds 2001, Harrus 2002). To date, there are no controlled scientific studies that prove a cause and effect relationship between vaccination and development of immune-mediated diseases or chronic diseases (Gaskell 2002).

Homeopathic veterinarians have long charged that a relationship between rabies vaccination and onset of neurological disease exists. There are studies that have linked neurological disease with vaccines, particularly the rabies component. A canine study (Rehulova 1971) and a human report of four cases of neurological complications following vaccination with cerebral-type lyophilized vaccine from the Province of Poznan have been profiled in journals. The latter reported cases occurring in middle-aged men that exhibited the following syndromes: Landry's ascending paralysis, polyradiculoneuritis, polyneuritis, and encephalopolyradiculoneuritis (Kowal 1986).

In the Hayward Study on Vaccines, William R. LaRosa, M.D., (Trustee of the Hayward Foundation) states that a number of autoantibodies to several critical proteins and DNA were identified in the vaccinated group. Identifying these autoimmune antibodies and monitoring their titers may lead to better understanding of the thyroiditis conditions, as well as to a better understanding of the role of vaccines in soliciting adverse events that contribute to problematic conditions observed in the Great Dane, such

as cardiomyopathy and various bone-related disorders. One control group was not vaccinated and the other group was vaccinated with a commercial multivalent vaccine at 8, 10, 12, 16, and 20 weeks of age and with a rabies vaccine at 16 weeks of age.

Some autoimmune diseases that may be considered in this spectrum are: diseases of the pancreas (diabetes), thyroid (Hashimoto's disease), collagen and fibronectin (scleroderma, lupus), cardiolipin (cardiomyopathy), and so on. The body literally attacks itself to cause the autoimmune disease. In this study, the vaccinated group developed significant levels of autoantibodies against fibronectin, laminin, DNA, albumin, cytochrome c, transferrin, cardiolipin, and collagen. The responses varied among individual animals, probably reflecting genetic differences. It is surmised that something in the vaccines is one of the etiologies (in the genetically susceptible dog) of such diseases as cardiomyopathy, lupus erythematosus, glomerulonephritis, and so on (Hogenesch 1997).

A recent research project studied 20 healthy research Beagles and 16 healthy pet dogs. The research Beagles were split into several groups. Five dogs were vaccinated with a multivalent vaccine and a rabies vaccine, five dogs received only the multivalent vaccine, five dogs received only the rabies vaccine, and five dogs were unvaccinated controls. The multivalent vaccine was administered at 8, 10, 12, 16, 20, 26, and 52 weeks of age and every 6 months thereafter. The rabies vaccine was administered at 16 and 52 weeks of age and then once per year. Assays for antibodies directed against bovine and canine thyroglobulin were performed prior to and 2 weeks after each yearly vaccination. In the pet dogs, blood was collected prior to and 2 weeks after 1 vaccination. A significant increase in antibovine thyroglobulin antibodies in all vaccinated dogs was found, compared with control dogs. There was a significant increase in anticanine thyroglobulin antibodies in the 2 groups of dogs that received the rabies vaccine but not in the group that received the multivalent vaccine alone. In the pet dogs, there was a significant increase in anticanine thyroglobulin antibodies after vaccination but no significant change in antibovine thyroglobulin antibodies (Scott-Moncrief 2002). Once again no one has proven that these rises in anticanine thyroglobulin result directly in clinical hypothyroidism, but this study coupled with other observations suggests that veterinarians use caution when designing preventive medicine programs for their patients.

Vaccines are sometimes grown in cell cultures containing same-species antigens. This is done to reduce unwanted reactions to foreign proteins, and it is the case for FVRCP vaccination, which is propagated in Crandall-Reese feline kidney (CRFK) cells. There has been concern over vaccination with autogenous species antigen and its ability to sensitize the immune system toward "self-antigens."

Lappin reported the presence of autoantibodies to feline renal tissue following routine vaccination, but has been careful to state that there is no positive research link between vaccination and the incidence of chronic renal disease (CRD) in cats. Because CRD is such a common disease in cats, this relationship deserves further investigation. Autoantibody production occurred in both subcutaneously administered killed and MLV FVRCP vaccinations, but did not result from intranasal vaccination. Veterinarians may wish to explore further which route they select for routine protection.

In 1983, a study showed that allergies (such as atopic dermatitis) develop in dogs when vaccinated with distemper, hepatitis, and leptospirosis vaccines just before, but not after, exposure to pollen extracts. Dogs predisposed to atopy produce excess amounts of IgE antibodies in response to antigens, resulting in chronically irritating skin inflammations. Other organs may exhibit signs of hypersensitivity, causing, for example, conjunctivitis or rhinitis, as exhibited in further studies by this group (Frick 1983).

In humans, hemophilus influenza B (HIB) vaccination appeared to be a risk factor and was shown to induce diabetes-related autoantibodies in 1-year-old children. Researchers concluded that HIB vaccination may have an unspecific stimulatory polyclonal effect, altering beta cell-related immune response (Wahlberg et al. 2003).

Vaccines may contain many other ingredients besides the attenuated pathogen. Substances such as heavy metals, antibiotics, antifungals, preservatives, and other chemicals may be present, along with biological protein and cellular extracts, and even the possibility of other unknown disease agents. Little is known about the long-term effects of these agents. For years we have operated on the idea that these small amounts of chemicals were simply too little to cause significant disease phenomena, but with the advent of discoveries into the field of nanopharmacology, we now know that small quantities of substance can cause stimulation of various bodily functions. The presence of heavy metals is one such concern, and although many manufacturers have removed one such substance (thimerosal), it is not known what other similar substances may be contained in the patented formulas of current products. Most pharmaceutical companies will not disclose the exact contents of their products.

A study conducted at the University of Maryland School of Medicine finds that exposure to low levels of mercury can speed up and worsen the symptoms of an induced lupus-like disease in mice, even when the exposure occurs before the development of the disease. In this study, healthy mice that were not genetically susceptible to mercury-induced autoimmune disease were given injections of low-dose inorganic mercury over the course of 2 weeks. The levels of mercury and the length of exposure

chosen were much lower than the range commonly used in mouse studies of mercury toxicity. Five days later, the mice were given cells from the lupus-inclined mouse strain to induce lupus-like chronic graft-versus-host disease, a well-established mouse model of acquired autoimmunity. Mercury exposure accelerated the deaths of the lupus-induced mice and sped up the course of a kidney disease associated with lupus. Further, antibodies, or markers characteristic of lupus-like autoimmunity, were significantly elevated in the mice that had been pretreated with mercury.

Mercury exposure in animals can exacerbate preexisting autoimmune disease and even induce autoimmune disease in susceptible animals (Via 2003). Because thimerosal is still present in some veterinary vaccines, this may be an issue in vaccinosis, and furthermore, this fact should alert consumers and professionals about the possibility of chemical exposure and vaccines in relation to onset of chronic disease states.

HOMOTOXICOLOGY AND NOSODES

Due to concerns about vaccination overload of the immune system with development of autoimmune diseases and “vaccinosis,” there has been a proliferation of anti-vaccination Web sites offering alternatives to conventional vaccinations. One of the alternatives is the use of “nosodes” to convey immunity. A nosode is defined in Dorland’s Medical Dictionary as any disease product used as a remedy. In the *Homeopathic Pharmacopoeia of the United States* (HPUS), which is recognized by the FDA, a nosode is defined as “A homeopathic attenuation of pathological organs or tissues, causative agents such as ova, bacteria, fungus, parasites, virus particles, yeast, of diverse products or excretions.” To get new nosodes officially recognized in the *Homeopathic Pharmacopoeia*, these nosodes have to have a track record and be written about in homeopathic literature. An official nosode has to be in the homeopathic literature before 1960 (Wilson 1990).

Microdoses of a medication can be used to stimulate the body’s defense systems. Classical homeopathy may use single remedies, homotoxicology may use complex remedies, and others may use a great deal of isopathy, which consists of using small amounts of the same thing as the patient’s pathologic process. Yet each branch of homeopathy is guided by this principle in conjunction with the Law of Similars. This concept is, of course, not unique to homeopathy; vaccination against smallpox is an isopathic example of this principle dating back to about 800 BC, when Chinese doctors prevented smallpox by sniffing pox lesion secretions. In 1,400 tuberculosis patients, they used some of their own diluted sputum. Then, in 1796, Jenner developed a smallpox vaccination by dilution of cowpox lesions, as a “similar.” In 1820,

Wilhelm Lux, a veterinarian, cured very sick animals that had distemper symptoms using auto-nosodes, by taking various discharges from the animals and giving those discharges back to them as a treatment. (We do this procedure, in a modified fashion, when we employ autotransfusion techniques, which are reviewed elsewhere in this text.) In 1825, Samuel Hahnemann proved a Psorinum (scabies) pustule, and it is the first mention in the homeopathic literature of using diseased product. Hering coined the term “nosode” in 1831, when he proved an important nosode, Lyssin, which is made from the saliva of a rabid dog. By 1900, bacteriology was rapidly evolving, and nosodes could be made from specific bacteria, viruses, protozoa, and fungi.

Nosodes are generally diffuse immune stimulants. Allopathic literature cites the experimental use of low-dose typhoid vaccine as an immune stimulant for AIDS patients in March of 1989. This study used five-hundredths of a milliliter, injected weekly into AIDS patients, and found that this nosode raised the lymphocyte count in patients that were not currently on AZT. There is also ongoing research using BCG (an attenuated TB bacterium) in the management of superficial bladder cancer, in which researchers instilled BCG vaccine inside the bladder once a week for 6 weeks. This therapy had a fairly high success rate, at 75% (Soloway 1988). Pyrogen is an interesting nosode, based on placenta, which has immune stimulant activity. It is useful for septic fevers, especially if the pulse is low and the fever is high, or vice versa.

Colibacillinum (*E. coli*) was introduced in 1933, and it was used in diarrheas and meningitis, as well as for bladder infections. In an epidemic outbreak of meningitis in 1974 in Brazil, a 10 CH nosode was made from meningitis types A and C and given as a preventive, due to a lack of adequate allopathic therapeutics. This reduced the incidence markedly. Though this wasn’t double blinded, it was a compelling report, given that 18,000 children were treated, with only 7 active cases and 4 deaths.

On the basis of their composition, nosodes act on the basis of the microvaccines that they contain. Nosodes may function to eliminate the antigenic stimuli initiated by bacteria and viruses. As a result of the products of disease that they also contain, nosodes additionally act to bind the autoantigens created by decomposition of the body’s cells. Nosodes may also enable reactivation of the partially inhibited mesenchyme by dissolution of the stable bond of the antigen to the micelles. They thereby affect the accelerated discharge of disease toxins that, because of their great molecular weight of more than twenty thousand, can be transported away only by lymphogenic channels and not through the blood. Optimal effects are developed here by nosodes in attenuation of D6 to D200, such as those found in Psorinoheel (Neuner 1988).

Nosodes have a long history of safety. Thus far, in the track record of 150 years of using nosodes, there have been no diseases caused by using them. The HPUS states that no nosodes can be dispensed in a concentration below 6 X. The first attenuation must be rendered sterile. The manufacturers must sterilize the first attenuation, usually with alcohol or ethanol, or they pass it through a millipore filter (Wilson 1990). There are few or no controlled studies in animals that support the use of nosodes, though nosodes do have a long track history of usage.

Nosodes are often offered as a substitute for conventional vaccinations, and further research may show varying success or lack thereof for this practice as it relates to each specific pathogen. There are many research opportunities involving nosodes, but at this time there is not sufficient evidence to recommend that nosodes be used in this manner. Some veterinarians recommend using conventional vaccinations and then using nosodes for annual boosters. Because most vaccinations last more than 1 year, this may not be needed, but it should not prove harmful to most patients.

Author's note

In an outbreak of disease, it is worthwhile to make a "herd" nosode, e.g., in a recent outbreak of warts in a goat herd, we obtained a scraping of a wart, crushed and suspended it in alcohol, and added a ml of the alcohol admixture to a 2-oz. cocktail of *Galium* plus Engystol and *Thuja compositum* tablets. This remedy was administered to the entire herd in their drinking water. The entire herd cleared within a very short time, and an individual animal that had just started with early lesions had rapid regression. This same system can be used in an outbreak of kennel cough or other viral disease, as it is disease- and species-specific. We use it routinely in herds of horses that have had a West Nile case, or in strangles outbreaks as well (Broadfoot).

Primary remedy selections with specific indications in vaccine-related issues

Echinacea compositum is a compound formula that contains several useful components, including:

Echinacea angustifolia (also in *Aesculus compositum*, *Arnica-Heel*, *Belladonna compositum*, *Galium-Heel*, *Mercurius-Heel*, *Tonsilla compositum*, *Traumeel*, *Echinacea PC*, *BHI-Infection*, and *BHI-Injury*). It is useful in fever, sepsis, and inflammations of every kind, as it acts on the lymphatic system. *Echinacea* has been used as well for the bad consequences of vaccination (Hamalcik 1989).

Aconitum napellus (also in *Aconitum homaccord*, *Cerebrum compositum*, *Gripp-Heel*, *Spascupreel*, *BHI-*

Chamomilla, *BHI-FluPlus*, *BHI-Injury*, *Traumeel*, and so on) is one of the important homoeopathic remedies for fever, great anxiety, rapid and tense pulse, strong and possibly irregular heartbeat, alternating fever and chills, and possible hyperthermia. Low potencies are normally given in pyrexia, in neuralgic symptoms with paraesthesia, as well as with post-vaccinal encephalitis or meningo-encephalitis.

Influenzinum, which is a nosode of influenza vaccine (also in *Ginseng compositum*), has been recommended for the general tendency to corpulence and adiposity that arises from thyroid hypofunction. This has some intriguing possibilities, given the emerging data on thyroiditis and hypothyroidism related to vaccinosis. It has excellent action in exhaustion phases. It is used as a prophylactic measure in patients with a tendency to catch viral diseases. It is also used in bronchial asthma, chronic polysinusitis and other sequelae of influenza, and iatrogenic damage.

Thuja occidentalis (also in *Atropinum compositum*, *Cerebrum compositum*, *Cutis compositum*, *Galium-Heel*, *Psorinoheel*, *Thuja compositum*, *Ypsiloheel*, *BHI-Allergy*, *BHI-Hair and Skin*, *-Inflammation*, and *Neuralgia, Sinus*) is indicated in cases of poisoning or in adverse reactions to vaccination, especially smallpox. Retoxically caused impregnations, whether caused by the introduction of deep-acting toxins, such as bacterial toxins and so forth, or by the medical inhibition of reaction phases and also the suppression of a fever, influenza, throat infection, and so on, become the object of attempts by the body to redirect them into regressive vicariation, eliminating the toxins via skin eruptions of various descriptions or other excretion phases. This remedy is selected when signs of the patient match the proving symptoms of *Thuja*.

Zincum metallicum (also in *Discus compositum*, *Testis compositum*, and *FluPlus*) is a great nerve remedy, exerting action both on the brain and on the autonomic centers, as well as the sympathetic and the parasympathetic nervous systems. When eruptions have been suppressed, or if symptoms of cerebral irritation occur after vaccination, or in cases of viral encephalitis, this component may provoke a regressive vicariation, inducing a release of the homotoxins from the nervous system. Among the chronic symptoms of Zinc are nerve pains, muscular twitching, and hyperesthesia (Reckeweg 2002).

Galium Heel contains *Thuja occidentalis* and *Echinacea angustifolia*.

Inflammation contains *Echinacea purpurea* (also in *Traumeel*, *BHI-Echinacea PC*, *Inflammation*, *Infection*, *Injury*), which has the same indications as *Echinacea angustifolia*. (See *Echinacea compositum*.)

Mercurius is indicated in cases that may have damage from low-level mercury exposure, and its brief use may assist with handling of symptoms. Also contains *Echinacea angustifolia*. (See *Echinacea compositum*.)

Psorinoheel named for its content of Psorinum-nosode contains many nosodes. Of particular note is Medorrhinum (Gonococcinum). The proving of Psorinoheel was first published by Hering in 1891. It is well indicated in skin diseases (especially when they alternate with asthma), and in infectious, chronic, protracted illnesses (Impregnation phases). It is indicated as a constitutional remedy in vaccinosis, in alternation with Thuja, Natrum sulphuricum, and Vaccininum, and in chronic rheumatism. Vaccininum is also known as Vaccinotoxinum (Julian).

Smallpox vaccine nosode (also in the discontinued formula *Lymphatic*) is used in cases of overreaction following smallpox vaccination, for example, and in post-vaccinial nephritis with albuminuria and haematuria, and thus should be considered in chronic renal failure of cats, which may occur secondary to vaccine autoimmunity. It may be used generally in severe toxic states and in septic illnesses (Reckeweg 2002).

Traumeel contains Echinacea angustifolia and purpurea (which has the same indications). It is useful in a wide range of inflammatory conditions, and in regulation rigidity cases, where there is chronicity of the Inflammation Phase.

Ubichinon compositum contains para-Benzochinonum, which has certain protective functions against viral infections and may also help with paresis occurring after poliomyelitis, encephalitis, or vaccinations, when there is a disturbance in neuromuscular coordination, or in conditions such as multiple sclerosis, which has been suggested to be a vaccine-induced condition in some patients. It is helpful in autoimmune illnesses, which may be iatrogenic in origin. It is also of use in cellular phases, viral diseases, and in toxic infections (reaction phases). Particularly helpful in neoplasm phases is Naphthoquinone, which is also indicated in epilepsy with a brief aura and in threatened vaccinial encephalitis. Ubiquinone may change the course of vaccinial damage following severe reaction to vaccination (Reckeweg 2002).

HOMOTOXICOLOGY TREATMENT OPTIONS AND IMMEDIATE HYPERSENSITIVITY REACTIONS

In an acute health crisis, standard emergency medications such as antihistamine and corticosteroids are appropriate. Antihomotoxic agents can be used along with these agents or in cases where animal stewards decline drug therapy (Reckeweg 2002).

Because the signs of immediate hypersensitivity syndrome are reminiscent of bee sting hypersensitivity, we treat symptomatically with a combination of *Apis homaccord* and *Lymphomyosot*. The dose varies from one-fourth vial to 1 vial each, depending on the size of the patient. Puppies under 10 pounds receive one-fourth vial,

dogs that are 10 to 30 pounds get one-half vial, and larger dogs get a full vial. In many cases, we give the remedies combined and administer half the dose in an intravenous injection, for rapid response. The remaining half, which contains a small amount of blood from the injection IV, is succussed and given subcutaneously.

Apis homaccord and *Lymphomyosot* drops can be mixed together as a take-home cocktail, and given at the rate of one-fourth to one-half cc per dose. Advise the owners to give as needed until the swelling subsides.

Palmquist has used *Schwef-Heel* successfully in several puppies presenting in acute collapse following vaccination. This is likely due to the effect of sulphur, as it “shocks” the system back into autoregulation. This remedy may be used in conjunction with or following *Apis homaccord* and *Lymphomyosot* when response is poor.

Engystol has had good effects on various skin diseases, such as neurodermitis, urticaria, eczema, and furunculosis, as well as on diseases of the respiratory organs, especially asthma and cardiac and circulatory diseases, and therefore should be considered in feline vaccine reactions (including cutaneous herpetic dermatitis), as there is a strong respiratory component to their manifestations of hypersensitivity. *Engystol* is dosed at one-half cc in acute feline asthma cases or vaccine sensitivity reactions. We frequently give part of this intravenously. The remedy is succussed in the syringe, and then the remainder is given as a subcutaneous injection, in the manner of an autotransfusion therapy. Acute cases, such as the “lumpy puppies,” generally respond quite dramatically, and they seldom require ongoing therapy, although the atopic, pruritic skin patients may need long-term support. For atopic cases, refer to the section in this text on atopy.

If thyroiditis is suspected, give *Thuja-Injeel* (for the vaccinosis), *Thyroidea compositum* to support thyroid and matrix, *Traumeel* for inflammation, *Hepar compositum* to dispose of the toxins, *Galium-Heel* and *Lymphomyosot* for drainage, and possibly *Cutis compositum* for skin. See also protocols for hypothyroidism.

The following can be used as deep detoxification remedies: *Galium-Heel*, *Lymphomyosot*, *Hepar compositum*, *Solidago compositum*, *Thyroidea compositum* ideally as an autotransfusion, followed by oral therapy at 5 to 8 drops every 3 days. This should take 90 to 120 days minimum in many cases.

Ubichinon compositum and *Coenzyme compositum*, 1 tablet on alternate days, or these can be mixed into the main formula above and given as directed.

In the case of mercury issues, e.g. Thimerosal, Thuja containing formulas may be used (*Atropinum compositum*, *Cerebrum compositum*, *Cutis compositum*, *Echinacea compositum*, *Galium-Heel*, *Psorinoheel*, *Spigelon*, and *Ypsiloheel*) according to patient symptoms, and rem-

edies containing Mercurius may be selected to try to offset the mercury damage. Both of these are contained in *BHI-Inflammation* tabs, along with many other useful components contained in *Traumeel* and *Belladonna homaccord*, *Osteoheel*, and *BHI-Bone*. Note also that these remedies may be helpful in cases manifesting bone inflammation and bone pain.

Engystol is an important agent for immunoprophylaxis, particularly in conjunction with *Gripp-Heel*.

Psorinoheel, *Tonsilla*, and *Echinacea compositum* can be used as indicated for general support, but not as a substitute for vaccination.

SECTION 7

Glossary

Acrid (pungent): An herb that promotes circulation of Qi or blood or causes sweating.

Acupoint: A specific area on the body that, when stimulated by pressure, current, or a needle, has a physiologic effect upon the body.

Acupressure: The application of pressure, usually digital, to the acupuncture point.

Acupuncture: The introduction of a needle into a specific area of the body to elicit a physiological response in a patient.

Adaptogens: Herbs that increase resilience and resistance to stress. They act via the hypothalamic-pituitary-adrenal axis on endocrine, nervous, or immune function. One definition of an adaptogen is a plant that (a) increases nonspecific responses to stress, (b) is mild in action, without strong adverse effects, and (c) can be taken for extended periods.

Adjuvant (assistant, zuo) herbs: Herb(s) in a formula that either treat less bothersome symptoms of a disease, decrease toxicity of other herbs, or counteract some of the actions of the major herbs to prevent overcorrection of the problem. For example, in a formula with a very cold chief herb, the adjutant may be warm to prevent excessive cooling action of the chief.

Allopathic: Using an agent that works against a symptom or pathogen, such as an antibiotic, anti-inflammatory medication, and so on; also, the method of treating disease with medications that produce effects differing from those produced by the disease itself.

Alterative: An herb that restores proper functioning of the body by improving physiologic processes of digestion and elimination. Alteratives are commonly referred to as depuratives, blood cleaners, or purifiers, because of their effects on altering the excretion of metabolites. They are most useful in chronic disease states.

Amplitude: The intensity of the electrical stimulation of an acupoint.

Antagonism: The use of 2 herbs with opposing actions to prevent overcorrection. For example, when using a very cold herb in a formula, the herbologist may add a warm herb to prevent the formula from being too cold.

Anticatarhal: Herbs with this action help to remove excess mucus from the body, such as the sinuses, but may reduce secretions, inflammation, and congestion on any mucous membrane.

Antioxidants (free radical scavengers): Prevent oxidation and neutralize reactive free radicals, preventing the initiation of the inflammatory process. This inflammatory response is often responsible for organ degeneration and cell death.

Antispasmodic: Relieves muscle spasms, especially smooth muscle spasms.

Aperient: An herb with mild laxative action.

Aquapuncture: The injection of a fluid, such as vitamin C, vitamin B, or medication, into acupuncture points to achieve an effect in the body.

Arndt-Schulz Principle: A pharmacologic principle stating that different doses of a substance result in different responses by the body. Very low doses stimulate, moderately strong doses accelerate, stronger doses act to suppress metabolic functions, and still higher doses suspend life functions and result in toxic reactions.

Assistant (adjuvant, zuo) herbs: Herb(s) in a formula that either treat less bothersome symptoms of a disease, decrease toxicity of other herbs, or counteract some of the actions of the major herbs to prevent overcorrection of the problem. For example, in a formula with a very cold chief herb, the adjutant may be warm to prevent excessive cooling action of the chief.

Astringent: An herbal action referring to the plant actives that astringe tissues and reduce secretions and discharges.

Autosanguis: The use of a patient's own blood and the homotoxins contained therein to stimulate the greater defense toward healing.

Biological therapy: Use of agents that gently work with the body's greater defense to stimulate and bring about improved function and repair of the organism. These agents assist the body in eliminating homotoxins, draining homotoxins, repairing cellular and humoral elements, and re-establishing autocontrol of the body. Another form of biological therapy refers to use of

biological agents (such as monoclonal antibodies) in cancer treatment.

Biological value of food: The level of activated or intact nutrients present in food that helps to create health and maintain wellness. This is called “life force” in human food circles and is found in the highest content in fresh, uncooked fruits and vegetables.

Bitter: An herb with a bitter taste. Herbs that are bitter constituents tend to increase tone and activity of gastric mucosa, improve appetite, and stimulate gastric juices. The term covers a number of different types of phytochemicals.

Bitter (TCM usage): An herb that dries and clears pathogens.

Bladder: Urinary bladder. It combines fluids with toxins from the body and eliminates them.

Bland: An herb capable of promoting urination.

Blood: Both the fluid within the blood vessels and the substance that nourishes the mind and carries the Qi throughout the body. When capitalized, it generally refers to the Traditional Chinese Medicine definition.

Calmative: An herb that relieves nervous tension.

Carminative: An herb that contains volatile oils that promote proper intestinal function through relieving bloating, aiding expulsion of gas, and reducing inflammation.

Carotenoids: A large category of phytonutrients that are synthesized by plants and impart the yellow, red, or orange pigment color to fruits and vegetables. The most common and well known are alpha, beta, and gamma carotene, as well as lutein, lycopene, and xanthophylls.

Chen (deputy): The herb(s) in a formula designed to enhance the function of the main, or king, herb.

Chief (king) herb: The herb in a formula that treats the main symptom of a disease.

Cholagogue: An herb that stimulates release and flow of bile already formed in the liver; generally a property of bitters, but produced by other plant constituents as well.

Choleretics: Stimulate bile production by hepatocytes, and most have effective cholagogue properties as well.

Classical homeopathy: The method of treatment developed by Samuel Hahnemann, as detailed in his text, *The Organon*. It consists of using a single agent in miniscule dilution to treat disease conditions by finding the agent, which predictably creates signs of toxicity most similar to a patient's current disease symptoms.

Clear: To rid the body of a pathogen.

Cold: A pathogenic force that interrupts the normal flow of Qi. It can cause pain by causing Qi stagnation, interrupt breathing leading to coughs, interfere with digestion causing diarrhea or vomiting, and so on. In general, if discharges are present, they are clear or white.

Compositae (singular: compositum): Combination anti-homotoxic agents that contain a combination of suis-organ and homeopathic dilutions of various agents to assist recovery from more chronic disease types.

Conception vessel: A meridian running along the ventral midline.

Counteraction: The use of a second herb to decrease or eliminate the toxicity of a primary herb.

Damp: A sticky, wet, heavy pathogen. It is manifested as mucus or leucorrhea.

Decoction: An herbal preparation made by boiling plant material and reducing the liquid to make it more concentrated. It is used with hard parts of plants like seeds, roots, and bark.

Dedifferentiation Phase: Damage to the genetic material leading to development of undifferentiated, nonspecialized cell lines that can take on malignant behavior.

Deficiency: An imbalance in the body caused by insufficiency. For example, a patient who is dehydrated may have a Yin deficiency.

Degeneration Phase: Homotoxin damage that is severe enough to cause sufficient disruption of cell function and tissue disruption and to result in organ degeneration.

Demulcent: An herb that is rich in mucilage, which helps to soothe and protect irritated or inflamed tissue.

Deposition Phase: A phase wherein the homotoxins accumulate in the matrix with little response by the body, and they have not done major structural damage.

Depurative: Herbs that help to remove impurities (metabolites) from the blood and organs (gastrointestinal tract, urine, skin, or lungs), thereby performing “blood purifying.”

Deputy (chen): The herb(s) in a formula designed to enhance the function of the main, or king, herb.

Diaphoretic: Promotes perspiration, usually via vasodilation of blood vessels.

Dry: A pathogen that damages fluids. It can result in dry eyes, dry skin, or a dry cough.

Dry needling: The insertion of solid acupuncture needles into an acupoint.

Electroacupuncture: The act of attaching acupuncture needles to a machine, which generates a current at the desired frequency and amplitude to achieve the desired effect.

Emollient: Protects, smoothes, and softens external tissue.

Endogenous and exogenous free radicals: Endogenous free radicals result from normal day-to-day bodily and immune functions. Exogenous free radicals are from exposure to environmental chemicals and toxins.

Endogenous homotoxins: Agents that are generated through normal physiological processes by the body itself.

- Enhancement:** The addition of a secondary herb to help increase the effect of a primary herb in a formula.
- Envoy (shi) herbs:** The herb(s) in a formula that direct the herbal formula to work on a specific part of the body or harmonize the functions of the herbs in a formula.
- Essence:** The substance that forms the basis for birth, development, and reproduction. It is similar to genetic potential in Western parlance.
- Evidence-based veterinary medicine (EBVM):** “The incorporation of evidence-based medicine (EBM) principles into veterinary practice.” EBM relies upon the principle that “the practice of medicine should be based on valid, clinically relevant research data” with a footnote that states “to be accurate, this definition should include the phrase, ‘whenever possible,’ as medical ethics precludes conducting research that includes inhumane circumstances” (EBVMA 2000).
- Excess:** The state of having too much of a substance in the body in relation to a steady state. For example, a patient with a fever can have excess heat in the body.
- Excretion Phase:** Phase of homotoxicosis wherein the body attempts to excrete homotoxins by a wide variety of means, including such routes as sweating, urination, defecation, vomiting, coughing, and sebum formation.
- Exogenic or exogenous homotoxins:** Homotoxins that are introduced into the body from exterior to the organism, such as pollutants or other chemical exposures.
- Expectorant:** Soothes bronchial spasm and promotes the removal of mucus from lungs and bronchi.
- Fire:** Extreme heat. It may cause a very high fever, severely painful red throat, petechiae, and so on.
- Flavonoids:** A large family of plant-derived chemicals discovered in the 1930s by Albert Szent-Gyorgyi, who originally classified them as vitamin P. The more commonly known flavonoids are flavones, isoflavones, anthocyanins, anthocyanidins, and flavonols. Commonly named flavonoids are rutin, hesperidin, and quercetin. Flavonoids help to regulate the immune response and help to control the reactivity of immune-mediated cells, such as T and B lymphocytes, mast cells, and neutrophils. As antioxidants, they help to reduce inflammation.
- Fluid extract:** A plant extracted as one part plant to one part solvent 1:1 (i.e., 1 ml of liquid equals 1 g of herb).
- Fluids:** All the moisture substances in the body, including blood, tears, urine, joint fluid, digestive enzymes, and so on.
- Free radicals:** Molecules or atoms containing additional electrons that make the substance into a reactive and potentially damaging molecule. Formed on exposure to oxygen, free radicals can initiate a local cellular inflammation and death.
- Frequency:** The number of electrical impulses generated per second to an acupuncture point.
- Fu:** Tubular organs such as intestines or the bladder. Sometimes also referred to as Yang organs.
- Gallbladder:** Stores bile and assists the liver with control of sinews and joints. It also “cleans” the blood that the liver stores.
- Generalities:** General signs, such as “hot in the morning,” that are used in homeopathy to help make up the patient’s symptom picture.
- Gland therapy:** Also known as organ, glandular, or cellular therapy, gland therapy is the use of raw glands and organ concentrates to achieve therapeutic results. Glandular extracts have been proven to possess an affinity for similar tissues and contain many chemicals, hormones, enzymes, and co-factors that can exert significant physiological, metabolic, and therapeutic effects on cells and organ systems.
- Glycetract:** An herb extracted in glycerine and sometimes an herb extracted in alcohol but preserved in glycerine with the alcohol removed.
- Governing vessel:** A meridian that runs along the dorsal midline.
- Greater defense mechanisms:** The entire defense system of an organism.
- Ground regulation system:** The multisystemic components responsible for autocontrol and regulation of the matrix/ground substance and its contents.
- Ground substance:** Composed of polymerized sugars plus structural and meshing glycoproteins, this is commonly referred to as “the gel between cells,” mesenchyme, or matrix. It is regulated by cellular, humoral, and nervous components of the organism.
- Harmonize:** The action of blending the function of multiple herbs to decrease toxicity and improve function. The action of integrating functions of the body to promote optimal health.
- Heart:** The organ that governs blood and circulation and also houses the mind.
- Heat:** A warm pathogen. It can be thought of as inflammation or infection.
- Hemoacupuncture:** The process of inserting needles into a blood vessel to promote bleeding.
- Homaccords:** Combination antihomotoxic agents that contain multiple homeopathic potencies of the same agent in one formula.
- Homotoxicology:** The study of agents toxic or destructive to biological systems, and the organism’s biological response to those toxins in the manifestation of disease and pathologic processes. The field uses combination homeopathic and herbal agents to drain, detoxify, and stimulate healing through natural means. Originally coined by its founder, German physician Dr. Hans-Heinrich Reckeweg, the term

homo-toxicology originates from “Homo sapiens” and “toxicology.”

Homotoxicosis (plural: homotoxicoses): “A non-physiological condition which arises after reaction of a homotoxin on cells and tissues. A homotoxicosis occurs as a humeral or cellular appearance and can be followed by morphological changes on tissues. The homotoxicosis leads to defensive measures of the organism whose goal is to eliminate the homotoxins and to restore the physiological conditions when possible” (Reckeweg 2000).

Homotoxins: “All of those substances (chemical/biochemical) and non-material influences (physical, psychical) which can cause ill health in humans. Their appearance results in regulation disorders in the organism. Every illness is due therefore to the effects of Homotoxins. Homotoxins can be introduced from exterior (exogenic homotoxins) or originate in the body itself (endogenic homotoxins)” (Reckeweg 2000).

Homotoxones: Chemical compounds that are combined to reduce the toxicity of homotoxins.

Impregnation Phase: A phase consisting of homotoxin incorporation into matrix structures and subsequent damage to their functions. This results in cellular damage and dysfunction.

Incompatibility: Two (or more) herbs that cannot be mixed together without causing severe side effects.

Inflammation Phase: A phase of homotoxicoses marked by the use of inflammatory mediators and cells to remove homotoxins.

Infusion: An herbal preparation made by steeping (not boiling) the herb parts in water, usually for soft plant parts like leaves and flowers.

Injects and Injectable Homeopathics: Injectable homeopathic agents from Heel (INJECTABLE-HEEL). Many of these are not available in the United States.

Integrative Veterinary Medicine (IVM): Combines natural and alternative approaches with conventional veterinary practice methods for the benefit of the patient.

Jing: Essence.

Jing luo: A web of pathways that connect the acupuncture points on the body with the internal organs, one side of the body to the other and one organ to the other.

Jun (king): The main ingredient in a formula. It is used to control the major symptom.

Kidney: The kidneys store the body’s essence and provide all the warmth needed for all physiological processes within the body. They also produce the marrow that fills the bones.

King (jun): Main ingredient in a formula. It is used to control the major symptom.

Large blood autosanguis: The use of larger quantities of blood, usually combined with homotoxicology formulas, ostensibly to create a hematoma, which deposits

larger volumes of cytokines, markers, defense cells, such as white blood cells, particularly macrophage elements, such as dendritic cells, into the muscle tissue, to encourage a more pronounced body defense response.

Large intestine: The organ system involved in reabsorbing water from ingesta and sending it to the kidney.

Laser therapy: The application of low-intensity lasers to the acupuncture points.

Lignans: Naturally occurring chemicals found in flax seed, fruits, vegetables, and seeds. Lignans are considered phytoestrogens; they mimic animal estrogen and are being studied in breast cancer and heart disease.

Liver: The organ responsible for ensuring the smooth flow of Qi in the body. This function integrates the body into one unit, ensuring that all organs have the energy required to function. It stores blood and regulates circulation and menstruation. Finally, it controls the joints and sinews.

Lung: The organ responsible for respiration, control of the skin, and sweating.

Materia Medica: A textbook listing the various components of a medical modality and their appropriate uses. Literally, it translates from Latin as “the materials of medicine.”

Matrix: The ground substance that serves as a meshwork for cellular basement membranes. It also comprises a bioactive space for communication and metabolism of mesenchymal structures.

Mentals: Mental symptoms that are used in homeopathy to help to make up the patient’s symptom picture.

Meridian: A pathway through which energy flows.

Metabolic analysis of blood (nutritional blood testing [NBT]): Nutritional blood testing evaluates blood chemistries physiologically. This metabolic interpretation of blood focuses upon organ system function by tracing chemical values toward their underlying physiology, i.e., the biochemical processes that produced these blood chemicals. This type of analysis serves as the basis for determining organ functionality as well as determining the required vitamins, minerals, enzymes, co-factors, and nutrients.

Modern: Being done in recent times and not necessarily indicating a superior nature to prior methods.

Moxibustion: The burning of moxa (*Artemisia vulgaris*) directly over acupuncture points or on the top of an acupuncture needle to achieve a physiological effect.

Mucilage: An herb containing constituents that are gelatinous, such as mucins (complex carbohydrates) that are demulcent or emollient in effect.

Nanopharmacology: The study of the effects of low doses of material on the body.

Nervine: Herbs that have an affinity for the nervous system. They may be relaxing, sedative, or stimulating, or they may nourish and support the nervous system.

- Neural segmental gate theory:** A proposed mechanism to explain the efficacy of acupuncture. In this model, the theory states that acupuncture stimulates the afferent A-delta fibers. These send impulses to the substantia gelatinosa and synapse on inhibitory neurons. This prevents pain impulses traveling on more slowly conducting C fibers from reaching the higher nervous system and being perceived.
- Nutritive:** Having the action to supply nutrients that aid in normal physiology and thereby nourish the body. Constituents that supply minerals, vitamins, fats, oils, or amino acids.
- Nutraceutical:** A combination of terms describing nutrition or the use of nutrients and “ceutical” (from pharmaceutical), simply meaning nutrients that have a therapeutic effect on the body.
- Pathogen:** Cause of disease. There are six external pathogens that come from the environment. These include Heat, Dry, Cold, Wind, Summerheat, and Damp. There are also internal pathogens, such as emotional distress, stress, anger, and so on, which can cause disease.
- Patterns:** Instead of an etiologic diagnosis, TCM diagnoses are patterns. The pattern is then treated. Excess heat conditions are cooled. Deficient conditions are tonified, and so on.
- Pericardium:** Bag that encloses the heart, similar to Western terminology. However, in TCM terms, it may also be manipulated to treat emotional disorders.
- Phase 1, or the Excretion Phase:** A phase of homotoxicosis wherein the body attempts to excrete homotoxins by a wide variety of means, including such routes as sweating, urination, defecation, vomiting, coughing, and sebum formation.
- Phase 2, or the Inflammation/Reaction Phase:** A phase of homotoxicosis marked by the use of inflammatory mediators and cells to remove homotoxins.
- Phase 3, or the Deposition Phase:** A phase wherein the homotoxins accumulate in the matrix with little response by the body and have not done major structural damage.
- Phase 4, or the Impregnation Phase:** A phase consisting of homotoxin incorporation into matrix structures and subsequent damage to their functions. This results in cellular damage and dysfunction.
- Phase 5, or the Degeneration Phase:** Homotoxin damage that is severe enough to cause sufficient disruption of cell function and tissue disruption that results in organ degeneration.
- Phase 6, or the Dedifferentiation Phase:** Damage to the genetic material leading to development of undifferentiated, nonspecialized cell lines that can take on malignant behavior.
- Phase Theory:** The predictable response of the body to homotoxins as they are contacted and penetrate into the body, doing damage, and the use of this information to predict course, prognosis, and treatment planning.
- Phlegm:** A pathogen created in the body from dampness. It is an accumulation of damp leading to nodules or masses, such as lipomas.
- Physicals:** Symptoms of the physical body that are used in homeopathy to help to make up the patient’s symptom picture.
- Physiological range:** Marker used to identify and localize organ and metabolic function. It is based upon a physiological/homeostasis model stating that changes occur in the blood and organ systems and can be identified before pathology occurs and symptoms of disease appear. Results that are outside of the physiological range are not indicative of disease but may present an indication that a particular organ system is weak or becoming imbalanced, thereby affecting the overall homeostasis.
- Phytonutrients:** Chemical compounds that are produced by and help in the performance of many of the metabolic functions of the plant. New and growing research is proving that these nutrients, although they are not classified as essential nor required like foods and vitamins, can act as antioxidants and prevent oxidative damage and exert a positive and often dramatic effect on wellness and health and longevity, as well as prevention and treatment of disease.
- Phytotherapy:** The modern use of science and tradition in employing plants as medicines.
- Potention:** The combination of herbs with similar taste and temperature to increase the effect on the body.
- Progressive vicariation:** Undesirable observed course of the patient’s homotoxicosis, moving from upper left to lower right on the Six-Phase Table of Homotoxicology. It signifies worsening of the patient’s condition and can be associated with sudden worsening and even death.
- Pulse diagnosis:** The palpation of the quality of a pulse to reach a diagnosis. It takes into consideration the rate, strength, location, and characteristics of the pulse to differentiate patterns of illness.
- Pungent (acrid):** An herb that promotes circulation of blood and Qi or causes sweating.
- Purgative:** Laxative or cathartic action.
- Qi (chi):** Energy, life force. It is the force that warms the body, defends the body, and provides the energy needed to activate all processes within the body.
- Qi gong:** A series of movements designed to promote physical and mental well being. Used in human therapy only.
- Reaction Phase or Inflammation Phase:** A phase of homotoxicosis marked by the use of inflammatory mediators and cells to remove homotoxins.

Reference range: A measurement defined as the values that 95% (or two standard deviations) of the population fall into.

Regressive vicariation: The desirable observed course of the patient's homotoxicosis moving from lower right to upper left of the Six-Phase Table of Homotoxicology. It is significant because it indicates biological improvement of the case.

Regular meridians: Main meridians. There are 14, one for each zang fu organ along with the conception vessel and the governing vessel.

Restorative: An herb that helps to strengthen tissue and restores normal function.

Retoxins (residual toxins): "Residual poisons," which "consist of deposits of homotoxins and endogenic substances that cannot be eliminated." Glucosylation of normal proteins by excess glucose in diabetic patients is an important example (Reckeweg 2000).

Salty: Herbs that soften hardness and therefore may be used in cases of mass lesions. They may be used to guide formulas into the kidney to treat kidney disorders, and they have purgative actions and may be used in conditions such as constipation.

San jiao: See Triple Heater.

Sedate: To diminish a symptom.

Sedative: An herb or constituent that reduces functional activity; it calms or tranquilizes.

Shen: The mind (as opposed to the brain, which is an organ).

Shi (envoy) herbs: The herb(s) in a formula that direct the herbal formula to work on a specific part of the body or harmonize the functions of the herbs in a formula.

Shu xue: Acupuncture point.

Sialagogue: An herb that promotes the secretion of saliva.

Single effect: The use of a single herb to treat a patient.

Six-Phase Table of Homotoxicology: A table demonstrating the six phases of homotoxicosis (consisting of Excretion, Reaction/Inflammation, Deposition, Impregnation, Degeneration, and Dedifferentiation/Neoplasia), and their relationship to tissue and organ types. This table can be used to identify response to therapy and worsening of disease patterns, as well as for the selection of appropriate antihomotoxic agents.

Small blood autosanguis: Therapy that uses very small amounts of blood, usually in combination with antihomotoxic medicines. They are often given in stepwise dilutions. Often employed in chronic, unresponsive disease states.

Small intestine: A digestive organ. It separates fluid from the ingesta and passes the rest down to the large intestine.

Sour: Herbs that prevent leakage of fluids; for example, they may decrease perspiration or treat polyuria.

Spasmolytic: See antispasmodic.

Spleen: The organ responsible for extracting the energy from food for the nourishment of the body. It also holds the substances in the body in place. For example, a weak spleen allows blood to leak from vessels or organs to prolapse.

Stagnation: An interruption in the normal flow of Qi, digestion, breath, blood flow, and so on. It often leads to a feeling of fullness or pain.

Sterols: Plant-based lipid compounds that are chemically similar to, and that compete with, cholesterol. The most commonly known and well studied is betasitosterol. It is felt that the phytosterols reduce inflammation, are immune modulators, and affect cell membranes in tumor growth.

Stomach: The organ involved in transporting food.

Stomachic: An herb that is a digestive aid or tonic or that improves appetite.

Suis: The Latin term for glandular or organ therapy originating from swine. Useful in stimulating repair of diseased organ(s) and contained in many compositae remedies.

Summerheat: The only pathogen restricted to a season. It is a combination of heat and damp and is manifested by signs that Western-trained physicians classify as heatstroke.

Sweet: An herb that is tonifying and moistening. These herbs can decrease toxicity of other herbs in a formula.

Symptom-based therapeutic formulas: Antihomotoxic agents used to address a particular symptom set.

Symptom picture: A list of the patient's symptoms used in homeopathy to match a proper remedy as precisely as possible. The symptom picture includes mentals, physicals, and generalities (see specific definitions).

Taste (of an herb): The effect of the herb upon the body, as opposed to the sensation it provokes on the tongue. See bland, salty, acrid/pungent, sweet, bitter, and sour.

Temperature (of an herb): The action of an herb on the body. A warm herb counteracts a cool pathogen, whereas a cool herb counteracts a warm pathogen or condition.

Therapeutic nutrition: Broadly defined as the use of various nutrients, such as vitamins, minerals, amino acids, essential fatty acids, co-factors, enzymes, antioxidants, and phytonutrients, to support the body's immune and healing systems, thereby altering the course and outcome of a disease process.

Tonic: An herb that works to restore and strengthen the functioning or structure of the body, organ, or system; it enhances or normalizes function.

Tonify: To strengthen.

Toxins: Pathogens that harm the body. In Western terms, toxins would be inflammatory mediators, bacteria endotoxins, metabolic byproducts, and so on.

Traditional Chinese Medicine (TCM): An integral system of diagnosis and treatment of ill health using acupuncture and moxibustion, diet and herbs, physiological manipulation, and, in human medicine, Qi gong.

Triple Heater: The three functional divisions of the body. The first is from the head to the diaphragm, the second from the diaphragm to the navel, and the third from the navel to the feet. Each section is assigned a function. The upper section is concerned with respiration, the middle section is involved with digestion, and the lower section controls excretion.

Trophorestorative: An herb that has an affinity for restoring function and morphology of a specific organ or tissue.

Urinary bladder: The organ that combines fluids with toxins from the body and eliminates them.

Vermicide: A constituent or herb that kills intestinal worms.

Vermifuge: A constituent or herb that is used to expel intestinal worms.

Vicariation: "The transition of the indicating signs of an illness within one phase to another organ system, or the change of the fundamental symptoms and signs into another phase, with or without a change of the organ system" (Reckeweg 2000).

Vital force: The principle that energy or a life force is inherent in the growth and function of the cells and tissues of the body.

Vulnerary: An herb that aids in the healing of wounds or ulcers, particularly of the skin, but it can also apply to stomach ulcers. Usually applied externally.

Wild peptides: Wild peptides are formed when molecules or substances are conjugated to body proteins, thus forming a new, potentially antigenic complex. These

complexes can create autoimmunity, when the body recognizes them as a foreign antigen, followed by extension of this immune response to self-antigens.

Wind: Movement such as tremors or seizures. It is also a pathological force that can blow a second pathogen into the body to allow a disease to develop.

Yang: The active warm aspect of an entity that complements Yin.

Yin: The cooler restful aspect of an entity that complements the Yang aspect. It can also refer to fluids or moisture.

Zang: Solid organs such as the spleen or liver. Sometimes also referred to as Yin organs.

Zang fu organs: A pairing of one zang (Yin) and one fu (Yang) organ.

Zuo (adjutant, assistant) herbs: Herb(s) in a formula that either treat less bothersome symptoms of a disease, decrease toxicity of other herbs, or counteract some of the actions of the major herbs to prevent overcorrection of the problem. For example, in a formula with a very cold chief herb, the adjutant may be warm to prevent excessive cooling action of the chief.

Appendix

ACUPUNCTURE POINTS MENTIONED

- BL 10: In the indentation at the caudolateral margin of the atlas lateral to the space between C1 and C2.
- BL 11: Midway between the medial border of the scapula and the caudal border of the dorsal spine of T1. It is in the intercostal space between the 1st and 2nd ribs.
- BL 13: Lateral to the longissimus thoracis muscle at the level of the 3rd intercostal space.
- BL 14: Lateral to the longissimus thoracis muscle at the level of the 4th intercostal space.
- BL 15: Lateral to the longissimus thoracis muscle at the level of the 5th intercostal space.
- BL 17: Lateral to the longissimus thoracis muscle at the level of the 7th intercostal space.
- BL 18: Lateral to the longissimus thoracis muscle at the level of the 9th intercostal space.
- BL 19: Lateral to the longissimus thoracis muscle at the level of the 10th intercostal space.
- BL 20: Lateral to the longissimus thoracis muscle at the level of the 11th intercostal space.
- BL 21: Lateral to the longissimus thoracis et lumborum muscle caudal to the last rib and cranial to the transverse process of the 12th lumbar vertebra.
- BL 22: Lateral to the longissimus lumborum muscle cranial to the transverse process of the 2nd lumbar vertebra.
- BL 23: Lateral to the longissimus lumborum muscle cranial to the transverse process of the 3rd lumbar vertebra.
- BL 25: Lateral to the longissimus lumborum muscle cranial to the transverse process of the 5th lumbar vertebra.
- BL 26: Lateral to the longissimus lumborum muscle cranial to the transverse process of the 6th lumbar vertebra.
- BL 28: Lateral to the longissimus lumborum muscle caudal to the transverse process of the 7th lumbar vertebra. It is craniolateral to Bai hui.
- BL 37: On the caudal surface to the thigh midway between the tuber ishium and popliteal crease.
- BL 40: On the caudal midline of the hind leg at the level of the popliteal crease.
- BL 54: Dorsal to the greater trochanter.
- BL 60: Cranial to the attachment of the Achilles tendon to the calcanean tuber in the indentation between the insertion of the Achilles tendon and the lateral malleolus.
- CV 3: On the ventral midline four-fifths of the distance from the umbilicus to the pubis.
- CV 4: On the ventral midline three-fifths of the distance from the umbilicus to the pubis.
- CV 6: On the ventral midline three-tenths of the distance from the umbilicus to the pubis.
- CV 12: On the ventral midline midway between the umbilicus and xiphoid process.
- CV 13: On the ventral midline one-fourth of the distance from the xiphoid process to the umbilicus.
- CV 17: On the ventral midline at the 4th intercostal space.
- CV 22: On the ventral midline just cranial to the manubrium.
- CV 23: On the ventral surface of the chin just caudal to the mandibular symphysis.
- HT 7: On the caudolateral surface of the carpus between the tendons of the flexor carpi ulnaris and the superficial digital flexor.
- GB 2: With the mouth open, it is the depression in front of the intertragic notch dorsal to the condyloid process of the mandible.
- GB 20: On the dorsocranial aspect of the neck just caudal to the occipital condyles between the sternocleidomastoid and cleidocervicalis.
- GB 21: The midpoint between GV 14 and the acromion.
- GB 29: Craniodorsal to the hip joint.
- GB 30: Caudodorsal to the greater trochanter.
- GB 34: In the indentation cranioventral to the head of the fibula.

GV 3: On the dorsal midline between the dorsal processes of L4 and L5.

GV 4: On the dorsal midline between the dorsal processes of L2 and L3.

GV 11: On the dorsal midline between the dorsal processes of T5 and T6.

GV 12: On the dorsal midline between the dorsal processes of T3 and T4.

GV 14: On the dorsal midline between the dorsal processes of C7 and T1.

GV 15: On the dorsal midline between C1 and C2.

GV 16: On the dorsal midline between C1 and the skull.

GV 20: On the dorsal midline on a line drawn between the tips of the ears.

GV 25: On the dorsal midline of the snout where the nose meets the hairline.

GV 26: On the midline between the nose and the lips, approximately one-third of the distance from the nose to the lips.

KI 1: On the plantar surface of the foot under the metatarsal pad between metatarsals 2 and 3.

KI 3: On the medial surface of the hock between the medial epicondyle of the tibia and the Achilles tendon.

KI 4: Caudoventral to KI 3.

LI 3: On the medial surface of the distal 2nd metacarpal bone.

LI 4: On the medial surface of the second metacarpal bone at the level of the junction with the 1st digit.

LI 10: On the lateral surface of the forearm one-sixth of the distance from the elbow between the extensor carpi radialis and the common digital extensor.

LI 11: On the lateral surface of the elbow at the lateral aspect of the crease when the elbow is fully flexed.

LI 18: On the ventrolateral surface of the neck between the sternocephalicus and brachicephalicus at the midpoint.

LIV 3: The position of this point is controversial in animals. Some claim that it is in the indentation on the dorsal surface of the hind foot where the 2nd and 3rd metatarsal bones meet. Others say it is on the medial surface of the 2nd metatarsal bone at the same level.

LU 1: In the first intercostal space in the depression medial to the greater tubercle of the humerus.

LU 7: On the medial surface of the paw caudal to the styloid process of the radius medial to the tendon of the extensor carpi radialis.

PC 5: One-fourth the distance from the carpal joint to the elbow, proximal to PC6 in the same groove.

PC 6: On the caudal surface of the forelimb at the distal junction of the radius and ulna.

PC 7: On the caudal surface of the forelimb in the center of the crease of the flexed carpal joint.

SI 9: Sometimes called “Qiang feng”; in the indentation at the meeting point of the lateral head of the triceps, the long head of the triceps, and the deltoideus.

SI 10: Just caudal to the shoulder joint ventral to the scapula.

SP 6: On the medial surface of the hindlimb one-fifth of the distance from the hock to the stifle tibia just caudal to the tibia.

SP 9: Caudodistal to the medial condyle of the tibia.

SP 10: On the medial surface of the hindlimb proximal and cranial to the distal femoral epicondyle.

ST 6: Rostral to the angle of the mandible, on the belly of the masseter muscle.

ST 7: Ventral to the caudal aspect of the temporomandibular joint with the mouth closed.

ST 25: In the muscle groove of the rectus abdominus lateral to the umbilicus.

ST 28: Three-fifths of the distance from the umbilicus to the pubis in the same sagittal plane as ST 25.

ST 35: In the lateral depression distal to the patella.

ST 36: Cranial to the proximal tibia one-fourth the distance from the stifle to the hock.

ST 40: Between the long digital extensor and the tibialis cranialis halfway between the stifle and the hock just lateral to the fibula.

ST 44: Just distal and lateral to the 2nd metatarso-phalangeal joint.

TH 5: On the cranial surface of the forelimb between the radius and ulna opposite PC 6.

TH 6: Three-fourths of the distance from the elbow to the wrist in line with PC 6.

TH 14: Just caudal to the shoulder joint and ventral to the acromion process.

Bai hui: On the dorsal midline at the lumbosacral junction.

Ding-chuan: At the lateral margin of the vertebrae at the level of the junction between C7 and T1.

Hua tuo jia ji: A series of points on the lateral edges of the vertebral bodies.

 - for degenerative myelopathy, 545, 548
- Vitamin B₁
 - for vestibular syndromes, 586
- Vitamin B₆
 - for bronchitis, 447, 450
 - for feline bronchial asthma, 453, 455
 - for hyperadrenocorticism (Cushing's disease), 513, 515
- Vitamin B₁₂
 - for anemia, 151, 154
 - for autoimmune anemia and thrombocytopenia, 128
 - for canine infectious hepatitis, 605, 607
 - description, 33–34
 - for exocrine pancreatic insufficiency (EPI), 379

Vitamin B₁₂ (continued)

for *Hemobartonella felis* (*Mycoplasma haemophilus*), 159, 161

in liver extract, 21

for nephritis, acute and chronic, 476

for renal dysplasia, 487

Vitamin C

antioxidant, 32

for autoimmune diseases

immune-mediated arthritis, 132, 134

lupus erythematosus, 137

for cancer, 721

cancer and, 32–33

for cystitis, 490

for degenerative myelopathy, 545, 548

for digestive system diseases

exocrine pancreatic insufficiency (EPI), 379

gingivitis, 278, 279

stomatitis/periodontal disease, 285

tooth extraction, 288, 290

for eye and ear diseases

cataracts, 393, 394

glaucoma, 404, 407

for infectious diseases

canine coronavirus diarrhea, 592, 593

canine parvovirus, 601, 603

FeLV, FIV, and FIP, 622, 623

herpes stomatitis, 626, 627

infectious tracheobronchitis, 609

tick-borne diseases, 631

for lymphadenopathy/tonsilitis, 171

for mange, 272, 273

for metabolic and endocrine diseases

Addison's disease, 509, 511

hyperadrenocorticism (Cushing's disease), 513, 515

for musculoskeletal system diseases

arthritis, 424

osteocondrosis, 434–435

spinal arthritis/spondylosis, 439

Vitamin E

for blood and lymph diseases

chylothorax, 156, 157

hyperlipidemia, 163

lymphadenopathy/tonsilitis, 171

for cancer, 721

heart base tumor, 738

hepatic adenocarcinoma, 742

squamous cell carcinoma, 761

for cardiovascular system diseases

cardiac arrhythmias, 209, 213

heart disease, 217, 220

heartworm disease, 226

hypertension, 229, 230

pericardial effusion, 232, 235

for cataracts, 393, 394

description, 33

for diabetes mellitus, 517, 521

for digestive system diseases

cholangiohepatitis, 356, 359

chronic active hepatitis, 348, 352

cirrhosis of the liver, 362, 364

exocrine pancreatic insufficiency (EPI), 379

for lupus erythematosus, 137

for neurological disorders

degenerative myelopathy, 545, 548

epilepsy, 550, 553

for pleural effusion, 457, 459

for urogenital system diseases

nephritis, acute and chronic, 476, 478

nephritis, glomerular, 481, 484

renal dysplasia, 487, 488

urolithiasis, 504, 505

Vitamins, 31–34. *See also specific vitamins*

Vitex fruit (Man jing zi)

for anterior uveitis, 390

for corneal ulcers, 400

Volatile oils, 120

Vomiting

definition and cause, 311

drug(s) of choice, 311

integrative veterinary therapies
