A John Wiley & Sons, Inc., Publication

Robert S. Goldstein is Director of Veterinary Services for Animal Nutritional Technologies, Healing Center for Animals, Northern Skies Veterinary Center and Director of Product Development for Earth Animal, all in Westport, Connecticut.

Paula Jo Broadfoot, DVM, graduated from Kansas State University School of Veterinary Medicine and has been studying and practicing therapeutic nutrition for the past 18 years.

Richard E. Palmquist, DVM, is currently the head of medicine at Centinela Animal Hospital in Inglewood, California. He is also currently a research chair for the American Holistic Veterinary Medical Association and a consultant in alternative medicine for the Veterinary Information Network (VIN).

Karen Johnston, DVM, works at Hampton Veterinary Hospital in the fields of small animal and exotic pet medicine, surgery, and acupuncture. She is also the co-owner of Natural Solutions, herbal supplements for veterinary use.

Jiu Jia Wen, DVM, is the owner of Hampton Veterinary Hospital in Speonk, New York. His hospital provides complete veterinary care for birds, reptiles, and small mammals using a combination of both Western style medicine and traditional Chinese modalities including herbal medicine and acupuncture.

Barbara Fougere, BSc BVMS (Hons), GDBus MOD&T CVA (IVAS), CVHM, CVCP, ACNEM, is the president of the Australian Veterinary Acupuncture Association and President for the International Veterinary Botanical Medicine Association.

Margo Roman, DVM, founded her own animal clinic in 1983. It originated as a mobile clinic and now is a full service holistic veterinary practice. In 2002 she opened the first holistic health center for animals offering chiropractic, cranial sacral, physical therapy, massage, reiki, and polarity in the lower level and in the main clinic homeopathy, acupuncture, herbs, surgery, and conventional medicine in an integrative method.

Dedication

This book is dedicated to our fellow colleagues and all veterinary professionals who have the insight, motivation, and inspiration to reach out and find innovative therapies that improve the health and well being of animals everywhere. A special acknowledgement goes to our patients, past and present, and their human companions for their courage, fortitude, and ability to persist through these

challenging times of transformation. They are our greatest teachers and rewards in this work. We also dedicate this work to the new patients who will benefit from the open mindedness of their veterinarians who begin to include nutritional, biological, and herbal therapies in their treatment regimes. God bless us all!

Foreword

By Carvel G. Tiekert

About 30 years ago I became interested in the concepts of alternative and complementary veterinary medicine and in the course of things searched out names of veterinarians who had similar interests. One of those is the editor of this new book in veterinary medicine. At that time Dr. Bob Goldstein was a practitioner with his brother Marty in New York State. During a visit with Bob, he said to me, “We need somebody who can pull us all together and get the idea of complementary veterinary medicine going.”

As a result, I sent letters around and in 1982 the American Veterinary Holistic Medical Association was formed at the Western States Veterinary Conference (now the Western Veterinary Conference). Over the course of time this organization’s name changed to the American Holistic Veterinary Medical Association. At the time of that initial meeting we wrestled with the terms to describe what we wanted to do in the profession, and the word (w)holistic was chosen because then it seemed to be the most commonly used word. We didn’t want “alternative” for obvious reasons, and “complementary” seemed too far away at the time.

Now things have changed, and veterinary medicine is looking to integrate these complementary and alternative veterinary protocols into mainstream veterinary medicine.

We have sessions relating to alternative and complementary therapies at all the major meetings, and almost all state associations have had sessions at one time or another. Even the words have changed. Since many presentations frequently mention conventional medicine techniques along with the alternative techniques, the word “integrative” is one that is appropriately used.

This book is designed to answer the changing needs brought on by these developments. Its concept is to be in the line of *Conn’s Current Therapy* for human medicine and Kirk’s *Current Veterinary Therapy* for veterinary medicine, taking diseases and syndromes and examining diagnostic treatment techniques for each of them. We have a number of books currently available within the profession that present great discussions about particular modalities. This book allows us to integrate those conventional modalities of the profession with a number of the complementary and alternative modalities to provide better care for our patients. It is my hope that this book, like *Current Veterinary Therapy*, will be updated and expanded as new information and understandings in veterinary medicine become available.

Carvel G. Tiekert, DVM; Founder, American Holistic Veterinary Medical Association

Foreword

By Martin Deangelis

Dr. Robert Goldstein and his contributing authors have written a book that bridges the gap between allopathic and complementary veterinary medicine, which many professionals consider opposing methods of treating disease. Allopathic and complementary medicine are methodologies that support each other in the quest to restore our patients to health and well being.

I am a board-certified surgeon and I have 42 years of experience as a veterinarian. I have worked closely with Dr. Goldstein and several other complementary practitioners for many years and I have come to greatly appreciate the benefits of these associations.

Over the years I have operated on animals that have been diagnosed with “inoperable” or “incurable” cancer. Many of these patients had tumor removal or debulking procedures followed by complementary medical treatment. A significant percentage of these individuals survived longer than expected, went into remission, or sometimes had no detectable cancer years after surgery. This experience has enabled me to recommend surgery in conjunction with complementary medicine for patients that in the past, without such support, I would have considered to be untreatable.

It is my experience that the importance of therapeutic nutrition and biological support in the management of serious and complicated disease is often unappreciated or given no credit. It is important for us to acknowledge that all drugs possess some degree of toxicity and potential for creating adverse side effects. When conventional drug therapy is chosen, side effects can be minimized

and efficacy increased by integrating complementary medicine.

As an example, nutritional and biological therapies, when given in combination with chemotherapy, often-times protect the patient from toxic side effects. Also, the elements of treating degenerative joint disease include weight and exercise control and the use of therapeutic levels of antioxidants to neutralize free radicals and their inflammatory effect. Nutritional supplementation can aid cartilage protection and repair and help relieve pain and joint stiffness.

Integrating Complementary Medicine into Veterinary Practice is written by experienced practitioners and presents in modern and concise language a fully referenced book on the theory of alternative methods as well as individual disease treatment protocols. This book gives clinicians a guide so they can quickly access a knowledge base of alternative therapies and decide on a case-by-case basis whether to use conventional medical or alternative therapies alone or a combination of both.

Integrating Complementary Veterinary Medicine into Veterinary Practice is important because an increasing number of clients request complementary medicine for their pets’ medical treatment as well as pre- and post-operative regimes. This book provides, in a clear and organized fashion, the indications and applications of complementary medicine for the general practitioner as well as the specialist.

Martin Deangelis, DVM; Diplomate, ACVS

Preface

The veterinary profession has made major diagnostic and therapeutic advances in the treatment of infectious and degenerative diseases. The incidence of chronic disease and cancer, however, has increased at alarming rates and is diagnosed at younger ages, even in puppies and kittens. Perhaps it is this rising incidence of degenerative diseases that has spawned an insatiable search by professionals, scientists, and animal guardians for alternative therapies. Such therapies are gentle in their action, more effective in their abilities to prevent disease, and hold the promise of true healing—a goal that modern medicine to date has only been able to control but not cure.

At this same time, there is a widening gap within the veterinary profession between the “conventional” and “holistic” practitioners. This gap is deep and has been fueled by misunderstandings in terms, evidence-based rules, and the sense that a clinician has to be either one type of practitioner or another, as well as an overall incorrect perception that one form of practice is right and therefore the other must be false or bogus.

Integrative veterinary medicine (IVM), as outlined in this book, defines one profession that uses a combination of alternative and conventional practice methods for the benefit of the patient. IVM seeks to remind veterinarians of their “oath” to use knowledge and skill for the protection of patients, to relieve suffering, to help advance medical knowledge and individual competency, and above all to do no harm.

Within the tenets of this oath and our intent to do right for our patients, we often run into the brick wall of evidence-based rules that prohibit the expanded use of alternative therapies because there is little statistical proof that they work. While the authors of this book do not challenge this “evidence-based filter,” our 100-plus years of combined experience has shown us that these therapies are right for our patients and their companions.

At some point in our evolution as practitioners, we made a paradigm shift to expand our approach and care for our patients within the broad framework of our veterinary oath. Each author has had a personal journey that

has led to the exploration of alternative therapies. At that point in time, there was no book nor reference nor scientific study that led to and opened the door. In our cases, “a light bulb went on” that brightened our way to explore alternative therapies with the ultimate goal of benefiting our patients and their companions. The intent of this “shift in perception” was not to abandon school and practice lessons, but rather to include therapies that we resonated with, that made sense, were requested by our clients, helped our patients, and improved our skills as medical healers.

We became proficient in these methods, but our profession as a whole did not embrace a unified vision, and many who were thought to be in opposing camps were choosing sides. The concept of one profession with multiple treatment choices was not materializing, and frustrated clients were forced to seek alternative solutions in areas such as the data-bloated Internet—fraught with misinformation—or from well intended but unqualified people. Our vision was to write a book for the professional that addressed these issues.

Integrating Complementary Medicine into Veterinary Practice was written in the convenient style of *Current Veterinary Therapy* or *Blackwell's Five-Minute Veterinary Consult*, offering clinicians fully referenced treatment protocols that address the clinical, emotional, and decisional situations that practitioners face daily. When this integrative veterinary concept was presented to Wiley-Blackwell, the publisher, they felt it was important to secure independent veterinary opinions as to the perceived need for a book of this type. This practitioner survey was overwhelmingly positive, indicating that the need for this book truly exists.

Chances are, if you are reading this preface, you too are wondering if there are other tools out there for your own personal toolbox of healing. Perhaps you hope for or envision a day when you can heal more patients with greater clarity in regard to this newly emerging field of practice. If so, we welcome you to our family and to the pages of this book. Holistic doctors believe that through natural methods much health can be rekindled and

engaged, and through conventional medicine many miracles can occur.

We truly believe that integrative medicine is the movement of the future. It holds the experiential efforts of pioneering healers long gone and the promise of technologies we haven't yet dreamed of discovering, let alone implementing. It uses science to chart a path but never forgets its own ability to watch, listen, and know what it sees. Medicine is and always will be an art, and technology serves that art; however, it is the artist that applies the technology in ways that lead to success. We as authors of this book have worked diligently in our

spare time to create this text, and we know that your experiences and comments will make the future editions even better. That is the reason that we came together to produce this text. It is our hope that this book brings you greater fulfillment and a new sense of joy in your work as veterinarians.

May your journey never end!

Respectfully,

Robert S. Goldstein, VMD, (editor); and
Rick Palmquist, DVM (writing for Paula J. Broadfoot,
DVM; Karen Johnston, DVM; Barbara Fougere, BVSc;
Jiu Jia Wen, DVM; and Margo Roman, DVM)

Acknowledgments

I would like to thank my wife Susan for her total support for the writing of this book. Thanks to Susan and Andes Best for the creation of the book's logo, which represents the guiding principle of integrative medicine. I thank Dan, who introduced Wiley-Blackwell to the data and concept that serve as the basis for this book. Thanks to Fred Best for his technical and editorial efforts and to Melissa, John, Betsy, Helmut, and Patricia for their ongoing support. I give my thanks to my family Abbey, Merritt, Jeff, Dan, Sam, Cooper, and Graham, and an extra special thanks to my brother Marty for his pioneering work in alternative veterinary medicine.

I give my thanks to PJ and Rick, who spent innumerable hours writing the homotoxicology sections of this book and also found the necessary time to assist me in the editing process, and to Jay and Karen for staying on course and especially for substantiating CHM clinical references under tremendous deadline pressure. A very special thanks goes to Barbara Fougere, who miraculously delivered the chapters on Western herbal medicine in an incredibly short amount of time, and to Margo Roman for her efforts and support of Barbara and the book. I thank Ray Kersey, Justin Jeffries, Erica Judisch, Erin Magnani, and Antonia Seymour from Wiley-Blackwell—especially Erica and Justin, who smoothed the road to a larger and more comprehensive book. And finally a special thanks to Tracy Petersen whose editing and query expertise has transformed the raw manuscript into a professionally organized, readable textbook.

Robert S. Goldstein, VMD

I would like to thank, first and foremost, my husband Jeff, who kept the ship afloat while I was working to research this text. I thank my children Brannon, Barrett, Burke, and Brea, who are a constant affirmation of just how important is our quest for a gentler, more biological approach to medicine; my clinic staff Susan, Sonia, Ila, Sally, and Emily, who kept me grounded and managed the day-to-day work so that I could devote more time to writing; my parents, especially my mother, Benita, for

allowing me to study and for instilling a thirst for knowledge and an abiding belief in my own abilities; Lauri Parent, for being a marvel of information and data gathering over the last decade; Carvel Tiekert, whose constant devotion to the furthering of integrative medicine—and in particular, homotoxicology—has made many of our advances possible; my co-authors—particularly Rick Palmquist—who remained steadfast in purpose and encouraged me to stay on task when I was weary of the work; and Bob Goldstein, without whom we would not have created this work. A particular tribute is owed to Susan Youngblood, my “girl Friday,” who has been with me for 25 years of this long journey and adventure into complementary healing.

PJ Broadfoot, DVM

My eternal gratitude extends to my parents Mary and Allen, for showing me how to know truth; my wife MJ and my children Jessica, Jake, and Jared, for allowing me the time and support to write; to my staff for their endless support; my clients and patients, for teaching me how to apply the wonderful things I learned in veterinary school; Martin Goldstein, for showing me another way to practice; my co-authors—especially PJ Broadfoot and Robert Goldstein—who I am sure will remain lifelong friends in healing; and the American Holistic Veterinary Medical Association, for providing a safe place for the development of CAVM. Finally, I extend my gratitude to Dr. Alta Smit of Heel for her tireless support of biological therapy.

Rick Palmquist, DVM

It has been a great honor to be trusted with the lives of my patients and I am grateful for the faith their people have shown in me. I promise to continue to seek knowledge so that I may always provide them with my best care. I would like to thank my family for their support throughout my schooling, and my husband Jiu for introducing me to herbs and acupuncture. I also want to thank Jason,

Joshua, and Jacob for being the best sons a mother could have.

Karen Johnston, DVM

I want to thank my wife Karen for all her support.

Jiu Wen, DVM

I would like to acknowledge Drs. Susan Wynn, Bob Goldstein, and Margo Roman for their support in this project; my teachers—particularly Kerry Bone—and my

four-legged patients who have shown me the gentle power of plant-based medicine.

Barbara Fougere, BVSc

I thank all the animals that have given enlightenment to the doctors and their caretakers and my horse Champ who empowered me to seek integrative veterinary medicine for his care and for inspiring the DrDoMore project.

Margo Roman, DVM

Introduction: How to Use This Book

This book is a working manual for veterinarians who are interested in the integration of alternative methods into conventional veterinary practice.

Section 1 of the book covers the history, theory, evidence, and clinical references for therapeutic nutrition, Chinese herbal medicine/acupuncture, homotoxicology, and Western herbal medicine. In each modality there is an extensive reference section that substantiates the use of each of the methodologies in both human and veterinary medicine.

Sections 2 and 3 of the book contain disease protocols using combination therapies of therapeutic nutrition, Chinese herbal medicine/acupuncture, and homotoxicology. Section 2 covers chronic degenerative diseases and Section 3 covers infectious diseases. The disease protocols are all similarly formatted as follows: definition and cause, medical therapy and nutritional recommendations, anticipated prognosis, integrative veterinary medicine, therapeutic nutrition (general considerations and appropriate nutrients), Chinese herbal medicine/acupuncture (general considerations and appropriate Chinese herbs), homotoxicology (general considerations and appropriate anti-homotoxic agents), the authors' suggested protocols (therapeutic nutrients, Chinese herbs, and homotoxicology), product sources, and references.

Section 4 is dedicated completely to Western herbal medicine. It lists similar diseases as found in Section 2 and 3 and specific Western herbal protocols for those diseases, followed by substantiating references.

Section 5 covers neoplastic processes and is similar in

organization to Sections 2 and 3. The first chapter in this section is a discussion of the integrative veterinary therapies of therapeutic nutrition, Chinese herbal medicine, and introductory homotoxicology. There is a discussion on diet, elaborating upon the restrictions that are required when Chinese herbal protocols are used. The next chapter spells out cancer treatment protocols by cancer type, listing the recommended therapeutic nutrients, Chinese herbal formulas, and homotoxicology remedies. The following chapter provides more in-depth discussions on the autotransduction and advanced homotoxicology approach to cancer and a complete listing of references and scientific studies that support the recommendations.

Section 6 is a discussion of vaccinations, their impact upon the cause and prevention of diseases, and alternatives, as well as treatment protocols that are designed to prevent complications and future problems. This is followed by scientific references.

Section 7 is a glossary of the most common terms related to therapeutic nutrition and nutraceuticals, Chinese herbal medicine and acupuncture, homotoxicology, and Western herbal medicine.

Section 8 is a comprehensive set of resources. It includes organizations and advanced studies for alternative methods and an extensive listing of companies that manufacture the foods, nutraceuticals, homeopathics, Western herbs, and Chinese herbs that are presented in the disease protocols in Sections 2, 3, and 5.

The Appendix contains a list of acupuncture points mentioned in this text.

SECTION 1

Introduction to Integrative Veterinary Medicine: The Integration of Old and Ancient Medical Practice Techniques into Conventional Veterinary Practice

Chapter One

Introduction to Integrative Veterinary Medicine

INTEGRATING ANCIENT MEDICAL PRACTICE TECHNIQUES INTO CONVENTIONAL VETERINARY PRACTICE

Integrative veterinary medicine (IVM) combines natural and alternative approaches with conventional veterinary practice methods for the benefit of the patient. IVM uses modalities such as therapeutic nutrition, Chinese herbal medicine, and homeopathy, along with a proper diagnosis, relying upon internal medicine, ultrasound, radiology, blood evaluation, and other recognized diagnostic techniques. The purpose of this book on integrative veterinary medicine is to define and blend conventional (allopathic) veterinary and alternative (holistic) practice methods along with traditional definitions of healing.

This book discusses the arts and practices of therapeutic nutrition, Chinese and Western herbal medicine, and homotoxicology (a combination form of homeopathy). Guidelines for practicing veterinarians to incorporate these treatment modalities into routine daily practice are outlined in modern terms. The book defines and clarifies terms and concepts of therapeutic nutrition and non-Western forms of medicine in more understandable language. As an example, fever, redness, inflammation, and thready pulse are commonly accepted terms that are often discussed in a clinical veterinary practice. Terms such as “Chi,” “Yin and Yang,” and “tongue or pulse diagnosis” often bring misunderstanding and confusion to conventionally trained clinicians.

The modern interpretation of alternative and ancient therapies allows them to be integrated into veterinary practice without years of intensive training or learning of new methodologies, terms, and procedures. The treatment protocols presented in this book have been used in a clinical setting and are specifically matched to the clinical condition. The goal is to improve therapeutic results when these treatment modalities are used alone or in combination with prescribed medications for the benefit of the patient. Also presented, when indicated, is a comparison of results when treating diseases with conven-

tional medicine alone, with alternative medicines alone, and with a combination of conventional and alternative methods.

DESCRIPTION OF VETERINARY PRACTICES TODAY

The basis of conventional veterinary practice—diagnosis and pathology orientation and symptom-oriented drug therapies

Our veterinary education builds from the scientific basis of biochemistry and physiology, through disease definitions and histology, and finally into the clinical application of diagnosis and medical treatments. The more specialized our veterinary training, the further our focus shifts from underlying causes and prevention to diagnosis and appropriate medical therapies. Additionally, most pharmaceutical research is focused upon the treatment of existing disease and less upon prevention and wellness.

As busy veterinary practitioners, we often become overwhelmed with the case load of infectious and chronic degenerative diseases. Many times we barely have enough time to do more than treat and stop the bleeding, itching, chewing, vomiting, diarrhea, limping, eating, drinking, urinating, and so on. In many practices, this required focus upon medicating symptoms often leaves little time to discuss prevention, wellness, supplements, and natural remedies, all of which may help the pet's present situation.

Although this may be an exaggeration of day-to-day practice, as veterinarians, we often guide our clients on daily home care, diet, supplements, training, grooming, and so on. However, the fact remains that wellness and prevention methods often do not get the time that they deserve. The unfortunate result is that clients, when faced with recurring conditions and desiring options for alternatives to chronic medications, often seek answers to their questions from the Internet or from other potentially unreliable sources.

Holistic, alternative, and complementary veterinary practice

Many terms such as “holistic,” “alternative,” and “complementary” are often used interchangeably, leading to confusion and a breakdown in communication between animal companions, veterinarians, and animal health care personnel. Current terminology refers to such practices as complementary alternative veterinary medicine (CAVM), which includes a diverse group of therapies typically not taught in medical schools. (Some alternative modalities, such as acupuncture, therapeutic nutrition, and Chinese herbal medicine, are now being taught in a few veterinary schools and an increasing number of medical schools.) Because of these misunderstandings, veterinarians are often reluctant to speak highly of any alternative therapies until there is sound evidence-based proof that these treatment modalities are clinically beneficial.

Unfortunately, this lack of scientifically validated evidence has helped to fuel and widen the gap between conventional and holistic veterinarians, leading to more client confusion and perceived divergent types of veterinary practices available for the public to select, i.e., conventionally trained or holistically trained practitioners. Many clients are beginning to say they prefer medical professionals trained in both types of healing, i.e., integrative veterinarians.

Alternative veterinary therapies may augment, or in some instances replace, conventional medical therapy, depending upon the condition and the clinical status of the patient. In this book on integrative veterinary medicine, we present protocols for chronic and infectious diseases using therapeutic nutrition, Chinese and Western herbal medicine, and homotoxicology. These therapies are presented on an integrative basis for veterinarians to choose at their level of comfort and experience.

Clinical (academic) veterinary nutrition

Veterinary schools recognize and offer nutrition as part of their teaching curriculum. Although the importance of proper nutrition in the cause and treatment of diseases is recognized, graduate veterinarians have not totally embraced the concept of nutrition for the treatment of disease. Of the approximately 60,000 veterinarians in the United States, there are about 60 diplomates of the American College of Veterinary Nutrition (ACVN), and only about one-third of veterinary schools have a diplomate on faculty staff.

The trained or board-certified veterinary nutritionist assesses nutrition in a clinical setting by first assessing the animal's condition, i.e., physical, diagnostics (blood and so forth), current diet, body weight, and hydration. This is done to gain knowledge about the animal's nutritional

requirements and adequacy of the current diet; it does not focus on the potential therapeutic value of food or supplements in the treatment of disease.

Please note that the disease protocols presented in Sections 2 and 3 (Chapters 6 through 18) of this book list nutrients based upon their therapeutic value in the treatment of that disease.

Integrative veterinary medicine

IVM incorporates a fair measure of the lost “art of medicine,” in which the practitioner uses his or her senses in a more critical way to assess the totality of the patient being treated, by tapping into an expanded list of therapies based upon the following criteria:

- The clinical and physical condition of the animal
- The medical diagnosis
- An evaluation of the proper medical or surgical treatments available, including their effectiveness and prognosis
- A similar evaluation of alternative therapies, such as therapeutic nutrition, as well as herbal and homeopathic remedies that are appropriate for the condition
- An evaluation of the client's needs and wants

This expanded treatment option program is discussed with the client, who then, with all the facts in hand, makes the appropriate decision for the animal's health and well being.

INTEGRATIVE MEDICINE AND THE EVIDENCE-BASED MODEL

Evidence-based medicine in practice

According to the Evidence-Based Veterinary Medical Association (EBVMA 2006), evidence-based veterinary medicine (EBVM) is “the incorporation of evidence-based medicine principles (EBM) into veterinary practice.” Evidence-based medicine relies upon the principle that “the practice of medicine should be based on valid, clinically relevant research data” with a footnote that states “to be accurate, this definition should include the phrase, ‘when-ever possible,’ as medical ethics precludes conducting research that includes inhumane circumstances.”

The EBVMA Web site goes on to say that this “is in preference to the traditional method of medical training—still in sway—that is weighted more toward authoritative ‘experts,’ espousing their best judgments, which are based on their experiences and their understandings of pathophysiology. Once fully integrated, EBM will place human medicine on a scientifically sound foundation so that decisions concerning diagnosis, prognosis,

treatment, and risk can be made on the basis of more predictable outcomes.”

As practicing veterinarians, we rely upon authoritative experts for our clinical, decision-making process. We also depend upon data from the pharmaceutical industry, veterinary journals, professional reference books, lectures, veterinary teaching schools and specialty groups, conventions, and the wealth of data that is available on the Internet. Another influence for veterinarians is our clients’ wishes for their animals. We are often faced with decisions that alter the course of our recommendations because the client does not wish to pursue our medical or surgical recommendations. Veterinarians are often asked what alternative therapies are available for the animals. Currently in veterinary practice, unlike in human medicine, the decision makers are the clients, and they are free to make the choices that they feel will be best for their animals and their families.

Integrative veterinary medicine

The American Veterinary Medical Association (AVMA) guidelines for complementary and alternative veterinary medicine (CAVM) assist veterinarians in making choices related to CAVM techniques. The AVMA guidelines clearly state, “All veterinary medicine, including CAVM, should be held to the same standards. Claims for safety and effectiveness ultimately should be proven by the scientific method. Circumstances commonly require that veterinarians extrapolate information when formulating a course of therapy. Veterinarians should exercise caution in such circumstances. Practices and philosophies that are ineffective or unsafe should be discarded.”

Therefore, veterinarians, confronted with the standards of EBVM and the AVMA guidelines for CAVM, face a dilemma when considering IVM therapies. To begin with, most current clinical research focuses upon the efficacy of a specific medical therapy for a disease condition, and little data has been published or peer reviewed on alternative veterinary therapies. To complicate matters further, although much data exists on alternative veterinary therapies, little has been published. There exists a much larger clinical pool of data in human medicine; however, many scientists and veterinarians correctly caution that human data is often not relevant for animals.

The practicing veterinarian is left to do the following:

1. Make the medical diagnosis.
2. Discuss the medical or surgical recommendation with the client.
3. Search out alternative methods when conventional therapy has no clear curative answers or when the client decides against conventional therapies.
4. Heed the precautions of the AVMA.

This book on integrative veterinary medicine helps practitioners who are interested in integrating alternative methods into their practices by compiling available, credible clinical research and authoritative data into a single resource.

Evidence-based history

The battle between evidentiary medicine and holistic medicine goes back hundreds of years. Factually, conventional doctors created the term “evidentiary” in their attack on homoeopaths. Homeopaths were concerned with results for individuals only and not on populations. Evidentiary doctors were worried about “broad-population” health issues, and at the time this term was coined, they were concerned with competition. As the medical and veterinary professions have progressed and become more sophisticated, so too has this evidentiary issue matured, such that today, it is a central issue in the growth and expansion of all healing professions.

The veterinary profession is broad in many opportunities for practicing and research veterinarians, from clinical small animal practice, food animal medicine, treatment of race and show horses, across the spectrum to zoo and laboratory animal medicine. These areas of specialties have a common thread as the basis for their teaching—there is evidence and research supporting their science and practice, but many things are not known and remain to be properly researched. Some alternative therapies, such as acupuncture and Chinese herbal medicine, are mainstream and being taught at veterinary schools, even though much evidentiary proof is scant or not available in the United States.

In homotoxicology and Traditional Chinese Medicine (TCM), for example, a large portion of the literature is not translated into English, which makes its pursuit even more challenging. Similarly, there is evidence and research on pharmaceutical agents, but that doesn’t assure their safety or efficacy. Traditional Chinese Medicine has been practiced for more than 4,000 years, and it is firmly entrenched in a methodology that is fundamentally different from the evidenced-based theories and practices upon which conventional (Western) treatments are based. TCM relies upon a deep, astute observation of body systems and responses to manipulation with herbs and other interventions. As a result, these ancient therapies are quite often difficult to integrate or evaluate, because their foundation uses a different point of reference.

When integrating these conventional and alternative methods of healing, we must realize that both the known and unknown are important. As individual doctors we need to be professionally responsible and use techniques that are predictable in assisting our patients in their recovery. When these are known we should recommend them.

When they are not known, it becomes the professional's responsibility to apply his or her knowledge of fundamental theories and concepts to the case at hand to improve the patient's condition.

For example, when some NSAIDs cause illness from side effects, it makes sense to look for alternatives. Glucosamine, chondroitin, and similar natural products lead to improvement and have no major side effects. Once these alternatives are known to be safe and helpful, it makes sense to choose them before resorting to more dangerous agents. In this way alternative agents become therapeutic norms, based on evidentiary results. We currently know that glycosaminoglycans assist in control of arthritis, and they have become more mainstream therapeutic agents. Similarly, milk thistle and its components, as well as SAmE, have moved forward by this same logic.

Evidence—The evolution of scientific truth

Humans have long sought information in pursuit of improved survival (Hellemans, Bunch 1988). Resulting fields of knowledge grow and are organized, and when they are beneficial, become specialized areas of expertise. In this way, civilization grows and prospers on the accuracy of its knowledge base. Professionals are respected for their command of knowledge and their ability to apply it in such a way that it helps the survival of others. The field of medicine is simply one such field, and judging from the longevity statistics over the last few generations, medicine is assisting our population to live longer and more productive lives.

As with all professions, veterinarians continually strive to gain better perspectives and theories of health and disease, and as we gather better information, we constantly review our practices, abandoning the less successful ones and adding those techniques with better outcomes. This is an endless process for any sincere profession. A profession that succeeds in this is respected and loved, and the veterinary profession is currently enjoying rapid growth and high respect. Individual veterinarians who perform these functions effectively are found to have superior incomes and better quality of life.

Science is the orderly asking of questions and recording of data, which is then organized into specialized areas of knowledge. This scientific data can be verified and is repeatable. The word "science" literally means "to know," and the process involves looking at a specific area, deriving what is known, making hypotheses about that area, and then testing those hypotheses using the scientific method. The data achieved from that process are organized and evaluated until a theory, an idea that explains phenomena in a more correct way, can be put forth. This theoretical idea gives rise to models, and these are tested until they are proven or refuted. Achieving scientific

knowledge is a process. It is never static, but rather dynamic, and movements within the fields of knowledge arise and build agreement for their theories and models. Political and economic pressures and factors can enter into the field and block this process with a resulting decline in understanding and scientific discovery.

Technology takes the data that is discovered by scientific method and organizes it into workable means of improving life. The more a discovery improves life, the more valued it becomes. Technology is simply applied knowledge. Philosophy values these discoveries and technologies and examines how they are beneficial or damaging. A truly enlightened civilization will realize that the more ethically its citizens behave, the greater the value of its discoveries and technologies. For this reason, there must always be a conscious ethical arm of any profession, and discussion of ethics (those actions that bring maximal survival to self, groups, and other life forms) must prevail in any living and active profession.

Evidenced-based medicine is a simple concept. It states that a doctor and profession should strive to use technology and techniques that have been proven to be helpful. This keeps a profession on its healing course and preserves the ethical compass of its practitioners, which further ensures the survival of the profession and its clients. It would be ridiculous to fight evidenced-based medicine as a theory, but there can be much disagreement as to what is considered evidence acceptable to the profession. Just as we see in science, a profession must examine the evidence and measure the outcomes of its activity. In doing so we must realize that we will invariably encounter disagreements stemming from a wide variety of sources, not the least of which are economic, religious, and political. The idea of evidenced-based medicine is a good one and one that should be actively pursued, but the concept can become a trap as well, especially when methodologies and meaning of evidence are not properly understood, or when economic or political pressures are brought to bear on a body of knowledge with a purpose other than discovery of the truth.

The word "evidence" comes from "evident," which originates from Latin and literally means "to see out." Evidence is what we see, perceive, or can measure on instruments. A hidden thing is not evident until one removes the barrier to perception, at which time it becomes obvious. The hidden thing is always there and acting as itself, even though science or scientists do not recognize it, name it, or understand it. Consider, if you will, the concept of the zero net energy field, the variable in physics equations that is known to exist but at present is an unquantifiable entity. On Earth, the sun appears to rise in the east and set in the west; however, until more recently there were many opinions and theories about where the sun spent its time at night. In medicine, the scientific

method has spent a considerable time understanding the events of the cell, but only recently did medicine begin to appreciate the massive contribution to the organism made by the space between cells and the connective tissue.

First proposed a century ago, this area of research has been hidden as the field of medicine that looked almost exclusively at cellular structural mechanics and the biochemical activity. Cellular study has been a most worthy study, with a host of lifesaving pharmaceuticals and techniques resulting. As we begin to delve into cellular energetics, field mechanics, and the actions of the connective tissue, we find a gold mine of information with which we may assist patients in recovery from disease, as well as create better states of health for our population.

The science of therapeutic nutrition

Therapeutic nutrition, of all the modalities discussed and explained in this book, is the most studied under the guidelines set by evidence-based standards. One simply has to go to a popular Web site, such as the Linus Pauling Institute at Oregon State University (<http://lpi.oregonstate.edu/>) or the Mayo Clinic (<http://www.mayo.edu/>), to find a wealth of credible information on the topic. Linus Pauling, the famous researcher most well known for his work with vitamin C, is referenced throughout chapter 2 of this book. Simply by going to the Linus Pauling Institute Web site and reviewing the micronutrient section one can find an extensive listing of references and clinical trials on vitamins, minerals, phytonutrients, antioxidants, foods, and so on.

In this age of the Internet and the overwhelming amount of credible and not-so-credible information, it is nearly impossible for the layperson, and somewhat difficult for the professional, to decipher truth from fiction. However, if one goes to credible sites such as the Pauling Institute, page after page of non-biased scientific research backs up the claims that various nutrients have been proven beneficial in medical conditions ranging from simple skin disease to cancer.

The one important difference in credible sites is the almost paranoid desire to get away from false and misleading claims and to state the true facts. For example, there is language such as: “while a specific clinical trial has definitively shown that a certain nutrient has been proven beneficial for a specific disease, there is equal and oftentimes more data that states that the specific clinical trial was not only flawed but that other clinical trials failed to prove what the original trial claimed.”

Using The Pauling Institute and the medical benefits of vitamin C in treating cancer as an example, one can find the following published data on the Pauling Institute Web site (<http://lpi.oregonstate.edu/>):

“Studies in the 1970s and 1980s conducted by Linus Pauling and colleagues suggested that very large doses of vitamin C (10 grams/day intravenously for 10 days followed by at least 10 grams/day orally indefinitely) were helpful in increasing the survival time and improving the quality of life of terminal cancer patients (Cameron, Pauling 1976). However, two randomized placebo-controlled studies conducted at the Mayo Clinic found no differences in outcome between terminal cancer patients receiving 10 grams of vitamin C/day orally or placebo (Creagan 1979, Moertel 1985). There were significant methodological differences between the Mayo Clinic and Pauling’s studies, and recently, two researchers from the NIH suggested that the route of administration (intravenous versus oral) may have been the key to the discrepant results. Intravenous (IV) administration can result in much higher blood levels of vitamin C than oral administration, and levels that are toxic to certain types of cancer cells in culture can be achieved with intravenous but not oral administration of vitamin C (Padayatty 2004). Thus, it appears reasonable to re-evaluate the use of high-dose vitamin C as cancer therapy.”

This example shows the evidentiary process in action. Some clinical trials support the use of vitamin C as a treatment and some do not. The important point regarding this book on integrative veterinary medicine and the current status of the veterinary/client relationship relates to the statement mentioned above in the section on the evolution of scientific truth. What do we as veterinarians recommend for our client whose dog has cancer and who is morally or ethically against chemotherapy and is asking for alternative advice? Three choices:

1. Refer the client to a holistic veterinarian who is experienced in treating cancer but who uses modalities that have no evidence-based proof.
2. Suggest that the client search the Internet or other sources for alternative therapies to treat the animal that has cancer.
3. Suggest alternative therapies that have been used clinically, that may or may not have evidence-based proof, that do no harm, and that offer the client the veterinary-supervised alternative therapy to help in the animal’s day-to-day battle against the disease.

Throughout this book’s sections on therapeutic nutrition, we will present clinical proof, when available, and outline specific protocols that are designed to assist veterinarians in making therapeutic nutritional treatment decisions for the benefit of their patients and clients.

The science of Chinese herbal medicine

Traditional Chinese Medicine has historically been passed down from one person to the next. In fact, formulas from one region might be markedly different from formulas in

another region. The doctors would use whichever herbs were available to them. Now we have classes and even entire schools dedicated to herbal medicine and acupuncture. This is an exciting development. Although some formulas may be proven to be ineffective, most have demonstrated efficacy in the laboratory and in practice.

Recent research has begun to assign Western indications to herbs. Not surprisingly, the Western and Eastern indications tend to match. In traditional Chinese medicine, ginseng (ren shen) is used for “wasting and thirsting disorder,” which is a syndrome of polydipsia and weight loss, such as might be seen with diabetes mellitus. In experimental settings we find that ginseng improves clinical signs and lowers blood glucose levels (Chavez 2001). It is also known to benefit Heart Qi in TCM. It is indicated for calming the spirit and for palpitations with anxiety due to Qi and Blood deficiency (Bensky 2004). Modern research has demonstrated that it has inotropic effects similar to cardiac glycosides in dogs, cats, and rabbits (CA 1992). It is clear that although the terminology differs between the two modalities, both are describing the same effect upon the body.

The final stumbling block for acceptance by “modern” practitioners is the often-mentioned lack of scientific studies concerning herbs. Throughout this book, references are cited to demonstrate the use of herbs for each specific condition. The references cited are based upon in vitro laboratory experiments or studies in animals or humans. When the authors have been unable to find studies of acceptable quality, the herbs are listed in a separate paragraph with a statement that these herbs help increase efficacy of the formula.

Because traditional Chinese herbal medicine originated in Asia, many of the studies of herbs and acupuncture were first conducted and published in Asian countries. It is only in recent times that researchers and universities in the United States and other countries have begun to publish on these topics. As a result, more reference material is currently available in foreign language texts. This is changing rapidly, and in future writings, we expect to cite more clinical studies that are published in English and in the United States.

In addition, professional journals have been reluctant to publish articles about herbs, preferring a more progressive image. Just recently, veterinarians who use herbs have been given columns in professional journals. *Veterinary Forum*, the *Journal of the American Veterinary Medical Association*, and *Veterinary Practice News* have all published articles concerning herbal medicine and acupuncture.

There are now entire practitioner-oriented publications that carry studies about herbal medicine, homeopathic medicine, and acupuncture. For example, *Alternative Therapies in Health and Medicine* is a peer-reviewed journal that has been available at the National Library of Medicine since 1996. Books devoted to acupuncture and

herbal medicine are being published in record numbers. Universities and government agencies are beginning to conduct research on the use and abuse of herbs. With this increase in research comes a greater understanding of the efficacy and safety of herbal therapy.

The science of homotoxicology

This text contains many studies regarding homotoxicology. Academic studies are desired in a scientific field, and homotoxicology has its share of them. The reader is referred to the evidence-based section (Chapter 4, introduction to homotoxicology) for more detail. Knowledge can be obtained in many ways. The simplest method is to ask the question and look at the material available. When we ask, “Does homotoxicology assist survival?” the answer is not clear to many people. This necessitates the application of scientific method and ethical discussion to the field, because it will be rapidly recognized that this question is simply too broad for inquiry. We must narrow the field and look at simpler systems to gain better understanding.

Analysis literally means “to break apart.” Just as we gained understanding of the body by dissection, a healing profession gains professional data from breaking fields down and examining their parts. For a professional considering integrative practice, that process involves constantly evaluating information and choosing those factors that seem plausible to assist patients and then incorporating them into clinical practice. As evidence arises, it is then examined and decisions can be made. The entire profession is currently involved in this very activity.

Homotoxicology attempts to unite and integrate the fields of conventional Western medicine and homeopathy. Its discoveries are validated by normal physiological and biochemical sciences, but the validity of homotoxicology is linked to the question of the validity of homeopathy. A major problem in examining homeopathy for validity has been the lack of any theory that adequately explains the results observed. Many trained in Western medicine feel that they must understand these materials before using them. Although understanding is nice, it is not necessary for successfully using an area of technology. A person can use a computer to assist a veterinarian in running his practice without knowing how the computer works. Homeopaths frequently comment that it is not necessary to know the details of how something works if it can be established that it does work. There is much merit to this comment.

Penicillin kills many bacteria and was successful for years before we understood how it interfered with bacterial growth. As we learned more, science discovered enzymes and enzyme inhibition, and our knowledge base grew. Penicillin continued to kill bacteria in the same way as before, and doctors used it frequently because it accomplished the treatment goals, even though there were no

random clinical trials done. Some areas of complementary alternative veterinary medicine and complementary alternative medicine (CAM) are more difficult to examine directly (Lewith, Jonas, Walach 2005). The anatomy of the spirit is a controversial concept, yet nearly half of our population believes that we are spiritual beings and resorts to prayer as part of the routine activity of living. Prayer is the most common form of CAM in human medicine.

Numerous studies have demonstrated benefits from prayer, and some of these are even blinded. This suggests that there is some phenomena, be it simply the power of positive thinking or something far greater, in action in this area. Fortunately for us, prayer rarely interferes with effective medical procedures; it is not required that we answer the exact mechanics involved in this area, because people do not routinely die from prayer; and involving prayer in a practice should not cause much harm to those involved! If a CAM procedure is not harmful in and of itself, then it may be criticized as an unnecessary expense, or it may cause the patient to seek out ineffective therapy over effective therapy, thus delaying needed treatment. For this last reason alone, it is wise for those seeking out CAVM to have an interest in the evidence for each aspect proposed for use in an animal hospital.

Homeopathy is a field that has suffered for lack of a concrete explanation of its method of action. Until recently no one really knew how a homeopathic remedy created its effect. Skeptics frequently state that homeopathy works as some sort of placebo, but one study demonstrated greater results than placebo alone, a fact that makes interested parties continue to investigate the field (Reilly, et al. 1986). Thanks to major attention from European universities, we are beginning to see that at least low-potency homeopathic agents create some of their beneficial effects by very conventional, scientific means (stimulation of cellular receptors and enzyme induction in accordance with the Arndt-Shultz and Michalis-Menton principles).

Perhaps we would be better served to discuss this new field as nanopharmacology, the study of the effects of low doses of substances on physiological systems. Such a change in semantics would likely end most of the misunderstandings between conventional medicine and homotoxicology. The new field that arises from these discoveries is rightly called “regulation medicine,” and it seeks to handle disease by assisting the body in its efforts to properly regulate itself.

In the past, however, this information was not known, and even now it is not widely disseminated. Therefore, and quite understandably, conventional medicine, with its attention concentrated on cellular mechanics, tended to reject homeopathic thinking and its terminology of “vital force.” Because classical homeopathy tended to be disagreeable to conventional practices of the late 1700s and dangerous medications (mercury and blood letting) due to their destructive and harmful natures, and because

classical homeopathy depended upon only one remedy being given at a time, there was natural disharmony between allopathic medicine and homeopathy.

The 2 fields separated early on, and the financial power lines followed allopathic research and development and the fundamental biological principles of enzyme suppression by large doses of biochemical agents. Pharmaceutical companies endowed modern medicine with billions of dollars to develop current medical practices based upon allopathic agents. Homeopaths, though, because of their ability to achieve results on seemingly difficult individual cases, weathered the storm and survived a period of extreme suppression. As research is conducted, more and more evidence exists to support the practice of homeopathy. Many clients seek out homeopathic doctors as their first choice because they feel they recover faster, better, and more naturally using this form of medicine.

Researching homeopathy is difficult, because no two identical patients exist. The allopathic method of diagnosis is not valid in homeopathy, because remedies are selected based upon symptoms and not classical Western pathological or etiological diagnosis. This makes it most challenging to design double-blind, controlled studies involving classical homeopathy.

In 1991, Kleijnen, et al. reviewed the literature and performed a meta-analysis of studies involving homeopathy. They examined 105 clinical trials involving homeopathic medicines and found positive results in 81 of the studies. Strong responses were identified in the treatment of respiratory disease (13/19 studies showed positive response) and trauma and pain management (18/20 studies indicated positive responses). A fairly large body of knowledge is building that shows some effects attributable to homeopathic agents in both humans and animals (Bellavite and Signorini 2002). Such studies are far from a final answer but indicate why clients seek out homeopathic doctors for their healthcare needs.

Something is working in these patients, and bearing in mind the safety records of homeopathic remedies, using homeopathics in the field of pain management becomes a very tempting impulse. Clients and professionals are well informed about the risks of NSAIDs and actively pursue alternatives (Barnard, Lavoie, Lajeunesse 2006; Lascelles, McFarland, Swann 2005). The most common way that conventional veterinarians enter the field of CAVM is in searching for safer, more effective ways to manage their patients' pain. This is another example of how truth spreads through good results, even in the absence of concrete understanding of a modality's method of action. This is good medicine, using a field with some clinical evidence and improved safety before using a method that is known to be potentially damaging and dangerous. Although classical homeopathy might not easily integrate with conventional allopathic medical practice, such studies should serve to indicate that homeopaths deserve respect

as healers and medical professionals. They should also serve to interest medical practitioners in finding out more about these modalities, and statistics show more veterinarians are trained in homeopathy than at any time in modern history.

The field of homotoxicology has evolved because of the obvious improvement in patients receiving homeopathy after treatment failures in conventional medicine, and out of respect for the infinite value of scientific diagnostic processes. The founder of homotoxicology, Dr. Hans-Heinrich Reckeweg, sought to integrate the field of homeopathy with Western scientific medicine. Through direct clinical observation and trial and error, he developed a series of formulas from mineral, plant, and animal components that assisted his patients in their recoveries. Homotoxicology contains a very active clinical research structure. Dr. Reckeweg was German, and so much of his writing and clinical research was not available in the United States. Recently, though, English material has become more available, and the work that is ongoing in Baden-Baden, Germany, continues to demonstrate the effectiveness and usefulness of homotoxicology remedies.

The presence of clinical research and the results of these studies, along with strong personal success stories of patients who have benefited through application of six-phase theory and antihomotoxic drugs, have led many human healthcare providers and veterinarians, as well as a large number of patients, to move toward use of homotoxicology remedies. In Dr. Reckeweg, once again we see the pattern of a single person who observed irregularities, created a theory explaining these irregularities, and then hypothesized a solution based on the theory. His clinical success led to the creation of a company to market his materials, and this company is the largest of its type worldwide. Currently more and more data are emerging to show that homotoxicology can integrate nicely into conventional veterinary practices and that these practices gain new tools to examine disease pathogenesis as well as therapy. The authors see this fact daily and hope that readers may benefit to the same degree from use of these gentle biological therapies.

It is only natural that veterinarians are becoming increasingly interested in this category of biological therapies. Only a few years ago, all seminars in homotoxicology were sponsored by the parent company, Heel, but homotoxicology is now taught at meetings sponsored by the American Veterinary Medical Association, the American Holistic Veterinary Medical Association, and a rapidly expanding number of local meetings, such as the North American Veterinary Medical Conference and the Annual Conference of the American Holistic Veterinary Medical Association.

Positive clinical results fuel this interest, but there are evidence-based reasons for selecting homotoxicology as

well. Many of these are discussed in the Chapter 4 later in this text.

Chapter Two

A Modern Approach to Therapeutic Nutraceuticals

INTRODUCTION

Therapeutic nutrition is broadly defined as the use of nutrients, such as vitamins, minerals, amino acids, essential fatty acids, co-factors, enzymes, antioxidants, and phytonutrients, to support the body's immune and healing systems, thereby altering the course and outcome of a disease process. This is a different application of nutrition than that defined above as clinical or academic nutrition as practiced in veterinary schools. Many of the nutrients, antioxidants, vitamins, and phytonutrients referred to in this section of the book have therapeutic value for patients. Therapeutic nutrition can be used as a preventive, i.e., helping to reduce inflammation and correcting deficiencies and imbalances before they lead to a disease process. Or enzymes, antioxidants, phytonutrients, co-factors, vitamins, minerals, and so on can be used as therapeutic agents.

The word “nutraceutical” is a combination of terms describing nutrition or the use of nutrients and “ceuticals” (from “pharmaceutical”), simply meaning nutrients that have a therapeutic effect on the body. The American Holistic Veterinary Medical Association (AHVMA) and other holistically oriented groups and practitioners further define and refine nutrition according to such properties as having a “hot” or “cold” or “damp” effect on the body, which is similar to theories of Chinese herbal medicine. Modern therapeutic nutrition and nutraceutical therapies focus not on food types, nor calories nor minimum daily requirements, but rather on the metabolic and physiological effects of foods on the body's healing and immune systems.

Therapeutic nutrition action focuses upon the intracellular and intercellular spaces. Unlike drugs, nutritional products are not designed to, nor do they function to, address symptoms or diseases; rather, they are designed to “feed” and “fuel” the cells of the body, using or calling upon the cells' inherent ability to heal and achieve homeostasis.

The goals of therapeutic nutrition fall within 3 broad categories of body essential action, which

directly help to improve cellular function and enhance healing:

- The supply of appropriate, bioavailable nutrients
- The reduction of inflammation
- The enhancement of elimination

Supplying appropriate, bioavailable nutrients (provides metabolic building blocks)

The pet food industry was greatly influenced by the guidelines created by the late Dr. Mark Morris, which attempted to help regulate and standardize commercially prepared pet foods. This method is based upon the chemical content and analysis of food (the actual levels of fats, proteins, carbohydrates, and moisture).

This regulatory methodology is accomplished via the guaranteed analysis of the food, which is required to be listed on all pet foods sold in the United States. To qualify as a pet food, the following 4 categories must be listed on the label: crude protein, crude fat, crude fiber, and moisture. A typical guaranteed analysis that is required to qualify as a canned pet food may look like this: crude protein, 10%; crude fat, 6.5%; crude fiber, 2.4%; moisture, 68%.

We veterinarians are familiar with the old shoes adage described by Dr. Morris, where he put together and chemically analyzed a mixture containing coal, shoes, and crankcase oil. (The full description is presented later in this chapter.) When chemically analyzed, this mixture met the minimum requirements of a pet food. Dr. Morris's goal was to dramatize that what is important in pet food is not only the chemical composition, but the bioavailability of the raw ingredients used.

The use of therapeutic nutrition as presented in this book adds the concept of the “biological” value of food, a premise touted by “anti-aging” scientists and doctors, which is covered in detail later in this chapter. For this current discussion of the supply of appropriate nutrients, therapeutic nutritional programs must ensure that beyond the chemical analysis (protein, fat, fiber, moisture, and carbohydrates), the biological value of food, i.e., the

vitamin content and the presence of biologically active antioxidants, phytonutrients, enzymes, co-factors and so on, is considered when nutritionally addressing a disease condition.

Reducing inflammation

The cause and method used to reduce inflammation are similar from one organ system to another. It has been clinically proven that free radicals (reactive oxygen molecules with unpaired electrons) bond to tissues and initiate an oxidative process that evokes an inflammatory response.

This load of free radicals can be reduced and neutralized with sufficient dietary levels of antioxidant vitamins, minerals, phytonutrients, and co-factors. Free radicals are formed as a result of the normal metabolic process. Excessive free radicals form upon exposure to foreign substances, such as chemical preservatives, pesticides, herbicides, and environmental chemicals. These foreign substances contribute to the depletion of the body's antioxidant reserves, such as vitamins E and C, which normally function to control the free radical levels. The resulting inflammatory response, if left unchecked, can lead to degradation of tissue and impaired organ system function.

The question often asked, however, is "Why don't vitamin- and antioxidant-enhanced pet foods neutralize this building free radical load?" The simple answer relates to the heat of cooking and processing. Studies demonstrate that many of the important vitamins and antioxidants, which are required to neutralize free radicals, are inactivated by heat. The nutrient inactivation of various antioxidants was reported in several studies (BASF 1983, 1986). In one study it was shown that more than 75% of the available vitamin C, a potent antioxidant, was inactivated by heat (BASF 1998).

The inflammation referred to above that responds to therapeutic nutrition is cellular inflammation. It has been demonstrated that free radical reactions initiate and create a local cellular inflammation, which, if unchecked, quickly spreads to groups and sheets of cells, tissues, and organs. Detection of this inflammatory response, if addressed and neutralized early, helps prevent this cellular inflammation, organ degenerating, and eventual organ and tissue disease (Cerutti 1994, Charlton 1999, Davies 1991, Gilchrist 1997, Halliwell 1989, 1993, 1994).

Enhancing elimination

The final piece underlying the effectiveness of therapeutic nutrition, and one of the keys to healing, is the elimination of metabolic wastes and toxins from the body. When an organ or system is diseased, ridding the body of the

metabolic wastes (toxins), as well as strengthening and supporting related organs and tissues, is beneficial to the overall healing process.

The enhancement of elimination is not confined to nutrition alone, as other modalities such as homotoxicology are built upon the concept of the body's ability to eliminate toxins. (See the homotoxicology section of this book on toxins, homotoxins, and detoxification.) The following is the basic underlying theory by which homotoxicology is built (Reckeweg 2000.):

"According to homotoxicology, all of those processes, syndromes, and manifestations, which we designate as diseases, are the expression, thereof that the body is combating poisons and that it wants to neutralize and excrete these poisons. The body either wins or loses the fight thereby. Those processes, which we designate as diseases, are always biological, that is natural teleological processes, which serve poison defense and detoxification."

FREE RADICALS, ANTIOXIDANTS, AND PHYTONUTRIENTS

Free radicals

Free radicals are reactive molecules that contain unbound or unpaired electrons that are initiated by metabolism or exposure to foreign materials, such as toxins and metabolic wastes. Formed on exposure to oxygen, these then reactive free radicals can initiate a local cellular inflammation that expands by a chain reaction to adjacent cells and tissues, and finally throughout the entire organ. There are 2 types of free radicals, endogenous and exogenous. Endogenous free radicals result from the body's normal day-to-day functioning, such as metabolism byproducts or the breakdown of bacteria and viruses by the white blood cell system. Exogenous free radicals are more well known and result from events such as exposure to environmental chemicals and toxins. One of the more studied is the effect of smog and secondhand smoke as a cause of free radical production and disease in people (Opara 1997).

The primary danger of these free radical complexes is that they can induce inflammation that can interfere with the DNA and the vital elements of the cell, causing improper functioning and even cellular death. In anti-aging human medicine, there is a popular theory that associates the process of aging directly with free radical production (Harman 1955, 1992, 1994; Masoro 1993).

Free radical formation is a normal, day-to-day occurrence. Free radicals are also normal byproducts of metabolism and serve physiological and biochemical purposes. However, research points to the fact that excessive formation of free radicals (the free radical load) for any number of reasons as explained below can lead to this oxidative

state, which results in cell destruction, inflammation, organ degeneration, and the developments of degenerative diseases, such as heart disease, liver disease, kidney disease, arthritis, and cancer (Cochrane 1992; Davies 1991, 1995; Halliwell 1989, 1993; Harman 1994; Poli 1993; Sies 1985, 1991; Spatz 1992).

Antioxidants

Antioxidants (free radical scavengers) are compounds that slow or prevent oxidation, neutralize reactive free radicals, and help prevent the initiation of the inflammatory process. This inflammatory response is believed to be responsible for premature aging, organ degeneration, and cell death.

The body's antioxidant system is one of the primary defenses against free radical production and associated cellular damage. Antioxidants are naturally occurring in fresh fruits and vegetables. Many antioxidants are not produced by the body and therefore are a requirement in the diet. The more common and well-known antioxidants are the vitamins A, E, beta carotene, and C and minerals such as selenium.

The mechanism of action of antioxidants is the prevention of peroxidation. By stabilizing the free radicals, antioxidants indirectly reduce the initiating oxidation, the resulting inflammatory response, the spread of inflammation, and cellular and tissue death.

The antioxidant reserve (the levels of activated antioxidants that are found in the body) depends upon many factors, including the level of antioxidants found in the diet. Although this appears to be a simple case of just eating more antioxidants, building the reserve, and capping the free radical buildup, there are numerous factors that interfere with this neutralization process, such as: growing food on depleted soil; the heat of cooking and processing, which destroys most naturally occurring antioxidants (BASF 1983); and stress, disease, infection, over-vaccination, chemical and toxin exposure, emotional issues, and so on (Opara 1997).

This balance between free radical load and depletion of antioxidants has broader implications. The Iams Company, at their symposium in 2000, presented proof that antioxidants such as vitamin E also play a direct role in immune system functioning, health maintenance, and disease prevention (Hayek 2000).

The importance of achieving the balance between antioxidant reserves and free radical load is one of the cornerstones of therapeutic nutrition. The addition of unprocessed, uncooked, unchemicalized, bioavailable antioxidants as part of a therapeutic nutritional program is essential for preventing the initiation and progression of degenerative diseases (Lindley 1998, Nicoli 1999).

Phytonutrients (phytochemicals)

Phytonutrients are chemical compounds that are produced by and help in the performance of the metabolic functions of the plant. New and growing research has proven that these nutrients, although not classified as essential nor required like foods and vitamins, act as antioxidants and prevent oxidative damage. They exert a positive and often dramatic effect on wellness, health, prevention and treatment of disease, and longevity (Broadhurst 2001, Duke 1992, Gaziano 1995, Shils 1994).

Phytonutrients, as they relate to health and nutrition, are activated plant compounds that, when eaten, are therapeutic and have beneficial effects on the physiology and metabolism of animals (Duke 1992, Hyson 2002). Described below are some of the more well-known and researched phytonutrients; however, literally thousands of phytonutrients have been discovered and are being researched for their health benefits.

Although phytonutrient compounds are not essential for life, they are beneficial for optimum health and are often classified with vitamins, minerals, and antioxidants. Recently, advanced scientific techniques and methodologies have allowed researchers to identify categories of phytonutrients and classify and define them according to their health benefits.

Categories of phytonutrients, such as amines, bioflavonoids, carotenoids, lignans, organosulfurs, phenols, phytosterols, sterols, sterolins, and terpenes are being clinically proven to positively affect health and well being, reduce inflammation, and slow degenerative disease. They are also being shown to have a critical role in cancer prevention (Ames 1993, Block 1992, Carlton 2000, Duthie 1996).

Carotenoids

Carotenoids make up a category of phytonutrients that impart the yellow, red, or orange pigment color to fruits and vegetables. The most common and well known are alpha, beta, and gamma carotene, as well as lutein, lycopene, and xanthophylls. New and emerging research has identified hundreds of carotenoids, which are being studied in all categories of degenerative diseases and cancer (Agarwal 2000, International Agency for Research on Cancer 1998, Naguib 2003).

The earlier research on carotenes, and particularly beta carotene, was centered upon dogs' ability and cats' inability to convert beta carotene to vitamin A, thereby preventing deficiencies. More recent research, however, has focused in the area of degenerative disease and cancer prevention. Besides their potent antioxidant (anti-inflammatory) properties, research has uncovered their immune-enhancing function and their ability to help regulate cellular communications and division (Gaziano

1995, Ito 1999, Nishino 2000, Slattery 2000, Zeegers 2001).

Research shows that long-term dietary deficiency of carotenoids is associated with chronic degenerative diseases due to carotenoids' antioxidant properties. Although much of this research is focused on people, veterinarians should be aware that the majority of dog and cat foods fed over the past 35 to 50 years was highly processed and cooked (canned and extruded dry foods) at extremely high temperatures, which has been demonstrated to have a negative effect on the health benefits of antioxidants and phytonutrients (Nicoli 1999, Price 1998, Shahidi 1997, Lindley 1998).

Besides the adverse affects of high temperatures upon vital nutrients, dog and cat foods most often are devoid of phytonutrients. Coupling this with the statements that the addition of vitamins, minerals, and table scraps (such as vegetables) should be avoided stimulates inquiry concerning a link between the rising level of chronic diseases and cancer in dogs and cats and the feeding of antioxidant- and phytonutrient-deficient foods (Delgado-Vargas 2000, Goldstein 1999, Heaton 2002, Seddon 1994).

Flavonoids

Flavonoids are a large family of plant-derived chemicals that are mainly responsible for the colors and pigments of most fruits and vegetables. They were discovered in the 1930s by Albert Szent-Gyorgyi, who originally classified them as vitamin P. The more commonly known flavonoids are flavones, isoflavones, anthocyanins, anthocyanidins, and flavonols. Commonly named flavonols are rutin, hesperidin, and quercetin. Some of the main health benefits of flavonoids are their function as potent antioxidants and their ability to help reduce inflammation.

Research has proven that flavonoids increase the body's level of the antioxidant glutathione, helping to control, reduce, and eliminate inflammation, pre-disease. Several studies indicate that flavonoids can help regulate the immune response and have a controlling effect over reactivity of immune-mediated cells, such as T and B lymphocytes, mast cells, and neutrophils (Middleton 1986, 1992; Myhrstad 2002; Panthong 1994; Roger 1998).

There is currently much investigation of flavonoids in disease prevention and treatment. Clinical evidence suggests that flavonoids' ability to reduce inflammation plays an important role in heart disease in humans (Blake 2003, Geleijnse 2002, Hertog 1997, Rimm 1996, Sesso 2003). Currently, the effects of flavonoids in prevention and treatment are not conclusive. Although some studies do show potential benefits, others have proven nonconclusive (Knekt 2002, Ross 2002).

Of primary importance for the health benefits of flavonoids is their susceptibility and inactivation secondary to processing, farming, and the high heat of cooking. Adding

flavonoids to dog or cat foods does not necessarily guarantee the health benefits. This is an important point substantiating the addition of fresh foods, such as fruits and/or vegetables, to the daily feeding of dogs and cats (Gil 1999, Ioku 2001).

Lignans

Lignans are naturally occurring chemicals found in both plants and animals and are broadly considered to be phytoestrogens. They are found in abundance in flax seed, fruits, vegetables, and beans. Phytoestrogens are plant-derived chemicals that mimic the activity of animal estrogens. Research into lignans (and also soy isoflavonoids) is occurring in the field of human mammary cancer prevention. The research interest in phytoestrogens is based upon the fact that plant-derived compounds can compete with the body's hormonal estrogen, actually lessen phytoestrogens' effect, and help prevent hormonally aggravated mammary cancers (Brooks 2005; Kleinsmith 2003; Wang 2002; Serraino 1992; Sung 1998; Thompson 1996, 1998).

Other studies show lignans may also have additional cancer prevention benefits (Sung 1998). Lignans are also being studied in relationship to heart disease prevention. Lignan-rich foods such as fruits, vegetables, nuts, and seeds are being studied for their beneficial, cardioprotective effects (Adlercreutz 1997, Arjmandi 1998, de Kleijn 2002, Jenkins 1999, Prasad 1997, Vanharanta 2003).

Sterols and phytosterols

Sterols are plant-based lipid compounds that are chemically similar to cholesterol and are found in many seeds. The most commonly known and well-studied sterol is betasitosterol. Sterols are similar to and able to chemically compete with cholesterol, and much research is being conducted in humans in the area of cholesterol lowering and heart disease prevention. One study compared the cholesterol levels of Seventh-Day Adventists (vegetarians) with the non-vegetarian public and found a significant low ratio between phytosterols and cholesterol and a lower risk for heart disease (Nair 1984). This study also indicated a higher risk of colon cancer related to the ratio of phytosterols to cholesterol, as compared to the actual level of blood cholesterol, emphasizing the importance of these phytosterols in the diet. It is thought that the phytosterols somehow interfere with both the reduction of inflammation and the altering of the cell membrane in tumor growth.

Pegel (1997) feels that sterols are essential for a properly functioning immune system. Pegel believes that in cancer patients, sterols can directly reduce the adverse immune-suppressing effects of both chemo- and radiation therapies. In studies on cats with FIV, sterols are believed to have an immune-modulating effect and help to main-

tain proper lymphocyte levels (Boucic 1997). Treated cats showed a 20% mortality rate, as compared to the non-treated cat mortality rate of 75%. It was further reported that there were no deaths in surviving cats after 3 years with sterol treatment. Although the sterols have no direct antiviral properties, the balancing and modulation of the immune system are enough to control the spread and effects of the virus.

Other properties of plant-derived sterols are their anti-inflammatory and antipyretic properties, which appear to be similar to corticosteroids and aspirin (Gupta 1980). Sterols have been found to enhance T lymphocyte production and moderate B cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Boucic 1996).

Awad (1999) proved that in the laboratory, the use of sterols reduced the number of breast cancer cells as compared to the controls. In another study Awad (1999) further proved that the sterols also enhanced intracellular communications in such a way that they inhibited cell growth, which can prevent the formation of cancer.

Antioxidants and phytonutrients: Their effect on aging and degeneration and their critical role in preventing degeneration and neoplasia

The theory that free radicals cause aging is quite popular and accepted, especially in human medicine. This theory, introduced in the 1950s, stated that highly reactive free radicals are directly linked to the aging process (Harman 1955). This theory states that free radicals are produced as a result of the metabolism, endogenously and exogenously, by exposure to foreign substances such as cigarette smoke. Left to accumulate into a free radical load, these reactive particles will initiate and damage cells, tissues, and organs. This theory is now being supported and proven by numerous clinical studies both in people and animals, which confirms the direct effect on the aging process and the formation of chronic degenerative diseases (Harman 1992). This theory also remains so popular because it integrates well with genetic and DNA research in which the free radicals, also called reactive oxygen species (ROS), alter the DNA and can cause mutations that in turn lead to diseases such as cancer (Opara 1997, Harman 1992, Masoro 1993).

Antioxidants, phytonutrients, free radicals, and their relationship to aging have spawned a tremendous amount of clinical research in both the medical and veterinary fields. The major dog food and cat food companies are funding research to prove that antioxidants and phytonutrients in their food have a beneficial effect on the health and well being of animals. Because degenerative diseases and neoplasia play such a dominant role in day-to-day veterinary practice, it is important to understand not only

the theory, but also what we practitioners can do to benefit our patients. Can adding these vital nutrients into our patients' daily regime slow the aging process, reduce inflammation, and ultimately affect disease prevention?

As veterinary students we have been taught how to treat disease when it is diagnosed. As practitioners, when dealing with chronic degenerative diseases, we focus upon the signs and symptoms of the disease and upon alleviating our animals' pain and suffering without doing any harm. The inherent issue, however, is that many of the recommended drugs carry long-term side effects that can be counterproductive for the disease and the patient. Take, for example, the treatment of chronic allergic dermatitis with corticosteroids. Although in the short term we are offering our patients the anti-inflammatory and antipruritic effects of the drugs, as well as comfort and self-trauma prevention, we are invariably exposing animals to the long list of inherent side effects that go along with the chronic use of corticosteroids.

One of the important benefits of integrative veterinary medicine is the ability to offer our patients nutritional, herbal, or homeopathic remedies that work alone or in combination with the medical treatment plan that we have selected. These therapies can often help improve the animal's day-to-day quality of life, speed up healing, and add the parameter of preventing future episodes. Although skeptics demand, "Show me the proof," one intent of this book is to compile and document the science and proof of these benefits in an organized format for clinicians.

The unanswered question remains: "What effect do these nutrients, herbs, and homeopathics have on the prevention of degenerative disease and the prevention of neoplasia?"

One possible answer concerns the role of free radicals in the pathogenesis of diseases. The free radical theory of aging, as noted earlier, describes the oxidative damage and altered cellular integrity leading to decreased organ function. This process sets the stage for the initiation of chronic degenerative diseases, such as arthritis, diabetes, heart disease, liver disease, and kidney disease, and of course cancer.

Although many chronic degenerative conditions are reported as "proven cause unknown," there is a mechanism, be it known or unknown, that starts the disease process. More and more scientists, researchers, and practicing doctors believe the disease initiator is this free radical oxidative process. When it occurs in the joints it can lead to arthritis, in the heart it leads to cardiomyopathy, and in the kidneys it may result in chronic renal failure. Although the organ system and disease names may be different, there is a common denominator underlying this initiating process, which if addressed early, can help in preventing degenerative diseases and in maintaining wellness.

The inquiring mind asks, “How does this occur?”

As free radical levels rise and dietary antioxidant levels decrease, the inflammatory process begins and spreads from cells to tissue to organ systems, and cells begin to die. Cellular debris is viewed as being foreign to the body, which responds by sending white blood cells and producing autoantibodies to rid itself of the cellular debris. The continual process of inflammation and immune attack causes organ degeneration, resulting in cellular infiltration, glandular hypofunction or organ hyperfunction, and a flooding of the mesenchyme with byproducts of inflammation.

Although no single theory explains all disease development, free radical damage is intimately involved in many of our most common pathologic processes and deserves attention. Good examples of this process are IBD, hypothyroidism in dogs, and hyperthyroidism in cats. Although these diseases are different, and signs and symptoms are different, the underlying initiating cause remains cellular inflammation, cellular infiltration, cell death, and the interference with normal organ function.

GLAND THERAPY

This book does not spend much time explaining drug therapies and does so only when they are necessary as part of an integrative approach for specific disease protocols. The important distinction made regarding drug therapies is that the medication does not focus upon healing, but rather on controlling the condition. For example, an acute infection treated with antibiotics is not cured by the medication. The antibiotic does destroy the bacteria that cause the infection, but the actual healing mechanism is generated internally by the body itself.

In chapters 6 through 18, which address disease protocols, we present medical therapies in relationship to the definitions and causes of the specific diseases. Most often, drugs address symptoms and signs and do not promote the body's ability to heal. As you read through the nutritional, herbal, and homeopathic sections of the disease protocols, you find that more often these modalities address the body's ability to heal, noting clinical proof substantiating the action that is claimed. It is the collective opinion of the authors of this book that the prudent integration of conventional and alternative therapies to control symptoms and enhance healing is beneficial for the patient's health and maintenance of wellness.

Gland therapy: the precursor to modern pharmaceuticals

Organ therapy, also known as glandular or cellular therapy, is broadly defined as the use of raw glands and

organ concentrates to achieve therapeutic results. Glandular extracts possess an affinity for similar tissues and contain many chemical, hormonal, enzyme, and co-factors that exert significant physiological, metabolic, and therapeutic effects on cells and organ systems.

Early examples of this type of therapy include the use of thyroid glands in the treatment of myxedema and the use of dried pancreas extract for the treatment of diabetes; these are well documented in earlier medical literature. More recent medical research discovered quicker-acting, more potent medications. The following quote from Lewis (1995) in *Complementary and Alternative Veterinary Medicine* summarizes this transition from gland therapy to drugs:

“Analytic methods improved greatly during the middle of this century, and many of the important hormones were discovered and isolated from glandular tissues, such as cortisone from adrenal tissue and thyroxine from thyroid tissue. The biomedical community was quick to ascribe all clinical results of glandular or cellular therapy to the presence of small quantities of hormones, which came to be regarded as the only active constituents of glandular materials. Advanced chemical methods allowed the pharmaceutical industry to produce large quantities of synthetic hormones. The gentle, physiologic action of whole glands or crude extracts was abandoned for the fast, pharmacological action of inexpensive synthetic hormones. This was the age of so-called wonder drugs, when physicians and patients came to expect dramatic and immediate results from medications. These quick results, however, were later associated with problems and side effects, such as the diabetes and immune depression following corticosteroid therapy and the development of antibiotic-resistant strains of bacteria following promiscuous use of antibiotics.”

Historical use

Historically, references to gland therapy appear in ancient times, and the use of animal parts in treating diseases of people has been documented. Early physicians such as Aristotle and Pliny the Elder discussed their use, and references exist throughout modern times. In the 1600s, the original theories discussed the workings of gland therapy based upon the principle that “like organs will help cure the same organ.” This should not be confused, however, with the underlying principles of “like healing like” that have been defined by classical homeopaths.

The gland therapy theory was introduced by the physician Paracelsus in his “Doctrine of Signatures.” This theory rationalized that eating an organ or a specific tissue would heal the same organ in the body. For example, if a person was suffering from a liver disease, eating raw liver would help to cure that disease. Likewise, eating raw heart tissue would help heal a weakened heart, and so on (Harrower 1916).

Although this concept of “like healing like” seems somewhat credible, it also seems scientifically unsound. Skeptics questioned why consuming a particular tissue type in the treatment of corresponding tissues would have any validity at all. They asked, “By what mechanism do these materials act? And where is the evidence to support the claim that they are absorbed and used by the user’s body?”

Scientific basis

Historically, there were arguments for and against this unproven theory. Skeptics of gland therapy stated that any tissue that is eaten is digested into its building-block components of proteins, fats, and carbohydrate, which in turn would be exposed to the body’s digestive enzymes and therefore completely inactivated. Scientists who supported the theory proposed that the raw glandular tissue, besides being composed of the basic food parts, also contained other factors that were responsible for their activity. It wasn’t until the later 1800s and the early 1900s that gland and cellular therapies began to acquire some scientific basis.

First came the understanding that the body is composed of many organs, including specific glands that produce or secrete various chemical compounds (hormones) that have a powerful effect on the functioning of the body and its systems. The use of crude organ extracts began in the early 1900s and was included in day-to-day medical practice. It was also at this time that scientific literature was rapidly expanding with new reports and “miracle cures” from these glandular substances. Harrower reported on the numerous uses and applications of gland therapies in his *Endocrine Handbook* (1939).

The first documented proof of the efficacy of organ therapy came in 1912 when injections of thyroid extract were able to help children suffering from myxedema and cretinism. In 1920, it was documented that thyroid extract could be absorbed from the intestinal tract: “Desiccated thyroid has been found to be absorbed from the gastrointestinal tract with greater regularity than has the sodium salts of thyroxine. At present, we prefer the oral administration of desiccated thyroid standardized on its iodine content” (“The Principles of Internal Secretion” as reported by Cima 1981). Cima continues: “In Addison’s disease, there is a definite adrenal deficiency. In some cases, dried adrenal gland produces improvement. Whole gland given in too large an oral dose produces physical and mental weakness, irritability, insomnia, intestinal disturbances and cramps” (“Glandular Therapy” as reported by Cima 1981).

In 1931, Dr. Paul Niehans, considered the father of gland therapy, administered raw parathyroid gland to a patient suffering from serious muscular spasms after a thyroidectomy and accidental destruction of the parathy-

roid glands. The response was immediate and dramatic, and the patient was cured. “The use of purified thyroid hormone and thyroid extracts are compared experimentally. The extracts are safer, and the activity of thyroid extracts is shown to be greater than that of pure synthetic hormone extracted from that amount of gland” (“Internal Secretions” as reported in Cima 1981).

At that time, science and medical research and clinical practice were becoming more sophisticated, as was the ability to document accurate results. One of the pioneers of the organ therapy movement was Dr. Royal Lee, who looked at the use of gland therapy from a different angle. He retraced organ therapy back to its inception, to the originating theory of “like healing like.” Many scientists and medical researchers were quick to accept the premise that “If it works, and if it is found to be concentrated in the same organ, then it must function according to the theory of like healing like.”

But Lee explored deeper. Lee theorized that as an organ becomes weakened and diseased, the cells are broken, releasing their contents into general circulation of the body. The body’s healing system, composed of various organs and chemicals, finds this cellular breakdown debris and immediately reacts by forming an antibody, the body’s mechanism to destroy invaders. He further theorized that these antibodies not only attack the cellular debris, they also attack the entire organ via an autoimmune response. The result of this autoimmune reaction is an inflammatory process in which the body inflames its own tissue. The organ weakens and begins to function at less-than-optimum levels, setting the stage for degenerative disease. If, for example, this autoimmune response occurs in the thyroid glands, causing them to function at less-than-optimum levels, the end result could lead to hypothyroidism.

Lee stated that gland extracts work not by “like healing like” but rather in a more straightforward way. The cellular debris contains intrinsic factors that are organ-specific and attracted to the same organ of the body. These factors stimulate production of antibodies that the body perceives as a foreign invader. Gland extracts then help to defend the organ by *neutralizing* the antigen-antibody response and thereby minimizing the autoimmune and inflammatory processes. This results in the organ being protected from the immune system’s internal attack, resulting in its ability to rest and heal (Lee 1947.)

Organ specificity

Another area of gland therapy that was rich fodder for the skeptic was and is that of organ specificity, as theorized by Lee. Lee proposed that when a person or animal ingested raw organ tissue such as bovine liver, the macromolecules are absorbed into the system and directed to the liver. The intrinsic factors derived from the ingested

Sidebar 2.1 Dr. Lee's Organ Specificity Theories Matches Today's Anti-Aging Beliefs

Dr. Lee's theory of glandulars protecting cells from the body's own immune attack fits in well with today's modern theory of aging, free-radical-induced inflammation, and protection of cells with antioxidants. (See Free Radicals, Antioxidants and Phytonutrients, above). Dr. Lee's theories of organ specificity were confirmed later by Dr. A. Kment (1967 and 1972). Kment, using radioactive isotopes, found that the chemicals from glandular tissues were absorbed into the blood and taken up by the corresponding glands in the body. This confirmation of organ specificity was also reported upon by Starzyl (1979) and Stein (1967).

liver would nourish and protect the person's or animal's own liver by neutralizing any attack from the immune system, thereby helping to improve the function of the now-rested and nourished gland.

Farfetched? Maybe not. This theory fits closely with the modern free radical theory of aging. See Sidebar 2.1 for further information on this.

Glands: Sources of nutrients, peptides, lipids, enzymes, vitamins, minerals, and precursors of hormones

Glands are generally derived from bovine or porcine sources. There are several methods of processing gland extracts, and these usually result in a dry powder extract of the entire organ or a liquid preparation. It is important that the source of fresh glands come from non-contaminated and disease-free animals that are accepted into the food chain. The glandulars are ingested and assimilated from the intestines into the blood and distributed throughout the body. Initially the skeptics of organ therapy claimed that the glands would be digested and therefore no beneficial compounds would be available for the body to use.

The accepted theory regarding absorption from the intestinal tract claimed that macromolecules would be reduced to their amino acid components and then absorbed, and that the intestinal tract itself would be a barrier to the direct absorption of these proteins. Research now offers proof that this is not the case, and the evidence shows that the larger macromolecules (hormones, proteins, enzymes) are absorbed from the gut directly into the bloodstream and can then have their therapeutic effect on the body (Ambrus 1966, Baintner 1986, Gardner 1988.)

These ingested, intact macromolecules, which are similar to the organ from which they came, can neutralize the autoantibodies that may be attacking that particular organ. These tissue-specific or physiologically active molecules therefore can be taken up into circulation and may exert a protective effect on cells and organs. (See tissue sparing, below.)

THE TISSUE-SPARING EFFECTS OF NUTRACEUTICALS AND PHYTONUTRIENTS

It is believed that gland extracts exert a tissue-sparing effect on bodily tissues. The mechanism is either neutralizing the autoantibody attack on organ cells or is supplying nutrients and enzymes that allow the specific organ to rest. Some examples are as follows:

Pancreas extracts

Besides the use of pancreatic enzymes in the digestive process, research indicates that pancreatic enzymes are reabsorbed in the lower bowel and returned to the pancreas to be stored for future use (Liebow 1975). It is believed that administration of pancreas extracts not only benefits digestion and assimilation, but also increases pancreatic enzyme reserves, thereby resting the pancreas in its day-to-day functioning. The same could be true for the adrenal, the gland that is often affected when an animal or person is under stress. Hans Selye (1976), in one of his famous books, talks about the direct negative effect of stress on the adrenal glands.

Adrenal extracts

Advocates of adrenal extract argue that the raw gland contains many substances and can carry out many metabolic functions that the isolated synthetics such as cortisone cannot. For example, Friedman (1956) reported that raw adrenal contains enzymes that convert cholesterol into glucocorticoid, thereby allowing the adrenal glands to rest. If this premise is true, then other glands and their intrinsic factors may support other organs and overall metabolism by supplying the necessary compounds required for the production of hormones, enzymes, and other essential body chemicals. In so doing, they can spare the organ from overworking, thereby promoting its optimum efficiency.

Liver extracts

A superior, bioavailable source of iron is the liver. When you compare the absorption rate of inorganic iron (ferrous sulfate, for example) to that of the iron-bound

hemoglobin (heme iron), the latter is a 30-fold winner. The best source of heme iron is concentrated liver extract. When you couple the iron content with the rich source of B vitamins, including B₁₂ and folic acid, liver extract becomes a potent source of nutrients, especially in a chronically degenerating animal. It also has been clinically proven, in double-blind studies, that liver extracts not only improve the functioning and efficiency of the liver but also are helpful in the healing of chronic degenerative liver disease. These studies confirmed that liver extracts can improve circulation; stimulate, regenerate, spare, and protect liver cells; and lower the levels of circulating liver enzymes in the blood (Frykman 1994, Ohbayashi 1972, Fujisawa 1984).

Cartilage extracts

Cartilage extracts are a good source of glycosaminoglycans (GAGS), such as chondroitin sulfate and glucosamine. Several studies have demonstrated the effectiveness of glucosamine and chondroitin in the management of arthritis in dogs (Das 2000, Guastella 2005). Setnikar et al. (1986) described how these compounds actually stimulate the body's own repair mechanism and help in the process of developing new cartilage. There have been numerous double-blind studies comparing the effectiveness of glucosamine and various NSAIDs, and glucosamine has resulted in as good as, or in many cases, even better, pain control and removal of the clinical signs associated with osteoarthritis (Prudden 1974, Brown 1981, Vaz 1982, DeAmbrosia 1982).

Phospholipids

Specialized phospholipids, such as phosphatidyl choline, phosphatidyl serine, and others, have been proposed as therapeutic agents for neurologic and other diseases (Horrocks 1986). These phospholipids are found in glandular brain, liver, and other glands. These glands are sources of highly unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system.

There has been extensive research into the use of phospholipids, particularly phosphatidyl serine, and the positive effects they exert on the brain and central nervous system. Cennacchi (1992), Engle (1992), and Dewaide (1986) have conducted double-blind studies in people with dementia and Alzheimer's disease with positive results. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Heart extracts

The nutraceutical coenzyme Q10 (CoQ10) has been proven to be beneficial as an energy-producing nutrient, with specific applications in heart disease, obesity, and cancer. In heart disease, it has been particularly beneficial in treating congestive heart failure and cardiomyopathy. It has been found to actually increase the levels of oxygen in the blood. Heart tissues contain high levels of CoQ10; therefore, one of the beneficial effects of giving raw heart tissue concentrate to animals with heart disease would be to increase the body's oxygen level (Judy 1984, Gaby 1989).

DO GLAND THERAPIES WORK?

There have been few clinical studies testing gland therapy for the treatment of disease in both animals and humans. Osband et al. (1981) carried out a study on histiocytosis X, published in *The New England Journal of Medicine*, in which 17 patients were injected with bovine thymus extract and 20 patients underwent chemotherapy. This is perhaps the most notable among glandular studies because it is the first controlled U.S. study to test glandulars on humans. Of the 17 patients who received the thymus extract, 10 went into complete remission without being medicated or receiving any chemotherapy. Although this was a preliminary study, the evidence points toward some positive results, especially if an integrative approach were to take the place of using chemotherapy in combination with the thymus therapy.

Clinical trials using thymus extract have shown that it is beneficial in people with hepatitis B (Skotnicki 1989). Additional clinical studies with oral thymus extract showed that blood values related to liver function as well as the blood immune markers all improved. Civereira (1989) showed similar results with hepatitis C (Galli 1985, Bortolotti 1988).

Raw glandular extracts of adrenal, lymph, spleen, bone marrow, and thymus tissue have been clinically shown to be anti-inflammatory, as well as tissue and organ sparing in cancer and other chronic degenerative diseases (Craveri 1971, Hartleb 1997, Singh 1998, Volk 1991, Sing 1985, Kouttab 1989, Schulof 1985).

One of the most powerful, steroid-like hormones is dehydroepiandrosterone (DHEA), which has been proven to have clinical significance for a variety of conditions, such as cognitive dysfunction and aging, diabetes, heart disease, and arthritis. DHEA also may possess anticancer activity. This hormone was left out of the equation when the medical research isolated and synthetically produced cortisone, thereby moving away from the traditional adrenal extract. As it turns out, DHEA's properties are as potent as cortisone itself. One of its properties that can

be beneficial for dogs that are cushinoid or have Cushing's disease is its ability to help control and lower cortisol levels (Kroboth 2003). What other yet undiscovered beneficial substances may be found in adrenal extract that are part of the mechanism of action? (Flood 1988, Schwartz 1981, Kalimi 1990.)

THE INTEGRATION OF THERAPEUTIC NUTRITION INTO PRACTICE

Most commonly, when veterinarians graduate, select their desired type of practice, and do an internship, residency, or enter private practice, their focus has been guided toward diagnosis, disease, pathophysiology, and therapy and less toward the underlying cause and prevention. In a typical veterinary practice, prevention and wellness often take a back seat to the treatment of acute, chronic, and neoplastic conditions. Integrative veterinary medicine strives to augment and enhance conventional medicine with therapeutic modalities that inherently address underlying causes and prevention.

Drug therapies are aimed at signs and symptoms and often do not address the underlying cause, nor do they heal. Only the body and its immune and healing systems can promote healing. Drugs are designed to control, suppress, stimulate, quiet, and diminish. Nutritional therapies, on the other hand, are designed to nourish, soothe, reduce inflammation, protect cells and glands, improve metabolism, enhance waste and toxin elimination, and promote homeostasis.

So long as the therapeutic nutrition does not interfere with the intended action of the drug, why would a veterinarian be reluctant to add it to his or her treatment protocol? One of the most common reasons is "I just do not know enough about nutritional therapies to use or recommend them" or "I would use therapeutic nutrition if I could see the evidence or the proof." The purpose of this book is to present to practitioners proven and well-documented protocols that can be used either alone or in combination with needed medical therapies.

This introductory section on therapeutic nutrition explains various nutrients and nutraceuticals, as well as their therapeutic value, and it refers to the scientific clinical documentation. Earlier in this section we presented the science and data behind glandular therapies. Later we present an in-depth discussion of the metabolic, physiological, and biochemical evaluation of routine blood chemistries and complete blood counts. Using routine blood results as a guide for selecting therapeutic nutrients, as well as for supporting weakened, inflamed, or disease organs, places the integrative veterinarian in a knowledgeable position. This knowledge helps veterinarians select the appropriate nutritional remedies that more closely address the specific disease, organ weakness, signs, and

symptoms that the animal is experiencing. The use of diagnostic blood results as a marker for recommending nutritional therapies gives veterinarians the comfort of using accepted clinical data (blood results) as it relates to the AVMA guidelines that "veterinarians extrapolate information when formulating a course of therapy."

THERAPEUTIC NUTRIENTS AND NUTRACEUTICALS

The following is a sampling, rather than an exhaustive list, of some of the more commonly used nutrients and nutraceuticals that are available to practitioners of IVM. In chapters 6 through 18, in the disease protocols sections, additional disease-specific nutrients and nutraceuticals, as well as their use, benefits, and clinical efficacy, may be listed.

Amino acids

Amino acids are defined as the building blocks of proteins. Many amino acids are classified as essential and need to be in the daily diet. Nonessential amino acids can be manufactured by the body or can be produced biochemically from other amino acids. The Association of American Feed Control Officials (AAFCO), in their Nutrient Profiles for Dogs and for Cats, list 10 and 11 essential amino acids for dogs and cats, respectively. They are arginine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, and valine; plus taurine for cats. Dogs can manufacture taurine, and cats cannot. A deficiency in any of these amino acids can lead to a disease process (AAFCO official publication).

Amino acids are essential for the health of cells and body tissues, including smooth and striated muscles, as well as for many of the metabolic and physiological processes. They are integral in the production of hormones, enzymes, and immunoglobulins used by the cells and organs to run bodily functions (Brady 1994). Proteins and specific amino acids are also required for the proper functioning of the immune system, the prevention of aging, and the maintenance of health and wellness (Davenport 1998, 2001; Hayek 2001; Lewis 1984; Williams 1998).

Pet food manufacturers spend millions on cutting-edge research design to confirm the importance of proteins and essential fatty acids required by growing, adult, and senior dogs and cats. This research supports the amounts and types of proteins and amino acids that are found in the foods that they produce and offer commercially to pet companions.

Note: It is important to distinguish the difference between protein and amino acids that are added to dogs' and cats' foods and designed to meet minimum protein

levels from the therapeutic use of amino acid as part of the treatment for chronic degenerative diseases.

L-carnitine

L-carnitine is produced from the metabolism of the amino acids lysine and methionine. L-carnitine is a lipotropic agent and requires vitamin C, thiamin, and pyridoxine to carry out this function. Fatty acids attach to carnitine, which transports them into the cell mitochondria to be converted into energy for the body. Carnitine helps to reduce both the circulating and stored levels of fat in the body. Many human nutraceutical companies tout the benefits of L-carnitine as a “fat buster.” L-carnitine is required in the metabolism of fatty acids and for the release of energy by the cells. Supplementing the diet with L-carnitine has a direct lowering effect on blood triglyceride levels (Sachan 1984).

In studies conducted by the Iams Company, the addition of carnitine to the diet of dogs was shown to reduce body weight by 6.4%, compared to 1.8% without supplementation (Sunvold 1998). Similar research in cats also suggests weight loss (Center 1998). Evangeliou (2003) showed that adding carnitine to the diet also helps to lower both cholesterol and triglyceride levels.

Carnitine plays a role in aging. Costell (1989) showed that carnitine levels decreased with aging; however, when animals were fed carnitine, it helped reverse the low levels and reversed the age-related changes in mitochondrial function.

L-carnitine has been proven effective in improving the functioning of the heart, especially when diseased. The heart muscle relies on fatty acids for energy, and L-carnitine is required for the transport of these fatty acids. Research has shown that when oxygen levels in the body are reduced, the cardiac reserves of carnitine are depleted. When L-carnitine is supplemented in the diet, it allows heart muscles to use lower levels of oxygen more efficiently. Cherchi (1985) and Orlando (1986) showed a benefit to heart patients with L-carnitine supplementation, and McEntee (1995) reported on low levels of L-carnitine in a dog with cardiomyopathy. The dog showed clinical improvement after L-carnitine therapy at 50 mg/kg/TID.

In other studies on heart disease, the addition of carnitine to the diet was found to reduce heart damage in animals (Lopaschuk 2000). In human patients with heart disease, it was found that introducing carnitine after the diagnosis of heart disease resulted in a significant improvement over standard drug therapy, in that the mortality rate in the L-carnitine-supplemented group was 1.2% as compared to 12.5% in the group that did not receive supplements (Davini 1992).

Clinical studies in humans show the benefit of L-carnitine on lipid metabolism and conversion to energy.

In diabetics, L-carnitine has been proven to significantly reduce levels of both triglycerides and cholesterol by more than 25% (Abdel-Aziz 1994). In addition, carnitine has been shown to reduce pain in diabetic-associated nerve damage (Onofri 1995). Acetyl-L-carnitine may slow or reverse mild cognitive impairment and the progression of dementia in Alzheimer's disease in younger patients (Brooks 1998, Sano 1992).

Taurine

Taurine is an amino acid that is nonessential for dogs, but essential for cats (AAFCO Cat Nutrient Profiles 1992, Monson 1989, Morris 1989). Cats, unlike many other mammals, cannot synthesize taurine from other amino acids and require adequate dietary sources. Low levels of taurine have been clinically proven to cause cardiomyopathy and retinal degeneration. Fox (1992), Kramer (1995), Novotny (1994), Ryan (1989), Simpson (1993), Pion (1992), and Wysong (1989) found a direct link between low levels of taurine and cardiac disease. It has been shown that dietary supplementation with taurine leads to clinical improvement in cats with retinal disease and cardiomyopathy. It has also been shown that developmental and platelet abnormalities and reproductive issues that are seen in adult cats and their offspring are related to a corresponding decrease in the taurine levels in mothers' milk (Dieter 1993; NRC 1986; Sturman 1986, 1991; Waltham 1993, 1994).

The health status of these cats is closely aligned with the findings of the Pottenger Cat Experiments that were carried out 60 years ago and that are discussed later in this section (Pottenger 1946).

In addition to the dietary need for taurine, it has been found that the composition and the method of food processing affect taurine requirements. For example, the level of dietary fiber directly affects taurine requirements. Hickman (1990, 1991) and Kim (1996a,b) have shown that the heat processing of food leads to lower plasma levels of taurine. See the sections on clinical nutrition and the biological factor later in this chapter for a more in-depth discussion of the effect of processing on the bioavailability of nutrients and the Pottenger Cat Experiment (NRC 1986; Pottenger 1946, 1995).

Arginine

The amino acid arginine is essential for both dogs and cats. Arginine has been proven beneficial in the healing of naturally occurring and surgical wounds and in the effect of growth hormone on the body. It also improves both gastrointestinal health and immune function (Barbul 1983, 1990; Besset 1982; Buchman 1999; Kirk 1993; Marcell 1999). Double-blind studies in people have also confirmed that arginine is beneficial in the treatment of congestive heart failure and in helping to improve

kidney function in these patients (Rector 1996, Watanabe 2000).

In studies of dogs with cancer, it was determined that they had lower plasma levels of arginine and other amino acids, which did not change after the tumor was removed surgically, suggesting that protein metabolism changes in these dogs. It is also felt that the same is true for cats. Hills, in their research for the development of their cancer diet, N/D®, showed that the addition of arginine and essential fatty acids to the daily diet of dogs with cancer can improve the prognosis and remission times (Hills—Canine Cancer, Ogilvie 1990, 2000).

Glutamine

Glutamine is a non-essential and the most abundant amino acid found in dogs and cats. Although it is readily available in food and manufactured by the body, in chronic periods of stress and disease, levels of glutamine can be depleted, negatively impacting health (O'Dwyer 1989). It is during these periods of stress that glutamine becomes so important. It has been shown that when both intracellular and plasma levels of glutamine fall significantly, negative health consequences can occur (Askanazi 1980, Souba 1992).

Glutamine is important for immune system health, especially in critically ill patients (Jones 1999, Griffiths 1997, Klimberg 1990). Besides improving immune function, glutamine is beneficial for the intestinal tract and can improve cellular integrity as well as permeability. This is especially important in immune-mediated disease conditions, such as inflammatory bowel disease (Souba 1985, Windmueller 1982, Yoshimura 1993).

In athletes, glutamine has been proven beneficial in preventing respiratory infections, especially after heavy exercise (Nieman 1998, Castell 1996).

Glutamine is often depleted in cancer cachexia. It has been suggested that supplementation with glutamine decreases tumor growth and improves immune function (Klimberg 1996). Besides being the preferred nutrient of the intestinal cells, research has shown that glutamine is also tissue sparing and cellular regenerative. It is an intermediary for the antioxidant glutathione in its role of protecting against the adverse effects of radiation therapy (Klimberg 1996). When chemotherapy is administered, glutamine helps reduce drug-induced inflammation in the bowel (Rombeau 1990, Fox 1988). In patients receiving chemotherapy, adding dietary glutamine has been shown to enhance the effectiveness of certain chemotherapeutics and to increase patient survival times (Klimberg 1991, 1992).

Enzymes

Metabolically, enzymes are essential in the conversion of nutrients to meet the energy needs of the body. They are

also involved as catalysts in many other biochemical processes. Enzyme deficiency is caused either by a specific organ malfunctioning or by a deficiency or lack of availability of the proper nutrients required for enzyme production. Nutrients, such as minerals, amino acids, and fatty acids, are required for the synthesis of various enzymes (Howell 1985).

The commonly known digestive enzymes are:

Amylase: carbohydrate digestion

Protease: protein digestion

Lipase: fat digestion

Cellulase: cellulose digestion

Inadequate or deficient levels of enzymes are caused by excessive free radical load leading to chronic inflammation, chronic disease, and organ malfunction, such as exocrine pancreatic insufficiency (EPI) or secondary to the chronic use of medications such as antibiotics.

Besides their function in the digestive process, which in turn improves the general food absorption and metabolism, enzymes provide the indirect benefit of helping to restore overall health. Given with meals, enzymes assist with digestion. Given separate from meals, they can replenish the body's normal reserves as well as help to process undigested and abnormal protein fragments.

Enzymes are natural protein complexes that digest foods and aid in the assimilation of nutrients. In cancer patients, enzymes can help to destroy immune complexes that are produced by and actually surround the cancer cell. These complexes help deter the immune system from attacking the cancer. Cichoke (1995) and Wrba (1990) talk about the use of enzymes to help contain further cell growth and prevent metastasis of the cancer. Some studies have shown that the ingestion of enzymes reduces the adverse effects of radiation therapy. Dale (2001), Gujral (2001), and Gonzales (1999) reported on increased survival times in patients taking enzyme replacement therapies as part of an overall nutritional support program for the treatment of pancreatic adenocarcinoma. Similarly, a retrospective study by Sakalova (2001) indicated improved quality of life.

Although enzyme replacement therapy is controversial, it is believed that adding enzymes to a sound nutritional program is beneficial, and as such several clinical trials are currently being conducted to establish evidence-based proof for enzyme replacement therapies.

Minerals/essential minerals

Many of the raw ingredients found in pet foods are either mineral deficient because of depleted soils or do not contain adequate levels of the minerals. Therefore, pet food manufacturers add minerals to their products to meet AAFCO label claims. For economic reasons, many

minerals used in pet foods are inexpensive, inorganic mineral combinations, such as copper sulfate and ferrous oxide. It has been demonstrated that inorganic combinations of minerals are not as well absorbed, assimilated, and used in the body (Ashmead 1982, 1985).

Metabolically and physiologically, minerals have numerous functions in the body. The osmotic balance that exists between synergistic minerals causes the movement of nutrients in and out of cells as well as throughout the fluid systems. Important mineral ratios include sodium/potassium and calcium/phosphorus, as imbalances can alter physiological balances, leading to deficiencies and disease states.

The following is a short list of minerals and how they are required in the day-to-day metabolic processes.

Calcium

Calcium is the most abundant mineral in the body and is the main mineral in the bones and teeth. Calcium is a catalyst for specific enzyme reactions that are required by various other vitamins and minerals to perform their physiological function. Calcium is required for proper contraction of the muscles of the heart and for the maintenance of blood pressure. It also aids in the metabolism of fat by helping lipoproteins' absorption from the intestines (Jorde 2000, Osborne 1996). Calcium is required for the proper clotting of blood and is needed for vitamin K activation, which is required to stop bleeding (Brody 1999).

The levels of calcium in the blood and tissues are tightly maintained in a range that is monitored closely. The body's physiological mechanisms and the parathyroid glands control calcium levels and if necessary will sacrifice bone to maintain adequate levels. Because of this requirement, adequate amounts of dietary calcium are needed for daily health (Weaver 1999). Calcium helps to mediate blood vessel contraction, constriction, and dilation, as well as nerve impulses and muscle contraction (Food and Nutrition Board 1997).

Studies conducted on animals suggest that adequate calcium levels are required for the prevention of colon cancer (Bostick 2001). Some studies show that diets that are higher in calcium are associated with lower colon cancer risks (Baron 1999, Bostick 1995, Lipkin 1995, Hyman 1998, White 1997).

Studies have shown that dietary essential fatty acids increase intestinal calcium absorption, and along with vitamin D, they help to decrease urinary calcium losses (Hertz-Picciotto 2000). It has also been shown that calcium may decrease the absorption of oxalates and may indirectly reduce the formation of kidney stones in people. Perhaps this is an area for veterinary researchers to study, i.e., the increased incidence of calcium oxalate crystals and stones in dogs and cats (Barilla 1978, Curhan 1993).

Chromium

Chromium assists in the release of sugar from the blood to the muscles and other tissues. It is also involved in helping fatty acids be properly absorbed from the intestines into the blood. Chromium is indicated in the treatment of diabetes mellitus. Early reports show that brewer's yeast, which is rich in chromium, can be helpful in the treatment of diabetes and the improvement of glucose tolerance (Anderson 1998, 2000; Offenbacher 1980).

In people, both type 1 and type 2 diabetes showed improvement with the addition of chromium, and this is believed to be due to improving sensitivity to insulin (Gaby 1996, Evans 1989). Chromium has also been shown to be beneficial in helping to reduce cholesterol and triglyceride levels as they relate to heart disease (Lee 1994, Hermann 1998).

Copper

Copper is an integral part of protein metabolism and in the release of toxins from the body. In veterinary medicine, we are aware of the difficulties animals face when there are higher-than-normal levels of copper (especially in Bedlington Terriers). However, copper deficiencies also present specific problems. Deficiencies can lead to reduced immune functions, less resistance to disease, anemia, and overall physical weakness. Copper can be hepatotoxic; however, the levels of copper in the body, as well as in the food, are important and required for daily health.

Iron

Iron is responsible for the uptake and use of oxygen by the cells. It is essential for life, because it is involved in the formation of hemoglobin and red blood cells. Metabolically, it is required for the proper balance of hydrogen and oxygen in the blood.

Magnesium

Magnesium is essential for the production of amino acids, the formation of RNA and DNA, and in conjunction with calcium, for the regular cardiac rhythm. Magnesium is also involved in the digestion and assimilation of proteins by the cells, by working in concert with and polarizing minerals for uptake through the cell membrane.

Magnesium has been extensively researched in terms of the pathogenesis and treatment of, as well as its beneficial effects in, the treatment of cardiovascular disease in people (Altura 1985; Seelig 1980, 1989; Sjogren 1989). Because of its inverse relationship with calcium, magnesium can act as a calcium channel blocker, helping to reduce blood pressure (Kawano 1998).

Physiologically, magnesium activates adenosine triphosphatase (ATP), which is required for the proper functioning of cell membranes and which fuels the sodium potassium pump. Magnesium deficiencies upset mineral

balance required for cardiac muscle contraction and rhythm (Rardon 1990, Whang 1990). Bashir (1993) showed that people taking magnesium supplements had a more than 30% reduction in arrhythmias. In a large population study, Tsuji (1994) associated low serum levels of magnesium with increased rate of arrhythmias. Tzivoni (1990), in a peer-reviewed study, showed that magnesium definitively reduced drug-induced arrhythmias.

Magnesium has also been associated with neuromuscular function and conditions such as muscle cramping, weakness, and neuromuscular dysfunction. Magnesium is recommended for epilepsy therapy and for weakening muscle function (Bibley 1996, Levin, 2002).

Diabetic people have been shown to be traditionally low in magnesium, and this can be corrected with supplementation (Eibl 1995, Paolisso 1990). In addition, magnesium supplementation has been shown to improve the production of insulin in people with type 2 diabetes (Paolisso 1989). It has also been shown that the requirements for insulin in people with type 1 diabetes are lower when supplemented with magnesium and that retinopathy is more likely to occur (McNair 1978, Sjorgren 1988). The American Diabetes Association suggests that there are “strong associations ... between magnesium deficiency and insulin resistance.” However, they will not confirm that this is a connection between a deficiency and the risk of developing diabetes (American Diabetes Association 1992).

Manganese

Manganese is an important catalyst and co-factor in many enzymatic and metabolic processes. Along with magnesium, it helps to get protein through the cell membrane. It is found in the pancreas, pituitary, liver, and kidney, and it functions in lipid and cholesterol metabolism as well as in the proper functioning of the pancreas in sugar metabolism. Manganese has also been proven beneficial in the treatment of arthritis in animals (Keen 2000).

Potassium

Potassium is an essential mineral that is found in abundance in the extracellular fluid, and it plays a critical role in the osmotic pressure and water balance. It also plays an important role in acid-base balance as well as in the transmission of electrical impulses in the heart and the regulation and the lowering of blood pressure in people (Whelton 1997). It is important in maintaining a regular heart rhythm, and it is involved in carbohydrate metabolism and assimilation by the cells.

Selenium

Selenium is an important antioxidant, functioning in this capacity along with the enzyme glutathione peroxidase

and vitamin E. It is involved in the proper functioning of the pancreas and helps with the absorption of glucose by the cells. It is beneficial in animals with cancer.

Selenium is an essential trace mineral (Burk 1999). There are numerous evidence-based studies that show that the addition of selenium to the diet helps to reduce the incidence of cancer in animals (Rayman 2000).

Sodium

Sodium is responsible for the osmotic balance in the cells and extracellular fluid along with potassium. Sodium is a metabolic indicator of adrenal function, and it is involved in the absorption of proteins and sugars across the cell membrane.

Zinc

Zinc is an essential mineral that is involved in many metabolic and physiological processes, including digestion and the absorption of carbohydrates across cell membranes. It is important in the metabolic processes of the immune system and for reproduction (Prasad 1998). Zinc is particularly beneficial for the metabolism and health of the skin. Zinc can compete with copper for absorption into the blood and therefore can indirectly lower copper levels by reducing its absorption (Broek 1986, King 1999).

Although zinc is required in dog and cat foods, its relative absorption and assimilation can vary depending on the animal and the chemical type of the mineral. A common deficiency disease in animals is zinc-responsive dermatosis, most commonly found in Huskies, Malamutes, and large-breed puppies (Griffin 1993, Werner 2003). Deficiencies occur because of the difficulty of absorbing zinc in certain breeds of animals. Factors that interfere with absorption besides breed predilection are fiber, plant phytates, and calcium, which may bind with zinc and prevent its absorption. Therefore, eating plant-based foods may lead to zinc deficiencies. It is important that dog and cat diets be fortified with zinc. Equally as important is the type of zinc added to the food. Studies indicate that inorganic mineral forms may not be as well absorbed as those bound or chelated to protein (Ashmead 1982, 1985). (See the diet section in this chapter for more details.) In addition, dogs and cats that have chronic intestinal diseases such as IBD may be more prone to zinc deficiencies because of impaired absorption (Lewis 1984, Mosier 1978, Mueller 1989).

Type 1 diabetes in people has been linked to zinc deficiencies, which also may adversely affect general immune function (Nakamura 1991, Mocchegiani 1989). It has also been shown that supplementing the diet with zinc can help to lower blood glucose levels (Rao 1987).

Zinc is related to impaired immune function, and deficiencies can increase susceptibility to various infections (Baum 2000, Shankar 1998). In human HIV patients, low

levels of zinc have been associated with higher mortality rates (Lai 2001, Wellinghausen 2000, Mocchegiani 2000).

Essential fatty acids (EFAs)

Much research has been conducted on the importance of essential fatty acids in the daily diet, and on the clinical management of various degenerative diseases (Reinhart 1996, Holub 1995, Herman 1998). The importance of the ratio between omega-3 and omega-6 fatty acids has been substantiated. Research on the use of polyunsaturated fatty acids has shown their beneficial and antipruritic effects on skin (Reinhart 1996, Schick 1996).

Some pet food manufacturers are addressing this important ratio by adding sources of omega-3 and omega-6 fatty acids. Many commercial dog and cat foods contain poultry fat as the primary source of fatty acids. Levels of fat in pet food range from 8% to 20%. Poultry fat contains approximately 20% linoleic acid (omega-6) or 2% to 3% of the total food. There is about 30 times more omega-6 than omega-3 in chicken fat (Erasmus 1993). Therefore, the estimated total amount of omega-3 fatty acids in pet foods that contain poultry fat as the primary fat source is less than 1% (Goldstein 2005).

Kendler (1987) reported that although both linoleic acid (LA) and gamma-linolenic acid (GLA) can be obtained from food, poor-quality ingredients can be low in essential fatty acids and lead to deficiencies. Because many commercially available pet foods obtain their poultry fat from by-products, the chances of EFA deficiencies are even greater (Hilton 1989).

A second important point is that although manufacturers are now adding omega-3 fatty acids to their foods, many of these compounds are easily destroyed by exposure to heat and light (Erasmus 1986). Therefore, it is essential to supplement the diet with a fresh source of omega-3 fatty acids. Good sources include flax, borage, hemp, and fish oil.

Food manufacturers and researchers are focusing on the role of fatty acids in the metabolism of the skin as well as their role in the inflammatory process. The 1998 *Recent Advances in Canine and Feline Nutrition, Vol. II*, sponsored by The Iams Company, focused attention on the role of fatty acids in the inflammatory process, wellness, and disease. Studies demonstrated that fatty acids, such as linoleic (LA) and gamma-linolenic (GLA), promote the formation of eicosinoids, which exert an anti-inflammatory response in the body. Metabolically, these essential fatty acids help to reduce the inflammatory process that predisposes the initiation of many disease processes.

The clinical use of EFAs in medical practice extends beyond the treatment of skin disorders. Other areas of potential use for EFAs include cardiovascular disease

(Capron 1993), arthritis (Carmichael 1982), cancer therapy, and renal disease (Holub 1995, Logas et al. 1991, Logas and Kunkle 1994, Herman 1998).

Fish oil

Fish oil contains high levels of eicosapentaenoic acid (EPA), an omega-3 fatty acid that helps to maintain the proper levels of eicosinoids, which in turn help to mediate the body's response to cancer cells. Research has shown that EPA can slow tumor growth and improve the response of the cell to chemotherapeutics (Sagaguchi 1990, Reich 1989). In people with heart disease, there have been reported benefits of fish oil in slowing the progression of arteriosclerosis and in improving disease symptoms (Leaf 1988, von Schacky 1999). Kremer (1995) has shown that fish oil helps reduce inflammation in people with arthritis.

It has been clinically proven that people suffering from colitis and Crohn's disease who supplemented their diet with EPA and DHA, the two omega-3 fatty acids that are found in fish oil, had significantly fewer recurrences over a 1- to 2-year period than those who did not supplement their diets (Belluzzi 1996, Mate 1991).

Flax seed oil

Flax seed oil contains more than 55% linoleic acid (omega-3). Flax seed is considered the "Rolls-Royce" of fatty acids because it contains more omega-3 than any other oil. It has antioxidant, anti-inflammatory, and anti-cancer effects on the body. Erasmus (1986), Murray (1996), and Budwig (1992) refer to flax seed oil's anti-cancer effects and its beneficial effects on arthritis.

Evening primrose oil (*Oenothera biennis* L.)

Evening primrose oil (EPO) is a seed oil that contains about 70% gamma-linolenic acid (omega-6), which is essential in the formation of eicosanoids, specifically prostaglandin E1 (PGE1), which has an anti-inflammatory effect. In a double-blind study of people with rheumatoid arthritis, Joe (1993) showed that a number of people had significant benefits from the addition of EPO. Eicosanoids, besides having anti-inflammatory effects, also have anti-cancer properties. Begin (1986) reported on the ability of omega-6 fatty acids to kill cancer cells. Other studies show that in some cases, patients reported anticancer effects of GLA (Pritchard 1990, Lee 1986, McIlmurray 1987, Naidu 1992, Van der Merwe 1987).

EPO has been proven to have both anti-inflammatory and anti-pruritic effects on skin diseases, and as part of a balanced nutritional program, it can exert a positive effect on animals with dermatological conditions. Studies suggest that EPO is beneficial in people with atopic dermatitis and eczema (Hederos 1996, Humphreys 1994, Morse 1989).

Cotterell (1990), in a double-blind study, showed that more than 50% of the women taking evening primrose oil with menstrually related irritable bowel syndrome improved, while none in the non-EPO group showed any benefit. In another study, Manning (1977) and Hotz (1994) showed improvement with IBS by adding psyllium to the diet.

Borage oil

Derived from the seed of the borage plant (*Borago officinalis*), borage oil, like EPO, is high in gamma-linolenic acid and has similar properties and benefits. Like EPO, borage oil, which contains high levels of GLA, should convert into eicosanoids; however, many factors, such as the quality of food, disease, and vitamin and mineral deficiencies, can influence this conversion to the anti-inflammatory eicosanoids. Therefore, supplementation is recommended to ensure that the adequate amount of GLA is present (Horrobin 1981). Borage oil has also been proven beneficial for skin conditions (Landi 1993, Tolle-son 1993) and arthritis (Pullman-Moore 1990, Leventhal 1993, Zurier 1996).

Seabuckthorne oil

Seabuckthorne oil was therapeutically used and recorded in China more than 1,000 years ago in the Tang Dynasty. In the *Sibu Yidian*, a Tibetan medical book, more than 30 chapters were dedicated to the use of this oil. The *Sibu Yidian* was published in Russia in 1903 (Ma Yingcai 1989). In the 1950s the Sichuan Medical College initiated research into seabuckthorne and its medicinal properties (Xu Zhonglu 1956). It has been discovered that seabuckthorne is rich in essential amino acids, beta carotene, lycopenes, flavonoids, sitosterol, folic acid, and essential fatty acids (Zhang Zhemin 1990). Seabuckthorne oil can be used to treat burns, skin radiation lesions, gastric and duodenal ulcers, and so on (Wu Fuheng 1991).

In animal studies, seabuckthorne oil has been shown to improve cardiac function, contractility, and oxygen utilization (Wu 1994, 1997). In cancer, it has been shown to improve immune function and can inhibit tumor cells. Zhang Peizhen (1989) and Tang Jing (1989) showed that seabuckthorne slowed hepatocyte proliferation in precancerous lesions. Zhong Fei (1989) showed that seabuckthorne could strengthen cellular immunity by improving phagocyte function. Ren Lisa (1992) showed that seabuckthorne oil improves immune and bone marrow function as well as that of natural killer cells. Seabuckthorne oil is clinically approved in Russia for use in circulatory disorders, to reduce inflammation, to protect against radiation damage, and to relax smooth muscles (Yance 2005).

Hemp oil

Hemp oil is a plant-derived oil that is extremely high in both linoleic (LA) and linolenic (LNA) fatty acids. These essential fatty acids are the building blocks for the longer chained eicosapentaenoic (EPA) and docosahexaenoic acid (DHA) that are prevalent in fish oil and have been clinically shown to be beneficial in the treatment of cancer in animals (Ogilvie 2000).

Because the cancer treatment protocols represented in chapter 31 of this book restrict the use of fish and fish oil, hemp oil can be used to supply the required essential fatty acids for these animals. (See the section on diet in chapter 31 for more details about the feeding of fish oil-restricted diets for cancer patients.)

The analysis of hemp oil shows that more than 70% is composed of polyunsaturated fatty acids, while it contains less than 20% saturated fats (Kralovansky 1994, Weil 1993). Because of its high level of gamma-linolenic acid (GLA), it is being investigated for its beneficial effects on immune function and cardiovascular disease (Horrobin 1992).

Nutraceuticals

N,N-Dimethylglycine (DMG)

N,N-dimethylglycine (DMG) is naturally produced by the body and has been clinically proven to support a broad range of immune functions (Graber 1981, Reap 1990). DMG improves circulation and helps the body in the removal of toxins (Kendall 2003). This ability to assist in detoxification is especially important when dealing with chronic and autoimmune conditions of the skin (Verdova 1965).

DMG has been widely researched in both humans and animals. It has been found to increase energy, improve cardiovascular function, and enhance immune function (Barnes 1979, Graber 1981, Walker 1988). Mackenzie (1958) has reported on the biochemistry of DMG. Meduski has called DMG a “metabolic enhancer” because it serves multiple functions, such as improving cellular oxygen use (an important component in cancer therapy) and supporting transmethylation pathways via S-Ado-Me, by being an indirect methyl donor.

In cancer treatment, DMG increases tumor necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988). Studies demonstrate that DMG is beneficial in its ability to modulate the immune system and in the prevention and treatment of many types of cancer (Mani 1999). DMG also helps prevent metastasis to other organs (Reap 1988, Kendall 1991). There is indication that DMG is beneficial in repairing DNA and that it helps in the regulation of gene expression and controlled cell division.

Kendall (2003) reports on research that suggests DMG is cellular protective in animals that are receiving radiation therapy. DMG is also indicated as part of an overall therapy program for the prevention and potential treatment of cancer in animals (Balch 1997, Mani 1999). Recent work has shown that DMG is a potent antioxidant and anti-inflammatory agent (Yanez 2007).

DMG has been studied extensively in horses over the past 20 years and has shown a positive effect on stamina and endurance in competing horses (Charles 1982, Jones 1988). Livine (1982) reported on DMG's ability to reduce lactic acid build-up and improve performance. In dogs, Gannon and Kendall (1982) reported improved racing times and stamina, as well as recovery when diets were supplemented with DMG. Seizure activity in dogs can also be reduced by the use of DMG (Kendall 2003).

Lecithin/phosphatidyl choline

Phosphatidyl choline is a phospholipid that is integral to cellular membranes and particularly on nerve and brain cells. It helps to move fats into the cells, and it is involved in neurotransmission and acetylcholine, particularly with cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by the skin and all the cells of the body for general health and wellness (Hanin 1987).

Studies with lecithin have shown that it can reduce triglyceride and cholesterol levels, because it is an emulsifier of fats (Brook 1986, Spilburg 2003).

Phosphatidyl serine (PS)

Phosphatidyl serine is a phospholipid and an essential ingredient in cellular membranes, particularly of brain cells. It has been studied extensively in people with altered mental functioning and degeneration, with positive results (Crook 1991, Cenacchi 1993). In people with Alzheimer's disease, the addition of PS to the dietary program showed a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

In studies with PS and cortisol levels, adding PS to the diet significantly reduces both the ACTH and cortisol levels. Reducing cortisol levels is beneficial in cushinoid dogs and in those with overt Cushing's disease (Fahey 1998; Monteleone 1990, 1992).

Medicinal mushrooms (maitake and reishi)

Maitake mushrooms have been used in Eastern herbal medicine for centuries. Studies show that properly extracted mushrooms are rich in beta glucans and help to support and enhance immune function. In stressful conditions, they metabolically support organ systems in maintaining balance and homeostasis. The active ingredient,

beta glucans, is a polysaccharide, which is responsible for the therapeutic action (Nanba 1987).

Numerous studies in Japan and now in the United States confirm their health benefits and immune-enhancing abilities. Recent studies indicate that maitake extracts may also be helpful as adjuncts to chemotherapy, by not only enhancing the drugs' effectiveness but also in the ameliorization of the drugs' potential side effects (Adachi 1987, Nariba 1993, Wagner 1985). Studies have shown the direct anti-tumor effect of an extract of maitake mushrooms called the D-fraction, which has been shown to increase natural killer cell (NK) activity, improves immune function and induces apoptosis. D-fraction extract has been approved for use in dogs and cats (Kodama 2003, Konno 2004, Shimada 2004).

Alpha-lipoic acid (ALA)

Alpha-lipoic acid is classified as an enzyme and is involved in mitochondrial activity. ALA is referred to as the "universal antioxidant" because it is soluble in both water and fat environments. As a potent antioxidant it has been shown to reduce oxidative stress, inflammation, and the mitochondrial decline often associated with the aging process. ALA has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, coenzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Lykkesfeldt 1998, Kagan 1990, Scholich 1989).

Clinically, because it is involved metabolically in sugar and fat metabolism, it has been shown to be beneficial in the management and treatment of diabetes mellitus and diabetic neuropathy often found in people (Konrad 1999, Nickander 1996, Packer, 1997). Estrada (1996) has shown ALA to improve glucose uptake in animals. The American Diabetes Association recommends ALA along with vitamin E for helping to prevent diabetic complications such as neuropathy, atherosclerosis, and cataract formation (Ou 1996, Yi 2006).

In the treatment and prevention of glaucoma, Filina (1995) has shown that higher levels of ALA improved clinical parameters associated with open angle glaucoma. Bartter (1980) showed that 67 of 75 patients with mushroom poisoning who took ALA recovered, as compared to the normal, untreated 10% to 50%. Sabeel (1995) showed similar effectiveness with ALA in the treatment of poisonous mushroom toxicity.

In other animal studies, ALA, along with other antioxidants and L-carnitine, was found to improve cognition and memory and to help in preventing cognitive decline (Farr 2003, Hagen 2002, Milgram 2005).

In the treatment of autoimmune encephalomyelitis (a model used in multiple sclerosis research), Marracci (2002) and Morini (2004) found that ALA slowed progression of the autoimmune response and the disease

process. It should be noted that free radical inflammation is implicated in initiating many of the disease processes discussed in the book; therefore, ALA and other antioxidants can function to reduce this inflammation, thereby helping to prevent many of these diseases.

One caution with alpha-lipoic acid is the concern of toxicity in cats. Hill (2004) reported that lipoic acid may be 10 times more toxic in cats than reported in dogs and people, so precaution should be used for cats.

Coenzyme Q10 (CoQ10)

Coenzyme Q10 (ubiquinone) is found in the mitochondria and is involved in the cells' energy production, which is required for the daily functioning of the body. CoQ10 is essential for the manufacture of ATP, the energy source for the body's cells and tissues. CoQ10 is a potent antioxidant and helps in the process of neutralizing free radicals and improving cell protection (Thomas 1997, Weber 1994).

Although coenzyme Q10 is produced by the body and is present in many foods, deficiencies can occur. Deficiencies generally affect the heart first, as the heart muscle requires the nutrient and continually uses energy in its functioning. CoQ10 is involved in maintaining the level of oxygen present in the blood and available to the cells.

Being a strong antioxidant and helping to reduce inflammation, CoQ10 has indications in the prevention and treatment of many common diseases, such as gingivitis and periodontal disease, heart disease, arthritis, diabetes, and many types of cancer (Gaby 1998, Shigeta 1966). Regarding periodontal disease, double-blind clinical trials have shown that people supplemented with coenzyme Q10 had improved results over those taking a placebo. Gaby (1998) suggests that periodontal disease is directly linked to a coenzyme Q10 deficiency (Nakamura 1973). In addition, double-blind studies show that taking 50 mg daily for 3 weeks led to a significant reduction in the symptoms of periodontal disease (Wilkinson 1976).

Much of the clinical research on CoQ10 has been in human heart disease. Research has shown that CoQ10 is beneficial in controlling cardiac arrhythmias, congestive heart disease, and cardiomyopathy (Gaby 1996; Giugliano 2000; Greenberg 1990; Folkers 1985, 1986; Harker-Murray 2000; Hofman-Bang 1995; Khatta 2000; Kim 1997; Mortensen 1985; Soja 1997; Morisco 1993; Permatnetter 1992). Results of these clinical studies showed an improvement in the related symptoms of heart diseases, such as a reduction in dyspnea and edema, improved blood pressure, and normalized heart rates. Harker-Murray (2000) showed that in dogs, although a deficiency in CoQ10 does not appear to be present with heart disease, supplementation does appear to lessen the resultant hypertrophic response.

In diabetes, Shigeta (1966) and Miyake (1999) have shown that a form of CoQ10 helped to lower blood sugar levels and also showed that diabetic patients had significantly lower levels of CoQ10 in their systems.

In immune system function and cancer, CoQ10 has been proven beneficial as a potent antioxidant and has been proven to be helpful to the available metabolic energy required by the body to heal and prevent disease (Folkers 1982, Lockwood 1995).

Probiotics

The normal flora of the intestines is required for proper assimilation of food and nourishment of the cells. In addition to enhancing digestion, probiotics help to reduce the presence of pathogenic bacteria and increase the general immune response, thereby decreasing the likelihood of infection (De Simone 1993, Kawase 1982, Mel'nikova 1993, Rasic 1983, Smirnov 1993).

The flora balance can be upset or diminished by the following conditions:

- Trauma or injury
- Chronic disease (weak immune system)
- Environmental and/or food toxins
- Pet food ingredients—coloring agents, dyes, digesters, chemical additives or preservatives
- Stresses—emotional and physical
- Antibiotics and other medication, such as chemotherapeutics

Adding the proper combination of dietary probiotics can re-establish the population of these beneficial organisms. Common types are *Lactobacillus acidophilus*, *Lactobacillus bifidus*, and *Lactobacillus casei*. Perdigon (1987), Goldin (1984), and Gorbach (1982) have reported on the positive impact probiotics have on the immune system, the intestines, and in the treatment of cancer.

Diarrhea from many different causes diminishes the level of these organisms and thereby leaves the intestines more susceptible to secondary infection from harmful bacteria (Saavedra 1995, 2000). The addition of probiotics to the diet can often prevent diarrhea (Scarpignato 1995). In addition, it has been shown that adding probiotics to the daily diet can help to reduce fungal infections (Hilton 1992, Reid 1994).

In the treatment of inflammatory bowel disease, Washabau (2005) recommends the addition of probiotics, because they can enhance the immune system:

“The Gram-positive commensal lactic acid bacteria (e.g., *Lactobacilli*) have many beneficial health effects, including enhanced lymphocyte proliferation, innate and acquired immunity, and anti-inflammatory cytokine production. *Lactobacillus rhamnosus* GG, a bacterium used in the production of yogurt, is effective in preventing and

treating diarrhea, recurrent *Clostridia difficile* infection, primary rotavirus infection, and atopic dermatitis in humans.

Lactobacillus rhamnosus GG has been safely colonized in the canine gastrointestinal tract, although probiotic effects in the canine intestine have not been firmly established. The probiotic organism, *Enterococcus faecium* (SF68), has been safely colonized in the canine gastrointestinal tract, and it has been shown to increase fecal IgA content and circulating mature B (CD21+/MHC class II+) cells in young puppies. It has been suggested that this probiotic may be useful in the prevention or treatment of canine gastrointestinal disease."

Washabau cautions, however, "Two recent studies have shown that many commercial veterinary probiotic preparations are not accurately represented by label claims. Quality control appears to be deficient for many of these formulations. Until these products are more tightly regulated, veterinarians should probably view product claims with some skepticism."

Many veterinarians recommend the addition of probiotics to the diet when animals have a chronic yeast infection of the ears or the skin. One reason for such therapy is that many of these animals are on antibiotics that diminish the levels of normal intestinal bacteria, and secondarily probiotics may have a preventive or therapeutic effect on the overgrowth of various fungi, which can result in such situations.

One important point is that many probiotics are heat sensitive and may be destroyed in processing. One study found that the majority of acidophilus capsules on the market contained no live cultures (Hughes 1990). It is therefore important to understand that the addition of probiotics to pet foods before the high temperatures of the cooking process will more than likely inactivate the effectiveness of friendly bacteria; therefore, additional supplementation with live culture probiotics is essential to create the desired therapeutic effect.

Super oxide dismutase

Super oxide dismutase (SOD) is a potent destroyer of free radicals and can protect cells against oxidative damage (Petkau 1975, Fridovich 1972). McCord (1974) has reported that SOD can protect hyaluronate from free radical damage and that it may also have an anti-inflammatory effect (Salin and McCord 1975).

Quercetin

Quercetin is in the flavonoid family and has potent antioxidant properties (see the phytonutrients section earlier in this chapter.) Quercetin also acts like an antihistamine and has been shown to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). This action is beneficial in the treatment of allergic conditions such as asthma, dermatitis, and eczema.

Quercetin is also a phytoestrogen, which is a plant-derived compound that has estrogenic effects on the body. In this estrogenic category, Miodini (1999) and Shoskes (1999) have demonstrated quercetin's positive effects in inhibiting breast cancer and reducing inflammation in men with prostatitis. Knekt (1997) reported that quercetin has proved beneficial in the inhibition of lung and other cancers.

Vitamins

Vitamins traditionally have been used as supplements when there appears to be a deficiency, or at low levels to help prevent deficiencies. Vitamins, like other nutrients, are required daily for the body's metabolic and physiologic processes. Day-to-day stresses, modern cooking, processing techniques, exposure to chemicals and infectious agents, and treatment with potent and sometimes toxic medications and chemicals all deplete the body's vitamin and antioxidant reserves almost as quickly as they are taken in or manufactured. Therefore, adding vitamins in the proper amount, form, and type is critical for the treatment, maintenance, and restoration of health.

Vitamin A and beta carotene

Vitamin A is a retinoid, a potent antioxidant, and is required for the proper division and growth of cells. It has also been shown to increase immune function and help minimize chemotherapy side effects (Ehrenpreis 2005, McCullough 1999, Michels 2001, Russell 2000, Semba 1998, Thurnham 1999).

Beta carotene is a pigmented phytonutrient and a member of the carotenoid family. Carotenoids have been associated with the reduction of the adverse side effects of chemotherapy and the cancer itself. Although there is some indication that high levels of antioxidants can decrease the effectiveness of chemotherapy, the protocols presented in this book consider dosage of antioxidants (Anon 1994, Baron 2003, Greenberg 1994, Heinonen 1998, Keefe 2001, Lee 2002, Michaud 2002, Toma 2003, Zang 1999).

Vitamin A was first identified in 1913. Research on animals proved that a diet deficient in vitamin A adversely affected growth and weakened the immune system (Olsen 1989). Vitamin A (retinol) and beta carotene (provitamin A) are fat-soluble antioxidants and have proven essential for the proper functioning of the immune system and the health of the skin, eyes, gums, and teeth.

As a free radical scavenger, vitamin A is cell and tissue protective (see the sections on antioxidants and free radicals earlier in this chapter.) It can be therapeutically beneficial in treating chronic degenerative diseases such as cancer, arthritis, autoimmune disorders, and skin disease.

It also can be beneficial for exposure to environmental pollutants (Halliwell 1994).

Recent scientific advances have identified vitamin A as representing a group of compounds known as retinoids that have functional health benefits for the body. The body uses vitamin A in normal cellular division and differentiation processes. Retinoids are particularly important in the differentiation of lymphocytes and the activation of T lymphocytes, the body's prime immune cell regulators (Semba 1998). They are also important for the proper function of the eye and for vision.

Vitamin A plays an integral role in helping the cells of the skin and mucous membranes, which act as the main barrier to protect the body from the environment. It has been shown that retinoids are required to help these cells maintain their integrity.

Vitamin A has proven anticancer properties. In numerous studies, vitamin A and its derivatives have been shown to prevent primary tumor recurrences and spreading. They have been shown to be particularly effective in squamous cell carcinoma and malignant melanoma (Halliwell 1994, Hong 1990, Meyskens 1984, Mischeche 1977, Olsen 1989). In lung and breast cancer in people, Comstock (2001) and Ching (2002) reported a link between the risk of developing the disease and the retinoid levels in the body. The treatment of leukemia with retinoids has led to patient improvement (Thurnham 1999, Ross 1999).

Vitamin A can exert toxicity at high levels, so care must be used to prevent overdosing. Dogs and horses can derive vitamin A activity from beta carotene. Cats, however, cannot convert beta carotene into vitamin A, so adequate amounts must be available in their diet (National Research Council 1989).

Vitamin C

Vitamin C is a water-soluble compound that is the most studied, researched, and controversial of the vitamins (Pauling 1976). Numerous papers, clinical trials, and books have been written about vitamin C's effects as an antioxidant and general stimulant of the immune system, as well as its properties, such as its actions in (1) stimulating the production of interferon, (2) activating natural killer (NK) cells, (3) being cytotoxic to cancer cells, (4) strengthening connective tissue, (5) increasing levels of other antioxidant enzymes, and (6) improving appetite and day-to-day quality of life in terminal cancer patients and others. De la Fuente (1998) and Penn (1991) showed that vitamin C in combination with other vitamins significantly improved immune function, as compared to those people taking placebo.

Vitamin C is required for the synthesis of collagen and is known best for the deficiency disease scurvy. It is a potent antioxidant that is involved in neutralizing free radicals and reactive oxygen species (ROS). Free radicals

result from normal metabolism, as well as exposure to chemical and environmental pollutants, and they are believed to be initiators of inflammation and premature aging.

Carr (1999) reports that vitamin C deficiencies can lead to lower levels of L-carnitine, the amino acid that is required for fat metabolism and the proper functioning of the heart. Enstrom (1992) showed that there was a significant reduction in death from heart disease in people who regularly added vitamin C to their daily diet. In addition, Osganian (2003) and Knekt (2004) showed a statistically significant reduction in the risk of heart disease in thousands of patients.

Vitamin C is involved in many of the metabolic and physiological processes of the body. It is accepted that most animals manufacture their own vitamin C, but humans, primates, guinea pigs, and some birds must get vitamin C in their diets. It is now believed that excessive free radicals deplete vitamin C reserves, even in animals that have manufacturing capabilities.

High free radical production can result from:

- Ingestion of chemical additives and preservatives
- Chronic exposure to pesticides, insecticides, herbicides, and environmental pollutants
- Overvaccination
- Chronic use of medications such as antibiotics, corticosteroids, insecticides, and chemotherapeutics

In these situations, antioxidant reserves are depleted and dietary replenishment is either deficient or cannot keep up with the free radical load. This results in secondary inflammation, which can lead to premature aging.

It has been suggested that inferior ingredients used in many pet foods in combinations with chemical additives and preservatives, as well as the high heat of processing, can further reduce and inactivate dietary sources of vitamin C and the necessary nutrients required by the body for its manufacture (Goldstein 2000, 2005; Verde 1986).

Vitamin C has been studied clinically in animals. Brown (1994), Berg (1990), and Newman (1995) reported on the benefits of vitamin C in the treatment of degenerative joint disease and movement in dogs and in horses. Belfield (1981) reported on the beneficial effects of using vitamin C in treatment and prevention of hip dysplasia in dogs.

Vaananen (1993) showed that people who are vitamin C deficient are more prone to periodontal disease. Aurer-Kozelj (1982) showed that increasing the daily dose of vitamin C from 20 to 35 mg to 70 mg showed a significant improvement in periodontal disease.

Vitamin C and cancer

Linus Pauling and his associates, along with numerous other researchers and clinicians, have examined the health

and therapy benefits of vitamin C. Vitamin C is the most studied of all vitamins in relationship to its effects on cancer (Bendich 1995, Golde 2003, Hunter 1993, Jacobs 2002, Lee 2002, Michels 2001, Moertel 1985).

Besides its antioxidant and immune-stimulating effects, vitamin C has been clinically proven to be effective in cancer therapy. It stimulates the production of interferon and activates natural killer cells, which can destroy cancer cells.

D. Kromhout (1987) reported a 64% reduction in the risk of lung cancer over a 25-year period in men who took daily doses of vitamin C. In a study in Sweden, women consuming 110 mg/day of vitamin C reported a 39% lower risk of breast cancer (Michels 2001). And Feiz (2002) showed that vitamin C decreases the presence of cancer-causing compounds in the stomach and reduces the risk of stomach cancer.

Linus Pauling was the most well known of the cancer/vitamin C researchers reporting increased survival times in people with cancer. These early studies confirmed that vitamin C, in high doses and given intravenously, helped to extend remission time and improved the day-to-day quality of life (Cameron and Pauling 1976, 1977). Others confirmed these results (Riordan 1995). The Mayo Clinic research, however, has failed to confirm similar results as Pauling and Cameron (Creagan 1979, Moertel 1985).

Recent claims from the American Cancer Society stated that vitamin C may even enhance cancer cell growth by protecting cancer cells from the free radical killing effects of chemotherapy and radiation therapies (Golde 2003). However, findings by Padayatty (2004) at the National Institutes of Health suggest that the IV route achieved much higher blood levels of vitamin C than the oral route that was used in the Mayo Clinic studies and therefore is suggesting that more research be done.

Recent research is now showing that vitamin C inhibits the growth of at least 7 types of cancer and appears to be cytotoxic (Leung 1993). Also, in a more recent study, Gonzales (2005) indicates that this anticancer effect is due to the antioxidant effects of vitamin C.

Intravenous vitamin C is being studied for its cytotoxic effects (Riordan 1995). In one study Riordan et al. (1995) used high-dose IV vitamin C in a person with pancreatic cancer. CT scans 6 months post surgery did not show any tumor progression. However, the cancer did recur when the IV dose of vitamin C was reduced. These studies are encouraging and suggest that more quality research is necessary.

Although there is controversy and questioning of the definitive proof substantiating Pauling's findings, research is continuing. Studies are being conducted to determine if the combination of antioxidant therapies and conventional cancer therapy is beneficial for the quality of life and longevity of treated human breast cancer patients and

dogs with lymphosarcoma and osteosarcoma (Kaegi 1998, Goldstein 2006).

It should be noted that oral use of vitamin C can cause diarrhea. In humans and animals the recommended upper-limit therapeutic dose of vitamin C is at "bowel tolerance." This means the oral dose is increased every other day until the patient's stool loosens. Then the dose is reduced to the next lowest level and maintained. Another approach is to use vitamin C intravenously (in the preservative-free, buffered sodium ascorbate form), especially therapeutically in cancer patients. Veterinarians interested in the therapeutic application of vitamin C should read Belfield (1998).

Vitamin E

Vitamin E is a fat-soluble vitamin and one of the body's main antioxidants, especially in its function of protecting lipids. As a potent antioxidant its primary function is the neutralization of free radicals and reduction of inflammation, particularly as it affects the oxidation and destruction of lipids (Traber 1999). As such, vitamin E is tissue protective for the cellular membranes. Vitamin E has also been found to block the activity of kinase C, which supports the body's cell signaling mechanisms.

Besides its antioxidant functions, vitamin E is involved in the proper functioning of the heart muscle, particularly in improving cardiac output, circulation, and helping to reduce platelet aggregation (Traber 2001). Vitamin E reduces inflammation and improves circulation by helping vessels to dilate and by reducing the agglutination of blood platelets. In cancer, vitamin E has been shown to induce apoptosis (Yu 2003, You 2002). It is also suggested that vitamin E inhibits tumor growth by enhancing tumor necrosis factor (Weber 2002, Malafa 2000, 2002).

Vitamin E is involved in scar tissue formation, and is tissue sparing to many of the glands of the immune system. It works synergistically with selenium, has been shown to have anticancer properties, and has been proven to enhance the effectiveness of specific chemotherapeutics. Also in cancer treatment, vitamin E has been shown to have organ sparing properties when chemotherapy or radiation therapy is being administered (Shklar 1982, 1987; Myers 1976, 1982).

It has been shown that people with lower blood levels of vitamin E are more prone to developing both type 1 and type 2 diabetes (Knekt 1999, Salonen 1995). In addition, it has been shown that vitamin E supplementation has improved glucose tolerance (Paolisso 1993). Vitamin E has also been shown to be beneficial in diabetic side effects, such as retinopathy and nephropathy (Bursell 1999, Ross 1982).

Vitamin B₁₂ (cyanocobalamin)

Vitamin B₁₂ is essential for the maintenance of the proper levels of red blood cells and nerves, as well as for the

manufacture of DNA. In nerve cells, vitamin B₁₂ is required for normal function and health.

In studies with people who supplemented their diets with vitamin B₁₂, it was shown that neuropathy and pain associated with diabetes or kidney disease were significantly reduced (Yamane 1995, Kuwabara 1999). Deficiencies of vitamin B₁₂ are associated with anemia and decreased function of the immune system. Berlin (1978), Kondo (1998), Lederle (1991), and Tamura (1999) have shown that B₁₂ supplementation treats the condition.

Folic acid

Folic acid is a B vitamin that is required for organized cellular division. Folic acid is integral in the synthesis of both DNA and RNA and therefore has an effect on the genetic modeling of the body.

Folic acid, both as a topical rinse and taken systemically, has been clinically proven to be beneficial in reducing inflammation and helping to stop bleeding in people with gingivitis and periodontal disease (Pack 1984; Vogel 1976, 1978).

Folic acid deficiencies affect bone marrow cell division and can lead to a macrocytic anemia (Food Nutrition Board 1998). Low dietary folic acid has been associated with colon cancer prevention in people (Giovannucci 1993). Other studies indicate that low dietary folic acid is associated with the increased risk of cancer in people that have ulcerative colitis (Lashner 1989, 1993, 1997). Freudenheim (1991), in a large population study, showed that decreased dietary folic acid is directly related to increased risk of developing colon cancer.

SUMMARY OF THERAPEUTIC NUTRIENTS AND NUTRACEUTICALS

It is appropriate to finish this discussion on therapeutic nutrients and nutraceuticals with the following quote taken from Roger Kendall's *Complementary and Alternative Veterinary Medicine* (Mosby 1998):

“Although there are no officially established guidelines for implementing therapeutic nutrition in veterinary practice, many veterinarians are including the aforementioned approaches in their practices. Therapeutic nutrition is based on the idea that if the body is provided with a better nutritional environment, healing will occur at a higher level of efficacy. The rational use of nutritional products and specific nutrients is based on a combination of clinical and nutritional research, clinical experience and the availability of high quality, safe and dependable nutritional products.”

It is the author's hope that the material presented in this chapter and in this book on integrative veterinary medicine will give veterinarians the comfort of adding

nutritional therapies to their existing medical and surgical protocols.

NUTRITIONAL BLOOD TESTING

Nutritional blood testing (NBT) evaluates blood chemistries physiologically rather than pathologically; i.e., it screens for biochemical changes that often precede overt manifestations of disease. This metabolic interpretation focuses upon organ function rather than the determination of a specific disease process or diagnosis.

Routine blood testing is an important evidence-based diagnostic tool. The chemical analysis of blood identifies levels of enzymes, electrolytes, proteins, and metabolites. These chemicals are indicators of the health or pathology of the organ systems and the mesenchyme that supports these systems. The blood values, along with the clinical picture and other diagnostic procedures (ultrasound, radiographs, cytology, etc), serve as the basis for diagnosis and the recommendation of appropriate medical therapy. The metabolic interpretation of blood results, on the other hand, traces these chemical values toward their underlying physiology, i.e., the biochemical processes that produced these blood chemicals. This type of analysis helps to determine organ functionality and provides an assessment of vitamins, minerals, enzymes, co-factors, and nutrients required to achieve and maintain homeostasis.

The reference range

A reference range for a particular test or measurement is defined as the values into which 95% (or 2 standard deviations) of the population fall (*Science and Technology Dictionary* 2003). This is commonly called the normal range, a term that can be misleading because not all animals outside the range are abnormal, and sick animals may have values inside the range. A good indicator for the diagnosis of a disease clearly delineates between the normal and diseased animals' ranges. Typically, values outside of the reference range are called abnormal.

Blood laboratories set their reference range on this standard deviation of the normal population of animals. Blood results outside the laboratory's reference range furnish veterinarians with the necessary information to localize, confirm, or rule out a specific pathological process or diagnosis and ultimately to recommend the proper therapy.

The physiological range

Another way to evaluate blood test results is to interpret them as a representative of the patient's physiological

status. Rather than just identify “normal” or “abnormal,” it is possible to examine these tests with the idea that states of health exist as dynamic conditions, which vary between normal ranges. By interpreting blood results along this continuum, decisions regarding organ state can be made, and this information is useful in selecting nutritional programs for patients.

As veterinary students, our training focuses upon an orientation toward pathology and not wellness. As defined above, conventional blood analysis measures organ and tissue health against the normal reference range. Values outside this normal reference range are used to indicate and localize the pathology to a particular organ system.

The physiological range, on the other hand, is a set of values that is used to identify and localize which organs and metabolic processes are functioning well or are beginning to weaken. The underlying theory is based upon a physiological/homeostasis model that says that changes occur in the blood and organ systems and can be identified before pathology occurs and symptoms of disease appear. Results that are outside of the physiological range are not indicative of disease but present an indication that a particular organ system is weak or becoming imbalanced, thereby affecting the overall homeostasis.

The modern medical antiaging movement is focused upon slowing and/or stopping the aging process. The underlying theory is that when the body is in a state of homeostasis, healing occurs. The term “homeostasis” was coined by Walter Cannon, M.D. (1939). In order for homeostasis to be achieved, organ systems and function must remain in balance. This means that the production of function-controlling hormones, the acid-base balance of the blood and body tissue, and the chemicals in the blood must also be in balance. If they are not, then homeostasis is upset, free radicals accumulate, inflammation sets in, and organ degeneration begins.

The blood has a major influence on homeostasis. Nutrients, chemicals, by-products, toxins, and metabolites circulating in the blood, such as glucose, urea nitrogen, minerals, fats, and triglycerides, all play a part in homeostasis (Albrecht 1975, Appleton 2005). Furthermore, the levels of many of these chemicals are influenced by food quality, preservatives, toxins, water, stress levels, and so on. Therefore, observing blood parameters physiologically and looking for early elevations and decreases can be an important pre-disease indicator.

To illustrate this physiological view further, protein and amino acid levels and storage pools are influenced via hormonal control of the pituitary, adrenal, and thyroid glands. Amino acids marked for catabolism are routed to the liver, and via the process of oxidative deamination, they are broken down into keto acids and ammonia, the latter of which is combined with carbon dioxide to

form urea, then routed via the blood to the kidneys for excretion. (See pages 84 and 85 for more detail.)

An elevated blood urea nitrogen (BUN) level is one indicator of kidney disease, and the recommendation for therapy is fluid therapy, a low-protein diet, and so on. What is not addressed in this interpretation is the fact that the kidneys are the “metabolic receptacle” for urea nitrogen. The kidneys did not *produce* these wastes but rather function to eliminate them. The conventionally accepted fact is that by the time kidney disease is diagnosed and elevated BUN levels are detected, approximately 75% of the kidney has been damaged. It would be beneficial for the animal if weakening kidneys could be identified, and metabolic waste burden reduced, before the 75% damage occurs and the situation has become critical for the patient.

When viewing the body as a whole, the approach to overburdened and weakening kidneys should take into consideration not only the kidneys and an appropriate diet, but also the organs of protein metabolism, such as the thyroid, pituitary, liver, and adrenal glands. It is these glands, which influence protein catabolism and the metabolic processes, that ultimately result in higher blood urea nitrogen levels, overworking the kidneys and setting the stage for degeneration.

It is therefore important in a preventive approach to disease to ensure that all involved organs (pituitary, thyroid, adrenal, liver, and kidneys) are properly nourished, spared from toxins, that the antioxidant-free radical ratio is monitored, and that the inciting cellular inflammation and resultant degeneration is addressed. This holistic, multiorgan approach to disease prevention and treatment, which focuses upon maintaining homeostasis, can ultimately help prevent degeneration and loss of organ function.

A simpler example is to imagine the sophisticated equipment used by an auto mechanic to diagnose your automobile’s malfunction. By testing the exhaust, mechanics can trace back to the malfunctioning parts, which, once replaced, can return your automobile to proper function and performance. Similarly, the metabolic interpretation of blood, by identifying the chemical blood metabolites, serves a similar function of identifying early organ weaknesses that can be nutritionally supported, helping to improve the overall health of the body.

Taking the automobile example one step further, if you add sand to the gas tank and visit your mechanic for repairs, the solution is not just replacement of the sand-clogged carburetor, but also stopping the addition of sand to the gas tank.

The same holds true for the body. Weakened kidneys require a global approach—not only looking at the overloaded kidneys and a restricted protein/phosphorus diet, but also nutritionally addressing the functionality of the

organs of protein metabolism (thyroid, adrenals, and the liver). Additionally, supplying antioxidants that reduce free radical-induced inflammation can help to improve organ functionality, as well as slow premature aging and degeneration.

More efficient protein metabolism contributes to lowering the metabolic waste load to an already burdened kidney. Reducing protein input and improving the metabolic efficiency of the liver, adrenals, and thyroid glands, in essence then, takes the “pressure” off the overloaded kidneys, allowing them the ability to rest and improve function (Goldstein 2005).

Lastly, the physiological interpretation of the blood does not conclude with a marker for a specific disease (such as an elevated BUN or ALT as an indicator for kidney or liver disease, respectively). Looking deeper into the underlying cellular physiology and biochemistry helps to determine the nutrients, vitamins, minerals, antioxidants, co-factors, and so on that are required by the cells and organ systems for proper function and the maintenance of homeostasis. Once determined, these nutrients can be added to the diet to ensure their availability when called upon by the cell and can be used for the maintenance of wellness.

Historical perspective

In the 1970s, when the metabolic analysis of animal blood was being clinically evaluated, some interesting concepts relating to animal health surfaced. Many animals with degenerative diseases had medically normal blood values, while perfectly normal animals often showed multiple abnormalities. Referred clients would say, “I know my animal is not well, but my veterinarian cannot find anything wrong, and her blood results are all normal!” We concluded that perhaps the interpretation of “normal values” we were schooled to rely upon for our diagnoses did not represent the complete picture for the early identification of a disease process (Goldstein 1999).

Take Cushing’s disease as an example. A negative adrenocorticotrophic hormone (ACTH) stimulation or dexamethasone suppression test would rule out hyperadrenocorticism. However, this does not indicate how close an animal is to overt disease requiring treatment. In this “positive” or “negative” approach to disease, there is no medical indicator evaluating compromised adrenal glands that are still functioning within normal medical parameters. There is also no medical data that determine when the degenerative gland will eventually become Cushing’s positive. The conventional medical wisdom in this instance is to “wait and see,” and if the animals becomes positive for Cushing’s, then initiate therapy.

Metabolic blood testing can show early indicators for adrenal dysfunction that may eventually lead to Cushing’s

disease. Alkaline phosphatase, for example, is a metabolic indicator of adrenal function. An elevation may indicate an inflamed gland requiring nutritional and/or antioxidant support. If this inflamed, overactive adrenal gland is detected early and supported nutritionally and with antioxidants, it is possible to neutralize free radicals, inflammation, and hyperactivity, and to re-establish normal adrenal function and homeostasis, thereby preventing the disease.

Metabolic blood testing can also help to identify a weakening adrenal gland that could lead to an exhausted adrenal system and eventually Addison’s disease. A typical normal range for ALP is 5 to 131. Readings within this range are deemed normal. Readings above 131 are elevated and become suspicious for an active process, neoplasia, or potentially early Cushing’s disease. However, what about readings of 6 or 7? These readings are not medically significant; however, they may be an early metabolic indication of a weakening adrenal gland and should be the focus of nutritional support. This is a situation that is not identified with the conventional interpretation of the blood. An animal doesn’t close her eyes at night with a healthy adrenal gland and wake up with Addison’s. There are progressive weaknesses or stresses that affect the adrenal function and, if detected early, can be addressed and may prevent development of the disease (Cima 2000; Goldstein 1999; Goldstein 2000, 2005).

In this chapter, we refer to free radicals, cellular inflammation, and antiaging science. Research has shown that weakening cells and organs that are inflamed but not yet diseased can be brought back to health and have improved function by antioxidants and phytonutrients. Using the physiological parameters that are representative in the blood as the basis for determining functionality of cells and organs is scientifically sound; however, it is not yet clinically proven. Clinical trials to assess the NBT evaluation and the effect of nutritionally supporting organ systems in animals who have lymphosarcoma and osteosarcoma are currently being carried out (Goldstein 2006) (also see the discussion on evidence-based medicine in chapter 1).

Other indications for blood-based nutritional recommendations

Processed, cooked pet foods are often devoid of organs and glands that are normally consumed by wild canines and felines. Lions, tigers, and wolves regularly eat their entire prey, including all the vital organs (in an uncooked form). Supplementing processed, highly cooked dog and cat foods with vital, unprocessed antioxidant- and phytonutrient-rich nutrients, often omitted from commercially prepared dog and cat foods, is beneficial for the health of the animal.

The standards set by the Association of American Feed Control Officials (AAFCO) are based upon the chemical analysis of the food and certain minimum nutrient requirements. There is no equivalent to the human RDA (recommended daily allowance) or “optimum” nutrient level for dogs and cats. The biochemical, metabolic, and physiological differences inherent in each animal are difficult to address by a “one-size-fits-all” pet food. It is difficult for mass-produced foods to satisfy the needs of all animals. Commercial foods only serve as a “base” diet, offering the basic food and nutrients as set by the AAFCO guidelines.

Feeding a dog or cat based upon his or her individual needs can more closely satisfy the animal’s requirements to help maintain wellness.

Disease protocols are presented in chapters 6 through 18 and chapters 32 through 34 of this book. In these protocols, specific nutrients and nutraceuticals are suggested.

These protocols are condition-oriented and may not take into consideration complications of the disease. For example, in the protocol for lymphosarcoma, a concurrent kidney issue and hypercalcemia must be identified and addressed along with the cancer. It is for this reason that when dealing with chronic debilitating diseases such as cancer, the clinician should identify and address all complicating factors. Using physiological blood parameters offers clinicians the ability to identify and specifically support organ complications along with the primary therapy for the condition.

THE GLANDS AND ORGANS (PHYSIOLOGY, METABOLISM, AND RELATED BLOOD TESTS)

The data presented in this section on the physiological and metabolic indications and related blood tests was compiled and summarized from the following sources: Bagnell 1985, Brockman (undated), Cima 2000, Cunningham 1997, Downey 1996, Goldstein 2000, Sodikoff 1995. This data should be viewed as introductory, and the reader is referred to these references for a more in-depth description of the metabolic analysis of blood results.

Adrenal glands

The first recognized report of the use of adrenal extracts was in 1919 when Lucke reported adrenal exhaustion in people who died from the flu epidemic. He reported that the adrenal glands were not infected *per se* but were exhausted from attempting to restore balance to the body.

In the 1930s and 1940s, adrenal extracts were quite popular and widely used for conditions that were caused by compromised adrenal function, such as fatigue, asthma, diabetes, early Addison’s disease, hypoglycemia, and allergies. The extracts were also used to improve resistance to infectious diseases (Harrower 1933, 1939).

Traditionally recognized as the stress glands of “fight or flight,” the adrenals are central to many metabolic and physiologic processes and are intricately involved in the functioning of the body’s immune system. The adrenal medulla manufactures epinephrine and norepinephrine, which directly affect the sympathetic nervous system and alter both heart rate and respiration. The adrenal cortex manufactures from cholesterol many hormones, such as glucocorticoids, mineralocorticoids, and adrenal androgens (17 ketosteroids, one of which is DHEA). The mineralocorticoids regulate the passage of minerals (primarily sodium and potassium) in the cell and the intercellular space. The glucocorticoids help control blood sugar levels and help in the reduction of inflammation. The adrenal androgens, such as DHEA and many others that have recently been identified, play a role in male and female functions. DHEA is believed to help manufacture other steroid hormones. The introduction of synthetic adrenal hormones such as cortisone replaced the use of adrenal extracts.

A controlled clinical trial has demonstrated that men with determined low levels of DHEA, who were then supplemented, showed a significant increase in immune function. And in a double-blind trial, pregnant women also showed significantly improved immune function (Casson 1993, Khorram 1997).

Pantothenic acid and vitamin C are required for proper action of adrenal hormones and for the metabolic and physiological functioning of the adrenal glands. Because of their central role in the immune system and the body’s reaction to stress, the adrenals are more likely to become weakened, inflamed, exhausted, and underactive. The chronic administration of cortisone will also diminish adrenal function, and chronic use of cortisone can cause the gland to underfunction and atrophy.

Adrenal cortex

Glucocorticoids

Glucocorticoids, through the process of gluconeogenesis, are involved in carbohydrate metabolism and help in the maintenance of blood sugar levels. Cortisol is the main glucocorticoid and has primary responsibility for gluconeogenesis and increasing the stored levels of glycogen in the liver. Cortisol also has metabolic functions related to protein and fats: it decreases cellular protein and increases blood and liver protein. Cortisol also increases the rate at which fat is stored in the adipose tissue.

Mineralocorticoids

Aldosterone is the primary mineralocorticoid. It functions by increasing the reabsorption of sodium (and chloride) and by increasing the excretion of potassium. It also works by increasing cellular sodium absorption while transporting potassium out of the cells. In simplified terms, the adrenal cortex directly affects and controls the acid-base balance of the body through mineralocorticoids and glucocorticoids. This is accomplished by controlling the metabolism of minerals (alkaline) and sugars (acid). One of the primary functions of minerals is to transport foods and chemicals throughout the body and across cell membranes. The adrenals function to make sure the minerals are in the proper locations. Proteins, fats, and carbohydrates are osmotically drawn into the cells. Based upon the sodium/potassium balance, chloride shifts at the cell membrane, causing it to open for nutrients to enter.

Adrenal medulla

The adrenal medulla has a direct attachment to the sympathetic nervous system. Sympathetic nerve stimulation directly controls the secretion of epinephrine and norepinephrine.

Epinephrine

Epinephrine does the following:

- Causes glycogenolysis and makes glucose available to the body for rapid metabolism
- Increases the rate of fat metabolism, causing fatty acids to be available to the body
- Neutralizes histamines
- Increases the metabolic rate and is involved in the chloride shift

Norepinephrine

Norepinephrine does the following:

- Is involved in glycogenesis
- Is involved in the chloride shift

Blood tests generally related to the physiology of adrenal function

Chloride

Chloride is one of the controlling minerals of the passage of nutrients through the cell. Chloride levels are influenced by the adrenal medulla.

Sodium

Sodium is influenced by aldosterone and is produced by the adrenal cortex. Lower sodium levels may indicate low aldosterone levels and underactive adrenal gland function.

Table 2.1. Important nutrients related to adrenal function and metabolism.

Elevated	Depressed
Adrenal gland extract	Adrenal gland extract
Gonadal gland extract	Thyroid gland extract
Pantothenic acid	Pituitary gland extract
PABA	Vitamin C (alkaline)
Vitamin C (acid)	Vitamin B complex
	Chloride
	Potassium
	Selenium

Alkaline phosphatase (ALP)

Alkaline phosphatase (ALP) is found in the liver, bone, and intestines. Physiological indications of elevated or depressed ALP levels relate to adrenal function, acid/base balance (alkalinizing effects of minerals), and sugar metabolism (acid effect and pH balance). The enzyme ALP is itself alkaline and affects the pH balance of the blood.

Thyroid hormone (T4)

Low thyroid values may indicate a decrease in deamination related to an underactive adrenal gland. Inefficient adrenal glands lower production of glucocorticoids, which increases protein storage and decreases protein delivered to the liver for deamination and the amount of urea nitrogen routed to the kidney for excretion.

Table 2.1 lists the important nutrients that are related to adrenal function and metabolism.

The heart

The heart, because it is not a secretory endocrine organ, has minimal direct metabolic functions. However, the heart is responsible for the circulation, is vital for life, and it helps to fuel the body's metabolic and physiologic functions. Besides its circulation responsibilities, the heart has its own metabolic needs. Heart muscle contractions require nutrients for their metabolism and produce lactic acid, which is routed through the liver and excreted via the urine.

Blood tests generally related to the physiology of heart function

Potassium

Potassium is involved in the contraction of the muscles and also helps to deliver oxygen to the heart muscles. Heart tissue has the highest level of potassium in the body. Elevated potassium levels may result in increased oxidation and free radical production.

Table 2.2. Important nutrients related to cardiac function and metabolism.

Elevated	Depressed
Heart glandular	Amino acids—taurine, L-carnitine
Vitamin E	Pituitary
Coenzyme Q10	Hypothalamus
L-carnitine	Coenzyme Q10
Magnesium	Lecithin
Calcium	Vitamin B complex
Zinc	Vitamin E
	Potassium

Creatine phosphokinase (CPK)

CPK is an enzyme found in striated muscles, the heart, nerves, and the brain. Elevated CPK levels may indicate excessive activity and oxidation in the muscles, nerves, and brain.

Table 2.2 lists important nutrients related to cardiac function and metabolism.

The hypothalamus

The hypothalamus is attached to the pituitary gland by the pituitary infundibulum. The hypothalamus functions as a clearinghouse for nervous impulses (the senses and so forth). It then converts this information into chemicals that direct the pituitary and other glands to produce the hormones required to operate the body's metabolic and physiological processes. The hypothalamus itself is composed of both nervous and endocrine tissue. Several releasing factors are produced by the hypothalamus, which in turn travel to and can cause release of the pituitary hormones.

Blood tests generally related to the physiology of hypothalamic function***Calcium***

Calcium acts as catalyst in many metabolic processes. Calcium (along with magnesium) is involved in the transport of fats and proteins across the intestinal wall and is absorbed into the blood. Calcium and the hypothalamus via its pituitary influence are involved in growth, bone and teeth formation, and the intestinal digestion of fats and proteins.

Cholesterol

Cholesterol is a dietary lipid that is derived from animal sources. Cholesterol is used for the manufacture of adrenal steroids. In the process of manufacturing these hormones, fat-soluble vitamins (A, D, E) and proteins are required.

Table 2.3. Important nutrients related to hypothalamic function and metabolism.

Elevated	Depressed
Pituitary glandular	Hypothalamus glandular
Parathyroid glandular	Calcium
Magnesium	Potassium
Lecithin	Lecithin
Inositol	Vitamin B ₁₂
Choline	Pancreatin
Vitamin B ₆	

Elevated cholesterol suggests an underactive hypothalamus and pituitary gland.

Potassium

Potassium is found primarily in the intracellular fluid. In the nerve cells, an impulse creates a reciprocal movement of potassium and sodium from intracellular to extracellular, causing movement of the nerve impulse. The hypothalamus, being neurological, requires proper nerve function to operate and is therefore dependent upon proper potassium levels. Low potassium levels can affect hypothalamic function.

Sodium

Sodium must be in balance and is reciprocal with potassium to produce proper nervous impulses. Elevated sodium levels often result in lower potassium levels, which can affect hypothalamic function.

Important nutrients related to hypothalamic function and metabolism are listed in Table 2.3.

The kidneys

The kidneys are the biological filters of metabolic waste removal. Primary kidney wastes include creatinine, urea nitrogen, and uric acid. Urea nitrogen is the primary by-product of protein metabolism. The adrenal and thyroid glands are involved in protein metabolism, and the deamination process occurs in the liver producing urea, which is then transported to the receptacle kidney.

Kidneys are also involved in the maintenance of fluid and mineral levels as well as the proper acid-alkaline balance. These complex metabolic processes are regulated through glandular control of filtration via hormones. For example, the kidney produces renin, which increases the production of angiotensin II, which in turn increases aldosterone levels (synthesized in the adrenal cortex from cholesterol), which in turn decrease the amount of sodium and potassium excreted by the kidneys. This affects the body's total volume of blood. Anti-diuretic hormone

(ADH), which is released by the posterior pituitary gland, also affects urine volume and flow.

Blood tests generally related to the physiology of kidney function

Creatinine

Creatinine is the nonprotein nitrogenous waste product resulting from muscle contractions and metabolism. Besides being a primary kidney function test, creatinine is an indicator of muscle metabolism, which is related to the functioning of the gonadal hormones, the pituitary, and the adrenal glands.

Blood urea nitrogen

Urea is formed in the liver by the deamination of proteins. The thyroid and iodine are involved in the denitrification process. The process of deamination and denitrification is under control of the pituitary gland. Metabolically elevated urea nitrogen levels can be related to high-protein diets, as well as pituitary, adrenal, liver, and thyroid functional imbalances. Low levels can be related to low dietary protein as well as hypofunctional liver, thyroid, and pituitary.

Important nutrients related to kidney function and metabolism are listed in Table 2.4.

The liver

The liver is the “seat of the metabolism.” It carries out numerous metabolic and physiological processes. The liver is actively involved in the metabolism of proteins, fats, and carbohydrates via such processes as gluconeogenesis, glycolysis, and deamination. The liver is also involved in the production and storage of various compounds, such as: plasma proteins (fibrinogen, prothrombin); lipids (cholesterol and phospholipids); vitamins A, D, and B₁₂; and iron (ferritin).

Detoxification function

The liver’s reticuloendothelial system is responsible for filtering toxins from the blood and removing

them from the body. Toxins include chemical additives and preservatives, environmental pollutants, pesticides and insecticides, bacteria and viruses, medication and vaccine by-products, and metabolic and physiologic wastes.

Important blood tests related to the physiology of liver function

Alanine transferase (ALT)

ALT (formerly SGPT) is found mainly in cytoplasm of liver cells and is released when there is hepatocyte destruction, both recent and currently occurring. ALT is also found in lesser amounts in muscle and the heart. ALT is an end product of the catabolism of fats and other compounds from cellular membranes, the sinusoids of the liver, and the lymph system. Elevation metabolically indicates liver inflammation and altered function.

Gamma glutamyl transferase (GGTP)

Abnormal levels of GGTP indicate biliary stasis. Metabolically, an elevation can be related to an inflamed liver or overactivity of the adrenal glands and elevated cortisol levels.

Total bilirubin

Bilirubin results from the turnover and breakdown of hemoglobin, which occurs primarily in the bone marrow and spleen. Bilirubin is a bile pigment, which by bacterial action in the intestines gives the feces their color. Elevated blood levels are an indication of liver inflammation or disease. Metabolically it can be interpreted that higher-than-normal levels of metabolic wastes in the blood may increase the body’s demand for globulin and involvement of the thymus gland.

Benefits of liver extracts

Liver glandular extracts, besides being a source of protein, provide a biologically available source of iron and vitamin B₁₂. Heme iron has often been used and recommended for anemia. Liver extracts have been clinically tested in people with liver disease and found to be beneficial (Fujisawa 1984, Sanbe 1973).

Table 2.5 lists important nutrients related to liver function and metabolism.

Table 2.4. Important nutrients related to kidney function and metabolism.

Elevated	Depressed
Kidney glandular	Adrenal glandular
Liver glandular	Pituitary glandular
Adrenal glandular	Magnesium
Thyroid glandular	Lecithin
Vitamin A	Inositol
Vitamin D	Choline
	Vitamin B ₆

The pancreas

In 1917, William Berkeley read his paper on diabetes to the New York Academy of Medicine, explaining the process of making pancreas extract for medical therapy. It was a simple extract of whole pancreas, taken orally, which dramatically reduced blood-sugar levels within 2 hours of ingestion. It was claimed to work for patients

Table 2.5. Important nutrients related to liver function and metabolism.

	Choline

with diabetes. In 1922, F.G. Banting published his finding on a substance isolated from the pancreas that addressed the problems of diabetes. He called the substance insulin. He received the Nobel Prize for his work in 1923 (Cima 1981).

The inherent danger of insulin was that if given in too large a dose, it could cause serious side effects and even induce coma and death. The product insert carried the following warning:

“Insulin, when given too long before a meal, or when given in too large a dose, will cause lowering of blood sugar below the normal level—a hypoglycemia. This is to be avoided, as too great a lowering will cause acute symptoms such as weakness, nervousness, and sweating. These early manifestations may be followed by drowsiness, stupor, and possibly serious results.”

The question at the time was “Why was insulin considered so potentially dangerous, whereas whole pancreas or pancreas extract was considered to be generally safe?” In its purified form, insulin is a concentrated medication with a narrow range of safety. By injection, its effects are rapid.

Pancreatic enzymes

The pancreas produces the following enzymes under instructions from the vagus nerve, and the hormones gastrin, cholecystokinin, and secretin: trypsin, chymotrypsin, amylase (digests carbohydrates), lipase, cholesterol esterase (hydrolyzes cholesterol esters), phospholipase (splits fatty acids from phospholipids), and protease.

Minerals involved in pancreas function

Bicarbonate ions (sodium) make up a portion of pancreatic secretions, which alkalize the gastric secretions of the stomach. Bicarbonate is controlled by secretin. Trivalent chromium causes fatty acids to oxidize, dividing fats from sugars. Zinc is used to help balance sugar and water levels. When the extracellular fluid contains higher quantities of zinc in combination with selenium, together they draw sugar out of the blood and into the extracellular

Table 2.6. Important nutrients related to pancreas function and metabolism.

Stomach glandular	Pancreas glandular
Vitamin B complex	Chromium
Zinc	
Chromium	

fluid. The sugar and water are combusted to form lactic acid, which is then converted back into lactic acid dehydrogenase in the blood.

The islets of Langerhans produce the following hormones:

Insulin—produced by the beta cells (sugar metabolism)
 Glucagon—produced by alpha cells (glucogenolysis)
 Somatostatin—produced by D cells and decrease pancreatic hormones (insulin and glucagons)

Metabolic note

A glucocorticoid imbalance can result in diabetes mellitus, and an ADH imbalance can result in diabetes insipidus.

Blood tests generally related to the physiology of pancreatic function

Calcium

Calcium bonds with lipoproteins and fatty acids as the intestines absorb it. Improper levels of pancreatic enzymes lead to poor oxidation of fatty acids in the intestines. This increases the need for calcium in the intestines to facilitate absorption and to decrease the optimal levels in the blood.

Lactic acid dehydrogenase (LDH)

LDH is present in the heart, muscles, liver, brain, and kidneys and is medically used as an evaluation of tissue damage, such as in cardiovascular stroke, liver disease, pancreatitis, and anemia. Metabolically, LDH is an enzyme that catalyzes the metabolism of glucose to lactate, which is delivered to the liver, converted back to glucose and picked up by the blood, and delivered to cells and body tissues. The primary organs and cells involved in glucose metabolism are the pancreas, liver, intestines, adrenals, and red blood cells.

Table 2.6 lists important nutrients related to pancreas function and metabolism.

The parathyroid

The parathyroid produces the parathyroid hormone. This hormone, along with calcitonin, is responsible for the

regulation of the body's levels of calcium. The parathyroid glands balance calcium and phosphorus levels by working with the kidneys and intestines. The parathyroid also regulates the body's levels of vitamin D. Basic metabolic functions related to calcium and phosphorus levels include:

- Adequate levels of phosphorus are required to maintain stomach hydrochloric acid levels.
- Calcium is required for the absorption of fats and proteins in the gut.

Blood tests generally related to the physiology of parathyroid function

Calcium

Calcium levels are a direct indication of parathyroid activity.

T4

Although the absorption of fat and the resulting blood levels depend on calcium, the release of fat from body tissues is under the control of the thyroid.

Table 2.7 lists important nutrients related to parathyroid function and metabolism.

The pineal gland

The pineal gland is embryonically a vestige of the third eye. It is involved in all the senses, especially vision. The nerve pathway for sight travels from the eyes to the hypothalamus and then to the pineal, activating its hormones. The quantity and type of light that the body is exposed to directly affect the pineal gland.

This gland is thought to be linked to sexual development by inhibiting the hypothalamic releasing factors. It is also believed to be involved in internal balance of water by interacting with the posterior pituitary.

The pineal helps to adjust the overall pH of the body in relationship to external environmental changes of light and sound. This is accomplished by assisting in the balance of sodium (adrenal cortex) and chloride (adrenal medulla).

Table 2.7. Important nutrients related to parathyroid function and metabolism.

Elevated	Depressed
Parathyroid glandular	Pancreatin
Magnesium	Parathyroid glandular
Vitamin B ₆	Calcium
Taurine	Magnesium
	Vitamin B ₁₂

Sodium and chloride balances are affected and responsive to the body's exposure to both light and sound.

The pineal gland produces melatonin. Melatonin was discovered in 1958; however, it wasn't until August 7, 1995, that *Newsweek* magazine described melatonin as having the ability to relieve many nagging conditions such as insomnia and jet lag. The article went so far as to report that melatonin boosts the immune system in its fight against certain types of cancer. Although melatonin is still not completely understood, it is believed to be directly involved in the body's internal clock and the regulation and formation of certain hormones at various periods during the day and night.

Similar to the adrenal gland, where scientists focused their attention on corticosteroids and overlooked DHEA, the pineal may contain other yet undiscovered hormones that could have a beneficial effect on the body and its natural balance of glands and hormones. As in the adrenals, this would support using the whole gland extract of the pineal as a legitimate approach, rather than using an isolated hormone such as synthetic melatonin.

Blood tests generally related to the physiology of pineal gland function

Sodium

Sodium is an alkaline mineral that helps to maintain alkaline activity and regulates acid-base balance. This directly affects the balance of the intracellular and extracellular fluid, water levels, and osmotic pressure. Pineal and sodium activity are related with regard to pH balance.

Chloride

Chloride is used to assess pH and electrolyte balance. One purpose of chloride is to block mineral-controlled substances from crossing the cell membrane. Pineal and chloride activity are related with regards to pH balance.

B/C

Urea nitrogen and creatinine are the metabolic by-products and kept in continual balance by the body's level of water. Water and pH balance are controlled by the posterior pituitary, adrenal, pineal, and the kidneys.

Table 2.8 lists important nutrients related to pineal function and metabolism.

The pituitary

Pituitary extracts were used in growth disorders in the 1920s, when gland therapy was enjoying high popularity. Acromegaly was identified as a disease related to an overactive pituitary gland. Evan (1922) discovered that injections of pituitary extracts into rats increased growth and

	Potassium

created a condition resembling gigantism. Uhlenhuth (1920) administered pituitary extract to salamanders, and noticed that those which received the substance showed a significantly increased rate of growth.

Since that time, much has been discovered about the pituitary gland, its components, and the physiological and metabolic processes that it, as the master gland, oversees. The pituitary is composed of the anterior and posterior pituitary and the infundibulum (the connector between the pituitary and the hypothalamus). The hypothalamus produces several substances that cause the pituitary to produce its own hormones (See the section on the hypothalamus, above).

Cima said: “The primary purpose of the pituitary is one of anabolism, rather than catabolism. Which means that any catabolic disease that overcomes the human body may have its roots in the anterior pituitary. Needless to say, supplemental pituitary concentrate could support and assist all of the areas in which the organ has activity. The pituitary, in many respects, is a cornerstone endocrine gland, operating in a sophisticated feedback system with other endocrine glands” (Cima 1981, 2000).

The anterior pituitary

The anterior pituitary produces hormones based upon instructions from the hypothalamus gland. The hormones are released into the circulatory system and sent throughout the body to their specific target organs and cells. Because of the numbers of hormones and their relationship to the general metabolism of the body, a well-balanced, optimum-functioning pituitary gland is essential for health and wellness:

- Adrenocorticotrophic stimulating hormone (ACTH): stimulates the adrenal cortex to produce mineralocorticoids and glucocorticoids.
- Follicle stimulating hormone (FSH): stimulates growth of the ovarian follicle.
- Luteinizing hormone (LH): oversees follicle maturation.
- Melanocyte stimulating hormone: stimulates the production of melatonin.

- Somatotrophin (growth hormone): oversees growth and is involved in the metabolism of proteins, fatty acids, and glucose.
- Thyroid stimulating hormone (TSH): stimulates the production of thyroxine.

Blood tests generally related to the physiology of anterior pituitary gland function

Urea nitrogen

Urea nitrogen is formed in the liver by the deamination of protein. Nitrogen is taken from the amino acid under the influence of the thyroid (thyroxine and iodine). The protein part is then used for the production of various hormones, antibodies, etc. This process of converting the protein into various body chemicals is under the control of the adrenal and anterior pituitary glands. The released nitrogen is used in the chemical conversion to urea (ornithine cycle), transported to the kidneys, and released in the urine. (See pages 84 and 85 for more detail.)

Elevated urea nitrogen levels may indicate overactive thyroid glands, increasing the metabolic rate and resulting in an excessive release of nitrogen and the production of higher-than-normal levels of circulating urea produced by the liver. Under this situation, the adrenals and anterior pituitary are overworking in their breakdown function of proteins, hormones, antibodies, etc. Conversely, low urea nitrogen levels may indicate a decrease in the functioning of the adrenal and pituitary, resulting in fewer proteins delivered to the liver for deamination.

Cholesterol

Cholesterol is a by-product of protein metabolism. It is one of the primary building blocks for manufacture of hormones, antibodies, and enzymes. The anterior pituitary, as a result of its role in protein metabolism and the creation of these substances, is linked to the blood levels of cholesterol. Elevated cholesterol levels may indicate an underactive anterior pituitary function while low cholesterol levels may indicate an overactive anterior pituitary.

Calcium

Calcium in the intestines assists in the absorption of lipoproteins across the intestinal wall. Calcium requires magnesium, hydrochloric acid, and vitamin D for optimal metabolism. The amount of calcium present and the level of proteins are directly related. When the ratio of calcium to magnesium is greater than 2:1, fat is drawn through the intestinal wall and cell membrane. This calcium-to-magnesium phenomenon creates an electrical osmotic gradient that draws the calcium and lipoprotein across the membrane of the cell. The anterior pituitary and its hormones are used to control the magnesium and due to

Table 2.9. Important nutrients related to anterior pituitary function and metabolism.

Anterior pituitary glandular	Inositol
Trace minerals	Choline
Magnesium	Calcium
Pancreatin	Vitamin B ₁₂

this “ratio effect,” both calcium and anterior pituitary function are required.

Table 2.9 lists important nutrients related to anterior pituitary function and metabolism.

The posterior pituitary

The posterior pituitary’s main metabolic function is controlling the body’s water levels that indirectly affect the pH balance. This is accomplished by anti-diuretic hormone (ADH) and the presence of intracellular potassium. At the cellular level, potassium (under the control of the posterior pituitary) functions to maintain water balance (intra- and extracellular) and aids in the transport of various substances across the cell membrane. This acid-base balance is also affected by carbohydrate metabolism (acid), the pancreas (sugar digestion and assimilation), and the adrenals (sugar metabolism), all of which are balanced by potassium and other alkaline minerals.

ADH (Vasopressin) controls the retention of water and potassium and the excretion of sodium by the kidneys. This is counteracted and kept in balance by the adrenals and the production of minerals and glucocorticoids, which act to counteract ADH. An ADH imbalance can result in diabetes insipidus. Likewise, a glucocorticoid imbalance can result in diabetes mellitus.

Oxytocin causes contraction of the uterus during the birth process, and causes the contraction of the myo-epithelial cells in the breasts when the baby suckles.

Blood tests generally related to the physiology of posterior pituitary gland function

Potassium

Potassium is an essential mineral used to carry out its physiological and metabolic functions. Potassium is closely involved with the adrenal glands in the proper sodium and acid-base balances via aldosterone. Potassium levels are also involved and closely related to posterior pituitary function.

Table 2.10. Important nutrients related to posterior pituitary function and metabolism

Elevated	Depressed

Intestine glandular	
Spleen glandular	
Trace and essential minerals	

Triglycerides

Abnormal triglyceride levels metabolically indicate the need for essential fatty acids. Triglycerides are composed of a molecule of glycerol and 3 molecules of fatty acids. The energy necessary for active transport across a cell membrane, via the influence of potassium, is supplied by fatty acids. Primary glands in triglyceride metabolism are the posterior pituitary, adrenals, and pancreas.

Glucose

Glucose, although affected by many other organs and glands, is also affected by the posterior pituitary, as it relates to the proper acid-base balance in the body.

BUN/creatinine ratio (B/C)

Urea, nitrogen, and creatinine ratios are the by-products of protein and muscle metabolism. Metabolism produces their blood levels, while excretion by the kidneys maintains their balance. This excretion is under the control of the posterior pituitary, which is responsible for the body’s water balance and acid-base balance.

Important nutrients related to posterior pituitary function and metabolism are listed in Table 2.10.

The spleen

The spleen is the largest of the lymphoid tissue organs and is highly vascular. As the blood passes through the spleen, aged red blood cells are removed and broken down, and the released hemoglobin is routed to the liver. The spleen also contains iron and fat, which are used in the synthesis of new red and white blood cells.

When red blood cells die, they trigger the spleen to start the process of hemopoiesis, which uses the stored iron and fat. This decreases the levels of iron and fat in the blood. Because it is lymphoid-type tissue, the spleen is part of the body’s immune system, and has a reticuloendothelial type of cellular system, which contains phagocytes that assist in the removal of foreign material such as bacteria and metabolic wastes.

Blood tests generally related to the physiology of splenic function

Cholesterol

Cholesterol and the spleen are required for the formation of bile salts and many of the immune-modulating hormones.

Hemoglobin

Hemoglobin levels, unless there is anemia, are related to the spleen's efficiency in the storage and breakdown of red blood cells.

Total bilirubin

Bilirubin levels, like hemoglobin levels, are related to the spleen's efficiency in the storage and breakdown of red blood cells.

Important nutrients related to splenic function and metabolism are listed in Table 2.11.

The thymus

Whole thymus extract is one of the most popularly used gland treatments today. Researchers and clinicians believe that the thymus gland is important in immune-boosting function, especially during a challenge from serious chronic degenerative diseases such as cancer and immune-mediated conditions. The thymus produces the hormone thymosin A, which increases the production and activity of the lymphocytes. T Lymphocytes are part of the cellular immune system and destroy invading, foreign, or toxic materials.

Clinical double blind studies with thymus extracts show increased prevention and a reduced rate of respiratory infections in children and adults (Fiocchi 1986, Galli 1990, Vettori 1987, Longo 1988). Thymus extracts have also shown improved immune function in people, some with diabetes (Braga 1994, Wysocki 1992).

Blood tests generally related to the physiology of thymic function

Albumin/globulin ratio (A/G)

The A/G ratio is directly affected by the level of globulin in the blood. When foreign substances (toxins, pathogens, chemicals, etc.) contact the body, the thymus and spleen direct the white blood cell buildup and increase globulin production of thymoglobulin and splenoglobulin to help fight invaders.

Globulin

The thymus gland is directly involved in the production of immuno-proteins, of which globulin is one type. Globulin is a direct assessment of the functioning of the thymus.

Total bilirubin

Immunoglobulin is produced by the destruction of red blood cells by the spleen and liver, which simultaneously release bilirubin. An elevated total bilirubin may also represent the presence of excess toxins in the blood, requiring the thymus to deliver additional globulin. Simultaneously, the spleen stops the production of, and focus on, the destruction of red blood cells.

Table 2.12 lists important nutrients related to thymic function and metabolism.

The thyroid

By the late 1800s, it had been determined that the thyroid gland was responsible for body temperature and for basal metabolism. In 1889, the Clinical Society of London published a report linking the thyroid to myxedema. In the early 1900s the thyroid was a major player in the use of raw organ extracts in the treatment of disease. Cima (1981), in *Biochemical Bloodwork Evaluation*, states the following:

Table 2.12. Important nutrients related to thymic function and metabolism.

Vitamin A	
Zinc	
Selenium	

“The well known disease, goiter (a visible enlargement of the thyroid gland, frequently a first step in the development of myxedema) was cured by giving thyroid. Organotherapy won its first triumph with thyroid. This can hardly be disputed, and even now, the generally accepted treatment for myxedema, cretinism and milder forms of hypothyroidism is with thyroid hormone or with whole-desiccated thyroid gland.

“Research into the chemistry of the thyroid hormone showed that iodine was always present in active preparations. By this, iodine itself had been proven to be an effective substance for certain simple goiters. It was later shown that iodine was indispensable to the physiological action of the thyroid gland. In 1917, E.C. Kendall offered his report to the American Chemical Society in Boston. He gave details of the isolation of the active principal of the thyroid gland. Kendall had produced 18 grams of thyroxine after starting with 2 tons of animal gland (not a very good yield). Thyroxine received its name from the fact that it came from the thyroid gland and was found to contain an indol group; hence the name thyroxine.

Thyroxine contained iodine and exerted a very potent effect when injected into laboratory animals. It seemed as though the effects of thyroxine equaled in every way the effects of the desiccated gland. It was stated that 100% positive response was observed. This work was immediately accepted by the medical profession and, in fact, reflects the logical scientific progression, which involves the isolation and purification of physiologically active molecules, and the subsequent clinical and experimental work was with the active hormone or enzyme rather than the tissue or organ from which it came. This became the main theme throughout the development of the field of endocrinology. It is interesting to note that, at that time, thyroxine was believed to be the one and only active principal obtainable from the thyroid; it was only later discovered that two other hormones, tri-iodothyronine (similar to thyroxine) and calcitonin (a plasma-calcium lowering hormone) were also produced by the thyroid.”

The thyroid is under the control of the pituitary gland via thyroid stimulating hormone. The thyroid glands are responsible for the metabolic rate and therefore have the following direct effects on organs and metabolic processes:

- Influence fat, carbohydrate, and protein metabolism.
- Influence the levels of enzymes in the body.
- Increase osteoclastic activity.
- Directly affect body weight.
- Direct affect the heart rate, circulation, and pressure.
- Increase the rate of respiration as the demand for oxygen increases.
- Increase the rate of absorption of food from the intestines.

Table 2.13. Important nutrients related to thyroid function and metabolism.

	Vitamin E

Blood tests generally related to the physiology of thyroid function

T4

T4 is a measurement of the thyroxine circulating in the bloodstream. This is a direct indicator of thyroid function. Too much thyroxine indicates a hyperactive thyroid, and vice versa.

Table 2.13 lists important nutrients related to thyroid function and metabolism.

DIET, NUTRITION, AND THE BIOLOGICAL FACTOR

Hippocrates, in about 400 BC, said, “Let food be your medicine.” His writings touted the use of foods and herbs as the basis for the maintenance of health and vigor. The history of food and how it relates to humankind and companion animals is a rich mixture of tradition, fads, panaceas, folklore, and science.

The following is a summary of McCay’s (1949) view of the birth of the modern pet food industry:

The modern era of feeding domesticated animals has its roots in home cooking, using the staple foods of the region. American literature from the early to mid 1900s contains references to dogs and cats being fed leftovers from the family table.

These table scraps consisted of boiled grains such as wheat or corn mixed with meat scraps, some ground vegetable parings, and limestone or bone meal. Animals living on farms would be treated to whatever crops or meats were produced, and cats were treated to raw unprocessed milk. As domesticated animals became family members, particularly in more urban and suburban areas, an industry developed around the dietary and health needs of animals. Dog and cat shows became popular, kennel and boarding facilities opened and flourished, and more people looked to adopt or purchase purebred dogs and cats.

Finding a steady supply of quality ingredients was difficult and, even more important, uneconomical since

kennels were now a business and needed to make a profit. At the same time, the popularity of dogs and cats as household pets was rising rapidly, adding a second, consumer-driven demand for quality feed.

This also led to another demand on the feed industry, one of convenience, especially in urban areas. Being able to purchase animal food locally in a package that could easily be stored and fed to the animal became important. Packaging and clear instructions were also demanded of manufacturers. The feed industry, recognizing a valuable business opportunity, quickly responded to the growing demands of kennel owners and consumers. Pet food had to fit certain criteria; consistency was at the top of the list. The food had to look the same each time so that kennel and/or pet owners knew that their animals were getting a consistent diet.

The feed industry also had to respond to the economies of operating a business. The search began for a continual supply of raw ingredients. This led to the human food-processing industry, which generated a tremendous amount of leftovers, which at the time were converted into low-profit fertilizers and farm-animal feed. This was the beginning of today's modern pet-food industry.

Pet food raw ingredients

Many pet foods include ingredients taken from leftovers of the human food-processing industry. Meat and chicken meals may contain some ground feathers, nails, claws, cartilage, tendons, bones, blood, and fecal waste, all of which have a low biological and nutritive value. Other components may include indigestible vegetable and grain fillers, such as shells, hulls, and stalks. While they provide bulk and fiber, their nutritive value is low. Other ingredients may be included as additives to make the food look uniform and appealing to the people who buy it. Coloring agents such as dyes, pigments, and minerals are typically added, as are appetite stimulants such as sugar, salt, and animal digests (meat scrap by-products dissolved in an acid to achieve uniformity, then turned into a liquid that is sprayed on the food).

The last decade has seen a strong movement in the pet food industry toward healthier, more nutritious ingredients, including:

- More whole grains such as brown rice, whole wheat, and corn, which replace by-products such as wheat middlings and brewers rice.
- More whole protein sources (chicken, beef, lamb, and turkey) which replace highly processed protein sources such as poultry by-product meal.
- Natural preservative systems using vitamins E and C, and herbs such as rosemary.

This movement is welcomed by many veterinarians and consumers. But change has been slow, hampered in part

by pet food guidelines established early on by the National Research Council (NRC) that were based on chemical content assessments (the actual levels of fats, proteins, vitamins, and minerals), and not the biological content (the quality and bio-availability of ingredients used to reach these nutrient levels).

Dr. Mark Morris and the pet food industry

We as veterinarians are familiar with the Guaranteed Analysis chart on the label of all pet foods. In order to qualify as a pet food, the crude protein, crude fat, crude fiber, and moisture categories must be listed on the label. A typical guaranteed analysis required to qualify as a canned pet food would be:

Crude Protein	10%
Crude Fat.....	6.5%
Crude Fiber	2.4%
Moisture	68%

Dr. Mark Morris, a pioneer of the American Veterinary Medical Association, put forth to the veterinary and lay communities the following tongue-in-cheek pet-food recipe (Published by Hill's Pet Nutrition, Inc. ®/™):

Blend:

- 1 pail crushed coal (carbohydrates)
- 1 gallon crankcase oil (fat)
- 4 pair old leather work shoes (protein)
- 68 lb water

The caption read, "The ingredient panel and chemical analysis on dog-food labels are not guarantees of nutritional quality." Morris' purpose was to show that the most important consideration in the manufacture of quality dog and cat food is not the chemical composition, but rather the raw ingredients. The government standards for pet food regulations at the time did not address any biological value, and instead were based solely upon chemical analysis. Morris, a true visionary, stated that this reliance on a chemical analysis of pet food was faulty. His recipe mocked the existing regulatory standards by showing that a mixture made of ground, cooked shoes; crankcase oil; and coal would pass the minimum requirements to be called a pet food.

The last item in early pet-food-industry history was the discovery that some pet food manufacturers were unscrupulously trying to increase their profits by using low-grade ingredients. In the early 1940s, the American Veterinary Medical Association, under the active leadership of Morris, set up a committee to certify reliable products. This led to the birth of laboratory and testing facilities and the ultimate standardization of commercially prepared feeds for animals. This laboratory process,

however, could only test the feed for its chemical content, i.e., levels of protein, fat, carbohydrates, minerals, water, etc. The only reliable way to test the biological value is to observe it in a living animal and the resulting overall health and well-being of that animal.

The failure of the testing facilities' guidelines and the chemical content assessment is vividly illustrated with the taurine issue. Many cats that were fed a taurine-deficient diet died from cardiomyopathy. The level of protein in the food was tested and found to be adequate, but the quality was not. The protein used to reach the required levels of crude protein was deficient in taurine. Pet-food manufacturers were slow to respond, but eventually supplemented their feline diets with additional essential amino acid.

The biological aspects of pet foods

There is a second important issue that can be learned from the clinical research carried out on taurine deficiencies in cats, i.e. the effect of heat and processing on pet food ingredients. To begin a discussion on the biological aspects of pet food, it is important to present the results of a scientific feeding trial carried out by Dr. Francis M. Pottenger Jr., which clearly demonstrated the debilitating effects of feeding cooked foods to cats.

From 1932 through 1942, Pottenger researched the process of standardizing body tissues and glands to determine their potency. While his focus was a surgical research protocol to set standards for human values, he astutely noticed that his test cats, raised for his procedures, were becoming weaker and more sickly with each successive generation. He believed he was feeding these cats the best possible diet, designed by experts in the field of pet nutrition. The diet consisted of market-grade milk; cod-liver oil; and cooked meat scraps, including cooked liver, beef, tripe, and sweetbreads.

The meat ingredients, obtained from a local sanitarium, were leftovers from what was fed to human patients. Pottenger and the other experts considered this top-notch nutrition for his cats. When they began to show classical signs of nutritional deficiencies, thereby becoming poor surgical risks, Pottenger grew perplexed. The cats were producing fewer kittens, and those that did survive birth had increasing amounts of skeletal deformities, organ malformation, and degenerative diseases. Their life span was also dramatically shortened.

As his program expanded, Pottenger outgrew the supply of cooked sanitarium meats. He approached a local meat packing plant and secured a supply of raw scraps consisting of muscle meat, organs, and bone. This raw meat ration was fed to a segregated group of cats, and in a matter of months, the cats in this group appeared in better health than the cats fed the cooked ration. Furthermore,

their kittens appeared healthier and were less of a surgical risk. The contrast between raw vs. cooked diets was so dramatic that Pottenger designed a formal protocol to study the cats. He published his findings (1946, 1995) on these cat experiments. Over the 10-year period, Pottenger observed the following Pottenger (1983):

Cats fed the raw meat and gland diet looked and felt better, were never sick, and always produced robust, strong kittens.

Cats fed the cooked diets were always sick, died younger, and gave birth to weak and deformed kittens.

After 3 generations of a cooked-food diet, the mother cats could no longer give birth. When cooked-food cats were fed the raw-food diet, their health and reproductive ability was renewed.

It is interesting to note from the study that the degenerative diseases experienced by the cooked-food cats are similar to those that affect modern cats, such as cardiomyopathy, liver and kidney disease, hyperthyroidism, chronic lower urinary tract disease, diabetes, arthritis, and cancer. The question is, are the results that have been reported by Dr. Pottenger the consequences of feeding raw vs. cooked foods or are there other factors that set the stage for deficiencies that may be at play here?

Since Pottenger carried out his clinical trials in the 1940s, he did not have modern testing and instrumentation to confirm the nutrient balance of his diets nor did he know about taurine deficiencies, which could be a factor. Taurine deficiencies in cats was not reported until the 1960s by Jacobsen (1968); they were expanded upon by Huxtable (1992). It was not until 1975 and 1985 that the required importance of taurine in cats was shown. (Hayes 1975a,b in National Research Council 1986, Schaeffer 1985).

We now know that cats lack the ability to manufacture taurine and require that it be added to their diets. We also know that taurine-deficient diets can lead to many disease conditions such as cardiomyopathy, retinal degeneration, and blindness, as well as reproductive issues and musculoskeletal deformities (Dieter 1993; Monson 1989; Morris 1989; Novotny 1994; Pion 1992; Ryan 1989; Sturman 1989, 1991, 1992; Waltham 1993, 1994).

However what is not widely reported is the effect of heating and processing upon taurine deficiencies. Hickmann (1990, 1991) and Kim (1996 a,b) reported that cats that eat cooked and processed foods have lower plasma taurine levels.

It is believed that the issue lies with the Maillard reaction, defined as a reaction between an amino acid and a carbohydrate in a heat condition. The Maillard reaction promotes the growth of intestinal bacteria that degrades the taurine, setting the stage for the deficiency (Hickmann 1990, 1992; Kim 1996). Sturman (1986) presents a link

between his modern knowledge and the Pottenger cat experiment from the 1940s. Two groups of cats were fed the same diet except one group's diet was taurine deficient. Sturman reported many malformations that were quite similar to those reported upon by Pottenger: retinal degeneration, a high incidence of still births, and a higher mortality rate in those cats receiving the taurine deficient diets.

This information on taurine serves as the basis to discuss what we call the biological factor in pet foods. The failure of nutritional guidelines to address the biological factor is one of the more serious drawbacks of today's commercial pet foods. Pet foods are required to be cooked at extremely high temperatures to meet government standards which ensure destruction of harmful bacteria and other contaminants. While temperatures well above 212°F are necessary from a bacterial standpoint for canning and cooking pet foods, these high temperatures can alter and inactivate such delicate or vital nutrients as vitamins, enzymes, and cofactors, making them much less effective for maintaining good pet health. Such vital nutrients (termed the "life force" by human nutritionists) are abundant and found in the highest content in raw meat and fresh, raw fruits and vegetables.

Modern pet food formulation, analysis, and regulations

Nutritional claims on pet food labels initially followed the guidelines set forth by the Committee on Animal Nutrition of the National Research Council (NRC). The NRC published the nutrient requirements of dogs in 1974 and of cats in 1978. The Association of American Feed Control Officials (AAFCO) was created to regulate pet food labels based on the guidelines established by the NRC. To simplify the process, AAFCO initially relied upon the NRC standards and the chemical analysis of the food to determine nutritional adequacy.

AAFCO did this despite the fact that experts reported this chemical analysis technique to be flawed. Controversy flared in the pet food industry after the NRC failed to address these known flaws in its guideline revisions of 1985 and 1986. Based upon these later revisions, AAFCO decided, for the interim, to stay with the older recommendations set in 1974 and 1978. In 1990 and 1991, AAFCO put together the canine nutrition expert (CNE) and feline nutrition expert (FNE) subcommittees. Their reports served as the bases for the published AAFCO Dog Food and Cat Food Nutrient Profiles, created to address and correct the flaws in the NRC report.

An unaddressed issue

Today, however, AAFCO profiles unfortunately do not refer to the biological value of the food, i.e., the nutrients

that help to create health and maintain wellness. The feeding trials recommended by AAFCO take a step toward biological evaluation by testing some parameters in a living animal, namely proper growth, weight maintenance, gestation, and lactation. But these parameters fall short of a complete definition of health and the prevention of disease.

Living organisms are incredibly complex, and the science of nutrition is still in its infancy. There are many more questions than there are answers regarding proper nutrition. As information increases, consumer and veterinary diets will continue to improve, but for now there are still weaknesses in the production of these products.

The following are some of the attributes related to pet foods and genetic makeup of animals that need further investigation and clarity:

- What effect do the extreme high temperatures of processing (extrusion and retorting) have on the availability and usability of certain nutrients, protein, fat, antioxidants, phytonutrients, and delicate vitamins and enzymes (broadly classified in human health food circles as the "life force" of the food)?
- What cumulative effect does the daily ingestion of small amounts of chemical preservatives and additives, coloring agents, pigments, appetite stimulants, and animal digests (used to color, improve palatability, and extend shelf life) have upon the health of the animal? Does their feeding increase the production of free radicals, leading to inflammation, degeneration, premature aging, and disease?
- What health effect does the feeding of rejected protein (beef, chicken, turkey, lamb, etc.) by-products (such as middlings, hulls, meals, gluten) have upon the long-term health of the animals?
- What effect does the inherent genetic make-up of individuals play in selecting which food substances are most appropriate for a particular animal or breed? (Consider gluten intolerance and other issues related to genetics, which so powerfully impact individual health.)

Chapter Three

The Modern Approach to the Integration of Chinese Herbal Medicine

TRADITIONAL CHINESE MEDICINE THEORY AND PRACTICE

The Chinese theory of medicine has a long history. This theory has developed and been modified over 4,000 years. It is an organized health system based heavily upon patterns observed by the ancient Chinese scholars and is a body of science that uses a combination of herbs, physical therapy, mental medicine (meditation techniques), and dietary therapy to restore a patient to a healthy state. This chapter gives a brief overview of Traditional Chinese Medicine from the Eastern perspective to serve as background for those interested in the theories and TCM terminology. In the following sections, only a brief TCM explanation will be given; the authors then provide a Western interpretation for the TCM diagnosis.

YIN AND YANG AND CHI—A BRIEF OVERVIEW OF TCM

A brief history of Traditional Chinese Medicine and an explanation of basic concepts are presented to facilitate the use of the herbs. However, it is not the intent of this book to make the reader a master herbologist. Those with a background in TCM will find the following text basic and incomplete. To try to put the background, history, and herbal therapy and acupuncture in one book would be equivalent to writing “the book” of veterinary medicine. It is simply not possible to encompass an entire course of study into 1 book. For further information, one may take courses at various colleges around the country or see the texts in the appendix.

Traditional Chinese Medicine is based upon patterns observed by the ancient Chinese. They noticed that all things consisted of 2 opposing and complementary facets, termed Yin and Yang. The Chinese character for Yang means the sunny side of a hill, whereas the character for Yin means the shaded side. The concept of Yang was then expanded to mean positive, strong, male, upwards, external, hot, energetic, bright. Yin is used to indicate passive, female, internal, restive, dark, moist, and cool aspects of

life. Yin and Yang must co-exist. Without dark, one cannot appreciate light. Neither one is better or worse than the other. They must be in balance. For example, the active, energetic Yang aspects of a being must be interrupted by peaceful, restful Yin aspects. Consider a person who is always active. Without a quiet “Yin” period, the person would be manic, unable to rest or enjoy the completion of a task.

Yang and Yin evolve into each other. For example, day is Yang and night is Yin. Night and day flow into each other as Yin and Yang do. Everything has both a Yin and a Yang component. In the example of the day, there is a very Yang aspect, that being noon. It is the brightest time of the day. Yet the day has a Yin component within it. After noon, the evening approaches. The evening is Yin within Yang or night within the day. Yin and Yang nourish, support, oppose, and evolve into one another.

A second basic tenet of Traditional Chinese Medicine is the existence of vital substances. There are 4 vital substances—Qi (also spelled Chi), Blood, Essence, and Body Fluids. Qi is an ineffable concept. It can be described as force, life force, movement, breath, energy, material force, mater-energy and vital power. It can be said that where there is Qi, there is life, where there is no Qi, there is no life. Qi flows throughout the body in meridians, or channels, in the body. Qi performs various functions within the body. It warms, defends, holds, activates, transforms, and contains. Qi activates all processes within the body. Without Qi, the organism would die.

Blood is similar to the Western concept of blood, but extends beyond our concept of the red liquid that flows in veins and carries oxygen, hormones, nutrients, and waste products. In the Chinese understanding, Blood also functions to nourish the mind, moisten the tissues of the body, and serve as a vessel to carry Qi around the body.

Essence, or “Jing,” is the substance that forms the basis for birth, development, and reproduction. It determines our basic constitution. It is responsible for our basic tendency to be healthy or subject to chronic illness. Essence influences fertility, the tendency toward degenerative

diseases, and aging. In Western terms it may be considered our genetic potential.

Body Fluids are all other liquids in the body, including sweat, tears, urine, saliva, mucus, and so on. This is also called yin. In this case, however, the Chinese do not use the term yin to contrast Yang. This yin is a separate concept. Unfortunately, since most Chinese words are composed of 1 to 2 syllables, there is a great deal of repetition in the Chinese language. Often a capital “Y” is used for the Yin that is the complement of Yang and a small “y” is used for the yin indicating fluids.

PATHOGENS

Pathogens such as viruses, bacteria, and fungi are not recognized in TCM. This is not surprising, given the fact that microscopes were not invented until 1590 (by Zaccharias and Hans Janssen) or 1674 (by Anthony Leeuwenhoek), depending upon one’s definition of the term “microscope” (Parker 1991). The ancient Chinese described 6 external pathogens based upon what they saw in nature: Heat or Fire, Wind, Damp, Cold, Summerheat, and Dry. Wise people observed that during windy, colder weather people developed nasal discharge and coughs. Not knowing about viruses and bacteria, they theorized that Wind and Cold entered the body to cause illness.

When studied, the pathogens make sense. Cold causes stagnation and pain in the body. Think of how it feels to put your hand in a glass of ice water for a prolonged period. If Cold gets into the digestive system it will cause a watery diarrhea with undigested food. This is due to the fact that there is not enough heat to digest the food. Discharges caused by Cold are usually clear or white.

The opposite of Cold is Heat or Fire. The translation into modern medicine would be inflammation or infection. Fever is an obvious sign of Heat invasion. A red, sore throat with purulent plaques would be Fire or Heat. The skin may show red, hot rashes. Discharges are yellow and commonly thick. In Western terms this makes sense because if Heat is translated into the term infection, the associated discharges consist of purulent debris. Purulent discharges are yellow. The heat of the disease evaporates the fluids, making the discharges less watery than a cold condition. Diarrhea due to Heat is usually foul smelling and fully digested. Again, in Western terms, fever in the body helps to speed the digestive enzymes so the food is completely broken down.

Wind is an interesting pathogen. On its own it can cause movement. Seizures and tremors are a sign of Wind. Think of wind blowing through trees causing them to sway. Wind can assist other pathogens to enter the body. It can, in effect, blow the pathogen into the body. A Western-trained physician may consider this to be airborne transmission. As wind is motion, a shifting joint

pain is a sign of Wind. Wind, therefore, could be the Western equivalent of migratory pain.

Damp is a heavy, thick pathogen. It disrupts the smooth flow of Qi and leads to stagnation. Damp is sticky and hard to treat. It tends to cause a feeling of heaviness or fullness. The Western equivalents are discharge, leukorrhea, and similar symptoms. Discharges due to Damp tend to be sticky. They may be white if combined with Cold or yellow if combined with Heat. For example, a cough with thick yellow sputum is attributed to Damp Heat in the lungs; whereas thin, copious, white sputum is a sign of Damp Cold in the Lungs.

Untreated Dampness can lead to Phlegm. Phlegm is created in the body, as opposed to an external pathogen. It can have the same meaning as it has in Western medicine, i.e. sputum. In addition, practitioners of TCM state that it can form nodules or masses. Lipomas and tumors are also considered Phlegm.

Dryness is the pathogen that tends to damage the body fluids. It can cause dry eyes and skin, constipation, and a dry throat. This is a broad term that is subdivided in Western medicine. Depending upon the location of the dryness, Western equivalents include dehydration, xerostoma, keratoconjunctivitis sicca, and so forth.

Summerheat is the only pathogen restricted to a season—it is only seen in the summer. It causes sweating, thirst, headache, oligouria, and a rapid pulse. This is similar to heat stroke in Western medicine.

THE ORGANS ACCORDING TO TRADITIONAL CHINESE MEDICINE

There are 6 basic organ system pairs in TCM.¹ Each pair consists of a Yin and a Yang organ, also called zang and fu organs. Zang and fu are both translated as organ in English. Zang organs are considered storage organs. They are the Yin aspect of the organ pair and are concerned with the storage of vital substances. The Yang organs are called the fu organs. These are considered to be hollow and function to move substances within the body. The following organ pairs are recognized:

<u>Yin organs</u>	<u>Yang organs</u>
Lungs	Large intestine
Spleen	Stomach
Heart	Small intestine
Kidney	Bladder
Pericardium	Triple heater
Liver	Gall bladder

The functions of these organs are not necessarily those learned in Western medical schools. The Chinese assigned additional or different functions to the various organs based upon their interpretation of how the body was affected in different states of pathology. It is a system that

is intrinsically true to itself. If one allows one's mind to accept an altered perception for a while, one will come to realize that their theories were consistent, but the language we use to describe the observations is different.

We can modify these ideas to fit our research. For example, the Chinese called mental illness a shen disturbance and assigned shen to the Heart. We now know that mental illness is a disorder of the brain. However, the Chinese use the acupuncture point they have designated as PC 6 (pericardium 6) effectively to calm agitated patients. Perhaps if we had discovered this point today, we would have named this point meninges 6 to keep in line with our understanding of the body.

A brief overview of each organ system and its assigned function is given below. The name of each organ is capitalized according to convention to indicate that the traditional Chinese theory of organ systems is being discussed.

Lung

The Lungs function in respiration. They bring the Qi from the environment (oxygen, in Western parlance) into the body. The Chinese physicians also recognize that dyspnea and coughing are related to the Lungs. In TCM they have an expanded role. They also are in charge water and sweat. To a certain sense we do agree that the Lungs have a role in fluid homeostasis. Much of the insensible water loss from the body is via respiration. The Lungs control the skin in Traditional Chinese Medicine theory. Rashes are a sign that the Lungs have some pathologic condition occurring. Again, this is not so farfetched. Think of an atopic animal. The offending allergen enters the body via the lungs and the allergic reaction is manifested by the skin.

Large Intestine

The Large Intestine reabsorbs water and sends it to the Kidneys. The impure water is sent to the Bladder for voiding. We recognize the absorption function of the large intestine in Western medicine and the role of the bladder in voiding liquid wastes.

Stomach

The Stomach is involved in the transportation of food. It prepares the food for the action of the Spleen. This is similar to what we now know of the biological function of the stomach. It indeed transports the food, but we are now aware that it also produces digestive enzymes and that the food is prepared for digestion in the small intestines, not by splenic enzymes, but rather pancreatic and hepatic substances.

Spleen

The main function of the Spleen is the extraction of the "food essence" or nutrients in Western thought. This role is now given to the pancreas and liver in modern medicine. The Spleen also has the function of "holding" in TCM theory. For example, the Spleen holds the blood in the vessels. If the Spleen is weak, petechiae, ecchymoses, and frank hemorrhage occur. If it cannot hold organs in place the patient may experience prolapses. An additional function assigned to the Spleen is the control of the flesh (muscles), so a weak Spleen can lead to a feeling of weakness.

Heart

The Heart governs the blood and circulation. This is self-explanatory to Western-trained practitioners. However, the Chinese believe that the Heart is also the house of the Shen, or mind. They do not recognize the brain as performing this function the way that Western-trained doctors do. Disturbances in this function of the Heart lead to abnormal behaviors much as we would recognize that disturbances in the brain's function can cause altered behavior.

Small Intestine

The Small Intestine is involved in fluid (think chyme) transformation. It separates clear from turbid fluid and sends the clear fluid into the body and the turbid fluid into the Large Intestine. The turbid fluid can be thought of as the chyme sent to the large intestine according to Western thought. The clear fluid is really the nutrients that the body absorbs. The functions of the Small Intestine are therefore basically identical in both systems.

Bladder

The Bladder takes fluids and combines them with toxins to make urine. Toxins can be translated into metabolic waste products, i.e. ammonia. The fluids are the water needed to excrete the toxins.

Kidney

The function of the Kidney does not correlate at all with Western thought. In TCM it does not play a role in the production of urine. The Kidneys store the body's Essence. The Kidneys control the fundamental substance for birth, growth, and reproduction. They provide the motive force for all physiological functions. Therefore, the Kidneys are the basic organs for providing the warmth for all of the functions in the body, i.e., oxidizing food to provide

energy. They also guide our birth and development and produce the Marrow that fills the bones.

Pericardium

In Chinese, the character for pericardium can be translated as heart bag or mind enclosure. It surrounds and protects the Heart and is often the target of herbal formulas used to treat emotional problems because the Heart is the home of the shen or mind.

Triple Heater

This is a concept that is not present in Western medicine. It is not truly an organ, *per se*, but a depiction of the 3 divisions of the body—the upper (head to diaphragm), middle (diaphragm to navel), and lower (navel to foot) sections. The upper section of the body is concerned with respiration and circulation. The middle part is concerned with digestion and the lower part is charged with the function of excretion.

Liver

The Liver performs many functions in Western thought. However, the Chinese did not assign to this organ any of the digestive, detoxification, or storage functions that we now recognize. In TCM, the Liver ensures the smooth flow of Qi throughout the body. It also stores Blood and controls the joints and tendons. Ensuring the smooth flow of Qi can be thought of as making certain that all parts of the body have the required energy and blood flow. The Liver's function of Blood storage allows it to regulate the volume of Blood in circulation and regulate the menses. In TCM terms, the ability of the animal to ambulate normally may be compromised if there is Liver dysfunction because it controls the joints and sinews.

Gall Bladder

The Gall Bladder stores bile. Its role in digestion is easily comprehended by those with a Western background. In addition, in TCM theory, it stores Blood and cleans the Blood at night. We know that the gall bladder does not actually store blood, but it is closely associated with the liver in Western thought. The liver has the function of “cleaning the blood” by neutralizing toxic metabolites, providing proteins to encapsulate and transport the lipids in the blood, and so on. A final function of the Gall Bladder is to assist the Liver in controlling the sinews.

Each of these organs has a meridian associated with it that is used for acupuncture. A meridian is defined as a pathway through which energy (Qi) can flow. The meridian connects the internal organ with the surface of the

body, allowing the insertion of acupuncture needles to affect the organs.

CHINESE HERBAL REMEDIES

Traditional Chinese herbal therapy has a long history. The Huang di Nei Jing—the Yellow Emperor's Inner Classic—was written during the period of the Warring States (475 to 221 BC) (Bensky 1990). The theory behind Traditional Chinese Medicine was discussed in this text. Later, during the Han Dynasty (25 to 200 CE), the Shen Nong Ben Cao Jing—Divine Husbandman's Classic of Materia Medica—was written. This is the earliest book of Chinese material medica (Chen 2001). It contained 364 entries, 1 for every day of the year, as the Chinese interwove health and nature to create their system of health care. Throughout the years, more experimentation has led to the discovery of more substances with useful effects on the body. The current Chinese Materia Medica, published in 2002, contains almost 9,000 different herbs, minerals, and animal-based materials (Bensky 2004). Many of these are used locally, while about 600 are commonly used throughout the world.

To facilitate the reading of this chapter, all substances, whether plant-based, mineral, or of animal origin, will be referred to as “herbs.”

Herbs are assigned several properties, the most important of which are taste and temperature. Taste does not always conform to what the taste bud on a tongue would register; rather, it is more an effect on the body. Herbs are classified as:

Sour: Sour herbs have the action of astringing abnormal leakage of fluids such as diarrhea, excess sweating, or polyuria.

Salty: Salty herbs soften masses. They may have the additional effects of treating constipation or tonifying the Kidney.

Acrid/pungent: These herbs promote the circulation of Qi and Blood and act as diaphoretics.

Bitter: These herbs dry and clear Heat and Damp.

Sweet: Sweet herbs are tonifying and moistening. They can also harmonize or decrease toxicity of other herbs in a formula.

Bland: These herbs promote urination.

Herbs are also described as hot, cold, cool, warm, and neutral in temperature. Again, this does not necessarily correspond to the feel in the mouth, but rather to the action on the body. Cool and cold herbs tend to clear pathological Heat and nourish fluids. Warm and hot herbs are used to counteract Cold conditions in the body.

Throughout the years herbalists have combined single herbs into formulas to modify or broaden their actions or

to decrease toxicity of any one single herb. When combined, herbs may have one of several interactions as follows:

Potentiation/accentuation: This occurs when herbs of similar taste or nature are added together to increase the effect upon the body. For example a formula may use anemarrhena rhizome (Zhi mu) with phellodendron bark (Huang bai) because both are bitter and cold when treating a very hot condition.

Enhancement: In this case, a primary herb is used with a secondary herb that enhances the effect of the primary herb. Sophora root (Ku shen) is a very good itch reliever. In some formulas, cypress (Di fu zi) is added to enhance the relief of pruritis.

Counteraction: This is the concept of using a second herb to decrease or eliminate the toxicity of a primary herb. Pinellia (Zhi ban xia) can irritate the gastrointestinal tract. If one wanted to use this herb for its action of drying Damp with moist coughs, but did not want to experience adverse gastrointestinal effects, one might combine it with fresh ginger (Sheng jiang).

Antagonism: In this case, each herb decreases the curative effect of the other. For example, Scutellaria root (Huang qin) is bitter and cold and clears heat. Fresh ginger (Sheng jiang) is warm. Added together, scutellaria root (Huang qin) would be less effective at clearing heat.

Incompatibility: When herbs that are incompatible are added together severe side effects can be seen that would not occur if the herbs were used alone. For this reason, Sechuan aconite root (Wu tou) is not used with tendrilled fritillary bulb (Bei mu).

Single effect: In this method, a single herb, rather than a mixture, is used to treat a patient.

Mixing herbal formulas is complex and takes years of study so most veterinarians use described formulas. A brief overview is given for those interested in the theory.

The ancient Chinese described their formulas in the form of feudal hierarchy. Herbs were assigned roles, much as members of the courts were. The king (jun) herb is the main ingredient in the formula. It is the herb prescribed to treat the main symptoms of the illness. It is assisted by deputy herbs (chen) that increase or enhance the action of the king herb. Assistant or adjunct herbs (zuo) are then added to the formula to treat less bothersome symptoms or decrease the toxicity or side effects of the primary herbs. Finally, there may be envoy herbs (shi), which may be used to direct the action of the formula to one part of the body or harmonize the body (see following definitions). Thus, the direction of Chinese herbal therapy is very different than the Western view.

TCM uses a combination of substances to enhance, modulate the activity, or decrease the toxicity of the formula. In Western medicine the trend is toward single substances at a specific concentration, i.e., 325 mg of acetylsalicylic acid per adult strength aspirin. Both systems have their merits and neither one should be considered inferior to the other. The Western-trained practitioner must become comfortable with the concept that the strengths of the various ingredients in an herbal formula may vary a bit from season to season as the growing seasons vary.

This is not a bad thing, but rather a natural occurrence. We assign a nutrition profile to our foods and vegetables. For example, a medium carrot has 26 calories, 1.83 g of fiber, 0.63 g of protein, and 17,158 IU of vitamin A (<http://www.truestarhealth.com/Notes/1691007.html> Accessed 11/05/2006). Common sense tells us that this is just an average. Carrots come in different sizes. Storage affects the nutritional content, and so on. To become comfortable with TCM the practitioner must accept variation as normal.

Some Western practitioners are uncomfortable with the number of different ingredients in herbal formulas. It is precisely the interactions between ingredients that make the formulas so safe and effective. We know side effects occur with single-ingredient medicines. Aspirin, a wonder drug, can cause ulcers, bleeding tendencies, Reye's syndrome, and so much more. We now realize that anesthesia and analgesia protocols are safer if combinations of opioids and dissociative, inhalant, and nonsteroidal medications are mixed so we can lower the dose of any one single medicament. With this trend in Western medicine, it will be easier for practitioners to become comfortable with TCM.

Diet and herbal therapy

Herbs work best if given on an empty stomach or with a small amount of food to facilitate administration. Large meals tend to delay the absorption of the herbs and decrease efficacy. There is also the possibility that the animal may not consume a large meal and then the dose of the herb becomes insufficient. (For diet related to cancer, please see the introduction to the cancer section).

ACUPUNCTURE

Acupuncture comes from the Latin words *acus*, which means needle, and *pungere*, which means to pierce (Schoen 1994). In its simplest form acupuncture is the introduction of a needle into a specific point on the body to cause a desired reaction in the body.

The Chinese word for acupuncture point is *shu xue*. *Shu* means communication and *xue* is hole. Together, the

term *shu xue* denotes a hole in the body that communicates with the internal organs. The point is connected to the organs via the *jing luo*. The term *jing* can be translated into weave, warp (the straight threads of a weaving), pathway, channel, or meridian. *Luo* means woof (the curved part of a weaving), connect, collateral, link, or interweave. Together, the term *jing luo* denotes a blanket of channels connecting the entire body—the surface to the interior, one organ to another, the upper part to the lower part, the left side of the body to the right. The meridians and collaterals are a set of imaginary lines through which Qi flows. The channel system forms a closed circuit of energy throughout the entire body.

Meridians serve multiple purposes. In addition to carrying Qi, they also coordinate the action of the Zang fu organs and can be used diagnostically to locate the site of disease. For example, the eyes are connected to the Liver by the Liver meridian. If the eyes are inflamed, the doctor trained in TCM may diagnose Heat in the Liver. They can be used therapeutically by transmitting the effect of acupuncture and herb.

There are 14 main meridians. Each of the 12 Zang fu organs has its own meridian; these 12 are the regular meridians. There are 2 other major meridians—the Conception vessel, which runs along the ventral midline, and the Governing vessel, which runs along the dorsal midline. Finally, there are 6 additional extraordinary meridians that are large branches of the 12 regular meridians. The 6 extraordinary meridians crosslink the left side of the body to the right and the back of the body to the front. These 6 meridians share points with the other meridians. There are many points on the body that do not belong to a meridian, yet can exert an influence on the physiology of the individual.

We still do not understand how acupuncture exerts an effect on the body. In all likelihood, acupuncture has multiple effects via multiple mechanisms. There are anatomical explanations for efficacy. In general, acupuncture points are located in areas of the body with a higher concentration of free nerve endings, arterioles, lymphatic vessels, and mast cells. For example, some meridians run along the radial or median nerves. On the head, points are often located where nerves emerge through foramina. There are 4 acupuncture point types based upon their location in relation to nerves and muscles. Type I are classified as motor points. These are located at sites where nerves enter a muscle. Type II are located on the dorsal or ventral midline where superficial nerves meet. Type III are located on superficial nerves or nerve plexi. Type IV are located at the junctions between muscles and tendons (Schoen 1994).

Electrical conductance has been measured at acupuncture points and along meridians. In general, 70% to 80% of the acupuncture points studied have been demonstrated

to be positively charged compared to their surroundings and some studies have demonstrated lower alternating current impedance along meridians (Reichmanis 1976). Because the body depends upon ionic charges for all nervous system function, muscle contraction, and cellular activity, it is apparent that one can alter the actions in the body by manipulating charges.

There are also physiological explanations for efficacy. It has been demonstrated that acupuncture incites a local inflammation. Hageman factor XII, bradykinin, histamine, heparin, and kinin protease are all released (Kendall 1989). These chemicals result in activation of the coagulation cascade, production of prostaglandins, vasodilation, increased vascular permeability, and activation of the complement system.

The neural segmental gate theory states that acupuncture stimulates the afferent A-delta fibers (Melzack 1965). These nerves carry non-painful sensory stimulation up to the substantia gelatinosa where they connect with inhibitory interneurons. These inhibitory neurons then close the “gate,” preventing the pain-stimulating impulse traveling along the more slowly conducting C fibers from reaching the higher nervous system and preventing the recognition of pain by the brain. This may explain some, but not all, of the effects of acupuncture.

A somatovisceral reflex can be incited by stimulating acupoints (Chang 1996). Sensory and somatic fibers connect in the central nervous system so stimulation of a sensory nerve can cause firing of somatic fibers. Somatic pain can cause visceral reactions. Pain may increase heart rate and blood pressure and cause an individual to vomit, depending upon the severity. Therefore, it is understandable that manipulation of somatic nerves by acupuncture needles can cause a reaction in a body organ.

Opioids also seem to play a role in the effect of acupuncture. Acupuncture increases the circulating levels of b-endorphin (Abenyakar 1994). In the CNS, levels of met-enkephalin, leu-enkephalin, and NAGA increase after treatment with acupuncture (Wang 1989, Pan 1984). In many cases, naloxone can reverse the analgesic effects of acupuncture (Pert 1982). Experiments have demonstrated that dexamethasone can decrease b-endorphine levels and decrease the analgesic effect of acupuncture (Han 1982).

Acupuncture is becoming more accepted for the treatment of musculoskeletal conditions; some insurance companies even cover treatment. It has been demonstrated to relieve pain and increase mobility without the harmful side effects of nonsteroidal anti-inflammatories and steroids and without the possible threat of addiction that opioids pose. Its applications are far more numerous, however.

Acupuncture can be used to reduce fever, stimulate the immune system, decrease blood pressure, relieve diarrhea, regulate the reproductive system, and so on. In fact, in

most every disease condition, acupuncture can be part of the therapy protocol.

The how to's

The authors strongly discourage veterinarians with no formal training from attempting acupuncture. This section is provided as a quick review for those who have been trained. Suggested points are mentioned in each disease section.

There are 10 basic methods of acupuncture:

1. Dry needling: using very thin needles in the specific acupuncture point.
2. Aquapuncture: injecting a liquid such as a vitamin solution, Adequan®, or another solution into the specific site (Schoen 1994).
3. Electroacupuncture: attaching electric leads to the needles after they are inserted into the acupoint. The frequency and amplitude are then adjusted to achieve the desired response (Schoen 1994).
4. Hemoacupuncture: inserting needles into a blood vessel to promote bleeding. Common acupuncture needles may be used, but often the practitioner uses cutting edge or hollow needles to allow more blood to flow from the point.
5. Moxibustion: burning *Artemisia vulgaris* directly over the acupuncture point or on a needle which has been inserted into the point (Schoen 1994).
6. Laser therapy: applying low intensity lasers to the acupuncture points (Schoen 1994).
7. Acupressure: applying pressure, usually digital, to the acupuncture point.
8. Gold bead implants: placing sterile gold beads into the site to prolong the effect once the practitioner is certain that the animal is responding to the therapy. Less common.
9. Magnetic acupuncture: applying magnetic waves to the acupoints. Rarely used.
10. Ear or auricular acupuncture: using only acupuncture points on the ear.

The decision to select a certain number of points depends upon the condition of the patient, the disorder to be treated, and the preference of the practitioner. Most practitioners use 4 to 8 points per treatment, but some conditions respond to a single point and some acupuncturists use as many as 30 needles per session. A general rule is that debilitated patients do not receive high numbers of needles because they may be too weak. When treating a single condition, fewer needles may be required than would be needed for more complex cases.

An acupuncture session usually lasts 10 to 30 minutes. Very rarely, a session may last 3 hours. This is generally only when severe pain or conditions such as status epilep-

ticus are being treated. Some practitioners assign special significance to the number 12 because there are 12 organs in the 6 Zang-fu pairs, 12 major channels on the body, and 12 periods in the day, each associated with a specific organ. These acupuncturists feel that acupuncture sessions should last for 12 or 24 minutes.

Patients are generally treated daily to weekly for the first 3 to 6 weeks. Once the patient responds, treatment may be decreased to once a week or every other week for up to 6 months. Depending upon the condition, therapy may be lifelong. For example, an elderly German Shepherd with severe hip dysplasia is likely to require acupuncture for the rest of its life. A young dog with paralysis secondary to spinal injury may recover completely and therapy may be discontinued.

Depth of insertion varies from point to point. Obviously, there is very little soft tissue on the digits so deep insertion to the points around the nail bed is impossible. When using points around the eyes, it is important to angle the needle such that the globe is not entered. CV8, the umbilicus, is not needled. Instead, this point is only treated with moxibustion. Needles are never inserted directly into ulcerated or infected skin, tumors, or scar tissue.

Needle size also varies. In general, 0.30-gauge needles are used in large animals and 0.22-gauge needles are used in small animals. The most common length used in cats is 13 mm. Depending upon the size of the dog and the site chosen, 13- to 50-mm needles are used. In a horse, 13-mm needles are used in the extremities, but a 100-mm needle may be used in the hip area.

Further exploration of the basic techniques

Dry needling

With dry needling, the practitioner may use a cotton ball with alcohol to move fur out of the way. Clients often expect this because they see their physician wipe the inoculation site with alcohol prior to an injection. In reality, an alcohol wipe probably has little effect on infection prevention. Of course, if the site selected is visibly soiled, it should be cleaned prior to use. Once the needle is inserted, the animal usually relaxes. Many even go to sleep. If the animal seems distressed by the needle, you may wish to remove it and either re-insert or select a different point. Because there are so many points with overlapping functions, and the body is interconnected by meridians such that by treating the left side the right also benefits, it is rare that you must use a point that causes obvious distress.

Some form of stimulation is often performed once the needle is inserted. The needle is manipulated periodically by twisting, thrusting, or scraping the handle with the practitioner's fingernail. (Schoen 1994). Many

practitioners manipulate the needle in a very specific manner to achieve the desired response.

Tonification versus sedation

In general, practitioners tonify weak or deficient patients. On the other hand, those patients suffering from excess conditions require sedation. The desired effect may be achieved by manipulating needles as follows:

- To tonify the patient, the practitioner may twist the needle rapidly for a short burst; whereas to sedate the patient he or she may twist the needle more slowly and for a longer period of time.
- Thrusting and lifting techniques may be used. In general, the needle is lifted partially out of the site forcefully and rapidly, then slowly and gently re-inserted—the effect is to tonify the patient. Conversely, slowly and gently lifting the needle and then rapidly and forcefully re-inserting it is said to sedate the patient.
- Insertion of the needle may be timed to the patient's breath. If the needle is inserted as the patient inhales it theoretically brings Qi into the body with the needle and tonifies the patient. If the needle is inserted as the patient exhales, the opposite effect is seen and the patient is sedated.
- The Qi in a meridian flows in a specific direction. Insertion of a needle with the flow of the Qi is tonifying, whereas insertion counter to the flow has a sedative effect.
- Points can be “closed” or “opened” upon withdrawal of the needle. If the patient is to be tonified, the acupuncturist may immediately press his or her finger over the site for a minute or so after withdrawing the needle. The idea is that this prevents Qi from escaping. To sedate the patient, the practitioner may twirl the needle at a slight angle to enlarge the hole prior to withdrawal. This “opens” the point to allow the pathogenic factor to leave the body.

Many people feel that you do not need to follow the guidelines above. These practitioners twist at moderate speeds and evenly to the left and right or thrust up and down gently with no dominant direction. The theory is that this allows the body to decide whether it requires tonification or sedation. This method is also used if the patient has a mixed condition—one with some signs of deficiency and some of excess.

Warming versus clearing

It may be desirable to warm patients with cold conditions such as Yang deficiency. This can be done by moxibustion of the points or by a technique known as Shao Shan Huo, or setting the mountain on fire. In this method, the acu-

puncture point is assigned 3 levels of depth. The most superficial level is called Heaven. Deep to this is Human and the deepest extent of the point is called Earth. To “set the mountain on fire” or warm the patient, the needle is slowly inserted to the first level, Heaven. It is then lifted and thrust shallowly or rotated 9 times. Next, the needle is advanced to the Human level and the manipulation process repeated. Finally, the needle is placed in the Earth level and the 9 thrusts or rotations are performed. The needle is then quickly withdrawn back to Heaven. The sequence is begun again. It is repeated 3, 5, 7, or 9 times, until the point feels warm. Once this point is reached, the needle is quickly withdrawn completely and the point is pressed.

A clearing technique may be employed in patients with excess Heat patterns. This is essentially the opposite of setting the mountain on fire. The clearing method is called Qing fa. In this approach, the needle is quickly inserted to the level of Earth; then it is rotated or lifted and inserted in small increments 6 times. The needle is then backed out to the Human level, where the needle is manipulated for another 6 times. Finally, the needle is brought to the Heaven level. After manipulating the needle at this level, it is rapidly thrust back to the Earth level. This process is repeated 2, 4, 6, or 8 times, until the point feels cool. At this point the needle is slowly withdrawn.

Aquapuncture

Some animals will not sit for dry needling. Birds, for example, resist being restrained for prolonged periods of time. Some animals are quite aggressive in hospital settings and need to be muzzled during treatment. Some cats will not relax in a hospital setting. Finally, some points, such as those near the nail bed, are often very sensitive, so many animals do not tolerate prolonged needling of these areas. In these cases, aquapuncture is often the preferred modality. Very small amounts of liquid can be injected into the site. Commonly employed substances include vitamin B, vitamin C, Adequan®, or saline. Only small volumes are needed. Vitamin C is most commonly used in the author's practice, because vitamin B may be too irritating. Most practitioners who use the vitamin B solution dilute it. Volumes as low as 0.15 to 0.25 cc can be used, even in large dogs.

Electroacupuncture

Electroacupuncture is performed by attaching wires to the needles after insertion. The frequency and amplitude should be set at zero prior to turning the electroacupuncture machine on. The frequency is set first. There are 2 commonly used frequencies. Low frequency is 4 or fewer Hz, and this is more commonly used. The authors use 1 to 2 Hz. High frequency is above 100 Hz. This high

frequency is used for surgical analgesia, which is not frequently employed in veterinary medicine. Once the frequency is selected, the amplitude is slowly increased until the muscles just start to twitch. Most animals tolerate this well. If the animal seems uncomfortable, decrease the amplitude until the animal relaxes. After 5 to 10 minutes, the amplitude may be increased slightly.

Hemoacupuncture

Hemoacupuncture is used for excess conditions. The most common indications in veterinary medicine are high fever and laminitis. In febrile conditions such as heatstroke, a 25-gauge needle may be inserted into the appropriate acupoint and a few drops of blood are allowed to drip from the body. The tip of the ear is frequently used for this purpose in veterinary medicine. One must be careful if the patient is debilitated and febrile. It is important to avoid hypovolemia, so large amounts of blood are not taken. In addition, care must be taken if a bloodborne disease is causing fever. Anthrax is considered to be a febrile disease not treated by hemoacupuncture because this could spread disease.

In horses, laminitis is commonly treated by hemoacupuncture, especially when acute. This is one instance in which large amounts of blood may be removed. It is important to warn the owner of this so he will not become upset.

Moxibustion

Moxibustion is limited by the fact that veterinary patients tend to have fur or feathers, which may catch fire. The herb also has a strong marijuana-like odor when burned. Animals may object to the burning odor and the clinic will smell like moxa. One must also be sure clients do not think marijuana is used in the clinic or a visit by authorities may result.

Laser therapy

Some people feel that laser therapy is most useful for musculoskeletal disorders. Others claim that the energy does not penetrate deep enough to have a physiological effect.

Acupressure

Acupressure is generally quite safe. Practitioners may wish to show clients the acupuncture points selected and have them press their fingers into the sites between clinic visits. In general, the pressure can be applied for 5 to 10 minutes; animals tolerate this quite well.

Gold bead implants

It is best to ensure that the patient will respond to the selected acupuncture point by dry needling, aquapunc-

ture, or electroacupuncture before going to the expense of gold bead implants.

The patient is usually sedated and the area around the acupuncture point clipped and scrubbed as for surgery. A hypodermic needle can be introduced to the point and the implant passed down into the site. If necessary, a small needle can be used as a stylet to push the bead through the larger needle. After situating the bead, the needle is withdrawn. No sutures or glue should be needed to close the site.

Auricular acupuncture

Dry needling techniques may be used in auricular acupuncture. Alternatively, beads may be placed on acupuncture points by adhesive tape. These are left in place and manipulated by hand periodically.

INTEGRATING CHINESE HERBAL MEDICINE INTO MODERN VETERINARY PRACTICE

Many feel that traditional Chinese herbal medicine is a pure art. That is, you must have a Traditional Chinese Medicine diagnosis to properly select an herbal formula or proper acupuncture points. In Western medicine, people with a sore throat due to overgrowth of *Streptococcus* bacteria are given amoxicillin for 10 days. It does not matter if one person has a fever and sore throat and another has swollen lymph nodes and a sore throat. The therapeutic regimen is the same for both. The Chinese treated symptoms rather than etiology. In TCM, both may be diagnosed as having Fire in the throat (redness). However, the doctor for the second patient may say that the Heat has boiled away body fluids, leaving masses of thick phlegm (enlarged lymph nodes). These two patients would receive different herbal prescriptions.

In addition, a single patient may receive different prescriptions depending upon the stage of the disease. With influenza, the patient initially experiences fever, muscle and body aches, and sweating. These symptoms later recede, leaving a patient tired and pale, sometimes for weeks, depending upon her constitution. A doctor trained in TCM would treat the patient for an excess condition initially, then a deficiency condition later in the course of disease. A Western-trained physician does not change antibiotics for a patient with a streptococcal sore throat after the fever subsides. The course of antibiotics is finished in the prescribed time period.

As we accumulate knowledge we find that we can combine the two modalities. Ancient Chinese doctors used the only tools available to them at that point in history—the 4-point diagnosis. This consisted of asking, observing, hearing and smelling, and palpating. Asking is

basically the equivalent of anamnesis. Observing involved looking at the person's overall appearance. This would included an assessment of a person's color—pale, flushed, or normal? Are the eyes bright or dull? Is the posture upright or hunched? Is there a limp? Hearing was used to detect unusual breath or heart sounds. Palpating is similar to our understanding of the word. Masses were palpated and musculoskeletal structures examined.

The ancient Chinese took this concept further when feeling the pulse. There is a whole school of study on pulse diagnostics. Pulses were palpated not only to assess the state of the cardiovascular system as they are today, but to give information about the entire body. The Chinese recognized 28 separate pulse qualities using terms such as wiry, choppy, full, scattered, and such.²

By contrast, today we are blessed with incredible diagnostic power. We can literally see into the body using ultrasound waves, X-rays, and magnetic resonance. Simple blood tests tell us about the chemical state of the body. Immunology tests such as fluorescent antibody and enzyme-linked immunofluorescence assays tell us about exposure to pathogens. Using cultures, we can grow pathogens in the laboratory. It does not make sense to ignore all the information we can glean from these modern modalities when treating a person or animal with herbs and acupuncture. The ancient Chinese masters would certainly have used any method at their disposal to cure their patients, just as we are bound to do professionally.

One must be open-minded and critical to incorporate herbal medicine and acupuncture into Western practice. We must be able to judge whether patients respond to a treatment or not, not stubbornly remain attached to what we were told in school. Neither Western nor Eastern medicine can cure all ills, but using them wisely improves the quality of care our patients receive.

Purists have stated that in order to use herbs and acupuncture, a doctor must be able to make a TCM diagnosis. However, it is illogical to say that one cannot apply Chinese herbal medicine to a Western diagnosis. Both a doctor trained in TCM and another trained in Western medicine can treat a given patient, despite using different terms to describe the patient's state of health. The patient can be given a modern drug by one doctor or a traditional herbal preparation by the other and improve either way. Given this, why can one not use herbal medicines with a Western diagnosis? It merely requires that individuals trained in both modalities guide the process and make it understandable to both schools of thought.

There has been some apprehension expressed about long-term use of herbal supplements. This is an interesting concern because many people in this country are on chronic medications for arthritis, high blood pressure, high cholesterol, and so on. Many women remain on birth

control pills for 15 years or more. When properly balanced, herbal supplements are safe and effective. This is the idea behind using combinations rather than single herbs in traditional Chinese practice.

Recent research has begun to assign Western indications to herbs. Not surprisingly, the Western and Eastern indications tend to match. In TCM, ginseng (ren shen) is used for "wasting and thirsting disorder," which is a syndrome of polydipsia and weight loss. In Western medicine we find that it improves clinical signs and lowers blood glucose levels (Chavez 2001). It is also known to benefit Heart Qi in TCM. Modern research has demonstrated that it has inotropic effects similar to cardiac glycosides in dogs, cats, and rabbits (CA, 1992). It is indicated for calming the spirit and palpitations with anxiety due to Qi and Blood deficiency (Bensky 2004). It is clear that although the terminology differs between the two modalities, both describe the same effect upon the body.

Purists may also state that a patient must be treated with herbal supplements or Western medications. They worry about interactions between the herbs and the drugs. These interactions can and do occur, of course. But we must also admit that interactions, both beneficial and detrimental, occur between various drug classes in Western medication. We have all been warned against combining corticosteroids and nonsteroidal anti-inflammatories. We often augment the action of one antibiotic by combining it with another, i.e. enrofloxacin with amoxicillin/clavulanic acid. When combining herbs with drugs, the same relationships occur. Occasionally there may be counteraction, i.e. it is not wise to combine St. John's wort with warfarin because this may increase the chance of bleeding (Yue 2000). However, in general, interactions between herbs and Western drugs are much less severe than interactions between two Western medications.

Combining the 2 modalities may expand therapeutic options. Take borreliosis, for example. It is common medical practice to treat seropositive dogs with clinical signs compatible with Lyme disease with antibiotics. These can be combined effectively with herbal supplements to protect joints and minimize the formation of arthritis. Veterinary oncologists who have treated patients on herbal supplements have been pleasantly surprised to see that these patients have much less severe neutropenia than animals not given herbs. This allows the oncologists to give the full dose of chemotherapy at the prescribed intervals and improves the efficacy of the chemotherapy. To restrict oneself to one modality is to miss the opportunity to improve the life of one's patient.

The final stumbling block for acceptance by "modern" practitioners is the often mentioned lack of scientific studies concerning herbs. Throughout this book, refer-

ences are cited to demonstrate the use of herbs for each specific condition.

Traditionally, professional journals have been reluctant to publish articles about herbs, preferring a more progressive image. Just recently have veterinarians who use herbs been given columns in professional journals. *Veterinary Forum*, the *Journal of the American Veterinary Medical Association*, and *Veterinary Practice News* have published articles concerning herbal medicine and acupuncture.

There are now entire publications directed toward practitioners that carry studies about herbal and homeopathic medicine and acupuncture. For example, *Alternative Therapies in Health and Medicine* is a peer-reviewed journal that has been available at the National Library of Medicine since 1996. Books devoted to acupuncture and herbal medicine are being published in record numbers. Universities and governmental agencies are beginning to conduct research into the use and abuse of herbs. With this increase in research comes a greater understanding of the efficacy and safety of herbal therapy.

Estimates vary according to the source, but between 11% and 80% of Americans take herbal supplements on a daily basis. For this reason alone, it is important for doctors to be familiar with herbs. Even if a physician is not prescribing the herbs, she is seeing patients that use them. Many people extend their use of herbs to animals. A veterinarian who is interested in providing optimal care for his patients has an obligation to become familiar with herbs. People will seek more herbal therapies as research demonstrates the efficacy of herbs and as more lawsuits are published highlighting the potentially serious side effects of Western medications.

Western medicine and herbal supplements should not be considered antagonistic modalities, but rather different sites along a spectrum of therapeutic options. They can and should be combined as needed to treat the patient in the most safe, efficacious, and cost-effective manner. Herbal therapies have become more popular as people find the positive effects of these supplements. As doctors and veterinarians become more familiar with the supplements, we will be able to use them along with Western medications to provide the safest, most comprehensive, and most efficacious therapy for our patients. Then we can truly fulfill our oath to protect animal health and relieve animal suffering.

Notes

1. Some clinicians disparaged Traditional Chinese Medicine because of the lack of specificity in assigning functions in the body to the proper organ. This occurred because it was not considered proper to perform autopsies in ancient Chinese culture. For this reason, it was difficult to assign a function to a particular organ. However, despite the dearth of information gleaned from autopsies, the ancient Chinese physicians did fairly well assigning various functions to the organs. They correctly surmised that the heart was related to circulation and the stomach and intestines to digestion. They did, however, assign various functions to organs that we now know are incorrect. For example, the spleen was believed to play a major role in digestion. We have

discovered that the pancreas and liver are responsible for the digestive roles the Chinese assigned the spleen. This does not, however, render Traditional Chinese Medicine incorrect. We merely need to change our vocabulary somewhat and we can recognize the inherent consistency in their theories. Perhaps when one substitutes liver/pancreas in one's

mind when reading the Chinese concept of spleen, it will make the theory more palatable to those of us trained in modern medicine.

2. It is not possible to become proficient in pulse diagnosis by reading books. The interested reader is referred to courses listed in the appendix for further information.

Chapter Four

Homotoxicology—The Modern Approach to Homeopathy

THE GENESIS OF HOMOTOXICOLOGY: DR. HANS-HEINRICH RECKEWEG'S DREAMS BECOME REALITY

Hans-Heinrich Reckeweg was born in 1905 and became a physician in pre-war Germany. At 18 years of age and following the cure of his father's degenerative kidney condition by homeopathy, Reckeweg declared that he would meld the disciplines of allopathic medicine and homeopathy. As a young medical practitioner, well schooled in the discipline of homeopathy, he noted patterns of disease and therapy emerging. Dr. Reckeweg combined frequently used remedies based upon symptom pictures, and developed an extensive formulae geared at modern scientific Western medical diagnoses.

Seeking to meld the gentler healing potential of homeopathic medicines with the diagnostic capabilities of Western medicine, Dr. Reckeweg spent his life in the pursuit of uniting the unexplained but often very successful art of homeopathy with the science and technology of allopathic medicine. In doing so, he engaged the known principles of both disciplines in a truly brilliant scheme for tracing the ebb and flow of biological systems.

He borrowed freely from the work of Hans Eppinger (1879–1946) and Alfred Pischinger (1899–1983) who were convinced that the body's health was vastly dependent upon the workings of the connective tissue. This opinion was in contrast to the more popular theories of Rudolf Virchow (1821–1902), a contemporary whose theories were based on cellular changes, and though scientific in its observations, were based on the static "photograph" of images seen transfixed on a microscope slide. Virchow's cell theory was the path upon which medical research and theory progressed. However, the fascinating, ever-changing life of the connective tissue ground substance, which constitutes the majority of body tissues, was incorrectly reduced to the importance of a mere sponge or sieve, with no bearing on the health of the organism.

Reckeweg recognized the importance of the intracellular space and developed therapies to affect its actions. As veterinary medicine moves into the next phase of integration, it will become readily evident that we must consider and make use of knowledge involving both the cell and the matrix surrounding it.

Dr. Hartmut Heine of the Institute of Antihomotoxic Medicine and Ground Regulation Research in Baden-Baden, Germany, continues the work of Eppinger and Pischinger today. Regulatory medicine seeks to understand complex metabolic interrelationships and enzymatic systems. The ultimate purpose of this effort is to bring about healing through attempts to gently shift the organism's own biological balance back toward homeostatic optimums through the use of Reckeweg's complex, biologically friendly formulas.

The resulting field known as homotoxicology is that branch of medicine which seeks to identify the toxins in the body, and then aid the organism's natural defense mechanisms in mobilizing the homotoxins, thereby rendering the fluids, intercellular spaces, and cells free of toxic debris. This chapter offers an introduction to this new field.

INTRODUCTION

Homotoxicology is the study of agents toxic or destructive to biological systems, and the organism's biological response to those toxins in the manifestation of disease and pathologic processes. Originally coined by its founder, German physician Hans-Heinrich Reckeweg, the term homotoxicology originates from "Homo sapiens" and "toxicology."

Dr. Reckeweg studied these reactions, made fundamental observations, and developed therapeutic formulas which gently stimulate the natural defense mechanism of mammalian systems toward healing (Homeopathia 2006). Originally designed for humans, homotoxicology has clinically shown promise in many mammalian species and

is being used in veterinary practices around the world. (Heel 2005; Reinhart, Broadfoot, Hanover 2005). Reckeweg was a man of science, trained in conventional, scientific medicine. His primary concern was the rapid and complete resolution of his patient's healthcare issues. Reckeweg's homeopathic training and his clinical familiarity made him acutely aware of the often-miraculous results inherent in the field of low-dose therapy. He reasoned that since both methods of treatment yielded improvement in a patient's health, there must be some connection in the broader field of biology, which, when used, would permit a better understanding of healing processes and pathologies. Homotoxicology evolved from this strong intention to unite fields of healing, and has proven to be a very helpful modality in both human and veterinary clinical practice.

In this chapter the reader will be introduced to the subject of homotoxicology, become familiar with a brief history of the science, learn the terms and fundamental concepts necessary to understand and practice homotoxicology in a clinical setting, and gain an initial understanding of low-dose pharmacology and homeopathy. Scientific evidence supporting this modality is contained at the chapter's end. Many veterinarians will quickly recognize and find attractive the fact that homotoxicology aligns nicely with other subjects studied on the path to becoming an effective veterinary practitioner, a fact that supports the validity of homotoxicology theories. Terminology is minimal and aligns with other biological and physical sciences.

The general field of medicine grew out of our mutual desire to help others recover from illness and ultimately live longer, more successful lives. Medicine is a rapidly expanding field, and the advent of a technology which gently stimulates the natural processes of a patient in his path to survival, allows for less invasive forms of treatment, and reduces the toxic side effects of other medical modalities should be readily welcomed.

The main barrier to learning this subject, like any other specialty, is in the definition of words and understanding the concepts that make homotoxicology cohesive with the entire fields of biology, chemistry, and physics. Because this is a rapidly developing field, this is a most exciting time to become involved. It is the author's sincere intent to assist the veterinary practitioner in becoming familiar and competent in the application of biological therapies in clinical practice. This text should not be considered an end to inquiry into the subject of homotoxicology. Interested students should pursue the subject further and will find that as their understanding increases, so will their clinical outcomes improve. As with all medical modalities, the science and technology combine with astute clinical skills to make this a most useful healing art in the hands of one properly trained.

TERMINOLOGY OF HOMOTOXICOLOGY

Every subject has its special terminology. Studies have shown that a major barrier to learning lies in misunderstanding the definitions of words (Hubbard 1992). A student should make a particular effort to duplicate correctly the basic words of any new subject. Because homotoxicology integrates and unites other fields of scientific study, it contains many specialized terms. Most of these terms are identical to the allied field's usage. Fortunately for the student, there are only a few very simple and basic terms and concepts necessary to begin study and practice in homotoxicology.

In studying these terms, keep in mind that homotoxicology is the examination of the relationship of toxins to disease manifestations, and views those disease manifestations as healing. Disease is the body's effort to recover. Biological therapy works with this natural flow of processes to assist the organism's goal of recovery and improvement of its homeostatic condition. When properly managed, pathology is the organism's friend. This concept will become much clearer as the student progresses in his or her study. Reckeweg (2000) defined this first tenet of homotoxicology as:

"According to homotoxicology all of those processes, syndromes, and manifestations, which we designate as diseases, are the expression, thereof that the body is combating poisons and that it wants to neutralize and excrete these poisons. The body either wins or loses the fight thereby. Those processes, which we designate as diseases, are always biological, that is natural teleological processes, which serve poison defense and detoxification."

NOTE: This is the principle or theory from which all of homotoxicology proceeds. It is the center point of biological therapy.

In examining this tenet we can easily see that there are toxic substances. Reckeweg (2000) called these **homotoxins**, from "Homo sapiens" and "toxin." Homotoxins are properly defined as "all those substances (chemical/biochemical) and non-material influences (physical, psychical) which can cause ill health in humans. Their appearance results in regulation disorders in the organism. Every illness is due therefore to the effects of homotoxins. Homotoxins can be introduced from exterior (exogenic homotoxins) or originate in the body itself (endogenic homotoxins)."

By convention, veterinary homotoxicologists have adopted this term to apply to animals as well. Clinical observation has shown that the concept is applicable in diverse species, including mammals, reptiles, and birds, and while the remedies or specific formulas needed by a particular species may vary, the concept is still quite appropriate. While some veterinarians may be tempted to

coin terms such as “canitoxin,” “felitoxin,” “equitoxin,” “bovitoxin,” or the broader term “zootoxin” in an attempt to differentiate veterinary homotoxicology from its human field, at this time we do not commonly distinguish verbally between toxins damaging to humans or other species. All such substances are currently simply called homotoxins by convention.

In this definition of a homotoxin we perceive the broad scope contained within homotoxicology and we can begin to see why it has such a powerful unifying effect on the subjects upon which it interacts. When we study the interaction of homotoxins upon organisms, we literally are considering all the data concerning disease, all of data regarding pathology, and all of physiology and psychology involved as well. Homotoxicology becomes the center spoke in the wheel of medicine, at once involving and aligning other fields of healing. For this alone Reckeweg deserves great accolade.

Homotoxins can originate from the environment; these exogenic or **exogenous homotoxins** can harm the body and lead to pathologic response. As an example, if air quality is poor, then the body must react to the noxious stimuli. One physiologic reaction is to secrete more tears and mucus to flush the toxic components away and buffer the extreme pH caused by air pollutants. The disease symptom of epiphora is actually the body’s attempt to handle the noxious stimuli by elimination and dilution, and thereby regain homeostasis. The body handles these exogenic homotoxins by dilution, excretion, conjugation, and sequestration. Tears physically wash material away, dilute the toxins to lower dilutions, interact with the toxic material chemically through enzymes, and adjust the pH of the resultant area to reduce injury to local tissues. Conventional medicine terms this as irritant conjunctivitis, a quite accurate description. In all three spheres of life, the organism’s physiology, conventional Western medical thinking, and homotoxicology, successful treatment begins by removing the organism from the noxious material. If the exposure to the toxin continues, or if the concentration is too high, then more severe damage can ensue and the organism must recruit other methods of handling the situation in its attempt to maintain homeostasis.

Because chemical and physical laws apply to the organism’s body, we readily observe that chemical toxins introduced into the system must remain within the system, be altered, or be excreted. These chemical agents can react further with other chemicals within the body and generate new compounds that may be useful or harmful to the organism in its attempt to maintain homeostasis. A practical example of this is heavy metal poisoning in which the toxic metal combines with bodily proteins and alters their function, leading to decreased viability. The body’s particular handling of these agents gives us vast fields of

biochemistry, pharmacology, enzymology, and toxicology, to name but a few.

It is important to note that homotoxins are NOT necessarily just chemical poisons. Factually, there are many things that can negatively affect living systems. Anything in excess can become a homotoxin. Take, for example, excess carbohydrates in the diet, which are processed into glucose and used for available energy needs. If biological energy needs are satisfied, then the excess glucose is converted and stored as fatty tissue in adipocytes. These adipocytes require circulatory exchange and energy to continue to function. As fatty tissue accumulates, the organism must supply blood to the area. This takes energy away from the body and is part of the reason why obese patients have less energy and feel tired. In felines, we know that continual exposure of the pancreatic tissue to excess glucose leads to secretion of amyloid and deposition of this material eventually is part of the onset of diabetes mellitus. Excess quantities of glucose in the diet can lead to disease states, and for those interested in disease pathology, that means that seemingly nontoxic items can be homotoxins and contribute to the development of disease.

Radiation and other forms of energetic injury can occur exogenously. These homotoxins lead to coagulation of proteins, DNA alteration, and subsequent loss of structural elements and cellular function, which leads to a decline in organismal integrity. Homeostasis is interrupted and negatively affected by these agents.

Homotoxins originating from within the organism are termed endogenic, or **endogenous homotoxins**. There are many examples of such homotoxins. One metabolic byproduct, ammonia, which results from the metabolism of protein, is a reactive and damaging compound. Raising ammonia levels only slightly leads rapidly to altered central nervous system activity. The body has developed a pathway to reduce the levels of toxic ammonia to maintain proper balance. This system, well known by physiology students, takes place in the hepatocyte, and involves a very powerful but simple biological process whereby enzymes take two toxic ammonia molecules and combine them into a less toxic molecule of urea (Figure 4.1) (Wikipedia 2006).

The resultant urea molecule can be excreted or used in metabolic processes, most notably the conservation of water by the renal medulla (Figure 4.2) ((Nicholson 2002). The nontoxic substance which results from the conjugation of homotoxins is called a **homotoxone**. In this example the homotoxin (ammonia) is conjugated into the homotoxone (urea).

Free radicals are another category of endogenous homotoxin. Free radicals are essential components of cellular metabolism, but if they accumulate to levels in excess of the body’s compensatory mechanisms, then cellular

Figure 4.1. In the hepatocyte, toxic ammonia molecules (homotoxins) are combined through enzymatic action to yield nontoxic urea (homotoxone), which is useful for maintaining water balance and can be excreted easily by the kidney. (Modified from Wikipedia courtesy of Alyx MacKenzie.)

injury can result. This appears to be a strong component in the aging sequence. Free radicals can cause direct oxidative damage and alter other molecules and allow for new reactive compounds to be produced. These steps are part of disease pathogenesis (Harman 1998).

On a slightly more abstract level, psychological stress, such as self-created worry, fear, or frustration, can promote tissue damage. It can become a philosophical exercise to determine whether these are actually intrinsic or exogenous homotoxins. One may argue the point either way regarding whether such emotional states are exogenic or intrinsic, but for the purpose of this discussion, it is unnecessary to make this distinction. The more important point is that these stressful states contribute to disease (Kendall 1998). Besides just creating altered circulation patterns, such emotional distress can result in altered nutritional requirements, allow for toxic compounds to accumulate, and alter energy metabolism.

Veterinarians are familiar with protracted states of anxiety or stress leading to increased cortisol levels and a corresponding increase in the frequency of infections and gastric ulcers. In human patients, there is evidence that many emotional states, particularly excessive fear, grief, anger, or worry, can generate specific particles, which act negatively on the organism. (Birnbaum, et al. 2004) As veterinarians, we do not usually deal directly with these psychological issues, but we are well informed about the negative effects of stress on the health of our livestock and pets. Some agents produced by the body in stressful conditions are directly harmful, such as excess hormonal secretion of epinephrine, insulin, and cortisone, while other mechanisms involved in chronically negative emotional states lead to altered mucosal function, diminished circulation, and decreased immune status, and subsequently lead to an increased potentiality for disease to manifest in a patient's overall condition.

Modern human and veterinary medicine are only beginning to scratch the surface of these complex and very important factors in the pathogenesis of disease conditions in living organisms. Oriental medical doctors have long seen a relationship between excessive or prolonged emotional states and specific organ disease. The following emotional relationships are commonly discussed in Oriental medicine: Anger affects liver and gallbladder, joy and love affect heart, worry affects lungs and spleen, pensiveness affects spleen, sadness and grief affect lungs, fear affects kidneys, shock affects kidneys and heart, hatred affects heart and liver, craving affects heart, and guilt affects kidneys and heart (Maciocia 1994). Homotoxicologists view these as biological states, which allow for homotoxin accumulation with resulting damage to the biological system, and corresponding tissue compromise.

It is fascinating to note the improved mental status of patients undergoing detoxification and organ-building therapies in homotoxicology. Patients frequently look brighter and act happier in relatively short periods of time. In one study, 78% of human patients older than 65 and suffering from a wide variety of ailments were found to feel better after just 30 days of treatment with 1 homotoxicology remedy called Galium Heel (Weiser, Gottwald 2000). With the aforementioned information in mind, we can now continue with the discussion of basic terminology and concepts.

In chronic conditions, homotoxins can become deposited with endogenous substances, which cannot be eliminated via normal excretion pathways or through irritation/inflammation. These residual toxins are known as **retoxins** (Reckeweg 2000). Reckeweg coined this term because a significant disease can persist or recur as a result of these agents. A commonly seen retoxin is represented in the nonenzymatic glucosylation of tissues and cell membranes in cases of glucose excess in poorly controlled diabetes mellitus. This

DEAMINATION OF AMINO ACIDS - THE UREA CYCLE

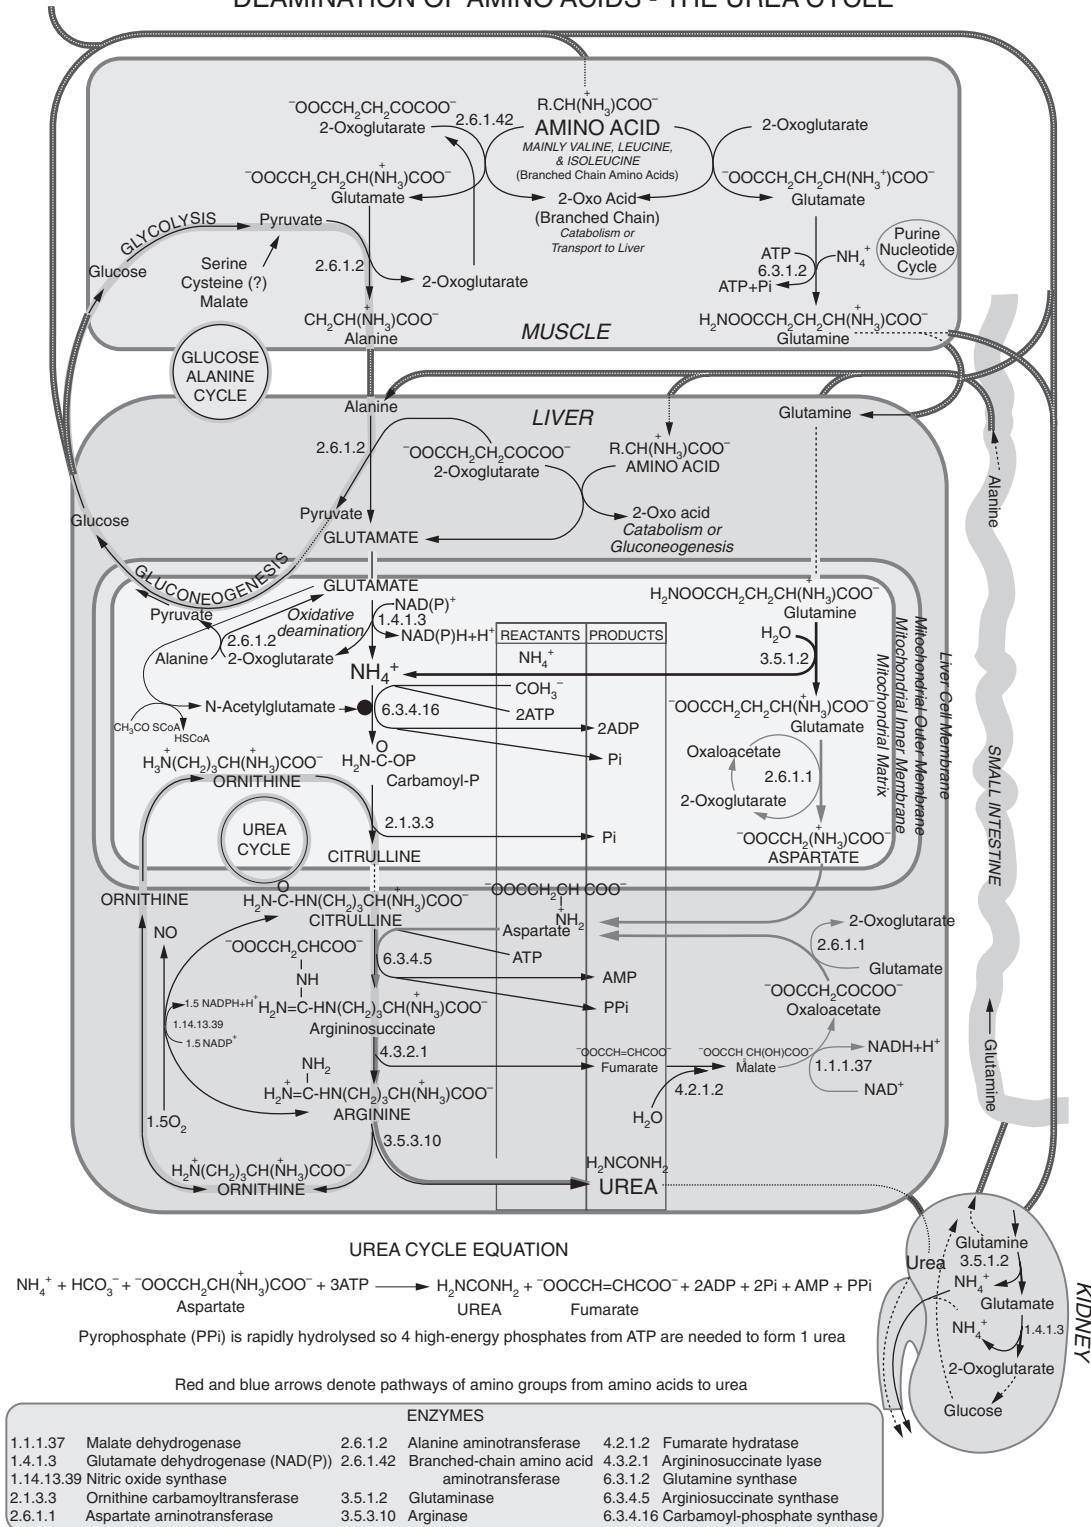

Figure 4.2. Deamination of amino acids leads to toxic ammonia formation. Multiple organ systems reduce this toxic material and excrete it as part of the basic metabolic process. Mitochondria are a major contributor to this important cellular function. (Image used courtesy of IUBMB, all rights reserved.)

glucosilization leads to cellular components that are less flexible and less available to perform their duties. This further leads to progression and worsening of the organic pathology manifested by the patient.

Homotoxicosis is the concept of disease according to homotoxicologists. This is defined by Reckeweg (2000) as “A non-physiological condition which arises after reaction of a homotoxin on cells and tissues. A homotoxicosis occurs as a humeral or cellular appearance and can be followed by morphological changes on tissues. The homotoxicosis leads to defensive measures of the organism whose goal is to eliminate the homotoxins and to restore the physiological conditions when possible.”

A homotoxicologist is concerned with both the patient’s medical diagnosis and the historical progression of disease signs. These relate to the state of homotoxicosis in a particular case. The medical diagnosis determines which remedies are selected, but the case progression and disease history allow the clinician to determine if a homotoxicosis is worsening or improving. From this information, the homotoxicologist works to alter the state of homotoxicosis present in the particular patient.

This dynamic process of monitoring disease patterns to properly prescribe for a patient requires a frame of reference, and in homotoxicology that reference is called “phase theory.” Reckeweg noted that homotoxicoses have chronological progressions and present the practitioner with varied clinical symptoms dependent upon the response of the “ground regulation” of the organism’s defense system. Ground regulation simply refers to the local regulation processes as well as the responses coordinated within the neurological, endocrine, humeral, and cellular immune responses. The so-called ground substance is monitored by the fibrocyte, and consists of proteoglycans and glycosaminoglycans as well as the structural and messaging glycoproteins. This connective tissue is also referred to as the “matrix.”

The Six-Phase Table of Homotoxicology

The response by the ground system results in a disease pattern indicative of the degree of penetration and damage done to the body by homotoxins. These responses are divided into 6 phases of activity (Figure 4.3) (Reckeweg 2000b):

- Phase 1—Excretion Phase
- Phase 2—Inflammation/Reaction Phase
- Phase 3—Deposition Phase
- Phase 4—Impregnation Phase
- Phase 5—Degeneration Phase
- Phase 6—Dedifferentiation Phase

The final basic concept of homotoxicology is the idea of vicariation, which can be progressive or regressive.

It is critical to our understanding that we see these phases as the natural progression of illness under specific sets of circumstances and the influences of toxins, both exogenous and endogenous. As we begin to recognize the ebb and flow of body defense mechanisms, we can begin to enlist these systems to the benefit of our patients by providing guidance to the regulatory reactions with natural, gentle stimulatory biotherapeutics.

The Six-Phase Table of Homotoxicology is both a conceptual and clinical tool. As students first approach the field of homotoxicology, they are directed to the conceptual tools contained therein. The Six-Phase Table maps disease pathologies resulting from exposure to homotoxins. As homotoxins approach the body, they act on specific tissues and the body responds in specific ways. The resulting signs, symptoms, and pathologies create a recognizable homotoxicosis. The first phases of a homotoxicosis take place in the humeral system and are less dangerous to the survival goals of the organism.

In Phase 1, the Excretion Phase, the body attempts to excrete the homotoxin by the action of various glandular elements. Saliva, tears, sebum, mucus, and sweat all lead to increased flow of material out of the body. Exposure of the body to cigarette smoke, and the homotoxins contained therein, provide a practical example of this principle. The eye and nose respond by secreting more tears and slightly more mucus. Such responses simply wash the area clean of homotoxins. This natural method of removal of homotoxins is extremely important to the maintenance of health in the organism. Generally speaking, such reactions should not be inhibited, and certain agents which decrease secretion of tears and body fluids make the body more susceptible to side effects caused by the body’s inability to properly clean itself. An example is increased gum disease seen in psychiatric patients placed on certain medications known to cause xerostomia. Inhibition of salivation leads to increased dental calculus deposition and worsening of periodontal disease.

If the body fails to properly excrete a homotoxin, or if the homotoxin penetrates past the epithelial barrier, then the bioregulatory defense mechanisms can trigger the inflammatory cascade in the continued attempt to remove the homotoxin through Phase 2, the Inflammation/Reaction Phase. In this phase, through the inflammatory cascade, humeral and cell-mediated responses serve to remove homotoxins through the actions of antibodies, cellular responses, phagocytosis, proteolytic enzymes, and increased blood flow to the affected area. Inflammatory exudates move to the surfaces of epithelial surfaces and are eventually excreted to the outside or absorbed by the bloodstream and processed by the lymphoreticular system. These immune system components exist to detoxify inflammatory material and remove it from the body, while simultaneously obtaining vital biological

SIX-PHASE TABLE

Organ system	HUMORAL PHASES			MATRIX PHASES			CELLULAR PHASES		
	Excretion Phases	Inflammation Phases	Deposition Phases	BIOLOGICAL DIVISION			Impregnation Phases	Degeneration Phases	De-differentiation Phases
Skin	Episodes of sweating	Acne	Naevi				Allergy	Scleroderma	Melanoma
Nervous system	Difficulty concentrating	Meningitis	Cerebroclerosis				Migraine	Alzheimer's disease	Glioma
Sensory System	Tears, otorrhea	Conjunctivitis, otitis media	Chalazion, cholesteatoma				Iridocyclitis, tinnitus	Macular degeneration, anosmia	Anaerobic, malignant tumor
Locomotor System	Joint pains	Epicondylitis	Exostosis				Chronic rheumatoid arthritis	Spondylosis	Sarcoma, chondroma
Respiratory Tract	Cough, expectoration	Bronchitis, acute	Silicosis, smoker's lung				Chronic (obstructive) bronchitis	Bronchiectasia, emphysema	Bronchial carcinoma
Cardiovascular System	Functional heart complaint	Endocarditis, pericarditis, myocarditis	Coronary heart disease				Heart failure	Myocardial infarction	Endothelioma
Gastrointestinal System	Heartburn	Gastroenteritis, gastritis	Hyperplastic gastritis				Chronic gastritis, malabsorption	Atrophic gastritis, liver cirrhosis	Stomach cancer, colon cancer
Urogenital System	Polyuria	Urinary tract infection	Bladder stones, kidney stones				Chronic urinary tract infection	Renal atrophy	Cancer
Blood	Reticulocytosis	Leucocytosis, suppuration	Polycythemia, thrombocytosis				Aggregation disturbance	Anemia, thrombocytopenia	Leukemia
Lymph System	Lymphedema	Lymphangitis, tonsillitis, lymphadenitis	Lymph-node swelling				Insufficiency of the lymph system	Fibrosis	Lymphoma, Hodgkin-/non-Hodgkin-lymphoma
Metabolism	Electrolyte shift	Lipid metabolism disturbance	Gout, obesity				Metabolic syndrome	Diabetes mellitus	Slow reactions
Hormone System	Globus sensation	Thyroiditis	Goitre, adenoma				Hyperthyroidism, glucose intolerance	Menopausal symptoms	Thyroid cancer
Immune System	Susceptibility to infection	Weak immune system, acute infection	Weak reactions				Autoimmune disease, immunodeficiency, chronic infections	AIDS	Slow reactions
	Alteration*	Reaction*	Fixation*				Chronic Forms*	Deficits*	Decoupling*
Psyche	Functional psychological disturbance, "nervousness"	Reactive depressive syndromes, hyperkinetic syndrome	Psychosomatic manifestation, neuroses, phobias, neurotic depression				Endogenous depression, psychosis, anxiety neurosis, organic psychosyndrome	Schizophrenic defective states, mental deficiency	Mania, catatonia

The six-phase table is a field matrix reflecting medical experience based on careful observation and empirical learning. It is a phase-by-phase arrangement of disorders with no direct relationship between them. No causal pathogenetic link between disorders can be inferred. The structure of the table makes it suitable for developing a prediction system giving a better assessment of the possibilities for a vicariation effect.

* Phase nomenclature in psychology.

Figure 4.3. As homotoxins accumulate, the greater host defenses of the body respond in an attempt to remove or reduce their damaging nature. These responses can be placed on a descriptive table, which aids clinicians in understanding a particular patient's pathology. Understanding the phase of disease assists clinicians in selecting specific therapy and predicting patient response as well. (© Biologische Heilmittel Heel GmbH, all rights reserved. Table 4.1. Selected Phase 2 (Inflammation Phase) disorders.

Acne	Cellulitis	Eczema	Otitis	Ranula
Arthritis	Meningitis	Endocarditis	Gastritis	Subluxation
Blepharitis	Cholangitis	Fistula	Polyarthritis	Ulcers
Bronchitis	Dermatitis	Folliculitis	Pyometra	Wounds

Table 4.2. Selected Phase 3 (Deposition Phase) disorders.

Adiposis	Bacterial Overgrowth	Cholesterol Elevations	Fibroma	Hypertension
Arthritis	Chalazion	Constipation	Hematoma	Flatulence
Ascites	Cysts	Exostosis	Helminthiasis	Ostealgia

information necessary for the protection of the body's form and function. Table 4.1 demonstrates the wide variety of pathologies represented by the Inflammatory Phase.

Inflammation literally “burns” certain homotoxins, through enzymatic action, much the same way that a homeowner might burn leaves which have accumulated on his property in the winter. Realize that homotoxins are chemicals and are guided by chemical laws. Once they exist in the body they cannot simply disappear. The body's defense mechanisms must expend energy to excrete, transform, isolate, or neutralize the homotoxin before it does further damage to the body. Inflammation is a major process for the destruction and elimination of homotoxins.

There are many fascinating aspects to the inflammatory reactions of the body. The science of inflammation has advanced tremendously in recent years, and this chapter contains a more in-depth view of inflammation and its relationship to healing in a latter section. Modern veterinary medicine has a mixed relationship with inflammation: On one hand, understanding that inflammation is necessary for proper immune function, and on the other hand, battling and suppressing the signs of inflammation by blocking essential enzyme systems, the result of which can result in devastatingly serious side effects. One example is the recent withdrawal of several prominent nonsteroidal anti-inflammatory drugs in the human medical field. Inflammation has been found to be absolutely necessary in disease recovery and it should not be interfered with unless no other options are available.

In many chronic disease states, the first major sign of true healing is activation of rather remarkable inflammatory signs. Patients may experience reddened eyes, mucus discharges, coughing, vomiting or diarrhea, and skin irritation as they begin to heal. The biological therapist, being properly informed about the importance of inflammation, welcomes these reactions because they signal healing. Fortunately, as we shall see later in this chapter,

homotoxicology contains several novel methods of dealing with inflammation, which do not require suppression and enzyme blockages to occur. In many cases, biological therapy can actually speed up the completion of the inflammatory reaction and so resolve the condition rather than simply suppress it.

The third phase is the Deposition Phase, in which the body experiences the effects of toxins depositing deeper into the tissue matrix. The homotoxins enter the matrix and the alterations seen, such as pigmentation, are the result of this infiltration. The excretory mechanisms of the body are overwhelmed and the homotoxin gains access to deeper portions of the tissue. Many disorders that occur in the Deposition Phase are not obvious, because the body compensates sufficiently that the biological reaction is not obvious to either patient or doctor. This phase is particularly difficult due to the occult nature of many of these changes. Table 4.2 shows some commonly encountered Deposition Phase disorders.

The **biological division or biological divide** is an imaginary, conceptual notion of a demarcation, which when crossed over, consists of sufficient damage that the organism is unlikely to recover when left to its own mechanisms. It is a biological point of no return. This imaginary line occurs at the precise moment when the homotoxins make the transition from simply residing in the connective tissue matrix to actually destroying its structure and function. To the right of the biological divide, homotoxicoses have resulted in severe damage and alteration, resulting in dysfunction and predilection to pathological processes. The biological division occurs midway in the matrix phases between the Deposition Phase and the next phase of disease.

If the homotoxins are not handled in Phase 3, or if the insult is severe enough to result in deeper damage, then their deposition and accumulation results in Phase 4, the Impregnation Phase disease. This is the final disease in the matrix phases and is to the right of the biological divide. The name of this phase describes the exact nature of the

Table 4.3. Selected Phase 4 (Impregnation Phase) disorders.

Diabetes mellitus	Inflammatory bowel disease	Heavy metal poisoning	Chronic hepatitis	Myasthenia gravis
Dyspnea Emaciation	Neuralgia Colic	Nephrosis Ostealgia	Polyneuritis Snake bite	Asthma Viruses

disorder as homotoxins enter the tissue matrix and are incorporated into the connective tissue, thus compromising its functionality by loss of structural and functional elements such as collagen and enzymes. The progressive worsening of symptoms in this phase results from the alteration in structure and function caused by the homotoxins, and the body's often failed attempts to eradicate them. Symptoms or signs of pain, discomfort, and fatigue frequently accompany these disease states. Allergies or viral infections are classic examples of Impregnation Phase diseases. Impregnation disorders tend to be chronic forms of diseases. Some other common diseases represented by this phase are included in Table 4.3.

The last 2 phases of the Six-Phase Table consist of cellular responses. In these phases the homotoxins enter the cellular sphere and compromise cellular function and structure. In the first phase of cellular disease we have Phase 5, or Degeneration Phase diseases. In this phase homotoxins cause more serious damage and even destruction of larger groups of cells in the tissue or organ. Severe compromise of the body's homeostatic systems leads to progressive, persistent disease. In some cases even these can be reversed through biological means, but in many instances the damage is too thorough for cure, and palliation of symptoms is often all that can be done.

With proper biological therapy and care not to exacerbate the homotoxicosis, such patients can often live long and very pleasant lives. However, all patients to the right of the biological division are prone to acute exacerbation and worsening from minor exposures to homotoxins. Drugs, food additives, environmental toxins or allergens, or even minor viral infections may cause a patient to worsen precipitously and move toward death. When handling these cases the therapist must be extremely careful not to increase the toxin load of the patient or compromise the immune system in any way.

The final phase is Phase 6, the Dedifferentiation Phase, which was formerly known as the Neoplastic Phase. The nomenclature was recently corrected to reflect the fact that not all cases in this phase develop clinical neoplasia. Dedifferentiation homotoxicoses result when homotoxins have penetrated the nucleus of the cell and have altered and damaged the cellular control and repair mechanisms, i.e. decoupling of the DNA strand, enzyme blockage, gene alteration, and gene blocking leading to an inability of

cellular repair. As oncogenes are activated and apoptosis is interrupted we see an increase in tumorigenesis (Bellavite, Signorini 2002).

Accumulated toxic material leads to a cytosol, which is not conducive to basic life processes. The cell, in an attempt to survive a bit longer in an acid environment deficient in oxygen, "de-evolves" and manifests more primitive metabolic pathways (Jordan, et al. 2002). These alterations in the cell population allow for prolonged survival of individual cells, but ultimately bring about a fatal stage of pathology. Even at this late phase, we see the organism creating a response intended to promote the isolation of homotoxins for the purpose of extending organismal survival. Examine the Six-Phase Table below and notice the relationships to clinical entities that are commonly presented to practicing veterinarians (Figure 4.4).

Vicariation, which considers the dynamic course of the patient's condition, is the final basic concept of homotoxicology. It was defined by Reckeweg (2000) as "The transition of the indicating signs of an illness within one phase to another organ system, or the change of the fundamental symptoms and signs into another phase, with or without a change of the organ system."

A veterinarian practicing homotoxicology is concerned with:

1. The homotoxins present
2. Their location
3. The level of penetration and damage to the organism
4. The response of the organism in terms of the phase represented by that response

Patients are found to progress either to the left or right of the Six-Phase Table in their disease patterns. Progression from left to right on the Six-Phase Table means that the homotoxins are doing further damage to the organism and its greater defenses are failing to reverse these effects (Reckeweg 1983).

The term **progressive vicariation** refers to this progression in the disease severity, wherein the patient's condition moves down and to the right of the Six-Phase Table. It means that therapy must be radically altered because the patient is moving closer to death. The desired effect of therapy is for a patient's signs and symptoms to move up and to the left of the Six-Phase Table of

Recovery and Self Healing ←				→ Chronic Disease		
Embryonic Tissue	Excretion Phase	Inflammation Phase	Deposition Phase	Impregnation Phase	Degeneration Phase	Dedifferentiation Phase
Ectodermal	Sebum, cerumen	Pyoderma, erythema	Keratosis, pigmentation	Chronic pigmentation	Dermatosis	Basal cell neoplasia, squamous cell tumor
1. Epidermal	Saliva	Stomatitis	Nasal polyps	Chronic stomatitis	Chronic atrophic rhinitis	Oral and nasal neoplasia
2. Orodermal	Neuro-hormones	Feline herpes dermatitis	Neuralgia, neuroma	Viral infection	Paresis, nerve atrophy	Neuroma
3. Neurodermal	Neuro-hormones	Feline herpes dermatitis	Neuralgia, neuroma	Viral infection	Paresis, nerve atrophy	Neuroma
4. Sympathico-dermal	GI secretion	Pharyngitis, enterocolitis	Constipation	Asthma, duodenal ulcers	Chronic bronchial disease, COPD	Cancer of stomach, small & lg intestines
Entodermal	Pancreatic secretions	Hepatitis, pneumonia	Gall stones	Chronic hepatitis, viral diseases	Liver cirrhosis, hyperthyroidism	Cancer liver, lung, gall bladder, pancreas
1. Mucodermal	Hyaluronic acid, GAGs	Abscess, deep pyoderma	Edema, adiposis	Influenza virus infection	Cachexia	Varrious fibrosarcomas
2. Organodermal	WBC production	Osteomyelitis	Exostoses	Osteomalacia	Spondylitis deformans	Osteosarcoma
3. Hemodermal	RBC, lymph production	Embolism, sepsis	Thrombus	Endocardiosis	Anemia	Leukemia, hemangiosarcoma
4. Lymphodermal	Antibodies, lymph	Tonsillitis	Swollen lymph nodes	Lymphatism	Lymphogranulomatosis	Lymphosarcoma
5. Cavodermal	Synovial fluid	Polyarthritis	Dropsy	Hydrocephalus	Coxarthrosis	Chondrosarcoma, synoviosarcoma
Mesenchymal	Urine	Nephritis, cystitis	Nephroliths, BPH	Hydronephrosis, albuminuria	Polycystic kidney disease	Renal carcinoma
1. Interstitiodermal	Serous secretions	Pericarditis, peritonitis	Ascites	Preliminary tumor phase	Tuberculosis of the serosa	Serous membrane neoplasia
2. Osteodermal	Ovary, sperm	Prostatitis	Ovarian cysts	Preliminary tumor phase	Sterility	Ovaries, testes, and uterine neoplasia
3. Hemodermal	Lactate	Myositis	Myogelosis	Myositis	Musc dystrophy	Myosarcoma
4. Lymphodermal						
5. Cavodermal						

Figure 4.4. Patterns of disease relationships and the development of pathological states; disease patterns, known as homotoxicoses, can be tracked as they progress or regress in severity using this table. GAG (glycoaminoglycan), WBC (white blood cell), RBC (red blood cell), BPH (benign prostatic hypertrophy), COPD (chronic obstructive pulmonary disease).

Homotoxicology; this movement to the left is termed **regressive vicariation** and is highly desirable. Regressive vicariation indicates that a patient's greater defense mechanisms are activating to remove or neutralize homotoxins. By using the Six-Phase Table of Homotoxicology while monitoring the patient's condition, the homotoxicologist can make therapeutic decisions.

As an example of the concept of vicariation, an aged, canine, pug patient is treated for pigmentary keratitis of both eyes. While supporting hepatic detoxification, the eyes suddenly become red and begin to discharge massive amounts of mucus. The dog feels better but continues to discharge mucus. Biologically, a homotoxicologist's approach to this case is to note that the pigmentation

indicates a Deposition Phase disease (Phase 3). Upon starting detoxification, the dog begins to have inflammation and excrete mucus copiously (Phase 2). A well-trained homotoxicologist recognizes this as a shift on the Six-Phase Table and records this as a regressive vicariation in the medical record. He advises the owner that this was critical to the pet's recovery and advises rechecking the case in a few weeks. On the recheck examination the doctor notes reduced pigmentation and reduced inflammation, and the Schirmer tear test reveals increased tear film. Also, closer examination demonstrates the mucus secretion has faded and now the dog is secreting more normal tears. These positive findings indicate healing in action. Therapy should be continued and monitored.

In a similar example, the owner fails to follow the instructions, becomes nervous, and seeks out a conventional veterinarian who prescribes suppressive cortisone eye drops. These reduced the symptom of pigmentation, but the dog later develops kerato-conjunctivitis sicca. This progression of the disease to a more serious and nonreversible disease is an example of progressive vicariation, and serves to demonstrate the importance of proper biological therapy whenever possible.

Understanding the aforementioned simple fundamentals and terminology allows for a nearly infinite number of approaches to a patient's treatment. For the student who spends time comprehending these basics, the application of biological therapy becomes as exciting as it is effective. It is rewarding to assist patients in their own efforts to recover. If, however, a student experiences confusion or difficulty at this point it is best to return to the beginning of this chapter and restudy, paying particular attention to the definition of words. The authors cannot emphasize enough how important these fundamentals are to becoming a successful homotoxicologist.

THE GREATER DEFENSE MECHANISMS

A complex treatise on the immune system is beyond the scope of this text. The authors assume a basic understanding obtained from training in professional schools when addressing basic sciences. Suffice it to say that the better a practitioner understands pathology, biochemistry, cytology, and immunology, the more she will appreciate the subtle workings of biological therapies. Fortunately, we do not have to become master immunologists to use homotoxicology, and in the future much will likely be discovered to explain the precise mechanisms of actions of many of these treatment formulas. It is useful, though, to have a basic understanding of the immune system, and particularly the ground regulation system, and its interactions with antihomotoxic medicines.

Each organism takes up a defined area of space and organizes it for the production of life activities. In the case of animals, these organisms take in physical chemicals and obtain energy through complex metabolic processes we call metabolism. Literally, every body is a mass of cells and control systems, which allow for chemicals (energy) to flow through the system and be organized as is necessary to maintain homeostasis. Hundreds of billions of reactions occur at any moment in a body at rest. Energy flows into the animal body as food and is converted and transported by a wide variety of mechanisms. Undesirable energy, commonly called waste products, must be eliminated. Disorders in energy production or transport negatively affect the ability of the organism to regulate itself. The very processes of life depend upon the organism's ability to maintain the appearance of a steady state in an

open energy system, which the laws of entropy constantly attempt to disorganize and disperse. This is the state of health available to an organism as it pursues its course of survival.

Biochemistry teaches us that organisms maintain their reactions at relatively low temperatures, and to do this they require the activity of catalysts called enzymes. These bioactive substances assist in forwarding chemical reactions at these low temperatures. Enzymes require assistance in terms of proper temperature, pH, and co-factors, and agents such as vitamins and minerals.

Most professionals are well versed in the cellular activities of life; however, many professionals know little about the activities that take place in the extracellular spaces of the body. The regulation of physiology in this area is what we are referring to when we talk about the ground regulation system. The extracellular space is filled with a wide variety of substances and acts as a sieve for materials leaving the circulatory system and progressing to the cell. It also contains waste products actively excreted by the cell, as well as through the process of osmosis. Structural proteins such as elastin and collagen provide form and support to a gel-like matrix composed of sugar protein complexes including proteoglycans and glycosaminoglycans. The latter are electrostatically charged in such a way that they bind water and regulate the volume of the connective tissue state. Through their actions the osmotic and ionic state of the tissue is maintained and regulated. We see the basic structural components, which coordinate their functions to maintain the ground regulation system, in the diagram below (Figure 4.5).

Axons contained in the ground substance convey information to the central nervous system, while capillaries carry substrates to the endocrine system and return hormonal substances to the ground substance for action on target cells. The fibrocyte reacts to local conditions and to control center instructions, and maintains proper conditions of the ground substance. Products of the fibrocyte maintain the proper sieve-like state of the ground substance. Note that improper pH or clogging of the matrix by other molecules detrimentally affects the functioning of the ground substance and can lead to deficiencies or excesses of substances needed by the cells that reside there. "Clogging" of the matrix is undesirable and leads to altered flows of waste and nutritional substances in the system.

The ground system maintains a balance of pH by alternating through fluctuating conditions of acidity and alkalinity. Work by Heine, et al. (1997) shows that the matrix's pH alters predictably in human subjects and these swings through pH extremes allow the remaking and maintenance of the structural collagen fibers. During the acid period the collagen molecules become softer and thinner and the matrix becomes more liquid. During the

Figure 4.5. The ground regulation system. Note the reciprocal relationships of the components of tissue shown in this figure. Every cell in the body is in contact with the ground substance, which acts like the Internet for bodily information collection, transmission, and evaluation. The functional control cell of the ground substance is the fibroblast, which is the metabolically active center, and controls the activities occurring there. The entire neuroendocrine system works through the ground substance to coordinate bodily functions. (Reckeweg 1983) (Image modified and used courtesy of Corazon Ibara 1983).

alkaline phase the matrix gels and collagen swells (Broadfoot 2004). Pathological pH excesses, particularly acidosis, and the corresponding increase in free radicals, are very damaging to the ground substance and eventually to the cells that reside within. While work of this type has not been done in animals, it makes sense that such a system exists in all higher level, multicellular species. Pain fibers and other inflammatory substances are activated under such circumstances, and can result in immune system overactivity and tissue damage from inflammatory mediators. This may be one of the mechanisms present in autoimmune syndromes. A practitioner can use low-dose antihomotoxic formulas to activate the fibrocyte and other aspects of the autoregulation system to assist the organism in recovery from homotoxin exposure.

The immune system responds to material in the ground substance in several ways. Homotoxicology formulas, also called antihomotoxic drugs, rely on a portion of the immune system for their effects. The immunological bystander reaction is one theory explaining the effects of

these medicines (Reckeweg 2000). When a macrophage contacts an antihomotoxic medicine and/or an antigen, it phagocytizes the material. Macrophages can also be exposed by contact with lymphocytes, which have patrolled mucous membrane surfaces and had contact with the material. After phagocytosis, the macrophage processes the material and adds it to an amino acid motif, which consists of the material conjugated to an amino acid chain of 9 to 15 amino acids. This amino acid motif is placed on the surface of the macrophage. Naïve Th0 lymphocytes are presented with these motifs and become recognizable. After accepting the amino acid motif, these Th0 lymphocytes become regulatory Th3 cells, which form motivated clones. After wandering through the lymphatic system and encountering a lymph node, these motivated clones migrate through the circulatory system and distribute to the entire body.

Motivated clones are attracted into areas by a wide variety of chemotactic agents (complement, chemokines), especially those resulting from inflammation. Upon entering the dysregulated area, they can react with other inflammatory lymphocytes (Th4 cells and their subtypes: T-Helper 1 and T-Helper 2 cells). A similarity between amino acid motifs of the lymphocytes allows the production of anti-inflammatory cytokines such as tissue growth factor-beta (TGF- β) and interleukins 4 and 10. TGF- β is a powerful anti-inflammatory cytokine and results in the suppression of the Th4 and other helper cells. Th-2 cells also release TGF- β and inactivate themselves by releasing IL-4 and IL-10, a reaction furthered by TGF- β . This reaction naturally ends or reduces the inflammatory reaction and results in the production of antibodies by B-cell lymphocytes, which have been stimulated by the processes at hand. In this way, antigen insult leads to inflammation, which results in antibody production and body-wide control of the offending agent (Heine 1997b).

Note that the amino acid motif presented does not have to be identical. When a similar agent is present on the amino acid motif, this leads to a reduction of the severity of inflammation and down regulation of the area to a more normal state (Brandtzaeg 1996). It is as if the body is saying, "We have seen this and responded to it already. Please, relax and handle the situation more calmly." We address this circumstance by using homotoxicology formulas that are similar to the disease-causing homotoxin. These much-diluted, low-potency agents stimulate the body into getting well more quickly. Interestingly and importantly, it appears that this reaction can ONLY occur with antigens at very low dosing. The calculated range for the immunological bystander reaction to take place is with antigen dosing of 1 μ g to a maximum of 1 gram per day per body (Reckeweg 2000). This mechanism provides homotoxicology formulas with several decided advantages. First, the practitioner does not have to know the

Figure 4.6. The immunological bystander reaction and its relationship to low-dose antihomotoxic formulas (A). Macrophages are stimulated by low-potency homeopathic dilutions in the D1 to D14 dilution range. These agents can be presented by administration via several routes including subcutaneous (SC), intravenous (IV), intramuscular (IM), and across respiratory mucosal membranes (aerosol). Upon uptake of these antihomotoxic agents, the macrophages form antigen motifs, which are prerequisites for the response by lymphocytes (Th3). These Th3 lymphocytes find chemotactically phlogogenic lymphocytes (T4, Th1, Th2) with similar antigen motifs and suppress these by releasing cytokines. (Image used courtesy of Prof Heine, all rights reserved 1997).

specific offending antigen, but can select one similar to treat a specific organ disease (Reckeweg 2000). Second, the bystander reaction is initiated by oral, subcutaneous, intramuscular, or intravenous routes of administration, a fact that provides the homotoxicologist greater latitude in therapeutic planning (Reckeweg 2000).

The bystander reaction works by further bioregulation and not by suppression, thereby keeping the patient's immune system intact and reducing the chances of further toxicity from higher drug dosages. As a summation, the immunological bystander reaction is illustrated above in Figure 4.6 (Heine 1997b).

WHAT ARE THE DANGERS OF HOMOTOXICOLOGY?

Since the inception of homotoxicology in the early 1950s, millions of doses of antihomotoxic medicines have been administered by a wide variety of dosing routes. According to Heel, 300,000 injections are given daily. Life-threatening adverse reactions so common to pharmaceutical agents have not been observed or reported. In examining injectable antihomotoxic agents the low rate of complication is remarkable, and most commonly involves some minor pain, redness, or swelling at the injections site.

Veterinarians have observed similar statistics (Broadfoot, Demers, Palmquist 2004). Properly used, these agents do not cause severe harmful side effects.

The main danger in practicing homotoxicology is failing to recognize disease patterns that have moved across the biological divide in either direction. Because diseases on the right side of the Six-Phase Table may not improve, patients may receive symptomatic or suppressive therapies to alleviate their immediate symptoms.

Another danger is the confusion that can result if clients and professionals are not properly educated about vicariation reactions. If a patient has begun healing and is involved in inflammatory reactions, some clients may become startled and seek out unnecessary allopathic therapy, which can slow patient recovery. While homotoxicology remedies can be used along with standard pharmacologic agents, caution should be used when choosing suppressive medications during a period of regressive vicariation. Patients who are on the right side of the biological divide can suddenly decompensate and even die after exposure to any toxic agent, including pharmaceutical ones. While this is not the fault of homotoxicology, it can lead to confusion involving those who do not understand biological therapeutic principles. Often this takes the form of a professional administering a standard drug that then gives an unusual reaction caused by the sudden weakening of an already compromised regulatory system. While a patient is receiving biological therapy it is important to avoid unnecessary drugs or chemicals that could cause progressive vicariation to occur.

THE SCIENCE OF LOW-DOSE THERAPY: A NEW FIELD

Nanopharmacology, which literally means small drug study, involves understanding the effects of extremely low doses of substances on the physiology of the body, (Bellavite, Signorini 2002). Until recently, modern medicine has concerned itself mostly with researching agents for pharmaceutical use in the traditional drug marketplace. New data is emerging and our understanding of low-dose therapy is expanding. Dr. Reckeweg and his homotoxicology formulas have provided strong evidence for the effectiveness of such therapy. In 1796, the German doctor Samuel Hahnemann was the first professional to discover the surprising effects of miniscule doses of individual substances and publish a body of empirical research based upon individual case responses. He discovered that when people took very small doses of substances, which in larger doses caused toxic reactions similar to their current disease symptomology, they would often recover from disease states. He called his new form of healing “homeopathy” from the principle “similia

similibus curentur,” which in Latin means “Like may be cured by like.”

From this practice, the Austrian veterinarian Wilhelm Lux further developed the science of vaccines in the 1830s by manufacturing the first vaccine for canine distemper, as well as anthrax. Hahnemann’s clinical practice became wildly successful and excitement spread throughout the world. Constantine Hering established the first homeopathic medical school in the United States in 1835, in Pennsylvania, where it remains today as an orthodox medical school, the Hahnemann Medical College and Hospital. It is unfortunate that, of the many medicines introduced by Hering, only nitroglycerine, a homeopathic medicine commonly used in conventional cardiology, remains in medical practice as a tribute to his medical genius.

Tremendous results from homeopathic therapies in several epidemic diseases helped homeopathy grow in the United States, so much so that by the turn of the 20th century, there were 22 homeopathic medical schools, including Boston University, University of Michigan, New York (Homeopathic) Medical College, and University of Minnesota. Approximately 15% of American doctors considered themselves homeopathic physicians, and there were more than 100 homeopathic hospitals. Homeopathy’s popularity declined sharply after the turn of the century, primarily due to the active efforts of the American Medical Association and its collaboration with American drug companies following the Flexner Report.

Because homeopathy had no hard scientific explanation for how these agents worked, and because of Hahnemann’s often invalidative, disdainful, and venomous attitude toward conventional medicine, newer doctors who were more interested in a Western scientific explanation fell away from studying homeopathy. The biggest problem with homeopathy has been the inability of anyone to truly explain how it actually works and the difficulty of arranging scientific trials to validate the practice. This remains a stumbling block to this day. Nevertheless, homeopathy has survived into the present time and still is a very valid field of healing thanks to its success in treating patients. Interested readers may find further data about homeopathy and research supporting the field in *The Emerging Science of Homeopathy: Complexity, Biodynamics and Nanopharmacology* by Paolo Bellavite, MD, and Andrea Signorini, MD (North Atlantic Books 1995).

In the late 1800s Dr. Rudolf Arndt and Hugo Schulz, a pharmacist, observed the Arndt-Schulz Principle, which states:

- Weak stimuli stimulate life functions.
- Moderately strong stimuli accelerate them.
- Strong stimuli act as inhibitors.
- The strongest stimuli suspend life functions.

In other words, low dilutions of agents stimulate the body. Moderate doses act as a stimulus to life functions while even higher levels lead to suppression and ultimately death. Take, for example, caffeine in coffee. A cup of coffee wakes a person up and prepares him for the day. Two cups makes him hyper, while 10 cups makes him lethargic. An overdose of coffee of more than 5 cups per day has a direct dose-related effect on the central nervous system, and may affect the heart and its rhythm, blood vessel diameter, and coronary circulation, and increase blood pressure, urine volume, and gastric secretions. These effects are capable of producing bizarre signs and symptoms, which are very baffling, i.e.: high fever or low-grade fever unresponsive to persistent antibiotic treatment, psychoneurosis (anxiety) unresponsive to diazepam, and paroxysmal atrial tachycardia (Flynn 1970).

Modern medical practitioners make use of this principle every day in clinical practice, and pharmaceutical companies have grown very wealthy and powerful using the higher doses of substances and stimulants and/or inhibitors. Most modern drugs, and many herbal preparations, fit this category of the Arndt-Schulz Principle. The lower dilution principles are used but less often appreciated by conventional clinicians.

Nitroglycerine, for instance, is a potent high explosive, but when used in low dilutions acts as a cardiovascular stimulant and vasodilator highly prized by cardiologists. Herbalists naturally use agents in the lower doses and this approach has been discussed in the herbal sections of this text. As scientific knowledge expands, we will no doubt gain information that explains the oftentimes miraculous results which can occur from application of low-dose therapy. The safety and efficacy of these remedies have given birth to a new field and nanopharmacology offers new frontiers for research and development with great potentials for those interested in healing human and veterinary patients.

THE DIFFICULTY OF THE INTEGRATION OF CLASSICAL HOMEOPATHY—A COMPARISON OF MODERN HOMEOPATHY AND MODERN HOMOTOXICOLOGY

While homeopathy dates back to Hippocrates, the founder of what is now modern homeopathy a German doctor, Samuel Hahnemann, who practiced in the late 1700s to mid 1800s. His original theory is based upon the principle of “*similia similibus curentur*” or “like cures like.” Simplified, when a large amount of a toxin is ingested, it can cause death. On the other hand, when this toxic substance is highly diluted, it can often reverse the effects of the toxin. Veterinarians may be familiar with

this from the use of phenobarbital. In high doses this barbiturate can cause death. If small amounts of the drug are placed in the body, the liver responds by increasing enzyme-based metabolism, thus reducing the toxicity of the drug.

In homeopathy, highly diluted mixtures of plant, animal, or mineral substances are administered to the patient. Since these remedies are designed to cause the symptoms of the disease they are intended to cure, they actually work with the body’s own innate processes. This process is unlike the use of standard medications, which are designed to either block or cover up symptoms. In contrast, a homeopathic treatment is designed to stimulate the innate healing power of the body so that all systems function at their optimum levels.

The symptoms, not pathological signs, of the sick patient are thus the most important guide to the choice of the correct remedy. Classical homeopaths view the animal as having one disease that shows several symptoms. Based upon their level of training and expertise, homeopaths select a single homeopathic remedy that most closely mimics all the symptoms. If the selected remedy is correct, it will cause a healthy animal to react with all the symptoms of the disease. This automatically boosts the body’s natural defenses, resulting in healing.

Classical homeopathy (single remedy)

The classical use of homeopathy as espoused by Hahnemann relies on a specific set of symptoms and circumstances occurring in the animal’s body. These are the very symptoms that result from the body’s inherent defense. The suppression of these symptoms usually inhibits the body in its healing process. Suppose, for example, that an animal has an upper respiratory infection with an ocular and nasal discharge. From the homeopathic point of view, the discharge is proper and beneficial to the body’s efforts to heal. The discharge is a combination of body wastes and the local infective bacteria (that are really secondary invaders). If this animal is given an antihistamine and an antibiotic, which dries and removes the inflammation in the mucous membranes, these medications will stop or hinder the process of the body ridding itself of these wastes, and homotoxins can accumulate, causing further damage to local tissues.

Homeopathically, the body is not efficient in discharging the wastes. The body wastes are then retained, which eventually may lead to a more serious condition such as chronic bronchitis or pneumonia. Inflammation and fevers literally burn off trapped homotoxins. They can be necessary to proper and full recovery.

What emerges from this example is a different perspective of the approach to disease and the healing process.

Instead of focusing on the suppression or removal of symptoms, the homeopathic approach is to support and augment the immune system and the cleansing effect of the eliminative processes so the body moves itself toward healing.

While classical homeopathy is a proven science and form of medicine and is supported by numerous medical and healthcare professionals, it also has a divisive side. In the 19th and early 20th centuries, it served as the catalyst in the development of modern medicine as the allopathic professionals left no stone unturned to discredit the science and art of homeopathy. While veterinary homeopathy is much more acceptable now, it still has an unintentionally divisive side with regards to integrative veterinary medicine. A veterinarian who steps away from the classical homeopathic model and focuses the homeopathic remedies instead of relying on the classical method of practice is derogatorily labeled an “allopathic homeopath” who uses a buffet type of approach to the treatment of the animal, bringing out the difficulty of integrating classical homeopathy within the holistic veterinary arena. Frankly, this difficulty may not be a bad thing, as classical homeopathy works best when done according to Dr. Hahnemann’s research findings. For the time being it appears that classical homeopaths get their best results when they maintain their separate status.

Classical versus combination homeopathy

Based upon the very nature and philosophy embodied by classical homeopathy, the use of other remedies and certainly any medications during treatment is not recommended and is, in fact, counterproductive. This is because the classical homeopathic approach uses a single remedy to achieve the same symptoms as the disease. Other medications and remedies that could alter these symptoms give the homeopath a false read and interfere with the treatment. Therefore, classical homeopathy does not lend itself to integration into veterinary practice.

Professionals who use combinations of homeopathic remedies differ from those who use classical, single remedies in their approach to a condition. The theory behind combinations is that several low-dilution remedies are mixed together with the purpose of addressing a specific symptom, supporting an organ or tissue, or helping set the stage for regeneration and healing. Good examples are combinations that are used in arthritic animals. Some individual ingredients may address inflammation, and others pain, while still others may support the body in the elimination of excess minerals and toxins. The overall result is that the remedy works with the body’s metabolic processes to reduce the symptoms at their origins and promote healing. In this regard, the homotoxicologist is

kin to the herbalist and this approach is found to be successful in both fields.

Homotoxicology—a more modern approach

Homotoxicology, founded by Dr. Hans-Heinrich Reckeweg in 1952, is a branch of medicine which combines classical homeopathy with conventional medicine to achieve the benefits of both art forms of practice. Dr. Reckeweg’s tenet of homotoxicology is that all signs, symptoms, and syndromes which we classify as disease processes are an expression of the organism in its active effort to combat homotoxins. The anti-homotoxic therapy uses low-potency combination homeopathic remedies in an indication-based approach to help the body to rid itself of toxic debris by supporting the natural defense mechanisms, thereby setting the stage for healing. Because homotoxicology uses conventional medical indications along with combination homeopathic solutions, it serves as the connecting link and basis for the integration of alternative therapies into conventional practice.

Homotoxicology works by engaging a complex set of bioregulatory feedback loops and improving the enzymatic and energy-producing activities of the cells, which regulate the relationship between anabolic and catabolic processes. The working principles of such a biological medicine use the body’s own self-regulating processes (autoregulation) to achieve self-healing. Dr. Reckeweg, in 1948, devised a brilliant concept for tracking the flow of disease, in what is called the Six-Phase Table of Homotoxicology. It is, in effect, a road map of the biological system’s response to the presence of toxins in the system, and it provides a logical sequence of events for the veterinary practitioner to evaluate therapeutic efficacy. One of the advantages of this modality is that a deep understanding of the principles is not required for a practitioner to find success in therapy. The remedies have such broad and deep activity, that even a superficial knowledge of the combinations produces startlingly good results.

Unlike the incredible fields of traditional Oriental medicine, Ayurveda, and other ancient healing arts, which can be nearly incomprehensible to novice practitioners, homotoxicology diagnosis and case programming is based upon symptom pictures and clinical diagnoses which are easily recognized by doctors trained in Western medicine. It is a “take home” kind of therapy. Armed with a few anti-homotoxic remedies and a desire to learn a gentler medicine, one can have a positive impact on the quality of life of his or her patients.

The following table illustrates how homotoxicology is a link between conventional and alternative practices and sets the stage for true integration by combining medical and diagnostic procedures along with the more natural healing techniques of homeopathy (Table 4.4).

Table 4.4. A comparison of homotoxicology with classical homeopathy and allopathic medicine.

	Allopathy	Homotoxicology	Classical homeopathy
Diagnosis	Using clinical findings	Using clinical findings	Using mental and somatic/constitutional findings
Therapy	To treat local symptoms	To create general well-being	To create general well-being
Remedy	Clinical preparations	Homeopathic combination preparations	Homeopathic single remedies

CLINICAL APPROACHES USING HOMOTOXICOLOGY AND NANOPHARMACOLOGY

We now have a basic understanding of the progression and pathogenesis of disease states according to basic homotoxicology theory. We have also seen how the immune system regulates itself and how low-dose agents appear to assist in regulating the greater defense mechanisms by gently stimulating the normal bioregulatory functions of the organism. In this next section, we examine the clinical approach to viewing a patient's particular conditions and the biological therapy steps which can be taken to assist the organism in its pursuit of better states of survival. As we move toward specific therapy, it is useful to gain some familiarity with the basic formulas available for use in the clinical environment.

Homotoxicology formulations

Homotoxicology contains a myriad of formulas designed by Dr. Reckeweg and distributed by a German company (with United States distribution) called HEEL, which stands for "herba est ex luce," or "herbs are from light" (Heel Web site). HEEL (usually written Heel) and Heel USA produce more than 200 separate formulas.

The clinical use of these particular remedies is detailed in the publication entitled *Biotherapeutic Index: Ordinatio Antihomotoxica et Materia Medica*. Serious use of homotoxicology requires an understanding of this text and it is highly recommended that readers obtain a copy as soon as possible in their study of homotoxicology. It has been observed that individual success in the subject depends upon having this text available in the clinical setting. Readers are also referred to *Materia Medica* by Hans-Heinrich Reckeweg and *Homeopathic Homotoxicological Repertory* by Ivo Bianchi for more detailed reading about individual ingredients and indications for use of these antihomotoxic formulas. Students greedy for knowledge will find a tremendous amount of useful material contained in these basic clinical references. A nearly infinite number of treatment options can be produced once a practitioner becomes familiar with their basic purposes and functions. Homotoxicology is well described as an art or applied science for this reason.

Other companies besides Heel produce combinations of low-dose agents, but few, if any, have produced the volume of agents and the research and support of practitioners seen at Heel. Therefore, this text deals extensively with Heel-produced remedies. This is not due to corporate sponsorship, but rather the experience of the authors with their products. Without doubt there are many products on the marketplace for clinicians and researchers to evaluate, and the Heel line is only one such product line. As this field develops, further research will no doubt expand our formulary of useful antihomotoxic medicines.

Examination of individual remedies is too extensive for this brief treatise. In the following paragraphs we peruse a few major remedies and provide some understanding on their applications. We also provide some literature citations for interested students to use as a springboard into their improved understanding and use of homotoxicology. Antihomotoxic formulas produced by Heel come in several forms:

Homaccords, so called because they contain one or more agents originating from mineral, plant, or animal sources, which have been prepared homeopathically in several different homeopathic dilutions. Examples of these are *Nux vomica homaccord*, *Cocculus homaccord*, *Phosphor homaccord*, and a host of others.

Compositae, which represent a unique development by Dr. Reckeweg. These agents contain a wide range of mineral, plant, and animal products that are at low-dilution strengths. These low-dilution substances gently strengthen particular organs or tissues. They assist the healing of specific organ syndromes and are extremely useful, especially in more chronic forms of pathology. The agents theoretically assist healing by many mechanisms including organ trophism, toxin drainage, inflammation moderation, and activation of fibroblast activity in the repair of tissue. These include, among many others, *Echinacea compositum*, *Apis compositum*, and *Placenta compositum*.

One of the most remarkable categories of antihomotoxic medicines is the remedy group known as catalysts. Dr. Reckeweg made a major contribution to medical therapy with these agents, which gently stimulate the basic metabolic processes and rehabilitate mitochondrial function. This allows for improved energy metabolism, a

requirement of nearly all chronically diseased patients. Three commonly used catalysts are *Ubichinon compositum*, *Coenzyme compositum*, and *Glyoxal compositum*. *BHI Enzyme* is another product with catalyst activity. In addition, many of the combination remedies in the compositae group contain catalysts for cellular and mitochondrial function (e.g. *Hepar compositum*, *Thyroidea compositum*).

Injeels, which are single-agent homeopathic preparations in a wide variety of dilutions. The word injeel comes from “injection-remedy Heel.” For readers in the United States, many of the injeel products are not readily available. European markets do provide these agents, which can be of great assistance in handling cases. Hopefully, in the future, more of these will become available to practices in the United States. This text does not deal with these products because they are not available in the United States, but basically they are applied according to their indications in classical homeopathy. Injection of these agents, as well as other antihomotoxic drugs, into acupuncture points is known as biopuncture, and it has many intriguing applications in human and veterinary medical practice (Kerschot 2002).

Symptom-based therapeutic formulas contain a wide variety of therapeutic agents and are designed to address specific clinical syndromes. Table 4.5 contains a list of important symptom remedy formulas. There are many of these formulas; those listed below are simply the most commonly used in veterinary practice. In a recent survey of active veterinary homotoxicologists, these formulas were listed in the top 25 antihomotoxic medications currently in use in the United States (Broadfoot 2004).

Table 4.5. Common antihomotoxic symptom remedies and their uses.

Remedy formula	Clinical application
Cralonin	Cardiac disease
Engystol-N	Influenza, viral infections, allergy, immune stimulation
Gripp-Heel	Influenza-like infections
Lymphomyosot	Lymphoedema, immune suppression
Rheuma-Heel	Non-articular rheumatism syndrome
Spascupreel	Colic, migraine-spastic, myogelosis
Spigelon	Headache
Traumeel S	Arthritis, traumatic injury
Vertigoheel	Vestibular syndromes
Viburcol	Fever, mild infection, excitation
Ypsiloheel	Central control
Zeel/Zeel compositum	Arthritis

One of the most researched and best-known homotoxicology remedies is *Traumeel-S*, which is formulated to decrease the severity of inflammatory reactions. It is a nonsteroidal, anti-inflammatory combination antihomotoxic remedy that does not inhibit necessary enzyme systems. *Traumeel-S* assists in ending the inflammatory reaction by accelerating the body through the Inflammatory Phase into the healing phase, as outlined previously in the section on immunological bystander reaction. It is one of the most used and recognized complementary medicines in the world. It has practically no listed side effects, other than some very rare minor reactions in individuals who are sensitive to its ingredients. Excretion and minor inflammatory reactions may occur as the body mobilizes and begins clearing homotoxins, and this is usually a desirable result as opposed to an adverse reaction. *Traumeel* is supplied as a tablet, oral vial, injectable vial, ointment, and gel. It is useful in many clinical syndromes, a partial list of which includes:

Soft tissue trauma of any kind
 Inflammation of any kind
 Postoperative pain
 Arthritis, especially of the hip, knee, and small joints
 Arthralgia
 Regulation rigidity, type 1
 Pyoderma
 Otitis externa
 Otitis media
 Pruritic dermatitis
 Peridontitis
 Gingivitis
 As an adjunct post radiation
 Abscess and furunculosis
 Intervertebral disc disorders

Traumeel's exact mechanism of action is not known, but it decreases inflammation, stabilizes blood vessels, modulates pain, and stimulates regeneration (Reckeweg 2000). Further discussion of this remedy occurs in the evidentiary section of this chapter.

If a student of homotoxicology progresses no further than to include one remedy, it should be *Traumeel-S*. Applying this remedy to the common issues seen each day in veterinary practice rapidly gives a new homotoxicologist the confidence needed to pursue other remedies. The authors use this preparation in nearly every surgery case for pain control as well as modulation and stimulation of the greater defense mechanisms, which are essential for rapid and proper healing. The results from using one vial of *Traumeel-S* in a bottle of IV fluids during routine treatment for shock can be very rewarding.

Another commonly used symptom remedy formula is *Zeel*, which comes as an oral drop, tablets, injection, and

Figure 4.7. Zeel is a commonly used antihomotoxic formula for treatment of osteoarthritis. (Image courtesy of Heel USA. All rights reserved.)

ointment. (Figure 4.7). *Zeel* contains a wide variety of low-dilution herbal, animal tissue, mineral, and organic molecular ingredients, which improve tissue function, reduce pain and inflammation, and fuel metabolism of cellular elements. This formula was recently evaluated in a double-blind placebo study and was compared against the NSAID drug Diclofenac. (Marrona, Weiser, Klein 2000). The study revealed that *Zeel* worked as well as the pharmaceutical NSAID in relieving arthritis pain of the knee in human patients, and has no dangerous side effects. Another study examined the effectiveness of *Zeel* versus Celebrex and yielded similar results (Birnesser, Klein, Weiser 2003). The onset of effect can be rapid but in most cases takes 4 to 5 weeks to become evident (Weiser 2003). *Zeel* has been demonstrated in vivo to effectively inhibit serine proteinases and metalloproteinases (Heine 1997, Stancikova 1999). The fact that *Zeel* has been shown to act on both the LOX and COX system explains its observed clinical effect as well as its increased safety (Jaggi et al. 2004).

Many acute cases of arthritis can be improved with of a combination of *Zeel* for long-term use, *Traumeel* for short-term pain management, nutraceuticals (glycoaminoglycans, MSM, SAmE, omega-3 fatty acids, etc.), and herbs. More details on these combinations appear in the clinical protocol section of this text. Because of its safety and the widespread incidence of various forms of arthritis in elderly patients, *Zeel* is a popular formula in both human and veterinary medicine. It often gives a patient her first exposure to natural medicine. It is not unusual

for a client to begin her pet on a course of *Zeel* and then develop further interest in pursuing biological therapy for her pet and herself.

Cralonin is a useful formula for management of geriatric cardiac conditions, both minor and more serious (Schroder, Weiser, Klein 2003). It contains homeopathic dilutions of *Crataegus*, commonly known as whitethorn or hawthorne. This herb and its homeopathic preparation is well known for its supportive effects on cardiac function, and hawthorne is used globally for this purpose. It is thought to increase blood flow to the heart and act as an antioxidant, thereby strengthening weakened cardiac tissues. Homotoxicologists frequently prescribe this formula to assist general cardiac issues, as well as strengthen geriatric patients whose examinations suggest decreased circulation. A case report demonstrates reversal of symptoms and echocardiographic lesions in a cat with hypertrophic cardiomyopathy. (Palmquist 2005, 2006). It will be some time before such reports can be substantiated through repetition and scientific study, but the prospects are exciting. In the meanwhile, use of *Cralonin* often yields excellent results and it should be readily considered in both early cardiac cases, as well as adjunctive therapy for more advanced cases. This particular formula is frequently prescribed for long-term use. As with all cardiac patients, regular re-evaluation of patients with heart disease is recommended.

The purpose of this section is to give a basic understanding of the types of symptomatic remedies available to the homotoxicologist and to provide the reader with some comfort in using these agents. Further clinical and scientific evidence is contained in the evidentiary section, which follows later in this chapter. By now the reader has a good foundation with which to approach cases, so now we embark on a clinical case that serves to illustrate how the theory of homotoxicology becomes an applied technology for healing.

Proceeding toward a treatment plan

We have reviewed the basic concepts and terms, discussed remedies briefly, and given the reader some familiarity with homotoxicology theory. In this section we begin to assemble what is needed for a student to apply this field to patients seen in clinical practice. As we proceed, please do not lose sight of the fact that all legitimate forms of healing can be considered in the development of a treatment plan. It is not our purpose to develop rote methods of application, because a competent practitioner will readily recognize that each patient's disease is a unique expression of his biological response. It is totally possible to have two patients share signs, symptoms, and pathological diagnoses that appear identical, but require vastly different treatment methods to get positive responses. The

application of theoretical principles and established technologies by an informed professional is what makes this the art of practice. Just as an artist uses many different media to convey his message, so may a doctor practicing biological therapy find a wide variety of valid pathways in her search for healing. Any methods which lead to regressive vicariation and an increase in ability for a patient are valid therapy. There are, though, predictable ways to approach patient programming and that is the purpose of this current discussion.

When presented with a patient, just as in regular veterinary practice, it is prudent to begin with a thorough medical history. If multiple doctors have been involved, it is a good idea to obtain copies of all medical records, laboratory tests, imaging, and other diagnostic testing, and review these with emphasis on the following items:

Environmental history: Where a patient has lived. Any stressful situations involving people or other animals (e.g., abuse, drug dependency, family strife, etc.). Known exposure to environmental chemicals (e.g. herbicides, pesticides, construction materials, tobacco smoke, incense, aromatherapy, etc.).

Disease history: Make a list of all diseases or problems in the medical record in order of appearance. Seasonality can be a major clue in many cases.

Therapeutic history: Make a list of all drugs, vaccines, topicals, supplements, and prescription diets.

Dietary history: Knowing which foods are eaten can give great assistance in evaluating a patient's disease evolution.

Current symptoms/diseases and their duration: Acute cases are often phases one through three, while more chronic cases fall in the last three phases of homotoxicoses.

Client's disagreements, upsets, or problems: Issues with past therapy, as well as client's current goals of therapy.

Complete physical examination: This is no different than any routine examination, and should include all body systems. Biological therapists pay particular attention to changes, which give a clue as to phase of disease. Some common clues can be seen as follows:

- **Discharges in excretion and reaction phases.** Generally, watery discharges locate a lesion more to the left of the phase table. Suppurative discharges usually occur in the Inflammation Phase, but can be observed in other phases and in particular the Impregnation Phase. As a homotoxicosis shifts phases, the clinician frequently notices the discharge will begin as solid or firm, then change to waxy or thick, and then finally become more oily or serous. Such changes indicate better prognosis. Because many of our common diseases, such as allergies, occur in the Impregnation Phase, it is common that these patients have little or

no obvious signs and then after beginning biological therapy develop copious discharges. These are greeted with excitement by skilled homotoxicologists because they signal the body's attempt to improve its status and health.

- **Pigmentation variations.** Pigment occurs when a chronic change has been in effect. It often signals a Deposition Phase disorder. If the pigment has been there chronically, then often these cases are in Impregnation or Degeneration phases. As they undergo regressive vicariation, patients with pigment commonly become intensely itchy and then develop inflammatory changes, which eventually discharge waxy or greasy material. If the clinician is aware, he or she will note that the pigmentation is thinning, often even developing small foci of normal or slightly pink coloring in the pigmented area. This is a very good prognostic sign and should NOT be interfered with or suppressed. Clients need to be advised regarding this for the best results to occur. Normally pigmented body parts losing pigment is a sign of serious homotoxicoses, which usually represent Degeneration Phase disorders. Diseases such as discoid lupus erythematosus (DLE) are marked by nasal depigmentation and represent autoimmunity aggravated by solar exposure and subsequent tissue degeneration. They can signal a patient's movement toward the neoplastic state.
- **Thickened or less flexible muscles, skin, tendons, or ligaments.** Thickening indicates a compensatory deposition of connective tissue fibers. These commonly occur in the Impregnation, Degeneration, and Dedifferentiation phases. Any veterinarian who has treated chronic cocker spaniel otitis or chronic anterior cruciate ligament tears (medial buttress) is familiar with these changes. Such alterations rapidly lead to a Degeneration Phase if left untreated. Upon activating the greater defense mechanism, affected patients frequently develop productive otitis. Chronic proliferative otitis shifts upon healing into an inflammatory condition, which represents a Phase 2 inflammatory reaction. If these cases are supported biologically and not suppressed, they can improve and reduce canal scarring and pinnal thickness, but the alteration in structure usually fails to resolve in its entirety. The clinician should expect a long course of healing and advise the caregiver accordingly. Not all clients agree to continue therapy, and their decision must be taken into account when approaching chronic cases. If a client is not willing to pursue a long course of therapy and the chronic inflammatory and exudative actions of the case as it heals, it may be more appropriate to resort to medical drugs and simply manage the symptoms.

- **Corneal and lenticular clarity.** The eyes become cloudier as homotoxins are deposited into connective tissue. Clients commonly report better corneal or lenticular clarity while undergoing detoxification therapy. Cataracts are generally in the Degeneration Phase and are irreversible in most patients. Detoxification of the liver frequently results in mucoid ocular discharge. During such periods the eyes can turn red as well. It is routinely noted that as the liver recovers this discharge declines and becomes more fluid. Chinese medicine has long realized this relationship between liver disorders and ocular changes and it is fascinating to see this connection appear in patients as they recover. This is a normal and good prognostic sign to an aware homotoxicologist.
- **Nails and hair coat characteristics.** Vital patients have adequate resources to produce healthy hair coats and nails. If the body is deficient or diseased, then the coat or nails are often dry or less vital. As a patient moves on the phase table, the coat and nails can serve as a clue as to whether the changes are regressive or progressive vicariation. Alopecia resulting from rabies vaccination has been reversed using antihomotoxic medications and biological therapy in the author's practice.
- **Mobility, vitality, and awareness.** These indicate the level of energy and assist in evaluating a patient's progress on the current treatment plan. It is often observed that a patient with discharges or showing other signs of disease such as coughing, vomiting, or fever demonstrates improving mental status. In cases where the patient's vitality is increasing, the clinician frequently finds that the disease signs actually represent active regressive vicariation. This can be extremely useful in determining when to intervene and when to allow the body the freedom and support to accomplish its reparative efforts. Many such exacerbations improve within 3 days of their appearance. When improvement of the condition is observed in this time period, the clinician can be reasonably certain that regressive vicariation is occurring and should reassure the client as continued patient monitoring occurs.
- **Oral health and breath.** Oral disease and conditions of the tongue, teeth, and gums can be very helpful in location and correct treatment. This is not unique to biological therapy, but the mouth is often overlooked, especially in fractious patients. Traditional Oriental medicine has much to say about diagnosis through evaluation of the tongue (Maciocia 1995). This is a useful modality for biological therapists in determining remedy selection and the efficacy of a treatment plan. Most courses in Oriental medicine include a section on tongue and pulse diagnosis.

The reader will recognize the aforementioned as common steps in conventional examination and diagnosis. Interpretation of signs can vary when one adds on understanding of homotoxicoses and the Six-Phase Table of Homotoxicology, but good medicine is the hallmark of good biological therapy. The best results in any medical scene occur with professionals who are well trained, effective observers, and who involve their clients in the process.

Upon completing and evaluating the examination, the doctor proceeds by listing conditions to rule out. A diagnostic plan is constructed and carried out with the client's understanding and consent. Once again, this is no different than conventional practice; however, by now the clinician should be forming some ideas about the phase of the patient's condition. Tests are completed and examined and a working diagnosis is developed. If the diagnosis is unclear, then the homotoxicologist can proceed to assist the patient by prescribing symptom- and phase-based remedies, while the process of diagnosis continues. One or more phase remedies can be selected from the table below (Figure 4.8).

The phase remedy or remedies selected are combined with a symptom remedy and the owner is instructed to administer the combination twice daily according to the dose schedule below (Table 4.6) (Broadfoot 2002).

Detoxification

Detoxifying the body involves draining the homotoxins from the area, and there are many remedies that assist in performing this action. For superficial cases—those in the Excretion or Inflammation phases—simple drainage and detoxification using the *Detox Kit*, which consists of *Berberis homaccord* (drains kidney and liver and supports adrenal function), *Lymphomyosot* (immune stimulation and lymphatic drainage), and *Nux vomica homaccord* (supports liver and drains the gastrointestinal system) is an excellent choice. For medium cases—those in the Inflammatory Phase more chronically or those in the Deposition Phase—a mixture of *Solidago compositum* (kidney support and drainage), *Hepar compositum* (liver support and drainage), *Galium-Heel* (cellular detoxification and drainage and organelle repair), and *Lymphomyosot* (lymphatic drainage and immune support) are selected.

For deeper cases—those in the Impregnation to Dedifferentiation phases—the detoxification formula is customized to the specific needs of the patient. Generally, this formula includes *Galium-Heel*, *Lymphomyosot*, *Thyroidea compositum*, *Solidago compositum*, *Hepar compositum* and/or *Hepeel*, and especially catalysts such as *Ubichinon compositum*, *Coenzyme compositum*, and *Glyoxal compositum*. These are dosed depending upon

Excretion Phase	Inflammation Phase	Deposition Phase	Biological Divide	Impregnation Phase	Degeneration Phase	Dedifferentiation Phase
Remedies	Remedies	Remedies		Remedies	Remedies	Remedies
Nux vomica Homaccord	Traumeel	Galium-Heel		Thyroidea Compositum Rx	Mucosa Compositum	Tonsilla Compositum
Lymphomyosot	Belladonna Homaccord	Lymphomyosot		Tonsilla Compositum	Molybdan Compositum	Galium-Heel
Berberis Homaccord	Aconitum Homaccord	Solidago Compositum		Psorinoheel Rx	Coenzyme Compositum	Lymphmyosot
Hepeel	Echinacea Compositum	Placenta Compositum		Echinacea Compositum	Ubichinon Compositum	Viscum Compositum
Reneel Rx		Pulsatilla Compositum			Galium-Heel	Glyoxal Compositum
Psorinoheel Rx					Lymphomyosot	
					Glyoxal Compositum	
					Placenta Compositum	
Alteration	Reaction	Fixation		Chronic Forms	Deficits	Decoupling

Figure 4.8. Phase remedies address the specific nature and location of pathology being manifested in a particular disease state. In treating with homotoxicology, the doctor selects 1 or more phase remedies to begin the process of homotoxin mobilization and excretion. These remedies are continued as long as the patient's status continues to change. As homotoxicoses shift, the practitioner alters the phase remedies selected. When used properly, these formulas lead to a regressive vicariation and patient improvement.

Table 4.6. Dosing schedule for oral antihomotoxic formulas in common veterinary practices.

Species and dose	Tablets	Tinctures	Ampoules 5ml	Oral vials/ampoules	Ear drops	Ointment/gel
Horse/cow	4—5 tabs 2—3X	10—20 drops 2—3X	1 vial 2—3X	1—3 vials 2—3X	1 vial 2—3X	Apply
Large dogs	1—2 tabs 2—3X	10—15 drops 2—3X	1/4—1/2 vial 2X	1/2—1 vial 2—3X	1 vial 2—3X	topically
Medium dogs	1 tab 2—3X	8—10 drops 2—3X	1/4 vial 2—3X	1/2—1 vial 2—3X	1/2—1 vial 2—3X	Apply as
Small dogs/cats	1/2—1 tab 2—3X	5—8 drops 2—3X		1/4—1/2 vial 2—3X	1/2 vial 2—3X	needed
Puppies/kittens	1/2—1 tab 2—3X	5 drops 2—3X		1/4—1/2 vial 2—3X	1/2 vial 2—3X	
Pocket pets	1/2 tab 2—3X	2—5 drops 2—3X		1/4 vial 2—3X	1/4 vial 2—3X	

patient response. They can be given as infrequently as twice per week and as often as several times daily. Most often they are given twice daily unless detoxification signs are too intense or uncomfortable, in which case the dosage is reduced so that the patient's system is not overwhelmed by excessive levels of homotoxins.

Because the process of biological therapy is dynamic, it is vital to note things clearly in the record and then

recheck the case regularly. The authors use the following schedule for many cases:

1. Initial consultation. History, examination, diagnostics, phase and symptom picture; begin treatment program.
2. Recheck in two weeks. If good progress, then recheck in 30 days. If no progress or problems, re-evaluate

the case and make changes necessary to allow the case to move.

3. Recheck cases every 1 to 3 months as needed. Instruct owners on the Six-Phase Table of Homotoxicology and have them contact the clinic if changes occur.
4. In healthy-appearing pets, or those that have successfully completed a course of biological therapy, it can be very helpful to do routine detoxification twice a year with a formula of *Berberis homaccord*, *Lymphomyosot*, *Nux vomica homaccord*, and possibly *BHI-Body Pure* (eliminates common toxins such as tobacco and petroleum byproducts). Using this mixture in the spring and fall for 30 days helps make pets more energetic and happy.

Demonstration case: a roadmap to biological therapy

Name: Sid Jones

Breed: Pug, male intact

Age: 24 Weeks

Vaccine History: DHPP 8, 12 weeks; Bordatella 12 weeks (dog park frequently); rabies 1 yr, 16 weeks

Drug History: Frontal Plus 8, 12, 16 weeks; Albon dose unknown 6 weeks of age

Environmental History: Private breeder until 7 weeks of age; owner home since then.

Disease History: Coccidiosis treated at 6 weeks of age; roundworms treated 8, 12, 16 weeks of age

Dietary History: Innova EVO puppy food and home-prepared scraps of meat and veggies (no raisins, grapes, onions, garlic, or chocolate verified)

Current Signs: Erythema on pinnae and multifocal small folliculitis lesions on abdomen

Rule-Outs: Staph pyoderma, demodex, sarcoptes, fungal, vaccination regressive vicariation

Phase: Inflammation Phase; Phase 2

Diagnostic Plan: Skin scrape→negative; Wood's lamp→negative

Client Decision: Owner declines fungal culture as lesions not typical. Advise owner fungal infections zoonotic can appear in many ways. If lesions spread or if people develop lesions call the office.

Treatment Plan: Phase remedy: *Echinacea compositum* 1 tablet BID PO 10 minutes before meals

Symptom Remedy: *Traumeel* 5 drops BID PO

Detoxification: *Detox Kit* 5 drops BID X 30days PO

Diet: Maintain present diet.

Recheck in Two Weeks

Recheck 7 Days: Lesions gone and dog doing well. Owner reports he began itching for several days and then developed a runny nose and eyes, which cleared in a week. Soft stools for 3 days but better now.

Assessment: Phase shifted from inflammation to excretion and to normal! Successful clearing of homotoxins, espe-

cially other viruses. Note: Advised owner that viral infections are usually Impregnation Phase disorders so be prepared if other conditions arise.

New Plan: Advise owner to avoid unnecessary chemicals or vaccinations, and consider titer testing next year instead of routine annual or triannual DHPP vaccinations, which may cause progressive vicariation.

The above example gives a basic roadmap to those new to biological therapy. New practitioners would be wise to make a standard form they could use in their clinics as they learn this subject. Taking an organized approach greatly assists the student in learning the craft as well as in evaluating cases when they seem to be slowing their response. Figure 4.9 presents an example of such a worksheet from the author's hospital (Palmquist 2000).

AUTOSANGUIS THERAPY

There are a host of other subjects for consideration in homotoxicology, and autosanguis (self plus blood) therapy is of great benefit in many different case presentations. Use of patient blood has long been promoted in healing arts, but only recently has it become evident why this practice can cause such startlingly effects. This advanced form of treatment involves taking patient blood and mixing it with various antihomotoxic remedies, thereby exposing the cellular arm of the immune system to a mixture of biological therapy agents in tandem with the current antigens in dilution. This mixture is presented to the patient by injection or oral routes, whereby the patient's immune system responds according to the immunological bystander principle discussed earlier in this chapter. The patient's own blood contains specific homotoxins associated with the present disease state, and when diluted in this manner, local macrophages can pick up this information and process it into data usable by local lymphocytes. Biological information specific and unique to the patient's form of homotoxicosis is made available to begin various immune cascades (Broadfoot 2005).

There are several methods commonly used to perform autosanguis therapy. The following method is commonly performed in the United States (Broadfoot 2002, 2005). Many modifications that can be made to individualize therapy for a particular patient or situation, but this basic technique is extremely workable and gives good results. Patients have a drop of blood drawn and then this blood is mixed in a sterile syringe with remedies from four categories:

1. Stage one. Symptom remedy or remedies are selected to match the present situation. Examples include *Traumeel-S*, *Belladonna homaccord*, *Engystol-N*, or *Apis homaccord*.

Figure 4.9. Use of an organized method of admitting new cases can greatly assist the biological therapist in properly diagnosing and treating patients

2. Stage two. Drainage remedy or remedies are selected to drain the affected terrain. Examples include *Lymphomyosot*, *Galium-Heel*, or *Engystol N*.
3. Stage three. Organ preparation or preparations including such remedies as *Hepar compositum*, *Solidago compositum*, *Mucosa compositum*, *Tonsilla compositum*, *Thyroidea compositum*, etc.
4. Stage four. Nosode preparation or preparations such as *Echinacea compositum* and *Psorinoheel*. Catalysts such as *Ubichinon compositum*, *Glyoxal compositum*, and *Coenzyme compositum* are frequently given in this stage.

The first drop of blood is drawn into the syringe and then mixed with the first stage remedy/remedies. Mixing is accomplished by a practice known as succussion. The mixture is strongly struck against the palm of the opposite hand 10 times. In homeopathic practice, succussion is believed to activate the formulas. Conventionally speaking, this strong impact may provide more intimate contact between cellular elements and homotoxins present. This mixture is given to the patient, and then the second stage remedy/remedies are drawn into the same syringe, succussed and then administered. This is continued through stages three and four using the same syringe.

Where allowed by law, autosanguis functions best when given by injection. While these injections may be given subcutaneously, or intramuscularly anywhere on the body, the clinician will find that using specific acupuncture points gives even better and more remarkable results. This practice is called biopuncture. The remedies can be given orally where the law does not allow such practices. It is common practice to mix at least a portion of each stage in a bottle of oral antihomotoxic medications to be taken home and given orally to the patient for an extended period of time. It is advisable to refrigerate these mixtures.

More on autosanguis appears in this text under the subject of cancer therapy; however, it has been found that often-miraculous results can be obtained following application of this sophisticated form of immune therapy. Autosanguis can be used in any phase of homotoxicosis, and its application is appropriate in nearly all cases from Deposition Phase to the right on the Six-Phase Table. Factually, many chronic and deep homotoxicoses do not respond until they are approached with autosanguis therapy, as developed by Dr Reckeweg and others (Broadfoot, Demers, Palmquist 2004).

WHAT IS THE SCIENTIFIC PROOF OF THE EFFICACY OF HOMOTOXICOLOGY?

Numerous scientific studies support the clinical use of antihomotoxic agents in human medicine. Efforts to

document these results in veterinary medicine are just beginning.

Many conversations regarding homotoxicology begin by questioning homeopathy as a valid science. Researching classical homeopathy is difficult, because no two identical patients exist. The allopathic method of diagnosis is not valid in homeopathy, since remedies are selected based upon symptoms and not classical Western pathological or etiological diagnosis. This makes it most challenging to design double-blind, controlled studies involving classical homeopathy.

In 1991, Kleijnen, et al. reviewed the literature and performed a meta-analysis of studies involving homeopathy. They examined 105 clinical trials involving homeopathic medicines and found positive results in 81 of the studies. Strong responses were identified in the treatment of respiratory disease (13 out of 19 studies showed positive response) and trauma and pain management (18 out of 20 studies indicated positive responses). Such a study is far from a final answer, but indicates why clients seek out homeopathic doctors for their healthcare needs. Something is working in these patients, and bearing in mind that homeopathic remedies are nontoxic and have no life-threatening side effects, using nanopharmacologic modalities, particularly in the field of pain management, becomes a very tempting impulse. Clients are well informed about the risks of NSAID drugs and actively pursue alternatives.

As research is done, more and more evidence exists to support the practice of homeopathy (Bellavite, Sinorini 2002). Many clients seek out homeopathic doctors as their first choice because they feel they recover faster, better, and more naturally using this form of medicine and the findings of research involving animals makes the likelihood of a placebo effect much less plausible (Reckeweg 2000). Since homotoxicology and conventional medicine share common diagnostic criteria, research is easier to perform and an active research arm involved in exploring homotoxicology and regulation medicines is emerging.

By actual fact, the most common way that conventional veterinarians enter upon the field of CAVM is in search of safer, more effective ways to manage their patient's pain. This is another example of how truth spreads through good results, even in the absence of concrete understanding of a modality's method of action. This is good medicine, using a field with some clinical evidence and improved safety before using a method that is known to be potentially damaging and dangerous. While classical homeopathy might not easily integrate with conventional allopathic medical practice, such studies should serve to indicate that homeopaths deserve respect as healers and medical professionals. They should also serve to interest medical practitioners in finding out more about these

modalities, and statistics show more veterinarians are trained in homeopathy than at any time in modern history.

Because of the obvious effectiveness of homeopathy, and out of respect for the infinite value of scientific diagnostic processes, the field of homotoxicology has evolved. The founder of homotoxicology, Dr. Hans-Heinrich Reckeweg, sought to integrate the field of homeopathy and Western, scientific medicine. Through direct clinical observation and trial and error, he developed a series of formulas from mineral, plant, and animal components, which assisted his patients in their recoveries. Homotoxicology contains a very active clinical research structure. Sadly, Dr. Reckeweg was a German and so much of his writing and clinical research was not widely known in the United States. Recently, though, English material has become more available and the work that is ongoing in Baden-Baden, Germany, continues to demonstrate the effectiveness and usefulness of homotoxicology remedies. The presence of clinical research and the results of these studies have led many medical doctors and veterinarians, and a large number of patients to move toward homotoxicology remedies.

Once again, we see the pattern of a single person who observed irregularities, created a theory explaining these irregularities, and then hypothesized a solution based on the theory. His clinical success led to the creation of a company to market his materials, and this company is the largest one of its type worldwide because its products are so helpful to those who use them. More and more homotoxicology data is emerging that can be integrated nicely into conventional veterinary practices. Furthermore, these practices gain new tools to examine disease pathogenesis as well as offer therapy. The authors, who began their journey from a skeptical view, now see this fact daily and hope that readers may benefit to the same degree from use of these gentle biological therapies.

It is only natural that veterinarians' interest is growing in this category of biological therapies. Only a few years ago, all seminars in homotoxicology were sponsored by the parent company, Heel, but homotoxicology is now taught at American Veterinary Medical Association and American Holistic Veterinary Medical Association meetings, as well as a rapidly expanding number of local meetings such as the North American Veterinary Medical Conference and the Annual Homotoxicology Conference of the American Holistic Veterinary Medical Association.

Positive clinical results fuel this interest, but there are evidence-based reasons for selecting homotoxicology, as well. While the majority of high-quality research in homotoxicology involves human medicine, which is logical considering that a human practitioner initially developed this field for human patients, the veterinary clinician often finds excellent results in the application of human proto-

cols. Veterinary research in Europe has been more active in recent years than in the United States, with veterinary data beginning to accumulate. This supports this statement from the *Biotherapeutic Index* (Reckeweg 2000):

"Animal diseases react to Heel biotherapeutical and anti-homotoxic agents with visible success, the objections occasionally raised being invalidated, i.e. that in the application of high dilution medicaments the effect is based predominantly on suggestion. The indications and methods of administration are the same as in human medicine."

In this section, due to the relatively small size of the veterinary literature on homotoxicology, most of the sources quoted are from human literature.

The most famous homotoxicology formula is *Traumeel-S*, and is properly classified as a nonsteroidal anti-inflammatory and is listed in the *Physician's Desk Reference* (Thompson 2005). This antihomotoxic formula contains 12 botanical and 2 mineral substances and is officially classified as a homeopathic remedy. The package insert carries this information (Heel unpublished):

"While its precise mechanism of action is not known, *Traumeel* does not seem to work as a result of cyclooxygenase (COX) or lipoxygenase (LOX) enzyme inhibition as is the case with many of the NSAID agents currently receiving such negative press for dangerous side effects. It does not inhibit arachidonic acid or prostaglandin pathways, either. *Traumeel* appears to work by modulation of the release of oxygen radicals from activated neutrophils, and the inhibition of the release of inflammatory mediators (possibly interleukin 1 from activated macrophages) and neuropeptides."

In vitro studies show the ingredients of *Traumeel* are noncytotoxic to granulocytes, lymphocytes, platelets, and endothelia, which indicates that the defensive functions of these cells are preserved during treatment with *Traumeel* (Comforti, et al. 1995).

Traumeel is one of the best-researched homeopathic agents in the world today, with its use supported in more than 2 dozen scientific articles and clinical studies (Broadfoot 2003). It carries an indication for inflammation of all kinds. Porosov, et al. recently found another clue to its mechanism of action in a study indicating that *Traumeel* affects immune system cell function related to inflammation by inhibiting, in a dose dependant fashion, the secretion of pro-inflammatory cytokines from both gut epithelium and leucocytes. The observed inhibition is inversely dose dependent, with no evidence of pro-inflammatory activity at any dose examined. Only extremely low dilutions of this mixture were found to have this effect, a finding that further supports the observations made by homeopathic doctors for more than 200

years. This study postulated that *Traumeel-S* might work by interference with specific intracellular signal transduction pathways (Porosov, et al. 2004).

Zell, et al. showed substantial results in the treatment of sprains in a placebo-controlled, randomized double-blinded study published in 1989 (Zell, et al. 1989). Athletes all over the world are familiar with *Traumeel* in its various forms of gel, ointment, tablet, and oral liquid, and many Olympic teams regularly use it in their training and competition programs. Demonstrating the wide variety of clinical applications in which *Traumeel* has proven efficacious, Oberbaum, et al. demonstrated the usefulness of *Traumeel-S* in the treatment of chemotherapy-induced stomatitis in children undergoing stem cell therapy (Oberbaum, et al. 2001). This study was also a randomized, controlled clinical trial and showed clear improvement in the stomatitis parameters measured in the group which received *Traumeel*. The study, published in 2001 in the prestigious journal of the American Cancer Society, *Cancer*, concluded that *Traumeel-S* may significantly reduce the severity and duration of chemotherapy-induced stomatitis in children undergoing bone marrow transplantation. Stomatitis is a significant complication of this procedure in children, and in this study 33% of the *Traumeel-S*-treated group did not develop stomatitis, while 97% of the placebo group did. This represents a significant advancement in patient comfort. Currently there is little effective or safe therapy for children with stomatitis of this type. Local anesthetics have unpleasant tastes and the risk of absorption limits the frequency at which these agents may be given. *Traumeel-S* was found to be nearly free of adverse side effects, and has a relatively low cost per patient, making it a highly desirable therapeutic agent.

Examination of *Traumeel-S* and other homotoxicology remedies may prove equally helpful for veterinary oncology patients. In one new study, comparisons of canine mammary patients receiving homotoxicology remedies after surgery were encouraging (Kurth, Neumann, Reinhart 2000). Patients receiving *Coenzyme compositum* were found to have increased survival times and reduced metastasis when compared to the expected results published in current veterinary literature. These findings coupled with clinically observed improvement in veterinary oncology patients' level of comfort provide some exciting possibilities for research.

The story of science's progression in this instance is equally fascinating and illustrates our points regarding evidentiary medicine. *Traumeel-S* has been widely used in Europe for nearly 80 years. Medical doctors, athletes, arthritis sufferers, and a wide variety of other users have observed excellent results from *Traumeel-S* and with minimal side effects. Clinicians using *Traumeel-S* frequently observe near miraculous results in a wide variety

of applications. These anecdotal reports have collected quietly for 8 decades. After patients undergoing chemotherapy reported some benefit, an interested doctor did a preliminary open study in 20 patients and compared the results with 7 untreated patients who were selected randomly. The results of this preliminary study were favorable and published in the *Biomedical Therapy* journal by Heel in 1998.

Finally, in 2001, the full study was completed and published by the American Cancer Society (Oberbaum, et al. 2001). Now that the data is in the mainstream American medical literature, it will take some time for the material to be disseminated widely, accepted, and put into use by oncologists. This clearly shows the long runway that data must undergo before being proven scientifically to be effective. If the medical doctors involved in this case had waited to use *Traumeel-S* until it was proven, we might never have known about this data. Because *Traumeel-S* is so safe, it seems prudent to attempt its use where there is no safe or truly effective option. Those patients lucky enough to receive *Traumeel* prior to 2001 benefited greatly even though no double-blind randomized study had been completed. Ethically, this was an acceptable activity because it improved patient comfort and did no harm.

Observing a single fact, accumulating a bit more data in support of that observation, and finally, when the results are nearly certain, designing an experiment to clearly demonstrate the desirable effect illustrate an ideal research pathway. Pain management is a massive issue and the present pharmaceutical agents subject patients to a wide variety of undesirable and dangerous risks including decreased fibroplasia and wound healing, skin eruptions, pulmonary complications, gastrointestinal ulceration and hemorrhage, drug-induced hepatitis, renal disease, bone marrow dyscrasias, keratoconjunctivitis sicca, myocardial infarction, and sudden death syndromes; therefore, homotoxicology remedies may prove extremely helpful to our profession in reducing pain as well as reducing iatrogenic damage to patients.

A human study examined the antihomotoxic formula known as *Zeel*, which is commonly used in clinical practice for treatment of osteoarthritis pain, especially arthritis of the knee. The paired cohort study compared Vioxx and Celebrex to *Zeel* and found that the NSAID drugs reduced pain and increased mobility slightly faster, but by 6 weeks there was no difference in efficacy. *Zeel* took longer to create a biological effect, but had NO adverse side effects (Birnesser, Klein, Weiser 2003). In a post marketing drug survey of human patients by Heel, which involved 190 orthopedists who administered 1 ampule of *Zeel* intrarticularly twice weekly for 4 to 5 weeks, it was found that 93.1% of clients reported positive results and only 0.45% reported adverse side effects, which all consisted

of local irritation at the injection site. Similar veterinary studies have not been conducted, but clinical responses appear to parallel this data and it seems prudent to pay attention to findings in the human medical field as we consider therapies for the veterinary profession.

When a clinician is faced with an agent that achieves the desired goals of therapy and knows that it has no major side effects, it seems prudent to select such therapies as initial treatments for patients seen in the clinic. If patients fail to respond to these treatments, then the clinician could consider other, more potentially dangerous or expensive agents for use in that patient's treatment program. At a minimum, clinicians need to advise their clients of these side effects and allow the client the freedom to choose the risk factors that they are most comfortable facing. Just making this minor change in practice could reduce the number of adverse drug reactions and the major problem with drug-related deaths and hospitalizations in the United States. The savings in costs associated with hospitalization, lost productivity, medical litigation, and bad public relations are substantial and well worth consideration in managing medical protocols.

In a human study involving *Cralonin*, the Crataegus-containing antihomotoxic symptom formula for cardiac patients was compared to the usual therapies for mild phase II heart failure. The study found no statistical difference between therapy groups, and concluded that (Schroder, Weiser, Klein 2003):

"The Crataegus-based preparation *Cralonin* is non-inferior to usual ACE inhibitor/diuretics treatment for mild cardiac insufficiency on all parameters except BP reduction."

It is interesting to note that 15 variables were examined. Both treatment protocols were well tolerated by patients. In the author's practice, we frequently use both conventional cardiac drugs as well as homotoxicology formulas with excellent outcomes (Palmquist 2005). It will likely be some time before studies are done to compare the results of such integrative protocols. These results are not really a surprise to those familiar with use of Crataegus in treating cardiac disease, which has been well known since the 17th century. The herb and homeopathic preparation is known to affect several cardiac parameters including increasing heart stroke volume, contractility, and coronary blood flow. Such changes are greatly appreciated by many geriatric patients and their caregivers.

Engystol-N, a common and extremely useful antihomotoxic preparation for activating the nonspecific defensive mechanisms of organisms, is indicated for a wide variety of uses including viral infections, allergies, vague feverish conditions, eczema, furunculosis, neurodermatitis, urticaria, asthma, migraine, diseases of the kidney, liver, and central nervous system, and experimentally in toxo-

plasmosis cases treated concurrently with *Traumeel* (Reckeweg 2000). The active ingredient is postulated to be Vincetoxicum hirundinaria, which is commonly called "shallowwort." *Engystol-N* is not thought to be directly antiviral. Heel awarded the Hans-Heinrich Reckeweg Prize for outstanding research to Professor Ryszard Matusiewicz of the Department of Internal Medicine of Gorchowski Hospital in Warsaw for his double-blind, placebo-controlled study of 40 human asthmatic patients. These patients had all required corticosteroid use prior to the study. The *Engystol* group experienced improvements in pulmonary function and were able to reduce corticosteroid use by significant levels (Malave, Manialavori, and Matusiewicz 1991).

In another study, Fimiani, et al. demonstrated an immunomodulatory effect of *Engystol* on some activities of isolated human leukocytes in whole blood (Fimiani, et al. 2000). The study demonstrated increased superoxide anion generation by leukocytes and increased cytokine production by T lymphocytes. This strongly supports the powerful effect of *Engystol* when used in autosanguis therapy and easily explains why *Engystol* appears to strengthen the immune system of patients suffering from viral infections. Finally, a European veterinary study showed reduced somatic cell counts in dairy cows receiving *Engystol* biopuncture (Ben-Yakir 2004).

Every veterinary practitioner has wished for weapons in the war against viruses, and homotoxicology has several powerful tools for the arsenal against viral infections. *Engystol* is certainly one such weapon, but research has also demonstrated antiviral activity in *Euphorbium nasal spray*. In one in vitro study the nasal spray demonstrated clear antiviral activity by itself and by 2 of its 3 ingredients (Glatthaar-Saalmuller, Fallier-Becker 2001). In another study, *Euphorbium nasal spray* was found to work as well as xylometazoline for nasal and sinus congestion in human patients (Ammereschlager et al. 2005).

Another remedy which strongly appeared to assist recovery of human patients with influenza is *Gripp-Heel* (Rabe, Weiser, Klein 2004). At the conclusion of one multicenter study comparing *Gripp-Heel* with conventional therapy, 67.9% of the *Gripp-Heel* group was asymptomatic versus 47.9% of the control group, which received conventional therapy. While tolerability and compliance were similar in both groups, treatment results were rated "very good" in 88.9% of those receiving *Gripp-Heel* versus 38.8% of those receiving conventional therapy.

Vertigoheel is another common homotoxicology remedy that is indicated for vestibular signs. This antihomotoxic drug has been evaluated in a randomized clinical trial and found to be equivalent to betahistadine in assisting human patients with attacks of vertigo (Weiser, et al. 1998). Both treatment groups had significantly reduced frequency,

duration, and intensity of the vertigo attacks. In a double-blinded, randomized controlled clinical study researchers found *Vertigoheel* noninferior to Ginkgo biloba in humans with atherosclerosis-related vertigo (Issing, Klein, Weiser 2005).

Klop, et al. examined the microcirculatory effects of *Vertigoheel* in human patients suffering from mild vertigo and documented marked alterations in microcirculation in patients following 12 weeks of therapy (Klopp, Niemer, Weiser 2005). None of the control patients experienced these changes, a fact indicating that this particular remedy has physiological effects on microcirculation. Increased partial oxygen pressures and increased levels of adhesion molecules ICAM-1 as well as increased levels of cell-wall adhering leukocytes were observed to occur in the *Vertigoheel*-treated group but not the controls. This documentation of altered microcirculation supports the activity and observed results claimed by Dr. Reckeweg, and indicates biological activity induced by use of the medicant. This agent is ripe for research in veterinary medicine and may also have a place in the treatment of vestibular disorders in veterinary patients.

Following the theories of homotoxicology, it would be nearly axiomatic that providing increased drainage of the lymph system would assist in removing homotoxins and lead to improvement in a wide variety of homotoxocoses. Dr. Reckeweg developed a formula known as *Lymphomyosot* to drain the lymph system and stimulate the greater defense system. This agent is recommended for a wide variety of disorders including hypertrophy of the lymph glands, edema, increased susceptibility to infection, glandular swelling, tonsillar swelling, and chronic tonsillitis. It is also a phase remedy for Excretion, Deposition, Degeneration, and Dedifferentiation phase conditions.

Recently, an additional indication for diabetic polyneuropathy in people has been added (Dietz 2000). A 2000 study found *Lymphomyosot* superior to α -lipoic acid in treatment of human type II diabetic polyneuropathy. This study involved 90 patients followed over an 8-month period. Three groups received *Lymphomyosot* or *Lymphomyosot* and α -lipoic acid. Nuclear magnetic angiography and color sonography were used to examine vascular lesions and edema and sensitivity to pain were measured and monitored. Seventy-five percent of *Lymphomyosot*-treated patients experienced a reduction of pain and edema and *Lymphomyosot* treatment was found to be superior to α -lipoic acid treatment.

Lymphomyosot and α -lipoic acid together worked synergistically to further improve patient conditions and the study rightly concludes that *Lymphomyosot* should become a standard agent in treating human diabetes type II patients. This agent seems ready-made for combination therapy wherein differing antihomotoxic agents are combined further to support various organ systems or tissue

needs during detoxification and repair. *Lymphomyosot* is a truly integrative biological agent. Broadfoot (2002) has reported success in using *Lymphomyosot* combined with *Apis homaccord* in treatment of insect bite hypersensitivity. *Lymphomyosot* research promises to yield helpful facts in many different conditions.

Veterinary homotoxicology research, while nearly nonexistent in the United States, is beginning to accelerate in European countries. One veterinary study in Israel demonstrated clear results in cows treated with a homeopathic agent over placebos and controls treated with saline. The number of animals in this study is low, but the groups had clearly different results. Significantly reduced somatic cell counts resulted from use of the homeopathic agent. The antihomotoxic medicine selected, *Engystol*, is promoted by Heel for its ability to increase the greater defenses, and this new research supports that by showing a biological response associated with increased immune cell activity. Because livestock producers are severely limited in the drugs they can use, the option of treating with gentle antihomotoxic medicines that do not require withdrawal periods is enticing and exciting indeed (Ben-Yakir 2004).

Clinical observations support that homotoxicology improves patient comfort, which is worthwhile. There also is evidence that antihomotoxic medicines may improve survival of veterinary cancer patients. A German study examining survival of dogs with mammary neoplasia demonstrated that the group receiving homeopathic medicines had prolonged survival rates over dogs receiving conventional surgery and chemotherapy alone. While all the dogs in this study received homotoxicology and the resultant survival times were compared with survival times as determined by the existing veterinary literature, this finding is reason enough to further examine the use of antihomotoxic medicines in treatment of cancer in veterinary patients (Reinhart, Broadfoot, Hanover 2005). The field of oncology would welcome nontoxic and effective means to reduce nausea and discomfort associated with chemotherapy and other cancer therapies. The idea that survival could be increased with gentle, nontoxic, antihomotoxic agents is welcome news to the field. Such statements are not strongly supported by sufficient scientific evidence but the possibilities make this research highly desirable.

The prior studies in this section should serve to demonstrate that something beneficial is happening through the application of homotoxicology principles and antihomotoxic agents. The question, "Does homotoxicology work?" would seem to be answered, at least superficially, in the affirmative. Evidence does exist that homotoxicology and other low-dose therapies can and do improve physiological states and disease recovery in people and animals. Further research and clinical application will

continue, and in the author's opinion such research will continue to demonstrate the usefulness of biological therapy to those with an inclination to assist their patients through this fascinating modality.

New biological practitioners should keep records of their results, and by sharing this information with other professionals our patients can benefit from newly acquired information. Through such actions the science of homotoxicology can expand even more quickly and better serve our clients and patients. The future appears bright for integrative veterinarians using this new modality.

REFERENCE SOURCES FOR HOMOTOXICOLOGY

Homotoxicology is a vast subject and requires continued and diligent study. This chapter is intended to provide some basic information and create interest in this wonderful form of healing technology. This text can never hope to contain the full subject, because it is simply too large, but it is a seminal effort to move integrative veterinary medicine forward on its search for better and safer therapeutic plans for our patients. As with any form of medicine, it is essential that the practitioner obtain a set of texts and references to adequately practice homotoxicology. Through the process of study, increased competence, and further handling of clinical cases, the veterinarian can find homotoxicology to be an exciting tool to add to the clinic's healthcare toolbox.

A recommended list of invaluable references for further study includes:

The Biotherapeutic Journal. This non-refereed publication is published by Heel. While it is a company-controlled publication, it contains the earliest and most complete history of literature in homotoxicology. Because the majority of homotoxicology research is currently done in Europe at this time, this journal is a significant source of information for both human and veterinary practitioners.

Biotherapeutic Index: Ordanatio Antihomotoxica et Materia Medica. Available from Heel. This text includes detailed descriptions of the 200 distinct homotoxicology formulations produced by Heel.

Veterinary Materia Medica. Available from Heel. This rather limited text includes commonly used veterinary applications of the remedies.

Journal of the American Holistic Veterinary Association. This journal contains frequent articles and comments regarding homotoxicology. Information is available at www.ahvma.org.

Obtaining and studying these texts will greatly assist any practitioner interested in biological therapy.

Professional organizations, which forward the art and science of homotoxicology, include:

The International Society of Homotoxicology. PO Box 100 264, 76483 Baden-Baden, Germany. info@homotox.de. Phone +49-7221-63252. Fax +49-7221-501-490.

The Society of Homotoxicology of North America. PO Box 2698, Edgewood, NM 87015.

The American Holistic Veterinary Medical Association. Dr. Carvel G. Tiekert, Executive Director, 2218 Old Emmorton Road, Bel Air, MD. 21015. Phone (410) 569-0795, fax (410) 569-2346. www.ahvma.org. Annual meeting on homotoxicology in Denver, CO; annual complementary-alternative veterinary medicine multimodality conference, and journal.

Chapter Five

A Practical Approach to the Integration of Western Herbal Medicine into Veterinary Practice

WESTERN VETERINARY HERBAL MEDICINE THEORY AND PRACTICE

The use of herbal treatments within veterinary medicine is not a new phenomenon, nor has it always been considered alternative! Ever since veterinary medicine as a discipline began in Europe in the 17th and 18th centuries, plants have been an important part of veterinary herbal medicine. In fact, many herbs were considered orthodox within the veterinary profession until at least the 1960s.

Contemporary veterinary herbal medicine is both a science and a tradition. It represents the synthesis of many fields, including botany, pharmacology, philosophy, history, pathology, ethnoveterinary medicine, research, clinical practice, and monograph study. Why use an herb when we have well-researched, established medicines for many veterinary conditions? We believe that where a conventional medicine is both safe and effective, it makes sense to use it. However for many conditions, drug use isn't safe and it's not always effective; chronic diseases are chronic because the medicine does not restore health (albeit relieving symptoms). And while we currently have good treatment options for patients with infections or parasite burdens, for example, we are challenged by diseases like cancer and allergic and degenerative diseases in animals.

For these conditions, if for no other reason, the traditions of herbal medicine deserve consideration. Herbs can simply represent another pharmacy toolkit; we have herbs to treat diarrhea or hepatitis, for example. We also have herbs (such as adaptogens and alteratives) that have properties that we simply don't have in conventional medicine. We can use herbs as pharmaceutical substitutes or we can undertake to use herbal medicine as a discipline in its own right. This means changing the way we think about medicine, from using drugs or herbs to relieve symptoms to using herbs to fundamentally alter the physiology of our patients toward health (Wynn 2006).

HISTORY OF WESTERN VETERINARY HERBAL MEDICINE

There are herbs for nearly every disease or symptom known and herbal medicine is currently used by 80% of the world's human population (Farnsworth 1985). This is not surprising, considering that for many centuries plants have formed the basis of every system of medicine in the world, including the Indian Ayurvedic system and Traditional Chinese Medicine. Even our Western system of pharmacology has its origins rooted in plant medicine. Despite a relative lack of modern research into the use of herbs in animals in the West, they are used extensively in many countries right now and have been throughout history.

These herbal traditions are even less familiar to scientifically trained modern veterinarians than human doctors. For the most part these traditions are completely ignored by veterinary colleges. However, there is no excuse for ignoring herbal possibilities when our orthodox medicine fails to serve our patients. Herbal tradition offers a long history of empirical experience and new avenues for scientific investigation. Veterinary herbalists can learn a lot from tradition as well as the plethora of emerging science (Wynn 2006).

We can also learn from the grandfathers of veterinary medicine. Any antiquarian veterinary textbook discusses the use of herbal medicines. In *The Illustrated Stock Doctor* (1883), Russell Mannings, MDVS, wrote that to treat "nasal gleat" (rhinitis) of horses, one should "inject the nasal passages thoroughly with the following: 1 oz bayberry bark, 1 pint boiling water. When cool, strain through a close linen or white flannel cloth and inject daily." The text also advises, that for simple colic in horses "If there is griping give the following: 15 to 20 drops of oil of peppermint, 1 oz laudanum." For early colic: "6 Drachms powdered aloes, 1 oz syrup of buckthorn, 1 oz tincture of ginger. Dissolve the aloes in a pint of warm water, add the buckthorn and ginger and give as a drench."

In 1895, Finlay Dun, a respected lecturer at the Edinburgh Veterinary College and an examiner in chemistry at the Royal College of Veterinary Surgeons, published the 9th edition of his popular textbook *Veterinary Medicines, Their Actions and Uses*. He details the use of remedies such as gentian as a bitter tonic “useful in treating atonic digestion” and dissolved linseed tea or ale together with nitre and Epsom salts for treating “simple catarrh in the horse.” Juniper is described as a topical irritant, a mild stimulant, a carminative, and diuretic “of use in treating indigestion and flatulence, diminishing the evil effects of bad fodder and marshy pastures.”

Herbs were still prominent in the veterinary literature into the 1900s. In Harold Leeney’s (1929) *Home Doctoring of Animals*, fennel, aniseed, gentian, fenugreek, ginger, opium, cassia bark, cinnamon, caraway, peppermint, cumin, aloes, thymol, male fern, digitalis leaves, elm bark, camphor, capsicum, belladonna, Peruvian bark, linseed, quassia, oak bark, licorice, cinchona, and other herbs were featured in standard powders, ball and drench recipes.

Even into the 1960s in P.W. Daykin’s *Veterinary Applied Pharmacology and Therapeutics*, a textbook used in veterinary schools throughout the UK, Australia, and United States, male fern, acacia, podophyllum, camphor, buchu, cascara, senna, peppermint, betel nut, calabar, kamala, licorice, aniseed, belladonna, ginger, and nuxvomica among others still featured highly as contemporary medicines among vaccines, antibiotics, corticosteroids, and hormone treatments now available.

Unfortunately, however, human herbal medicine suffered a demise with the rise of “scientific” medicine, veterinary medicine also began to turn away from these traditional medicines. Many of the patented remedies used in veterinary medicine at the time had become associated with the use of inorganic substances such as mercury and arsenic. It is therefore not surprising that the use of such remedies came into some disrepute with the advent of “modern” pharmaceuticals. Perhaps paralleling the contemporary story of Western herbal medicine, as pharmaceuticals and the double-blind placebo controlled trial become the modern standard of medicine (including veterinary), within a decade the study of herbs all but disappeared from the curriculum of veterinary schools (Griggs 1981). Instead, plants as treatments were replaced with the study of plant toxicology.

Veterinary botanical medicine renaissance

Because the fundamental principles of modern herbal medicine, which are based on science and tradition, are sound, and because there has been a resurging interest in herbal medicine for people since the 1960s, it is not surprising that there has been a corresponding increase in

demand for herbal medicine for animals. “Clearly a new opportunity had surfaced to improve the quality of practicing veterinary medicine by using herbal plants and their extracts to improve health, increase energy, facilitate healing, modify symptoms, help the immune system function and improve quality and longevity of patients lives” (Basko 2002).

The first international veterinary herbal organization, the Veterinary Botanical Medicine Association, (www.vbma.org) was formed in 2000 to develop responsible herbal practice by encouraging research and education, strengthening industry relations, keeping herbal tradition alive as a valid information source, and increasing professional acceptance of herbal medicine for animals. A growth in interest and use is expected to continue as we reflect on the various traditions and scientific applications of herbal medicines and find their place within the context of veterinary medicine. Research needs to continue into the safety, efficacy, and appropriate applications of herbal medicines and comparative costs and benefits in veterinary practice.

Sidebar 5.1 Global Warming’s Effect on Sustainable Herbal Medicine

The global environment is changing rapidly with global warming, deforestation, and pollution. Many plant species are threatened with extinction or are becoming poisoned with chemicals and pesticides. Herbs incorporate what is in their environment as they grow. What is taken in the roots will be part of that plant forever.

Veterinary herbalists are concerned about herb sustainability and plant conservation. Organic sustainable cropping and harvesting of medicinal herbs needs to be supported to ensure the safety, efficacy, and integrity of the herbs that we use. We need to care about our herbs as much as our patients in this emerging field of veterinary herbal medicine, and consider “sustainable” medicine as the interconnectedness and dependency between animal health and ecosystem health. This must be understood, embraced, and respected.

INTEGRATING WESTERN HERBAL MEDICINE INTO VETERINARY PRACTICE

Veterinarians are using herbal medicine again. A recent survey of 2,675 veterinarians in Austria, Germany, and Switzerland showed that approximately three-quarters of veterinarians in those countries are using herbal medicine,

especially for chronic diseases and as adjunct therapy (Hahn 2005).

Herbal medicine is used differently from the ways pharmacologic drugs are used. Herbs are complex compounds with nutritional elements and multiple pharmacological elements that interact both synergistically and antagonistically within the same plant and with other herbal medicines within a formula. At first, this polypharmacy seems a weakness and contrary to what we are philosophically taught in veterinary school; however, this is also an incredible strength. Once the practitioner becomes familiar with herbal medicines and their actions, constituents, and indications, the clinical effects of using numerous properties are more profound than those seen in drug therapy. Patient prescriptions are based on both the pharmacology AND the traditional indications for the herbs; they do not just treat the symptoms, but also the physiology of the affected tissues (Wynn 2006).

There is no reason why herbal medicine cannot be used concurrently with conventional medicine, except to say that careful monitoring and attention to drug doses are needed, because these frequently need to be reduced as the patient's health improves. This is how many veterinary herbalists begin, covering all bases. As confidence improves, it becomes a strategy to withdraw conventional medications over time, while still working on various aspects of the patient.

The use of herbal medicines in veterinary practice offers an extremely rewarding expansion of therapeutic options, especially for chronic disease. However, like any medicine, a good working knowledge is important, and it behooves the veterinary practitioner seeking to integrate herbal medicine into practice to study and learn herbal medicine as a professional rather than as a dabbler. The efficacy of herbal medicine is increased by experience and knowledge, and if it doesn't work, it is more likely a fault of the practitioner than the medicine!

NOTE: *A veterinary herbalist's goal is to restore a patient's vitality and well-being by addressing the underlying and perpetuating causes of the disease. The practitioner works to improve physiology at an organ and cellular level as well as relieve symptoms.*

MODERN WESTERN HERBAL MEDICINE—UNDERSTANDING THE TERMINOLOGY

Alteratives, anodynes, adaptogens, galactogogues, and other seemingly old-fashioned herbal terms appear in our veterinary textbooks of yesteryear. They were words in common use to the orthodox veterinary practitioner, and are becoming increasingly more common again in the contemporary veterinary herbal literature. One of the most common ways herbs are discussed is by their action,

or their effect, on an organ, tissue, or system. By understanding the actions of herbs and knowing the pathophysiology of a particular condition we can strategize the selection and use of particular herbs for individual patients.

Many actions are completely understandable to veterinarians; there are antacid, anthelmintic, anti-inflammatory, and antimicrobial herbs, for example. However, based on individual symptoms, an herb might be chosen for its breadth of action for one patient with multiple systems involved, or for a single, particularly strong action for another patient. This is the beauty and art of herbal medicine—the herbs have appropriate actions and yet are tailored to the whole health of the individual patient. A complete review of an herb's actions, traditional use, doses, and other pertinent information is called an herbal monograph. The *Veterinary Herbal Medicine* (Wynn, Fougere 2006) reviews more than 120 herbs from a veterinary perspective and is a useful guide for new veterinary herbalists. The following section outlines some less familiar herbal terminology that is used to describe the actions of some herbs. This is by no means complete, and there are differences in the potency of the actions of individual herbs.

Alteratives

The alterative classification was used in veterinary herbal medicine literature until the 1950s. These herbs tend to stimulate metabolism so that all functions of the body are enhanced. They have a role in stimulating the elimination of wastes from tissues and organs and are often referred to as blood cleansers or depuratives. Although there are different alteratives for each body system, alteratives are most commonly applied to the skin, lymphatics, GIT (liver and large intestine), and kidneys.

Traditional alteratives used to cleanse the skin include *Iris versicolor*, *Scrophularia nodosa*, *Fumaria officinalis*, *Mahonia aquifolium*, *Urtica dioica*, *Trifolium pratense* and *Rumex crispus*. Those that cleanse the lymphatic system include *Gallium aparine*, *Phytolacca decandra*, and *Thuja* spp.

Traditional alteratives that cleanse the liver and large intestine include *Arctium lappa*, *Mahonia aquifolium*, *Taraxacum officinalis* root, and *Sanguinaria canadensis*. Those that cleanse the kidneys: *Apium graveolens*, *Betula alba*, *Urtica dioica*, and *Fucus vesiculosus*.

Adaptogens

Adaptogens help regulate and balance the body's response to stress, i.e., adaptation. They support adrenal function, and often affect the immune and nervous systems. The original definition of adaptogen is (Panossian, 1999):

1. The adaptogenic effect is non-specific in that the adaptogen increases resistance to a very broad spectrum of harmful factors ("stressors") of different physical, chemical and biological natures;
2. an adaptogen is to have a normalizing effect, that is, it counteracts or prevents disturbances brought about by stressors and
3. an adaptogen must be innocuous to have a broad range of therapeutical effects without causing any disturbance (other than very marginally) to the normal functioning of the organism.

Herbalists believe that in addition to those criteria, adaptogens must work through the hypothalamic-pituitary-adrenal access, which differentiates them from other function-regulators such as immunostimulants. Adaptogenic herbs are especially useful for mitigating the effects of stress in overworked horses and dogs, run-down production animals such as dairy cows, and perhaps chronically stressed dogs and cats exhibiting anxiety-related behaviors. They also help elderly or chronically ill animals counteract lethargy and weakness. These herbs have been investigated for use in enhancing performance in healthy athletes; early clinical trials in humans suggested the effect but more recent high-quality studies do not support this.

Some of the major adaptogenic herbs are *Panax ginseng*, *Panax quinquefolium*, *Eleutherooccus senticosus*, and *Withania somnifera*. *Centella asiatica*, *Ganoderma lucidum*, *Avena sativa*, *Verbena officinalis*, and *Glycyrrhiza glabra* also have adaptogenic activity.

Amphoterics

Amphoterics normalize organ or system dysfunction. If deficient, the herb stimulates activity, and if excessive, the herb normalizes or even blunts the activity. In other words, they "know what to do."

Anodynes

Anodynes herbs that relieve pain by topical application.

Anthelmintics

Intestinal worms have been and continue to be of the most common problems of domesticated animals. Many plants were used to expel infestations and are still used in ethnoveterinary medicine today. Areca compounds, extract of male fern, kamala, and santonin (from *Artemisia* spp.) were used in different animals to varying effect in veterinary medicine. A common procedure was to follow administration of these plant compounds with a purgative. The difficulty in killing intestinal worms without harming the patient meant that skill was always required in administering these anthelmintics (Mills 1989).

Antiemetics

Antiemetics, which suppress emesis, include demulcents which coat, protect, lubricate, and soothe the gastric mucosa. Local gastric sedatives (antacids and alkaline stomachics) act by acid neutralization (coating the gastric mucosa) or by local nerve sedation. Central gastric sedatives depress the vomiting center.

Aperients

Aperients are mild laxatives which help to promote natural movement of the bowels, rather than provoking them forcibly. Examples include bulk laxatives such as psyllium and linseed and dietary fiber and plant remedies such as *Articum lappa* (burdock), *Berberis aquifolium* (Oregon grape), and *Berberis vulgaris* (barberry).

Bitter tonics

The taste of bitterness is an extremely common feature of many herbs, and it is important to note that this taste has a major pharmacological action. The bitter principles are a range of chemicals with the common ability to stimulate the bitter receptors inside the mouth, which in turn send signals via the gustatory nerve (Mills 1989) and stimulate the release of gastrointestinal hormones. They also affect other physiological functions. Bitters traditionally have been used for liver and digestive complaints, poor appetite, debility, and a wide range of other conditions.

In traditional medicine this property was highly regarded as leading to a real tonic improvement in health. Bitters were seen as "cooling," or reducing fever by switching blood flow to the breakdown of food and reducing toxin resorption in such conditions, and even more generally by improving nourishment at the expense of "circulatory heat." Bitters were therefore prescribed in "hot" conditions, or those in which the patient felt the heat, were thirsty, had a dry tongue, red tongue, or that experienced nervous agitation, restlessness, and tension. The bitter option still remains one of the most central choices facing the herbalist (Mills 1989). See also Sialogogues, below.

Carminatives

Carminative herbs cause the expulsion of gases from the stomach and large intestine. They are mainly volatile compounds in oils from herbs such as aniseed, ginger, and peppermint. They cause mild irritation of the gastrointestinal mucosa, which results in vasodilation. This is probably responsible for the well-known "warm feeling" which follows the swallowing of these compounds. These herbs also cause the relaxation of the gastrointestinal

musculature, but particularly the cardiac sphincter, for a period of up to 30 minutes, which probably plays a large part in releasing gases from the stomach. The rhythm and tone of peristalsis may be initially increased, but this is often followed by a decrease of movement, which helps to relax colic spasms (Daykin 1960).

Cholagogues

Cholagogues stimulate the release and flow of bile already formed in the liver. They are generally a property of bitters, but are also produced by other plant constituents. Cholagogues are used to improve the cleansing of the liver and to aid it in removing material as excretion in bile. They are often combined with laxatives, and formerly emetics, and make up an important part of the eliminative regime and in the treatment of liver disease and wider liver dysfunction (Mills 1989).

Choleretics

Choleretics stimulate bile production by hepatocytes and most have effective cholagogue properties as well. There is very little interest in choleretic and cholagogue treatments in conventional veterinary medicine. Interestingly, NSAIDs, especially aspirin, (in one study at a level of 100 mg/kg) caused choleresis in animals. Magnesium sulphate (Epsom salts) sometimes used for constipation, has been shown at doses of 500 mg to exert a direct effect on the motor activity of the gallbladder in dogs (Mills, Bone 2002).

Contraindications for choleretic and cholagogues include obstructed bile ducts (e.g., cancer of bile duct or pancreas), jaundice following hemolytic diseases, acute or severe hepatocellular disease (e.g. viral hepatitis), septic cholecystitis, intestinal spasm or ileus, and liver cancer.

Demulcents

Demulcents are used to lubricate, soothe, and protect mucous membranes, but the term is usually applied only to those that affect the mouth, pharyngeal, oesophageal, and gastric mucosa. Demulcents can be used to protect the mucous membranes prior to and during administration of irritants to allay irritation and inflammation already caused by chemical or bacterial action. They also can act as bulking agents for other drugs/herbs. Examples of demulcents include honey, treacle, malt extracts, linseed mucilages, and licorice powder.

Diuretics

Diuretic herbs promote the flow of urine, but not necessarily in the same way as conventional diuretic drugs.

They treat urinary tract infections and conditions in which the body retains water. Traditionally, these herbs were given as teas; with the increased water consumption there was a natural increase in urine output. Herbal diuretics work in three basic ways: by increasing renal circulation and therefore the glomerular filtration rate (e.g. *Crataegus oxyacanthoides*), by decreasing reabsorption of salts or sugars (e.g., *Agropyron repens* or *Zea mays*), or by irritating the kidneys (eg., *Juniperus communis*).

Laxatives

Many laxatives contain anthraquinone glycosides and bitter constituents. They are classified into four groups, from the mild aperients to the powerful purgatives:

Aperients: e.g., *Taraxacum officinale* root, *Arctium lappa*, *Mahonia aquifolium*, and *Rumex crispus*

Bulk Laxatives: e.g., *Linum usitatissimum* seed, *Plantago psyllium* seed, and *Cannabis sativa* seed

Cathartics: e.g., *Rheum palmatum*, *Cassia angustifolia*

Purgatives: *Aloe barbadensis*, *Phytolacca decandra*

Astringents

Astringent are compounds which precipitate protein, whether intracellular or extracellular. The precipitate of protein covering the surface of the cell or tissue is relatively impermeable to the passage of fluids in either direction. It also acts as a barrier between tissue and irritant and the underlying tissue is therefore soothed and protected from further damage so that healing can take place. The protecting and soothing effect is enhanced by an astringent action on any exposed nerve ending so that pain is lessened; the toxins and histamine-like substances released in damaged tissues are not absorbed. Local and generalized shock are both reduced while the recovery rate is speeded up (Daykin 1960).

An example is tannic acid, found in most plants in small quantities. Stewed tea is very high in tannic acid, as are rhubarb and oak gall. It is suggested that these be used for a limited time (no longer than about 2 weeks). Herbs that are high in tannins can interact or limit absorption of some alkaline drugs.

Sialagogues

The aim of sialagogues is to improve a patient's digestion and appetite through increasing saliva production. They may also increase gastric secretion (such as gentian), so they may be classed as stomachics or gastric stimulants, as well. Gentiana is a reflex sialagogue; it initiates a reflex by stimulating the taste buds on the tongue, which results in salivation.

Sialagogues are also referred to as “bitters.” The bitter principles vary considerably and may contain alkaloids. “Simple bitters” can be divided into aromatic simple bitters, such as orange and lemon peel, and non-aromatic simple bitters, such as gentian. Because sialagogues act locally on the taste buds, they must be administered in the form of a powder or tincture. Tablets, pills, and capsules bypass the taste buds. They should be administered 5 to 15 minutes before feeding or be mixed in with food. Dogs and cats usually object to the taste, so meat or meat extracts are probably more useful as salivary or gastric stimulants. Gentian can be mixed with bran mashes for convalescing cattle and horses (Daykin 1960).

Tonics

In Western herbal medicine “tonic” refers to herbs that increase the tone of a tissue or an organ. Tonics might also be taken for their nourishing and supportive effect—what traditional herbalists more clearly referred to as “trophorestoratives.” They can be classified according to the tissues or organs upon which they act.

Cardiovascular tonics: e.g., *Crataegus oxycanthoides*, *Convallaria majalis*, *Leonurus cardiaca*, *Achillea millefolium*, *Aesculus hippocastanum*, *Vaccinium* spp., *Vitis vinifera*, *Salvia miltorrhiza*, and *Polygonum multiflorum*

Nervous tonics: e.g., *Avena sativa*, *Scutellaria lateriflora*, *Verbena officinalis*, *Turnera diffusa*, *Ganoderma lucidum*, *Panax* spp., *Centella asiatica*, *Withania somnifera*, and *Hypericum perforatum*

Upper gastrointestinal tonics: e.g., *Agrimonia eupatoria*, *Mahonia aquifolium*, *Hydrastis canadensis*, and *Gentiana lutea*

Lower gastrointestinal tonics: e.g., *Myrica cerifera*, *Rhamnus purshiana*, and *Terminalia chebula*

Mucous membrane tonics: e.g., *Hydrastis canadensis*, *Mahonia aquifolium*, *Myrica cerifera*, *Vaccinium* spp., *Plantago lanceolata*, and *Calendula officinalis*

Liver tonics: e.g., *Cynara scolymus*, *Silybum marianum*, *Berberis vulgaris*, *Andrographis paniculata*, *Schizandra chinensis*, *Curcuma longa*, and *Taraxacum officinalis* root

Reproductive tonics: e.g., *Turnera diffusa*, *Serenoa serrulata*, *Withania somnifera*, *Panax quinquefolium*, *Chamaelirium luteum*, *Rubus idaeus*, *Angelica sinensis*, and *Cimicifuga racemosa*

Urinary tonics: e.g., *Rehmannia glutinosa*, *Urtica dioica* seed, *Tribulus terrestris*, *Althaea officinalis*, *Solidago virgaurea*, and *Plantago lanceolata*

Respiratory tonics: e.g., *Equisetum arvense*, *Inula helenium*, *Glycyrrhiza glabra*, *Panax quinquefolium*, *Plantago lanceolata*, *Astragalus membranaceus*, *Adhatoda vasica*, and *Bryonia alba*

Immune tonics: e.g., *Echinacea* spp., *Astragalus membranaceus*, *Ganoderma lucidum*, *Picrorrhiza kurroa*, *Andrographis paniculata*, *Atractylodes macrocephala*, *Withania somnifera* and *Codonopsis pilosula*

WHAT IS THE SCIENTIFIC PROOF OF THE EFFICACY OF WESTERN HERBAL MEDICINE?

The gold standard for research is the double-blinded placebo controlled trial, which reduces variability and compares the test agent with a placebo. Contrary to what many veterinarians may imagine, there are many rigorous clinical studies on herbs in the literature. These are primarily in human medicine, but a small yet growing number are in veterinary herbal medicine. These, combined with an enormous number of laboratory studies both in vivo and in vitro on herbs and herbal extracts, explain the mechanisms of action and efficacy for a large number of herbs. There have been a surprising number of research studies performed on cats, dogs, and some large animals, and thousands on rats, mice, rabbits, and guinea pigs, which are outlined further in this text.

Many of the published efficacy studies are available on PubMed (www.ncbi.nlm.nih.gov/entrez) or Medline (www.medline.com). Authoritative reviews of herbal efficacy can be accessed in the Cochrane reports (www.update-software.com/publications/cochrane) and the European Scientific Cooperative on Phytotherapy (www.escop.com). ESCOP is an international network of scientists and physicians who have published material submitted to the central European medicines regulatory authorities. Another database that ranks herbal efficacy according to the rigor of the studies is available on www.phytotherapy.info. Many of these studies confirm that whole plant extracts have more than a dietary supplement effect, that they can have efficacy on a particular disease and set of symptoms. However, it is likely that the efficacy of herbal medicine is still underrated, and problems with clinical research in herbal medicine can include using doses that are much smaller than in traditional herbal medicine. The use of *Echinacea* for colds is one example in which research doses are much smaller than those used by herbalists. Another problem is the use of the same herb or herbal combination for a particular disease when the philosophy of herbal medicine is to treat the individual patient; in other words, aiming to improve overall physiology rather than to treat the disease as such.

MODES OF ACTION AND EFFICACY OF WESTERN HERBAL REMEDIES

It is necessary to know something about herbs' active constituents and their effectiveness to understand their

uses and modes of action. Herbalists think of plants as more than the sum of their constituents, and avoid considering a researched “active constituent” as being the reason for a plant’s efficacy. While it is important to know that research confirms a particular activity, herbalists use the whole plant rather than a single constituent. Dr. Duke’s Phytochemical and Ethnobotanical Database (www.ars-grin.gov/duke) states which nutritional and other constituents occur within any given herb and which herbs contain a particular constituent. Plants produce a vast range of chemical constituents, which can have important physiological effects on animals. Several of the most common constituent categories are listed below, along with research that supports their traditional and modern uses.

Flavonoids

Flavonoid compounds are found in many plants; high levels are found in hawthorn, grapes, elderflower, and bilberry. Flavonoids and proanthocyanidins, which are oligomers of flavonoids, are almost universally antioxidant (Moreira 2004, Fremont 1998, Ferrali 1997, Hu 1995). Most are anti-inflammatory (Pelzer 1998, Robak 1996, Pathal 1991) antineoplastic (Vayalil 2004, Hou 2004), and anti-allergic (Lee, et al. 2004), and they reduce capillary permeability and fragility (Roger 1988, Keli 1996, Knekt 1996).

Anthraquinones

Anthraquinones are red or yellow pigments found in well-known laxative herbs, including aloe vera, senna, yellow dock, turkey rhubarb, and cascara. Their laxative effects have been supported by pharmacological research (Leng-Peschlow 1993, Mascolo 1998). They also have anti-inflammatory action (Anton 1980, Spencer 1997).

Coumarins

Coumarin compounds are found in many plants, including lavender, horse chestnut, dandelion, solanaceous plants, poppies, sweet clover, parsley, and angelica. Their fermentation product, dicoumarol, is a potent anticlotting agent and forms the basis of warfarin. Several coumarin derivatives have been used as anticoagulants, but other coumarins do not have this property. Their actions are antibacterial (de Souza, et al. 2005), spasmolytic (Khadzhal, et al. 1966), vasodilative (Chen, et al. 2005), and antiedema (Kontogiorgis, et al. 2006). As medical herbs they have use as venous and lymphatic vessel tonics.

Oxalic acid and oxalates

Oxalates and oxalic acid tend to be found in leaves of yellow dock and rhubarb. They have a mild laxative effect

but can precipitate calcium ions under certain circumstances, leading to the formation of stones. The use of oxalate-containing herbs should be limited in quantity and duration of treatment.

Alkaloids

Alkaloids are derived from amino acids and tend to taste bitter (thus acting on the digestive system). They are precipitated by tannins, so should not be mixed together (tannins can therefore be used to treat acute alkaloid toxicity). Pyrrolizidine alkaloids as a subgroup are important for their potential toxicity; for example, in comfrey. Another group, isoquinolone alkaloids, include berberine, hydrastine, and sanguinarine, which are found in herbs such as barberry, Oregon grape root, goldenseal, and bloodroot. Among the actions of these alkaloids: antimicrobial (Cernakova 2002, Sun 1988), antioxidant (Ju 1990), anti-inflammatory (Akiba 1995), ionotropic (Zeng 2003), and antineoplastic (Eun 2004, Kuo 1995).

Salicylates

Salicylic acid is classified with simple phenols as a carboxylated phenol. It occurs naturally as salicylic glycoside precursors (such as salicin, spiraein, salicortin, and populin), esters (such as methyl salicylate), and salts in many fruits and vegetables, processed cheese, nuts, and herbs. The best known are plants including *Salix* species, willow (*Salix spp.*), wintergreen (*Gaultheria procumbens*), black cohosh root (*Cimicifuga racemosa*), poplar tree bark (*Populus spp.*), sweet birch tree bark (*Betula lenta*), silver birch (*Betula pendula*), marshmallow (*Althaea officinalis*), red clover (*Trifolium pratense*), black haw (*Viburnum prunifolium*), cramp bark (*Viburnum opulus*), oak (*Quercus robur*), and meadowsweet (*Filipendula ulmaria*). Salicylates are antiseptic (ESCOP 1997), analgesic (Scmid 2001), antipyretic, anticoagulant, and anti-inflammatory (Hardman 1996, Weissmann 1991).

Saponins

Saponins generally have a sweet taste and they lather in water. They are found in herbs such as wild yam, panax ginseng, astragalus, licorice, and ivy. They tend to have steroidal molecules that can modulate effects on steroidal receptors (Baker 1995, Rao 1992). They have demonstrated anti-inflammatory, antiviral effects (Davis 1991). They increase mucous production in the lungs and act as expectorants (Shin 2002, Boyd 1946) and reduce cholesterol (Oakenfull 1990). Saponin glycosides can cause hemolysis in large amounts, but are extremely safe when used normally.

Sterols and sterolins

Sterols and sterolins, also known as phytosterols, are present in all plants, fruits, and vegetables, and are chemically similar to cholesterol. Betasitosterol is the major phytosterol in higher plants and beta sitosterolin is its glycoside. Animal studies have demonstrated that phytosterols have anti-inflammatory and antipyretic (Gupta 1980), antineoplastic (Bouic 1997), glucose-lowering (Ivorra 1988), and immune-modulating activity (Bouic 1996).

Tannins

Tannins are generally astringent in nature due to their ability to bind protein molecules. They are found in many herbs including oak bark, black tea, blackberry, witch hazel, and galls. Tannins are used as astringents for wounds and have styptic activity (Rot-Bernstein 1982, Akah 1988), anti-inflammatory and antiulcer action (Maity 1995, Ezaki 1985, Murakami 1991) in the gastrointestinal tract, and are valuable in the treatment of diarrhea (Lamaison 1990). They also have antioxidant activity (Haslam 1996, Okuda 1991).

Volatile oils

Volatile oils are found in aromatic herbs and include the common kitchen herbs such as peppermint, lemon balm, fennel, rosemary, cardamon, and cinnamon. They are used variously to stimulate digestion and reduce flatulence (carminatives) (Giachetti 1988), and have shown spasmolytic activity on tracheal and gastrointestinal smooth muscles (Reiter 1985, Sparks 1995), expectorant activity affecting mucociliary clearance (Dorow 1987), anti-inflammatory activity (Albring 1983), and antiseptic activity (Moleyar 1992, Pattnaik 1997, Janssen 1987).

VETERINARY HERBAL MEDICINE—THE PRACTICE

Veterinarians who choose to incorporate herbal medicine into their practice should obtain a good understanding of both the traditional and scientific aspects of herbal medicine and gain qualifications in this form of medicine to provide the most appropriate individualized treatment for patients. Each herb must be studied and its full range of therapeutic activity, contraindications, and dose should be known. When clients want their veterinarian to use herbs or when a veterinarian elects to treat with herbs without this education, these guidelines apply:

Patients should be monitored carefully when using herbs for the first time. Ensure that the client is able to

give the herbs without stressing the patient to increase compliance. Some improvement should be observed within 2 weeks or sooner. Herbs generally take longer to work, although some can work within hours. If no improvement is seen, reassess the case and prescription and possibly increase the dose.

Use good-quality herbs that state the species and potency and are from reputable companies. Most herbs are available for purchase as teas, tinctures, tablets, capsules, salves, and ointments. Sending clients to health food stores is risky because they may not be able to make these assessments.

Ideally, choose companies that demonstrate ethical harvesting of herbs and concern for conservation. Organic products are ideal.

Use up to 5 herbs at a time if making formulas to enable pharmacological dosing. Dilution occurs with multiple herbs and each dose will have to be increased accordingly or herbs will have more of a physiological rather than therapeutic effect.

Choose a main herb that provides the general thrust of the formula. Consider the predisposing and perpetuating factors that keep the patient in a chronic state and deal with those. Pay special attention to the digestive system. If this isn't working, bioavailability of herbal constituents may be compromised.

Start with small doses and increase if you are inexperienced. Adjust on a weekly basis until a therapeutic effect is observed, then hold.

For long-term use give the client and patient a break on weekends or a week off once a month by stopping herbs during these times.

HERB FORMS AND DOSES

Forms

Fresh herbs: Many fresh garden herbs such as parsley, thyme, and rosemary can be added to food, although palatability can be affected by adding too much! Alternatively, make a tea from fresh herbs and mix it with food. Avoid picking wild herbs unless you are trained to identify and harvest ethically.

Dried herbs: Dried herbs are frequently used in capsules or tablets. Dried herbs without further processing are not as potent as herbs that have undergone extraction processes, but they are still useful and relatively easy to add to food. Ensure they are free of mold.

Tablets or capsules: Tablets or capsules may contain dried herbs or dried herbs that have been extracted and concentrated, which affects dosing. Sometimes extracted dried herbs are 5 to 10 times more potent than their dried forms. They are often easy for clients to give because they are familiar with tablets and capsules. Lubricate them

with butter, sardines, pate, cheese, mashed sweet potato, or peanut butter to help them down.

Infusions and decoctions: Infusions are teas made by pouring 1 cup of boiling water over 1 teaspoon of an herb (usually fresh leaves and flowers) in a glass or china cup. Infuse for 3 to 15 minutes; the tea may become more bitter with time. Strain and add to food or administer with syringe by mouth. Add honey or chicken broth if needed. A decoction is simply made by simmering hard herbal materials such as roots, wood, and barks. Place 1 teaspoon in 1 cup of cold water in a glass or ceramic vessel. Bring to a boil, and then simmer, cool, and strain. Make the infusion or decoction daily and discard leftovers.

Tinctures: Tinctures are generally made by placing dried herbs in varying proportions of alcohol, depending on the nature of the constituents. After a period of time the alcohol is strained from the plant material and bottled. Each herb is prepared specifically according to prescribed methods as a quality control measure. Sometimes the alcohol is evaporated or removed and replaced by glycerin, producing potent but sweet-tasting herbs. Herbs also may be placed directly in glycerin for extraction of particular constituents. Alcohol tinctures are very stable, and are particularly useful in acute conditions because the alcohol promotes the absorption of the herb across the mucous membranes and the skin. The major disadvantage is that most dogs and cats hate the taste of alcohol but this can be dealt with by disguising the taste in food, or evaporating the alcohol as much as possible by allowing the herb liquid to sit over warm water (or add warm water). These are best given diluted in water, or in food. Milk, glycerin, or honey can be added to them.

Glycetract glycerine tinctures: Glycetract glycerine tinctures have a sweet and warming taste and are readily accepted by dogs and cats. They are suitable to give to diabetic dogs, when monitored. They are less potent in general than alcohol tinctures, so more is required. They can be given directly or added to food. They may need to be refrigerated.

Fresh plant creams: Chickweed, calendula, comfrey, Echinacea, and other herbs can be made into creams by juicing the fresh plant, then filtering the juice through a coffee filter. Combine 10 ml of the juice with 100 grams of vitamin E cream, sorbelene, or olive oil. Many commercial skin preparations can be purchased. Remember that whatever is applied is likely to be licked off, so check the ingredients and safety before applying.

Doses

One of the major difficulties in veterinary herbalism has been the lack of research to provide the most appropriate

dosage of specific herbs and formulations for dogs. The variable concentration of different products containing the same herb further complicates dosing. The active compounds also can vary in potency, depending on when and where herbs are harvested. As a result, it is much easier to administer correct dosages of conventional drugs than herbs.

Herbs are best used in formulas to exploit synergies while minimizing the potential for side effects. Human herb doses are better established due to traditional use and published research. The following list contains very general guidelines. Ideally, more specific dose rates are available for veterinary use (Fougere, Wynn 2006).

Single herbs per 10 kg/20 pounds:

Capsules or tablets: 1 to 3 twice daily. The actual dose depends upon whether the herbs are concentrated, extracted forms (low dose) or dried powder herbs (high dose).

Dried herbs: 1 to 2 teaspoons daily in divided doses mixed with food.

Infusion: One-fourth cup of infusion or decoction up to 3 times daily.

Tinctures: 0.5 to 1 ml tincture daily (in divided doses) up to 3 ml daily for very safe herbs; 1 to 2 ml glycetract daily (in divided doses) up to 4 ml daily for very safe herbs. Note that the dose is for individual herbs with a potency of 1:2 or 1:3. If more herbs are added the total volume increases proportionally. For example, a 10-pound cat would receive 0.5 to 1 ml of a glycetract of marshmallow: 0.25 to 0.5 ml in the morning and 0.25 ml to 0.5 ml in the evening.

Multiple herbs (for 10 kg/20 pounds): 0.5 ml to 1 ml of each tincture (up to 5 tinctures) in divided doses. For example, a 5-kg cat would receive 0.25 to 0.5 ml of each herb daily. A total dose of 5 herbs would equal 1.25 to 2.5 ml daily, with 1 ml given at morning and night.

SAFETY AND HERB-DRUG INTERACTIONS

It is important to note that some herbs (for example, yellow jasmine, pokeroor, and comfrey) are very toxic, and even lethal in very small doses. Likewise, even the safer herbs can be potentially dangerous if used inappropriately. There have been many reports of toxicities in people, ranging from allergic reactions to the plants themselves to side effects such as vomiting, diarrhea, and liver damage caused by the actives in the herbs, to death, although this is rare. Herbs work best and are safest when prescribed by a veterinary herbalist who can tailor the most appropriate herbs at the most effective doses. It behooves us as responsible practitioners to have a working knowledge of the herbs, their actions, clinical

uses, contraindications, and doses. These are potent plant medicines.

The issue of herb-drug interactions is important and serious, but perhaps overemphasized by the published literature. Herb-drug interactions are less about the chemical interaction between a drug and an herb and more about 1 herb constituent causing an increase or decrease in the amount of drug in the bloodstream. For example, frequently cited herb-drug concerns center on warfarin, in which the impact of the herb on warfarin, an anticoagulant, leads to a bleeding episode or formation of a dangerous clot. Other concerns often stem from pharmacology studies rather than actual clinical experience, such as those about the impact of valerian, which may increase the effects of certain anti-seizure medications or prolong the effects of anesthetic agents.

One review consolidated the clinical and pharmacologic aspects of drug-herb interactions by searching databases from 1966 to 2002; 162 citations were identified. Only 22 citations met the inclusion criteria of being adequately reported. Most interactions were pharmacokinetic; most actually or theoretically affected the metabolism of the affected product by way of the cytochrome P450 enzymes. In this review, warfarin was the most common drug and St. John's wort was the most common herbal product reported in drug-herb interactions (Brazier 2003).

In an earlier review, an intensive search of the literature and evaluation of reports of herb-drug interactions yielded the following: "108 cases of suspected interactions were found: 68.5% were classified as 'unable to be evaluated,' 13% as 'well-documented,' and 18.5% as 'possible' interactions." Warfarin was the most common drug (18 cases) and St. John's Wort the most common herb (54 cases) involved." Thus, 14 cases were well-documented in this report published about 2 years earlier than the new report, which found 22 reasonably supported cases (Fugh-Berman 2001). So perhaps drug-herb interactions are overstated but no doubt many other instances occur and go unreported. None the less, in this author's experience herb-drug interactions have not been detrimental. Rather, they have been beneficial to the patient and lower doses of drugs such as prednisolone or non-steroidals have been achieved. If an herb-drug interaction is suspected, or to check the literature to see if it has been reported, access Entrez-PubMed on <http://www.ncbi.nlm.nih.gov/PubMed/> or use a search engine to locate PubMed. The procedure for checking herb-drug interactions is to type in: (name of the drug), herb-drug interactions.

Adverse events associated with herbs and potential herb-drug interactions can be reported on the Web site of the Veterinary Botanical Medicine Association: www.vbma.org

SECTION 2

Integrative Therapy Protocols by Organ System

In the “Author’s Suggested Protocol” section of each disease, the authors recommend products and dose schedules used in their practices. The author may have an affiliation with the company producing such products. These specific products are listed because of the author’s clinical experience and use patterns. No author has experience with all products available and it was deemed prudent to recommend those products for which we had clinical experience. When applicable, the authors have included alternative product recommendations in some protocols. In the case of homotoxicology and Chinese herbal formulations, there are often few or no alternatives. When determining the remedies recommended for any condition, combination formulas of nutraceuticals, herbs, or homotoxicology agents often have enhanced, synergistic activity when compared to their individual components.

It is important for veterinarians to understand that natural, herbal, and nutritional products can differ dramatically from each other, even if the listed ingredients are the same. Practitioners should not assume any government regulation of these products. Also, practitioners who are accustomed to the standardization of pharmaceuticals should realize that these natural products are impossible to compare without extensive clinical testing of each product. Pharmaceuticals are chemical products produced under stringent standardized regulation and can usually be reliably compared to each other. For most suggested therapies recommended in this book, the rationale for use of the strongest indicated components are outlined within the text. It is beyond the scope of this text to deal with each ingredient individually, and the reader is referred to the list of supportive texts in the reference and resource sections of this book for further information and study.

Chapter Six

Autoimmune Disease

AUTOIMMUNE ANEMIA AND THROMBOCYTOPENIA

Definition and cause

Autoimmune anemia and thrombocytopenia are the result of increased destruction or decreased production of red blood cells or platelets. While the literature cites many causes for both diseases, such as destruction by antibodies, infectious agents, exposure to antigens, neoplasia and tick borne diseases, the basic mechanism of action is an exaggerated immune response against its own tissue (RBCs, thrombocytes) or a decreased production by the bone marrow (Calia 2003, Lewis 1996, Regan 1995, Stewart 1993, Thompson 1995, Bucheler 1995). Some research has suggested that combination vaccinations may be associated with a higher incidence of these diseases (Duval 1996).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

In the majority of instances, the rationale for treatment is direct suppression of the exaggerated immune response with cortisone (prednisone or dexamethasone) or chemotherapeutics (azathiaprine and cyclophosphamide) along with supportive care (Calia 2003). Nutritionally, the dietary addition of essential fatty acids such as eicosapentaenoic acid has been shown to be beneficial (Harbige 1998).

Anticipated prognosis

It is estimated that one-third of animals will be nonresponsive to therapy and will die from either disease (Calia 2003, Williams 1984).

Integrative veterinary therapies

In addition to proper medical therapy, IVM focuses on the imbalanced immune system and its exaggerated

response toward its own tissue. The removal of the offending cause is important for long-term remission. One underlying principle of alternative therapies focuses upon the inflammatory process that results from oxidation and an excessive free radical load. A local, cellular autoimmune response progresses and the target tissue (the red blood cells or thrombocytes) begin to be destroyed. The goal of integrative therapies is to quiet or neutralize this autoimmune pathogenesis and help to prevent further cellular destruction and the initiation of a chronic disease process.

Nutrition

General considerations/rationale

An imbalanced immune system, one that has an exaggerated response against its own tissue, requires nutritional supplementation, reduction of oxidative damage, and cell or organ sparing. In addition to addressing the autoimmune response, the nutritional support program should also supply nutrients required by other target cell or organ.

Appropriate nutrients

Gland therapy: Glandular bone marrow, liver, spleen, and thymus support supply intrinsic nutrients and can help protect target organs. One of the most bioavailable sources of iron is liver. Comparing of the absorption rate of inorganic iron (for example, ferrous sulfate versus heme-iron), the latter is 30 times more effective. The best source of heme-iron is concentrated liver extract (Frykman 1994). Liver is also a superior source of vitamin B₁₂ and folic acid.

Note that autoimmune anemia and thrombocytopenia are serious diseases and can involve multiple organs. It is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This will allow for a more specific gland and nutritional support protocol (see Chapter 2, Nutritional Blood Testing, for more information).

Betasisitosterol: Plant-derived sterols such as betasisitosterol show anti-inflammatory properties that appear to be

similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune suppressing effects is beneficial in immune-mediated anemia. Bouic (1996) reports on the immune-enhancing and -balancing effect of plant sterols, which can be beneficial to an animal with immune-mediated anemia.

Vitamin B₁₂: Essential for the maintenance of the proper levels of red blood cells. Deficiencies of vitamin B₁₂ are associated with anemia and decreased function of the immune system. Supplementation with vitamin B₁₂ often addresses the condition (Berlin 1978, Kondo 1998, Lederle 1991).

Folic acid: A B vitamin that is required for organized cellular division. Folic acid is integral in the synthesis of both DNA and RNA, and therefore has an effect of the genetic modeling of the body. Folic acid deficiencies affect bone marrow cell division and can lead to a macrocytic anemia (Food Nutrition Board 1998).

Chinese herbal medicine

General considerations/rationale

Autoimmune hemolytic anemia: Practitioners of TCM define autoimmune hemolytic anemia as a Yin deficiency and internal heat. The Heat leads to toxin formation. The Western interpretation is that the Heat is the immune reaction that destroys the blood. Toxins, in this case substances such as bilirubin, build up in the blood. Because Blood is part of Yin, the fluids of the body, one can translate the concept of Yin deficiency into blood deficiency (anemia).

Immune-mediated thrombocytopenia (ITP): In traditional Chinese medicine, ITP is considered to be a result of Blood, Yin, and Spleen Qi deficiency with internal Heat. For the Western interpretation, the authors translate this etiology as follows: Again, Heat can be translated as the inflammation or excessive immune reactivity of the body. This inflammation is directed toward the blood components, the thrombocytes in this situation. In TCM theory, one function of the Spleen is to use its energy to keep blood in the vessels. When the Spleen energy is too weak, blood can leave the vessels. The result is the petechiae seen in ITP. Blood deficiency is the anemia and thrombocytopenia is seen in this condition. Yin is the fluids of the body. Because Blood is a component of Yin, when there is a Blood deficiency, there must be a Yin deficiency.

Appropriate Chinese herbs

Immune-mediated hemolytic anemia (IMHA)

Immunoregulator: Contains Astragalus (Huang qi), which has been shown to increase the production of blood cells in the bone marrow (Nan Jing Zhong Ye Xue Yuan Xue Bao 1989), and Ligustrum (Nu zhen zi), which stimulates the production of blood cells in mice (Zhong Yao Tong Bao 1983).

Immune-mediated thrombocytopenia (ITP)

H13: Contains Astragalus (Huang qi), which has been shown to increase the production of blood cells in the bone marrow (Nan Jing Zhong Ye Xue Yuan Xue Bao 1989).

Agrimony (Xian he cao): Increases the platelet count in dogs and rabbits (Zhong Yao Yao Li Yu Ying Yong 1983).

Eclipta (Han lian cao): Extremely effective at stopping hemorrhage (Zhe Jiang Zhong Yi Za Zhi 1988).

Litospermum root (Zi cao gen): Has been used to treat patients with purpura (Zhong Hua Nei Ke Za Zhi 1976).

Madder (Qian cao): Decreases bleeding time in rabbits (Zhong Yi Yao Yan Jiu 1991).

Moutan (Mu dan pi): Has been used successfully to treat humans with anemic purpura (Zhong Xi Yi Jie He Za Zhi, 1985).

Notoginseng (San qi): Used topically, decreased bleeding time in transected rat tails by 30% compared to controls that were treated with wheat flour (Fan 2005).

Rehmannia (Sheng di huang): Improves hemostasis (Zhong Yao Xue 1998). Also increases the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998). By increasing the ACTH level it may increase the corticosterone levels in the body. This would have a similar effect to administration of prednisone on decreasing the immune response.

Acupuncture

Acupuncture has been shown to increase the hematocrit and platelet count in various pathologies. One case study reported increased platelet and red blood cell numbers in a 69-year-old man with aplastic anemia. The patient had been treated with prednisone, which caused compressive spinal fractures, and cyclosporine, which caused toxicity. Still his counts remained low. Treatment with electroacupuncture was begun at various locations depending upon his presenting signs. Both the platelet number and red blood cell count returned to normal parameters (Lu 2002). Some practitioners claim that acupuncture should be avoided due to potential hemorrhage problems.

Homotoxicology

General considerations/rationale

Autoimmune hemolytic anemia and immune-mediated thrombocytopenia represent Impregnation and Degeneration Phase disorders. Homotoxins have altered normal structure and function to the degree that dangerous imbalances occur and cellular damage leads to life threatening circumstances.

Conventional therapy is needed to block inappropriate savage attempts by the organism's immune system, which, left unchecked, would tip the biological balance toward

death. Intensive medical monitoring and support are recommended and biological therapy is initiated to assist in normalizing responses, supporting injured tissues, removing homotoxins that are responsible for initiation of the imbalance, and re-establishing normal autoregulation (Reckeweg 2000). Extreme care must be taken to avoid progressive vicariation in these patients. Vaccinations, which can alter red cell or thrombocyte surface antigens, and use of drugs that are not directly indicated should be avoided in these patients unless vital (Duval 1996, Dodds, 2005).

Appropriate homotoxicology formulas

Due to the severe nature of these homotoxicoses, many systems may be involved. The practitioner using biological therapies must be well versed to program these long-term cases (Smit 2004). Exact treatment programs depend upon the precise cause of the condition, which is usually difficult if not impossible to elucidate. The practitioner must evaluate the state of vicariation currently being manifested by a specific, individual patient, and use this data to direct therapy. Compositae antihomotoxic formulas are vital for success in these patients, and autosanguis therapy should be considered (Broadfoot 2004). In initial phases of therapy, where immunosuppression is desired, avoid use of immune stimulating antihomotoxic medicines such as *Echinacea compositum*, *Engystol-N*, and *Tonsilla compositum*. Once the condition is under control, such formulas may prove helpful in repairing damage, normalizing immune function, and leading to regressive vicariation.

Please note the following convention throughout this book: (1) Italicized and capitalized terms are Heel product names; (2) Capitalized, nonitalicized names involve product constituents. Agents are selected for therapeutic use which match the present symptoms or signs of the patient.

The following agents may be useful in approaching anemia and thrombocytopenia:

***Aletris heel*:** Exhaustion, anemias.

***BHI-Exhaustion*:** The ingredient *Cinchona officinalis* 4X assists in cases of exhaustion resulting from loss of blood (Heel 2002).

***China homaccord*:** Exhaustion, weakness, and collapse after blood or fluid loss.

***Coenzyme compositum*:** Support of cellular energy metabolism.

***Ferrum homaccord*:** A main remedy in cases of secondary anemia, anemia of iron deficiency, or anemia of chronic disorder wherein iron sequestration has occurred. May be used in inflammatory or febrile conditions, particularly after infectious disease (Bianchi 1995).

***Galium-Heel*:** Important phase remedy for both Impregnation and Degeneration phase homotoxicoses. Activates

the nonspecific defense mechanisms in cellular phases. This is a main remedy in all anemia cases.

***Glyoxal compositum*:** Decouples polymers, which block enzyme systems.

***Graphites homaccord*:** Exudative diatheses, petechial hemorrhages.

***Hepar compositum*:** Support of hepatic detoxification, drainage, and repair, as well as support for iatrogenic damage caused by corticosteroid therapy.

***Lymphomyosot*:** Support of endocrine and lymphatic function.

***Mucosa compositum*:** Support of mucous membranes, particularly related to damage from corticosteroid therapy. Phase remedy for Degeneration Phase disorders.

***Phosphor homaccord*:** Tendencies toward hemorrhage or bleeding (Reckeweg 2002).

***Pulsatilla compositum*:** Regulation rigidity cases and to reverse the iatrogenic damage from corticoids.

***Solidago compositum*:** Support of renal function and detoxification.

***Thryoidea compositum*:** Matrix drainage and endocrine support.

***Tonsilla compositum*:** Supports bone marrow, spleen, and immune function, and assists in repair in Impregnation Phase diseases. Broadfoot (2005) recommends *tonsilla* and *Traumeel-S* as a mixed autosanguis, with *Lymphomyosot*. In cases of acute chronic inflammation it is useful in preventing a trend toward Degeneration (Bianchi 1989).

***Traumeel S*:** Activation of inactive sulfur-containing enzyme systems, nonsteroidal anti-inflammatory effects, modulation of the inflammatory system.

***Ubichinon compositum*:** Support of cellular energy metabolism and mitochondrial repair. Para-benzoquinone should be considered in conditions with damage to the spleen and changes in the blood composition, and in states arising from removal of the spleen and in which auto-antigens (wild peptides) are involved, such as autoimmune diseases (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Glandular therapy: Blood, bone marrow, and immune support formulas at 1 tablet for each 25 pounds of body weight BID.

Energizing iron (liver extract plus iron): 1 capsule for every 25 pounds of body weight, maximum 4 capsules daily.

Betathyme: 1 capsule for each 35 pounds of body weight BID, maximum 6 capsules daily.

Folic acid: 50 micrograms for every 35 pounds of body weight

Fishoil: 1 tsp for each 20 pounds of body weight with meals.

Chinese herbal medicine

Immune-mediated hemolytic anemia (IMHA): The authors recommend Immuneregulator at 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs cited above, Immuneregulator also contains bamboo leaves (Zhu ye), coix (Yi yi ren), dendrobium (Shi hu), light wheat (Fu xiao mai), lotus seed (Lian zi xin), ophiopogon (Mai men dong), and poria (Fu ling). These herbs increase the efficacy of the cited herbs.

Immune-mediated thrombocytopenia (ITP): The authors recommend H13 at 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs listed above, this supplement contains angelica root (Dang gui), donkey skin gelatin (E jiao), fleece flower root (He shou wu), gardenia (Zhi zi), red peony (Chi shao), and spatholobus (Ji xue teng). These additional herbs enhance the formula's effectiveness.

Typically the authors try to avoid acupuncture treatments due to potential complications of hemorrhage. The combination of herbs and Western therapy is the usual approach to critical cases.

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Symptom formula: *Galium-heel*, *Ferrum homaccord*, *Phosphor homaccord*, *China homaccord*, *Traumeel*, *BHI Exhaustion*, PO BID.

Deep detoxification formula: *Lymphomyosot*, *Thyroidea compositum*, *Hepar compositum*, *Solidago compositum*, *Mucosa compositum*, *Coenzyme compositum*, *Ubichinon compositum*; PO EOD. *Glyoxal compositum* weekly.

IMMUNE-MEDIATED ARTHRITIS**Definition and cause**

Immune-mediated arthritis (rheumatoid) is an inflammatory, non-infectious polyarthritis. It occurs mainly in dogs 2 to 8 years of age, and less commonly in cats. Its basic form is defined as an exaggerated response of the immune system resulting in destruction of the joint via erosion or inflammation. The two forms, erosive and non-erosive, have the common underlying cause of an antigen/anti-

body reaction similar to rheumatoid arthritis (RA) in people. The underlying cause is a cellular and humeral exaggerated response from the immune system toward the joint tissue (Beale 1998, 2003; Goring 1993; Pederson 1976, 1983; Tizard 2004; Zvaifler 1979).

Immune-mediated arthritis affects the synovial tissue, as opposed to degenerative joint disease, which is categorized as inflammation and destruction of the cartilage. There are specific stages of classification of rheumatoid arthritis in people, which relate to dogs only because of the similarity of RA and immune-mediated arthritis. In cats, progressive polyarthritis is linked to feline leukemia (Pederson 1980).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Once the immune-mediated process begins, it is reported that there is no cure. The goal of medical therapy, therefore, is to improve the animal's day-to-day quality of life by reducing pain and inflammation and helping to prevent the immune destruction of joint tissues. Besides immunosuppressive drugs such as cortisone, azathioprine, and cyclophosphamide, NSAIDs such as aspirin, carprofen (Rimadyl), and other Cox2 inhibitors such as Metacam and Previcox are indicated. There has been some recent research regarding the use of essential fatty acids and their benefit in reducing inflammation and improving healing. As a result, some veterinarians are recommending the use of fatty-acid-rich oils in the treatment of arthritis (Campbell 1992, Darlington 2001, DeGroot 1998, Goring 1993, Levinthal 1994).

Anticipated prognosis

Because the etiology of immune-mediated arthritis is unknown, conventional treatment is directed toward suppressing the immune response and controlling pain. Because the medical approach does not address the underlying cause, the prognosis is poor and the disease will continue to progress and worsen (Beale 2003, Goring 1993, Pederson 1989).

Integrative veterinary therapies

While synovial tissue is the target tissue and the surface diagnosis is arthritis, the underlying mechanism is an exaggerated response via the immune system against its own tissue. The use of immune-suppressing drugs such as cortisone and chemotherapeutics, along with anti-inflammatory drugs such as NSAIDs, pays little attention to this underlying cause. An integrated approach to immune-mediated arthritis considers the immune system and the resultant inflammation and destruction of tissue.

Nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on the cells of the synovial tissue can often control the clinical signs, improve the day-to-day level of comfort, reduce pain, protect against the ongoing assault on the synovial cells, and in many cases reduce the need for and reliance on drugs that may have long-range, undesirable side effects (Little 2001).

Nutrition

General considerations/rationale

Immune-mediated arthritis is not a disease of the joints, but rather the cartilage, joint capsule, and synovium are the target organs of the immune attack. While medical therapy is focused upon the joints, nutritional therapies should focus upon reducing free-radical-incited inflammation, helping balance the glands of the immune system, and supplying the required nutrients for repairing damaged cells (Goldstein 2000, 2005).

Appropriate nutrients

Gland therapies: Glandular adrenal and thymus, glucosamine and chondroitin, and other intrinsic nutrients that can help reduce inflammation and protect target organs. The adrenal and thymus glands are integral to the immune response and are important in all autoimmune diseases (Goldstein 2000).

Betasitosterol: Plant-derived sterols that show anti-inflammatory and antipyretic properties and appear to be similar to corticosteroids and aspirin (Gupta 1980). In addition, sterols can enhance immune function. Sterols have been found to be able to enhance T-lymphocyte production and moderate B-cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Bouic 1996).

Vitamin C: Required for the synthesis of collagen and a potent antioxidant that is involved in the free radical and reactive oxygen species (see free radicals in Chapter 2), which result from normal metabolism as well as exposure to chemical and environmental chemicals and pollutants (Carr 1999). Vitamin C has been studied clinically in animals. Brown (1994), Berg (1990), and Newman (1995) reported on the benefits of vitamin C in the treatment of degenerative joint disease and movement in dogs and horses.

Super oxide dismutase (SOD): A potent destroyer of free radicals; can protect cells against oxidative damage (Petkau 1975, Fridovich 1972). McCord (1974) has reported that SOD can protect hyaluronate from free radical damage and may also have an anti-inflammatory effect (Salin and McCord 1975).

Glucosamine and chondroitin: Glycosaminoglycans (GAGS) such as chondroitin sulfate and glucosamine are

beneficial for cartilage repair. Clinical studies have demonstrated the effectiveness of glucosamine and chondroitin in the management of arthritis in dogs (Das 2000, Gaskell 2005). Stinker, et al. (1986) have described how these compounds stimulate the body's own repair mechanism and help in the process of developing new cartilage. Numerous double-blind studies have compared the effectiveness of glucosamine against various NAIADs, with glucosamine resulting in as good as, or in many cases, better pain control and improved symptoms associated with osteoarthritis (Prudden 1974, Brown 1981, Vaz 1982, DeAmbrosia 1982).

Chinese herbal medicine

General considerations/rationale

Arthritis is due to a combination of Wind, Damp, and Cold or Heat affecting the Kidneys. This leads to Qi and Blood stagnation. In the later stages there is Qi and Blood deficiency. The Chinese thought that Wind blew the pathogen into the body. It is also considered to be the reason why some patients experience migrating joint pain: it was as though the Wind was blowing the pathogen from place to place. The target organ was considered to be the Kidney because this organ is given the function of controlling bones in TCM.

In terms of traditional Chinese medicine, immune-mediated arthritis is a result of the accumulation of fluid (Damp) and inflammatory mediators in the joints. This manifests as swelling of the joints. The inflammatory mediators generate Heat in the joints, making them painful and even warm to the touch in some cases. Later on, the joint cools off and becomes stiff, yet still painful. Application of external heat to the joint often provides relief. At this stage, the ancient practitioners believed there was stagnation of the Qi and Blood. The treatment goals are to decrease inflammation, stop pain, and improve motility.

Appropriate Chinese herbs

Achyranthes (Niu xi): Has been found to have significant analgesic and anti-inflammatory effects in a variety of animals (Zhong Yao Tong Bao 1988).

Aconite (Chuan wu): Has anti-inflammatory and analgesic properties and seems to have a centrally mediated analgesic effect. In mice it was shown to be effective for decreasing inflammation and pain. It is stronger than aspirin in reducing inflammation (Xian Dai Zhong Yao Yao Li Xue 1997). Aconite controlled the signs in 92% of 150 human patients with arthritis when given in combination with Cao wu, Qiang huo, Du hua, Fu zi, Mo yao, Ru xiang, Dang gui, Chuan niu xi, Ma huang, Gui zhi, Wu gong, Chuan xiong, and Ma qian zi (Nei Meng Gu Zhong Yi Yao 1986).

Artemesia (Yin chen hao): Contains capillarin. This compound has been shown to have analgesic properties in mice and anti-inflammatory and antipyretic effects in rats (Wan 1987, Shan 1982).

Citrus (Chen pi): Has anti-inflammatory effects and has been shown to decrease vascular permeability and reduce inflammation in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

Cyperus, processed (Xiang fu zi): Has analgesic effects (Gui Yang Yi Xue Yuan Xue Bao 1959) and is 6 times stronger than aspirin at relieving fever in rats (Gupta 1971).

Frankincense (Ru xiang): Has boswellic acids that have demonstrated anti-inflammatory effects both in vivo and in vitro. These decrease capillary permeability and stabilize mast cells (Roy 2006, Pungle 2003). Frankincense also has analgesic properties (Zhong Yao Xue 1998, 539:540). It decreases signs of arthritis in dogs and humans (Reichling 2004, Kimmatkar 2003).

Milettia (ji xue teng): Helps to regulate the immune system. It inhibits the cell-mediated immunity by inhibiting T-lymphocyte blastogenesis and decreasing interleukin-2 activity (Yang 1997, Xu 1993).

Myrrh (Mo yao): A very good analgesic, especially when combined with ru xiang (Zhong Yao Xue 1998, 541:542).

White peony (Bai shao): Has been shown to have analgesic effects (Shang Hai Zhong Yi Yao Za Zhi 1983). It contains paeoniflorin, which is a strong antipyretic and anti-inflammatory (Zhong Yao Zhi 1993).

Acupuncture

Relief of musculoskeletal disorders is one of the most common reasons why humans seek acupuncture. The World Health Organization has placed musculoskeletal disorders on their list of conditions responsive to acupuncture (World Health Organization 2006).

Homotoxicology

General considerations/rationale

Acute polyarthritis is an Inflammation Phase disorder. More chronic immune-mediated arthritides are Impregnation Phase to Degeneration Phase homotoxicoses. Alteration of matrix elements leads to improper host immune responses, which damage rather than protect tissues. Basic biological therapy can be very rewarding in many of these cases. Dietary therapy can yield remarkable results in cases involving adverse reactions to food or true food allergy. Vaccination can be associated with polyarthritis syndromes, and if recent vaccination is in the medical history, then steps should be taken to address their presence.

Autosanguis may present a perfect modality in such cases. Careful search for occult infections can be impor-

tant to successful outcomes. In many cases a complete dental evaluation yields chronic dental disease with periapical or periodontal abscessation. Proper treatment of these lesions can lead to total resolution of the autoimmune disorder, but caution should be exercised following such a circumstance so that other agents are not given which could aggravate the patient and shift them to progressive vicariation.

Compositae remedies play largely in homotoxicoses right of the biological divide. Autosanguis therapy is particularly useful in these cases because blood elements may be present that are actively associated with the disease process. The author has several cases of polyarthritis associated with recent vaccination, which resolved quickly using autogenous blood therapy (Palmquist 2003).

Appropriate homotoxicology formulas

Aconitum Homaccord: Acute cases, particularly if they are accompanied by fever or generalized erythema.

Asuraneel: In severely ill patients, in marked regressive vicariations.

Berberis homaccord: Detoxification and support of urinary and hepatic systems.

BHI-Arthritis: Arthritic support alternated with *Zeel* (for joint repair, joint pain relief).

Bryaconeel: Rheumatic pain, inflammation, influenza-like conditions, myalgia/neuralgia, tearing pains (e.g. after a sports injury) with damage to synovial and fibrous tissue and muscles, intercostal pains (Reckeweg 2002).

Causticum compositum: Weakness, paresis, neuralgias. Suited for Impregnation Phase with arthrosis, cracking of joints, and stiffness (Reckeweg 2002).

Coenzyme compositum: Energy metabolism support.

Colocynthis homaccord: Pain from arthrosis or neuritis, particularly lumbosacral location.

Cruroheel: Soft tissue pain and inflammation, particularly in hind limb, tarsal region issues.

Discus compositum: Widely useful for musculoskeletal ailments of varying descriptions (Broadfoot 2003). Contains berberis vulgaris (joint pain, heaviness of limbs, drawing and tightness of muscles), Cartilago suis (rheumatoid: intra- or peri-articular) (Reckeweg 2002).

Echinacea compositum: Fever, bacterial infections.

Engystol N: Matrix drainage and immunostimulation, particularly in viral infections or allergies.

Ferrum homaccord: Shoulder pain, anemia, rheumatism.

Galium-Heel: Cellular detoxification and repair, activation of the nonspecific host defenses, support in vaccine reactions, renal tubular support. Phase remedy in Deposition and Degeneration Phase conditions.

Gelsemium homaccord: Rear leg weakness and pain (Demers 2005).

Graphites homaccord: Rheumatism with joint deformities.

Hepar compositum: Hepatic drainage and support, relief of iatrogenic damage from corticosteroid therapy.

Lymphomyosot: Detoxification, drainage, and immune support of lymphoreticular system.

Neuralgo-rheum: Rheumatism and neuralgia, particularly in cold weather.

Nux vomica homaccord: Detoxification and support of liver and gastrointestinal systems.

Rheuma-Heel: Soft tissue and periarticular conditions.

Rhododendroneel: Extremity arthritic pain. Contains benzoic acid for shifting pains, periodically and at rest, sleep disturbed between 2 and 4 a.m. (Reckeweg 2002).

Solidago compositum: Urinary tract support and drainage.

Spascupreel: Muscle spasms and associated pain.

Tonsilla compositum: Activation of reticuloendothelial elements in deeper homotoxoses.

Thuja forte: Vaccination-related disorders. (Thuja is also present in Galium-heel).

Thyroidea compositum: Deep matrix drainage and detoxification and hormonal support. Contains funiculus umbilicalis suis, which is indicated for autoimmune problems.

Traumeel S: This remedy is indicated in all cases because it relieves pain and reduces inflammation and corresponding joint injury while modulating the inflammatory reaction. In acute cases it can be given by injection, IV, IM, or subcutaneously, and then followed every 15 minutes orally as an oral drop or tablet. It is available in a topical cream and gel, which is well tolerated by veterinary patients.

Ubichinon compositum: Mitochondrial energy production/autoimmune issues.

Authors' suggested protocols

Nutrition

Gland therapy: Cartilage and immune support formulas at 1 tablet for 25 pounds of body weight BID.

SOD: Follow manufacturers suggested dosage.

Vitamin C: 100 mgs per 10 pounds of body weight BID.

Betathyme: 1 capsule for each 35 lbs of body weight BID (maximum 3 capsules BID).

Chinese herbal medicine

Rheumatoidin: 1 capsule for each 10 to 20 pounds of body weight BID. In severe cases the dose may be increased to effect. Rheumatoidin also contains aconite (Cao wu), astragalus (Huang qi), atracylodes (Bai zhu), aurantium

fruit (Zhi qiao), centipede (Wu gong), eupolyphaga (Di bie chong), hornet's nest (Feng fang), poria (Fu ling), saussurea (Mu xiang), and scorpion (Quan xie). These herbs help balance the formula and increase the efficacy of the herbs mentioned above.

The authors recommend the following acupoints: GV20, Baihui, LI11, PC6, GB30, ST36, SP6, BL20, BL22 and BL23 as generalized points. The patient may also benefit from local treatment of local points.

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for small dog or cat)

Acute case symptom formula: *Traumeel*, *Zeel*, or *BHI arthritis*, *Aconitum homaccord*, *Rhododendroneel* (polyarthritis of extremities), *Colocynthis homaccord* (if severely painful particularly lumbar pain), *Echinacea compositum* (if infection or vaccination suspected), *Engystol N* (if viral suspected). Give PO every 15 to 30 minutes until relief, then BID to TID as needed.

Acute case detoxification formula: *Lymphomyosot*, *Nux vomica homaccord*, *Berberis homaccord*. Give PO BID 30 to 60 days.

Chronic case symptom formula: *Traumeel*, *Galium-heel*, *Zeel*, *Bryaconeel*, *Rhododendroneel* (polyarthritis of extremities), *Colocynthis homaccord* (if severely painful particularly lumbar pain), *Echinacea compositum* (if infection or vaccination suspected), *Engystol N* (if viral suspected). Give PO every 15 to 30 minutes until relief, then BID to TID as needed.

Chronic case deep detoxification formula: *Lymphomyosot*, *Hepar compositum*, *Thyroidea compositum*, *Solidago compositum*, *Tonsilla compositum*, *Coenzyme compositum*, *Ubichinon compositum*. Give PO EOD to E3D for 60 to 120 days.

SYSTEMIC AND CUTANEOUS (DISCOID) LUPUS

Definition and cause

Systemic lupus erythematosus is an autoimmune disease that can affect many organ systems and result in many signs and conditions such as those of the skin, joints, kidneys, blood etc. Both systemic lupus erythematosus (SLE) and the less severe cutaneous lupus erythematosus (CLE or discoid) result from an exaggerated immune response. Commonly affected breeds are Labradors, Collies, Shetland Sheepdogs, and German Shepherds. Lupus is less common in cats (Halliwell 1989; Lewis 1989; Friberg 2006; Jackson 2004, 2006; Peterson 1991; Rosenkrantz 1993).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

As an immune-mediated disease, SLE is treated with cortisone and when necessary with chemotherapeutics such as azathioprine, cyclophosphamide or chlorambucil. CLE is much more responsive to lower doses of cortisone along with adequate levels of essential fatty acids and vitamin E. More care must be taken in cats due to their susceptibility to drug side effects (Scott 1995).

Anticipated prognosis

Systemic lupus offers a poor prognosis because of either the direct side effects of the immunosuppressive drugs or secondary complications such as glomerular nephritis or anemia. CLE can usually be brought under control with less likelihood of secondary organ complications (Scott 1995, Halliwell 1989).

Integrative veterinary therapies

As is common with many autoimmune diseases, the medical approach focuses on suppression of the immune response, and in the case of SLE, support of secondary organ disease such as kidney disease or anemia. Integrative veterinary therapies expand the approach to support and help balance the glands of the immune system as well as the animal's emotional well-being. In addition, the focus is on neutralizing the antibody attack upon the target organs (skin, kidneys, blood) to help achieve remission; however, the prognosis is still guarded for SLE (Bardana 1982, Cooke 1985, Gershwin 1984, Newbold 1976, Segal 2004, Simopoulos 2002, Vien 1988).

Nutrition

General considerations/rationale

The nutritional approach is aimed at reducing inflammation and supporting associated organs that have been

affected by the autoimmune attack. Support of bone marrow, liver, heart, skin, and kidney is often indicated. In addition, the nutritional support of the organs of elimination, such as the liver and kidneys, helps the body eliminate accumulated toxins that can increase free radical load and propagate inflammation.

Appropriate nutrients

Glandular therapy in support of immune system organs: Adrenal, thymus, lymph and bone marrow. In addition, based upon disease presence, other organ support such as for the skin, liver, kidney, and heart may be indicated.

Note: Lupus can be severe and involve multiple organs. It is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This allows for a more specific gland and nutritional support protocol (See Chapter 2, Nutritional Blood Testing, for more information).

Betasitosterol: Plant-derived sterols show anti-inflammatory and antipyretic properties that appear to be similar to corticosteroids and aspirin (Gupta 1980). In addition, sterols can enhance immune function. Sterols have been found to be able to enhance T-lymphocyte production and moderate B cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Bouic 1996).

Quercetin: Functions like an antihistamine as well as a potent antioxidant. It has been shown to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). This, therefore, is beneficial in the treatment of allergic conditions.

Vitamin C: Has been confirmed via clinical trials to be a potent antioxidant and a balancer of immune function. Regarding immune function, vitamin C has been shown to stimulate production of interferon and natural killer cells (NK) and to increase production of other antioxidant enzymes (Bendich 1995, Carr 1999, Padayatty 2004).

Vitamin A: Has been shown to be beneficial to the skin, helps balance and improve immune function, and helps minimize chemotherapy side effects (McCullough 1999, Semba 1998). As a potent antioxidant, vitamin A is also cell and tissue protective in that it acts as a free radical scavenger (See free radicals in Chapter 2). In this area of free radical scavenger and inflammation reduction, vitamin A can be therapeutically beneficial in treating chronic degenerative diseases such as cancer, arthritis, and autoimmune and skin disease. It also can be beneficial for exposure to environmental pollutants (Halliwell 1994).

Vitamin E: As a potent antioxidant, vitamin E's primary function is to neutralize free radicals and reduce inflammation, particularly as it affects the oxidation and destruction of lipids (Traber 1999).

Chinese herbal medicine

General considerations/rationale

Lupus is a combination of Wind, Heat, and Toxins invading the body. TCM treats the various manifestations of systemic lupus as separate diseases. In general, the signs are caused by inflammation and toxins in the body. The toxins in this case are the inflammatory mediators released by the immune system of the affected animal. These inflammatory toxins cause rashes in the dermatological presentation or accumulation of fluids or swelling in the joints. The renal presentation is due to accumulation of the immune complexes in the kidney. The resultant renal failure leads to further toxin accumulation in the body.

Treatment is aimed at decreasing the inflammation and controlling secondary effects such as anemia and hypertension from renal disease and skin infections from secondary invaders.

Appropriate Chinese herbs

For dermatological manifestations, the following herbs may be useful:

Bupleurum (Chai hu): Decreases dimethyl benzene-induced auricular concha inflammation in mice (Liu 1998). It may help to decrease skin inflammation in lupus.

Dandelion (Pu gong ying): Inhibits various bacteria including *Staphylococcus aureus* and B-hemolytic streptococci (Zhong Yi Yao Xue Bao 1991). It may help prevent secondary bacterial infections of dermal lesions.

Earthworm (Di long): Enhances the growth of fibroblasts, capillaries, and collagenous fibers in the skin. This promotes wound healing (Zhang 1999).

Fleece flower root (He shou wu): Increases the hormonal secretion by the adrenal gland (Zhong Yao Yao Li Yu Lin Chuang 1989). This may mimic the administration of corticosteroids.

Honeysuckle (Jin yin hua): Contains chlorogenic acid and isochlorogenic acid, both of which have strong antibacterial properties. Among the bacteria inhibited are *Staphylococcus aureus* and b-hemolytic streptococci (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). This may help to reduce secondary infections.

Kochia (Di fu zi): Has been shown to inhibit the growth of some dermatophytes (Yun Nan Zhong Yao Zhi 1990).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid. These compounds have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991).

Moutan (Dan pi): Inhibits various bacteria including *Staphylococcus aureus* and b-hemolytic streptococci (Zhong Yao Cai 1991). It contains paeonol, which has decreased the mass of immune organs and prevented splenic lymphocyte proliferation in mice. It also inhibited

delayed hypersensitivity reactions in the mice (Wang 1992). These properties suggest that it may be useful in immune-mediated diseases. It may be able to down regulate the immune system.

Poria (Fu ling): Has antibacterial efficacy and has been shown to inhibit *Staphylococcus aureus* (Nanjing College of Pharmacy 1976).

Rehmannia (Sheng di huang): Increases the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998). This may have the effect of increasing serum corticosterone levels and calming the excessive immune response.

Scutellaria (Huang qin): Contains biacalin which has antibiotic activity against *Staphylococcus aureus* and *b-hemolytic streptococcus* and some dermatophytes (Zhong Yao Xue 1988, Liu 2000). This may help prevent secondary infection of the dermal lesions.

Siegesbeckia (Xi xian cao): Decreases both humoral and cellular immunity in mice (Zhong Guo Zhong Yao Za Zhi 1989).

White peony (Bai shao): Inhibits a variety of bacteria including *Staphylococcus aureus* and *b-hemolytic streptococci*. It also has activity against some dermatophytes (Xin Zhong Yi 1989).

For renal manifestations the following herbs may be useful:

Achyranthes (Niu xi): Has anti-inflammatory effects. It decreases egg white-induced foot swelling in rats (Xong 1963).

Angelica root (Dang gui): As strong as aspirin in decreasing inflammation (Yao Xue Za Zhi 1971).

Astragalus (Huang qi): Can increase serum albumin and decrease proteinuria, which in turn helps to preserve amino acids, and improves the dysfunctional protein metabolism in glomerulopathy (Zhou 1999). Renal failure is often associated with hypertension. Astragalus has demonstrated ability to lower the blood pressure of cats, dogs, and rats under anesthesia (Modern TCM Pharmacology 1997, Xu 1999, Luo 1999).

Cnidium (Chuan xiong): Dilates blood vessels and reduces blood pressure (Zhong Yao Yao Li Yu Ying Yong 1989). It also inhibits blood platelet aggregation induced by ADP, collagen, and thrombase (Pharmaceutical Industry Research Institute of Beijing 1977).

Codonopsis (Dang shen): Can increase the hematocrit and lower blood pressure (Zhong Yao Xue 1998).

Corn silk (Yu mi xu): Has been shown to lower blood pressure in dogs (Zhong Yao Da Chi Dien 1037). In a trial involving 9 people with chronic nephritis, 3 recovered completely and 2 improved after 2 weeks to 6 months. Kidney function improved, edema was reduced, and proteinuria decreased (Zhong Hua Yi Xue Za Zhi 1956).

Eucommia bark (Du Zhong): Lowers blood pressure. The zinc:copper ratio in RBC is elevated in hypertensive

people as compared to individuals with normal blood pressure. Eucommia can lower the zinc:copper ratio and the blood pressure (Wang 1997).

Giant knotweed root (Hu zhang): Lowers blood pressure (Xi An Yi Ke Da Xue Xue Bao 1982). It also has anti-inflammatory properties (Zhong Guo Yi Yuan Yao Xue Za Zhi 1988).

Honeysuckle (Jin yin hua): Has demonstrated anti-inflammatory effects in mice and rabbits (Shan Xi Yi Kan 1960).

Imperata (Bai mao gen): Has been used to treat renal inflammation. In one trial 11 children with acute nephritis were treated with imperata. Nine recovered completely and 2 showed moderate improvement. Edema and hypertension resolved and hematuria and proteinuria cleared (Guang Dong Yi Xue 1965).

Leonurus (Yi mu cao): May protect the kidney. In one experiment it was shown to decrease renal damage in gentamicin-induced acute renal failure in rats (Xia 1997).

Moutan (Mu dan pi): Possesses anti-inflammatory properties. In mice, it can prevent dimethylbenzene-induced ear inflammation and carrageenin-, formaldehyde-, or egg white-induced foot swelling (Wu 1990). Moutan can decrease blood pressure (Liao Ning Yi Xue Za Zhi 1960).

Phellodendron (Huang bai): Decreases blood pressure (Zhong Guo Yao Li Xue Tong Bao 1989).

Rehmannia (Sheng di huang): Lowers blood pressure (Zhong Yao Xue 1998).

Salvia (Dan shen): Controlled the signs of 70% of 48 patients with chronic nephritis in one study (Shang Hai Yi Yao Za Zhi 1981). It also reduces blood pressure (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1991).

Scrophularia (Xuan shen): Can lower blood pressure (Gong 1981).

White atractylodes (Bai zhu): Can increase the proliferation rate of CFU-E and BFU-E colonies (Hou 1999). This may make it useful for treating anemia associated with kidney failure. It also decreases the degeneration rate of the kidney (Jing 1997). This effect may help protect the kidney from damage from the immune complex deposition.

Wolfberry (Gou qi zi): Has several functions in an herbal supplement designed for renal disease. It increases the production of red blood (Zhong Yao Xue 1998) and decreases blood pressure (Zhong Yao Zhi 1984).

For skeletal manifestations the following herbs may be of use:

Achyranthes (Niu xi): Has demonstrated analgesic effects in experiments using hot plates in mice (Li 1999).

Aconite (Chuan wu): Has a centrally mediated analgesic effect. In mice it was shown to be effective for decreas-

ing inflammation and pain. It is stronger than aspirin at reducing inflammation (Xian 1997) and has been used successfully for arthritis pain. It controlled the signs in 92% of 150 human patients with arthritis when given in combination with Cao wu, Qiang huo, Du hua, Fu zi, Mo yao, Ru xiang, Dang gui, Chuan niu xi, Ma huang, Gui zhi, Wu gong, Chuan xiong, and Ma qian zi (Nei Meng Gu Zhong Yi Yao 1986).

Citrus (Chen pi): Was shown to have bidirectional effects on the immune system of guinea pigs. It increased serum lysozyme levels and the number of cardiac blood T-lymphocytes but also inhibited the T-lymphocyte transformation rate (Jin 1992). This indicates that it may have the ability to regulate the abnormal immune system, possibly decreasing excessive action while enhancing suppression.

Cyperus (Xiang fu zhi): Has been shown to have analgesic effects in mice (Gui Yang Yi Xue Yuan Xue Bao 1959).

Mastic (Ru xiang): Contains boswellic acids which have anti-inflammatory effects (Roy 2006). It has been used to decrease signs of arthritis in dogs (Reichling 2004) and humans (Kimmatkar 2003).

Milettia (Ji xue teng): Depresses cellular immunity. It inhibits T-lymphocyte blastogenesis and interleukin-2 activity (Yang 1997, Xu 1993). This may help decrease the hyperactive immune activity seen in lupus.

Myrrh (Mo yao): A very good analgesic, especially when combined with mastic (Ru xiang) (Zhong Yao Xue 1998).

Oriental wormwood (Yin chen hao): Has analgesic and anti-inflammatory effects. It contains 6, 7-dimethoxy coumarin which has shown analgesic effects on acetic acid-induced body twisting and anti-inflammatory effects on carrageenin-induced foot swelling in rats (Wan 1987, Shan 1982).

White atracylodes (Bai zhu): Has been shown to be effective in humans in treating chronic back and leg pain (Hu Bei Zhong Yi Za Zhi 1982).

White peony (Bai shao): Contains paeoniflorin which is a strong anti-inflammatory (Zhong Yao Zhi 1993). This may help decrease pain.

Acupuncture

Some patients with lupus seem to respond to a combination of herbal formula and acupuncture. Thirty-two people with a diagnosis of SLE were treated with a formula containing aconite (Cao wu), buck grass (Shen jin cao), cinnamon (Gui zhi), epimedium (Xian lin pi), licorice (Gan cao), schizonepeta (Jing jie), scrophularia (Xuan shen), and siler (Fang feng) along with acupuncture. The points chosen included GV 20, GB 20, GV 14, LI 11, LI 4, BL 23, ST 36, SP 1, and Liv 3. More than half of the patients reported significant decreases in the signs,

and another 28% reported some improvement (Wang 1998).

Homotoxicology

General considerations/rationale

These are Degeneration Phase disorders wherein the tissue undergoes significant damage associated with autoaggressive attack by the host immune system (Reckeweg 2000). Multiple tissues and organ systems may be involved and treatment must be individualized for each case. Care should be taken to thoroughly diagnose these cases so that occult infections are detected and resolved. Dental disease or kidney infections can potentiate autoaggression (Emily 1982). Efforts are made to rehabilitate energy metabolism, drain the matrix, and allow for oscillation between inflammation and repair stages.

Appropriate homotoxicology remedies

Numerous antihomotoxic formulas may be needed because these patients move through their disease cycles. There are no canine or feline studies from which a protocol can be designed. One successfully managed case of canine discoid lupus involved use of the deep detoxification formula listed below in conjunction with niacinamide and vitamin E. In that case both vitamin and homotoxicology formulas were needed to resolve the symptoms (Palmquist 2005).

Major remedies that have theoretical usefulness are listed below:

Abropermol: Hyperkeratosis, hyperhydrosis, pigmented skin, vascular disease, swollen glands.

Aesculus compositum: Assists with peripheral circulation.

Arsuraneel: Contains Condurango indicated for cracks and ulcers on lips.

BHI stramonium complex: contains Aurum iodatum and sulphur.

Causticum compositum: Burns or burn-like lesions on the skin. This is helpful for some cases of discoid lupus, particularly as they are worsened in UV light.

Coenzyme compositum: Cytosol energy metabolism. Contains nicotinamidum indicated for pigmentary disturbances and stomatitis.

Cruroheel: Used intermittently to preserve tendon health.

Cutis compositum: Repair and detoxification of the skin.

Galium-Heel: Main formula for cellular phase diseases. Drains the cell and deep matrix, and stimulates repair mechanisms. Supports kidney tubules. Contains Thuja occidentalis, which is helpful in many cases of vaccine-associated disease.

Hepar compositum: Liver support and drainage.

Lamioflur: In cases involving gastrointestinal or urogenital mucocutaneous junctures.

Lymphomyosot: Lymph drainage and immune system support.

Hormeel: Normalization of hormonal patterns.

Mucosa compositum: Support and drainage of mucosal elements. Contains Condurango indicated for cracks and ulcers on lips.

Placenta compositum: Promotes vascular repair. See Vitiligo protocol (Heel 2003).

Psorinoheel: Drainage of dermatological homotoxins and in deep cases of constitutional disease. Cracked, peeling lips, nodules, vesicles, diffuse red patches, internal soreness and dryness of nose (Reckeweg 2000).

Traumeel: Anti-inflammatory.

Ubichinon compositum: Mitochondrial rehabilitation. Contains nicotinamidum indicated for pigmentary disturbances, and stomatitis.

Thyroidea compositum: Matrix drainage as regressive vicariation begins. Support of thyroid and thymus glands and metabolism.

Solidago compositum: Renal support, glomerulonephritis.

Zeel: Joint pain.

Authors' suggested protocols

Nutrition

Nutrition/glandular therapy: Immune and Lymph support formulas at 1 tablet for 25 pounds of body weight BID. In addition Liver, Kidney, Skin, Heart or Bone Marrow support formulas may be indicated.

Quercetin tablets: 35 mg for each 10 pounds of body weight daily.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum 2 capsules BID).

Fishoil: 1 tsp for every 20 pounds of body weight.

Chinese herbal medicine

In TCM, the presentation of the disorder is treated, not the etiology. In disease processes such as lupus, where multiple organ systems are affected, multiple formulas may be used. The authors use 1, 2 or all 3 of these formulas simultaneously depending upon the presenting signs.

For cutaneous manifestations, the authors recommend ImmunoDerm at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs cited above, ImmunoDerm contains angelica root (Dang gui), atractylodes (Cang zhu), buffalo horn shavings (Shui niu jiao), oldenlandia (Bai hua she cao), tokoro (Bi xie), and xanthium fruit (Cang er zi) to help improve efficacy of the formulation.

For renal manifestations, the authors recommend H87 Shar pei fever at a dose of 1 capsule per 10 to 20 pounds twice daily. This supplement is designed for renal disease with an immune component. In addition to the herbs

above, H87 contains areca peel (Da fu pi), ciborium (Gou ji), fleece flower root (He shou wu), fossil bones (Long gu), isatis root (Ban lan gen), oldenlandia (Bai hua she cao), ophiopogon (Mai dong), oyster shell (Mu li), poria (Fu ling), pyrola (Lu xian cao), and tortoise plastron (Gui ban) and carapace (Bie jia).

For skeletal manifestations, the authors recommend Rheumatoid arthritis at a dose of 1 capsule per 10 to 20 pounds twice daily. Rheumatoid arthritis contains aconite (Cao wu), astragalus (Huang qi), aurantium fruit (Zhi qiao), centipede (Wu gong), eupolyphaga (Di bie cong), hornet's nest (Feng fang), poria (Fu ling), saussurea (Mu xiang), and scorpion (Quan xie). These herbs complete the formula.

Homotoxicology (Dose: 10 drops or 1 pill for 50-pound dog; 5 drops for 10-pound dog or cat)

Symptom Formula: *Galium-Heel*, *Lymphomyosot*, *Psorinoheel*, *Aesculus compositum*, *Abropernol*, *Causticum compositum* (if ulcerated) PO BID.

Deep detoxification formula: *Lymphomyosot*, *Hepar compositum*, *Solidago compositum*, *Thyroidea compositum*, *Ubichinon compositum*, used for 60 to 120 days or longer as indicated by patient response.

Cutis compositum intermittently PO Q3D as needed.

Coenzyme compositum, *Ubichinon compositum*, *Placenta compositum*, *Testes compositum*, OR *Ovarium compositum* (use gender appropriate formula). PO or injected SQ or IM Q3D.

In discoid lupus, depigmented areas on the nose can be treated with a mixture of *Lymphomyosot* gel and *Traumeel* gel, applied sparingly to small areas every other day (Broadfoot 2003). NOTE: This can trigger regressive vicariation. If a patient so treated becomes lethargic do not repeat until recovery is noted. This is not an adverse reaction but signals major clearance of homotoxins. Do NOT treat ulcerated or large areas with this mixture because excessive homotoxins can be released. Discoid lupus cases should receive vitamin E, niacinamide, Standard Process Veterinary Formulas Hepatic Support (or other liver support formula), and tetracycline may be required as well as immunosuppressive agents, depending upon case response.

PEMPHIGUS

Definition and cause

The pemphigus complex, consisting of pemphigus vulgaris, foliaceus, erythematosus, and vegetans, all have a common underlying autoimmune cause and the formation of antibodies that attack the outer layers of the skin, resulting in blisters, sores, pustules, crusting, and ulcerations. The different forms are usually diagnosed via histopathology. The complex is common in Chows, Newfoundlands, Dachshunds, Collies, and Dobermans; it occurs much less commonly in cats (Halliwell 1989, Muller 1989, Swartout 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical treatment for pemphigus is usually lifelong use of immune-suppressing drugs such as corticosteroids, many times in combination with chemotherapeutics, such as azathioprine, chlorambucil, cyclophosphamide or cyclosporine, along with topical applications of shampoos and medicated salves (Halliwell 1991, Swartout 2003, Thompson 1989).

Anticipated prognosis

The prognosis is related to the pemphigus type. Erythematosus and vegetans are controllable with low-dose cortisone, whereas vulgaris and foliaceus are potentially more serious and likely to become systemic. There are also more chances of serious secondary side effects due to prolonged use of immunosuppressing drugs. It has been reported that approximately 50% of all pemphigus animals respond well to cortisone alone, while others require additional chemotherapeutics or immunosuppressants (Scott 1995, Muller 1989).

Integrative veterinary therapies

Generally with autoimmune diseases, the medical approach focuses on immune suppression and secondary complications. In most cases, lifelong medication is required. Integrative veterinary therapies consider all aspects of the animal, including the skin (target organ) and the glands of the immune system, and help to balance

the emotions (sense of well-being). Helping to balance and nourish the immune system, which includes helping to neutralize antibody attack of the target organ, can often help prevent recurrences of the disease and other system autoimmune signs (Cargill 1993; Dodd 1992, 1993).

Nutrition

General considerations/rationale

Therapeutic nutrition focuses on reducing of inflammation and preventing secondary skin infections, which helps to counteract and protect the organ systems from the long-term use of antimicrobials and immune-suppressing drugs and supports and balances the compromised immune system glands.

Appropriate nutrients

Nutrition/gland therapy: Glandular adrenal, thymus, and lymph supply intrinsic nutrients required by these organs. These nutrients help to neutralize a cellular immune attack, thereby sparing these organs from ongoing inflammation and eventual degeneration (See Chapter 2, Gland Therapy, for more details).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes. Lecithin, as a part of the cell membranes, is an essential nutrient required by the skin and all of the body's cells for general health and wellness (Hanin 1987).

Alpha lipoic acid (ALA): Involved in mitochondrial activity and referred to as the "universal antioxidant." As a potent antioxidant it has been proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, Coenzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Scholich 1989).

In the treatment of autoimmune encephalomyelitis (a model used in multiple sclerosis research), Marracci (2002) and Morini (2004) found that ALA slowed progression of the autoimmune response and the disease process. Free radical inflammation is implicated as the initiator of many disease processes that are discussed in the book. ALA and other antioxidants have been proven to reduce this initiation of inflammation, and therefore are indicated in the prevention of many of these disease conditions.

Dimethylglycine: N,N-Dimethylglycine (DMG) is naturally produced by the body and has been clinically proven to support and enhance immune function. It has also been found to improve cellular oxygenation and circulation, and it helps remove toxins. The latter is quite important in dealing with chronic and autoimmune skin conditions (Verdova 1965). DMG has immune-modulating ability and has been clinically proven to increase both tumor

necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988).

Chinese herbal medicine

General considerations/rationale

In TCM terms, pemphigus is caused by Wind, Heat, and Toxins invading the body. This leads to Qi and Blood stagnation in Liver and Qi and Yin deficiency. The Western translation of the etiology of pemphigus uses the term inflammation in the skin to mean Heat. Toxins are the inflammatory mediators from immune cells. These chemicals act on the skin to cause the typical signs of blisters, ulcers, and crusting. These lesions can then become infected with bacteria or fungi.

The ancient Chinese believed that Wind helped blow the disease into the body and spread it around. The protective Qi or Wei Qi keeps the individual healthy. This can be translated into the proper function of the immune system in protecting the individual. In the case of pemphigus, the Wei Qi or protective Qi is deficient. In Western terms, the underlying cause of the lesions is the dysregulation of the immune system. Blood and Qi stagnation can lead to pain, and many patients have painful skin lesions. In addition, the stagnation of the Blood leads to the discoloration of the skin seen in these patients.

Yin deficiency meant lack of fluids to cool the patient to the ancient Chinese. Yin-deficient patients could have dry skin. There may be a low-grade fever due to lack of fluids to cool the body. To treat the patient the doctor must regulate the immune system (Wei Qi) and decrease the toxicity from the inflammatory mediators and the secondary invaders.

Appropriate Chinese herbs

Atractylodes (Cang zhu): Has activity against *Staphylococcus aureus* and some dermatophytes (Zhong Yao Xue, 1998).

Angelica radix (Dang gui): Has been used to treat a variety of dermatological disorders with excellent results (Shan Xi Yi Yao Za Zhi, 1975).

Bupleurum (Chai hu): Has anti-inflammatory effects (Zhong Yao Yao Li Yu Ying Yong 1983 Liu Wei 1998).

Dandelion (Pu gong ying): Has antibacterial effects against *Staphylococcus aureus*, B-hemolytic streptococci, and *Pseudomonas aeruginosa* (Zhong Yi Yao Xue 1991).

Earthworm (Di long): Enhances the healing rate of skin lesions (Zhang Feng Chun 1999).

Honeysuckle (Jin yin hua): Contains many compounds with antibacterial activity. The strongest among these are chlorogenic acid and isochlorogenic acid. This herb can help to control secondary bacterial infections by *Staphylococcus aureus*, B-hemolytic streptococci, *E. coli*, and

Pseudomonas aeruginosa (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960).

Licorice (Gan cao): Can inhibit the immune system. Glycyrrhizin and glycyrrhetic acid have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Yao Xue 1991).

Poria (Fu ling): Inhibits *Staphylococcus aureus*, a common skin inhabitant, and can help prevent secondary infections (Nanjing College of Pharmacy 1976).

Rehmannia (Sheng di huang): Has anti-inflammatory effects. Both water and alcohol extracts decrease inflammation in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

Scutellaria (Huang qin): Contains flavones, which have an anti-inflammatory action (Cao Zhi Sheng 1999).

White peony (Bai shao): Contains paeoniflorin, a strong anti-inflammatory compound (Zhong Yao Zhi, 1993).

Homotoxicology

General considerations/rationale

These are Degeneration Phase homotoxicoses, and as such, may not be clinically reversible. Several approaches can be taken, depending upon the treatment goals. Simply detoxifying and supporting these patients may make them feel better and assist with managing side effects of immunosuppressive, chronic allopathic drug therapy. In cases in which it is desirable to attempt cure, the owners must be well advised that this may not be possible and will entail long periods of itching, discharge, and other biological processes which occur during tissue repair. Such treatment is purely experimental; there are no cases of cure in the veterinary literature. The use of other medications may well interfere with necessary biological processes and can cause progressive vicariation. In one case it was observed that a canine patient lived comfortably while under biological therapy, and deteriorated rapidly once placed on immunosuppressive drugs. The protocol listed below is based on this single case (Palmquist 2005). All these circumstances need to be thoroughly discussed with the owner before a course of therapy is chosen.

Appropriate homotoxicology remedies

Because of the wide variety of other signs that can occur, many possible remedies may be used to manage pemphigus vulgaris. While no published veterinary cures exist, applications of basic biological therapy principles apply. Autosanguis therapy should be considered where allowed by law. Several commonly used remedies are listed below:

Abropemol: Eczema, erythema multiforme, hyperkeratosis, hyperhidrosis.

Aesculus compositum: Apis and Dulcamara address swelling and itching, and this formula promotes healthier vascular functions.

BHI Skin: Blisters, eczema, rashes, and hives (Heel 2002).

Causticum compositum: Ulcerated or burned appearing lesions.

Coenzyme compositum: Supports cellular energy metabolism.

Cutis compositum: Support and drains skin in all phases.

Echinacea compositum: Bacterial infections and immune modulation, particularly in regressive vicariation stages.

Engystol N: Sulfur-containing formula that is indicated in allergic skin conditions and to increase immune function, particularly in viral disorders.

Galium-Heel: Important phase remedy for both Impregnation and Degeneration Phase homotoxicoses. Activates the nonspecific defense mechanisms in cellular phases. Contains *Caltha palustris*, which has a favorable action in cellulitis and is indicated in pemphigus vulgaris with bullae surrounded by a ring accompanied by pruritis. This is a main remedy in all anemia cases (Reckeweg 2002).

Glyoxal compositum: Decouples polymers, which block enzyme systems.

Graphites homaccord: Exudative diatheses; greasy, hyperpigmented hair coat.

Hepar compositum: Supports hepatic detoxification, drainage, and repair, as well as iatrogenic damage caused by corticosteroid therapy. Hepar suis is indicated for skin with popular or blotchy eruptions which itch (Riley 1995). This remedy is valuable for those patients with liver damage and deficient detoxifying action of liver that may manifest in chronic eczemas, neurodermatitis, psoriatic conditions, erythema, dermatomycoses, and pemphigus (Reckeweg 2002).

Histaminum: As a single remedy, is suggested for Impregnation Phases and retoxifications of all kinds, including eczemas and other skin diseases such as neurodermatitis, pyoderma, and pemphigus. It is frequently indicated as an intermediate remedy in all cellular phases, and is preferably combined with the intermediary acids of the citric acid cycle and other intermediary catalysts (Reckeweg 2002). It is found in the aforementioned combinations of *Hepar compositum* and *Ubichinon compositum*.

Lymphomyosot: Supports endocrine and lymphatic function.

Molybdan compositum: Trace mineral support.

Mucosa compositum: Support mucous membranes, particularly related to damage from corticosteroid therapy. Phase remedy for Degeneration Phase disorders.

Psorinoheel: Deep remedy for constitutional issues. The German Monograph-Preparation Commission lists *Bufo rana*, contained in *Psorinoheel*, for purulent blisters (pemphigus) on the skin and mucosa and dermal inflamma-

tions with a tendency toward suppuration (Reckeweg 2002).

Pulsatilla compositum: Regulates rigidity cases and reverses the iatrogenic damage from corticoids.

Solidago compositum: Supports renal function and detoxification.

Thyreoidea compositum: Matrix drainage and endocrine support.

Tonsilla compositum: Supports bone marrow, spleen, and immune function, and assists in repair in Impregnation Phase diseases. Broadfoot (2005) recommends *Tonsilla compositum* and *Traumeel-S* as a mixed autosanguis, with Lymphomyosot. According to Bianchi, it is useful in preventing a trend toward degeneration in cases of acute chronic inflammation.

Traumeel S: Activates inactive sulfur-containing enzyme systems and nonsteroidal anti-inflammatory effects, and modulates the inflammatory system.

Ubichinon compositum: Supports cellular energy metabolism and mitochondrial repair.

Authors' suggested protocols

Nutrition

Nutrition/glandular therapy: Skin and immune support formulas at 1 tablet for 25 pounds of body weight BID

Alpha-lipoic acid: 10 mg per 15 pounds of body weight daily; maximum of 100 mgs

DMG: 5 mg per pound of body weight daily

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID

Chinese herbal medicine

Formula ImmunoDerm: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs listed above, ImmunoDerm contains buffalo horn shavings (*Shui niu jiao*), fleece flower root (*He shou wu*), fructus xanthii (*Cang er zi*), kochia (*Di fu zi*), moutan (*Mu dan pi*), oldenlandia (*Bai hua she cao*), siegesbeckia (*Xi xian cao*), and tokoro (*Bi xie*). These herbs help increase the efficacy of the herbs above in treating pemphigus.

Homotoxicology formulas (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Autosanguis: *Causticum compositum*, *Hepar compositum* plus *Solidago compositum*, *Thyreoidea compositum*, *Ubichinon compositum*. Inject half into patient where allowed by law and combine the remaining material into the oral cocktail below.

Oral cocktail: *Galium-heel*, *Lymphomyosot*, *Berberis homaccord*, *Nux vomica homaccord*, *Mucosa compositum*, plus autosanguis therapy mixture. Refrigerate. Administer PO BID. Reduce the frequency of dosing to every three days if signs of detoxification are too strong.

Also consider adding *Aesculus compositum* TID orally if nonresponsive. *Psorinoheel* may be helpful as well.

Administer with nutritional support of vitamin E, niacinamide, Standard Process Veterinary Formula Hepatic Support. Consider oral tetracycline (not given in successful case report).

MYASTHENIA GRAVIS

Definition and cause

Myasthenia gravis is an autoimmune disease that targets the neuromuscular junction, resulting in poor nerve impulses and weakness and atrophy of the muscles. The mechanism is a blocking of acetylcholine receptors on striated muscles so that muscular function does not occur. It is common in Jack Russell terriers, Akitas, and Fox terriers, and rare in cats. The disease is more commonly acquired than congenital (Cuddon 1989; Hopkins 1992; Pedroia 1992; Shelton 1992, 2002, 2004; Melmed 2004).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The common therapy is the anticholinesterase drug pyridostigmine bromide syrup (Mestinon syrup). A second option involves corticosteroids and immunosuppressive drugs, such as azathioprine, if there is little response to the anticholinergics.

Anticipated prognosis

The prognosis for acquired myasthenia gravis is often good, with proper and supportive care. The primary concern is the prevention of aspiration pneumonia, so feeding from an elevated position is important (Shelton 2001).

Integrative veterinary therapies

While the target of the exaggerated immune response is the acetylcholine receptors, the underlying mechanism is an imbalanced immune system. The fact that the literature

reports spontaneous remissions with myasthenia gravis suggests that it is possible to balance the immune system's response. The addition of nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, regenerative, and balancing effects on the organs of the immune system can help to augment the process of healing. At the same time, medications such as the pyridostigmine bromide syrup can act to bridge the gap and strengthen muscle activity while underlying healing takes place (Shelton 2001).

Nutrition

General considerations/rationale

The nutritional approach to myasthenia involves support of the nervous system and its ability to conduct impulses. Simultaneously, supporting weakened immune system organs and protecting the body from potential adverse side effects of anticholinergic or immune suppressing medication is beneficial for the animal.

Appropriate nutrients

Gland therapy: Involves nutritionally supporting the nerves and brain with intrinsic factors and vital nutrients that improves the metabolism of the nerve cells. In addition, supporting the immune system glands of the thymus, adrenal, and spleen help to facilitate balance and the reduction of inflammation.

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes and particularly the nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As a part of the cell membranes, lecithin is an essential nutrient required by the nerves and all of the body's cells for general health and wellness (Hanin 1987).

Phosphatidyl serine (PS): A phospholipid that is essential for the integrity of cell membranes, particularly of the nerve and brain cells. It has been studied extensively in people with impaired mental functioning and degeneration with positive results (Cenacchi 1993). People with Alzheimer's disease who had PS added to the program showed a mild to significant clinical improvement (Funfgeld 1989).

Coenzyme Q10 (ubiquinone): Found in the mitochondria and is involved in the cell's energy production; it is required for the daily functioning of the body. It is essential in the manufacture of ATP, the energy source for all the body's cells and tissues. CoQ10 is also a potent antioxidant and helps in the process of neutralizing free radicals and cell protection (Thomas 1997, Weber 1994).

Betasitosterol: A plant-derived sterol which has anti-inflammatory properties similar to corticosteroids and aspirin (Gupta 1980). In addition, sterols have been

proven to enhance immune function (Bouic 1996). Sterols have been found to be able to enhance T-lymphocyte production and moderate B-cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Bouic 1996).

Magnesium: Physiologically, magnesium activates adenosine triphosphatase, which is required for the proper functioning of the nerve cell membranes, and it fuels the sodium potassium pump. Magnesium deficiencies can upset the proper mineral balance required for cardiac muscle contraction and rhythm (Rardon 1990, Whang 1990). Magnesium is associated with neuromuscular function and conditions such as muscle cramping, weakness, and neuromuscular dysfunction. Magnesium is recommended for therapy for epilepsy and weakening muscle function (Bibley 1996, Levin 2002).

Chinese herbal medicine

General considerations/rationale

According to TCM, myasthenia gravis is the result of Qi deficiency and stagnation with phlegm accumulation in the middle burner, affecting the Stomach and Spleen. According to Western interpretation, myasthenia gravis is a deficiency of energy or strength (Qi). In terms of gastrointestinal signs, the animal does not have the strength to digest food, leading to the accumulation of Phlegm. In this case the term Phlegm refers to the liquid ingesta in the gastrointestinal tract as well as the interference with normal digestion. According to the traditional Chinese medicine system, the Stomach and Spleen are both involved with digestion. The Spleen is easily obstructed by excess liquid (or Phlegm) and becomes unable to function correctly. The normal flow of ingesta through the gastrointestinal tract is disrupted, resulting in vomiting. In addition, because an additional function of the Spleen is to control the muscles, there is the potential for weakness when a Spleen deficiency exists. The energy (or Qi) deficiency affects the nervous system, leading to further weakness.

Appropriate Chinese herbs

The following herbs may be useful for the esophageal weakness leading to regurgitation:

Cyperus seeds (Xiang fu zi): Stops stomach cramping (Zhong Cao Yao Fang Ji De Ying Yong 1976).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid which have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). This may be equivalent to using low-dose steroid therapy.

The following herbs are helpful for the muscle weakness secondary to myasthenia gravis:

Atractylodes (Bai zhu): Has been shown experimentally to increase swimming endurance in mice (Xin Yi Yao Xue

Za Zhi 1974). That same effect could help with muscular weakness seen in myasthenia gravis.

Cuscata (Tu si zi): Modulates the immune system. Depending on the dose it can either increase or decrease the transformation of lymphocytes. It can either enhance or depress IL-2 production (Li 1997). This property of moderating the immune system may be useful in a condition such as myasthenia gravis, in which the body seems to lose the ability to regulate its own function.

Deer horn gelatin (Lu jiao jiao): Has a general strengthening effect on the body (Zhong Yao Da Ci Dian 1977).

Gastrodia (Tian ma): Increases strength. In one experiment it enhanced the subjects' swimming endurance (Bai 1996).

Homotoxicology

General considerations/rationale

Myasthenia gravis is an Impregnation Phase disorder early in the disease course, which progresses to a Degeneration Phase disorder. Many cases of myasthenia gravis go into spontaneous remission (Brooks 2003). Myasthenia gravis associated with thymoma is a Dedifferentiation Phase disorder. Because it is on the right side of the biological divide, this condition may not be reversed to the point of cure. Vaccination has been shown to exacerbate active myasthenia gravis, and should be delayed or avoided in such cases (Brooks 2003). The *Veterinary Guide* contains no protocols for this disease, but Reckeweg formulated treatment recommendations for human patients (Reckeweg 2000). These have been updated and are in clinical use in Europe (Smit 2006). Clients should be so advised prior to beginning therapy.

Appropriate homotoxicology remedies

Aesculus compositum: Provides support for circulatory disturbances.

Aletris homaccord: Contains Cocculus, which is indicated for CNS disorders, primarily vagotonous states and symptoms of exhaustion to the point of paralysis or unconsciousness. Also indicated for weakness of the neck muscles and in the legs (Reckeweg 2002).

Arsuraneel: Severe illness, loss of body condition, hopelessness, and weakness.

Causticum compositum: A high degree of weakness, often associated with trembling and an unsteady gait, so that the patient stumbles easily. Weakness associated with trembling, and with unsteadiness while walking, possibly to the point of paralysis, especially localized on the right side. Local pareses, e.g. of the vocal cords, muscles of deglutition, the eyelids, the bladder sphincter, musculature of the extremities, and Bell's palsy (Reckeweg 2002).

Cerebrum compositum: Dahlke describes Kali phosphoricum as a universal nerve remedy, which may at

times be used simply on the basis of nervous weakness. Magnesium phosphoricum is indicated in rheumatic pains in the limbs, associated with weakness in the arms and hands and stiffness and possible numbness in the fingers, with general muscular weakness. Also contains cocculus, conium, and gelsemium (Reckeweg 2002).

Coenzyme compositum: Energy metabolism.

Galium-Heel: Cellular phase support in all cases, at least intermittently.

Gelsemium homaccord: Support of cranium and posterior limb strength. The most prominent symptom is the complete relaxation and exhaustion of the entire muscular system, with partial or complete paralysis of the motor nerves, as though the muscles no longer obey the will (Reckeweg 2002).

Ginseng compositum: Weakness and exhaustion. Conium for increasing paralysis and weakness, Hydrastis canadensis for severe muscular weakness and emaciation, and Ginseng for general weakness and debilitation (Reckeweg 2002).

Glyoxal compositum: Used intermittently and not repeated until recovery wanes.

Ovarium compositum: Female gonadal support.

Phosphor homaccord: Weakness and tremor with exertion.

Placenta compositum: Revitalizing connective tissue support and recirculation.

Testes compositum: Male gonadal support. Also has a revitalizing effect, and good for paretic, weakness syndromes.

Thyroidea compositum: Hormonal support and matrix drainage. This remedy contains Thymus suis for regulation via the thymus, and Funiculus umbilicalis suis for revitalization (Smit 2006).

Traumeel: Enzyme activation and anti-inflammatory characteristics.

Ubichinon compositum: Mitochondrial support, general weakness (ubiquinone, which is Coenzyme Q10), and Hydrastis canadensis for severe muscular weakness and emaciation (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Glandular therapy: Brain, nerve support and immune support formulas at 1 tablet per 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: one-fourth teaspoon for every 25 pounds of body weight BID.

Phosphatidyl serine: 25 mg for every 25 pounds of body weight BID.

Coenzyme Q10: 25 mg for every 10 pounds of body weight SID.

Betathyme: 1 capsule for each 35 pounds of body weight BID (maximum 2 capsules BID).

Magnesium: 10 mg for every 10 pounds of body weight SID.

Chinese herbal medicine

Ding chen rou ge tang: This patent formula may be used for regurgitation. In addition to the herbs cited above, this formula contains agaste (Huo xiang), amomum fruit (Sha ren), aquilaria (Chen xiang), astragalus (Huang qi), atracylodes (Bai zhu), blue citrus (Qing pi), Chinese eaglewood (Chen xiang), citrus (Chen pi), cloves (Ding xiang), ginseng (Ren shen), leaven (Shen qu), lindera (Wu yao), magnolia bark (Hou po), malt (Mai ya), massa fermentata (Shen qu), nutmeg seeds (Rou dou kou), ophiopogon (Mai men dong), pinellia (Ban xia), poria (Fu ling), pueraria (Ge gen), round cardamon (Bai dou kou), tsaoko fruit (Cao guo), and white peony (Bai shao). These additional herbs increase the efficacy of the formula. The supplement is dosed to the supplier's directions.

Qi wei fang: This patent formula is indicated for the muscle weakness secondary to myasthenia gravis. In addition to the herbs cited above, it contains aconite (Fu zi), angelica root (Dang gui), astragalus (Huang qi), Chinese quince fruit (Mu gua), codonopsis (Dang shen), epimedium (Yin yang huo), and rehmannia (Shu di huang). The addition of these herbs improves efficacy. This supplement is dosed according to the supplier's directions.

Acupuncture points: The authors are not aware of any well-controlled studies to evaluate the efficacy of acupuncture. The following points are suggested points based upon TCM theory: PC 6, BL 17, CV 22, CV 23, and CV17.

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Symptom formula: Alettris homaccord, Gelsemium homaccord, Gallium-heel, Arsuraneel, Traumeel, Neuralgo-Rheum, and Circuloheel, PO BID to TID. Use TID dosage until progress is made and then reduce to BID.

Deep detoxification formula: Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum, Testis compositum, OR Ovarium compositum, PO EOD.

Cerebrum compositum: Twice weekly.

Glyoxal compositum: One injection and do not repeat until recovery wanes.

Chapter Seven

Diseases of the Blood and Lymph

ANEMIA

Definition and cause

Anemia is caused by many different conditions and classified into many different types, including: regenerative, non-regenerative, aplastic, autoimmune, iron deficiency, anemia of chronic disease (such as renal failure), babesia, parasites (fleas, hookworms, or whipworms), vaccine-induced, secondary to onion ingestion, and neoplasia. In all instances it is imperative to diagnose the underlying cause and initiate corrective medical measures (Birkenheuer 1999, Cowgill 1992, Duval 1996, Knoll 2003, Kristensen 1995, Morgan 1999, Rebar 1981, Yamato 1998, Young 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy focus not only on replacing blood, but also on the underlying cause. This includes stabilizing the azotemia, blocking the immune attack of the RBCs, stimulating the production of RBC with erythropoietin, augmenting the diet with hematinic nutrients such as iron and folic acid, and correcting the bleeding, such as in a bleeding gastric ulcer or cystitis (Knoll 2003, Rogers 1995).

Anticipated prognosis

The anticipated course of anemia depends on the underlying cause, which, if diagnosed and addressed, often sets the stage for a good prognosis (Knoll 2003, Rogers 1995).

Integrative veterinary therapies

After the cause of the anemia is established and addressed, it is prudent to integrate nutrition, homeopathy, and herbal remedies to support the body's organ system and the bone marrow's production of red blood cells, and to

supply the nutrients required for the formation of red blood cells.

Nutrition

General considerations/rationale

After the cause of the anemia is established, nutritional support focuses upon the bone marrow, liver, and spleen, along with the required nutrients for the manufacture of red blood cells.

Appropriate nutrients

Nutrition/gland therapy: Glandular bone marrow, liver, and spleen supply the intrinsic nutrients for these organs. One of the most bioavailable sources of iron is the liver. Comparing the absorption rate of inorganic iron (for example, ferrous sulfate versus heme-iron), the latter is 30 times more effective. The best source of heme-iron is concentrated liver extract (Frykman 1994). Liver is also a superior source of vitamin B₁₂ and folic acid.

Vitamin B₁₂: Essential for the maintenance of the proper levels of red blood cells. Deficiencies of vitamin B₁₂ are associated with anemia and decreased function of the immune system; supplementation with vitamin B₁₂ often addresses the condition (Berlin 1978, Kondo 1998, Lederle 1991).

Folic acid: A B vitamin that is required for organized cellular division. Folic acid is integral in the synthesis of both DNA and RNA and therefore affects the genetic modeling of the body. Folic acid deficiencies affect bone marrow cell division and can lead to a macrocytic anemia with fewer but larger red blood cells (Food Nutrition Board 1998).

Chinese herbal medicine

General considerations/rationale

According to Traditional Chinese Medicine theory, anemia is a combination of Yin and Blood deficiency in the Liver, Kidney, and Spleen. This leads to secondary Qi and Yang deficiency. According to the Western interpretation, Yin is fluid and blood is a component of fluid, so

when there is a blood deficiency there is also a Yin deficiency. The Liver stores the Blood, and the Kidney and Spleen play a role in making the blood. Secondary to the loss of blood, there is Qi and Yang deficiency. Basically, Qi deficiency refers to the weakness that an anemic patient might feel. As red blood cells carry the oxygen, anemic patients may have oxygen-deprived tissues. Many anemic people report feeling cold. This corresponds to the TCM concept of Yang deficiency. In order to treat anemia, it is necessary to discover and treat the underlying cause. If there is chronic blood loss or destruction or underlying nutritional deficiencies, these must also be addressed.

Appropriate Chinese herbs

Astragalus (Huang qi): Stimulates the production and maturation of cells in the bone marrow (Nan Jing Zhong Yi Xue Yuan Xue Bao 1989).

Attractoides (Bai zhu): Promotes the proliferation rate of colony-forming units (CFU-E) and erythroid burst-forming units (BFU-E), thereby increasing the red blood cell count (Hou 1999).

Codonopsis (Dang shen): Increases the red blood cell count and hemoglobin levels (Zhong Yao Xue 1998).

Cuscuta (Tu si zi): Increases resistance to hypoxia (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Donkey skin gelatin (E jiao): In one experiment in which anemia was induced in dogs via hemorrhage, e jiao increased the red blood cell count and hemoglobin level more than iron treatment (Zhong Cheng Yao Yan Jiu 1981).

Fleece flower root (He shou wu): Promotes hematopoietic stem cells (Zhou 1991).

Scrophularia (Xuan shen): Significantly increases the ability of healthy mice to tolerate oxygen deprivation (Zhang Bao Heng 1959, Gong 1981).

Wolfberry (Gou qi zi): Increases the production of red blood cells in mice (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Anemia can originate from many different causes and the phase of disease depends upon the precise cause in each case. Most cases represent Impregnation or Degeneration Phase homotoxicoses. Each case should receive a standard medical and historical approach so that all predisposing factors are uncovered. Many cases are so-called “anemia of chronic disorder,” and taking steps to improve general health can also improve the patient’s anemia. Monitoring these patients over time gives valuable information about treatment response as well as the potential to uncover further unknown pathology. Autoimmune hemolytic anemia requires extensive support (see Chapter 6, Autoimmune Disease).

Appropriate homotoxicology

Any antihomotoxic medicine that improves general health may assist these patients. The following list consists of major remedies only:

Aletris-Heel: An important remedy for anemia because Aletris is indicated for anemia and weakness, as is Chininum arsenicosum, which serves as a tonic remedy. Helonius also has indications for weakness. Other constituents support debility, weakness, and exhaustion.

BHI-Bleeding: Contains Aceticum acidum for edematous swellings, which have a waxy appearance and may be associated with anemia. Rapid emaciation with fainting, despondency, irritability, attacks of anxiety and great debility, weakness, confusion of thoughts and a kind of stupor may occur, and there may be steatorrhea and intestinal bleeding (Reckeweg 2002). *Bursa pastoris* (shepherd’s purse), which was introduced for hemostatic purposes because of a shortage of *Secale* during World War I (Reckeweg 2002), is also of critical value in this combination. The main indications for *Bursa pastrois* are hemorrhages, metrorrhagia, menorrhagia, hematuria, epistaxis, bloody diarrhea, hemorrhoidal bleeding, etc.

Crotalus horridus (rattlesnake venom) is another very powerful component of this remedy. Indications for its use include: hemorrhages from eyes, ears, nose, and any organ of dark, fluid blood. Aggravation is in the spring. Other indications include inflammations with gangrene and sepsis and purpura, toxic icterus, and viral hepatitis. Typical of *Crotalus* is the great lassitude and exhaustion and the rapid dwindling of energy, which can occur with fainting, trembling all over, and convulsions. In chronic conditions there is apathy, despondency, and anxiety, with restlessness and unsociability. There may be hemorrhages from orifices of the body, and general jaundiced skin discoloration and hemorrhages from the capillary network of the skin, and possible ecchymoses (Reckeweg 2002).

BHI-Enzyme: Adjunctive agent that supports metabolism (Heel 2002). Of primary importance is succinic acid, which is related to blood formation and should therefore be used in cases of anemia and leukemia, anemic headaches, nutritional disturbances of vegetarians (human; in which there is the typical pale appearance), after the consequences of antibiotic treatment for frequent catarrhal affections, and possibly for pulmonary hemorrhage and epistaxis. There may also be signs of vitamin deficiency, nerve-pain (trigeminal, sciatic), and lumbago. There is always a characteristic disturbance of the red blood cells and there may be nervous irritation of the stomach, hypochlorhydria, dyspepsia with flatulence, duodenal ulcers which do not heal, enteritis, and colitis with diarrhea at the slightest excitement. It is used as a subsidiary remedy in intestinal bleeding (Reckeweg 2002). This component is also found in *Coenzyme compositum*.

BHI-Exhaustion: Contains *Cinchona officinalis* for exhaustion following blood loss or fluid loss (nursing). Citricum acidum supports the citric acid cycle and improves oxygen use (Heel 2002).

China homaccord: Weakness following blood loss. It takes its name from China Peruvian bark (*Cinchona officinalis*), (and not the country of same spelling), from which quinine is obtained. It was formerly used as a specific against malaria. China is used less as a fever-remedy, and more in states of weakness and anemia after substantial loss of blood or losses of vital fluids of all kinds. China symptoms are characterized by a pale, yellowish face with sunken eyes and dark rings around them, anemic headache with air, hunger, pulsation of the carotid arteries, and possibly edema. "There is also a tendency to profuse haemorrhage of dark blood from various organs. If these have been temporarily treated with some haemostatic, then after a dose of China has been given they may reappear if China is given in too low a dosage. Thus it has generally proved expedient, where haemorrhage is present, first of all to treat the haemorrhage symptomatically (e.g. with preparations of Cinnamomum), and only to use China later on in order to remove the secondary anaemia" (Reckeweg 2002).

Icterus may occur as well. The fevers, which respond to China, are extraordinarily characteristic, with the fever worsening day by day. The liver and spleen may be swollen and sensitive. There is a tendency for profuse hemorrhages (Reckeweg 2002). This remedy is one that fits the disease picture of many tick borne diseases such as *Ehrlichia canis*, et. al. Cinchona is also common to *Arsuraneel*, *Hepar compositum*, and *Hepeel*.

Cinnamomum homaccord: Active hemorrhage, epistaxis, etc. (Reckeweg 2000).

Duodenoheel: Support of gastrointestinal tissues, especially in ulcerative disease.

Ferrum homaccord: Iron deficiency and iron sequestration anemias. Contains a group of several ferrum (iron-containing) compounds: ferrum metallicum, muriaticum, phosphoricum, and sulphuricum. These are broadly used for anemias, splenomegaly, and general weakness (Reckeweg 2002).

Galium-Heel: Cellular detoxification and repair.

Gastricumeel: Support of the stomach during nausea and ulceration disorders.

Graphites homaccord: Petechial eruptions; constitutional remedy for tendency toward obesity, chronic constipation, and eczema with honey-colored crusts.

Molybdan compositum: Used as a donor for rebuilding blood cells. Zincum gluconicum is one of the many components of this combination. Zinc compounds influences important enzyme functions, e.g. in anemia, diabetes mellitus, liver damage, kidney diseases, degeneration phases, and particularly neoplasm phases. Cobaltum gluconicum,

another component, is important because the anti-anemic principle in vitamin B₁₂ is a complex compound of Co⁺⁺. Cobalt deficiency causes a serious degenerative disease of sheep in Australia, "coast disease," which is distinguished by progressive emaciation, weakness, loss of appetite, and apathy, leading to severe anemia. Niccolum metallicum (nickel) is another component, with the following pertinent indications: hoarseness, spasmodic coughing, and nosebleeds. It stimulates blood coagulation (Reckeweg 2000).

Mucosa compositum: Support of mucosal barriers in Degeneration Phase disorders or in repair following other mucosal defects; support of mucosal elements after iatrogenic damage (NSAIDs, corticosteroid therapy, etc). *Mucosa compositum* owes some of its value to the *Lachesis* (bushmaster venom) component; it is suitable in widely varying illnesses, of both a functional and an organic kind. It is particularly suitable to septic illnesses and decomposition of the blood, thrombocytopenic purpura, hemorrhagic diathesis, gangrene, malaria, and kidney diseases with edematous swelling. *Lachesis* is often indicated in serious blood dyscrasias and in disorders of hormonal function, particularly at menopause, but also in catarrhs of the mucosa, hemorrhoids, suppurations, inflammations with the development of sepsis, and malignant infectious diseases. It usually works particularly well in the form of injections, since this is most similar to the natural toxic action of snake venoms (Reckeweg 2002).

Phosphor homaccord: In cases of petechial hemorrhage, tendency toward hemorrhages or bruising, laryngitis (Heel 2003). Also used for purpura, thrombocytopenia, bleeding hemorrhoids, protracted hemorrhages, and hematoma without obvious injuries. Higher potencies must be used when there is a hemorrhagic tendency. Phosphorus is indicated in other kinds of Impregnation and Degeneration phases, e.g. myocardial damage, endocarditis and fatty degeneration of the heart, and typhoid anemia, and in suppurations of connective tissues and glands. Clear states of exhaustion require phosphorus in low potency (Reckeweg 2002). This remedy is also found in *Galium-heel*, *Hepeel*, *Mucosa compositum*, et al.

Solidago compositum: Support of urogenital tissues, renal failure.

Tonsilla compositum: Trophic function on spleen and bone marrow. Contains homeopathically potentized cortisone (*Cortisonum aceticum*) that is indicated for damage to the adrenal cortex and pituitary and connective tissue. May also be tried for inflammation, ulceration, and bleeding of the mucosa of the alimentary tract; bone decalcification; disorders of the skin, blood, and vascular systems; and behavioral disorders and emotional discord or upset (Reckeweg 2002). There are consequences for cortisone abuse of cortisone and other iatrogenic damage. Cortisone is also found in *Thyroidea compositum* along with

Medulla ossis suis (bone marrow). The main indications are: anemia, leukemia, agranulocytosis and other iatrogenic conditions, and radiation damage. (This formula is particularly suitable after radiation therapy, given its therapeutic range).

Authors' suggested protocols

Nutrition

Blood/bone marrow support formula: 1 tablet for each 25 pounds of body weight BID.

Energizing iron (liver extract plus iron): 1 capsule for every 25 pounds of body weight, maximum 4 capsules SID.

Vitamin B₁₂: 50 micrograms for every 25 pounds; maximum 200 micrograms.

Folic acid: 50 micrograms for every 35 pounds of body weight, maximum 200 micrograms.

Chinese herbal medicine

H28 anemia: Recommended by the authors at 1 capsule per 10 to 20 pounds twice daily as needed. In addition to the herbs mentioned above, H28 also contains aconite (Fu zi), amomum fruit (Sha ren), angelica root (Dang gui), antler powder (Lu jiao jiao), cordyceps (Dong chong xia cao), cornus (Zhu yu), licorice (Gan cao), moutan (Mu dan pi), poria (Fu ling), and rehmannia (Shu di huang). These herbs help to increase the efficacy and decrease potential side effects of the formula.

It is also important to address the underlying cause of the anemia.

Homotoxicology (Dose 10 drops for 50-pound dog; 5 drops for small dog or cat)

Select the symptom remedy or remedies that best match the case and then select the Detoxification formula which is applicable based upon the case's location on the Six-Phase Table of Homotoxicology.

Symptom formula (anemia of chronic disorder): *Galium-heel*, *Phosphor homaccord*, *Ferrum compositum* BID PO.

Symptom formula (blood loss): *Traumeel*, *Cinnamomum compositum*, *China homaccord*.

Deep detoxification formula: *Lymphomyosot*, *Hepar compositum*, *Solidago compositum*, *Thyroidea compositum* E3D PO.

CHYLOTHORAX

Definition and cause

The accumulation of thoracic fluid that is high in chylomicrons. Initially, chylothorax was believed to be secondary to injury or a rupture of the thoracic duct such as is found in a diaphragmatic hernia. Because the thoracic duct was found to be unaltered in most animals with chylothorax, it is now believed that any process that interferes or inhibits normal lymph flow can lead to chylothorax. These processes include high venous pressure, dilated lymph vessels, heart disease such as cardiomyopathy or heartworm disease, and hyperplastic or neoplasia of the mediastinal lymph nodes. (Birchard 1998; Fossum 1986, 1994, 2003; Kerpsack 1994; Meadows 1994).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

All cases should receive a complete work-up and the client should be advised that the prognosis is guarded. Chylothorax cases can respond to basic therapy with thoracentesis, and rutin therapy may be beneficial (Fossum 2003, Thompson 1999). Surgical repair of thoracic duct ligation is indicated where possible, but many cases have nonsurgical disease (Kerpsack 1994, Fossum 2001). Patients may develop fibrosing pleuritis from scar tissue deposition caused by any thoracic exudates such as chylothorax or pyothorax. The recommended dietary support is a low-fat diet which helps to decrease fat in the pleural effusion (Fossum 2003).

Anticipated prognosis

May resolve spontaneously. Surgery is indicated if medical therapy and thoracentesis do not control the condition. A continual requirement for thoracentesis or secondary complications such as dyspnea or fibrosing pleuritis often lead to the decision to euthanize. (Fossum 1986, 1991, 2001).

Integrative veterinary therapies

Besides direct injury to the thoracic duct, chylothorax is a result of circulatory and lymphatic stasis secondary to a blockage or an inflammatory process within the system, or is related to associated organ conditions such as enlarged lymph nodes or heart disease.

An integrated approach considers the reduction of inflammation and improvement of fluid stasis. The use of nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on the organs and vessels and can help improve circulation.

Nutrition

General considerations/rationale

After the cause(s) of chylothorax has been established and medical or surgical therapy is initiated to control the condition, nutritional support focuses on the heart, lung, and lymphatic systems. Support is also directed toward reducing free radical load and associated inflammation inside vessels or in perfused organs.

Appropriate nutrients

Nutritional/gland therapy: Glandular heart, lung, and lymph supply intrinsic nutrients that help neutralize a cellular immune inflammatory process. This helps spare the organ from cascading inflammation and eventual degeneration. (See Gland Therapy in Chapter 2 for a more detailed explanation).

Betasitosterol: Plant-derived sterols have been shown to have anti-inflammatory and antipyretic properties that appear to be similar to corticosteroids and aspirin (Gupta 1980). In addition, sterols have been proven to enhance immune function (Bouic 1996). Sterols have been shown to enhance T-lymphocyte production and moderate B-cell activity, thereby helping to balance the immune response and indirectly reducing the risk of an autoimmune reaction (Bouic 1996).

Vitamin A: Is an antioxidant, cell and tissue protector, and free radical scavenger (See Antioxidants and Free Radicals, Chapter 2). By reducing inflammation, vitamin A is therapeutically beneficial in treating chronic degenerative diseases (Halliwell 1994).

Vitamin E: Reduces inflammation and improves circulation by helping vessels to dilate and reducing the agglutination of blood platelets (Traber 1999, 2001). Vitamin E also has organ-sparing properties that help to reduce scarring (Meyers 1982).

Lecithin/phosphatidyl choline: Studies with phosphatidyl choline have shown that it can reduce triglyceride and cholesterol levels because it emulsifies fats (Brook 1986, Spilburg 2003).

Chinese herbal medicine/acupuncture

General considerations/rationale

Chylothorax is the result of Qi and Blood deficiency in the Spleen and Lung, with Qi and Water stagnation. Spleen Qi deficiency leads to Spleen Blood deficiency (insufficient Spleen Qi leads to the inability to produce Blood). The Spleen can't produce adequate Qi without adequate Blood. As a result, a circular pattern of progressive deficiency occurs.

In the Western interpretation, the spleen holds fluids in the correct location. When the spleen is Qi-deficient it lacks the energy to do this and fluid can leak into abnormal compartments. In this disease process, the plasma and chylomicrons, which should be held in the blood vessels, leak into the thoracic cavity. The lung is responsible for helping to distribute fluid. When it is Qi-deficient, fluids can accumulate in abnormal places because the Lung does not have the energy to function normally. The term "water stagnation" refers to the fluid in the chest. Treatment is aimed at decreasing fluid in the chest and addressing lipid abnormalities.

Appropriate Chinese herbs

Apricot seed (Xing Ren): Can increase serum HDL levels while lowering the total cholesterol (Diliner 1999); also lowers blood pressure (Zhong Cao Yao Xue 1976).

Bupleurum (Chai hu): Contains saikosaponin A and D which decrease triglyceride levels and to a lesser extent cholesterol levels (Zhong Yao Xue 1988). This may decrease the lipid content of the effusion.

Lepidium (Ting li zi): Has diuretic actions (Zhong Yao Zhi 1984) and may help drain fluid from the chest.

Imperata (Bai mao gen): Has diuretic properties (Ren Min Wei Sheng Chu Ban She 1983), which may help to decrease thoracic fluid.

Platycodon (Jie geng): Decreases blood lipid levels (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). It also decreases blood pressure (Zhong Yao Yao Li Yu Ying Yong 1983).

Poria (Fu ling) also has diuretic effects on the body; this was shown in rabbits after 5 days of treatment with 500 mg poria/kg/day (Lu 1987, Lu 1988).

Homotoxicology

General considerations/rationale

Chylothorax represents serious deterioration of the body's ability to maintain normal structure and function, and represents a Degeneration Phase disorder. It can be associated with a wide variety of predisposing issues including trauma, cranial vena caval thrombosis, granuloma, right heart failure, neoplasia, lymphangiectasia, and any issue that alters the flow of lymph through the thoracic duct. The prognosis is guarded and many cases are found to have undiagnosed neoplasia. This connection makes it appropriate to address these cases as Dedifferentiation Phase homotoxicoses if they fail to respond to traditional therapies.

Appropriate homotoxicology formulas

There are no known published case reports or studies of successful handling of chylothorax in veterinary patients with homotoxicology. Basic homotoxicology phase theory should guide practitioners wishing to use such therapies in their practice. Palmquist (2006) was recently successful in handling a case of chylothorax which initially presented with no signs of other concurrent illness. This patient resolved its thoracic fluid accumulation, but ultimately developed pancreatic carcinoma and was euthanized a few months later.

Abropemol: Contains Abrotanum, which can be useful in chronic pleurisy with effusion and other exudative processes, including the after effects of chest surgery for hydrothorax or empyema. Difficult respiration and a dry, persistent cough, plus a sensitivity to cold air, are characteristic of this remedy. Nitricum acidum is also included for mucosal and respiratory conditions (Reckeweg 2002).

Aesculus compositum: A peripheral circulatory remedy that contains Colchicum, which, according to Heinigke, acts upon individual areas of the mucosa and the serous membranes (pleura, peritoneum, and pericardium), and the muscle fibers (especially of the intercostal muscles and

the diaphragm), where inflammatory processes predominate. It is thus useful in endocarditis and edema (pleura, pericardium, peritoneum) with effusions into body cavities (Reckweg 2002). *Colchicum compositum* S. is a remedy that is not available in the U.S. but can be obtained from Europe. This remedy is also common to *Ginseng compositum* (see below).

***Antimonium arsenicosum*:** A single remedy with excellent properties for this type of condition. It has indications for bronchiolitis with weakness of the heart and symptoms of dyspnea, cyanosis, and capillary congestion. It has been used for pulmonary emphysema, pulmonary edema, and bronchial asthma with circulatory weakness and myocarditis. A strong indication for this remedy is extreme dyspnea, and effusion, which occurs in pleurisy and pericarditis (Reckweg 2002). The remedy can be ordered from Europe.

***Apis homaccord*:** Used for mobilizing fluid accumulations and for edema, by way of *Apis mellifica* (bee venom). Also indicated for pleural effusions and ascites, diseases of the serosa, edematous swellings with formations that resemble water-filled sacs, and infiltration of the cellular tissues (Reckweg 2002). Also contains *Scilla* for laryngeal and bronchial catarrhs with difficult expectoration, pleurisy with effusion, and edema in heart and kidney disease (Reckweg 2002). This remedy also contains *Antimonium tartaricum* and has strong indications for inflammations of the lower respiratory passages with circulatory insufficiency, accumulation of mucus on the chest with rales and inability to raise the mucus, pneumonia and pulmonary catarrhs, and consolidation of the lungs persisting after the use of antibiotics (Reckweg 2002).

***Cor compositum*:** Contains many remedies that are useful for pulmonary and cardiac complaints, and supports the strained cardiovascular system. The pulmonary remedies include *Arsenicum album*, *Naja*, *Carbo vegetalis*, *Kali carbonicum*, and *Ranunculus*, for shortness of breath, chest constriction, pleurisy with serous effusion, and consequent adhesions and diseases of the parietal pleura (Reckweg 2002).

***Ginseng compositum*:** Has several indications in the pulmonary sphere and is a good regulating agent for accompanying exhaustion. It contains *Colchicum*, *Galium aparine*, *Kreosotum*, *Natrum oxalaceticum*, and *Sulfur*, which figures heavily into the cellular respiration cycles and in deep diseases, particularly with retoxic damage.

***Hepar compositum*:** Contains several useful remedies for the disposition of toxins and edema, including *Calcium carbonicum* or effusions. The functioning of the lymphatic system is generally disturbed in the *Calcium carbonicum* patient. *Carduus marianus* has indications for coughing and congestive states of the pleura and peritoneum. *Chelidonium* is used for inflammation of the respi-

ratory organ and pleuritic conditions. *Cynara scolymus* has tonic, resolvent, and diuretic action by way of an enzyme, which converts insulin into levulose. This is a deep-acting, effective liver remedy and is useful in edema to stimulate the detoxifying function of the liver (Reckweg 2002).

***Lymphomyosot*:** Lymphatic drainage.

***Mucosa compositum*:** Broad support of mucosal elements throughout the body and useful in Degeneration Phase disorders.

***Placenta compositum*:** Assists in healing of vessels; contains stem cell components.

***Tonsilla compositum*:** In Traditional Chinese Medicine the spleen helps hold fluids in, which makes *Tonsilla compositum* (Spleen suis) a viable item for experimentation. Response was noted in one unpublished clinical case with this remedy (Palmquist 2006). It is indicated in Dedifferentiation and Impregnation phases.

***Traumeel S*:** Indicated in all potentially traumatic cases and as an initial agent for many other conditions. May function through its nonsteroidal anti-inflammatory actions in all phases of homotoxicosis per the Six-Phase Table of Homotoxicology. Indicated in non-responsive cases as a therapy that addresses regulation rigidity.

***Ubichinon compositum*:** Contains Anthracinon, which has strong indications in affections of the lungs, pleurisy, pneumonia, and respiratory illness, where there is usually effusion (Reckweg 2002).

Authors' suggested protocols

Nutrition

Cardiac and lymph support formulas: 1 tablet for every pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID, (maximum 2 capsules BID). **Alternative Choice:** Moducare—follow manufacturer's directions.

Vitamin A: 2,500 IU for every 35 pounds of body weight SID.

Vitamin E: 50 IU for every 20 pounds of body weight SID.

Chinese herbal medicine/acupuncture

Formula H61 chylothorax: 1 capsule per 10 to 20 pounds twice daily, depending upon severity. It may still be necessary to drain the thoracic fluid of some animals periodically, however the frequency of drainage should be lower. In addition to the herbs discussed above, H61 contains *aurantium* (Zhi qiao), *benincasa seed* (Dong gua ren), *coix* (Yi yi ren), *phragmites* (Lu gen), *talc* (Hua shi), and *trichosanthes* (Gua lou).

Homotoxicology (Dose 10 drops for 50-pound dog PO; 5 drops for small dog or cat PO)

Select the symptom remedy or remedies that best match the case and then select the Detoxification formula which is applicable based upon the case's location on the Six-Phase Table of Homotoxicology.

Usage is in addition to proper medical care (also see cancer, chapters 31 through 34).

Symptom formula: Because every case of chylothorax is caused by differing pathogenesis, no protocol can address this adequately, but consider starting by mixing the following agents together and giving orally BID for 5 to 7 days: *Traumeel S*, *Abropernol*, *Aesculus compositum*, *Lymphomyosot*, *Apis* and *Ginseng compositum*.

Tonsilla compositum: 1 to 3 times weekly.

Cor compositum: 1 to 3 times weekly.

Deep detoxification formula: *Thyroidea compositum*, *Hepar compositum*, *Solidago compositum*, *Ubichinon compositum*, *Coenzyme compositum*, *Testes compositum* OR *Ovarium compositum* mixed together and given orally every 2 to 3 days.

HEMOBARTONELLA/FELINE INFECTIOUS ANEMIA/FELINE HEMOTROPIC MYCOPLASMOSIS

Definition and cause

Hemobartonella felis, recently renamed *Mycoplasma haemophilus*, is a parasitic organism which resides on the surface of the red blood cell. Infection is thought to occur from exposure to bloodsucking parasites such as fleas and ticks. Once the organism gains access to the bloodstream it attaches to red blood cells, rapidly reproduces, and feeds upon the substrate of the blood. The host antibody is produced and directed against the organism and becomes deposited on the red blood cell membrane. The reticuloendothelial elements of the spleen and liver phagocytize sections of the red blood cell membrane, leading to a form of hemolytic anemia. Immunosuppression by agents such as FeLV and FIV make clinical disease more likely, but normal cats can be infected as well. Cats may be diagnosed by direct observation of the parasite, but such observation can be difficult and the development of PCR testing specific for this agent has greatly assisted veterinarians in accurate diagnosis (Carney 1993, Eberhardt 2006).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment involves an antibiotic (usually doxycycline or a quinolone) for 3 weeks. Hemolytic anemic cats are usually given immunosuppressive doses of corticoste-

roid, such as prednisone, so that the immune-mediated hemolysis is decreased sufficiently for the patient to recover. A blood transfusion may be required (Greene 1998).

Anticipated prognosis

Prognosis is fair for most cats that are diagnosed early and properly treated. Ectoparasite control is recommended (Greene 1998).

Integrative veterinary therapies

Integrating nutrition and medicinal herbal and biological therapies can help counteract the side effects of medications designed to destroy the parasite and suppress the immune system. These therapies also support immune function and red blood cell regeneration.

Nutrition

General considerations/rationale

Nutritional support supplies the nutrients required for the production of new red blood cells. In addition, immune system organs receive nutrient support to help balance the immune response.

Appropriate nutrients

Nutritional/gland therapy: Bone marrow, liver, adrenal, thymus, and spleen supply the intrinsic nutrients to support these organs and produce new red blood cells. The most bioavailable source of iron is the liver. Comparing the absorption rate of inorganic iron (for example, ferrous sulfate versus heme-iron), the latter is 30 times more effective. The best source of heme-iron is concentrated liver extract (Frykman 1994). Liver is also a superior source of vitamin B₁₂ and folic acid.

Vitamin B₁₂: Essential for maintaining the proper levels of red blood cells. Deficiencies of vitamin B₁₂ are associated with anemia and decreased immune function. Supplementation with vitamin B₁₂ often addresses the condition (Berlin 1978, Kondo 1998, Lederle 1991).

Folic acid: A B vitamin that is required for organized cellular division. Folic acid is integral in the synthesis of both DNA and RNA and therefore affects the genetic modeling of the body. Folic acid deficiencies affect bone marrow cell division and can lead to macrocytic anemia with fewer but larger red blood cells (Food Nutrition Board 1998).

Chinese herbal medicine/acupuncture

General considerations/rationale

Hemobartonella is a disorder caused by parasites. It leads to Qi, Blood, and Yin deficiency in the Kidney and Spleen.

Author's interpretation

Both schools of thought consider hemobartonella to be a parasitic disease. The Kidney is the main immune organ in TCM theory. If the Kidney is deficient, it is hard for the body to eliminate the parasite. The Spleen produces the Blood, so if the Spleen is deficient, anemia may result, leading to weakness, a manifestation of Qi deficiency. Treatment is aimed at eliminating the organism and treating secondary effects such as anemia and pyrexia.

Appropriate Chinese herbs

Angelica root (Dan gui): Increases phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978) and has some antibiotic effects (Hou Xue Hua Yu Yan Jia 1981). It may help clear the organism.

Astragalus (Huang qi): Has antibiotic activity (Zhong Yao Zhi 1994) and may help clear infection. It is also an immunostimulant. Astragalus contains astragalin, which increases phagocytic activity of macrophages and the production of antibodies (Jiao 1999), which may help the body clear the infection.

Atractyloides (Cang zhu): Has shown efficacy against some bacteria (Zhong Yao Xue 1998). It is possible that attractyloides may help eliminate the organism.

Bupleurum (Chai hu): Stimulates both humoral and cellular immunity in mice (Shang Hai Yi Ke Da Xue Xue Bao 1986). It also has antibiotic effect (Zhong Yao Xue 1988), which may inhibit the microorganism.

Codonopsis (Dang shen): Increases the hematocrit (Zhong Yao Xue 1998) and stimulates the immune system. It not only increases the number of leukocytes, but was shown to counteract the reduction in the white blood cell count induced by hydrocortisone (Huang 1994). This may indicate that it can be used with prednisone to support an immune system yet prevent autoimmune destruction of the red blood cells.

Coptis (Huang lian): Reduces fevers (Zhong Guo Bing Li Sheng Li Za Zhi 1991). In vitro experiments have shown that coptis has antibacterial properties (Chen 1996).

Dandelion (Pu gong ying): Has antibiotic properties (Zhong Yi Yao Xue Bao 1991) and is an immunostimulant (Zhong Yao Xue 1988). It may help the body clear the infection.

Forsythia fruit (Lian qiao): Inhibits a variety of bacteria and has antipyretic effects (Ma 1982).

Honeysuckle (Jin yin hua): Contains chlorogenic acid and isochlorogenic acid, which have antibacterial properties (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). It also has antipyretic effects (Shan Xi Yi Kan 1960).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid. These compounds have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991) and may help decrease immune-mediated destruc-

tion of red blood cells. Licorice also has antibiotic properties (Zhong Yao Zhi 1993).

Phellodendron bark (Huang bai): Has antibiotic efficacy (Zhong Yao Xue 1998, Zhong Yao Da Ci Dien 1977).

Poria (fu ling): Has antibacterial effects (Nanjing College of Pharmacy 1976). Poria contains pachman, which enhances the phagocytic ability of macrophages (Lu 1990).

Scrophularia (Xuan shen): Inhibits various bacteria and reduces fevers (Zhong Yao Yao Li Yu Ying Yong 1983).

Scutellaria (Huang qin): Contains biacalin, which has antibiotic activity (Zhong Yao Xue 1988). Both biacalin and another compound found in scutellaria, biacalein, suppress inflammation (Kubo 1984). Scutellaria enhances cellular immunity (Pan 1991) and has antipyretic effects (Xu 1999).

Homotoxicology

General considerations/rationale

This is an infectious disease and it progresses rapidly from Inflammation phase (phagocytosis and immune processing by macrophages and antibody production) to Deposition phase (red blood cell attachment) to Impregnation phase (antibody attachment), and becomes a Degeneration phase homotoxicosis upon cell destruction by the reticuloendothelial system. Bear in mind that the blood is considered to be an active connective tissue and so access into the blood is a matrix phase. There are no proven veterinary homotoxicology protocols that have evidence sufficient to recommend them over conventional therapy, which is indicated in all overt clinical cases. Treatment programs may be augmented with biological therapies aimed at improving immune status, eliminating organisms, supporting production of new red blood cells, and enhancing the removal of homotoxins and damaged tissue elements. Antihomotoxic drugs may also assist the patient's recovery by reducing iatrogenic damage caused by pharmaceutical agents such as tissue deposition, impaired intestinal mucosal health, altered flora, enzyme blockage, and mitochondrial injury.

Appropriate homotoxicology formulas

Also see Tick Borne Diseases in Chapter 18; Chapter 6, Autoimmune Diseases; and Chapter 11, Chronic Active Hepatitis. The following agents are theoretically indicated for this type of issue:

China homaccord: For exhaustion and collapse.

Coenzyme compositum: Metabolic support following antibiotic therapy and in Degeneration phase disorders.

Echinacea compositum: Inflammation and Impregnation phases. Supports the immune system and encourages elimination of the organism. An antihomotoxic antibiotic.

Ferrum homaccord: For anemia.

Galium-Heel: Assists in cases of anemia and in detoxification following antibiotic therapy.

Ginseng compositum: For collapse, weakness, and exhaustion.

Hepar compositum: Reversal of damage to the liver from hemolysis and anemia, as well as iatrogenic damage from pharmaceutical agents used to control the disease.

Lymphomyosot: Lymph drainage and immune support.

Solidago compositum: Support of urinary tissues in deep detoxification and in Degeneration Phase regressive vicariations following this disease.

Thyroidea compositum: Hormonal support and deep matrix clearing.

Tonsilla compositum: Degeneration Phase cases to normalize immune function and support splenic, adrenal, hepatic, bone marrow, lymphoreticular, and hypothalamic defense systems.

Ubichinon compositum: Metabolic support following antibiotic therapy and in Degeneration Phase disorders.

Authors' suggested protocols

Nutrition

Blood, bone marrow, and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Energizing iron (liver extract plus iron): 1 capsule for every 25 pounds of body weight, maximum 4 capsules.

Vitamin B₁₂: 50 micrograms for every 25 pounds, maximum 200 micrograms.

Folic acid: 50 micrograms for every 35 pounds of body weight, maximum 200 micrograms.

Chinese herbal medicine/acupuncture

The author recommends the following formulation: astragalus (Huang qi), 50 g; codonopsis (Dang shen), 50 g; atractyloides, 50 g; poria (Fu ling), 50 g; dandelion (Pu gong ying), 50 g; honeysuckle (Jin yin hua), 50 g; forsythia fruit (Lian qiao), 50 g; raw rehmannia (Sheng di huang), 40 g; scrophularia (Xuan shen), 40 g; phellodendron bark (Huang bai), 40 g; licorice (Gan cao), 40 g; angelica root, 40 g; coptis (Huang lian), 50 g; scutellaria (Huang qin), 50 g; bupleurum (Chai hu), 50 g; and lithospermum (Zi cao gen), 50 g (Cong 1986). It is dosed according to the manufacturer's recommendations.

Homotoxicology

Symptom formula: Tonsilla compositum given every 3 days during acute phase of hemolysis. Galium-heel and Lymphomyosot mixed together and given orally at 5 drops BID PO.

Deep detoxification formula: Galium-heel, Lymphomyosot, Hepar compositum, Solidago compositum,

Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum given every 3 days for 60 to 120 days following recovery.

Also see Autoimmune Diseases (Chapter 6) and Tick Borne Diseases (Chapter 18).

HYPERLIPIDEMIA

Definition and cause

Hyperlipidemia can be primary (idiopathic) or secondary (diet, or to a disease such as liver disease, diabetes, Cushing's disease). The disease is found in cats and dogs. It is

common in miniature Schnauzers, where it is often associated with hypertension. While post-prandial hyperlipidemia is normal, some animals have a difficult time metabolically clearing fat from the blood. The primary underlying cause is either genetic or secondary to another condition, which affects lipid metabolism such as diabetes mellitus (Armstrong 1989; Greco 2003, 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment is to feed a fat-restricted diet (reducing the fat to the 7% to 10% range) such as Hills W/D or Science Diet Lite and re-check the blood in 4 to 5 weeks. This confirms dietary hyperlipidemia. Other recommended therapies include the addition of fish oil (omega-3-fatty acid rich) along with vitamin B₂ (niacin) to help bring the triglyceride levels down. Medication such as Gemfibrozil (to increase levels of lipoprotein lipase) and cholesterol-lowering drugs have also been recommended (Armstrong 1989, Bauer 1995, Ford 1994, Greco 2003, Jones 1994).

Anticipated prognosis

Animals that respond to the dietary adjustments, including the addition of fish oils, have a much improved prognosis. The prognosis is less positive when elevated fat levels persist, primarily because of secondary disease complications such as diabetes, fatty liver, pancreatitis, and Cushing's disease.

Integrative veterinary therapies

The integrative approach closely follows the medical approach of dietary fat restriction, paying particular attention to ensure that sources of ingredients are biologically correct, in addition to being chemically correct. The recommended ingredients should be highly bio-available, contain lower levels of saturated fats, contain beneficial fiber, and produce lower levels of metabolic wastes.

Nutrition

General considerations/rationale

Nutritionally, the approach includes feeding a diet that is higher in protein and soluble and insoluble fiber, recommending food that is lower in saturated fats and higher in omega-3 and beneficial omega-6 fatty acids, a supplement program that contain support nutrients for intestinal and pancreatic digestion while protecting the liver from inflammation and fatty infiltration. With client compliance, the diet should contain higher levels of

fresh meat or poultry, more omega-3- and omega-6-rich vegetable oils, and fiber from vegetable or whole grain sources. Home-prepared raw or cooked foods are recommended (see Product Sources) (Goldstein 2005).

Appropriate nutrients

Nutritional/gland therapy: The liver, pancreas, and intestines are the key organs in the metabolic processes of digestion and assimilation. The supply of intrinsic nutrients and the control of free radical build-up help reduce cellular inflammation, which improves organ function and helps to prevent the body's infiltrative process and fat deposition.

Lecithin/phosphatidyl choline: Studies have shown that lecithin reduces triglyceride and cholesterol levels. Lecithin is an emulsifier of fats and helps to improve overall lipid metabolism (Brooks 1986, Spilburg 2003).

Enzymes: Pancreatic lipase is essential for lipid metabolism and assimilation. Enzyme deficiencies caused by organ underproduction or excessive dietary fats (especially saturated types) contribute to hyperlipidemia (Howell 1985).

Probiotics: The normal flora of the intestines is required for proper assimilation of food and nourishment of the body's cells (De Simone 1993, Smirnov 1993).

Oils: Many commercial dog and cat foods contain high levels of poultry by-product fat as the primary source of fatty acids. Levels of fat in many pet foods generally range from 8% to 20%. Poultry fat contains approximately 20% linoleic acid (omega-6) or about 2% to 3% of the total food (Goldstein 2000, 2005). Erasmus (1986) reports that there is about 30 times more omega-6 than omega-3 in chicken fat, equaling less than 1% omega-3 fatty acids. This imbalance can adversely affect lipid metabolism in general. Kendler (1987) reported that while both linoleic acid (LA) and gamma-linolenic acid (GLA) can be obtained from food, poor-quality foods can be low in essential fatty acids, leading to deficiencies.

L-carnitine: A lipotropic agent known in human circles as a "fat buster." L-carnitine is required in the metabolism of fatty acids for the release of energy by the cells. Supplementing the diet with L-carnitine has a direct lowering effect on the blood triglyceride levels (Sachan 1984). In studies conducted by the Iams Company, the addition of carnitine to the diet of dogs was shown to reduce body weight by 6.4% compared to 1.8% without supplementation (Sunvold 1998). Similar research in cats suggests weight loss (Center 1998). Evangelidou (2003) showed that the addition of carnitine to the diet helps to lower both cholesterol and triglyceride levels.

Vitamin E: A fat-soluble vitamin and is one of the body's main antioxidants, especially in its function of protecting lipids. As a potent antioxidant its primary function is the neutralization of free radicals and reduc-

tion of inflammation, particularly as it affects the oxidation and destruction of lipids (Traber 1999).

Chinese herbal medicine

General considerations/rationale

Based upon TCM theory, hyperlipidemia is a matter of Qi deficiency, Blood stagnation, and Phlegm and Damp accumulation.

Phlegm and Damp are thick liquid substances in the Western interpretation. Hyperlipidemia causes lipemic blood. Many people with hyperlipidemia feel heavy and fatigued. Some have shortness of breath due to arteriosclerosis. The plaques in the vessels are accumulations of Phlegm. The blood flow may be slow due to sludging when there are very high levels of lipids. This is described as Blood stagnation in Eastern terms. The Qi deficiency is manifested by fatigue.

Appropriate Chinese herbs

Alisma (Ze xie): Has several uses in cases of hyperlipidemia. It has been proven to lower blood cholesterol and triglyceride levels in humans. Half of the subjects in one study had a decrease of 10% or more (He 1981). In experiments on hamsters, alisma decreases the levels of total cholesterol and LDL-cholesterol in the serum. In addition, it protects the liver from lipodosis in animals that consume high-fat diets (Institute of Pharmacy 1976). This may help prevent the development of hepatic disease in patients with chronic hyperlipidemia.

Cinnamon (Gui zhi): Dilates blood vessels and promotes blood circulation (Zhong Yao Xue 1998).

Crataegus (Shan zha): Was used experimentally in quails with high blood cholesterol levels. Blood cholesterol levels were decreased by 34% to 63%. In addition, it decreased the formation of arterial atheromatous plaque in the quails, preventing the development of experimental atherosclerosis (Chu 1988). It was also shown to have the potential to prevent the deposition of lipids on vascular walls in rats (Cai 2000).

Fleece flower root (He sou wu): Normalizes the blood lipid profile. It has been shown to increase the levels of HDL while simultaneously lowering the total cholesterol and triglyceride levels (Zhong Cao Yao 1991). In humans with high cholesterol, 5 g/kg can lower cholesterol to the normal level. In one experiment taking fleece flower root for 1 week lowered the total cholesterol level in the treatment group to 88 ± 11 mg. Untreated control subjects had blood levels of 188 ± 12 mg (Zhao 1984, Mei 1979).

Pinellia (Ban xia): Can prevent the development of dietary hyperlipidemia in rats. It lowers both total cholesterol and LDL levels (Hong 1995).

Pueraria (Ge gen): Contains daidzein, formononetin, and genistein. These compounds lower blood lipids (Modern TCM Pharmacology 1997).

Homotoxicology

General considerations/rationale

Hyperlipidemia has many causes; in some breeds, a constitutional predisposition exists. Most hyperlipidemias benefit from a low-fat diet with higher fiber levels. Weight loss and exercise may also help. Support of liver function is recommended for this Deposition phase disorder and monitoring appropriate laboratory data is recommended (Reckeweg 2000).

Appropriate homotoxicology formulas

No studies document the use of homotoxicology for hyperlipidemia in veterinary medicine. Extrapolation from human practice is appropriate, but should be considered as experimental. Useful remedies may include:

Aesculus compositum: Regulates peripheral blood flow and vascular health, improves cerebral blood flow, tones the arterial system, and eliminates homotoxins from the lymph system (*Baptisia*). Hamamelis assists in venous stasis and venous hemorrhages. Ateriasuis supports repair of structures.

Barijodeel: In arteriosclerosis, and lymphatism, for altered cerebral blood flow. This is a major remedy with common use in human geriatric patients. Because arteriosclerosis is not as severe an issue for animals, *Aesculus compositum* may prove stronger in assisting veterinary patients.

Cerebrum compositum: Acts on the central nervous system and after stroke.

Cor compositum: Reinforces cardiac functions.

Berberis homaccord: Drains the kidney and lower urinary tract in prostatic disease, supports the adrenal in stressful conditions and support of liver. Use intermittently in cases with pigmentation in the axillary region.

Galium-Heel: Provides cellular detoxification, renal support, and anticancer effects. Indicated for vaccine reactions and allergies, and is a phase remedy for Deposition Phase disorders (Palmquist 2006).

Hepeel: Used intermittently for liver support, drainage, and detoxification. May be combined with *Coenzyme compositum* for powerful action on the liver and can be useful in allergy therapy as well.

Hepar compositum: Used for liver detoxification and support, metabolic support.

Lymphomyosot: Provides lymph drainage, and is a phase remedy for Deposition phase disorders.

Nux vomica homaccord: Acts on hepatic and gastrointestinal function.

Placenta compositum: Provides peripheral vascular support and helps with cold extremities, and is a phase remedy for Deposition phase disorders.

Psorinoheel: A constitutional remedy for cases that may have genetic causes, and a phase remedy for Deposition phase disorders.

Solidago compositum: Provides urogenital support, and is a phase remedy for Deposition phase disorders.

Veratrum homaccord: Used in cases of collapse, weakness, and/or diarrhea.

Authors' suggested protocols

Nutrition

Pancreatic and intestinal support formulas: 1 tablet for 25 lbs of body weight BID.

Megaliptrophic: 1 capsule for every 20 pounds of body weight; give with food.

L-Carnitine: 100 mg for every 20 pounds of body weight; give with food.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight per meal for dogs.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Probiotic MPF: $\frac{1}{2}$ capsule per 25 pounds of body weight with food.

Chinese herbal medicine-3

Formula lipidemia: 1 capsule per 10 to 20 pounds twice daily to start. The dose is modified based upon serial blood monitoring.

In addition the herbs listed above, lipidemia also contains astragalus (Huang qi), notoginseng (San qi), poria (Fu ling), rhubarb (Da huang), salvia (Dan shen), trichosanthes (Gua lou), and white atractylodes (Bai zhu).

Homotoxicology (Dose: 10 drops PO for 50-pound dog, 5 drops PO for small dog or cat)

Symptom remedy: *Nux vomica homaccord*, *Aesculus compositum*, *Lymphomyosot*, and *Barijodeel* mixed together and given BID to TID.

Detoxification remedy: *Galium-Heel*, *Hepar compositum*, and *Solidago compositum* mixed together and given twice weekly PO. *Hepeel* and *BHI-Enzyme*: 1 tablet each evening for general liver support.

LEUKOPENIA**Definition and cause**

Leukopenia simply refers to a reduction in the number of circulating leukocytes; this descriptive term is not a diagnosis. The clinician should do appropriate testing to determine the underlying cause of the reduced leukocyte numbers and address that specific cause wherever possible. Generally speaking, reduced white blood cell numbers come from increased loss, decreased production, or a combination of these circumstances. Causes include corticosteroid administration (secondary effect), systemic viral infection such as parvovirus in dogs and FeLV, FIP, or panleukopenia in cats; as well as neoplasia. Leukopenia is often seen in lymphoma (Aiello, Merck Manual 2006).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy depends on the determination of and subsequent addressing of the underlying cause or causes. For example, leukocytosis secondary to corticosteroid administration requires stopping the medication. Leukocytosis secondary to parvo, panleukopenia, or FeLV requires intensive medical therapies.

Anticipated prognosis

The prognosis depends upon finding and addressing the underlying cause.

Integrative veterinary therapies

Once the underlying cause has been determined, integrative therapies can be selected as an adjunct to medical therapy or as a stand-alone treatment plan, depending upon the diagnosis and the choice of the clinician. The use of nutraceuticals, medicinal herbs, and combination homeopathics that have regenerative and nutritive effects on the organs of white blood cell can help resolve the leukopenia.

General considerations/rationale

Addressing leukopenia nutritionally requires a determination of the underlying cause(s). Nutritional therapies are directed at nourishing the bone marrow and spleen, supplying the vital nutrients required for production of white blood cells, and supporting the organs of the immune system such as the adrenal, thymus, and lymph glands.

Appropriate nutrients

Nutrition/glandular therapy: Bone marrow, adrenal, thymus and spleen add specific vital nutrients required by these organs for their metabolic and biochemical processes. If these organs are compromised secondary to a free-radical-induced process or a disease, the addition of dietary glandulars can help to neutralize an immune attack and reduce secondary inflammation (Goldstein 2000) (Also see also Gland Therapy in Chapter 2).

N,N-Dimethylglycine (DMG): Has been shown to support immune function and improve removal of toxins (Verdova 1965). DMG has immune-modulating ability and has been clinically proven to increase both tumor necrosis factor (TNF) and interferon production (Graber 1986, Kendall 2003, Reap 1990, Wang 1988).

Maitake mushrooms: Rich in beta-glucans, which help to support and enhance immune function and can stimulate the production of natural killer cells (NK) (Kodama 2003, Nanba 1987).

Chinese herbal medicine/acupuncture General considerations/rationale

Leukopenia is due to Qi and Yin deficiency in the Spleen and Kidney. Heat and toxins build up and Qi and Blood stagnate. According to the author's interpretation, the Kidney controls the bones and marrow. If the Kidney is too weak (Qi deficiency) or lacks nourishment (Yin deficiency) it cannot nourish the marrow, and blood cell proliferation and maturation are disrupted. The Spleen is too deficient in Yin and Qi to send nutrients to the Kidney to correct this organ's insufficiencies. This closely reflects the Western idea of using iron and vitamin B supplements to treat anemia. Both Western and Eastern medicines recognize that proper nutrition is necessary for normal bone marrow function.

When the marrow is deficient, Heat and Toxins can build up. This is the Eastern description for the immunosuppression and secondary infections seen with bone marrow suppression. Qi and Blood stagnation cause pain. Some conditions causing leukopenia, i.e. neoplasia, can be quite painful. Treatment involves increasing the white blood cell count, preventing secondary infections during the leukopenic period, and treating the underlying cause of the leukopenia.

Appropriate Chinese herbs

Arisaema pulvis (Dan nan xing): Has anticancer properties (Zhong Yao Yao Li Yu Ying Yong 1983). It may treat neoplastic causes of leukopenia.

Astragalus (Huang qi): Enhances both the cellular and humoral immune system. It contains astragalin, which increases the phagocytic action of macrophages and increases antibody production (Jiao Yan 1999). This may help protect the body from secondary infections. Astragalus also promotes the production and maturation of leukocytes in the bone marrow (Nan Jing Zhong Yi Xue Yuan Xue Bao 1989).

Atractylodes (Bai zhu): Can increase the T helper count (Xu 1994). It also increases the weight of the thymus gland and the spleen (Tang 1998).

Barbat skullcap (Ban zhi lian): Has shown the ability to inhibit various bacteria (Sato 2000). It may treat underlying bacterial causes of leukopenia or prevent secondary infections. It also has antineoplastic properties (Ren Min Wei Sheng Chu Ban She 1988). It may treat neoplastic causes of neoplasia.

Burreed tuber (San leng): Has demonstrated antineoplastic effects (Zhong Yao Xue 1988).

Centipede (Wu gong): Has both antineoplastic and antibacterial properties (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). It may treat the underlying etiology of the leukopenia or prevent secondary infections.

Codonopsis (Dang shen): Has been shown to increase the weight of the spleen and thymus and raise the white blood cell count (Huang 1994).

Coix (Yi yi ren): Helps inhibit the growth of neoplastic cells and increases the phagocytic abilities of macrophages (Li 2000). It may help reverse immunosuppression and treat some of the causes or secondary pathogens involved in leucopenia.

Cornus (Shan zhu yu): Has antibacterial properties (Shang 1994). It may help treat underlying bacterial etiologies of leucopenia and prevent secondary bacterial complications.

Dioscorea (Shan yao): Stimulates both humoral and cellular immunity (Miao 1996). This may help prevent secondary pathogens from invading while the patient is immunosuppressed.

Forsythia (Lian qiao): Inhibits multiple strains of bacteria (Ma 1982). It contains rengynic acid, which has been shown to inhibit RSV in vitro (Zhang 2002). It may help to control viral and bacterial etiologies and prevent secondary invasion of pathogens.

Hornet's nest (Feng fang): Has anti-neoplastic properties (Li Li 1999). It may help treat leucopenia secondary to neoplasia.

Mastic (Ru xiang): Contains boswellic acids, which have anti-neoplastic effects (Shao 1998). It may help control neoplastic etiologies.

Oldenlandia (Bai hua she cao): Prevents the growth of cancer cells (Gupta 2004, Wong 1996). This may treat neoplastic causes of leucopenia.

Poria (Fu ling): Contains pachman, which has been shown to increase the phagocytic activity of macrophages (Lu 1990). This may help decrease the immunosuppression associated with leucopenia.

Prunella (Xia ku cao): Has demonstrated inhibitory effects against several bacteria and some dermatophytes (Zhong Cao Yao 1989).

Sage tangle (Kun bu): Contains iodine and therefore can kill a number of bacteria and viruses (Kong 1994).

Salvia (Dan shen): Has some anti-cancer effects (Li Xu Fen 1999). Salvia may be of use in neoplastic etiologies.

Sargassum (Hai Zao): Increases phagocytic activity of macrophages (Zhong Guo Yao Ke Da Xue Xue Bao 1988). It may help treat underlying infectious causes of the leucopenia or prevent secondary infections.

Scorpion (Quan xie): Has inhibitory effects on cancer cells (Jiang Su Yi Yao 1990).

Silkworm (Jiang can): Has been shown to inhibit the growth of bacteria (Zhong Yao Xue 1998).

White peony (Bai shao): Has shown efficacy against several bacteria and some dermatophytes (Xin Zhong Yi 1989). It may prevent secondary infections while the white blood cell count is low.

Wolfberry (Gou qi zi): Has been shown to prevent cyclophosphamide-induced leucopenia experimentally (Pu 1998). It promotes lymphocyte transformation and improves the phagocytic abilities of macrophages (Geng 1988).

Zedoaria (E zhu): Has antineoplastic activity (Xin Yi Yao Xue Za Zhi 1976).

Homotoxicology

General considerations/rationale

Homotoxicologists view leukopenia as a hemodermal pathology in the Impregnation or Degeneration phase.

Appropriate homotoxicology formulas

Because a wide variety of factors may be involved, the following list is only a superficial consideration of major remedies:

BHI-Echinacea PC: Supports the immune system in minor infections.

Aletris-Heel: Combination well suited for cases manifesting exhaustion, anemia, and metabolic fatigue. Contains Natrium muriaticum, and is recommended for drug-induced leukopenias (Bianchi 1995).

BHI-Infection: Immune supportive; also given for fever, inflammation.

BHI-Inflammation: Similar to a combination of *Traumeel* and *Echinacea compositum*, this remedy contains Staph and Strep nosodes for immune stimulation and direction. Useful for arthritis, fever, inflammation, acne, and minor injuries.

Coenzyme compositum: Provides metabolic support. A primary constituent in this condition is Cysteinum, a sulfhydryl group (SH-group) containing factor of redox potentials (e.g. Glutathione). It is useful in retoxic and iatrogenic damage of all kinds, e.g. leukemia, pre-cancerous states, and neoplastic diseases (Reckeweg 2002).

Echinacea compositum: Functioning as a natural antibiotic and immune-supporting formula, this remedy is helpful in all cases of infection. It is particularly indicated in the Inflammation and Impregnation phases. *Echinacea angustifolia* is listed for pancytopenic conditions in the Degeneration phase (Bianchi 2005). Zinc is critical to immune function, according to a number of studies (Kirsteen, et al. 2001). Because Zincum metallicum is no longer available as an injeel in the United States, the remedies *Echinacea compositum* and *Testis compositum* are both sources of Zinc, which is critical because DNA makes RNA, which in turn makes proteins that further drive biological function. Trace minerals work as catalysts in enzyme complexes and alter reactions and stability of proteins. Zinc acts as an anti-oxidant, and in addition, studies have shown that Zinc must be present for lymphocyte maturation and is a lymphocyte mitogen. Additionally, zinc is a necessary co-factor in activation of

serum thymic factor (Clark). Thymocytes undergo rapid apoptosis and changes in the susceptibility of cells to undergo apoptosis when high levels of exogenous zinc are provided, which may explain resistance of cells to certain toxic agents after exposure to various agents, including glucocorticoids, ionizing radiation, and environmental agents. Cellular zinc content is an important factor in the propensity of thymocytes to undergo apoptosis. Changes in the susceptibility of cells to undergo apoptosis when high levels of exogenous zinc are provided may explain the resistance of cells to certain toxic agents (Kirsteen 2001).

Engystol N: Increases white blood cell numbers. Commonly used in viral infections and allergies. Along with *Coenzyme compositum* and *Ubichinon compositum*, it has been recommended for agranulocytosis and bone marrow deficiencies. It also is used for iatrogenic damage to bone marrow due to antibiotics and for leukopenias in general (Bianchi 2005).

Euphorbium compositum: Due to its antiviral activity this remedy may assist in cases of leukopenia caused by to viral infection and replication.

Galium-beel: Cellular detoxification in anemia and leukopenia. It is immune supportive.

Glyoxal compositum: A cellular phase remedy directed at improving metabolism and cellular functioning by removal of homotoxin “polymers” that act to block enzyme systems.

Hepar compositum: Used to drain, detoxify, and repair liver tissue, and support pancreas and gastrointestinal tissues.

Lymphomyosot: Drains lymphatics and may reduce toxin levels at the site of pathology. It contains thyroxine, which provides immune and endocrine support.

Molybden compositum: A trace mineral donor. Contains copper and molybden, among many others. These trace minerals are involved in many biochemical processes such as cellular respiration, cellular use of oxygen, DNA and RNA reproduction, maintenance of cell membrane integrity, and sequestration of free radicals, which helps to maintain the integrity of membranes, reduces the risk of cancer, and slows the aging process (Chan 1998). It has been recommended for bone marrow deficiencies resulting in agranulocytosis (Bianchi 2005). Clients need to keep this particular medicine out of the reach of their pets and children because accidental ingestion can lead to toxicity. At normal dosing it is quite safe, but caution is indicated in allowing access to the product.

Solidago compositum: Provides renal support and detoxification.

Testis compositum: Contains factors for regeneration of blood and lymphoid tissue. It also contains factors for other metabolic dysfunctions, such as exhaustion issues, including: Zincum (see *Echinacea compositum*), Embryo

suis (a gland therapy source of stem cells and stem cell associated micromolecules), Glandula suprarenalis suis for adrenal dysfunction, and Ginseng for exhaustion. Cortisonum, as cortisone, can have immensely damaging effects on the production of immune cells, because it induces leukopenia, lymphopenia, eosinopenia, and thymic and adrenal atrophy (Committee for Veterinary Medical Products 1999). The effects of corticosterone and hydrocortisone on the thymus and the pituitary-adrenal axis have been studied. Short-term effects within 48 hours after 1 or 2 corticoid injections and late effects 7 days after a regimen of 4 corticoid injections were discerned, with an induction of leukopenia and monocytopenia being quantified from the parenteral administration of glucocorticoids (Van Dijk 1979).

Thyroidea compositum: Provides endocrine support and activation, as well as deep matrix drainage. Contains Thymus suis, a glandular extract of the thymus, which is intimately involved in the signaling pathways of leukocytes (Clark). The thymus involutes early in life, and corresponds to decline in function of the hypothalamic-pituitary-endocrine axis and cellular immune deficiencies of aging. The pituitary, pineal gland autonomic nervous system, thyroid, gonads, and adrenals all factor into thymic integrity and function. An important endocrine function of the thymus is to package zinc in zinc-thymulin for delivery to the periphery. There have been recent efforts to treat immune deficiency in aged and cancer-bearing patients (Hadden 1998). Listed in the spectrum of activity for Splen suis (also in *Tonsilla compositum*) are leukemia and anemia, as well as action for general revitalization and in weakness of old age in order to enhance the resistance to infection (Reckeweg 2002). It is recommended for agranulocytosis, particularly when due to a bone marrow deficit (Bianchi 1995). Medulla ossis suis (also in *Tonsilla compositum*) has indications in anemia, leukemia, agranulocytosis, and other iatrogenic conditions (Reckeweg 2002).

Tonsilla compositum: By virtue of its effect on bone marrow and blood development this remedy should be considered in all cases of leukopenia, especially those deeper homotoxicoses to the right of the Biological Division on the Six-Phase Table. It has deep acting effects on the endocrine system and central controls. Stem cell activity may stimulate repair or cellular activation.

Ubichinon compositum: Provides mitochondrial support of metabolism. In particular, help is sourced via para-Benzochinonum, which helps with regenerative action on cell respiration and also in cases of genetic mutations. It is indicated in all cellular phases, leukemia, neoplasm phases, and other conditions. It can have protective functions against viral infections, and is useful after damage to the spleen with changes in the blood composition. It can have a positive effect on all illnesses,

which could be connected with auto-immune disease (Reckeweg 2002).

Authors suggested protocols

Nutrition

Immune support and blood bone marrow support formulas: 1 tablet for every 25 pounds of body weight BID.

Maitake DMG: 1 ml per 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

The authors recommend formula H98 Lymph “K” at a dose of 1 capsule per 10 to 20 pounds twice daily as needed. In some cases conventional drugs are given in conjunction with the herbs to increase their efficacy. In addition to the herbs mentioned above, H98 Lymph “K” also contains eupolyphaga (Tu bie cong), fritillaria (Bei mu), house lizard (Bi hu), myrrh (Mo yao), rehmannia (Shu di huang), Selaginellae doederleini (Shi shang bai), and Typhonium giganteum rhizome (Bai fu zi). These additional herbs help increase the efficacy of the formula.

Homotoxicology (Dose: 10 drops PO for 50-pound dog, 5 drops PO for small dog or cat)

Symptom formula In Phases 1 through 3: *Echinacea compositum*, *Engystol N* plus *Galium-Heel*, preferably as an autotransfusions. The action of these are reinforced by activation of intermediary metabolism through administration of *Coenzyme compositum* and *Ubichinon compositum*. The entire therapy is complemented by the activation of the mesenchyme, an indispensable step of therapy made possible by application of the preparation *Lymphomyosot* (see detoxification formula below), rounded off by nosode therapy, such as *Psorinoheel*. *Molybden compositum* and *Causticum compositum* may also be of value in refractory cases.

Detoxification formula in Phases 1 through 3: *Berberis homaccord*, *Nux homaccord*, and *Lymphomyosot* mixed together and given BID for 30 to 90 days.

Symptom formula in Phases 4 through 6: *Tonsilla compositum* every 3 days and *Echinacea compositum* daily until main infection has ceased. *Galium-heel* BID.

Deep detoxification formula in Phases 4 through 6: *Lymphomyosot*, *Hepar compositum*, *Thyroidea compositum*, *Solidago compositum*, *Coenzyme compositum*, and *Ubichinon compositum* mixed together and given every 3 days.

LYMPHADENOPATHY/TONSILLITIS

Definition and cause

Lymphadenopathy/tonsillitis is defined as enlarged lymph nodes and glands. Causes can range from generalized inflammation with or without hyperplasia to infectious with white blood cell component infiltration to neoplasia—either primary as lymphoma or secondary to metastatic diseases. Lymphadenitis or hyperplasia can be local as in tonsillitis or local lymphadenopathy, or generalized throughout the peripheral and internal nodes.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The medical and or nutritional recommendations for treatment depend upon the diagnosis. In this section we address tonsillitis, lymphadenopathy, and lymph hyperplasia. For lymphoma please see Chapters 31 through 34, which address cancer. Generally, treatment focuses upon the reduction of inflammation and prevention of cellular infiltration using corticosteroids and antibiotics.

Anticipated prognosis

The prognosis is generally good for tonsillitis, lymphadenopathy, and lymph hyperplasia as primary conditions.

The prognosis changes based upon secondary involvement of the lymph system. Surgical removal of the tonsils is often recommended when there are associated signs of gagging, excessive salivation, and vomiting.

Integrative veterinary therapies

The cause of lymph inflammation, hyperplasia, and WBC infiltration begins secondary to local, cellular inflammation leading to hyperplasia and cellular infiltration. Treatment with corticosteroids and antibiotics suppresses the inflammatory process and resultant infiltration and hyperplasia but does not address the underlying causes. Examples include: the inciting cause of the inflammation such as excessive free radical production; the reaction to and the removal of specific allergens, toxins, vaccinations, environmental chemicals, pesticides, herbicides etc.; the organ elimination of foreign materials; the balancing of the immune response and the quieting of an exaggerated response (Appleton 2005).

Nutrition

General considerations/rationale

The lymph system is one of the body's primary immune defense mechanisms and as a result is a primary location for a free radical cascade and resulting inflammation. Early lymph system inflammation results in swelling and stasis of lymph flow. More chronic, unaddressed inflammation can result in cellular infiltration and gland enlargement. The integrative use of therapeutic nutrition can help address and neutralize free radical production, inflammation, and cellular infiltration.

Appropriate nutrients

Nutrition/gland therapy: Oral administration of glandular lymph, thymus, adrenal, and bone marrow can neutralize a cellular autoimmune attack and help prevent secondary cellular infiltration (Goldstein 2000) (See Gland Therapy in Chapter 2 for more detailed information).

Vitamin A: A retinoid and a potent antioxidant that is required for the proper division and growth of cells. As a potent antioxidant, vitamin A is cell and tissue protective in that it acts as a free radical scavenger (See Antioxidants and Free Radicals, Chapter 2). In this area of free radical scavenger and the reduction of inflammation, vitamin A can be therapeutically beneficial in treating early inflammatory disease conditions such as lymphoid hyperplasia (Halliwell 1994).

Vitamin C: An effective antioxidant, which helps to reduce tissue and cellular inflammation. It has also been shown to increase the levels of other antioxidant enzymes. Vitamin C is involved in the free radical and reactive oxygen species (See free radicals in Section 1) which result from normal metabolism as well as exposure to chemical

and environmental pollutants (Bendich 1995, Carr 1999, Pauling 1976).

Vitamin E: A fat-soluble vitamin and one of the body's main antioxidants, especially in its function of protecting lipids. As a potent antioxidant, its primary function is the neutralization of free radicals and reduction of inflammation, particularly as it affects the oxidation and destruction of lipids (Traber 1999). As such, it is tissue protective for the cell membranes.

Betasitosterol: A phytosterol found in higher plants; betasitosterolin is its glycoside. Animal studies have demonstrated that phytosterols have anti-inflammatory, antipyretic (Gupta 1980), and immune-modulating activity (Bouic 1996).

Chinese herbal medicine

General considerations/rationale

Tonsillitis is due to Wind and Heat affecting the Lung and Stomach. According to the Western interpretation, wind blows the pathogen into the body. Heat refers to the inflammation seen in the throat. The Stomach opens to the mouth so inflammation in the Stomach can be evidenced by oral pathology. The Lung controls the airways. The treatment goals are to cool the inflammation and repel the pathogen causing the inflammation. In the acute phase there may also be fever, which must be addressed.

Appropriate herbs

Acute tonsillitis

Arctium (Niu bang zi): Has anti-inflammatory and antipyretic effects (Zhong Yao Xue 1998; 91:92). It also has antibacterial efficacy (Group of Virology 1973).

Coptis (Huang lian): Has antibiotic and antiviral effects (The Merck Index 2000). It contains berberine which has demonstrated anti-inflammatory actions in rats (Yao Xue Za Zhi 1981). Coptis also has antipyretic effects (Zhong Guo Bing Li Sheng Li Za Zhi 1991).

Forsythia (Lian qiao): Contains rengynic acid, which has been shown to inhibit RSV in vitro (Zhang 2002). It also inhibits multiple bacteria and has anti-inflammatory, analgesic, and anti-pyretic effects (Ma 1982).

Gardenia fruit (Zhi zi): An anti-inflammatory (Zhang 1994). It contains geniposide, which has analgesic properties (Zhong Yao Zhi 1984). It has demonstrated efficacy against several types of bacteria (Zhong Yao Zhi 1984).

Honeysuckle (Jin yin hua): Has chlorogenic acid and isochlorogenic acid. These compounds have strong antibacterial properties (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). Anti-inflammatory and antipyretic actions have been demonstrated in rabbits and mice (Shan Xi Yi Kan 1960).

Licorice (Gan cao): Has analgesic properties (Zhong Yao Xue 1998). It contains glycyrrhizin and glycyrrhetic

acid which have anti-inflammatory effects (Zhong Cao Yao 1991). Glycyrrhizin has been shown in vitro to inhibit a number of viruses (Zhu 1996). Licorice also has antibacterial effects (Zhong Yao Zhi 1993).

Mint (Bo he): Decreases fevers and has anti-inflammatory effects (Zhong Yao Xue 1998). It has shown efficacy against viruses and bacteria (Wang 1983).

Platycodon root (Jie geng): Contains platycodin, an antipyretic compound (Li 1984, Zhang 1984). It causes anti-inflammatory effects by promoting the secretion of corticosterone (Li 1984, Zhang 1984, Zhou 1979).

Rhubarb (Da huang): Contains emodin, rhein, and aloe-emodin which have antibiotic effects (Zhong Yao Xue 1998). Rhubarb has also been shown to inhibit viruses (Xie 1996). It has antipyretic, analgesic, and anti-inflammatory properties (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). Finally, it can enhance immunity (Zhang 1997), which may help the patient recover more quickly.

Schizonepeta stem (Jing jie): Has analgesic effects (Zhong Yao Cai 1989), which may help soothe sore throats.

Scrophularia (Xuan shen): Has antibacterial action against various bacteria (Chen 1986). It also reduces fevers (Zhong Yao Yao Li Yu Ying Yong 1983).

Scutellaria (Huang qin): Contains biacalin, which has antibiotic activity (Zhong Yao Xue 1988, Liu 2000). Both baicalin and a second ingredient, biacalein, have been shown to suppress inflammation in mice (Kubo 1984). It seems to act on the central nervous system to reduce fevers (Xu 1999).

Siler (Fang feng): Has been shown to decrease fevers (Zhong Yi Yao Xin Xi 1990). It also has demonstrated antibacterial and antiviral effects (Zhong Yao Tong Bao 1988).

Chronic tonsillitis

Licorice (Gan cao): See above.

Loquat leaf (Pi pa ye): Has antibiotic properties (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Ophiopogon (Mai men dong): Was shown to increase mucociliary transport and decrease respiratory tract mucus secretion (Tai 2002). This may decrease congestion in the throat and help sweep pathogens out of the pharynx. It has antibiotic actions (Zhong Yao Xue 1998).

Oriental wormwood (Yin chen hao): has shown antibiotic activity against a variety of bacteria and some viruses (Zhong Yao Yao Li Yu Ying Yong 1990). It has analgesic and anti-inflammatory effects (Wan 1987, Shan 1982).

Rehmannia (Shu di huang): When cooked, increases the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998). This in turn may increase the plasma cor-

tisone level and decrease inflammation. Raw rehmannia (Sheng di huang) reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Scutellaria (Huang qin): See above.

Acupuncture

The World Health Organization placed tonsillitis on the list of conditions responsive to acupuncture in 1979 (World Health Organization Accessed 10/20/2006). In a study involving 220 people, Chen (1987) showed that tonsillitis symptoms could be decreased by acupuncture.

General considerations/rationale

Generalized lymphadenopathy: Lymphadenopathy is due to Heat and Toxins affecting the Lung, which leads to blockage of the meridians. There is also Qi and Blood stagnation with Ying Qi and Wei Qi disharmony.

According to the Western interpretation, Heat and Toxin refer to inflammation and the cause of that inflammation. Just as swelling can lead to blockage of vessels in Western medicine, swelling can block the meridians in TCM. The blockage leads to Blood and Qi stagnation as the normal flow is disrupted. Stagnation can lead to swelling—of the lymph nodes in this case.

Wei Qi is translated as protective Qi. It can be thought of as the immune system. The Ying level is the muscle layer and when the Ying Qi and Wei Qi are in disharmony it means that the immune system is battling the pathogen. The pathogen is stuck in the muscle layer, but is prevented from getting deeper into the body by the immune system. Treatment is aimed at decreasing the swelling and eliminating the cause of the lymphadenopathy.

Appropriate Chinese herbs

Anemarrhena root (Zhi mu): Has anti-inflammatory effects. It has been found to raise the plasma corticosterone level in mice (Chen 1999), which suggests it may be of use in decreasing the inflammation in lymph nodes.

Dandelion (Pu gong yin): Has antibiotic properties (Zhong Yi Yao Xue Bao 1991). It may possess anti-inflammatory actions (Mascolo 1987).

Forsythia fruit (Lian qiao): Contains rengynic acid, which has been shown to have antiviral properties (Zhang 2002). In addition it has antibacterial effects (Ma 1982). These actions may be of use in infectious lymphadenopathy.

Honeysuckle (Jin yin hua): Has chlorogenic acid and isochlorogenic acid, which have very strong antibacterial functions (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991).

This may help in inflammatory lymphadenopathy. In addition, licorice has antiviral and antibacterial properties (Zhu 1996, Zhong Yao Zhi 1993).

Phellodendron bark (Huang bai): Has antimicrobial effects (Zhong Yao Xue 1998).

Rehmannia (Sheng di huang): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983). This may help decrease the inflammation in the nodes.

Scutellaria (Huang qin): Contains biacalin which has antibiotic activity against multiple strains of bacteria fungi and viruses (Zhong Yao Xue 1988, Liu 2000). Baicalein, another component of Huang qin, causes apoptosis of human myeloma cells in vitro (Zi 2005). The flavone component decreases inflammation (Cao 1999). This may be useful to decrease inflammation in the lymph nodes.

Siler (Fang feng): Has some antibacterial and antiviral effect (Zhong Yao Tong Bao 1988). It was shown experimentally to inhibit the development of solid tumors in mice (Li 1999). It may help to inhibit neoplastic causes of lymphadenopathy.

White peony (Bai shao): Has antibacterial and antifungal properties (Xin Zhong Yi 1989). It contains paeoniflorin which is a strong antipyretic and anti-inflammatory (Zhong Yao Zhi 1993).

Homotoxicology

General considerations/rationale

Tonsillitis and lymphadenopathy are Inflammation Phase disorders. As disease processes continue they can progress to Impregnation Phase disorders. In acute cases it is desirable to determine the aggravating factors present, but there is some indication that the pathogenic bacteria, viruses, or fungi might not be capable of causing infection if the matrix was healthy. In cases of homotoxicoses there may well be phenomena at work, making the immune system more susceptible to infection. In the extreme, it is possible that infectious agents may actually be involved in devouring and processing homotoxins into less dangerous material. Of course, pathogens may produce or release other toxic agents into the milieu and further the progression of the homotoxicosis. Therapy is aimed at supporting detoxification, promoting lymph drainage, and improving immune function. Providing adequate rest and improved environmental conditions (proper temperature, reduced stress, adequate fluid intake and proper diet), along with gentle massage or movement to mobilize lymph is also helpful.

Antibiotics can cause bacterial death and release of homotoxins that become deposited in tissues. They can further accumulate and there is an observed link in humans between the treatment of tonsillitis and the onset of agranulocytosis or even further, into the neoplastic phase of leukemia. This represents an undesirable pro-

gressive vicariation (Reckeweg 1989). Antibiotics may be needed in these cases, but if they present early it is advisable to attempt treatment biologically and avoid further damage.

Appropriate homotoxicology formulas

Special note: The combination of *Lymphomyosot* and *Apis homaccord* provides a powerful weapon against both swelling and pain.

Apis homaccord: Used for pain and swelling. Apisum and Apis have edematous swellings with formations like water-filled sacs, infiltration of the cellular tissues, and right-sided tonsillitis with edematous swelling of uvula (Reckeweg 2002) as indications. Apis is also found in *Arnica Heel*, below.

Arnica-Heel: Used for tonsillitis with pain. Significant remedies include *Eucalyptus*, with its main indications: influenza and influenzal catarrhs, tracheitis, laryngitis, bronchiolitis, swollen lymph nodes, rheumatic pains with a pricking sensation in the muscles and joints with nocturnal aggravation, tiredness, and stiffness of the limbs (Reckeweg 2002).

Belladonna homaccord: Treats acute inflammatory issues. Belladonna's list of complaints includes typical engorgement and swelling of mucosa, the mucous membranes of the oral cavity, and a dry, red tongue, a catarrh of the soft palate with inflammatory swelling, extending from the tonsils, linked with overwhelming thirst. Usually this is accompanied by difficulty and pain in swallowing, and on attempting to drink (Reckeweg 2002). This is also a component of *Mercurius Heel*, *Mucosa compositum*, and *Traumeel*.

BHI-Infection: Used for sharp, splinter-like pain, sensitivity to being touched, minor infections.

BHI-Lymphatic Rx: Used to treat swollen glands, bronchial cough, eczema, rhinitis, and sensitivity to weather changes. It contains nosodes to improve immune function (Currently unavailable).

BHI-Throat: Used for sore throat. It contains Calcium carbonicum with indications for swellings of the lymph-nodes, tonsils, hilar glands, and mesenteric glands (Reckeweg 2002). It is used with *Hyoscyamus*, whose range includes parotitis and tonsillitis. *Hyoscyamus* should also always be indicated by the symptom of grinding the teeth in sleep. Acute tonsillitis reacts mostly, but not only, to *Belladonna*, but also to *Hyoscyamus*, when there is the sensation of great dryness, scratching and burning in the palate and the esophagus, with swallowing difficulties caused by the inflamed swelling of the tonsils (Reckeweg 2002).

Echinacea compositum: Immune support in infections. This remedy contains *Hepar sulphuris calcareum*, which is often used for chronic catarrhs of the respiratory organs with expectoration of purulent sputum and croupy cough.

Because of its action in suppurations, Hepar sulph is the main remedy for abscesses of the lung and in the tonsils (Reckeweg 2002). It is also found in *Traumeel*.

Engystol N: Used for viral infections. This seemingly simple remedy contains Vincetoxicum, which is used in acute febrile reaction phases. It is used for mononucleosis (glandular fever), lymphadenitis, and viral diseases. The other component is Sulphur, which figures into chronic diseases, particularly in the context of reotoxic Impregnation phases and cellular phases that show a tendency toward regressive vicariation but are unable to complete the process. Also used for viral illnesses (Reckeweg 2002).

Galium-Heel: Used in Deposition Phase cases and to the right on the Six-Phase Table. It also is used as a cellular detoxification and repair agent with immune stimulation. This contains *Thuja*, which has in its remedy picture swollen gums as well as ulcers in the mouth and throat and possibly swellings of the tonsils and glands. It also contains *Clematis erecta* for very sensitive pustular eruptions, characterized by burning, stinging pains, and also pustules, which often proceed with inflammatory swellings of the neighboring lymph nodes. Another valuable component is *Saponaria*, which is almost exclusively used in the treatment of acute colds, coryza and throat pains, tonsillitis, pharyngitis, and laryngitis. *Saponaria* is used in combination remedies because of a certain blood cleansing action by which it facilitates the elimination of homotoxins which have been freed through harmless catarrhal symptoms such as an acute cold or, in serious cases, tonsillitis. “*Saponaria* then compensates for this by inhibiting inflammation in a biological way by changing the homotoxic ‘soil’” (Reckeweg 2002).

Lymphomyosot: Used for lymphatic drainage, fever, and immune and hormonal support. This complex includes *Juglans*, whose prime indication is lymphadenopathy and lymphadenitis (Reckeweg 2002).

Mercurius-Heel S: An antiviral and antibacterial for very red and inflamed, painful tonsils. This wide-ranging remedy has *Mercurius solubilis*, (see *Tonsilla compositum*), *Belladonna* (see *Belladonna compositum*), and *Phytolacca*, whose main indications include tonsillitis. It is characterized by violent inflammation of the whole pharyngeal area and the throat is swollen and dark red (Reckeweg 2002).

Tonsilla compositum: Used in Degeneration Phase, Impregnation Phase, and Dedifferentiation Phase cases for immune support. It primarily takes its name from *Tonsilla suis*, which is indicated for hypertrophy of the tonsils. It is also used for chronic tonsillitis, enlarged lymph glands, tubercular glands, and exudative diathesis. May also be tried experimentally in lymphogranulomatosis and reticulosis. It also contains *Calcium phosphoricum*, a constitutional remedy for status lymphaticus, and

is also found in *Lymphomyosot*. *Tonsilla compositum* also contains *Dulcamara*, which has proved its worth in chronic sore throats that are worsened in wet weather, particularly if they are suppurative (Reckeweg 2002). *Glandula lymphatica suis* is another valuable component with the following indications: lymphadenopathy, exudative diathesis, vague swellings of the lymph nodes from other causes, agranulocytosis, chronic tonsillitis, and hypertrophy of the tonsils (Reckeweg 2002). *Mercurius solubilis Hahnemanni* (Merc. Sol), another component, is useful in patients that have a tendency toward suppurations of all kinds, including tonsillitis, sinusitis, empyema, or of the thorax (Reckeweg 2002). Merc. Sol. is also a component common to *Traumeel*.

Traumeel S: An anti-inflammatory used in acutely painful cases and in regulation rigidity cases to activate sulfur-containing enzymes. *Calendula*, which is homeopathically characterized by great irritability with a tendency to choke and rheumatoid pains everywhere, has a beneficial effect on vesicular eruptions and on inflammatory swelling of the submaxillary gland, tonsils, parotid glands, and various lymph glands. It could also be used for mononucleosis—also known as glandular fever—along with Vincetoxicum or *Engystol* (Reckeweg 2002). Many recurrent tonsillar issues may be based in viral impregnation diseases.

Ubichinon compositum: Includes Naphthaquinone in its remedy list. A shortage of oxygen in the tissues is expressed as cyanosis of the lips, conjunctiva, and nails. In severe cases of cancer, lymphatic congestion may also be present. Since Naphthoquinone has particular affinities for the tonsils and the appendix, i.e. for the secondary defenses of the lymphatic mechanism, it should also be used after tonsillectomy or appendectomy (human).

Authors’ suggested protocols

Nutrition

Immune and Lymph support formulas: 1 tablet for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID (maximum, 2 capsules BID).

Chinese herbal medicine

Tonsillitis

Acute stage: Use patent formula “Qing Yan Li Ge Tang” at the recommended dose (Yu 2000). In addition to the herbs cited above, Qing Yan Li Ge Tang also contains mirabilite (Mang xiao).

Chronic stage: Use patent formula “Gan Lu Yin” at the recommended dose (Yu 2000). In addition to the herbs cited above it also contains asparagus tuber (Tian men dong), bitter orange (Zhi ke), and dendrobium (Shi hu).

Recommended acupuncture points: GB4, LI11, LU5 and TH1 (Handbook of TCM Practitioner 1987).

Generalized lymphadenopathy

Use patent formula "Ji Yin Tang." In addition to the herbs discussed above, Ji Yin Tang also contains angelica radix (Bai zhi), cyperus (Xiang fu), fritillaria (Bei mu) and orange peel (Chen pi) as part of the patent formula. Dose according to manufacturer's recommendations (Yu 2000).

Homotoxicology (Dose: 10 drops for 50-pound dog, 5 drops for cat or small dog)

Lymphomyosot, Mercurius, Apis homaccord, Belladonna homaccord: Mixed together and given every 15 minutes in acute cases and then BID to TID PO. Antibiotic therapy is appropriate if patient response fails to appear rapidly.
BHI-Lymphatic Rx tablets: An option; give TID PO.

Product sources

Nutrition

Immune and Lymph support formulas: Animal Nutrition Technologies. **Alternative:** Immune System Support Standard Process Veterinary Formulas, Immuno Support—Rx Vitamins for Pets, Immugen—Thorne Veterinary Products.

Betathyme: Best for Your Pet. **Alternative:** Moducare—Thorne Veterinary Products, follow manufacturers directions.

Chapter Eight

Behavior and Emotional Conditions

AGGRESSION

Aggressive behavior often originates from anxiety and generally represents a biological response to the environment. It may represent a wide variety of conditions (Beata 2006a). There has been a tremendous amount of study, observation, and explanation of aggression in both dogs and cats in relation to their ancestry and domestication. Classifications of aggression are based upon a number of factors, such as the following, which have been well described: (a) lack of socialization; (b) play, fear, or pain; (c) predatory; (d) territorial; and (e) idiopathic aggression. For more information, see Beata (2001).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The important point is that medical therapy will not cure any behavior problem. Due to the large amount of research that has been done, the response to drugs can be predicted and often dogs or cats improve for periods of time. However, medications do not cure the condition. The current veterinary approach to aggression in dogs and cats is a combination of behavior modification techniques along with appropriate and predictable drug therapy. The rationale for the use of psychotropic drugs is that if they are not used, then the number of aggression-related euthanasias will rise dramatically (Beata 2001, Houpt 1998, Overall 1994, 1997).

Typical drug therapies are: sedatives such as acepromazine or risperidone, thymoregulators such as carbamazepine, antidepressants such as fluoxetine, and anti-anxiety medications such as amitriptyline or buspirone. Besides the inherent side effects associated with the drugs, the more important point again is that drugs alone, without behavior modification, simply are not effective (Beata 2001, Houpt 1998).

Anticipated prognosis

Aggression can be a real problem for people as well as the animal, and therefore the prognosis is individualized.

Veterinarians should play an integral part in the treatment decisions and instruct clients when the prognosis is poor and danger exists (Beata 2001).

Integrative veterinary therapies

Neither drug nor behavior modification approaches consider internal, physiological, biochemical, nutritional, and autoimmune reactions, such as those to vaccines. When integrative therapies—including nutrition, medicinal herbs, and homotoxicology remedies—are used with drugs and behavior modification or as a free-standing protocol, the day-to-day quality of life as well as the cessation and control of the aggression can be improved.

In addition, the authors recommend liver support in nearly all cases of aggression; this can take the form of nutritional or herbal support, acupuncture, biopuncture, or antihomotoxic medicines.

Nutrition

General considerations/rationale

The nutritional approach to aggression is often multifaceted, consisting of nutrient support of the brain and nervous system; detoxification and elimination of chemicals, toxins, and prior vaccinations; removal of chemical additives, preservatives, coloring agent, dyes, and other unnatural ingredients from the diet; and the addition of behavior modifying natural remedies.

Appropriate nutrients

Nutrition/gland therapies: Glandular brain and liver supply intrinsic nutrients and can help improve circulation and reduce inflammation in the brain, central nervous system, and liver (Goldstein 2000) (see Chapter 2, Gland Therapy, for more detailed information).

Specialized phospholipids, such as phosphatidylcholine, phosphatidylserine, and others, have been proposed as therapeutic agents for neurologic and other diseases (Horrocks 1986). These phospholipids are found in high concentrations in the brain, liver, and other glands. These glands are also sources of unsaturated omega-3 fatty

acids, which are thought to play a vital role in the development and maintenance of the central nervous system. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by the nerves and all of the cells of the body for general health and wellness (Hanin 1987).

Phosphatidyl serine (PS): A phospholipid that is an essential ingredient in cellular membranes, particularly of brain cells. It has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). In people with Alzheimer's disease the addition of PS to the program showed a mild to a significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Blue-green algae: Blue-green algae have been observed to create a generalized feeling of well being in humans taking the product and may prove helpful in veterinary patients. This may be due in part to their content of natural antihistaminic compounds or their levels of omega-3 fatty acids (Bruno 2001). Many studies in recent years have confirmed the beneficial results from these critical fatty acids. *Aphanizomenon flos aquae*, a blue-green algae, has been shown in clinical settings to have positive effects on brain function. In addition to omega-3 fatty acids, it contains a full spectrum of essential amino acids, a broad-based mineral content, a rapidly assimilable glycolipoprotein cell wall, and a wide variety of vitamins. It has mild chelating properties, and therefore can be of value in heavy metal toxicoses. It is an asset as a micronutrient resource and figures prominently in many treatment programs (Broadfoot 1997).

Chinese herbal medicine

General considerations/rationale

According to TCM theory, aggression is a result of excessive Yang and Fire in the Liver and Heart. In the Western interpretation, Yang can be thought of as energy and Fire as heat. In Western parlance one might say an aggressive person is hot-headed. The ancient Chinese believed that the Heart housed the Shen, or spirit. When the Shen is disturbed, a patient is unable to relax. He is easily upset. The Liver ensures a smooth flow of blood to the mind, according to TCM. When the Liver is hot, the smooth flow is disrupted, leading to irritability. The image conveyed by the TCM terms is an individual who is hyper-reactive, easily angered. In order to treat such a patient it is necessary to soothe or sedate the psyche. In

Western parlance this means sedating the central nervous system.

Appropriate chinese herbs

Albizzia flower (He huan hua): Has sedative effects (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Contains saikosaponins, which have sedative effects (Zhong Yao Yao Li Yu Ying Yong 1983).

Curcuma root (Yu jin): Contains curdione, a compound that sedates the central nervous system. Experiments on cats showed that the effect of curcuma root on sleep patterns indicates that it inhibits the central nervous system (Hao 1994).

Grass-leaf sweet-flag root (Shi chang pu): A central nervous system suppressant (Zhong Yao Xue 1998). Grass-leaf sweet-flag root was used along with Shu di huang, Shan zhu yu, Fu ling, Tai zi shen, Suan zao ren, Hu po, Dang gui, Gou qi zi, Wu wei zi, and Zhi gan cao in 48 people with anxiety disorders. Seventy-five percent showed significant improvement and 22% had some improvement (Wang 1998).

Polygala root (Yuan zhi): Causes sedation (Zhong Yao Yao Li Yu Ying Yong 1983). It contains a high level of bromine, and therefore a tranquilizing effect (Ou 1990).

Polygonum (Ye jiao teng): A tranquilizer. Experiments in mice showed that it can decrease the amount of pentobarbital needed to sedate animals (Chen 1999).

White peony (Bai shao): Causes sedation, as has been shown experimentally in mice (Zhong Yao Tong Bao 1985).

Zizyphus (Suan zao ren): Has demonstrated sedative effects in various animals (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995).

Homotoxicology

General considerations/rationale

From a homotoxicologic viewpoint, aggression represents homotoxicoses typical of the neurodermal Inflammation Phase (Heel 2003). As homotoxins accumulate or do further damage, these cases may deteriorate to involve any phase to the right (Deposition, Impregnation, Degeneration, and Dedifferentiation) (Palmquist 2005). Proper diagnosis is critical and every case should have a complete history, physical examination, dietary consultation, and full laboratory testing including CBC, chemistry, and thyroid or other endocrine tests as appropriate (Beaver 2003).

Toxins play a large part in aggression and properly dealing with homotoxins can lead to remarkable results. One homotoxicologist feels there is a connection between canine distemper and aggression in some cases (Palmquist 2003). Rabies vaccination has been associated with aggression, but this assertion is not widely accepted by conven-

tional veterinarians at this time. The evidence in support of this is the response of some of these cases to the homeopathic remedy *Lyssin*, which comes from rabies virus. Vaccines may contain heavy metals and other agents, which can negatively affect the nervous system. Products now exist which contain no added thimerosal and are recommended for routine use in veterinary practice. It should be remembered that negative emotions, thoughts, and treatments are all categories of homotoxins (see Chapter 4), and that these can aggravate neurological tissue.

Traditional Oriental medicine has instructed students for years that anger and aggression are related to the Liver (Maciocia 1989). Certainly it is noted that excessive anger subjects the organism to increased quantities of toxic substances that must be handled by the liver (i.e., histamine, serotonin, epinephrine, corticoids). Support of the liver in aggressive patients can yield many remarkably improved cases, as can elimination diets (Palmquist 2003). The exact mechanics of this is not currently quantified in the literature, but CAVM practitioners have long observed this and recommended support of the liver in these cases.

Classical homeopathy may yield surprising responses in some cases of aggressive behavior, and should be considered (Day 1990). This subject is beyond the scope of this text, but it is important to note that aggression can be a manifestation of many different emotional states (anxiety, fear, anger, frustration, resentment, and antagonism, to name just a few), and each of these require separate consideration in developing a classical homeopathic approach (Kent 1921). Seeking a trained homoeopathic practitioner with experience in behavioral cases is advised in such situations (Pitcairn 2006).

Another area of CAVM anecdotally reported to assist with aggression involves the use of Bach flower essences. They are used primarily when there are disturbances of a mental, emotional, or behavioral nature. *Rescue Remedy* is the most well-known flower essence combination. It consists of five different flower essences: Cherry plum, clematis, impatiens, rock rose, and star of Bethlehem. *Rescue Remedy* is used in situations of high stress and anxiety. It is important to note that *Rescue Remedy* does not have conventional tranquilizing properties but simply a calming effect that reduces or relieves the sense of stress and anxiety. Many practitioners use *Rescue Remedy* in their practices to settle fractious dogs and cats and its use is much appreciated by patients, clients, and technicians alike. Today there are hundreds of other regional flower essences besides Dr. Bach's original 38 English essences. Each individual flower essence has its particular area of mental, emotional, or behavioral use. For example, Aspen helps in situations of apprehension or fear, but not of a known entity—rather, the fear of an unknown. Mimulus, on the other hand, is useful for fears of known things.

Holly is used in the strong and aggressive emotions of outright anger and jealousy (Wright 2006).

Of course, a discussion of appropriate handling and treatment of these patients must include consideration of consultation with a qualified behavioral specialist, and use of pharmaceutical agents should be considered as experimental. Psychiatric drugs should be reserved for only the most severe cases because they may cause further, as yet unknown, damage to the liver and nervous system of the affected animals. No amount of drugs, whips, shocks, or other treatment can substitute for proper, compassionate handling in these cases, and improper treatment of aggressive patients can do far more damage than good.

The client should always be informed that such treatment is not without risks. Aggressive patients treated with any modality may suddenly and unpredictably aggress and cause injury to themselves or others. Risk should always be assessed properly, because aggression may recur at unpredictable times (Beata 2006). Proper handling of such patients is critical to success. It should be recognized that patients with impregnated homotoxins may develop Inflammatory Phase changes, and when this occurs intracranially, the resultant neurological swelling and inflammation can cause changes in emotion and behavior, and lead to physical signs such as cranial pressure/headache, altered sensation, photosensitivity, altered perceptions, seizures, weakness, tremors, and a host of other phenomena, which when approached biologically often lead to improved patient condition. This is especially common in heavy metal and viral homotoxicoses (Palmquist 2004).

The professional and client must remember that regressive vicariation is desirable and must work with the patient's own autoregulatory system in this fashion. Similarly, when treating patients with homotoxicology, it may be observed that mental changes occur during detoxification. These are usually mild and should be supported because most disappear in 1 to 3 days. These signs may cycle in and out of clinical significance as tissue repair occurs.

Appropriate homotoxicology formulas

An unpublished clinical report shows that homotoxicology formulas were used to treat a case of feline aggression of two months' duration involving housemate cats. The formula consisted of *Nervoheel* (1 tablet), *Neuroheel* (1 tablet), *Ypsilohheel* (1 tablet), *Berberis homaccord* (15 drops), and *Valerianaheel* (15 drops), mixed with water to make 1 ounce (Roach 2006). A 90% reduction in aggressive incidents was reported within 14 days and owner satisfaction was high. Long-term follow-up is not currently available due to the recent nature of the report.

Appropriate antihomotoxic medicines include:

Aconitum homaccord: Used for nervous conditions involving irritation with great agitation, pain, paralysis, restlessness, fear of death, and consequences of fright, which are made much worse by the slightest contact. Also used in cases involving violent, acute complaints of red skin, fever, and fear aggression (Palmquist 2006).

Belladonna homaccord: Used when patient strikes out to bite suddenly and ferociously when afraid.

Berberis homaccord: Provides support of liver and adrenal gland function.

BHI-Calming: Used more for anxiety, but used in humans in cases of swearing mad and mania (Heel 2002).

Cerebrum compositum: Combination remedy that supports cerebral tissues and blood flow. It contains Hyoscymus for states of excitement with great restlessness, mobility, vehemence, jealousy, raving, and attacks of fury. At the other end of the scale, this formula may be indicated when there is depression to the point of melancholia, and dull apathy (in chronic poisoning). The eyes may have a glazed stare and an unusual sheen (Reckeweg 2002). This description may partially fit those animals with rage syndromes.

Cerebrum compositum also contains Anacardium with indications for retoxic impregnations after suppressed skin eruptions, in particular cerebral and emotional symptoms with irritability, timidity, and fearfulness of misfortune and danger. This is also indicated for mental exhaustion, emotional discord or upset, and delusions. A human patient may feel as if he has two wills, each driving him to do opposing things, such as is found in schizophrenia (Reckeweg 2002). The remedy also contains Embryo suis with notes of anxiety on waking, an aversion to or a desire for company, and fears that something bad will happen. Patients who need this combination may be irascible or irresolute. They may be irritable with a changeable mood or be sensitive to music and noise. They also may be sensitive to touch and so aggravated by contact (Reckeweg 2002).

Chelidonium homaccord: Used for patients that manifest bilious anger, gallbladder pain, or pain at alarm point for gallbladder; also used in cases with elevated serum alkaline phosphatase values.

Gastricumheel: Used for the behavioral trait of “bites when nervous” (Heel 2003).

Gelsemium homaccord: Indicated for headaches, rear leg weakness, anxiety.

Glyoxal compositum: Provides enzyme activation. Has been used in human medicine at the outset of schizophrenia (Reckeweg 2000).

Hepar compositum: Drains and supports liver function in deeper homotoxicoses. Contains Pancreas suis for

mental notes of fear of being injured or attacked or of being in narrow places. It is also used for irritability from trifles or on waking (Reckeweg 2002). It may support healing in dermatosis and neurogenic dermatitis, wherein patients suffer irritation, negative emotional responses, and antagonism resultant from altered skin sensations.

Hepeel: Provides support of liver function and detoxification. Contains the homeopathic potency of Veratrum album D5 (psychotic behavior).

Ignatia homaccord: Used for sadness and depression, leading to anger/aggression and restlessness (Pitcairn 2006).

Lachesis-Injeel: Although this remedy is not available in the United States, it deserves mention for cases of thyrotoxicosis.

Lymphomyosot: Used for lymph drainage and endocrine support.

Nervoheel: Indicated for anxiety.

Neuroheel: Provides nervous support.

Nux vomica homaccord: Prescribed for patients that manifest anger and may bite from nervousness (Heel 2003).

Phosphorus homaccord: “The phosphorus-type/personality has slender limbs, silky hair, and thin skin; it is nervous, irritable, and fatigues quickly” (Heel 2003). Overexcitability and fear also can be noted (Heel 2003).

Spascupreel: Owing to the constituent Agaricus, used for excessive excitement or to reduce excitability of the nervous system. Also used in sequelae of drug and medication abuse, confused states, or cerebral seizure disorders (Reckeweg 2002). Contains Chamomilla, which is particularly suited to states of nervous agitation as a tranquilizing remedy. Patients are irritable, bad-tempered, irascible, and spiteful. Chamomilla is, in principle, a nerve remedy, indicated for easy agitation without any pre-existing organic problem. Reckeweg (2002) states, “the decision to give Chamomilla is based on the discrepancy between the objective findings and the presenting emotional state of the patient.”

Thyroidea compositum: Used for endocrine support and matrix drainage in advanced homotoxicoses.

Tonico-Injeel: Indicated for physical and psychic exhaustion.

Ubichinon compositum: Given for mitochondrial support of energy metabolism.

Valerianaheel: Has a mild tranquilizing effect.

Ypsiloheel: Used for central regulation.

Authors' suggested protocols

Nutrition

Brain nerve and behavior/emotional support formula: 1 tablet for each 25 pounds of body weight BID.

Liver support formula: One-half tablet for every 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Phosphatidyl serine (PS): 20 mg for every 15 pounds of body weight SID.

Blue-green algae: One-fourth teaspoon for every 25 pounds of body weight daily.

Chinese herbal medicine

The authors recommend Relaxol at a dose of 1 capsule per 10 to 20 pounds twice daily to effect.

In addition to the herbs mentioned above, Relaxol also contains lily bulb (Bai he), oyster shell (Mu li), haematite (Dai zhe shi), rehmannia (Sheng di huang), anemarrhena (Zhi mu), and fossil teeth (Long chi). Based on clinical observation, this formula helps to modulate behavior and reduce the aggression.

Warning: Any aggressive behavior must be handled very carefully. No single drug can eliminate the aggression entirely. Behavior modification, training, and safety precautions should be applied.

Homotoxicology (10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Begin biological therapy in support of known issues. Do behavior modification/training simultaneously. Recheck cases every 14 to 30 days, depending upon progress.

Select the symptom remedy or remedies that best match the case and then select the Detoxification formula based upon the case's location on the Six-Phase Table of Homotoxicology.

Symptom remedy: As determined by case presentation. Contains Nux homaccord (aggression), Aconitum homaccord (fear aggression or history of generalized fever or red rash), Belladonna homaccord (history of red spots on skin, sudden lunging attacks), BHI-Calming (hyperactivity and aggression), and Cerebrum compositum (cases with no clear picture).

Detoxification formula (for Phase 1 and 2): Detox Kit, which consists of Lymphomyosot, Nux homaccord, and Berberis homaccord, mixed together and given BID PO for 30 to 60 days, or Hepeel, Reneel, and Coenzyme compositum tablets given orally twice weekly for 30 days.

Deep detoxification formula (for Phases 3,4,5, and 6): Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum, mixed together and succussed, then administered PO every 3 days for 30 to 120 days or until recovery wanes.

In advanced or deep homotoxicoses consider Glyoxal compositum, given once.

COMPULSIVE DISORDERS

Definition and cause

Compulsive disorders are not a specific diagnosis, and recommending therapy based upon diffuse, descriptive diagnoses often serves to label a patient, but not lead to successful understanding or management of that patient's condition. Generally speaking, it is advisable for professionals to avoid such descriptive diagnoses, especially when recommending therapy.

Compulsive disorders are frequently triggered by stressful conditions such as separation or change of environment, routine, or companionship. Once established, the disorders can become habitual and be present even without a trigger. The end result is a habitual behavior that, in dogs, often takes the form of self trauma such as flank sucking, acral lick granuloma, circling, or nail biting. In cats it takes the form of excessive licking and pulling out hair (Bradshaw 1997, Landsberg 2003).

While the underlying cause is debatable, there is uncertainty as to whether there is a similar underlying neurological disorder or whether the trigger influences the type and location of the compulsive behavior (Landsberg 2003, Luescher 1998).

In all instances of suspected compulsive disorders, it is essential to first rule out any underlying physical or medical causes. A complete physical examination, including blood work and urinalysis, is essential for proper diagnosis.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

All therapies should be preceded by identifying and eliminating the underlying cause. Medical therapy with tricyclic antidepressants such as Clomipramine have proven successful. Selective serotonin reuptake inhibitors (SSRI) such as Fluoxetine have been shown to be effective with fewer side effects (Overall 1996, Wynchank 1998). In all compulsive disorders, combining medical therapy with behavioral modification techniques and environmental modification offers the best results for controlling the condition.

Anticipated prognosis

In many instances it is not possible to totally eliminate the compulsive behavior; however, good success can be achieved in reducing the frequency as well as the intensity of the episodes.

Integrative veterinary therapies

Integrative therapies should be considered after the diagnosis has been made and complicating conditions such as chronic pain have been confirmed or ruled out. The medical approach of drug and behavior modification techniques do not consider physiological, biochemical, nutritional, and autoimmune reactions such as those from environmental chemical toxins as well as adverse reactions to medications and vaccinations. The inclusion of integrative therapies, nutrition, nutraceuticals, medicinal herbs and homotoxicology remedies, along with drugs and behavior modification therapies or as a freestanding protocol, can improve day-to-day quality of life as well as help to control the compulsive behavior.

Nutrition

General considerations/rationale

The nutritional approach to compulsive disorders consists of nutrient support of the brain and nervous system; enhancement of the gentle detoxification of environmen-

tal chemicals, toxins, medication, and vaccinations; and the addition of behavior-modifying or -enhancing natural remedies such as flower essences.

Appropriate nutrients

Nutritional/gland therapies: Glandular brain and pineal supply intrinsic nutrients and can help improve circulation, reduce inflammation, and improve function of the brain and central nervous system (Goldstein 2000) (see Chapter 2, Gland Therapies, for additional information).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes particularly of nerve and brain cells. It helps to move fats into the cells and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by cells for general health and wellness (Hanin 1987).

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is essential for cellular membranes, particularly of brain cells. It has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). In people with Alzheimer's disease, the addition of PS to the program provided a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Essential fatty acids: Research confirms the benefits of essential fatty acids with regards to their calming effect on the central nervous system (Erasmus 1993).

Chinese herbal medicine

General considerations/rationale

Compulsive disorders are thought to arise from Yin deficiency in the Heart and Qi stagnation in the Liver according to TCM theory. According to the Western interpretation, the Heart houses the Shen, or mind. When there are not enough fluids (Yin) to nourish the Heart, the Shen may be disturbed. This leads to a propensity for the affected individual to have psychological disturbances. The Liver is responsible for overseeing the smooth flow of the Qi. Energy does not flow efficiently when Liver Qi is stagnant. The individual feels constrained and irritable, and she may turn to repetitive actions to try to calm herself. It is necessary to relax the mind to treat these compulsive activities.

Appropriate chinese herbs

Albizzia flower (He huan hua): Depresses the central nervous system (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Contains saikosaponins, which have sedative effects (Zhong Yao Yao Li Yu Ying Yong 1983).

Curcuma root (Yu jin): Contains curdione, which is a sedative in cats (Hao 1994).

Fossil teeth (Long chi): Used for psychological disturbances. Seventy-nine schizophrenic patients were treated with a supplement containing fossilized animal bones, Mu li, Zhi gan cao, Da zao, Xiao mai \pm other herbs as determined by the individual doctor. Seventy-eight percent responded well (Zhe Jiang Zhong Yi Yao Za Zhi 1982).

Grass-leaf sweet-flag root (Shi chang pu): Has tranquilizing effects (Zhong Yao Xue 1998).

Polygala root (Yuan zhi): Causes sedation. Its high level of bromine has a tranquilizing effect (Ou 1990).

Polygonum stem (Ye jiao teng): Has demonstrated sedative effects in mice. Experimentally, it decreased the amount of pentobarbital needed to sedate mice (Chen 1999).

White peony (Bai Shao): Has sedative effects in mice and increases sedation time when combined with phenobarbital (Zhong Yao Tong Bao 1985).

Zizyphus (Suan zao ren): Has been shown to have sedative effects in dogs, cats, rats, rabbits, and guinea pigs. The total flavone portion was proven to inhibit the autonomous activities of mice. Studies have indicated that jujuboside is most likely to be the component responsible for the sedative effects. When combined with barbiturates, zizyphus can increase sedation time in mice. It has been shown to counteract the excitatory effects of caffeine (Zhao 1995, Guo 1998, Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995).

Homotoxicology

General considerations/rationale

No homeopathic or homotoxicology remedies have been specifically studied for use in these conditions in animals. When approaching such cases, the author recommends attempting to identify more precise pathology and select the treatment based upon those findings. In a general sense, the Six-Phase Table of Homotoxicology can be used to guide remedy selection. These disorders fall in nearly any phase, so it is necessary to look carefully for clues in determining the phase of the homotoxicoses. In many cases, these broad general complaints may direct a trained homeopathic veterinarian to select a specific classical homeopathic remedy, but these are still used on a more or less trial basis and broad clinical protocols cannot be properly formulated at this time.

Every compulsive disorder case should be carefully examined for pain. Generalized, regional, or focal pain

may cause irrational or repetitive behavior. Trigger point therapy can involve localizing specific painful points and injecting them with specific antihomotoxic medicines such as Traumeel or Spascupreel (See remarks for *Galium-Heel* below).

Appropriate homotoxicology formulas

Because antihomotoxic medicines are generally nontoxic and free of harmful side effects, it may be appropriate to attempt treatment of these cases using homotoxicology theory and other biological therapies. Clients should be so informed prior to ever beginning therapy. All patients presented for such issues should have a thorough medical and behavioral history (including any known trauma or abuse), full physical and detailed neurological examination, CBC, chemistry, and thyroid determinations, as well as urinalysis and urine culture. Radiographs and other forms of imaging may be needed. Consultation with medical and behavioral specialists may be indicated.

The clinician should be especially aware of the contribution of dietary and other allergies to these cases. Every attempt should be made to determine exposure to potential toxins, both environmental and medical. Adverse reactions to many medical agents can cause neurological and mental signs and cessation of nonessential medications may assist in some cases. Detailed discussion of these remedies is beyond the scope of this text, but several commonly considered remedies are listed below:

Belladonna homaccord: Consider if seizures are present in cases associated with focal inflammatory reactions and sudden aggression.

Berberis homaccord: Supports and drains urogenital tissues and supports the adrenal gland.

BHI-Headache II: Indicated for throbbing headache, pain aggravated by noise and light, and restlessness.

Engystol N: Useful in cases of viral impregnation damage, particularly in cases associated with neurological damage from canine distemper virus.

Galium-Heel: Commonly prescribed due to the mental and physical symptom notes provided by Phosphorus, which consist of inflammation of the respiratory, digestive, urinary, and reproductive organs; severe infectious diseases; disorders in convalescence; conditions of exhaustion and rheumatism; spinal complaints, neuralgia; headaches; paralysis; hypersensitivity of the sensory organs; abnormal behavior; emotional discord; or upset (Reckeweg 2002). It is important to consider that many stereotypical behaviors may have roots in discomfort and pain, and since all painful conditions represent Impregnation disorders, *Galium-Heel* is frequently needed in cases involving pain as a phase remedy.

Hepar compositum: Useful in establishing deep drainage, detoxification, and support of hepatic tissues.

Hormeel: Used for hyperactivity, nervous disorders.

Ignatia homaccord: Used for depression, anxiety, hysteria, nervous excitability.

Neuro-Injeel: Contains Valeriana, as well as Ignatia, and both of these homeopathic dilutions are recommended for nervous disorders; also indicated for emotional discord or upset and spasmodic conditions experienced at hollow organs and muscles. Mental notes are great anxiety on waking and are worse after midnight; indicated by business, irritability, restlessness, sensitivity to noise, and possessed of repetitive thoughts (Reckeweg 2002). Ignatia is also found in *Cerebrum compositum* and *Nervoheel*.

Nervoheel: Indicated for depression, restless hands and feet, neuralgia.

Cerebrum compositum: Supports cerebral tissue and detoxification; improves mentation. Embryo suis is a key component of this combination with the mental picture attributed as follows: active and busy, confusion on waking, patient may be discontented and/or demonstrate symptoms showing that the case is better from diversions. Changeable mood, restlessness improve with the condition of the patient. Human patients have thoughts that are persistent, or that are clear but with more emotion (Reckeweg 2002). Also contains Medorrhinum, which has effects on mucosal inflammations of the urinary and reproductive organs, the respiratory passages, and the gastrointestinal tract; rheumatism; abnormal behavior; and premature aging (Reckeweg 2002).

Psorinoheel: Deep remedy for use in Excretion and Impregnation phase disorders; consider if seizures present.

Spascupreel: Contains Agaricus (*Amanita muscaria*). Indicated for patients demonstrating sensitivity to cold air, motor restlessness, chorea, tics, states of agitation, epileptiform attacks, itching, crawling sensations, burning pains, and sensations of numbness (as if frozen). The predominant characteristic is a hyperesthesia of the whole body, with the slightest pressure causing pain. There is general painfulness of all of the limbs, especially the lower extremities; pain is marked on sitting or standing, and gradually subsides on walking. This is accompanied by a feeling of coldness with paresthesia (numbness and crawling sensation) and sensitivity to cold air. There is a general restlessness of the muscles with a compulsion to move in unusual ways (Reckeweg 2002).

Valerianaheel: Used for restlessness and neurasthenia. This remedy takes its name from the herb Valeriana. Its main homeopathic indications are consequences of excitement, insomnia, waking with fear and gagging, and restlessness with compulsive motion (pacing, etc.) (Reckeweg 2002).

Veratrum homaccord: Indicated for gastroenteritis, colitis, diarrhea, paper shredding, collapse, or psychosis.

Ypsiloheel: Improves central nervous system regulation.

BHI-Calming: Used for twitching muscles, headache, mania, and compulsive twitching.

Authors' suggested protocols

Nutrition

Brain nerve and behavior support formulas: 1 tablet for every 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Phosphatidyl serine (PS): 20 mg for every 15 pounds of body weight SID.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Chinese herbal medicine

Relaxol: 1 capsule per 10 to 20 pounds twice daily to effect. It may be advisable to consult with an animal behaviorist for complementary therapy. In addition to the herbs mentioned above, Relaxol contains anemarrhena (*Zhi mu*), haematite (*Dai zhe shi*), lily (*Bai he*), oyster shell (*Mu li*), and rehmannia (*Sheng di huang*). These additional herbs help increase the efficacy of the formula. They have synergistic actions with the herbs mentioned above.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Select the symptom remedy or remedies that best match the case and then select the detoxification formula which is applicable based upon the case's location on the Six-Phase Table of Homotoxicology.

Symptom formula: Select individual formulas based upon the symptoms manifested by the patient from the Appropriate Homotoxicology Formulas (above) or according to further research by the clinician. *Cerebrum compositum* twice weekly is a safe starting place. *Hormeel*, *Nervoheel*, and *BHI-Calming* are also common first remedies.

Detoxification formula (for cases in phases 1, 2, 3): *Lymphomyosot*, *Berberis homaccord*, and *Nux vomica homaccord* mixed together and given BID for 30 to 60 days, OR *Hepeel* plus *Reneel* BID PO. In cases where environmental toxicity may play a part, also give *BHI-Body Pure* BID.

Deep detoxification formula (for cases manifesting homotoxicoeses in phases 3, 4, 5, 6): *Galium-Heel*, *Lymphomyosot*, *Hepar compositum*, *Solidago compositum*, *Thyroidea compositum*, *Coenzyme compositum*, and *Ubichinon compositum* mixed together and given PO every 3 days for 120 days or longer as needed.

In Degeneration or Dedifferentiation phase disorders consider *Glyoxal compositum*, given once and not repeated until recovery wanes.

INAPPROPRIATE URINATION

Definition and cause

Inappropriate urination is defined as urinating outside the litter box or in particular and specific locations in the house. It is often a behavioral trait related to normal feline marking behavior; abnormal, habitual, or compulsive behavior; or a physical condition. This condition is more common in cats than dogs and in males than females.

All patients presented for such issues should have a thorough medical and behavioral history (concentrating on diet, water intake, environmental stressors, and litter box medium, location, and cleanliness), physical/neurological examination, urinalysis, and urine culture/sensitivity performed. In many cases, further diagnostic evaluation is necessary and may include urinalysis, urine culture and sensitivity, CBC, serum chemistry and thyroid/endocrine determinations, FeLV/FIV virus status, and radiographs and ultrasound imaging. Blood pressure determination may reveal hypertension, which can be associated with behavioral problems. Consultation with medical and behavioral specialists may be indicated and many of these patients are greatly assisted with pheromone therapy and proper litter box handling.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The treatment should be based on the proper diagnosis of any causative medical condition. Most veterinarians recommend environmental and behavioral modification techniques before resorting to medications. Techniques include frequent cleaning of the litter box, strategically locating litter boxes in heavily soiled areas, and separating feeding and litter locations. Medication is usually recommended as the last resort.

Medications such as benzodiazepines (Alprazolam) can be used but can be associated with serious complications such as liver failure. Other drugs such as Buspirone and amitriptyline have also been used with varying degrees of success. Pheromone therapy such as Feliway (Farnum Pet Products, Phoenix, Ariz.) have been reported to halt the problem (Cooper 1997; Ekstein 1996; Houpt 1998, 2004; Overall 1994, 1997, 1998).

Anticipated prognosis

While not a serious condition, this is a very common condition that often leads to frustration and helplessness

and can result in the decision to euthanize. For this reason it is important to establish and eliminate any underlying causes early, and quickly implement behavior and environmental modification techniques that improve the chances of successful control of the condition (Houpt 2004, Halip 1992, Borchelt 1986).

Integrative veterinary therapies

While the medical approach focuses on the environmental and behavioral aspects, and the medical route as a last resort, often, little is done to internally correct the physical or emotional imbalances that underlie the condition. A more global view of the condition illustrates the surface conditions such as the odor of the litter, the physical placement of the litter box, the elimination of boredom, etc. as the trigger to the behavior. These factors are stresses or stressors that, when triggered, bring on the condition.

Integrative therapies add the dimension of nourishing, balancing, and improving the nervous, mental, and emotional stability of the animal. This helps the animal to become less reactive to stressors and therefore less likely to initiate episodes of inappropriate urination.

In addition to nutritional and herbal therapies, the authors advise multiple clean litter boxes, both with and without covers, to allow cats to satisfy their preference. Offer the cat both clay and sand litters to avoid substrate avoidance. In some cases it may be advisable to avoid perfumed substrates.

Nutrition

General considerations/rationale

The nutritional approach to inappropriate urination consists of nutrient support of the brain and nervous system; enhancement of the detoxification of environmental chemicals, toxins, medication and prior vaccinations; and the addition of behavior-modifying or -enhancing natural remedies such as flower essences (see Separation Anxiety, below).

Appropriate nutrients

Nutritional/gland therapies: Glandular brain and pineal supply intrinsic nutrients and can help improve emotional status and brain function (see Chapter 2, Gland Therapies). Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid, an essential ingredient in cellular membranes

and particularly of brain cells. It has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). In people with Alzheimer's disease the addition of PS to the program showed a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Essential fatty acids: Blue-green algae have been observed to create a generalized feeling of well-being in humans taking the product, and may prove helpful in veterinary patients. Its effects are usually observed to be slower in onset with the resultant benefits taking 3 to 4 weeks to appear. This may be due in part to their natural antihistaminic compounds or their levels of omega-3 fatty acids (Bruno 2001).

Many recent studies have confirmed the beneficial results from these critical fatty acids. *Aphanizomenon flos aquae*, a blue-green algae, has been shown in clinical settings to have positive effects on brain function. In addition to the omega-3 fatty acids, it contains a full spectrum of essential amino acids, a broad-based mineral content, a rapidly assimilable glycolipoprotein cell wall, and a wide variety of vitamins. It has mild chelating properties so it is valuable in heavy metal toxicoses such as Thimerosal reactions. It is an asset as a micronutrient resource and figures prominently in many treatment programs (Broadfoot 1997).

Chinese herbal medicine

General considerations/rationale

According to TCM theory, inappropriate urination is due to Yin and Blood deficiency in the Heart with Qi stagnation in the Liver. According to the Western interpretation, inappropriate urination is defined in TCM terms as a disturbance in the mind. The Shen, or Mind, is housed in the Heart. Blood and Yin (fluids) are nourishing. The mind is not nourished when there is a Blood and or Yin deficiency in the Heart; therefore, the mind does not function normally. The Liver uses its energy or Qi to ensure the smooth flow of energy and emotions in the body. When the Liver Qi becomes stagnant, the animal becomes irritable, stressed, and nervous. In the case of inappropriate urination, the animal manifests this stress by eliminating in an undesirable location(s). Therefore, treatment must be directed at calming the patients.

Appropriate chinese herbs

Albizia flower (He huan hua): Has been shown to cause sedation in mice (Zhong Yao Xue 1998).

Grass-leaf sweet-flag root (Shi chang pu): Has demonstrated sedative effects (Zhong Yao Xue 1998).

Polygala root (Yuan zhi): Contains a high level of bromine, which has a tranquilizing effect (Ou 1990). It has been shown to be tranquilizing in mice (Zhong Yao Li Yu Ying Yong 1983).

Polygonum stem (Ye jiao teng): Has tranquilizing effects in mice (Chen 1999).

White peony (Bai shao): Has sedative effects in mice and has a synergistic effect with phenobarbital in prolonging sleep time. It also protects against cardiazol-induced seizures (Zhong Yao Tong Bao 1985).

Zizyphus (Suan zao ren): Has sedative and hypnotic effects in mice, dogs, cats, rabbits, rats, and guinea pigs. This effect has been attributed to the jujuboside component (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995). The flavone component combined with pentobarbital sedates the central nervous system and can counteract benzedrine-induced central excitation (Zhao 1995, Guo 1998).

Homotoxicology

General considerations/rationale

When approaching such cases, the author recommends attempting to identify more precise pathology and then recommending treatment based upon those findings. In a general sense we may use the Six-Phase Table of Homotoxicology to guide remedy selection. These disorders fall in nearly any phase, so it is necessary to look carefully for clues in determining the phase of the homotoxicoses.

Most veterinary behavioral specialists reserve the use of drugs in these cases of last resort. Psychoactive drugs are advocated by some authors, but bearing in mind the damage and side effects that these medications can cause in humans, it is recommended that all other options be eliminated before prescribing potentially damaging drugs (Palmquist 2003, Prozactruth.com).

The authors have many cases referred to them in which clients report negative side effects of commonly prescribed psychiatric drugs. While the veterinary literature is lacking in understanding these side effects, it is not unlikely that veterinary patients suffer similar mental side effects, which they are unable to communicate to their owners. Many of these owners have left their prior veterinarian after receiving psychiatric prescriptions and observing lethargy or generalized poor vitality after administering the drugs to their pets. Biological therapy provides another option.

Treating the correct cause, selecting proper symptom remedies, and conducting proper detoxification may prove helpful in cases of inappropriate urination. In some cases, these broad general complaints may direct a trained homeopathic veterinarian to select a specific classical homeopathic remedy, but these are still more or less used on a trial-and-error basis. Broad clinical protocols cannot be properly formulated at this time.

Appropriate homotoxicology formulas

Because antihomotoxic medicines are generally nontoxic and free of harmful side effects, it may be appropriate to

attempt treatment of these cases using homotoxicology theory and other biological therapies. Clients should be so informed prior to ever beginning therapy. Use of homotoxicology remedies without proper diagnosis and dietary therapy is discouraged. Some useful remedies appear below.

***Berberis homaccord*:** Used for support and drainage of urogenital tissues and adrenal gland. Some characteristic indications of *Berberis* indications are irritations and inflammations of the urinary tract; radiating renal pains, especially pain radiating down the ureters; and tenesmus (physical sensations frequently found in cases suffering from renal colic and urinary gravel), even extending down the urethra and into the testicles. *Berberis* is one of the main remedies for renal calculi, pyelitis, and cystitis (Reckeweg 2002). The constituent of *Berberis* is also found in the following antihomotoxic medicines: *Reneel*, *Solidago compositum*, and *Populus compositum*.

BHI-Calming—(behavioral): Indicated for twitching muscles, headache, mania, and compulsive twitching.

***Cantharis compositum*:** Used for cases with burning urination, stranguria, and hematuria. The formula's primary constituent is *Cantharis* (Spanish Fly), which principally affects the mucosa of the genito-urinary organs, with indications for violent inflammations with states of irritation and hemorrhagic inflammations. The urinary symptoms are frequently accompanied by cramping and spastic contraction, and are linked with continuous violent urging to urinate. The urine is only passed in drops and violent burning pains persist afterwards, extending possibly as far as the sacrum (Reckeweg 2002). This remedy is contained in the following formulas: *Populus compositum*, *Reneel*, and *Solidago compositum*.

BHI-Bladder: Used for cystitis complaints.

BHI-Prostate: Used for cases manifesting FUS blockage (once relief of obstruction has occurred), straining, burning, and difficult urination.

***Echinacea compositum*:** Used in cases of bacterial and inflammatory cystitis, especially in Inflammation and Impregnation phases.

***Galium-Heel*:** Used for cellular detoxification and renal tubular support. Specific renal system support comes from several components. *Clematis* helps with inflammation of the urinary bladder, urethra, testicles, prostate, and epididymis; urethral strictures and pain in the urethra on external pressure; spasmodic narrowing and contraction of the urethra with purulent discharge (urethritis); and tenesmus and pain on urinating, with intermittent stream and involuntary dribbling afterwards. *Clematis* also helps the mental status parameters, including great irritability, choleric temperament, and the complaints often triggered by anger or vexation. The chief component, *Galium aparine*, acts especially on the urinary system and is said

to be able to dissolve renal calculi. It is also useful in edema, dysuria, and cystitis. *Juniperus communis*, whose main indications include glomerulonephritis, acts as a diuretic that targets elimination dysfunctions of the urinary tract collection system (Reckeweg 2002). The remedy also contains *Phosphorus* for inflammations of urinary and reproductive organs; severe infectious diseases; and disorders in convalescence and conditions of exhaustion along with abnormal behavior, emotional discord, or upset (Reckeweg 2002).

***Hormeel* (behavioral):** Used for hyperactivity and nervous disorders by way of its homeopathic constituent *Sepia*, which is used for the following symptoms: sensation of bearing-down and fullness in the urinary organs; pressure on the bladder and frequent passing of urine with flatulence in the lower abdomen; inflammation of the urinary organs; and the urine contains a sediment like clay and may also be very offensive. *Sepia* also helps with disorders in voiding from the urinary bladder. In enuresis, the incontinence usually takes place during the first stages of sleep. Mental factors used in prescribing this for humans include exhaustion, disorders of an emotional or otherwise psychological nature, and depressive emotional discord or upset (Reckeweg 2002).

***Mucosa compositum*:** Used in the recovery phase of cystitis or pyelonephritis. Contains *Colibacillinum*, which may be given for urinary tenesmus and dark-colored, offensive urine; salpingitis; cystitis; renal calculi; and cholangitis; and in depressive psychoses. It has a strong behavioral component. It is especially indicated after antibiotics and in retoxic damage caused by antibiotics (Reckeweg 2002).

***Plantago homaccord*:** Used in cases demonstrating cystalgia and urinary incontinence. Note that this combination is not currently available in the United States, but it is extremely useful and it is hoped that it will be reinstated as part of Heel's product line.

***Populus compositum*:** Contains *Kreosotum*, which is useful in cases demonstrating incontinence at night as a prevailing symptom; also for profuse pale urine and violent urge to urinate. *Populus compositum* also contains *Mercurius sublimatus corrosivus* for affections of the mucosa, acute glomerulonephritis with albuminuria, haematuria, and tenesmus. Mental notes useful to this remedy include shivering, trembling of the limbs, fear, restlessness, unquenchable thirst, brain symptoms. *Populus compositum* is also found in *Solidago compositum* (Reckeweg 2002). Other remedies in this combination include: *Equisetum*, *Solidago*, *Berberis*, and a number of other well-indicated components.

***Reneel*:** Used for kidney support and detoxification. This remedy contains *Causticum*, which is known for its usefulness for disorders of the urinary tract, spasmodic contractions, paralysis, itching of the urethral orifice,

tenesmus of urine, raw pain in the bladder, enuresis day or night, and stress incontinence of urine (Reckeweg 2002). In addition, it has the mental notes dictating use in cases manifesting emotional discord or upset, and thus may be valuable in stressed animals.

***Solidago compositum*:** This is a formula for deep drainage and support of urogenital tissues in Deposition, Impregnation, Degeneration, and Dedifferentiation phase cases. Contains Colibacillinum (See Mucosa compositum, above) and Equisetum arvense, with the main indications being use for cystitis; pyelitis with copious discharge of mucus in the urine; dull, raw pain in the bladder; nephrolithiasis; gravel in the urine; and nocturnal enuresis associated with irritation of the bladder. All varieties of Equisetum act primarily on the connective tissue and the urinary tract, with signs of renal pain extending as far as the bladder and urethra. The urge to urinate with violent pains after urination, and passage of urine drop by drop are typical symptoms; there are also violent burning and cutting pains on urination (Reckeweg 2002).

***Ubichinon compositum*:** Provides mitochondrial support and improved cellular energy mechanics in deep phase disorders. Bianchi (1995) recommends this agent for renal damage following vaccinations.

***Spascupreel*:** Used for cases that suffer spasms and painful constriction. *Spascupreel* has an affinity for smooth muscle. The Gelsemium component is particularly indicated in states of paralysis, and in weakness of the bladder and urinary incontinence (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Brain nerve formula: 1 tablet for every 25 pounds of body weight BID.

Behavioral/emotional/stress formula: 1 tablet for every 25 pounds of body weight BID.

Phosphatidyl serine (PS): 20 mg for every 15 pounds of body weight SID.

Blue-green algae: One-fourth teaspoon for every 25 pounds of body weight daily.

Chinese herbal medicine

For psychogenic inappropriate urination the authors recommend Relaxol at a dose of 1 capsule for every 10 to 20 pounds twice a day as needed. In addition to the herbs listed above, Relaxol also contains anemarrhena (Zhi mu), bupleurum (Chai hu), curcuma root (Yu jin), fossil teeth (Long chi), haematite (Dai zhe shi), lily (Bai he), oyster shell (Mu li), and rehmannia (Sheng di huang). These additional herbs improve the efficacy of the formula.

Homotoxicology (dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Select the symptom remedy or remedies that best match the case and then select the detoxification formula which is applicable based upon the case's location on the Six-Phase Table of Homotoxicology.

Symptom formula: Select individual formulas based upon the symptoms manifested by the patient from the Appropriate Homotoxicology Formulas section or according to further research by the clinician. For cystitis, consider Berberis homaccord, possibly combined with BHI-Bladder BID to TID PO. For behavioral issues, consider Valerianaheel and possibly Horneel or BHI-Calming BID PO.

Detoxification formula (for cases in phases 1, 2, 3): Lymphomyosot, Berberis homaccord, and Nux vomica homaccord mixed together and given BID PO for 30 to 60 days, or Hepeel plus Reneel BID PO. In cases where environmental toxicity may play a part, also give BHI Body Pure BID.

Deep detoxification (for cases in phases 3, 4, 5, 6): Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum mixed together and given PO every 3 days for 120 days or longer as needed.

In Degeneration or Dedifferentiation phase disorders, consider Glyoxal compositum given once and not repeated until recovery wanes.

ACRAL LICK DERMATITIS (ALD OR LICK GRANULOMA)

Definition and cause

Acral lick dermatitis develops secondary to chronic licking. It leads to secondary inflammation and often a non-healing, ulcerated wound, and is most common in larger breeds such as Golden Retrievers, German Shepherds, Labrador Retrievers, and Great Danes. The causes besides allergies, infection, infestation, foreign bodies, etc. are generally linked to emotional or habitual stresses such as boredom, separation anxiety, loss or depression, and appropriately called canine neurodermatitis. It also has been reported in cats (Paterson 1998; Scott 2000; Virga 2003, 2005).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Recommended treatments are most often restrictive collars or bandages coupled with systemic and topical cortisone or bitter/herbal cremes, surgical excision, and antidepressant types of drugs. Many of these approaches are temporary unless the underlying behavior issues are identified and addressed. Success comes from a multi-faceted approach that includes identifying the underlying cause (Dodman 1988, Eckstein 1996, Rappaport 1992, Hewson 1998, Reichling 2004).

Anticipated prognosis

The success of treatment and the prognosis is directly related to the individual animal, identifying the underlying cause, preventing self-mutilation, and correcting the habitual behavior. Improved prognosis will occur if the client increases exercise, seeks professional behavior training, and reduces or eliminates the underlying stress anxiety (Dodman 1988).

Integrative veterinary therapies

Integrative therapies follow the holistic approach and address symptoms and underlying causes such as pruritus, infection, habitual behavior, anxiety, and self-trauma, which propagate the condition. The expanded treatment approach relies upon natural remedies which address the animal's emotional status, reduce cellular inflammation, and improve the animal's ability to heal, all of which are essential for permanent healing.

Nutrition

General considerations/rationale

The nutritional approach to habitual disorders such as acral lick dermatitis should focus upon the nutrient support of the brain and nervous system, reduction of cellular inflammation, enhancement of metabolic elimination via the skin, and addition of behavior-modifying or -enhancing natural remedies such as flower essences (see Separation Anxiety).

Appropriate nutrients

Nutritional/gland therapies: Glandular adrenal, brain and pineal along with intrinsic nutrients can help reduce inflammation, improve metabolic elimination, and improve nervous and emotional function (see Chapter 2, Gland Therapy, for more information).

Fatty acids: Recent studies have shown that adding essential fatty acids (omega-3 and -6) have proven beneficial for the health of the skin and coat. For allergic reactions, fatty acids that contain high amounts of DHA, EPA, and GLA helped reduce the inflammation and pruritus. These fatty acids, when used in conjunction with medications such as cortisone, can reduce the required amounts of those medications (Ackerman 1997, Campbell 1992, Degroot 1998, Mooney 1998).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membrane, particularly that of nerve and brain cells. It helps to move fats into the cells, and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient that is required by the nerves and all of the body's cells for general health and wellness (Hanin 1987).

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid and an essential ingredient in cellular membranes, and particularly those of brain cells. It has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). In people with Alzheimer's, disease the addition of PS showed a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to traditional Chinese medicine theory, acral lick granulomas are a result of Wind and Phlegm in the Liver.

The authors' interpretation is that in traditional Chinese medicine, acral lick dermatitis is a disturbance of the Shen. In Western medicine this means an emotional disturbance. The Liver is charged with assuring the smooth flow of energy (Qi) throughout the body. When the smooth flow is disrupted, the patient feels tense and irritable. Phlegm is, in this case, a symbolic sticky substance that interferes with the Liver's function. It does not exist in a solid form in the Liver, i.e., you will not find pockets of mucus in the liver of dogs with acral lick granulomas. It is more a metaphorical description of what is occurring in the organ. This internal Phlegm is mirrored by the discharge on the skin, which can be clear or, if there is a secondary bacterial infection, yellow or white. The itching sensation felt by the patient is ascribed to wind.

In the case of acral lick granulomas the emotional disturbance is manifested as compulsive licking of the skin. The skin then secondarily becomes damaged and inflamed. The Chinese herbal medicine approach is thus directed at decreasing the inflammation of the skin to eliminate the physical impetus for licking, and calming the mind to address the psychological basis of the licking behavior. Any inciting cause or secondary bacterial infection must also be addressed.

Acupuncture has been used in a variety of dermatological conditions with varying results (Khoe 1976). It may help reduce itching, possibly by decreasing histamine release (Belgrede 1984, Lundeberg 1988). A study at the Glasgow University Veterinary School found that acupuncture can be quite successful in treating acral lick dermatitis (Scott 2001).

Appropriate chinese herbs

Albizia (He huan hua): Has sedative effects. Experiments showed that administration of albizia reduced the activity of mice (Zhong Yao Xue 1998).

Anemarrhena root (Zhi mu): Can increase plasma corticosterone levels and has anti-inflammatory effects in animals with intact adrenal glands. It also decreases adrenocortical hormone, indicating that it stimulates the

release of corticosteroids from adrenal glands (Chen Wan Sheng 1999). It also has antibacterial efficacy against *Staphylococcus aureus*, alpha and beta hemolytic streptococci, *E. coli*, and *Pseudomonas* (Yao Xue Qing Bao Tong Xun 1987).

Bupleurum root (Chai hu): Decreases the effect of serotonin and histamine on the permeability of capillaries, thereby decreasing inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Grass-leaf sweet-flag root (Shi chang pu): Contains alpha-asarone, which sedates the central nervous system (Yao Xue Tong Bao 1982).

Lily bulb (Bai he): Has been used topically on sores with good results (Hong Cheng Yao Yan Jiu 1985).

Peony root (Bai shao): Has anti-inflammatory effects (Zhong Yao Zhi 1993).

Polygala root (Yuan zhi): Was shown to have sedative effects in mice (Zhong Yao Yao Li Yu Ying Yong 1983). The sedative effect has been proposed to be due to the high level of bromine that the root contains (Ou Yang Guang Ying 1990). It has further application for use in acral lick granulomas for its antibacterial effects. It has been shown to be effective against *Staphylococcus aureus*, a common cause of dermatitis (Peng Wen Duo 1998).

Polygonum multifforme vine (Ye jiao teng): Has a sedative effect when given to mice at the dosage of 20 g/kg (Chen Dao Yuan 1999).

Rehmannia (Sheng di huang): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Sour jujube (Suan da zao): Has significant sedative effects, apparently due to the flavone component (Zhao Qiu Xian 1995, Guo Sheng Ming 1998).

Turmeric (Yu jin): Contains curdione, which seems to have sedative effects (Hao Hong Qian 1994). Furthermore, it contains volatile oils with antibacterial efficacy (Cao Yu 1998).

Homotoxicology

General considerations/rationale

Acral lick dermatitis generally represents Inflammation Phase homotoxicoses. It may appear in Impregnation Phase disorders as well, and is more difficult to treat successfully owing to the permanent alternation in tissue structure and function. Dedifferentiation Phase disorders may yield an important phenomenon known as Alternative Phase, which represents a homotoxicosis in which severe cellular alterations occur in either preneoplastic or neoplastic circumstances. The body may attempt to eliminate material through inflammatory and excretion pathways involving localized areas of the skin during these occurrences. These lesions resemble smaller or larger areas of cutaneous ulceration and they are frequently found on acupuncture meridians or at specific acupuncture points. Alternate phase disorders should be addressed

as Dedifferentiation Phase conditions and the surface lesions should not be interfered with because this may cause rapid progressive vicariation in the patient.

Appropriate homotoxicology formulas

Due to the wide variety of homotoxicoses which can be associated in these lesions, the following list contains items that are directly applicable. Further remedies may be required in total case management as vicariation occurs. The clinician must examine the case's presenting symptoms, select appropriate remedies that are equivalent in their provings, and then administer them to the patient. The resulting response by the patient dictates subsequent case programming needs. Further research into materia medicas may be needed.

Berberis homaccord: Provides urinary and hepatic detoxification and adrenal support.

BHI-Allergy: Its components, including Sulphuricum acidum, are indicated for neurodermatitis, and can be used as a cellular regeneration agent (Reckeweg 2002). This complex formula has many remedies that are geared toward itching, burning skin lesions. One such ingredient, Graphites, is used for various skin diseases such as dermatitis with crusty eruptions and discharge of a sticky, honey-like fluid that hardens into scabs and is often found in the folds and creases of the skin. Graphites is also used for itching that is aggravated by warmth.

The ingredient Formicum acidum can change the course of rheumatism and treats neuralgias and allergies in all cellular phases. Thuja is useful for skin diseases within the context of Deposition or Reaction phases and those developing out of Impregnation phases. Thuja is especially useful in treating warts, condylomata, papilloma, mucosal polyps, adenoid growths, epithelial proliferations in the glands, Meibomian cysts, ranula in the sublingual gland and Bartholin cysts, and scabby skin eruptions such as impetigo. It is also used in neuralgias that are limited to small, circumscribed locations and fixed ideas or incipient psychoses, because there are often emotional components to these cases.

Histaminum helps with eczema and other skin diseases, neurodermatitis, pemphigus, pyoderma, boils, and carbuncles. It is recommended after contusions, fractures, tissue destruction, and emotional traumas (Reckeweg 2002), so an undiagnosed previous injury might well respond to this remedy. Histaminum is also an ingredient common to *Causticum compositum*, *Hepar compositum*, and *Ubichinon compositum*. It is frequently indicated as an intermediate remedy in all cellular phases, possibly in combination with the intermediary acids of the citric acid cycle and other intermediary catalysts.

Causticum compositum: Treats lesions resembling burns or radiation injury. The component Arsenicum is noted for burning sensations, when there is burning of the

skin and itching with burning after scratching, and when skin eruptions and other symptoms are mostly of a stubborn nature, or may even border on the Degeneration Phase or begin to look malignant (Reckeweg 2002).

Coenzyme compositum: This agent is used for metabolic support. It contains several useful remedies, including alpha-Ketoglutaricum acidum and dl-Malicum acidum (malic acid), as an active factor in the citric acid cycle and in redox systems. These are used for all kinds of Impregnation Phases, such as pruritus, skin diseases, psoriasis, pre-cancerous states and neoplasm phases (especially in the early stages). They improve cell respiration, promote cutaneous cell functions, and stimulate regeneration (Reckeweg 2002). Both of these remedies are also found in the combination *Hepar compositum*, below.

Cutis compositum: Used for repair and detoxification of skin. It has Cutis suis, which is indicated in allergic reactions, dermatoses, eczema, pemphigus, fissures, psoriasis, and dermatomycoses. Used after burns (including X-ray burns) and to treat neurodermatitis (Reckeweg 2002). This formula also has many other remedies that are discussed in this section, including Hepar suis, alpha-ketoglutaricum, and a host of other skin therapeutics.

Echinacea compositum: A natural “antibiotic” in Impregnation, Degeneration, Dedifferentiation phase disorders.

Engystol N: Supports skin in allergic disorders.

Galium-Heel: A cellular detoxification agent that is useful for both drainage and repair, especially in geriatric and allergic patients.

Glyoxal compositum: Activates enzymes in deep homotoxicoses.

Hepar compositum: Used for liver detoxification in deeper disorders. The following statement from Reckeweg (2002) details the factors useful in deciding on its use: “On the skin, there is a tendency to fester, (skin slow to heal), the wounds being mostly flat with a pulsating sensation. The edges are sensitive to touch and often surrounded by pimples. The discharges are generally thick and purulent, with a characteristic odor of old cheese” (Reckeweg 2002). This remedy also contains malic acid, alpha-ketoglutaricum (see *Coenzyme compositum*), Histaminum (see *BHI-Allergy*), and sulphur (see *Psorinoheel*.)

Lymphomyosot: Provides lymph drainage.

Nux vomica homaccord: Used in cases that need hepatic and gastrointestinal detoxification and drainage.

Psorinoheel: Contains Psorinum, from which it gains its name. Used for emotional lability, depression, catatonia, and intransigent neuralgias. Also used for chronic eczema, impetigo and all kinds of skin eruptions, asthma alternating with eczema, psoriasis, boils, acne, seborrhea, etc. Pruritus in Psorinum cases is relieved by scratching until the patient bleeds. Psorinoheel also contains homeopathic Sulphur, which is indicated for itching, in skin

diseases or on its own, often followed by burning (those symptom notes are also common to Phosphorus and Arsenicum album). Other signs that may direct the clinician to Psorinoheel are chronic skin diseases, lichen planus, acne vulgaris, pruritic eczema and suppurative skin diseases, urticaria neurodermitis, dermatoses with much itching (especially at night), behavioral disorders, emotional discord, or upset (Reckeweg 2002). This remedy also contains Thuja (see *BHI-Allergy*) and Bufo, which is homeopathically indicated for certain cases involving itching and burning skin.

Solidago compositum: Used for urogenital detoxification in deeper disorders.

Traumeel S: Used topically or systemically. *Traumeel* may also be injected in small amounts around the lesion. This is known as “circle the dragon” in Traditional Chinese Medicine.

Thyroidea compositum: A powerful matrix drainage and hormonal support antihomotoxic drug used commonly in deeper disorders.

Ubichinon compositum: Used for metabolism support.

Authors’ suggested protocols

Nutrition

Skin and behavioral/emotional/stress support formulas: 1 tablet for every 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Phosphatidyl serine (PS): 20 mg for every 15 pounds of body weight SID.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Chinese herbal medicine

Relaxol: 1 capsule for every 10 to 20 pounds of body weight BID (to effect). About 50% of dogs respond well. The Relaxol formulation by Natural Solutions, Inc. also contains hematite (Dai zhe shi), dragon’s tooth (Long chi), and oyster shell (Mu li), which help to balance the formula and increase the efficacy of the herbs mentioned above.

Acupuncture: The authors are not aware of any well-controlled studies regarding the use of acupuncture for acral lick granulomas. They recommend the following points based upon TCM theory and clinical experience: GV20, LI11, PC6, ST36, SP6, Baihui, GB30, BL15, and BL18.

Homotoxicology

Initial therapy: Traumeel, given orally, topically, and by injection surrounding the lesion. This is called the “circle the dragon” technique in acupuncture.

Detoxification remedy (phase 1 and 2): Hepeel and Coenzyme compositum tablets given orally twice weekly for 30 days, or Detox Kit Lymphomyosot, Nux homaccord, and Berberis homaccord BID PO for 30 to 60 days.

Deep detoxification remedy (phases 3, 4, 5, 6): Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, and Ubichinon compositum, given every 3 days for 30 to 120 days or until recovery wanes. In advanced or deep homotoxicoses consider Glyoxal compositum, given once.

SEPARATION ANXIETY

Definition and cause

Dogs and cats have become close members of many families, and as such, when separated from family members to whom they have bonded, they can experience anxiety leading to behavior problems. Behavior abnormalities such as destruction of home furnishing, urination and defecation in the home, vocalization, incessant barking and howling, and depression often result from the distress of being separated.

Before the diagnosis of separation anxiety is made, other causes such as medical or physical problems, inability to reach the litter box, and inadequate training must first be ruled out (Borchelt 1982, Lund 1999, Schwartz 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Client compliance is an important part of proper therapy; this includes behavior modification, desensitization, counter-conditioning, habituation, and medications. Drugs should not be the first choice; they should only be prescribed after a well-thought-out behavior modification program has been tried. If the behavior modification program does not completely control of problem, then the use of medication can be considered. The drug of choice is Clomicalm®, which is approved for the treatment of separation anxiety, but side effects of diarrhea can prove problematic (Horwitz 2000, Takeuchi, 2000).

Anticipated prognosis

As with other compulsive disorders, client compliance and adherence to the behavior modification program are essential for control of the condition. In addition, the formulation of a good behavior modification protocol that helps to desensitize the animal is as important as compliance (Lem 2002, Takeuchi 2000).

Integrative veterinary therapies

Separation anxiety is not a specific diagnosis. Recommending therapy based upon diffuse, descriptive diagnoses often serves to label a patient, but may not result in the successful understanding or management of that patient's condition. Generally speaking, it is advisable for professionals to avoid such descriptive diagnoses, especially when recommending therapy.

Excessive anxiety can lead to vocalization, hyperactivity, destructive behavior, and client dissatisfaction. Such activities can originate from natural, survival-oriented behavior in canines, and therefore do not necessarily represent pathological conditions. Puppies left alone or separated from the pack become vulnerable to predation, and it is natural for them to seek pack members for protection. Shredding clothing, especially shoes and undergarments, may actually be the puppy's attempt to get closer to the owner for protection. Most puppies may only need non-drug behavior modification; pheromone aerosolizers also may be very helpful.

Puppies may have other issues that lead to excessive anxiety behaviors. In some instances there are factors affecting the normal development of the nervous system. Damage in utero, poor nutrition, adverse reactions to food, food allergy, poor environment, excessive stress, improper handling of the puppy in its new environment, and premature removal from the dam may negatively affect the puppy's development and lead to behavioral problems. Genetic factors may play a role. Furthermore,

there may be a reaction to vaccination (See Chapter 35, Vaccinations, for more information)

Careful evaluation may be needed to properly approach these cases, and difficult cases should be referred to a behavioral specialist prior to more desperate actions (Mege 2006).

A veterinarian addressing separation anxiety should take a careful medical and behavioral history in addition to conducting a complete physical examination and should attempt to determine any aggravating causes for the anxious behavior (Beata 2006). A therapeutic plan can be initiated once these factors are identified. The addition of therapeutic nutrition, medicinal herbs, and homeopathic remedies can help balance the animals' emotions and make them less reactive to stresses.

Nutrition

General considerations/rationale

The nutritional approach to separation anxiety consists of nutrient support of the brain and nervous system; the gentle detoxification of environmental chemicals, toxins, medication, and vaccinations; and the addition of behavior-modifying or -enhancing natural remedies such as flower essences.

Appropriate nutrients

Nutrition/gland therapies: Glandular brain and pineal supply intrinsic nutrients and can help nourish brain and nerve cells, improve circulation, and reduce inflammation in the central nervous system (see Chapter 2, Gland Therapy, for more information).

Phospholipids in glandular brain are a source of unsaturated omega-3 fatty acids, which are thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is essential for cellular membranes, particularly those of brain cells. PS has been studied in people with altered mental functioning and degeneration with positive results (Crook 1991, Cenacchi 1993). In people with Alzheimer's disease the addition of PS showed a mild to significant clinical improvement (Delewaide 1986, Engel 1992, Funfgeld 1989).

Blue-green algae: Blue-green algae have been observed to create a generalized feeling of well-being in humans and may prove helpful in veterinary patients. Blue-green algae's effects and benefits are slower in onset, generally taking 3 to 4 weeks to appear. This may be due in part to their content of natural antihistaminic compounds or their levels of omega-3 fatty acids (Bruno 2001).

Many studies in recent years have confirmed the beneficial results from these critical fatty acids. *Aphanizomenon flos aquae*, a blue-green algae, has been shown in clinical settings to have positive effects on brain function. In addition to the omega-3 fatty acids, it has a full spectrum of essential amino acids, a broad-based mineral content, a rapidly assimilable glycolipoprotein cell wall, and a wide variety of vitamins. It has mild chelating properties and thus, can be valuable in heavy metal toxicoses such as Thimerosal reactions. It is a tremendous asset as a micro-nutrient resource and figures prominently in many treatment programs (Broadfoot 1997).

Chinese herbal medicine

General considerations/rationale

Separation anxiety is considered to be a combination of Yin deficiency in the Heart and Qi stagnation in the Liver. In the Western interpretation, The Shen or mind is housed in the Heart in TCM terms. Yin can be thought of as nourishment or fluids. When there is a Yin deficiency of the Heart, the mind is not nourished. This leads to anxiety. The Liver is responsible for the smooth flow of emotions. When the Liver Qi is stagnant, the animal feels constrained, frustrated, and irritable. Treatment is aimed at calming the patient.

Appropriate chinese herbs

Albizzia flower (He huan hua): Has been shown to have sedative effects in mice (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Contains saikosaponins, which have sedative effects (Zhong Yao Yao Li Yu Ying Yong 1983).

Curcuma (Yu jin): Contains curdione, which depresses the central nervous system (Hao 1994).

Gardenia (Zhi zi): Sedates the central nervous system. It decreases spontaneous activity in mice (Jiang 1976).

Grass-leaf sweet-flag root (Shi chang pu): Has demonstrated sedative effects (Zhong Yao Xue 1998).

Peony (Bai shao): Has sedative effects and prolongs sleeping time when administered along with phenobarbital in mice (Zhong Yao Tong Bao 1985).

Polygala root (Yuan zhi): Contains a high level of bromine, which causes sedation (Ou 1990).

Polygonum (Ye jiao teng): Causes sedation. When given to mice it causes a significant decrease in the amount of pentobarbital needed to induce anesthesia (Chen Dao Yuan 1999).

Poria (Fu ling): Has a calming effect. It has been shown to be capable of counteracting the excitatory effects of caffeine in mice (Hu 1957).

Zizyphus (Suan zao ren): Has demonstrated sedative effects in dogs, cats, rats, rabbits, and guinea pigs. It also counteracts the excitatory effects of caffeine and benzedrine. One of the components of zizyphus, jujuboside, is

the most likely candidate for the sedative effects (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995, Zhao Qiu Xian 1995, Guo 1998).

Practitioners have used acupuncture successfully to treat many psychological conditions, among them separation anxiety (Xie 2006).

Homotoxicology

General considerations/rationale

No homotoxicology remedies have been specifically studied for use in separation anxiety in animals, but anxiety as a generality is often addressed homeopathically and a theoretical discussion of these principles follows.

Anxiety can originate from neurodermal impregnation homotoxicoses. In these conditions, the binding of homotoxins to the matrix damages the patient's nervous system. Such binding negatively affects the proper functioning of these elements. Viral particles, toxins (heavy metals), and a host of other possibilities exist. Dyes and food additives may contribute as well. Food allergy is an example of a common Impregnation Phase homotoxicosis seen in clinical practice (Reckeweg 2000). Anxious behavior can temporarily appear and fade away during regressive vicariation and is associated with improved patient condition. During these periods the patient may benefit from improved levels of neurosupportive nutrients (see nutrition discussion).

Antihomotoxic medicines may help establish calm, relieve organ stress, and reduce homotoxin levels. In some cases they provide a psychological benefit to the animal's owner because they provide the owner with something to do while training methods, pheromones, and other treatment plan steps have time to function effectively.

If properly managed, most of these cases do not require psychopharmaceutical agents, which may be associated with progressive vicariation and unpleasant side effects such as diarrhea. In limited cases, especially when there is bona fide, organic nerve damage, the use of such agents may be considered, but it should be recognized that such treatment may be associated with functional nerve damage, a highly undesirable side effect (Gur 1998a, 1998b).

L-theanine, an amino acid in green tea, may also assist some cases. Although it is nonsedating, L-theanine tends to create a calmer mental outlook. The authors have used this agent with limited success in clients looking for natural, nonpharmaceutical solutions to puppy anxiety (Mitchell 2003, Palmquist 2005).

Classical homeopathy may yield surprising responses in some cases of anxiety, and should be considered (Day 1990). This subject is beyond the scope of this text, but it is important to note that anxiety can be a manifestation

of many different emotional states (anxiety, fear, anger, frustration, resentment, and antagonism, to name a few), and each of these requires separate consideration in developing a classical homeopathic approach (Kent 1921). Seeking a trained homeopathic practitioner with experience in behavioral cases is advised in such situations (Schoen 1998).

Bach flower essences also have anecdotal use in anxiety. They are used primarily when there are disturbances of a mental, emotional, or behavioral nature. Dr. Bach's original 38 English flower remedies included the popular combination known as *Rescue Remedy*. It consists of 5 flower essences: cherry plum, clematis, impatiens, rock rose, and star of Bethlehem. *Rescue Remedy* is used in situations of high stress and anxiety. It is important to note that it does not have conventional tranquilizing properties, but simply a calming effect that reduces or relieves the sense of stress and anxiety.

Many practitioners use *Rescue Remedy* to settle fractious dogs and cats, and its use is much appreciated by patients, clients, and technicians alike. Each individual flower essence has a particular area of mental, emotional, or behavioral use. For example, Aspen purportedly helps in situations of apprehension or fear, but not of a known entity, more the fear of an unknown. Mimulus, on the other hand, is believed to help with fears of known things. Holly is commonly used in the strong and aggressive emotions of outright anger and jealousy (Wright 2006). Because these agents are safe and nontoxic, therapeutic trial use can prove very helpful, especially in milder cases. Callahan (1997) reports that Recovery Formula helps animals in a state of emotional stress as well as addictive patterns.

Appropriate homotoxicology formulas

Antihomotoxic formulas to consider as starting points include:

***Aconitum homaccord*:** Animals that benefit from this often have fearful cases; nervous conditions; irritation with great agitation; sharp, stabbing pains; paralysis; restlessness; fear of death; and consequences of fright, which may be made much worse by the slightest contact. Patients responding to this remedy may have violent, acute complaints; red skin; and fever.

***Apis homaccord*:** Used for certain nervous disorders, vaccination reactions, urticaria, or angioedema (in combination with *Lymphomyosot*) (Broadfoot 2006).

***Atropinum compositum*:** Used for its Argentum nitricum component, which is indicated in some cases of anxiety, abdominal complaints, diarrhea, and spasm.

***BHI-Calming*:** Indicated for anxiety, but used in humans in cases of swearing mad and mania (Heel 2003).

***Cerebrum compositum*:** Provides support of cerebral tissues and blood flow. This combination contains Hyo-

scyamus for states of excitement with great restlessness, mobility, vehemence, jealousy, raving, and attacks of fury. At the other end of the scale there may also be depression to the point of melancholia and dull apathy (as in chronic poisoning). The eyes may have a glazed stare and an unusual sheen (Reckeweg 2002). This description may partially fit those animals with “rage” syndromes.

This combination also contains Anacardium, which is indicated for re toxic impregnations after suppressed skin eruptions. It is particularly indicated for cerebral and emotional symptoms with irritability, timidity, and fearfulness of misfortune and danger; along with mental exhaustion; emotional discord or upset; and delusions. Human patients may feel as if they have two wills, each driving them to do opposing things, as is found in schizophrenia (Reckeweg 2002).

Also contained in this formula is Embryo suis, with notes for use in cases demonstrating anxiety on waking, an aversion to or desire for company, and fear that something bad will happen. These cases often are irascible and irresolute. Irritability with a changeable mood may also be seen. Some cases may demonstrate sensitivity to music and noise, while others may be sensitive to touch and have their signs aggravated by physical contact (Reckeweg 2002).

Diarrheel S: Given for diarrhea with neurosis (contains Argentum nitricum) (Heel 2003).

Gelsemium homaccord: Used for headaches and anxiety (usually in older pets), possibly in reactions to vaccines in which headache or neurogenic swelling occurs.

Hepar compositum: This combination drains and supports liver function in deeper homotoxicoses. Contains Pancreas suis with mental notes for use such as fear of being injured or attacked or of narrow places. Assists with irritability from trifles or on waking (Reckeweg 2002). *Hepar compositum* may support healing in dermatosis and neurogenic dermatitis, which can cause irritation, negative emotional responses, and antagonism resultant from altered skin sensations. It also contains arsenicum, which is associated with nervousness and anxiety (Day 1990).

Ignatia homaccord: More typically used for depression, but cases of aggression originating from sadness exist (Pitcairn 2006). It is logical to consider this agent in some cases of anxiety.

Nervoheel: Used for anxiety.

Phosphor homaccord: Assists with melancholy.

Valerianaheel: Provides mild, gentle sedation through homeopathic and herbal dilutions.

Veratrum homaccord: Used in cases showing some or all of the following: paper shredding, psychotic behavior, collapse, vomiting, and diarrhea.

Authors' suggested protocols

Nutrition

Brain nerve support and behavior support formulas: 1 tablet for every 25 pounds of body weight BID.

Phosphatidyl serine (PS): 20 mg for every 15 pounds of body weight SID.

Blue-green algae: One-fourth teaspoon for every 25 pounds of body weight daily.

Chinese herbal medicine

The authors recommend Relaxol at a dose of 1 capsule for every 10 to 20 pounds twice daily to effect. It is important to combine medical therapy with behavioral therapy for optimal results. Relaxol contains albizia flower (He huan hua), anemarrhena (Zhi mu), bupleurum (Chai hu), curcuma root (Yu jin), fossil teeth (Long chi), grass-leaved sweet-flag root (Shi chang pu), haematite (Dai zhe shi), lily (bai he), oyster shell (Mu li), peony (Bai shao), polygala root (Yuan zhi), polygonum (Ye jiao teng), rehmannia (Sheng di huang), and zizyphus (Suan zao ren).

An alternative therapy is jia wei xiao yao wan, a patent formula. It contains angelica (Dang gui), atracylodes (Chao bai zhu), bupleurum (Chai hu), gardenia (Zhi zi), licorice (Gan cao), moutan (Mu dan pi), peony (Bai shao), and poria (Fu ling). This formula was used in 42 human subjects who reported anxiety. Seventy-four percent experienced significant reduction in anxiety while another 21% received some relief (Xu 1996).

These supplements contain some herbs not mentioned above. The extra herbs serve to increase the efficacy of the formula.

The authors use the following acupuncture points: GV15, GV20, GB20, SP6, and PC6.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Symptom formula: Select individual formulas based upon the symptoms manifested by the patient from the Appropriate Homotoxicology Formulas section or according to further research by the clinician. In cases in which no clear picture is evident, begin with Cerebrum compositum at 1 tablet EOD. If no improvement after 2 weeks, adjust the prescription accordingly (Nervo-Heel, BHI-Calming, Ignatia homaccord, Valerianaheel, etc.).

Detoxification formula: Hepeel or Coenzyme compositum tablets every day, both given PO in the evening.

Note: The addition of flower essences such as Rescue Remedy or Recovery may be beneficial.

STORM, NOISE (FIREWORKS), AND OTHER PHOBIAS

Definition and cause

Phobia is not simply a fear of something. By definition it is an extreme fear, one far worse than rationally explained. Storm phobia is a descriptive term and not a specific diagnosis, and as such, cannot be used as a diagnostic criterion in conventional medicine. Abnormal, unwarrented, or excessive fear can occur in many different organic states and can be a sign of abnormality or malfunction of the nervous system. Storm phobia may be associated with other fears or abnormal behaviors in dogs (McCobb 2001). A medical work-up is indicated in these cases as with any other neurological condition.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The medical approach to storm phobias focuses on tranquilization, sedation, or anti-anxiety medications. Medications such as Diazepam and Acepromazine are more commonly used by veterinarians. Anti-anxiety and panicolytic drugs such as Alprazolam (Xanax), Amitriptyline (Elavil), Buspirone (Buspar), and Clomipramine (Clomicalm) are gaining popularity.

While these drugs do not address specific causes of the problem, they generally are helpful in preventing injury to a pet that would otherwise be too afraid and reactive to properly control its own behavior. These drugs may have long-term harmful effects not yet understood in vet-

erinary medicine; so caution should be exercised in the use of psychoactive drugs in animal patients until further, more thorough research is completed (Gur 1998). Even the experts say that using drugs such as Acepromazine, a dissociative anesthetic, really does not help or address the issue and may make the associated fear worse (Overall 1997).

In addition to medication, veterinary behaviorists recommend behavior modification techniques, desensitization to the noise, proper nutrition, noise-blocking techniques, and counter-conditioning methods, all of which improve the effectiveness of the drugs and success rates (Nash).

Anticipated prognosis

The prognosis is good when conventional medication and other techniques such as behavior modification and desensitization are used; however, client compliance is essential for long-term control.

Integrative veterinary therapies

When dealing with these phobias, it is accepted that medical therapies do not address the underlying cause and their values lie more in the prevention of injury to the animal. Furthermore, there may be harmful side effects that are not known at this point, which could actually worsen the situation. Therefore, precautions must be taken and alternatives should be explored.

Flower remedies may be helpful and some people have also reported anecdotal success with essential oils (Essential Science 2002, Wright 2006). Some of the authors have recommended *Rescue Remedy*, *Mimulus* (for fear of known things), and *rock rose* (for terror and panic) with some success. *Anaflora's Tranquility* also has shown success anecdotally (Callahan 1997).

L-theanine, an amino acid from green tea extracts, may be helpful in this condition, but there are no controlled studies on its use. Peppermint oil has been recommended by several holistic veterinarians and is worth trying (Silver 2004). The authors have not been able to duplicate success using this oil, but exploration of this field may yield useful information in the future. Blue-green algae may be helpful over longer periods of time owing to its rich mineral and omega-3 fatty acid content (Broadfoot 2003).

A behavioral specialist may provide successful training and destimulation or counter-conditioning drills. The first step is usually environmental controls. Providing a safe space or hiding area may reduce the behavior in many cases (Haug 2006). Caution should always be taken when dealing with phobic pets to avoid unnecessarily stressful or restimulative situations.

A few novel techniques deserve mention. T-Touch™ technique is a method of calming fearful dogs and cats that has been used by thousands of animal owners and professionals with good success (Tellington-Jones 1999). Another novel approach to anxiety and fear is “body wrapping.” This may calm some pets by placing pressure on peripheral nerve receptors, and it provides yet another drug-free method of addressing the issue (Farber 2002). Sadly, in some cases there may be no other option but short-term use of a pharmaceutical agent.

Nutrition

General considerations/rationale

If the cause has been identified and medication and behavior modification techniques are being used, nutritional support that focuses upon the brain and the emotions can often improve the animal’s general attitude and well-being.

Appropriate nutrients

Nutritional/gland therapies: Glandular brain and pineal supply intrinsic nutrients and can help improve function and reduce inflammation in the brain and central nervous system (see Chapter 2, Gland Therapy).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Lecithin/phosphatidyl choline and inositol: Lecithin is an essential nutrient required by cells for general health and wellness (Hanin 1987). Inositol, which often is found in combination with lecithin, has been shown to help people with panic attacks. In a double-blind study it has been shown to be effective in relieving symptoms of obsessive-compulsive disorders (Benjamin 1995, Fux 1996)

Phosphatidyl serine (PS): Phosphatidyl serine is a phospholipid that is essential in cellular membranes, particularly those of brain cells. It has been studied in people with altered mental functioning with positive results (Crook 1991, Cenacchi 1993).

Essential fatty acids: Research confirms the benefits of essential fatty acids regarding their calming effect on the central nervous system (Erasmus 1993).

Chinese herbal medicine

General considerations/rationale

According to traditional Chinese Medicine, storm phobias are Heart Yin and Blood deficiency and Liver Qi stagnation. In the Western interpretation, the Liver is

charged with ensuring the smooth flow of energy within the body. Anything that interferes with this function can cause constraint, according to Traditional Chinese Medicine. This may be an emotional disorder. Often, people who feel constrained are irritable. Therefore, it is easy to see how the ancient Chinese felt that Liver Qi stagnation caused irritability. The Heart is the seat of the Mind or Shen. When the Heart is not nourished properly due to Yin and Blood deficiency, the patient feels fearful. Treatment is aimed at calming the patient.

In December 1979 the World Health Organization recognized psychological conditions as being responsive to acupuncture therapy. Storm phobias and other phobic conditions fall into this category. Wang and Kain used aural acupuncture in 55 patients to decrease anxiety with good results, based upon the State-Trait Anxiety Inventory scale, which measures tension (Wang 2001). In another study 18 people with insomnia and anxiety above 50 on the Zung Anxiety Self Rating scale were treated with acupuncture with excellent results (Spence 2004).

Appropriate chinese herbs

Albizzia flower (He huan hua): Has sedative effects (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Contains saikosaponins, which have sedative effects (Zhong Yao Yao Li Yu Ying Yong 1983).

Curcuma root (Yu jin): Contains curdione, a compound that sedates the central nervous system. Experiments on cats showed that it inhibits the central nervous system, which affects sleep patterns (Hao 1994).

Grass-leaf sweet-flag root (Shi chang pu): A central nervous system suppressant (Zhong Yao Xue 1998). Grass-leaf sweet-flag root was used along with Shu di huang, Shan zhu yu, Fu ling, Tai zi shen, Suan zao ren, Hu po, Dang gui, Gou qi zi, Wu wei zi, and Zhi gan cao in 48 people with anxiety disorders. Seventy-five percent showed significant improvement and 22% had some improvement (Wang 1998).

Polygala root (Yuan zhi): Causes sedation (Zhong Yao Yao Li Yu Ying Yong 1983). It contains a high level of bromine, which has a tranquilizing effect (Ou 1990).

Polygonum (Ye jiao teng): A tranquilizer. Experiments in mice showed that it could decrease the amount of pentobarbital needed to sedate the animals (Chen 1999).

White peony (Bai shao): Causes sedation, as has been shown experimentally in mice (Zhong Yao Tong Bao 1985).

Zizyphus (Suan zao ren): Has demonstrated sedative effects in various animals (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995).

Homotoxicology

General considerations/rationale

Classical homeopathy has recognized general mental complaints as important diagnostic criteria since its inception more than 200 years ago. Classical homeopathy contains many remedies associated with fear (Pitcairn 2006). Kent's classic text lists six and one-half pages of remedies that are useful in cases of fear (Kent 1999). Physical diseases may manifest as a restlessness or fear if pain or other abnormal sensations occur as a result. Homeopathic remedies that are considered in physical symptoms due to changes of weather might be considered in light of medical findings. Quinhydrone can be used in sensitivity to weather but should be given in frequent doses. This remedy is complemented by Sulphur and by all homeopathic remedies that have aggravation from wet weather, such as *Kalmia*, *Dulcamara*, *Rhus tox*, *Rhododendron*, *Medorrhinum*, *Bryonia*, and others (Reckeweg 2002).

Homotoxicologists have noted similar findings, and case reports regarding treatment of fear and fear aggression are beginning to appear (Palmquist 2006, Roach 2006). No controlled studies exist for antihomotoxic drugs in these cases, but because homotoxicology formulas and classical homeopathic remedies are nontoxic, it seems prudent to consider them in therapeutic plans for patients in this category. Such therapy is by trial and error at this time, and clients should be informed of the experimental nature of such treatments.

Appropriate homotoxicology formulas

Useful formulas (also see protocols for Separation Anxiety, Compulsive Disorders, and Aggression):

***Aconitum homaccord*:** Used for intense fear.

***BHI-Calming*:** A calming remedy that works more gently than others on this list.

***Gelsemium homaccord*:** Animals likely have baroreceptors, which may be hypersensitive in some storm phobia cases. The main constituent in the remedy is a neuractive herb that is diluted homeopathically and used for cases showing sensitivity to falling barometric pressure, fear of thunder, and/or fear of falling. Consider this remedy in cases in which fear begins long before thunder starts (falling barometric pressure).

***Cerebrum compositum*:** Contains *Gelsemium* (see the listing in this remedy set). It is used for cerebral insufficiency, detoxification, and support. It also contains *Thuja*. The Impregnation phases that are characteristic of *Thuja*-responsive cases are found in the typical mood that is observed, which tends toward frequent angry outbursts, despondency and melancholy, discontent, anxiety, restlessness, and peevishness. These may be the consequences of bacterial and animal poisoning, vaccinations, snakebites, etc., and the symptoms are worse in cold and wet weather (Reckeweg 2002).

***Mucosa compositum*:** Used for nervous diarrhea owing to the signs of poisoning demonstrated with *Lachesis*.

***Nux vomica homaccord*:** Used with the ingredient *Bryonia* (for fear of thunderstorm), and also in cases with joint or respiratory complaints or nausea/vomiting.

***Phosphor homaccord*:** This is a major remedy for cases showing fear of loud sounds and thunderstorms, thin animals, nervous debility, and neurosis (Boericke 1927, Heel 2003). Phosphorus is the principal remedy selected for use in this formula for patients with the following general symptom picture: emotionally there is a general excitability and irritability, timidity and fearfulness at twilight, and above all during thunderstorms; the patient fears being alone, and is hypersensitive to light, noises, and music, as with *Nux vomica* (Reckeweg 2002).

***Rhododendron homaccord*:** Used for fear of thunderstorms, joint pain, and problems that originate following vaccinations (Day 1990).

***Spigelon*:** Used with the ingredient *Bryonia* (used for fear of thunderstorm), and also in cases with joint or respiratory complaints. *Spigelon* is characteristically known for its assistance in migraine headaches in humans.

***Valerianaheel*:** Has a mild calming effect.

***Ypsiloheel*:** Leads to improved central mediation; contains *Lachesis* (Kent 1921).

Authors' suggested protocols

Nutrition

Brain nerve support and behavior support formulas: 1 tablet for every 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Inositol: 100 mg for every 25 pounds of body weight SID/BID.

Phosphatidyl serine (PS): 20 mg for every 15 pounds of body weight SID.

Omega-3,-6,-9: 1 capsule for every 25 pounds of body weight with food.

Chinese herbal medicine

Relaxol: 1 capsule for every 10 to 20 pounds of body weight, twice daily to effect. This therapy must be continued every day. It will not be effective if the supplement is only given before or during the storm.

In addition to the herbs mentioned above, Relaxol also contains *anemarrhena* (*Zhi mu*), *haematite* (*Dai zhe shi*), *lily* (*Bai he*), *oyster shell* (*Mu li*), and *rehmannia* (*Sheng di huang*). These additional herbs increase the efficacy of the formula by supporting the actions of the other herbs.

The authors use the following acupuncture points in phobic patients: PC6, GV15, SP6, and GB20.

Homotoxicology (Dose: 1 tablet or 10 drops for 50-pound dog; 1 tablet or 5 drops for small dog or cat)

Phosphor homaccord or Cerebrum compositum: Use as a starting prescription, or as indicated by other symptoms.

Chapter Nine

Diseases of the Cardiovascular System

CARDIAC ARRHYTHMIAS

Definition and cause

Cardiac arrhythmias can occur for many reasons (Keating 2001, Bhatt 2005). Hypoxia, trauma, biochemical insult resulting in tissue injury, metabolic disturbances, genetic alteration, reactions to medications, hyperthermia, neuroendocrine imbalances, nutritional deficiencies, and neoplasia are only a few of the possible causes. Disturbances of cellular function lead to improper cellular responses, which can subsequently lead to rhythm disturbances (Bhatt 2005).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Many cardiac arrhythmia patients require cardiac medications once a proper diagnosis has been reached (Vaughan-Williams 1970). These should be used as necessary to stabilize, preserve, and prolong life. In other cases, it is possible that the condition will resolve once the primary causative factors have been handled. Periodic monitoring of physical health, laboratory data, and cardiac testing such as electrocardiographic, echocardiographic, and radiographic imaging are helpful in following the progress and adjusting the treatment programs.

Anticipated prognosis

The prognosis depends upon the underlying cause. The arrhythmias usually are resolved if the cause is corrected.

Integrative veterinary therapies

An integrative approach to cardiac arrhythmias should be prescribed only after a definitive diagnosis and the underlying cause have been determined. This integrative approach focuses upon both the underlying cause and the physiological cellular changes that have occurred in both nerve and

cardiac cells that result in the arrhythmia. Nutrients, nutraceuticals, medicinal herbs, and combination homeopathics can reduce cellular inflammation, improve mineral and nutrient passage through membranes, protect cells, and work alone or in combination with medication, when indicated, to improve the animal's clinical condition.

Nutrition

General considerations/rationale

After the cause of the arrhythmia has been established and addressed, nutritional support can be recommended to address both the cause and the arrhythmia. Nutrients that are required for the proper functioning and nourishment of cardiac and nerve cells, as well as antioxidants to reduce free-radical-induced inflammation, often help to stabilize the condition.

Appropriate nutrients

Nutritional/gland therapy: Glandular heart and nutrients such as magnesium, potassium, carnitine, taurine, and antioxidants can help neutralize immune cellular inflammation and eventual cellular degeneration and organ (see Gland Therapy, Chapter 2).

Coenzyme Q10: Much of the clinical research on CoQ10 has been in human heart disease. Research has shown that it is beneficial in cardiovascular disease and in controlling cardiac arrhythmias (Gaby 1996).

Taurine: Deficiencies of taurine have been clinically linked to cardiac disease in animals (Fox 1992, Novotny 1994).

L-carnitine: L-carnitine is proven to improve cardiac function. Research has shown that the cardiac reserves of carnitine are depleted when oxygen levels in the body are reduced. Orlando (1986) showed a benefit to heart patients with L-carnitine supplementation and McEntee (1995) reported on low levels of L-carnitine in a dog with cardiomyopathy. The dog showed clinical improvement after L-carnitine therapy at 50 mg/kg/TID.

Vitamin E: Vitamin E is involved in the proper functioning of the heart muscle; it particularly improves cardiac output and circulation (Traber 2001).

Magnesium: Bashir (1993) showed that people taking magnesium supplementation had a reduction of more than 30% in arrhythmias. In a large population study, Tsuji (1994) associated low serum levels of magnesium with an increased rate of arrhythmias. Tzivoni (1990), in a peer-reviewed study, showed that magnesium may definitively reduce drug-induced arrhythmias.

Fish oil: In a double-blind trial, people with ventricular premature complexes had a reduction of 70% in abnormal heartbeats when fish oil was added to their diets (Sellmayer 1995).

Potassium: Lumme (1989) showed that the addition of potassium to the diet also significantly reduced arrhythmias.

Chinese herbal medicine

General considerations/rationale

In Traditional Chinese Medicine terms, cardiac arrhythmias are caused by Qi deficiency and Blood and Qi stagnation affecting the Heart. Under the Western interpretation, Qi deficiency can be translated into weakness or fatigue. Qi stagnation in the Heart may lead to irregular beating. The Heart may not beat while the Qi is blocked, but may then beat faster as the Qi breaks through. An arrhythmia results. Blood stagnation prevents normal blood flow, which leads to chest pain. Treatment is aimed at restoring blood flow by strengthening the heart contraction, increasing cardiac output, and normalizing the cardiac rhythm.

Appropriate Chinese herbs

Aconite (Fu zi): Can cause positive inotropic and chronotropic effects (Yao Xue Xue Bao 1983).

Astragalus (Huang qi): In a study of 14 human patients with heart failure, astragalus led to increases in cardiac output, cardiac index, stroke output, and stroke index. Experiments on animals show that astragalus can increase coronary blood flow and decrease coronary circulation resistance (Modern TCM Pharmacology 1997, Xu 1999, Luo 1999).

Carthamus (Hong hua): Has positive inotropic effects at low doses (Zhong Cheng Yao Yan Jiu 1983).

Cinnamon twig (Gui zhi): Has cardiogenic effects and vasodilatory properties (Zhong Yao Xue 1998).

Cnidium (Chuan xiong): Contains chuanxiongine, which can inhibit the thoracic aorta's contraction when it is induced experimentally by noradrenalin, potassium chloride, or calcium chloride. It was shown to dilate pulmonary vessels in rats (Zou 1984, Chen 1990, Wang 1990). Additionally, it improved coronary blood flow in experiments using isolated rat and hamster hearts (Gao 1987).

Codonopsis (Dang shen): Has been shown to increase cardiac output and improve blood perfusion in cats (Zhong Yao Xue 1998).

Licorice (Gan cao): Used with good results in 23 humans with arrhythmia (Bei Jing Zhong Yi Xue Yuan Xue Bao 1983). Licorice can decrease myocardial oxygen consumption and improve the general condition of blood vessels (Xu 1997).

Notoginseng (San qi): Improves arrhythmia due to decreased cardiac output (Zhong Yao Xue 1998).

Ophiopogon (Mai men dong): Treats drug-induced arrhythmia in rats (Zhong Cao Yao 1982).

Peach kernel (Tao ren): Has been shown experimentally to be able to increase the blood flow in dogs' femoral arteries and rabbits' auricular arteries by reducing vascular resistance (Liu 1989).

Peony (Chi shao): Increases resistance to hypoxia in animals (Zhong Cheng Yao Yan Jiu 1980).

Rehmannia (Sheng di huang): Has demonstrated cardiogenic effects (Zhong Yao Xue 1998).

Salvia (Dan shen): Increases perfusion of coronary arteries, thereby decreasing damage from cardiac ischemia (Gou Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1991).

White peony (Bai shao): Dilates peripheral blood vessels, thereby decreasing vascular resistance (Zhong Guo Yao Li Xue Tong Bao 1986).

Zizyphus (Suan zao ren): Has been shown to decrease experimentally induced arrhythmias (Zhong Guo Shou Yi Za Zha 1988).

Homotoxicology

General considerations/rationale

Most commonly encountered clinical veterinary cardiac arrhythmias represent Impregnation, Degeneration, or Dedifferentiation phase disorders. Clinicians should conduct full medical evaluations so they possess the most accurate information concerning the patient's condition. Diagnostic data is critical to properly treating these pets. Some arrhythmia patients can taper medications and continue on only their antihomotoxic support, while others require continued allopathic support.

Clinicians should not hesitate to mix antihomotoxic medications and pharmaceutical cardiac agents in a patient's treatment program. When prescribing cardiac glycosides, it may be observed that much lower doses are sufficient due to the synergistic effects of antihomotoxic drugs. Monitoring levels is advised in all patients that receive digitalis type drugs. In the author's practice, digoxin is rarely required to handle most cardiac patients.

Homotoxicology readily integrates with many different fields of healing, and Demers and Ben-Yakir have pre-

sented data regarding integration of homotoxicology with Traditional Chinese Medicine (Demers, 2005, Ben-Yakir, 2005ab). Factually, many patients that receive integrative treatment protocols feel better and require less medication. Cardiac healing and repair can occur as a result of homotoxicology treatment and have been reported (Palmquist 2005, 2006). Homotoxicology and other biological therapies are increasing in popularity, providing an exciting set of alternatives for handling cardiac issues in veterinary practice. Future research should prove interesting.

Appropriate homotoxicology formulas

Because arrhythmias can result from many different causes, this list primarily concerns those conditions that relate directly to the heart (see other protocols as indicated by the specific case):

***Aconitum homaccord*:** Used for anxiety, fear, fever, generalized erythema, and Inflammation phase homotoxins. Active ingredient is Aconitine and causes death by respiratory paralysis and ventricular fibrillation (Dorland 2006).

***Aesculus compositum*:** Used for peripheral vascular repair.

***Angio-Injeel (AngioHeel)*:** Currently not available in the United States. Used for angina, arterial hypertension, left-sided cranial pains, cardiac circulatory issues, anxiety, palpitations in the neck (these sometimes occur and lead to feline patients vocalizing in distress), and in allergic or sensitive patients. Glonoin (Nitroglycerin), an ingredient in this remedy, may assist in managements of these cats. Glonoin is also contained in *Cactus compositum*, *Cardiacum-Heel*, *Cor compositum*, *Glonoin homaccord*, *Strophanthus compositum*, and *Ypsiloheel* (Reckeweg 2000).

***Aurumheel*:** Used for hypotension, hypertension, and cardiac arrhythmias. The ingredient *Convallaria majalis* (lily of the valley) is known to assist in myocardial weakness and is used as a Western herb to increase cardiac performance and strength. It also treats hypertrophy and decompensation. It is part of the recommended human protocol for atrial fibrillation (Reckeweg 2000, Broadfoot 2005). The main indications are: weakness of myocardium, endocarditis, nervous palpitation, and athlete's heart (hypertrophy). The patient's history may include dyspnea with a feeling of faintness and palpitations, along with air hunger on the slightest movement, fluttering in the heart on exertion, then flushing of the face, and a sensation as if the heart were about to stop beating, then it would suddenly beat strongly again, and be accompanied by a feeling of faintness. Arrhythmia and cardiac insufficiency are the defining symptoms (Reckeweg 2002).

***Cactus compositum*:** Indicated for angina and weakness in coronary blood flow/supply. *Kalium carbonicum* supports cardiac arrhythmias; Glonoin (Nitroglycerin) is indicated for anginal pain and palpitations involving the neck. Also contains *Crataegus*, as in *Cralonin* (below) (Reckeweg 2000, Broadfoot 2005).

***Carbo compositum*:** Currently not currently available in the United States. Used in hypertensive patients and for cardiocirculatory disturbances.

***Cardiacumheel*:** Indicated for cardiac pain, angina, pain radiating up the neck, arrhythmia, intercostal pain (*Ranunculus*), cardiac pain with *China homaccord*, exhaustion, and weakness with lowered ability to function. It is useful after loss of body fluids (*China*), and to treat the origins of pain in vertebral area.

***Coenzyme compositum*:** Used to repair enzyme systems associated with metabolism. It is useful in all cellular phases. Its spectrum includes *Natrum pyruvicum*; in its sphere of use, *Natrum pyruvicum* has certain similarities to the indications for Sulphur in that pyruvic acid is situated at a focal point in the citric acid cycle, and Sulphur-like symptoms occur when there is an accumulation of pyruvates, e.g. in iatrogenic damage. Thus, *Natrum pyruvicum* can be combined with *Engystol*, Sulphur, and possibly *Hepar Sulph.*, and all sarcodes and numerous nosodes. It is especially indicated in cellular phases of all kinds, and in chronic conditions, including Impregnation Phases such as asthma, angina pectoris, pruritus, skin diseases, and psoriasis. It is also indicated in other Degeneration Phases, e.g. organic nervous diseases, and in pre-cancerous states and neoplasm phases.

The regressive vicariations that follow should be tackled with suitable single remedies. The homotoxins that require *Natrum pyruvicum* are not characterized so much by disorders of the direct energy extraction and use as they are by respiratory disorders, but rather they concern an integral part of the energy extraction which precedes the introduction of the decomposing carbohydrates into the citric acid cycle (Reckeweg 2002). A recent study from the *Annals of Thoracic Surgery* showed that administration of pyruvate upon reperfusion after cardioplegic arrest mitigated oxidative stress, protected mitochondrial enzymes, and increased the myocardial energy state, which supports Reckeweg's therapeutic application of pyruvates, particularly after cardioplegic arrest (Knott 2006).

***Cor compositum*:** Initiates repair and provides detoxification and drainage of the cardiac tissues. Its indications include hypertension, cardiac circulatory disorders, post-infectious and post-toxic cardiac disease, myocarditis, preinsufficiency, dyspnea, and anxiety associated with cardiac weakness, dyspnea, arrhythmia, and collapse (Reckeweg 2000). *Cor compositum* works similarly to

carnitine. Due to its ingredient *Cor suis* (heart), it may theoretically contribute to cellular repair.

Cor compositum contains *Kali carbonicum*, which is also contained in *Cactus compositum*, *cardiacum*, and *Cralonin*. This remedy targets heart symptoms. It can treat some perpetual arrhythmias, possibly interspersed with paroxysmal tachycardia, as well as defects of the valves that are associated with myocardial weakness pains in the heart. The *Kali* salts have a general prophylactic action in respect to heart attack. Problems arise most frequently around 3 a.m. in patients responsive to this agent.

Another strong contributor to this far-reaching remedy is DL-malicum acidum (malic acid), which is also found in *Coenzyme compositum*. It is an active factor in the citric acid cycle and in redox systems, and is useful in Impregnation Phases including asthma and angina pectoris, and neoplasm phases (especially in the early stages) to improve cell respiration. It has a diuretic action and should be given in conjunction with fumaric acid, which is also found in *Cor compositum* and *Coenzyme compositum*, because they aid in general detoxification and oxygenation of glandular and muscular tissues. Malic acid is also used to treat angina pectoris, myocardial weakness with dyspnea, tachycardia from metabolic and post-infective weakness of the myocardium, circulatory collapse, and bradycardia in athletes. Cold hands and feet and cyanosis of the skin are all typical symptoms (Reckeweg 2002).

Cralonin: Supports cardiac strength in geriatric conditions and positive inotrope through action of *Crataegus* (Hawthorne, also known as Whitethorn). *Cralonin* is useful in nearly all cardiac complaints, hypertension, fatigue, and anemia, and as emergency injection in acute cases (Reckeweg 2000, Schroder 2003, Broadfoot 2005). *Crataegus*' action is not confined to the circulation, but extends to other systems. Therefore, in addition to cardiac function, there is a general toning action on the circulation, and a regulating effect on the blood pressure. As a result, it also relieves tension in the peripheral circulation, as blood pressure is controlled both centrally and peripherally. Thus, it affects arrhythmia, angina pectoris, and dysarteriotomy.

The indications are as follows: weakness of the heart muscle, including that of a toxic nature (infectious toxic weakness of the heart muscle), myocarditis, cardiomyopathy, senile heart syndromes, athlete's heart, fatty degeneration of the heart, hypertension, general arteriosclerosis, and myocardial ischemia and disturbances of coronary circulation with angina pectoris. It is useful after infectious diseases such as influenza and pneumonia and after fever (Reckeweg 2002). *Crataegus* is also found in *Angio-Heel*, *Aurumheel*, *Cactus compositum*, *Cor compositum*, *Cralonin*, *Glonoïn homaccord*, and *Melilotus homaccord*.

Engystol: May be valuable in cases that could have a viral onset with subsequent alteration of cardiac conductivity (e.g., rheumatic fever in humans).

Glonoïn (nitroglycerin): An agent that bridges homeopathic and allopathic practice (Schuppel 1997). The name *Glonoïn* is based on the three components: Gl = glycerol, O = oxygen, and N = nitrogen. It can be helpful in cases of chest pain, tachycardia, arrhythmias associated with hyperthyroidism in cats (*Lycopus*), and nocturnal howling in elderly cats (perhaps through action on palpitations reaching up the neck) (Reckeweg 2000, Palmquist 2005).

Melilotus homaccord: Contains cardiac glycosides, which makes it useful in tachycardia (*Strophanthus*), angiospasm, arrhythmia (*Arsenicum album*), pericarditis, collapse, asthma, and emphysema (*Carbo vegetalis*) (O'Hanlon 1952, Norn 2004). It can be used as an antistress remedy in acute failure and vasodilates. *Strophanthus* is a primary component, with indications for cardiac decompensation, palpitations, tachycardia, cardiac insufficiency, and anticipatory anxiety (Reckeweg 2002). This formula also contains *Crataegus*, which is used primarily for hypertensive states with arrhythmias.

Rauwolfia compositum: Takes its name from *Rauwolfia serpentina*, long recognized as a very efficient regulator of blood pressure. It also contains, among other components, *Melilotus*, which has a characteristic action on the kidneys and to some extent opens the glomeruli for a more generous flow of blood. It has not yet been experimentally clarified whether the decrease in blood flow might be due to spastic contractions of the arterioles. After *Melilotus* has been given the congestion usually improves, so that *Melilotus* can also be helpful in chronic kidney conditions, e.g., renal hypertension (Reckeweg 2002). This remedy also contains *Ren suis* and *Hepar suis* to help drain the organ systems. *Viscum album* is the anti-arrhythmic component, which is useful for Impregnation phases and is indicated for hypotension and hypertension, sensations of vertigo, coronary stenosis, arrhythmia, and articular diseases of attrition (Reckeweg 2002).

Ubichinon compositum: This remedy is deeper reaching than *Coenzyme compositum* in supporting metabolism and mitochondrial functions in Degeneration and Dedifferentiation phase homotoxicoses. Seventy-nine percent of patients who were suffering from chronic disorders with metabolic problems and were treated with *Coenzyme compositum* showed improvement.

Authors' suggested protocols

Nutrition

Cardiac support formula: 1 tablet for every 25 pounds of body weight.

Coenzyme Q10: 15 mg for every 10 pounds of body SID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. One teaspoon for every 35 pounds of body weight for dogs.

Vitamin E: 50 IU for every 20 pounds of body weight SID.

Chinese herbal medicine

H110 Arrhythmia: Recommended at a dose of 1 capsule per 10 to 20 pounds of body weight twice daily. In addition to the herbs mentioned above, H110 Arrhythmia also contains amber (Hu po), cnidium (Chuan xiong), fossil bones (Long gu), oyster shell (Mu li), and schisandra (Wu wei zi).

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Symptom remedy (general arrhythmia): Cralonin, Cardiacum-Heel, Aesculus compositum, and Aurumheel mixed together and given TID PO. Cor compositum given by injection or orally acutely and then repeated twice weekly as needed. For ventricular fibrillation, consider adding Aconitum homaccord (give at close intervals until effect is noted, then taper dose) in addition to drugs. *Crataegus* remedies given I.V. are the best choice for fibrillation. Cor compositum serves as a rescue medication in these cases (Broadfoot 2005).

For those that are possibly hypertensive, the remedy *Melilotus*, with *Crataegus*, *Melilotus* homaccord, and *Strophanthus*, may be a valuable therapeutic tool, in conjunction with Coenzyme compositum for the mitochondrial support in a crisis. For impending circulatory collapse, a remedy which is unfortunately unavailable at this time is *Strophanthus* compositum. That remedy contained *Carbo* and *Veratrum*, the homeopathic equivalent for shock, along with *Strophanthus*, *Cactus*, *Glonoinum*, *Aconitum*, *Latrodectus*, and *Aethusa*.

Symptom remedy (atrial fibrillation): Aurumheel and *Chelidonium*, with alternating remedies of *Cardiacum-heel* (for anxiety, pressure, or stabbing chest pains), *Hepeel*, and *Cralonin* (Reckeweg 2000).

Symptom remedy (paroxysmal tachycardia): *Cardiacumheel*, *Belladonna* homaccord, *Aurumheel*, *Gastricumheel*, and *Psorinoheel*. Give *Glonoin* if pulsating neck pains or in hyperthyroidism/thyrototoxicosis (Reckeweg 2000).

Detoxification remedy: Uses as indicated by other conditions and phases of homotoxicoses present. Most patients should receive *Galium-Heel* in combination with other remedies. Coenzyme compositum, *Ubichinon* compositum are indicated in most cases, as well.

CARDIOMYOPATHIES, CONGENITAL HEART DISEASES, CARDIAC ARRHYTHMIAS, CONGESTIVE HEART FAILURE

Definition and cause

Because of the similarity in the approach of integrative therapies, heart disease (congenital, congestive and cardiomyopathy) is described together in this section.

Cardiomyopathy: Several forms of myocardial disease exist, including “idiopathic dilated cardiomyopathy (DCM), arrhythmogenic cardiomyopathy (ACM) (Boxer, English Bulldog, and Doberman Pinscher), lone atrial fibrillation (AF)(Wolfhound), or ventricular ectopia (Doberman Pinscher) without obvious echocardiographic evidence of myocardial failure” (Bonagura 2001). It is currently felt that most cases of cardiomyopathy have multiple causal factors, including genetics, diet, body type, breed, and sex. DCM and ACM are most common in dogs, while hypertrophic cardiomyopathy (HCM) is most common in cats and is more commonly seen in dogs of the Boston Terrier breed (Bonagura 2001, Pion 1987). Sudden death can occur in both species without prior symptomology being noted by veterinarian or client.

A full medical evaluation is indicated for the clinician to assess the patient’s condition. Feline patients with an arrhythmia or murmur noted on routine physical examination should have a cardiac work-up, because many of these cats are asymptomatic cardiac cases. Diagnostic data is critical to properly treating these pets. Tumor (hemangiosarcoma), electrolyte imbalances, post trauma or postoperative ventricular arrhythmia, medication reactions, and thyroid imbalances may all contribute to the disease process. Once a proper diagnosis is reached, many of these patients require cardiac medications. These should be used as necessary to stabilize the patient and preserve and prolong life (DeFrancesco 2003, Pion 1987).

Congenital heart disease: Surgery can be attempted for congenital defects and consultation with a surgeon and cardiologist is recommended early in the course of therapy. Dilated cardiomyopathy in dogs is one of the more common congenital heart diseases. It is most often idiopathic, but there are indications that there may be underlying causes such as familial protein abnormalities or nutritional deficiencies of taurine and/or L-carnitine (Miller 2003, Sissan 1999). Certainly any pediatric patient should be examined fully and this examination should include auscultation and determination of pulse quality. Abnormalities in these areas should prompt advice to proceed with a cardiac work-up including radiography, echocardiography, and possibly electrocardiography. The

clinician should search further for other congenital abnormalities in such patients.

Congestive heart disease: Valvular lesions in animals commonly result in heart failure. This can be so-called “endocardiosis,” an alteration of the valve leaflet caused by changes in the matrix or by interference with valvular function by a vegetative lesion consisting of infection or tumor. Rupture of the chordae tendoneae can lead to rapid congestive heart failure and sudden death. Other causes are secondary to dilated cardiomyopathy, chemotherapy such as doxorubicin, or hyperthyroidism (Smith 2003).

Autoaggressive disease can damage valve function as well, as can deterioration of the heart’s lining in endocarditis. Feline congestive heart failure is usually the result of cardiomyopathy, but other valve defects and congenital defects can also occur in cats, too (see congenital heart disease protocols).

Periodic monitoring of laboratory data and blood pressure, as well as physical examination and cardiac testing such as electrocardiographic, echocardiographic, and radiographic imaging are helpful in following the progress and adjusting treatment programs for best effect. Careful attention to other body systems is warranted because congestive heart failure affects multiple organ systems. Screening kidney values is important, especially for those patients treated with cardiac pharmaceuticals, such as enalapril and diuretics, which may cause exacerbation of renal function. Altered renal function may require adjustment of drug dosages as well, as in the case of digoxan. Concurrent dental disease can be aggravating or causative in valvular disease, and proper dental care is an important part in the prevention and management of cardiac disease in veterinary patients.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy is dictated by the condition and complicating factors such as hypoxemia, pleural effusion, ascites, pulmonary edema, arrhythmia, elevated blood pressure, etc. Medically matched drugs such as adrenergic blockers, beta-blockers, anti-arrhythmics, calcium channel blockers, ACE inhibitors, and diuretics are recommended. The use of nutritional supplementation such as taurine, carnitine, and Coenzyme Q10 remains controversial. Cats and American Cocker Spaniels, however, respond quite well to taurine supplementation (See Nutrition, below). All cats with heart disease should be placed on taurine supplementation (DeFrancesco 2003, Miller 2003).

Anticipated prognosis

The prognosis for dogs and cats varies considerably with the underlying cause and the clinical status of the disease.

Cats with hypertrophic cardiomyopathy can do well for years, even after medication is withdrawn. Dogs with dilated cardiomyopathy is listed in the literature as always fatal within 6 months to 2 years after diagnosis (Kienle 2003, Miller 2003).

Integrative veterinary therapies

While the veterinary literature contains many references relating to cardiovascular pathology and diagnostic techniques, there is little focus on alternative therapies, except taurine supplemental therapy in cats. The lack of acceptable evidenced-based studies has been the deterrent.

The heart, a muscle that is continually contracting with no periods of rest, has very specific metabolic needs. Proper function relies upon a steady supply of nutrients to fuel cardiac cells as well as good perfusion for metabolic waste removal. The heart requires glandular and hormonal support to maintain proper function, because blood supply to the body's vital organs and tissues is critical for life. No other organ exemplifies the importance of reducing inflammation and enhancing elimination than the heart. Free radical production has been clinically proven to set the stage for degeneration of heart tissue, be it the heart muscle, the valves, or the conduction system itself (Facino 1994).

An integrative approach to cardiac disease considers not only the medical control of the symptoms associated with compromised cardiac function, but also the underlying causes in the heart itself, i.e., nutritional requirements; inflammatory or degenerative processes in the heart muscle, nerves, and conduction system; or valvular efficiency and integrity. The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory and tissue protective effects on cells can often aid in the control of the clinical signs, reduce dependency on medication, and improve the day-to-day quality of life.

Many patients with congestive heart failure require cardiac medications for stabilization, and to preserve and prolong life. Some animals with CHF and cardiomyopathy may be able to be weaned off medications and be maintained on protocols of nutritional supplementation, Chinese herbal medicine, and/or homotoxicology support, while others may require continued ongoing medical support. When the cardiac condition is caused by other factors (i.e., endocarditis secondary to periapical dental abscessation), it is possible that the condition will resolve upon handling of the primary causative factors, but in most cases of valvular disease, the alterations are not reversible.

Periodic monitoring of laboratory data, and physical examination and cardiac testing such as electrocardiographic, echocardiographic, and radiographic imaging is helpful in following progress and adjusting treatment pro-

grams. (See Homotoxicology References for Ben-Yakir 2005; Broadfoot 2005; Demers 2005; Knott 2006; Norn 2004; Palmquist 2005, 2006; Reckeweg 2000, 2002; Schroder 2003; Van Wassenhoven 2004.)

Nutrition

General considerations/rationale

Nutritional support required for the proper functioning and nourishment of cardiac cells, and antioxidants to reduce free-radical-induced inflammation and help in cellular regeneration can help to stabilize the heart condition after the cause of the heart disease has been established and addressed.

Note: Because heart disease can be severe and involve organ failure, it is recommended that blood be analyzed both medically and physiologically to determine related organ involvement and disease. This allows for a more specific gland and nutritional support protocol (see Nutritional Blood Testing, Chapter 2).

Appropriate nutrients

The heart requires a continuous supply of bioavailable proteins and amino acids, essential fatty acids, and essential minerals.

Nutritional/glandular therapy: Glandular heart and other important nutrients such as L-carnitine and Coenzyme Q10 help to nourish heart cells, reduce free-radical-induced inflammation, and neutralize a cellular immune attack. It is this process at the cellular level that is one of the initiating causes of inflammation, leading to cellular weakness and breakdown, antibody production, and finally an auto-immune attack on heart cells. Gland therapy can help spare the heart, reduce inflammation, and help prevent eventual organ degeneration (see Chapter 2, Gland Therapy, for more details).

Essential fatty acids: In people with heart disease, fish oil been shown to be beneficial in slowing the progression of arteriosclerosis and improving disease symptoms (Leaf 1988, von Schacky 1999). In studies on animals, seabuckthorne oil has been shown to improve cardiac function, contractility, and oxygen utilization (Wu 1994, 1997).

Taurine: Low levels of taurine have been clinically proven to cause cardiomyopathy. Ryan (1989), Simpson (1993), Pion (1992), and Wysong (1989) found a direct link between low levels of taurine in the body and cardiac disease (Fox 1992, Novotny 1994).

L-carnitine: L-carnitine has proven effective in improving the functioning of the heart by allowing heart muscle to use lower levels of oxygen more efficiently. Cherchi (1985) and Orlando (1986) showed a benefit to heart patients with L-carnitine supplementation and McEntee (1995) reported on low levels of L-carnitine in a dog with cardiomyopathy and clinical improvement after L-carnitine therapy at 50 mg/kg/TID.

Studies on heart disease have shown that the addition of L-carnitine to the diet can reduce heart damage in animals (Lopaschuk 2000). In a study of human patients with heart disease Davini (1992) found that the introduction of L-carnitine after the diagnosis of heart disease resulted in a significant improvement over standard drug therapy: the mortality rate in the L-carnitine-supplemented group was 1.2% as compared to 12.5% in the group that did not receive supplements (Davini 1993).

Potassium: Potassium plays an important role in the transmission of electrical impulses in the heart and the regulation and lowering of blood pressure in people. (Whelton 1997). It is also important in maintaining a regular heart rhythm.

Magnesium: Magnesium has been extensively researched with regards to pathogenesis and treatment and its beneficial effects in the treatment of cardiovascular disease in people (Altura 1985; Seelig 1980, 1989; Sjogren 1989). Because of its inverse relationship with calcium, magnesium can act as a calcium channel blocker and help reduce blood pressure (Kawano 1998).

CoEnzyme Q10 (CoQ10 or ubiquinone): CoEnzyme Q10 is a strong antioxidant that helps reduce the associated inflammation that precedes many chronic diseases. CoQ10 has indications in the prevention and treatment of common diseases such as gingivitis and periodontal disease, heart disease, arthritis, diabetes, and many types of cancer (Gaby 1998, Shigeta 1966).

Clinical research in people has shown that CoQ10 is beneficial in controlling cardiac arrhythmias, congestive heart disease, and cardiomyopathy (Gaby 1996, Giugliano 2000, Greenberg 1990, Folkers 1985, Harker-Murray 2000, Hofman-Bang 1995, Kim 1997, Khatta 2000, Mortensen 1985, Morisco 1993, Permanetter 1992, Soja 1997). Results of these clinical studies showed an improvement in the related symptoms of the heart diseases, such as reducing dyspnea and edema, improving blood pressure, and helping to normalize heart rate. Harker-Murray (2000) showed that in dogs, while a CoQ10 deficiency does not appear to be present in dogs with heart disease, supplementation does appear to lessen the resultant hypertrophic response.

Vitamin E: Besides its antioxidant functions, vitamin E is involved in the proper functioning of the heart muscle, particularly in improving cardiac output and circulation and helping to reduce platelet aggregation. Vitamin E works by helping vessels to dilate and reduce the agglutination of blood platelets (Traber 1999, 2001).

Chinese herbal medicine

General considerations/rationale

Cardiomyopathy: Cardiomyopathy is a combination of Qi and Yang deficiency in the Heart with accompanying

Blood stagnation. According to the author's interpretation, Qi and Yang are energy. When there is a deficiency in the Heart, it becomes too weak to move the Blood. One result is the stagnation of Blood, which leads to pain—in this case, angina. Another consequence of the Heart deficiency is the inability of the Blood to nourish the body because the Heart cannot ensure proper circulation. This leads to the clinical signs of exercise intolerance and weakness.

Congenital heart disease: In the case of congenital heart disease there may also be an Essence deficiency. According to the author's interpretation, Essence is the genetic potential an individual is born with. Therefore, it stands to reason that a congenital problem is attributed to a deficiency of Essence.

Congestive heart disease: This is basically the decompensated form of cardiac disease. At this point, the Lung is not being nourished, which leads to dyspnea because the Lung is responsible for water distribution. If the Lung is deficient, it may allow the buildup of "water" or, in Western terms, pulmonary edema and pleural effusion or ascites. Concurrently, the Liver is not being nourished, causing elevated hepatic enzymes, and stagnation of Blood in the Liver may lead to the hepatomegaly that is often seen in affected patients.

Treatment involves strengthening the heart muscle, decreasing peripheral vascular resistance, and treating sequelae such as pleural effusion and hepatomegaly.

Appropriate Chinese herbs

Alisma (Ze xie): Has a diuretic effect in humans (Shi 1962). It decreases blood pressure (Zhong Yao Yao Li Yu Ying Yong 1983). In one experiment on rabbits, it increased blood flow in the coronary arteries (Yamahara 1991).

Astragalus (Huang qi): Has been shown to decrease hypertension and improve cardiac output. It increases coronary circulation (Xu 1999, Luo 1999). It also has been shown to have diuretic effects in people (Modern TCM Pharmacology 1997).

Atractyodes (Bai zhu): Has diuretic properties (Zhong Hua Yi Xue Za Zhi 1961). It may help decrease pulmonary edema.

Carthamus (Hong hua): Can have a positive inotropic effect if given in small doses. Larger doses have a negative effect (Zhong Cheng Yao Yan Jiu 1983).

Cnidium (Chuan xiong): Causes vasodilation and decreases blood pressure. It also increases blood flow to the coronary arteries (Zhong Yao Yao Li Yu Ying Yong 1989).

Codonopsis (Dang shen): Decreases blood pressure, thereby improving cardiac output (Zhong Yao Xue 1998).

Cultivated cordyceps (Dong cong xia cao): Decreases heart rate, blood pressure, and myocardial oxygen require-

ments (Zhong Cao Yao 1986). In one study it controlled arrhythmia in 37 of 57 patients (Zhong Cao Yao 1983).

Lepidium (Ting li zi): Increases the strength of cardiac contraction while slowing the heart rate (Wu Han Yi Xue Yuan Xue Bao 1963). It also has diuretic effects (Zhong Yao Zhi 1984).

Poria (Fu ling): Has diuretic effects (Lu 1987). It may help decrease pulmonary edema.

Red peony (Chi shao): Decreases blood pressure and dilates coronary arteries. It also increases the patients' resistance to hypoxia (Zhong Cheng Yao Yan Jiu 1980).

Salvia (Dan shen): Decreases heart rate and blood pressure (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1991). In rabbits it was shown experimentally to decrease EKG abnormalities and the severity of myocardial necrosis after myocardial infarction (Wei 1999).

Scrophularia (Xuan shen): Slows tachycardia and lowers blood pressure. It also improves the patients' ability to tolerate hypoxia (Zhang 1959, Gong 1981).

Acupuncture

Acupuncture may improve cardiac function (Ballegaard 1998). Acupuncture at PC6 has been shown by serial equilibrium radionuclide angiography to improve cardiac function (Ho 1999). In one trial 15 people with left-sided heart failure were treated by acupuncture at PC6 and Lu 7. Tachycardia decreased in all of the participants (Hu 1997).

Homotoxicology

General considerations/rationale

Cardiomyopathy: Most cases of cardiomyopathy represent primary disorders of the myocardium; thus, they fall in the category of Degeneration Phase disorders. Clinicians should not hesitate to mix antihomotoxic medications and pharmaceutical cardiac agents in a patient's treatment program. When prescribing cardiac glycosides, it may be observed that much lower doses are sufficient due to the synergistic effects of antihomotoxic drugs. Monitoring levels is advised in all patients receiving digitalis-type drugs. In the authors' practice, digoxin is rarely required to handle most cardiac patients.

Homotoxicology readily integrates with many different fields of healing and Demers and Ben-Yakir have presented data regarding integration of homotoxicology with Traditional Chinese Medicine (Demers 2005, Ben-Yakir 2005ab). Factually, many patients receiving integrative treatment protocols feel better and require less medication. Cardiac healing and repair can occur as a result of homotoxicology treatment and has been reported (Palmquist 2005, 2006). Since the effectiveness of early intervention is controversial in asymptomatic cardiomyopathy cases, homotoxicology and other biological therapies

may provide an exciting set of alternatives for consideration of handling cardiac issues in veterinary practice. Future research should prove helpful in determining more precise treatment protocols in integrative veterinary medicine.

Congenital heart disease: Congenital heart diseases represent Degeneration Phase homotoxicoses. Homotoxicology theory can be applied in early cases to attempt to alter the tissue state, but the authors are unaware of any studies showing reversal of congenital cardiac defects resulting from antihomotoxic medications.

The possibility for activation of stem cell elements and resumption of autoregulation in developmental disorders has been raised, but such therapy would need to be done early in the course of disease. A trial of stem-cell activating remedies such as *Discus compositum*, *Zeel*, *Tonsilla compositum*, *Cor compositum*, and *Placenta compositum* might be useful for determining future areas of investigation, but for now the clinician can concentrate on handling cardiac insufficiency as it arises in these cases. *Psorinoheel* may also have some effects on genetic defects owing to its effects on constitutional disorders. Another interesting area for exploration is the use of *Traumeel* in patent ductus arteriosus. Because aspirin may be used to close the ductus arteriosus in cases with early diagnosis, *Traumeel* may have an application due to its nonsteroidal anti-inflammatory nature. There is currently no data regarding this theory, however.

Congestive heart disease: Congestive heart failure can occur for many reasons. Most commonly encountered clinical veterinary cases represent Impregnation, Degeneration or Dedifferentiation phase disorders, and a full medical evaluation is needed to diagnose the patient's condition. Diagnostic data is critical to properly treating these pets.

Appropriate homotoxicology formulas

Antihomotoxic formulas with actions in cardiovascular disease include:

Aconitum homaccord: Indicated for anxiety, fear, fever, generalized erythema, and Inflammation Phase homotoxicoses. The active ingredient is Aconitine, which causes death by respiratory paralysis and ventricular fibrillation (Dorland 2006).

Aesculus compositum: Used for peripheral vascular repair.

Angio-Injeel (AngioHeel): Treats angina, arterial hypertension, left-sided cranial pains, cardiac circulatory issues, anxiety, and palpitations in the neck (these sometimes occur and lead to feline patients vocalizing in distress). It is also used in allergic or sensitive patients. The *Glonoinum* (nitroglycerin) in this remedy may assist in management of these cats, and is also contained in *Cactus compositum*, *Cardiacum-Heel*, *Cor compositum*, *Glonoin*

homaccord, *Strophanthus compositum*, and *Ypsiloheel* (Reckeweg 2000).

***Apis homaccord*:** This remedy has a wide variety of uses due to the action of *Apis* (Bee venom). It is a powerful agent in mobilizing edema (angioedema, pulmonary edema, cerebral edema, positional swelling), and this effect is accentuated in combination with lymph-moving remedies such as *Lymphomyosot* (Broadfoot 2006). Patients that are allergic to bee stings should use this remedy with extreme caution.

***Arnica-Heel*:** The ingredient *Solanum dulcamara* (Bittersweet) helps to reduce subacute and chronic inflammatory conditions, especially those that worsen in wet weather.

***Aurumheel*:** Used for hypotension, hypertension, hypertrophy, decompensation, and cardiac arrhythmias. The ingredient *Convallarea majalis* (Lily of the Valley) is known to assist in myocardial weakness and is used as a Western herb to increase cardiac performance and strength. It is part of the recommended human protocol for atrial fibrillation (Reckeweg 2000, Broadfoot 2005). The main indications are weakness of myocardium, endocarditis, nervous palpitation, and athlete's heart (hypertrophy). The patient's history may include dyspnea with a feeling of faintness and palpitations, along with air hunger on the slightest movement, fluttering in the heart on exertion, then flushing of the face, and a sensation as if the heart were about to stop beating. Then it would suddenly beat strongly again, with a feeling of faintness. Arrhythmia and cardiac insufficiency are the defining symptoms (Reckeweg 2002).

***Belladonna homaccord*:** The ingredient *Echinacea angustifolia* helps treat localized inflammatory reactions and septic processes (Melchart 1995, Pedalino 2004).

***Berberis homaccord*:** Used for hepatic, urogenital, and adrenal gland support and drainage and to treat painful urination.

***Cactus compositum*:** Used for angina and weakness in coronary blood flow/supply. *Kalium carbonicum* supports cardiac arrhythmias.

***Carbo compositum*:** Used in hypertensive patients for cardiocirculatory disturbances.

***Cardiacumheel*:** Treats cardiac pain, angina, pain radiating up the neck, arrhythmia, intercostal pain (*Ranunculus*). Also treats cardiac pain, exhaustion, and weakness with loss of ability to function (China). Useful after major loss of body fluids (China), and pain originating in the vertebral area.

***Chelidonium homaccord*:** Provides drainage of the gall bladder, support of biliary tree, and assistance for arrhythmia patients through support of liver function. Bile acids contribute to the correction of cardio rhythms. This complex remedy is indicated for arrhythmia cordis (Reckeweg 2000).

***Coenzyme compositum*:** Helps repair enzyme systems associated with metabolism and is useful in all cellular phases. It contains *Natrum pyruvicum*. A recent study showed that administration of pyruvate upon reperfusion after cardioplegic arrest mitigated oxidative stress, protected mitochondrial enzymes, and increased the myocardial energy state, which supported Reckeweg's theoretical, therapeutic application of pyruvates, particularly after cardioplegic arrest (Knott, Sun, et al. 2006).

***Cor compositum*:** Initiates repair, detoxification, and drainage of the cardiac tissues. It has indications for hypertension; cardiac circulatory disorders; post-infectious and post-toxic cardiac disease; myocarditis; preinsufficiency dyspnea; and anxiety associated with cardiac weakness and dyspnea, arrhythmia, and collapse (Reckeweg 2000). The ingredient *Cor suis* (Heart) may contribute to cellular repair. It works similarly to carnitine.

***Cralonin*:** Supports cardiac strength in geriatric conditions and positive inotrope through action of *Crataegus* (Hawthorne, also known as Whitethorn). *Cralonin* is useful in nearly all cardiac complaints, hypertension, fatigue, and anemia, and as emergency injection in acute cases (Reckeweg 2000, Schroder 2003, Broadfoot 2005). *Crataegus*' action is not confined to the circulation, but extends to other systems. Therefore, in addition to cardiac function, there is a general toning action on the circulation, and a regulating effect on the blood pressure. As a result, it also relieves tension in the peripheral circulation, as blood pressure is controlled both centrally and peripherally. Thus, it affects arrhythmia, angina pectoris, and dysarteriotomy.

The indications are as follows: weakness of the heart muscle, including that of a toxic nature (infectious toxic weakness of the heart muscle), myocarditis, cardiomyopathy, senile heart syndromes, athlete's heart, fatty degeneration of the heart, hypertension, general arteriosclerosis, and myocardial ischemia and disturbances of coronary circulation with angina pectoris. It is useful after infectious diseases such as influenza and pneumonia and after fever (Reckeweg 2002). *Crataegus* is also found in *Angio-Heel*, *Aurumheel*, *Cactus compositum*, *Cor compositum*, *Cralonin*, *Glonoin homaccord*, and *Melilotus homaccord*.

***Echinacea compositum*:** Simulates immune response in febrile and bacterial diseases.

***Engystol N*:** May be valuable in cases that could have a viral onset with subsequent alteration of cardiac conductivity.

***Glonoin* (nitroglycerin):** Indicated for anginal pain and palpitations involving the neck. Also contains *Crataegus*, as in *Cralonin*, above (Reckeweg 2000, Broadfoot 2005). *Glonoin* is an agent that bridges homeopathic and allopathic practice (Schuppel 1997). It can be helpful in tachycardia, arrhythmias associated with hyperthyroid-

ism in cats (*Lycopus*), and cases of nocturnal howling in elderly cats (perhaps through action on palpitations reaching up the neck) (Reckeweg 2000, Palmquist 2005).

Glonoin's main characteristic symptoms are palpitations extending to the neck, which can be seen in the pulsating carotid arteries, and a tendency to sudden violent irregularities in the circulation, with a sensation of fullness in the precordium and strong pulsations throughout the body, as if the chest would burst. It is linked with pains radiating out into the arms and throat (Reckeweg 2002).

***Glyoxal compositum*:** Used for decoupling polymerized homotoxins and blocked enzymes in deep homotoxicoses. Such activity exposes blocked membrane receptors and transport proteins for reactivation. It may help clear impregnated viral stages.

***Hepar compositum*:** Indicated for liver support and drainage in more chronic diseases.

***Lymphomyosot*:** Provides lymph drainage and detoxification in Excretion, Deposition, Degeneration, and Dedifferentiation phase disorders. It also supports thyroid function. Combined with *Apis homaccord*, it can be helpful in edema management. Consider trying this combination in pericardial fluid accumulations in combination with conventional therapy.

***Melilotus homaccord*:** Contains cardiac glycosides, which are useful in tachycardia (*Strophanthus*), angiospasm, arrhythmia (*Arsenicum album*), pericarditis, collapse, asthma, and emphysema (*Carbo vegetalis*) (O'Hanlon 1952, Norn 2004). Helps with anti-stress and vasodilation in acute failure. *Strophanthus* is a primary component, with the following indications: cardiac decompensation, palpitations, tachycardia, cardiac insufficiency, anticipatory anxiety (Reckeweg 2002). This remedy also contains *Crataegus*, which is used primarily for hypertensive states with arrhythmias.

***Mucosa compositum*:** Provides repair and drainage of mucosal elements throughout the body. It contains *E. coli* nosode for use in mucosal infections. Due to the energetic organ connection of the heart and small intestine, this remedy is frequently used in regimens directed at Degeneration Phase cardiac disorders.

***Nux vomica homaccord*:** Provides drainage and support of the gastrointestinal system. It is also used in angry pets and people.

***Pectus-Heel*:** Treats anxiety, precordialgia, spasm, stress, emotional issues. This agent has sympathicotonic (similar to beta-blockers) characteristics. Can also be used in cases manifesting sudden angina (Broadfoot 2005).

***Psorinoheel*:** Used in Excretion and Dedifferentiation phase disorders, constitutional cardiac issues, angular disorders in humans (the pertinent ingredient is *Oleander*), bacterial issues through *Bacillinum*, skin disorders, seborrhea, headaches, post-vaccinal issues, and convulsions.

***Pulsatilla compositum*:** Treats regulation rigidity cases in which there is no response to *Traumeel S*, migrating disorders, and therapeutic damage from corticoid hormones or drugs. It is helpful in many chronic diseases, and in cellular activation. It may initiate desirable regressive vicariation syndromes in which use of *Traumeel S* is desirable.

***Rauwolfia compositum*:** Takes its name from *Rauwolfia serpentina*, long recognized as a very efficient regulator of blood pressure. It also contains *Melilotus*, which has a characteristic action on the kidneys and to some extent opens the glomeruli for a more generous flow of blood. The components *Ren suis* and *Hepar suis* provide additional regulating functions of the drainage organ systems. The arrhythmic component is primarily covered by the addition of *Viscum album*, which is useful for Impregnation phases and is indicated for hypotension and hypertension, sensations of vertigo, coronary stenosis, arrhythmia, and articular diseases of attrition (Reckeweg 2002).

***Traumeel S*:** A nonsteroidal anti-inflammatory agent that activates sulfide-containing enzymes in all phases. Can be alternated with *Arnica Heel* in inflammatory cardiac conditions. *Arnica* constitution is usually muscular, athletic and plethoric and tends to hypertension. It treats the consequences of overexertion, e.g. muscular ache and sportsman's heart. Indications include injuries of every kind, such as hemorrhages, those to the soft tissues, concussion, dislocations, contusions, fractures, subluxations, and others (Reckeweg 2002). *Arnica* is found in *Traumeel*, *Arnica Heel*, *Aesculus compositum*, *Aurumheel*, *Carbo compositum*, *Cor compositum*, *Rauwolfia compositum*, *Secale compositum*, and *Spigelia compositum*, all of which are circulatory remedies.

***Ubichinon compositum*:** This remedy is deeper reaching than *Coenzyme compositum*, and supports metabolism and mitochondrial functions in Degeneration and Dedifferentiation phase homotoxicoses. Seventy-nine percent of patients suffering from chronic disorders with metabolic problems who were treated with *Coenzyme compositum* and *Ubichinon compositum* showed improvement.

Authors' suggested protocols

Nutrition

Cardiac support formula (contains Heart, K, Mg, Carnitine, Taurine): 1 tablet for every 25 pounds of body weight BID.

Coenzyme Q10: 15 mg for every 10 pounds of body weight daily.

Additional vitamin E: 50 IU for every 25 pounds of body weight.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Beyond essential fats: One-half teaspoon for every 35 pounds of body weight with food.

Chinese herbal medicine

H64 HeartAssist: This formula, which is used by the authors, may be used with vasodilators and diuretics if needed. Do not combine it with digitalis. Give 1 capsule for every 10 to 20 pounds twice daily. In addition to the herbs discussed above, HeartAssist also includes aquilaria (Chen xiang), fossil bones (Long gu), leech (Shui zhi), oyster shell (Mu li), and tortoise shell (Bie jia). These herbs increase the efficacy of the formula.

Acupuncture points to consider include BL14, BL15, PC6, ST36, and PC5 (Handbook of TCM Practitioners 1987).

Homotoxicology

Cardiomyopathy (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog): Because cardiomyopathy represents deep homotoxicoses, consider autotransfusion therapy where allowed by law. The following represent starting formulas, which should be adjusted according to patient response as the case progresses:

Symptom formula for canine DCM: (The goal is to manage cardiac function and address congestive heart failure and rhythm disturbances as indicated as with conventional pharmacologic interventions such as digoxin, benazepril, enalapril, spironolactone and or furosemide as indicated; treat arrhythmias if present and significant with agents such as ascarvedilol, propranolol, metoprolol, mexiletine, sotalol, etc.) Cralonin, Aurumheel, Cactus homaccord, Cardiacumheel or China Homaccord, mixed together and given orally BID.

Lymphomyosot and Apis homaccord in cases with pulmonary edema. Orally QID to TID initially and then reduce to BID when stable.

Psorinoheel may be helpful in constitutional (genetic) cases.

Traumeel may be helpful in early cases.

Symptom formula for canine ACM (tachycardia): (The major goal is to slow heart rate with beta-blocking drugs such as atenolol or metoprolol.) Cardiacumheel, Cralonin, Aurumheel as a mixture used BID PO.

Cardiacumheel can be given every 5 to 10 minutes in acute cases to gain control of the situation.

Give Pectus-Heel if heart rate stays high; consider BID PO.

Symptom formula for atrial fibrillation: Aurumheel, Chelidonium homaccord, given orally BID.

Cralonin can be used, alternating with Cardiacumheel and Hepeel intermittently.

Symptom formula for HCM (feline or canine): (The major conventional goal is to slow the heart rate with beta blockers such as atenolol.) Cralonin, Aurumheel, and China homaccord, combined and taken orally BID.

Engystol N can be given intermittently if there is viral disease or allergy in the history.

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum, and Cor compositum, mixed together and taken twice weekly PO. If frequent infections or other indications of lowered immune response, substitute Tonsilla compositum for Thyroidea compositum for 30 to 60 days.

Congenital heart disease: (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog)

Specific treatment of congenital cardiac cases is not indicated based upon clinical experience. However, Cor compositum, Tonsilla compositum, Traumeel, Discus compositum, and Placenta compositum may be tried early on in pediatric cases to attempt to activate stem cells, along with the catalysts, particularly Ubichinon comp. The client should be informed that this is experimental treatment, which may have no effect whatsoever. Any positive results from such treatment should be submitted for publication. Cralonin, Aesculus comp and other cardiac formulas may be used as needed to manage other cardiac insufficiency signs (See Congestive Heart Failure).

Congestive heart failure (Dose: 10 drops for 50-pound dog; 5 drops for cat or small dog):

Symptom remedy: Cardiacumheel, Aurumheel, used BID PO in all cases. In mild cases, Cactus compositum and China homaccord are commonly needed additions to this basic protocol.

Cralonin alone may be adequate to improve cardiac blood flow in early or mild cases. Use BID PO.

Apis homaccord and Lymphomyosot can be given QID to TID for pulmonary edema initially and reduced to BID as condition improves.

Cor compositum may be given as an injection therapy 2 to 3 times weekly, along with Coenzyme comp, possibly alternating with Ubichinon comp. These adjunctive therapies can be very helpful in heartworm cases with cardiac damage.

Detoxification: Lymphomyosot, Galium-Heel, Hepar compositum, Solidago compositum, Thyroidea compositum, Coenzyme compositum, Ubichinon compositum combined and given twice weekly PO.

Hepeel twice daily.

HEARTWORM DISEASE

Definition and cause

Caused by *Dirofilaria immitis* which obstruct blood flow, causing secondary heart and pulmonary issues such as thrombosis and hypertension and signs such as coughing, rapid breathing, dyspnea, loss of energy, lethargy, and weight loss. Generally more adult worms occur in dogs than in cats (Calvert 1994, Clay 2003, Dillon 2000, Miller 2003, Soulsby 1982).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The treatment of choice is the adulticide Immiticide for dogs and Thiactarsamide sodium (Caparsolate®) for cats. In most cases, adulticide medication is not recommended for asymptomatic cats. Symptomatic treatment with anti-inflammatories such as corticosteroids and diuretics is often recommended (Blagburn 2003, Clay 2003, Dillon 2000, Lok 1997, Miller 2003).

Anticipated prognosis

Treated dogs and asymptomatic cats usually have a good prognosis. Symptomatic cats and severely infested dogs have a more guarded prognosis (Calvert 1994, Clay 2003, Dillon 2000).

Integrative veterinary therapies

Medical therapies for heartworm disease treatment and control are safe and effective. Therefore, integrative approaches take into consideration the immune system, secondary inflammation, and cellular protection of the involved organs, from not only the parasite but also from the required medications. Not all animals bitten by infested mosquitoes develop the disease; and therefore, there is an immune component that should be addressed on the prevention side of the equation. The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing,

and immune-enhancing effects should be used in conjunction with conventional prevention and treatment protocols

Nutrition

General considerations/rationale

The nutritional approach to heartworm disease adds nutrients, antioxidants, and gland support for the heart and organs of the immune system, and for the reduction of inflammation.

Appropriate nutrients

Nutritional/gland therapy: Glandular heart, lung, adrenal, thymus, and spleen supply intrinsic nutrients that improve organ function and reduce cellular inflammation. This helps to spare these organs from cascading inflammation and eventual degeneration (see Gland Therapy, Chapter 2, for a more detailed explanation).

Essential fatty acids: Fish and flaxseed oil have been shown to slow the progression of arteriosclerosis and improve disease symptoms in people with heart disease (Budwig 1992, Capron 1993, Leaf 1988, von Schacky 1999). In studies on animals, seabuckthorne oil has been shown to improve cardiac function and contractility and oxygen utilization (Wu 1994, 1997).

Coenzyme Q10 (CoQ10 or ubiquinone): Clinical research in people has shown that CoQ10 is beneficial in controlling cardiac disease. Results of clinical studies showed an improvement in the related symptoms of the heart diseases, such as a reduction in dyspnea and edema and well as improvements in blood pressure and helping to normalize heart rate (Gaby 1996, Giugliano 2000).

L-carnitine: L-carnitine has proven effective in improving the functioning of the heart. Heart muscle relies on fatty acids for energy, and L-carnitine is required for the transport of these fatty acids. Research has shown that when oxygen levels in the body are reduced, the cardiac reserves of carnitine are depleted. When L-carnitine is supplemented in the diet, it allows the heart muscle to use lower levels of oxygen more efficiently. Cherchi (1985) and Orlando (1986) showed a benefit to heart patients with L-carnitine supplementation. In studies in heart disease the addition of carnitine to the diet in these patients has been found to reduce heart damage in animals (Lopaschuk 2000).

Taurine: Low levels of taurine have been clinically proven to cause cardiomyopathy, and dietary supplementation with taurine led to clinical improvement (Ryan 1989, Simpson 1993, Pion 1992, Wysong 1989). Fox (1992) and Novotny (1994) found a direct link between low levels of taurine in the body and cardiac disease.

Potassium: Potassium plays an important role in the transmission of electrical impulses in the heart and the

regulation and the lowering of blood pressure in people (Whelton 1997). It is also important in maintaining a regular heart rhythm.

Magnesium: Magnesium has been extensively researched with regards to the pathogenesis and its beneficial effects in the treatment of cardiovascular disease in people (Altura 1985; Seelig 1980, 1989; Sjogren 1989). Because of its inverse relationship with calcium, magnesium can act as a calcium channel blocker and help in the reduction of blood pressure (Kawano 1998).

Chinese herbal medicine/acupuncture

General considerations/rationale

Both schools of medicine recognize parasites as the cause, and both recommend eradicating the parasites. It is also necessary to control the inflammatory reaction to the dying parasites.

Appropriate Chinese herbs

Areca seed (Bing lang): Has been used to eliminate hookworms, roundworms, and tapeworms (Jiang Su Zhong Yi Za Zhi 1960, Zhong Hua Yi Xue Za Zhi, 1957, Zhe Jiang Yi Ke Da Xue Xue Bao 1980). It may also be useful against other parasites.

Atractylodes root (Bai zhu): Can increase the phagocytic function of macrophages (Tang 1998). This may help the body eliminate dead worms.

Bupleurum (Chai hu): Has anti-inflammatory effects. It was shown to decrease dimethyl benzene-induced ear swelling in mice (Liu 1998), which may help control the inflammatory response to the dying worms.

Garlic (Da suan): Prevents the eggs of some parasites from hatching (Bastidas 1969). It is possible that it may have efficacy against parasites such as *Dirofilaria immitis*.

Slough of snake (She tui): Has an anti-inflammatory effect (Guo Wai Yi Xue Zhong Yao Fen Ce 1981), which may help prevent adverse reactions to the dead parasites.

Walnut (Hu tao ren): Has anti-inflammatory properties (Zhong Yao Tong Bao 1986).

Wormwood (Yin chen hao): Has anti-inflammatory effects. It inhibits carrageenin-induced foot swelling in rats (Wan 1987, Shan 1982).

Homotoxicology

General considerations/rationale

Heartworm disease is a Deposition Phase disorder. There are no published protocols for heartworm disease using homotoxicology formulas. Furthermore, bearing in mind the safe and efficacious nature of conventional heartworm control and treatment, one would be hard pressed to vary from established protocols. Antihomotoxic medications can be used in the handling of many of the complications

originating from heartworm infestation and treatment, however.

Appropriate homotoxicology formulas

A wide variety of situations may benefit from use of homotoxicology formulas in heartworm disease. The remedies below have particularly common applications:

Aesculus compositum: Used for circulatory disorders, post infarction.

Apis homaccord: Used to treat acute swelling and edema or hypersensitivity reactions, especially when combined with *Lymphomyosot*.

BHI-Circulation: Used for angina, arrhythmia, tachycardia (Heel 2002).

BHI-Recovery: Used for post-embolic events.

Carbo compositum: An antihomotoxic regulation following embolic crisis.

Cactus homaccord: Indicated for coronary circulatory disorders.

Berberis homaccord: Provides adrenal support and detoxification of the urinary tract and liver.

Cardiacumheel: Provides cardiac support.

China homaccord: Used for exhaustion and collapse.

Circulo-Injeel: Used for circulation disorders.

Cralonin: Provides support of heart function.

Cor compositum: Provides heart and circulatory support.

Galium-Heel: Used for allergies and glomerulonephritis. It is a cellular detoxification and drainage agent and a phase remedy for Deposition Phase diseases.

Hepar compositum: Provides detoxification and support of liver function, and repair after iatrogenic injury.

Lymphomyosot: Used to reduce swelling, and for lymph drainage, and for edema when combined with *Apis homaccord*.

Nux homaccord: Provides gastrointestinal and hepatic detoxification.

Placenta compositum: Used for vascular repair, particularly of peripheral circulation. It is a phase remedy for Deposition Phase diseases.

Solidago compositum: Provides drainage and support of urinary tissues, and treats glomerulonephritis (Heel 2003). It is a phase remedy for Deposition Phase diseases.

Traumeel S: Used for inflammation and modulation of inflammation. This is a natural nonsteroidal anti-inflammatory medication. To prevent clots and embolic issues, conventional agents such as aspirin may be superior, but *Traumeel* has the potential to stabilize a wide variety of conditions. Further research is indicated. It also may decrease pain and speed healing associated with the parasite and with deep intramuscular injection of heartworm adulticide.

Authors' suggested protocols

Nutrition

Heart and bronchus/lung support formulas: 1 tablet for every 25 pounds of body weight BID.

Immune support formula: One-half tablet for every 25 pounds of body weight BID.

Coenzyme Q 10: 25 mg for every 10 pounds of body weight daily.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Beyond essential fats: One-half teaspoon for every 35 pounds of body weight with food (maximum 100 pounds).

Additional vitamin E: 50 IU for every 25 pounds of body weight.

Chinese herbal medicine

Recommended formula: Garden Balsam seeds (Tou gu cao) 30%, atracylodes root (Bai zhu) 16%, scorpion (Quan xie) 5%, slough of snake (She tui) 16%, bupleurum (Chai hu) 30%, and centipede (Wu gong) 3%. For the average 60-pound dog, the dose is 2 g of 1:5 ratio of extracted powder daily (Yang 1996). The author recommends adding areca seed (Bing lang), areca husks (Da fu pi), garlic (Da suan), walnut (Hu tao ren), and wormwood (Yin chen hao) to increase efficacy and decrease the inflammatory reaction to the dying parasite.

Homotoxicology

(See Congestive Heart Disease, Arrhythmia, Hepatitis, Vomiting, etc.) Treat conventionally and handle conditions as they arise. For most cases consider:

Traumeel S: Give orally BID on the day of adulticide injection and for 3 days afterward.

Coenzyme compositum: Give daily.

Hepar compositum and Solidago compositum: 1 tablet every 3 days for detoxification and support for 30 days following treatment.

Galium-Heel: Give daily for 30 days after treatment, especially in patients that are more ill.

Cactus compositum, Cralonin, Aurumheel: Mix together and give orally BID to TID if symptoms of cardiac distress are present.

HYPERTENSION

Definition and cause

Hypertension is defined as continual elevation in arterial blood pressure. Often, hypertension is secondary to other diseases such as renal disease, hyperthyroidism, and hyperadrenocorticism (Cowgill 1983; Henik 1997; Hypertension Consensus Panel 2002; Snyder 1991, 2003).

Hypertension is an important diagnosis, and small-animal clinicians should regularly screen their geriatric population for this condition. Renal disease is the most commonly found condition associated with hypertension in animals, especially in cats, and any patient with renal disease should be carefully monitored for the appearance of hypertension (Littman 1994, Mishina 1998). Patients presenting for various other complaints such as hyperthyroidism, acute or chronic loss of vision, detached retina, retinal hemorrhage, cerebrovascular embolic or hemorrhagic disease, altered behavior, vocalization, diabetes

mellitus, hyperlipidemia, and obesity should also be screened (Acierno 2005, Kobayashi 1990, Littman 1994, Snyder 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The preferred drugs of choice are calcium channel blockers and/or ACE inhibitors. Dietary adjustments include feeding of low-sodium foods (Acierno 2005, Cowgill 1983, Snyder 2003).

Anticipated prognosis

The prognosis depends upon the underlying cause and is often controlled well with medication. Client compliance is essential (Acierno 2005, Snyder 2003).

Integrative veterinary therapies

Determining the underlying cause is important when selecting alternative therapies. Adequate water intake, proper diet (sodium restricted), and appropriately chosen pharmaceutical agents should be used to control blood pressure because this is a potentially life-threatening condition. The clinician should integrate nutritional, herbal, and biological therapy, and in some cases may find that less medication is needed to stabilize the blood pressure. In some cases the hypertensive condition will resolve, and can be maintained without pharmaceutical agents. Many patients require lifetime therapy and regular monitoring of their medical condition.

Nutrition

General considerations/rationale

After the causes of the hypertension are established and medical therapy started to control the condition, nutritional and metabolic support of the heart should be started.

Appropriate nutrients

Nutritional/gland therapy: Glandular heart, pituitary, and hypothalamus supply intrinsic nutrients that help to improve organ function and reduce cellular inflammation (see Gland Therapy, Chapter 2, for a more detailed explanation). Because hypertension may have multiple causes and contributing factors, a medical and physiological blood evaluation is recommended to assess glandular health. This helps clinicians to formulate therapeutic nutritional protocols that address the local lesions as well as underlying organ conditions that may be ultimately responsible for elevated blood pressure.

Coenzyme Q10: Supplementation with Coenzyme Q10 leads to a significant reduction in blood pressure in people

with hypertension (Folkers 1981, Langsjoen 1994, Digiesi 1994).

Essential fatty acids: Morris (1993) found that people who supplemented their diet with fish oil that is rich in the essential fatty acids EPA and DHA significantly lowered their blood pressure.

Arginine: Some amino acids have been shown to affect blood pressure. Abe (1987) demonstrated that animals supplemented with taurine had lower blood pressure. Kohashi (1983) showed similar results on blood pressure in people. Arginine is believed to have a dilating effect on blood vessels and a resultant decrease in blood pressure. In a controlled trial, Pezza (1998) showed that people who were not responding to medical therapies did respond positively with reduced blood pressure when arginine was added to the diet.

Vitamin E: A double-blind study showed that 200 IU of vitamin E per day was significantly more effective than a placebo in reducing both diastolic and systolic blood pressure (Boshtam 2002).

Note: Hypertension is often secondary to other organ conditions. It is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This will allow for a more specific gland and nutritional support protocol (see Chapter 2, Nutritional Blood Testing, for more information).

Chinese herbal medicine/acupuncture

General considerations/rationale

Hypertension may be due to stress, improper diet, lifestyle, Yang excess or Yin deficiency leading to Yin-Yang disharmony, fire rising up from the Liver, or Phlegm accumulation. The authors note that stress, improper diet, and lifestyle are discussed in Western medical journals as causes of hypertension. Yin-Yang disharmony is a relative excess of either Yin or Yang. As Yang is heat, motion, activity, energy when Yang is in excess, the Blood may move faster and pressure may be higher. The Liver is charged with maintaining a harmonious flow of Qi. When the Liver heat flares up, this smooth flow is disrupted. Just as a fire heats up air and causes rapid and irregular gusts of wind, Liver fire flaring up can cause rapid and reckless flow of Qi and Blood, or hypertension. Phlegm (cholesterol plaques) may accumulate in blood vessels, leading to strokes and heart attacks, although this is more common in humans and possibly birds than most animals. Treatment involves lowering blood pressure, treating both potential causes, and preventing sequellae of the disorder.

Appropriate Chinese herbs

Alisma (Ze xie): Has a mild antihypertensive effect (Zhong Yao Yao Li Yu Ying Yong 1983).

Angelica root (Dang gui): Causes vasodilation (You 1981), which helps decrease the blood pressure.

Chinese yam (Shan yao): Has been shown to lower the blood pressure in mice (Zhang 1997).

Cinnamon bark (Rou gui): Causes peripheral vasodilation and a reduction in blood pressure and heart rate (Zhong Yao Tong Bao 1981).

Cornus (Shan zhu yu): Has diuretic actions (Zhang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). Diuretics are commonly prescribed to lower blood pressure in Western medicine.

Eucommia bark (Du Zhong): Can lower blood pressure. In humans, the erythrocyte zinc:copper ratio of hypertensive patients is higher than that of healthy people. This herb decreases both the zinc:copper ratio and blood pressure (Wang 1997). It has also been shown to decrease the blood pressure of anesthetized dogs (Fan 1979).

Gentian root (Long dan cao): Has a diuretic effect (Zhong Yao Yao Li Yu Ying Yong 1983).

Licorice (Zhi gan cao): Decreases myocardial oxygen consumption and helps to prevent arrhythmias. It also helps protect blood vessels (Jiang Su Zhong Yi Za Zhi 1987, Xu 1997).

Rehmannia(cooked) (Shu di huang): Reduces blood pressure (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). It also lowers the concentration of serum T3 while simultaneously increasing serum T4 (Qu 1998, Zhang 1999, Hou 1992). Because T3 is about 4 times as active as T4, the overall effect is to counteract hyperthyroidism, which is a common cause of hypertension in animals.

Wolfberry (Gou qi zi): Lowers blood pressure (Zhong Yao Zhi 1984).

Acupuncture

Acupuncture has been used to treat hypertension (Dan 1998). It has been theorized that acupuncture works by regulating serum nitrogen monoxide (Cai 1998).

Homotoxicology

General considerations/rationale

Hypertension is considered to be an Impregnation or Degeneration phase disorder. High systolic blood pressure resulting from a functional thyroid tumor is an example of a Dedifferentiation Phase condition. When this is confusing, further examination of the patient and an inventory of other historical and diagnostic findings will lead the practitioner toward the correct therapy.

Appropriate homotoxicology formulas (Dose:
10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

Angio-Injeel: Alternated with *Circulo-Injeel* in some cases.

Berberis homaccord: Used for detoxification of the urinary system, in cases with pigmented axillary regions. The ingredient Berberis is contained in *Reneel* and *Solidago compositum* as well.

Circulo-Injeel: Alternated with *Angio-Injeel* in difficult cases.

Coenzyme compositum: Provides energy metabolism support.

Cralonin: Provides support of cardiac muscle.

Engystol N: Used for constitutional hypertension (not common in animals).

Galium-Heel: Provides cellular drainage and support, especially of kidney and renal tubular pathologies. Has been used in 2 cases of congenital polycystic kidney disease of Persian cats; improved and prolonged the quality of life (Palmquist 2006).

Glonoïn homaccord: Used for palpitations and in hyperthyroidism.

Hepar compositum: Provides liver drainage and support, and is part of the Deep Detoxification Formula.

Hepeel: Provides liver detoxification and repair. It can be altered with *Hepar compositum* or used singly. It is part of the Deep Detoxification Formula.

Melilotus: Used for congestive headache, which is better following nosebleed; consider in cases of retinal hemorrhage or detachment with hypertension.

Rauwolfia compositum: The primary agent in hypertension (*Rauwolfia serpentina*-Indian snakeroot), this rapidly lowers blood pressure when injected (use with caution by prescription only). Use caution in individuals sensitive to compounds that contain iodine (Reckeweg 2000).

Reneel: Provides kidney detoxification and support.

Solidago compositum: This is an important phase remedy in Deposition Phase cases and in the Deep Detoxification Formula. It detoxifies and assists in the repair of renal and other urogenital tissues.

Traumeel S: Used in constitutional hypertension (not common in animals).

Ubichion compositum: Used for mitochondrial energy production and autoimmune issues.

Authors' suggested protocols

Nutrition

Cardial (contains taurine and carnitine) and pituitary/hypothalamus/pineal support formulas: 1 tablet for every 25 pounds of body weight BID.

Coenzyme Q10: 15 mg for every 10 pounds of body weight daily.

Beyond essential fats: One-half teaspoon for every 35 pounds of body weight, with food.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Arginine: 50 mg per 10 pounds of body weight daily.

Additional taurine: 100 mg per 10 pounds of body weight daily.

Vitamin E: Additional vitamin E—50 IU for every 25 pounds of body weight.

Chinese herbal medicine

Severely elevated blood pressure should be managed with Western medications in addition to herbs. The patient may be weaned off Western medications once the blood pressure is out of critical ranges.

Acute and young patients can be treated with Long Dan Xie Gan Tang, which contains alisma (*Ze xie*), angelica root (*Dang gui*), bupleurum (*Chai hu*), gentian root (*Long dan cao*), licorice (*Gan cao*), and plantago seed (*Che qian zi*).

In chronic hypertension or in older patients, the patent formula You Gui Yin is appropriate. It contains aconite (*Fu zi*), Chinese yam (*Shan yao*), cinnamon bark (*Rou gui*), cornus (*Shan zhu yu*), eucommia bark (*Du Zhong*), licorice (*Zhi gan cao*), rehmannia (cooked) (*Shu di huang*), and wolfberry (*Gou qi zi*). The aconite helps prevent the side effect of hypotension.

These formulas are dosed as per the manufacturer's recommendations.

Acupuncture points that are recommended include GB20, LI11, ST36, LI3, PC6, GB34, SP6, and Baihui (Handbook of TCM Practitioner 1987).

Homotoxicology (Dose: 10 drops for 50-pound dog; 5 drops for small dog or cat)

Determine the cause of hypertension and address that primary condition. Use pharmaceutical agents as needed to safely decrease and control the hypertension.

Symptom remedy: *Rauwolfia compositum* by injection or tablet, given 1 to 3 times weekly. In acute cases, this may be given daily, but blood pressure and patient condition should be monitored to avoid rapid decline in blood pressure and weakness associated with too rapid a drop in systolic pressure. IV administration is associated with hypersensitivity reactions in rare patients and is not recommended routinely. Patients sensitive to iodine should receive this agent with caution.

Deep detoxification formula: *Galium-Heel*, *Lymphomyosot*, *Hepar compositum*, *Thyroidea compositum*, *Solidago compositum*, *Coenzyme compositum*, and *Ubichinon compositum* given every 2 to 3 days for 120 days or longer as indicated by case responses.

PERICARDIAL EFFUSION

Note: When secondary to neoplasia, see Section 5, Heart Base Tumor.

Definition and cause

Pericardial effusion is defined as excessive fluid in the pericardial sac and often cardiac tamponade. Common causes are idiopathic infections such as FIP or bacterial pericarditis, congestive heart failure, and neoplasia (Miller 1995, Smith 1999, Rush 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Pericardiocentesis and pericardectomy are often the recommended choice because of the serious nature of the tamponade. Medical management is generally recommended to help control the fluid build-up (Miller 1995, Smith 1999, Rush 2003).

Anticipated prognosis

The prognosis is fair to good with pericardiocentesis and pericardectomy. Neoplasia carries a more guarded prognosis. (Rush 2003).

Integrative veterinary therapies

An integrative approach to pericardial effusion is to use therapeutic nutrition and herbal and biological therapies in support of surgery and medical control of the condition. Once the effusion is controlled, integrative therapies can help maintain control and minimize the necessity for ongoing pericardiocentesis and the chronic use of medication.

Nutrition

General considerations/rationale

After the causes of the pericardial effusion are established and medical or surgical therapy has been selected to control the condition, nutritional support focuses on metabolic support of the heart. Support is also directed toward reducing associated inflammation, especially when the cause is unknown or is determined to be pericarditis.

Appropriate nutrients

Nutritional/gland therapy: Glandular heart and lung supply intrinsic nutrients that improve organ function and reduce cellular inflammation (see Gland Therapy, Chapter 2, for a more detailed explanation).

Coenzyme Q10 (CoQ10 or ubiquinone): Clinical research in people has shown that CoQ10 is beneficial in controlling cardiac disease. Results of clinical studies showed an improvement in the related symptoms of the heart diseases such as a reduction in dyspnea and edema and well as improvements in blood pressure and helping to normalize heart rate (Gaby 1996, Giugliano 2000).

Essential fatty acids: Fish and flaxseed oil have been shown to slow the progression of arteriosclerosis and improve disease symptoms in people with heart disease (Budwig 1992, Capron 1993). In studies on animals, seabuckthorne oil has been shown to improve cardiac function and contractility and oxygen utilization (Wu 1994, 1997).

Vitamin E: Besides its antioxidant functions, vitamin E is involved in the proper functioning of the heart muscle, particularly improving cardiac output and circulation and helping to reduce platelet aggregation (Traber 2001).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM theory, pericardial effusion is due to Qi and Yin deficiency with Phlegm and fluid accumulation in the upper burner. There may be internal Heat, Qi, and Blood stagnation and/or Toxin accumulation. In the author's interpretation, the upper burner contains the Heart, Pericardium, and Lungs. In this case the Fluid accumulates in the pericardial space. This fluid is termed Phlegm because the Qi deficiency makes the patient too weak to transform fluids. In addition, the Yin is deficient so the body fluids become thick, leading to Phlegm. Heat (inflammation) or Toxin accumulation (bacterial infection, for example) further dries fluids and may cause the patient to develop stagnation of Qi and Blood. Stagnation can lead to pain and/or an irregular heartbeat. The Qi deficiency can also cause weakness and exercise intolerance.

Appropriate Chinese herbs

For pericardial effusion:

Angelica root (Dang gui): Was 83% effective in a study of 100 patients in controlling cardiac arrhythmias (Zhong Yi Za Zhi 1981). It may help stabilize cardiac function in cases of pericardial effusion.

Astragalus (Huang qi): Can increase cardiac output and coronary blood flow (Xu 1999, Luo 1999). This may help preserve cardiac function.

Codonopsis (Dang shen): Increases cardiac output and blood perfusion (Zhong Yao Xue 1998).

Ophiopogon (Mai men dong): Can control drug-induced arrhythmias (Zhong Cao Yao 1982). It also has positive inotropic effects (Hua Xi Yao Xue Za Zhi 1991) and some antibacterial effects (Zhong Yao Xue 1998). This may help in the rare case of bacterial causes of pericardial effusion.

Platycodon root (Jie geng): Has anti-inflammatory effects. It increases the secretion of corticosterone in rats (Li 1984, Zhang 1984), which may be beneficial in cases of immune-mediated pericardial effusion.

Scutellaria (Huang qin): May be beneficial for several reasons. It contains baicalin and baicalein, which have been shown to be anti-inflammatory (Kubo 1984). This may help in inflammatory or immune-mediated pericardial effusion. Baicalein has also been shown to have the ability to inhibit cancer cells (Zi 2005). It may help with heart-based neoplasia. In addition, baicalin has antibiotic properties (Liu 2000). One interesting effect of Scutellaria is that it increases the ability of animals to withstand hypoxia (Liu Xiao Juan 1999). This is extremely useful because pericardial effusion decreases cardiac function and impairs blood flow.

Talc (Hua shi): Has antibacterial efficacy (Microorganism Group 1959). It may help in cases of bacterial infections.

Trichosanthes root (Tian hua feng): Has anti-neoplastic effects (Xu Zhen Wu 1997, Bi 1998) and may be useful in neoplastic etiologies. It has shown antiviral effects against the AIDS virus in humans (Modern TCM Pharmacology. 1997). It may be useful for pericardial effusions of viral etiology if it has efficacy against other viruses.

White peony (Bai shao): Contains paeoniflorin, which has anti-inflammatory actions (Zhong Yao Zhi 1993). It may help in inflammatory or immune-mediated pericardial effusion.

H60 Anticancer/generic:

Antler powder (Lu jiao shuang): May have some efficacy as an adjuvant cancer therapy (Du 1981).

Astragalus (Huang qi): Enhances the immunity of mice with solid tumors (Ying 1999). It also has direct anticancer effects on some tumors (Liu Hui 1999, Shi 1999).

Barbat skullcap (Ban zhi lian): May inhibit tumor growth (Ren Min Wei Sheng Chu Ban She 1988).

Centipede (Wu gong): Has demonstrated anticancer effects in vitro (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Coix (Yi yi ren): Can inhibit the growth of tumor cells and enhance natural killer cell function (Lu 1999).

Cornus (Shan zhu yu): Has positive inotropic effects (Hu 1988).

Ginseng (Ren shen): Has positive inotropic effects (CA 1992).

Honeysuckle (Jin yin hua): Has demonstrated anti-inflammatory effects (Shan Xi Yi Kan 1960). It may help decrease inflammation of the pericardium.

Hornet nest (Lu feng fang): Can inhibit tumor growth, possibly by enhancing macrophage activity (Li 1999).

Licorice (Gan cao): Can improve the heart function and decrease myocardial oxygen consumption (Xu Ling 1997). It prevented aconitine-induced arrhythmia (Hu 1996). It may also help with arrhythmias secondary to pericardial effusion.

Poria (Fu ling): Contains pachyman. This can be used to inhibit cancers (Chen 1986).

Reishi mushroom (Ling zhi): Seems to be effective for preventing and treating cancer. A polysaccharide extract called ganopoly has been shown to have anti-oxidant and radical scavenging effects. It also increases the function of T cells, macrophages, and natural killer cells. There is some evidence of direct cytotoxicity and it may induce apoptosis. It may also have anti-angiogenic capabilities (Gao 2004).

Salvia (Dan shen): Inhibits the growth of cancer cells (Li Xu Fen 1999).

Scorpion (Quan xie): Has been used to treat sarcoma in mice (Jiang Su Yi Yao 1990). It may have efficacy against other tumors.

Homotoxicology

General considerations/rationale

The pericardium originates from mesothelial elements that have development in common with the kidney, reproductive system, heart, and other serous membranes. Pericarditis represents an Inflammation Phase disorder. Pericardial fluid accumulations can also occur in Deposition, Impregnation, Degeneration, and Dedifferentiation phase homotoxicoses. The primary pathology directs the clinician in determining the correct phase for designing the most effective treatment plans. Medical and surgical methods can be used, depending upon the animal's diagnosis. Prognosis is guarded to grave. In many cases, it is appropriate to deliver emergency care and refer these patients to the proper internist and/or surgeon for support and therapy. Emergency treatment can include the proto-

col listed below in addition to proper conventional medical and surgical care.

Clinicians should be aware that several commonly used medications can be associated with hemothorax, pleural/pericardial effusion or thickening, ascites, and drug-induced lupus syndrome. The list of these medications is long and contains commonly used medications such as angiotensin converter enzyme inhibitors, beta-blockers, chlorpromazine, hydralazine, minocycline, procainamide, propranolol, sulfamides-sulfonamides, sulfasalazine, and tetracycline (Foucher, Camus 2006). Smallpox vaccination has been associated with pericarditis in humans; clinicians should be aware of the historical importance of prior vaccination in certain cases of pericarditis and pericardial effusion (CDC 2003).

Appropriate homotoxicology formulas (Dose: for 50-pound dog; 5 drops PO for small dog or cat)

See cardiac protocols.

Aesculus compositum: Provides vessel support. Acidum benzoicum is indicated in autoimmune disorders (Wemmer 1996).

Angio-Injeel: Contains Acidum formicicum, which is indicated in autoimmune vasculitis (Wemmer 1996).

Apis homaccord: Mobilizes fluid from body spaces, especially when combined with Lymphomyosot. Is used to treat pulmonary edema.

Arnica-Heel: Used for generalized or localized inflammatory reactions (Reckeweg 2000). Mercurialis perennis is indicated in endocarditis and pericarditis (Reckeweg 2002).

Aurumheel: Has anti-arrhythmic qualities.

Bryaconeel: Used in conditions involving serous membrane inflammation and coughs worsened by chill. Rheumatism is associated in many cases. Connections between polyarthritis and inflammation of serous membranes in pericarditis exist and have been known for more than 100 years (Mihoc 1986).

Cactus compositum: Treats coronary circulatory disorders.

Cardiacum-Heel: Supports cardiac functions.

Coenzyme compositum: Provides metabolism support of citric acid cycle cytosol components.

Cor compositum: Provides cardiac support. See *Spigelon* for details regarding *Spigelia anthelmia*. The component of *Cactus* benefits autoimmune cases (also present in *Cactus compositum*, *Cardiacum-Heel*, and *Strophanthus compositum*). (Wemmer 1996)

Cralonin: Cardiac support. See *Spigelon*, below, for details regarding *Spigelia anthelmia*.

Echinacea compositum: Used for bacteria endocarditis and infections or sepsis.

Engystol: Supportive in viral conditions.

Galium-Heel: Provides powerful immune support and cellular drainage formula.

Glyoxal compositum: Used for decoupling and enzyme activation.

Hepar compositum: Provides liver drainage and support.

Lymphomyosot: Provides lymph drainage and detoxification, and is used to mobilize edema when combined with *Apis compositum*.

Molybdan compositum: Provides trace mineral metabolism support and supplementation.

Mucosa compositum: Supports excretory mucosal surfaces. In Traditional Chinese Medicine, the Heart and Small Intestine are paired, and the Pericardium and Triple Heater are paired. Support of the energy metabolism and gastro-intestinal excretion pathways are advantageous.

Pectus-Heel: Contains *Spigelia anthelmia* (see *Spigelon*), *Arnica montana* (see *Anica-Heel*), and *Aconitum napellus* for stabbing pains, fever, and cardiac disorders. (Reckeweg 2000).

Placenta compositum: Provides support for vessels and activation of stem cell elements.

Psorinoheel: Used in Excretory and Impregnation phase disorders.

Ranunculus homaccord: A minor remedy for pericardial effusion that is more directed at pleuritis and pain associated with chest wall pathology through *Ranunculus bulbosus*. Also used if there is sciatica. Use with caution in combination with other remedies because *Ranunculus* is believed to antidote *Bryonia*, *Camphor*, and *Rhus* (Boericke 1927).

Solidago compositum: Provides urogenital support and detoxification. Contains Coxsackie virus B1-B5, which in human medicine is associated with myocarditis and infectious pericarditis. Because kidney tissue arises from mesothelial elements, support of renal tissue may prove to be helpful in such cases.

Spigelon: Contains *Spigelia anthelmia*, which is indicated in cases manifesting precordial pain, pericarditis (with sharp pains and dyspnea), sore left side, neuralgia, and a preference to lie on the left side (Boericke 1927). Functions by targeting tissues in the pericardium, endocardium, trigeminal nerve, and central nervous system (Hamalcik 1990). *Spigelia anthelmia* is also present in *Angio-Heel*, *Cactus compositum*, *Cardiacum-Heel*, *Cor compositum*, *Cralonin*, *Oculoheel*, *Pectus-Heel*, *Strophanthus compositum*, *BHI-Heart*, and *BHI-Neuralgia* (Reckeweg 2000).

Thyroidea compositum: Provides endocrine support and matrix drainage in precancerous cases. There is a possible connection to the Triple Heater Meridian in Traditional Chinese Medicine.

Tonsilla compositum: Used in deeply immunosuppressed individuals and to support the spleen, which in Traditional Chinese Medicine is thought to control the blood vessels and hold in fluids. Also used in Impregnation and Dedifferentiation phase disorders.

Traumeel S: Used in traumatic incidents as a nonsteroidal anti-inflammatory agent, in infections, and in chronic conditions to activate blocked enzymes (Mihoc 1986).

Ubichinon compositum: Provides mitochondrial support and conditioning.

Authors' suggested protocols

Nutrition

Heart and bronchus/lung support formulas: 1 tablet for every 25 pounds of body weight BID.

Coenzyme Q10: 15 mg for every 10 pounds of body weight daily.

Beyond essential fats: One-half teaspoon with food for every 35 pounds of body weight (maximum, 100 pounds).

Vitamin E: 50 IU for every 20 pounds of body weight SID.

Chinese herbal medicine/acupuncture

If the pericardial effusion is secondary to cardiac disease or pericarditis, the authors use H38 Pleural effusion/cardiac at a dose of 1 capsule for every 10 to 20 pounds twice daily.

H38 Pleural effusion/cardiac contains angelica root (Dang gui), astragalus (Huang qi), codonopsis (Dang shen), dianthus (Qu mai), fritillaria (Bei mu), lily bulb (Bai he), ophiopogon (Mai men dong), pharbitis (Qian niu zi), platycodon root (Jie geng), scutellaria (Huang qin), talc (Hua shi), trichosanthes root (Tian hua feng), and white peony (Bai shao).

If the effusion is secondary to a heart-based tumor or is idiopathic, the authors use a combination of the H38 Pleural effusion/cardiac and H60 Anticancer at a dose of 1 capsule of each formula per 10 to 20 pounds twice daily.

H60 Anticancer contains antler powder (Lu jiao shuang), arisaema (Dan nan xing), astragalus (Huang qi), barbat skullcap (Ban zhi lian), centipede (Wu gong), coix (Yi yi ren), cornus (Shan zhu yu), dandelion (Pu gong ying), dioscoria (Shan yao), ginseng (Ren shen), honeysuckle (Jin yin hua), hornet nest (Lu feng fang), licorice (Gan cao), mugwort (Liu ji nu), poria (Fu ling), rehmannia (Shu di huang), reishi mushroom (Ling zhi), salvia (Dan shen), scorpion (Quan xie), and tortoise shell (Bie jia).

The herbs not discussed above are added to the respective formulas to increase efficacy.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat dose)

Emergency treatment including drainage and other drugs should be instituted while fluid analysis, cytology, culture, and other imaging is in progress. Autosanguis may prove helpful in advanced cases.

Symptom remedy (all cases): Apis homaccord, Lymphomyosot, Cactus compositum, Cralonin give every 15 to 30 minutes until response is noted, and then 2 to 6 times daily.

Symptom remedy (additional in infectious cases): Consider Engystol N (viral or allergic) BID, Echinacea compositum or Tonsilla compositum (bacterial) once daily by injection or PO BID by tablet.

Symptom remedy (traumatic cases): Traumeel S IV, IM, SQ, or PO.

Symptom remedy (hemorrhagic cases): Cinnamomum compositum plus Traumeel S by injection.

Symptom remedy (neoplasia cases): Tonsilla compositum and Viscum compositum by injection (plus above symptom remedies as indicated) (See Cancer, Section 5).

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Thyroidea compositum, Solidago compositum, Coenzyme compositum, and Ubichinon compositum given every 2 to 3 days for 120 days or longer as indicated by case responses.

Chapter Ten

Diseases of the Dermatological System

ALLERGIC DERMATITIS, ATOPY, AND FLEA BITE DERMATITIS

Definition and cause

The basic underlying cause for allergic dermatitis in dogs and cats is an exaggerated immune response to allergens such as pollen, dander, molds, dust mites and other environmental allergens and chemicals. The basic exaggerated immune response is believed to involve T- and B-lymphocytes, the production of IgE, and the stimulation of mast cells and eosinophils, causing the local, cutaneous reaction (Hnilica 1997, 1998; Ihrke 1995; Plant 2003; Reedy 1997; Scott 1995).

The result is that sensitized animals react in receptor sites in the skin, leading to pruritus and secondary issues. There is also an inherited component; many popular breeds such as Golden Retrievers, Irish Setters, and Old English Sheepdogs are more prone to the condition (Reedy 1997, Scott 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The central focus of standard therapy is to identify and eliminate the causative agent in combination with antihistamines and oral and topical immune-suppressing drugs such as corticosteroids and cyclosporine. In addition, allergen desensitizing (immunotherapy) injections are favored by some dermatologists. Dietary recommendations include hypoallergenic diets in combination with omega-3-rich sources of fatty acids (Ihrke 1995, Paterson 1995, Plant 2003, Reedy 1997, Saevik 2004, Scott 1995).

Anticipated prognosis

Most animals with allergic dermatitis respond well to topical and oral therapy in combination with avoidance of exposure to allergens. Allergic dermatitis is a progressive condition and most often requires ongoing medical therapy to control the allergic response (Reedy 1997).

Integrative veterinary therapies

Pollutants, preservatives, food additives, and a host of compounds can lead to tissue injury and activate the immune response. The mucosa is the primary barrier and location of many immune elements, and anything that injures the mucosal integrity can lead to immune dysfunction.

Once allergens gain access to these tissues, they can be removed and processed by macrophages in a wide variety of locations (especially the gut, liver, spleen, and lung). In cases in which the damage is rapidly repaired, there is a reduced likelihood of chronic allergies developing, but if a chronic defect in mucosal integrity occurs, then allergies can develop more easily. Genetic predisposition is a factor in this situation.

The liver is responsible for processing much of the material that originates from mucosal borders. The hepatic macrophage system of Kupfer cells is very efficient in removing and processing antigens. The liver can metabolize, conjugate, and excrete many homotoxins, and support of liver function and excretion is a critical portion of any allergic therapy.

Macrophages present the antigen components to lymphocytes and these dictate the development of immune response through the action of T-lymphocytes (TH-0, TH-1, and TH-2 cells). Alteration of the T-helper cell can determine the type of immune response by the organism. Homotoxins that are not removed by first passage through the liver can also be excreted by the kidney, skin, and lung. Homotoxins that have been eliminated by the liver but reabsorbed through the enterohepatic circulation also enter the system at this level.

Support of mucosal tissues is critical, and therefore one of the first areas requiring attention in allergic patients is the intestinal tract. The patient should be fed an easily digested ration which ideally lacks excessive amounts of allergens. This allows for improved intestinal function and reduces homotoxins presented to the liver. It also allows for improved mucosal integrity. In managing airborne allergens, it is advisable to reduce the level of

homotoxins such as pollens, scented products and incenses, and toxic agents such as ozone and pollutants, which might damage mucosal integrity.

Adequate water consumption is also important in maintaining proper immune function and repairing damaged tissue. Probiotics may greatly assist in protecting the mucosal border and local immune system and are useful in most immune imbalance cases. Antioxidant agents such as vitamins and minerals, as well as other nutraceuticals, herbals, and whole foods, provide needed protection from oxidative damage and assist in repairing tissues.

Support of liver function assists greatly in handling allergic cases and in many clinical situations support of the enterohepatic system is the first action in preparing a case.

Providing attention to the renal system further assists detoxification, and is especially necessary in cases that are undergoing regressive vicariation from the Impregnation Phase to the Deposition and Inflammation phases. Providing adequate levels of fatty acids, especially omega-3 fatty acids, assists in repairing cell membranes and in decreasing levels of tissue inflammation.

Unnecessary or redundant vaccinations should be avoided in all patients, but this is particularly true in allergic pets. Risk for vaccination reaction is higher in atopic pets. In 1983, a study showed that allergies (such as atopic dermatitis) develop in dogs when vaccinated for distemper, hepatitis, and leptospirosis just prior to, but not after, exposure to pollen extracts. Dogs predisposed to atopy produce excess amounts of IgE antibodies in response to antigens, resulting in chronically irritating skin inflammations. Other organs may exhibit signs of hypersensitivity causing, for example, conjunctivitis or rhinitis, as exhibited in further studies by this group (Frick 1983). A recent study demonstrated no increase in the rate of atopy in children receiving vaccinations (Adler 2005). Good medical practice dictates caution in the use of any agent in patients that are known to be prone to allergic reactions (see Vaccinations, Chapter 35).

Note: See Homotoxicology for the “4 Rs” approach to an allergic patient.

Nutrition

General considerations/rationale

While the target tissue is often the skin or intestinal tract, allergies are metabolically a systemic disease. They often involve multiple organs, particularly the liver, which shares the same detoxification enzyme systems (Ahmad 2004). In addition, the elimination of toxins, allergens, and metabolic wastes often burdens the organs of detoxification, namely the bowel, kidney, lung, and skin. The use of immune-suppressing drugs such as cortisone, while often necessary because of self-trauma, actually exacer-

bate the condition by slowing elimination and covering up the inflammation. Because allergies are metabolically a multi-organ disease, a physiological evaluation of the blood is recommended to more closely address nutritional deficiencies and required gland support (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular intestines, kidney, adrenal, thymus, liver, and pituitary supply intrinsic nutrients that improve organ function, reduce cellular inflammation, and promote and enhance detoxification (see Gland Therapy, Chapter 2, for a more detailed explanation).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon (1987). Probiotics have been shown to improve and enhance the digestive process by secreting their own source of enzymes (McDonough 1987).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties, which appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune-suppressing effects is beneficial in all allergic reactions. Bouic (1996) reports on the immune-enhancing and balancing effect of plant sterols, which are also beneficial to animals with allergic reactions or responses.

Evening primrose oil (EPO): Evening primrose oil has been proven to have both anti-inflammatory and anti-pruritic effects. As part of a balanced nutritional program, EPO can exert a positive effect on animals with skin disease. Studies suggest that EPO is beneficial in people with atopic dermatitis and eczema (Hederos 1996, Humphreys 1994, Morse 1989).

Quercetin: Quercetin is a flavonoid and has potent antioxidant properties (see Chapter 2, Phytonutrients). Quercetin also functions similar to an antihistamine in that it can inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). This antihistamine attribute helps treat allergic conditions such as asthma, dermatitis, and eczema.

Chinese herbal medicine

General considerations/rationale

Practitioners of Traditional Chinese Medicine consider allergic dermatitis to be a combination of Wind, Heat, and Damp. Allergy generally is considered to be an immune disorder. Heat refers to the inflammation, which tends to be red and may be warm to the touch. Dampness describes the greasy nature of some allergic dermatitis patients. It can also apply to skin with serous discharge, i.e., “weepy” sores or purulent debris in pustules. Wind translates into itching, in modern terms.

Appropriate Chinese herbs and acupuncture

Angelica (Bai zhi): Has been shown to have anti-inflammatory and antipruritic effects in mice. (Zhong Guo Zhong Yao Za Zhi 1991).

Atractylodes (Cang zhu): Has activity against *Staphylococcus aureus* and dermatophytes (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Decreases the effect of histamine release (Zhong Yao Yao Li Yu Ying Yong 1983) and has antibiotic effects against streptococci (Zhong Yao Xue 1998).

Cicada slough (Chan tui): Has been used successfully in humans to treat chronic urticaria (Pi fu Bing Fang Zhi Yan Jiu Tong Xun 1972).

Licorice (Gan cao): Inhibits the growth of *Staphylococcus aureus* (Zhong Yao Zhi, 1993). It contains glycyrrhizine and glycyrrhentic acid, which have corticosteroid activity (Zhong Cao Yao 1991).

Lonicera flower (Jin yin hua): Has antibiotic effects against *Staphylococcus aureus*, *E. coli*, and *Pseudomonas aeruginosa* (Xin Yi Xue 1975) and is anti-inflammatory (Shan Xi Yi Kan 1960).

Mint (Bo he): Relieves itching (Zhong Cao Yao Xue 1980) and has anti-inflammatory effects (Zhong Yao Xue 1998).

Moutan (Mu dan pi): Demonstrates anti-inflammatory actions via inhibition of prostaglandin synthesis and decreases vascular permeability (Sheng Yao Xue Za Zhi 1979, Zhong Guo Yao Ke Da Xue Xue Bao 1990). It inhibits the growth of *Staphylococcus aureus*, streptococci, and dermatophytes (Zhong Yao Cai 1991).

Platycodon (Jie geng): Decreases allergic reactions (Zhong Yao Yao Li Yu Ying Yong 1983).

Poria (Fu ling): Has inhibitory effects on *Staphylococcus aureus* (Zhong Yao Cai, 1985).

Rehmannia (Sheng di huang): Has shown anti-inflammatory activity in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

Siegesbeckia (Xi xian cao): Inhibits the growth of *Staphylococcus aureus* (Phytochemistry, 1979).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It also has antibiotic effects against *Staphylococcus aureus*, some streptococci, *E. coli*, *Pseudomonas aeruginosa* and some dermatophytes. (Xin Zhong Yi 1989).

Acupuncture has been used to treat skin allergies (Lundesberg 1988). By stimulating specific acupuncture points, it is possible to stimulate the pet's immune system and reduce the itching and inflammation associated with allergic dermatitis.

The authors have used GV14, SP9, and SP10 to control inflammation (Clear Heat in TCM terms). LI11 can be used to stop itching and HT7 can be used to calm the

animal so it does not lick or scratch and irritate the skin further.

Local points can be used. These include LI4 for the front legs, GB34 for the back legs, and GB20 for the neck (Schoen 1994).

Homotoxicology

General considerations/rationale

The basic biophysiology of allergies is well described. Allergic reactions represent Impregnation Phase homotoxicoses as IgE binds to mast cells and alters the response of the connective tissue to allergens. Numerous homotoxins are released as part of the allergic response; histamine is a major homotoxin that requires detoxification and elimination. Excessive amounts of histamine lead to tissue injury and progressive vicariation.

Understanding the elimination pathways for homotoxins is critical to properly handling allergic cases. Biological therapy for allergies involves decreasing the levels of homotoxins, improving detoxification pathways, increasing elimination of homotoxins, and supporting repair of injured tissues and organs.

4 Rs: This system for approaching allergic cases consists of:

Remove: Remove toxic materials, antigenic substances, pathogens, disease-causing stressors, and other factors that favor pathology. This allows for a cessation or reduction in tissue injury, and calming of the overtaxed immune response. Healing occurs best in a safe environment at a microscopic and macroscopic level. Avoidance of unnecessary vaccinations and unnecessary symptom-suppressive medicants, and use of limited-antigen and more natural diets, air filters, hygiene, endoparasite control, ectoparasite control, as well as an altered environment, are all examples of this step. In some cases, all that is needed for recovery is removal of the antigenic stimulation (flea allergy, mild pollen or food allergy). This is an important first step in handling all allergy patients. Detoxification therapy is useful in this step and it has been frequently observed that allergic pets do better clinically if they are given routine detoxification therapy at regular intervals (at least twice yearly). In mild cases, the easiest form of detoxification is the Detox Kit. In deeper homotoxicoses, the deep detoxification formula is recommended (see below).

Repopulate/Revive: Provide adequate probiotic bacteria to repopulate a proper intestinal and mucosal flora, and revive function of chief excretory organs such as the liver and intestine. Probiotic bacteria also provide a means of reactivating damaged enzyme systems from earlier disease elements such as bacterial or fungal toxins and pharmaceutical agents such as cortisone, NSAIDs, and antibiotics.

Rebalance/Repair: Assist the natural bio-oscillation of inflammation and pH fluctuations, eliminate diseased

tissue elements, clear the matrix of debris, promote collagen repair and replacement and provide improved circulation of hemic-lymphatic components, and provide adequate raw materials for enzyme production and tissue repair.

Reorganize: Cycles of repair continually improve the status of the diseased tissue and its relationship to the body as a whole. Hering's Law of Cure manifests at this level as we see the body repair from inside to outside, from most important organ to least important organ, from the head down and in reverse order of present pathologic history. This is a useful tool for the clinician in determining whether a patient is undergoing regressive vicariation (in which case the clinician would simply continue therapy), or undergoing less desirable progressive vicariation (in which case the clinician would need to intervene and address the patient's worsening condition).

In patients that are already on symptom-suppressing drugs such as corticosteroids, antihistamines, antibiotics, or cyclosporin, it is advisable to begin therapy gently and not to stop these medications initially. After the system has been sufficiently strengthened, the dosages can be gradually reduced until many patients no longer require as much medication to manage their cases. In some instances they may no longer need symptom-suppressing medications to maintain a healthy lifestyle. Not all allergic patients can be cured, but it is a worthwhile goal to simply improve their quality of life and when possible reduce their dependency on pharmaceutical agents.

Allergic patients can be greatly assisted by proper use of biological therapies and many make surprising recoveries if they are allowed to go through regressive vicariation and are not subjected to further suppression of their body's natural healing responses. Homeopathy has been used for many years to treat allergies in human and veterinary patients (Witt 2005). Clinicians should advise clients that this process might take from 1 to 3 years, and ascertain if the clients are dedicated to the process before embarking on such a program. It may be more expedient for some clients to simply suppress symptoms, but for those who desire maximizing the health of their pet, it is very rewarding and challenging work. Biological therapy options should be discussed with clients as part of the informed consent procedure as an option to administering potentially damaging pharmaceutical agents.

Appropriate homotoxicology formulas

A large number of antihomotoxic formulas may be needed to manage a case of allergic skin disease. Autosanguis therapy can be particularly useful. (Also see sections on Otitis externa and Otitis media, Chapter 12; vomiting and diarrhea, Chapter 11; coughing, Chapter 14; and seborrhea, throughout this chapter). Careful attention to phase and phase shifting is needed to guide remedy selection. A list of commonly used agents follows:

Aesculus homaccord: Promotes improved circulation and lymph drainage.

Apis homaccord: Used for urticarial reactions (especially when combined with *Lymphomyosot*) (Broadfoot 2005). Also used for pruritic dermatitis, pustular dermatitis, and bullous eczema (Reckeweg 2000).

Belladonna homaccord: Treats intensely red lesions, furunculosis, boils; the skin is dry, red, and hot; patients resent being touched. The ears may itch intensely, to the point that the pet drills things into the ears or rubs excessively. There is excessive head shaking.

Berberis homaccord: Part of Heel's *Detox Kit* used for adrenal support and detoxification of the renal system and liver, in cases with pigmentation of the axillary area.

BHI-Allergy: Used for skin rashes and hives, and respiratory and ocular allergy symptoms (Heel 2002). In the authors' experience, this remedy is usually not sufficient to use as a single agent, except in mild, acute cases, and works best when combined with other remedies in management of allergy symptoms. Contains Sulphur 12X, which is useful in a wide variety of skin conditions and chronic illnesses.

BHI-Inflammation: Used for pyoderma, itching, inflammation, and atopy (especially when there is a tendency toward pyoderma with multiple small lesions). Can be used like an antihistamine in these cases, before other drugs are tried. Response can be seen within 1 week. Provides long-term control of itching in some patients as a simple nontoxic strategy (Palmquist 2003).

BHI-Skin: Used for "eczema, blisters and cold sores, rashes and hives" (Heel 2002).

Coenzyme compositum: Provides metabolic support (Reinhart 2005).

Cutis compositum: A wide-reaching formula that stimulates nonspecific defenses in a variety of cutaneous conditions. Can be used in any phase homotoxicosis; opens skin to drainage and repair. Supports regeneration and repair of organs involved in skin health. Contains *Cutis suis*, *Hepar suis*, *Splen suis*, *Placenta suis*, *Glandula suprarenalis suis*, and *Funiculus ubilicalis suis*. Also contains Sulfur to repair blocked enzyme systems and Cortisonum aceticum to repair damage from prior corticosteroid exposure. The ingredient *Aesculus hippocastanum* supports circulation and drainage (Reckeweg 2000).

Detox Kit: A combination of *Lymphomyosot* for lymph drainage, *Nux vomica homaccord* to support the gastro-hepatic system, and *Berberis homaccord* for adrenal, renal, and hepatic support that is used as a method of general detoxification.

Echinacea compositum: Used to control bacteria infections and for immune normalization.

Engystol N: Supports immunity. Through Sulphur, acts as a catalyst in chronic diseases (Reinhart 2005). Useful in viral infections and allergic disorders.

Galium-Heel: This remedy is indicated in most allergic cases. It is a phase remedy for Deposition to Dedifferentiation phases. It has diuretic effects due to Galium aparine, Sempervivum tectorum, Ononis spinosa, Juniperus communis, Betula alba, Saponaria officinali, and Acidum nitricum, and detoxifying effects due to Galium mullugo. It supports parenchyma (lung, liver, kidney, and heart) through Phosphorus. *Galium-Heel* is used for edema and to create drainage through connective tissue. It also is used for itching (Apis mellifica), infectious Inflammatory phases (Pyrogenium-Nosode), and eczema and dermatosis (Urtica urens) (Reckeweg 2000). Finally, it is also a cellular drainage and repair agent.

Graphites homaccord: Used in obese patients with alopecia, oozing purple-colored lesions, and erosions that develop into suppurative sores (Macloed 1983).

Hepar compositum: Provides drainage and repair of the liver, support of metabolism, and reversal of prior corticosteroid therapeutic damage. It is critical as a first line of defense in skin repair, because it bears the brunt of detoxification.

Hepeel: Provides liver detoxification.

Histamin-Injeel: A homeopathically prepared histamine that assists in reversal of damages from histamine excess in allergic patients. When combined with *BHI-Allergy* vials it may produce a more potent Histaminum homaccord.

Lymphomyosot: Provides lymph drainage and support, as well as support of the thyroid function.

Mucosa compositum: Supports mucous membranes throughout the body. Used intermittently during repair stages.

Nux vomica homaccord: Provides detoxification of the liver and gastrointestinal tract; is part of the Detox Kit.

Psorinoheel: An exudation and cellular phase remedy that is used for itching, precancerous conditions, chronic skin conditions, acne, seborrhea, eczema, and pruritus.

Pusatilla compositum: Reverses the effects of prior cortisone therapy and regulates rigidity cases to move them toward inflammation and regressive vicariation.

Reneel: Provides kidney and urinary tract detoxification.

Schwef-Heel: Contains a homaccord of Sulphur, which is widely used in homeopathic practice (Becker-Witt 2004). It is used for dermatosis with eczema, pyoderma, and red skin (Reckeweg 2000). It has great affinity for skin and adnexal tissues, and is known for working from the inside out on dirty and filthy animals prone to skin infections (Boericke 1927). Helps with redness and itching made worse by heat and red body orifices, and often is useful in concomitant use with other remedies in opening cases (Macloed 1983).

Solidago compositum: Provides renal support and is a phase remedy for Deposition Phase disorders.

Sulfur Heel: Used for eczema, pruritus, neuralgia with sensitivity to cold air (Daphne mezereum), urticaria with burning and itching skin (Arsenicum album), and irritating eczema (wood tar). It is also useful in scabies dermatitis (Reckeweg 2000).

Thyroidea compositum: Provides endocrine support and deep matrix cleansing. It is a phase remedy in Impregnation Phase disorders.

Traumeel S: Provides nonsteroidal anti-inflammatory action, activates and regulates normal inflammatory responses, and unblocks enzyme systems.

Ubichinon compositum: Provides metabolic support.

Authors' suggested protocols

Nutrition

Skin and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Intestinal and/or liver support formulas: One-half tablet for every 25 pounds of body weight BID. When required, kidney and pituitary support can be added.

Probiotic MPF: One-half capsule for every 25 pounds of body weight with food.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Betathyme: 1 capsule for every 35 pounds of body weight BID. (maximum 2 capsules BID)

Quercetin: 50 mg for every 10 pounds of body weight daily.

Chinese herbal medicine/acupuncture

The authors advise a combination of two herbal preparations: ImmunoDerm and Dermguard. In addition to the herbs discussed above, these preparations contains scutellaria (Huang Qin), fleece flower root (He shou wu), siler (Fang feng), tokoro (Bi xie), schizonepeta (Jing jie), dandelion (Pu gong ying), oldenlandia (Bai hua she cao), kochia (Di fu zi), xanthium fruit (Cang Er zi), bitter orange (Zhi ke), angelica radix (Dang gui), buffalo horn shavings (Sui Niu jiao), earthworm (Di long), silkworm (Jiang can), and cnidium (Chuan xiong). The combination of these 2 formulas has anti-inflammatory, antipruritic, and antibacterial effects.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

An autosanguis with Traumeel S, Engystol N, Hepar compositum, and Cutis compositum is quite useful in many allergy cases. Open the case as follows for 3–6 months, and use other antihomotoxic medications as listed above depending upon the patient's specific symptom picture:

Traumeel S: Give orally once on Monday and Thursday.

Engystol N: Give orally once on Monday and Thursday.

Hepeel and Coenzyme compositum or BHI-Enzyme: Give each evening for 30 days.

Detox Kit (Lymphomysot, Nuv vomica homaccord, Berberis homaccord): Give orally twice daily.

Galium-Heel: Give orally twice daily.

In the case of chronic or deep homotoxicoses, use:

Deep detoxification formula: Galium-Heel, Lymphomysot, Hepar compositum, Thyroidea compositum, Solidago compositum, Coenzyme compositum, Ubichinon compositum, given orally twice weekly for 60 to 120 days and then alternated with Detox Kit above.

In the event of severe pruritus, give:

BHI-Allergy plus Histamin-Injeel, Cutis compositum, and Psorinoheel: Give as an injection; often gives sufficient relief so that biological therapy can continue. This can be repeated twice weekly as needed.

ALOPECIA

Definition and cause

Alopecia is one of the most common conditions seen by veterinarians. It is often a result of multiple underlying causes with the secondary ramification of loss of hair. The broad categories of alopecia are (1) genetic predisposition, and (2) acquired, such as inflammatory, infectious (bacterial, fungal), immune-mediated, hormonal imbalances, parasitic, and secondary to other diseases such as hypothyroidism, Cushing's, etc. (Griffin 1993, Helton-Rhodes 1990, McKeever 1998, Paterson 2000, Schmeitzel 1994, Scott 1995, Tilley 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy for alopecia relies upon the proper and accurate diagnosis, because the underlying cause dictates the course of therapy. Please refer to other sections in this book for underlying causes and their appropriate therapies.

Anticipated prognosis

Because alopecia is most often secondary to multiple underlying causes, the prognosis varies with the primary cause.

Integrative veterinary therapies

An integrative approach to alopecia starts with a determination of the underlying cause. If the cause can be identified and addressed, the alopecia usually resolves.

The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that help balance gland function, reduce inflammation, and prevent cellular degeneration should be part of the therapeutic approach to alopecia.

Nutrition

General considerations/rationale

When searching for the underlying cause and proper diagnosis, a medical and physiological blood evaluation should be included as part of the clinician's diagnostic protocol. This nutrition-based information gives clinicians the ability to formulate therapeutic nutritional protocols that address the local lesions as well as underlying organ conditions that may be ultimately responsible for the surface condition. For example, identifying early thyroid and pituitary weakness and supporting their function with appropriate nutrients, antioxidants, and gland support can help re-establish a normal coat. (See chapter 2, Nutritional Blood Testing for more information.)

Appropriate nutrients

Nutritional/gland therapy: Glandular hypothalamus, pituitary, and lymph provide intrinsic nutrients that nourish and help neutralize cellular immune inflammation and help improve organ function (see Gland Therapy, Chapter 2, for a more detailed explanation).

Zinc: Zinc is a mineral that particularly benefits metabolism and skin health. Zinc-responsive dermatosis is a common deficiency disease in animals; it is found often in huskies, malamutes, and large-breed puppies (Griffin 1993, Werner 2003).

Essential fatty acids: Research has been conducted on the importance of essential fatty acids in the daily diet, and on the clinical management of various degenerative diseases (Reinhart 1996, Holub 1995, Herman 1998). The importance of the ratio between omega-6 and omega-3 fatty acids has been substantiated. Research on polyunsaturated fatty acids has shown their beneficial and anti-pruritic affects on skin (Reinhart 1996, Schick 1996).

Chinese herbal medicine

General considerations/rationale

According to TCM theory, alopecia is a result of Yin and Blood deficiency in the Liver and Kidney, accompanied by blockage of the meridians. The Liver and Kidney control the Blood. The fur is the end of the Blood, according to TCM. Without Blood and fluids (Yin), there is no fluid to nourish the skin. Similarly, if the meridians are blocked, nourishment cannot get to the skin to allow the fur to grow. Without nourishment, the follicles become inactive.

The etiology of the Yin and Blood deficiency must be corrected to heal the patient. In Western practice this

means that not only is the hair loss treated, but the cause of the alopecia must also be addressed. To modern practitioners, this means any immune dysfunction, pathogen infection, or hormonal imbalance must be corrected.

Appropriate Chinese herbs

Actractylodes (Cang zhu): Has anti-inflammatory effects. Experimentally, it has been shown to ameliorate swelling caused by treatment with xylene, carrageenin, and acetic acid (Zhang 1998). It also inhibits *Staphylococcus aureus* and some dermatophytes (Zhong Yao Xue 1998).

Angelica (Bai zhi): Has demonstrated anti-inflammatory properties in mice (Zhong Guo Zhong Yao Za Zhi 1991), which suggests efficacy in any inflammatory type of alopecia.

Angelica root (Dang gui): Was used in 40 patients with alopecia areata, an immune-mediated skin disease in which the follicles are attacked, leading to baldness or hair loss on the entire body. In this trial, all 40 patients had improvement in their symptoms (Shan Xi Zhong Yi 1987).

Buffalo horn shavings (Shui niu jiao): Has anti-inflammatory effects. It has been shown to decrease experimentally induced edema in the ears and feet of mice (Mao 1997). It may help promote cellular immunity. It increases the leukocyte count (Wu 1985), which may help in cases of infectious alopecia.

Bupleurum (Chai hu): Stimulates both humoral and cellular immunity in mice (Shang Hai Yi Ke Da Xue Xue Bao 1986), which may help in cases of alopecia of infectious etiology. In addition it has been shown to inhibit various bacteria (Zhong Yao Xue 1988). Bupleurum has anti-inflammatory effects, as was demonstrated in a mouse model using dimethyl-benzene-induced ear swelling (Liu 1998).

Cnidium (Chuan xiong): Stimulates the cellular immunity. It increases phagocytic function of macrophages (Lang 1991, Zhao 1993, Cheng 1993). It also stimulates the humoral immune system. It can also promote the formation of sheep red blood cells (SRBC) antibody in mice (Lang 1991).

Dandelion (Pu gong ying): Has demonstrated antibacterial efficacy against many bacteria, including *Staph aureus* and beta-hemolytic streptococci (Zhong Yi Yao Xue Bao 1991).

Earthworm (Di long): Has immunostimulant properties. It improves macrophage function (Zhang Feng Chun 1998). It also promotes wound healing. Earthworm was shown to enhance the production of fibroblasts and capillaries in experimentally induced wounds in rabbits. It also increased the healing rate of the skin (Zhang 1999).

Fleece flower root (He shou wu): Increases thyroid hormone secretion (Zhong Yao Yao Li Yu Lin Chuang 1989). This may be beneficial in cases of hypothyroid-

induced alopecia. Furthermore, it has been shown to inhibit a variety of bacteria including *Staphylococcus aureus* (Zhen 1986). It may prove efficacious in cases of bacterial pyoderma.

Honeysuckle (Jin yin hua): Has demonstrated antibacterial properties. This is due in large part to the action of chlorogenic acid and isochlorogenic acid. Among the bacteria these compounds inhibit are *Staphylococcus aureus*, beta-hemolytic streptococci, and *E coli* (Xin Yi Xue 1975, Jiang 1960).

Kochia (Di fu pi): Has been shown to inhibit some dermatophytes (Yun Nan Zhong Yao Zhi 1990).

Licorice (Gan cao): Has demonstrated a complex effect on the immune system. It has shown the ability to both stimulate and inhibit the phagocytic activity of macrophages (Zhong Yao Xue 1998). It also contains glycyrrhizin and glycyrrhetic acid, which have approximately 10% of the corticosteroid activity of cortisone and decrease the permeability of blood vessels and interfere with histamine action (Zhong Cao Yao 1991). These actions suggest that licorice may be useful in allergic, immune-mediated, and infectious alopecia. In addition it has antibiotic effects on different bacteria including *Staphylococcus aureus* (Zhong Yao Zhi 1993).

Mint (Bo he): Has demonstrated anti-inflammatory properties (Zhong Yao Xue 19981). This may make it useful in inflammation-mediated alopecic condition.

Mouton (Mu dan pi): Reduces inflammation. In mice it was shown to decrease dimethylbenzene-induced inflammation in the ear (Wu 1990). It also may treat bacterial dermatitis. It has a direct inhibitory effect on multiple strains of bacteria including *Staphylococcus aureus* and beta-hemolytic streptococci (Zhong Yao Cai 1991). It has been shown to enhance phagocytosis of peripheral neutrophils on *Staphylococcus aureus* (Li 1994).

Platycodon (Jie geng): Prevents allergic reactions and decreases capillary permeability (Zhong Yao Yao Li Yu Ying Yong 1983). It has been shown to promote the secretion of corticosterone in rats (Li 1984, Zhang 1984, Zhou 1979), which suggests that it is indicated in cases of allergic pyoderma.

Poria (Fu ling): Inhibits *Staphylococcus aureus*, among other bacteria (Nanjing College of Pharmacy 1976).

Rehmannia (Sheng di huang): Increases the level of estradiol in females and testosterone in male rats (Chen 1993). This may be applicable in cases of hormone-responsive alopecia. It also has anti-inflammatory properties. It reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Schizonepeta (Jing jie): Decreases the signs in cases of pruritic rashes and itching (Zhong Yi Za Zhi 12:18).

Scutellaria (Huang qin): Contains biacalin, which has antibiotic activity against *Staphylococcus aureus*, b-hemo-

lytic streptococcus, as well as other bacteria and some dermatophytes. Biacilin can have synergistic effects with ampicillin, amoxicillin, methacillin, and cefotaxime. It can help overcome B lactam resistance (Zhong Yao Xue 1988, Liu 2000). Biacalein has an added benefit of suppressing inflammation (Kubo 1984). It has been shown experimentally to decrease swelling induced by dimethylbenzene and formaldehyde (Cao 1999). While decreasing inflammation, it also enhances cellular immunity. It enhances production of IL2, which stimulates the cellular immune system (Pan Ju Fen 1991).

Siegesbeckia (Xi xian cao): Possesses anti-inflammatory properties. It has been shown to decrease swelling in rats. (Zhong Yao Yao Li Yu Ying Yong 1983). It decreases both humoral and cellular immunity in mice (Zhong Guo Zhong Yao Za Zhi 1989), which suggests that it may be of use in immune-mediated cases of alopecia. Furthermore, it has antibiotic actions and may be of benefit in bacterial etiologies (Kim 1979).

Siler (Fang feng): Has been shown to inhibit various bacteria, including *Staphylococcus aureus* (Zhong Yao Tong Bao 1988).

Silkworm (Jiang can): Has antibiotic effects. It has been shown to affect *Staphylococcus aureus* and other bacteria (Zhong Yao Xue 1998).

White peony (Bai shao): Has antibiotic properties against a variety of bacteria including both *Staphylococcus aureus* and beta-hemolytic streptococci. It also inhibits some dermatophytes (Xin Zhong Yi 1989). It contains Paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). These capabilities may make it useful for bacterial, fungal, allergic, and immune-mediated alopecia.

Xanthium (Cang er zi): Decreases histamine-mediated increases in capillary permeability (Huang 1996). This indicates that it may be of use in allergy-mediated alopecic conditions.

Homotoxicology

General considerations/rationale

Alopecia can occur as a consequence of Inflammation, Deposition, Impregnation, Degeneration, or Dedifferentiation phase disorders. Proper diagnosis is needed to select therapy. In Inflammation Phase disorders, simply treating the primary cause usually results in regrowth of hair. In deeper homotoxicoses, hair growth may be delayed or may not occur.

Appropriate homotoxicology formulas

(Also see other protocols such as Cushing's, hypothyroidism, pancreatic insufficiency, etc).

Cutis compositum: Stimulates healing and detoxification of the skin.

Aesculus homaccord: Supports vascular repair.

BHI-Hair and -Skin: Used for alopecia, dandruff, acne, poor toenails, dry hair coat, postvaccinal hair loss, and hair loss after severely debilitating disease (Heel 2002).

BHI-Skin: Treats eczema, rashes and redness, blisters, and cold sores.

Cerebrum compositum: Supports cerebral tissues.

Coenzyme compositum: Provides metabolic support.

Galium-Heel: Used for cellular and matrix drainage and detoxification, and after vaccination reactions.

Hepar compositum: Supports hepatic tissue.

Lymphomyosot: Provides lymph drainage and support.

Ovarium compositum: Treats endocrine alopecia in females.

Placenta compositum: Used to improve vascularization of extremities.

Psorinoheel: Phase remedy in Excretion and Impregnation phase disorders, intense pruritus of elbows and legs, warts, and excretion of malodorous material.

Pulsatilla compositum: Used for type two regulation rigidity.

Selenium homaccord: Used in conjunction with *Psorinoheel*.

Solidago compositum: Provides support of renal tissues.

Sulfur Heel: Provides general support of mesenchymal structures.

Testis compositum: Supports endocrine alopecias in males.

Thuja homaccord: Used in post vaccinal alopecia.

Thyroidea compositum: Provides endocrine support and deep detoxification and matrix drainage.

Tonsilla compositum: Supports endocrine and central controls.

Traumeel S: Used for type one regulation rigidity and after inflammatory skin issues such as allergies or vaccination reactions.

Ubichinon compositum: Provides metabolic support.

Ypsiloheel: Used for central regulation.

Authors' suggested protocols

Nutrition

Pituitary/hypothalamus/pineal and skin support formula: 1 tablet for every 25 pounds of body weight BID. When indicated, lymph and thyroid support formulas may be added.

Zinc: 15 mg for every 25 pounds of body weight SID.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight for dogs.

Omega-3,-6,-9: 1 capsule for every 25 pounds of body weight with food.

Chinese herbal medicine

The authors recommend a full diagnostic work-up to determine the cause of alopecia because it is a symptom, not a diagnosis. For most causes of alopecia the authors recommend a combination of DermGuard and ImmunoDerm at a dose of 1 capsule of each herbal supplement per 10 to 20 pounds twice daily.

DermGuard contains angelica (Bai zhi), angelica root (Dang gui), aurantium fruit (Zhi qiao), bupleurum (Chai hu), cicada (Chan tui), cnidium (Chuan xiong), honey-suckle (Jin yin hua), licorice (Gan cao), mint (Bo he), moutan (Mu dan pi), platycodon (Jie geng), poria (Fu ling), schizonepeta (Jing jie), scutellaria (Huang qin), siegesbeckia (Xi xian cao), siler (Fang feng), silkworm (Jiang can), and xanthium fruit (Cang er zi).

ImmunoDerm contains atracylodes (Cang zhu), angelica root (Dang gui), buffalo horn shavings (Shui niu jiao), bupleurum (Chai hu), dandelion (Pu gong ying), earthworm (Di long), fleece flower root (He shou wu), honey-suckle (Jin yin hua), kochia (Di fu zi), licorice (Gan cao), moutan (Mu dan pi), oldenlandia (Bai hua she cao), poria (Fu ling), rehmannia—raw (Sheng di huang), scutellaria (Huang qin), siegesbeckia (Xi xian cao), tokoro (Bi xie), white peony (Bai shao), and xanthium fruit (Cang er zi).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

Symptom formula: *Psorinoheel*, *Selenium homaccord*, *Galium-Heel*, *BHI-Hair and Skin*, and *Sulfur-Heel* mixed together and given BID PO. In acute cases, *Traumeel* or *BHI-Hair and Skin* as single agents may suffice.

Deep detoxification formula: *Thyroidea compositum*, *Solidago compositum*, and *Hepar compositum* given every three days. *Cutis compositum* given every seven days.

CHRONIC PYODERMA

Definition and cause

Broadly defined as a secondary bacterial infection of the skin, pyoderma is one of the most common diseases seen in dogs. It is less common in cats. In most instances the surface of the skin has been compromised and bacteria infections are initiated. Pyodermas are classified as superficial and deep, and arise secondary to allergies and/or in combination with compromised immune function. The most common canine bacterial skin infection is caused by staphylococci. Some pyodermas can be secondary to other diseases such as hypothyroidism and Cushing's disease. (Carlotti 1996; Codner 2003; Day 1994; Ihrke 1978, 1987, 1996; Kwochka 1993; Miller 1991; Muller 1989).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The approach to pyodermas is often topical, local, and systemic. The treatment of choice is the use of medicated shampoos and lotions such as chlorhexidine or benzoyl peroxide in combination with systemic antibiotics. Corticosteroids are not recommended due to the potential exacerbation of the infection. The dietary recommendation is a high-quality, hypoallergenic type of diet. Immunotherapy with bacterins such as Staph Lysate has proven to be successful in superficial pyodermas (Staph-

age Lysate©) (Day 1994; Krishnan 1994; Lloyd 1992; Mason 1989, 1990; Morales 1994; Nesbitt 1983; Van Kampen 1997).

Anticipated prognosis

Pyodermas, especially the superficial types, are quite responsive to therapy. However, both superficial and deep pyodermas tend to recur, become chronic, and are often less responsive to medical therapy. This may be due to compromised local and immune system function.

Integrative veterinary therapies

In Western medical terms, the bacterial growth on the skin is the focus of therapy. In IVM therapies, the bacteria is viewed as secondary to the skin's detoxification process. Bacteria are attracted and replicate in areas that favor their growth. Patients that exude material onto their skin in an attempt to detoxify themselves, with faulty digestion, with defective cutaneous function, or that suffer from altered immunity from a wide variety of causes, are all prone to pyoderma. Parasites, food sensitivities, allergies, endocrinopathies, and a host of other causes such as adverse reactions to drugs, vaccinations, herbs, and some supplements may be involved in chronic recurring pyoderma.

Careful historical and physical evaluation is indicated in all cases, and skin scraping is recommended. In more advanced cases, full laboratory evaluation including CBC, serum chemistries, and thyroid testing are always indicated. Other tests such as further endocrine evaluation, urinalysis, culture and sensitivity, and skin biopsy may be needed. Insufficient treatment duration or client noncompliance is also a common reason for recurrent infections of the skin.

Topical therapy is an important part of any treatment plan. Gentle products that remove exudates are desirable. In more serious cases products that flush the pores and remove debris such as benzoyl peroxide are useful. Antibiotic, antifungal, and antibacterial shampoos should be reserved for cases that do not respond to biological therapy to avoid further intoxication of the cutaneous tissues. In cases requiring systemic antibiotics, it is necessary to treat for at least 3 weeks to get full resolution. Probiotics are recommended in cases undergoing antibiotic therapy because antibiotics can damage the intestinal mucosa and lead to alterations in digestive and immune system function.

Nutrition

General considerations/rationale

While medical therapy is focused externally, therapeutic nutrition adds nutrients, antioxidants, and organ support to help reduce inflammation and enhance detoxification and elimination. In addition, the skin, which is the largest

and most visible organ, is often a barometer of internal imbalances, inflammation, and disorders. Therefore, it is especially important in chronic recurrent pyoderma to look past the skin and assess all internal organs for early or overt inflammation or disease. It is therefore recommended that clinicians evaluate the blood both medically and physiologically as a method of assessing glandular health. This information gives clinicians the ability to formulate therapeutic nutritional protocols that address the local lesions as well as underlying organ conditions that may be ultimately responsible for the surface condition (see Chapter 2, Nutritional Blood Testing).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, and lymph provide intrinsic nutrients that nourish and help neutralize cellular immune inflammation and degeneration (see Gland Therapy, Chapter 2, for a more detailed explanation).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes, particularly those of nerve and brain cells. It helps to move fats into the cells, and it is involved in neurotransmission and acetylcholine, and particularly with cellular integrity. Lecithin, which is part of the cell membranes, is an essential nutrient required by the skin and all of the cells of the body for general health and wellness (Hanin 1987).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties which appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune-suppressing effects is beneficial in immune-mediated conditions. Bouic (1996) reports on the immune-enhancing and balancing effect of plant sterols, which are also beneficial to animals with immune-mediated disease.

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes, which is beneficial for immune-compromised animals (McDonough 1987).

Evening primrose oil (EPO): In diseases of the skin, evening primrose oil has been proven to have both anti-inflammatory and anti-pruritic effects, and is part of a balanced nutritional program that can exert a positive effect on animals with skin disease. Studies suggest that EPO is beneficial in people with atopic dermatitis and eczema (Hederos 1996, Humphreys 1994, Morse 1989).

Chinese herbal medicine/acupuncture

General considerations/rationale

Practitioners of TCM consider pyoderma to be caused by Heat and Toxins in the Lung. In general, skin infections

are related to either immune deficiency or immune disorders with secondary bacterial infection. There is also often an allergic factor. The Lung controls the Skin, so Heat in the Lung translates to inflammation on the Skin. Toxins refer to the inflammatory mediators seen in dermatitis.

Appropriate Chinese herbs

Angelica (Bai zhi): Inhibits multiple strains of bacteria (Zhong Yao Yao Li Yu Ying Yong 1983) and is anti-inflammatory (Zhong Guo Zhong Yao Za Zhi 1991).

Angelica root (Dang gui): Stimulates the immune system by increasing the phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978). It also inhibits many types of bacteria (Hou 1981).

Atractylodes (Cang zhu): Has activity against *Staphylococcus aureus* and dermatophytes (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Has antibiotic effects against streptococci (Zhong Yao Xue 1998).

Cnidium (Chuan xiong): Enhances the immune system. It increases the phagocytic ability of macrophages and increases antibody formation (Lang 1991, Zhao 1993, Cheng 1993, Lang 1991).

Dandelion (Pu gong ying): Has antibiotic activity against a variety of bacteria including *Staphylococcus aureus*, *b-hemolytic streptococci*, and *Pseudomonas aeruginosa* (Zhong Yi Yao Xue Bao 1991). In addition, it may possess anti-inflammatory actions (Mascolo 1987).

Earthworm (Di long): Stimulates the immune system. It has been shown to increase the phagocytic activity of macrophages in mice. It may also shorten the inflammation period, promote fibroblast activity, and enhance the healing rate of the epidermis, thereby promoting the resolution of dermatological lesions (Zhang 1998).

Honeysuckle (Jin yin hua): Has antibiotic effects against *Staphylococcus aureus*, *E. coli*, and *Pseudomonas aeruginosa* (Xin Yi Xue 1975), and is anti-inflammatory (Shan Xi Yi Kan 1960).

Kochia (Di fu zi): Inhibits some dermatophytes and fungi (Yun Nan Zhong Yao Zhi 1990).

Licorice (Gan cao): Inhibits the growth of *Staphylococcus aureus* (Zhong Yao Zhi 1993).

Mint (Bo he): Has anti-inflammatory effects (Zhong Yao Xue 1998).

Moutan (Mu dan pi): Inhibits the growth of *Staphylococcus aureus*, streptococci, and dermatophytes (Zhong Yao Cai 1991).

Platycodon (Jie geng): Decreases inflammation by increasing the secretion of corticosterone (Li 1984, Zhang 1984, Zhou 1979).

Polygonum (He shou wu): Increases hormonal secretion by the thyroid gland (Zhong Yao Yao Li Yu Lin Chuang 1989). Many animals are hypothyroid and it is necessary to address this imbalance to gain control over the disease process. This herb also enhances immunity. It

increases the total white cell count, especially the T-cells. It also increases the phagocytic activity of macrophages (Zhong Yao Yao Li Yu Lin Chuang 1989) and it stimulates the activity of B cells (Zhou 1989).

Poria (Fu ling): Has inhibitory effects on *Staphylococcus aureus* (Zhong Yao Cai 1985).

Rehmannia (Sheng di huang): Has shown anti-inflammatory activity in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

Schizonepeta (Jing jie): Has been shown to have efficacy against pruritic dermatological conditions (Zhong Yi Za Zhi).

Scutellaria (Huang qin): Contains biacalin, which has antibiotic activity against many bacteria including *Staphylococcus aureus* and some dermatophytes. This compound not only acts on its own, but also is synergistic with some penicillins and can help overcome β lactam resistance (Zhong Yao Xue 1988, Liu 2000). Biacalin, along with another component of *Scutellaria*, biacalein, have anti-inflammatory effects (Kubo 1984). Patients with chronic pyoderma may benefit from stimulation of the immune system to help the body fight the pathogens. *Scutellaria* enhances the cellular immunity and increases production of IL2 (Pan 1991).

Siegesbeckia (Xi xian cao): Inhibits the growth of *Staphylococcus aureus* (Kim 1979).

Siler (Fang feng): Inhibits bacteria, including *Staphylococcus aureus* (Zhong Yao Tong Bao 1988).

Silkworm larva (Jiang can): Inhibits bacteria, including *Staphylococcus aureus*, *E. coli*, and *Pseudomonas aeruginosa* (Zhong Yao Xue 1998).

Water buffalo horn (Shui niu jiao): Enhances immunity. It increases the total white blood cell count (Mao 1997). A second experiment by Wu Xiao Yi showed that this increase in white blood cell count was accompanied by an increase in antibody production (Wu 1985).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993:183). It also has antibiotic effects against *Staphylococcus aureus*, some streptococci, *E. coli*, *Pseudomonas aeruginosa*, and some dermatophytes (Xin Zhong Yi 1989).

Homotoxicology

General considerations/rationale

Simple pyoderma is an Inflammation Phase disorder. Aggravations caused by homeopathic substances can result in pyoderma. The appearance of pustular lesions may represent phase shift toward Inflammation Phase, which is a desirable step toward healing. The clinician must evaluate other signs to determine the most appropriate action in these regressive vicariation cases.

Chronic cases represent Impregnation or Degeneration phase homotoxicoses. So-called Alternative Phase disorders occur when deep, unseen homotoxicoses (neoplasia

or precancerous conditions) shift their attempt to excrete toxic materials to the outside. Inhibiting Alternative Phase conditions can suppress needed excretory actions, internalize homotoxins, and lead to rapid progressive vicariation. Caution should be exercised when confronted with elderly pets presenting with recurring, focal, moist, eczema-type lesions. A careful search for other pathological conditions is advised in all such cases.

Appropriate homotoxicology formulas

Belladonna homaccord: Used for focal carbuncles and boils, and larger and more intensely red lesions.

BHI-Infection: Is similar to *Echinacea compositum*.

BHI-Inflammation: Small pustules, itchy skin, and possible lameness are signs to consider for this remedy. An older formulation contained Staph and Strep nosodes, but the new formulation no longer contains these ingredients, a change that has a negative impact on this product's efficacy in pyoderma cases. The authors hope that eventually the company will restore the original formula.

BHI-Skin: Used for skin infections, redness, eczema, and blisters.

Cutis compositum: Contains Hepar sulph and Histaminum, both of which indicated in pyodermas (Reckeweg 2002).

Echinacea compositum: Used for bacterial infections as a substitute for antibiotics.

Psorinoheel: an excretion Phase and Impregnation Phase remedy that is useful in a wide number of skin issues.

Schweel-Heel: Contains Sulphur, which is useful for minor pustular lesions, dry skin with red color, and malodorous pets.

Tonsilla compositum: Contains *Baryta carbonica*, *Funiculus umbilicalis suis*, *Geranium*, *Hepar suis*, *Mercurius solubilis*, and *Psorinum nosode*, all of which have very strong indications for pustular skin diseases (Reckeweg 2002). This is often used as an initial autosanguis, or blood therapy.

Traumeel S: All pustular inflammations benefit from *Traumeel* due to its anti-inflammatory characteristics.

Authors' suggested protocols

Nutrition

Immune and skin support formulas: 1 tablet for every 25 pounds of body weight BID.

Lymph support formula: One-half tablet for every 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID. (maximum 2 capsules BID)

Probiotic MPF: One-half capsule for every 25 pounds of body weight with food.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Chinese herbal medicine/acupuncture

The authors use a combination of ImmunoDerm and DermGuard, which stimulates and modulates the immune system and has anti-inflammatory effects and antibacterial function. It helps to control itch. The combination is administered at a dose of 1 capsule of each for every 10 to 20 pounds twice a day.

In addition to the herbs discussed above, these preparations contains bitter orange (Zhi ke), cicada slough (Chan tui), oldenlandia (Bai hua she cao), tokoro (Bi xie), and xanthium fruit (Cang er zi).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

Therapy depends upon the primary causation. (See also allergy, atopy, food allergy, hypothyroidism, Cushing's Disease, etc.). In recurring cases autotransfusion therapy is worthy of consideration. It is particularly useful to start with Tonsilla compositum and the catalysts Coenzyme compositum and/or Ubichinon compositum. Consider the following in combination with appropriate topical therapy:

Acute pyoderma: Psorinoheel plus Schwef-Heel plus Traumeel S BID PO. Cutis compositum once weekly. Also use Detox Kit BID PO.

Recurrent pyoderma: Psorinoheel plus Schwef-Heel plus BHI-Inflammation or Echinacea compositum plus Traumeel S BID PO. Cutis compositum every two weeks. Also use Deep Detox Formula (below).

Deep detoxification formula: Galium-Heel plus Lymphomyosot plus Thyroidea compositum plus Hepar compositum plus Solidago compositum plus Coenzyme compositum mixed together and taken orally twice weekly for 60 to 120 days.

EOSINOPHILIC GRANULOMA

Definition and cause

Feline eosinophilic granuloma is an inflammatory disease that most commonly occurs in cats but can occur in dogs and other species. While the proven cause is not known, it is believed that the underlying cause is related to an allergic reaction (food, insect, environmental) (MacEwen 1987, Song 1994, Werner 2003). Other suspected causes include genetic predisposition, infection, or an autoimmune response. The body's inflammatory response involves infiltration by eosinophils (Gelberg 1985, Scott 2001, Song 1994).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment is usually with systemic, interlesional, and/or topical corticosteroids. More resistant or deeper lesions often require immunosuppressant medication such as Cyclophosphamide or immunomodulating therapy such as Levamisole (Scott 2001, Song 1994). Omega-3 and -6 fatty acids have been shown to improve the condition and reduce the reliance on corticosteroids (Scott 2001).

Anticipated prognosis

The prognosis depends upon determining the underlying cause. Allergically incited lesions often respond well so long as the underlying cause of the allergy is controlled. Often, however, control is achieved with ongoing medication, and recurrences are common (Scott 2001, Werner 2003).

Integrative veterinary therapies

Eosinophilic granuloma is chronic inflammation secondary to antigens, which may gain access to the body through a wide variety of portals. Direct injury as in insect bite hypersensitivity is a classical example. As a flea feeds on the host, it releases anticoagulants and other proteins, which are detected by the immune system as it performs its police function at the injury site. In its attempt to prevent further injury, the immune system codes for antibody against these foreign proteins. Immunoglobulins are produced and IgE binds to mast cells in the skin, creating a future hypersensitivity reaction. Chemotactic factors lead to the infiltration of the tissue by eosinophils and the appearance of a lesion. Further contact with the offending antigen can trigger the disease state. (For additional information on the immune system's production of auto-antibodies and cellular immune processes inciting disease, see Chapter 2 for Gland Therapy and Free Radicals.)

Antigen can be presented by other methods as well. Direct contact, inhalation, and ingestion are all possible genesis points for the condition. The gastrointestinal (GI) and integumentary systems are intricately involved with the basic homeostasis of the organism. Lymphocytes and macrophages are active in both the skin and intestinal tract. Dendritic cells in the intestine communicate with lymphocytes and often encode a "tolerance" response on the part of the organism to antigens, which enter through the digestive system. If this system is imbalanced, then hyperactivity and proinflammatory reactions may occur.

Food allergy, adverse reactions to food, injury to the normal functions of digestion and absorption, and bacterial overgrowth, along with ingestion of toxic substances such as food additives, aflatoxins, and preservatives can all permit the presentation of antigen to the immune system, which can result in inflammatory reactions in several areas of the body. Holistic doctors have long recognized the connection of the intestinal system and allergic symptomology, and successful handling of many patients commonly involves honoring this relationship by beginning therapy with attention to bowel health and diet. This syndrome of pathology resulting from altered permeability and digestion is often described as "leaky gut." Conventional medicine also recognizes the importance of food trials, and is beginning to appreciate the relationship of intestinal injury from other factors such as adverse reactions caused by drugs (i.e., corticosteroids and NSAIDs).

Psychoneuroendocrine and immune factors also affect the skin. Stress can cause increased intestinal permeability and a corresponding onset of inflammatory pathologies.

Phylogenetically, there is an association with the excretory system, and in Traditional Chinese Medicine the Skin is governed by functions of the Kidney Zang Fu organ. When confronting eosinophilic granuloma complex issues, the clinician must recall all these factors in the maintenance of homeostasis. As the body attempts to handle homotoxins, it is common to see involvement of skin as both a barrier and an excretory organ. Furthermore, inflammation frequently can be observed in the integument. Eosinophils are frequently involved in cats. (See Homotoxicology, below, in this section.)

The clinical approach to such lesions involves looking for obvious agents such as fleas, gnats, and mosquitoes. Simple steps should be taken to remove them from the patient and time should be provided to see if recovery occurs. Use of proper insecticide can be the difference between a need for large amounts of immunosuppressive drugs and no medication whatsoever. Many patients begin to improve within 2 weeks after application of an effective spot treatment insecticide. Gentle, natural methods of parasite control (borax powder, diatomaceous earth, etc.) can be used and may be helpful, but care

should be used with essential oils because these can be very toxic to some individuals, and in particular feline patients. Some pets are chemically sensitive and can be made ill by insecticides. Some of these individuals may genetically lack appropriate detoxification systems.

Elimination diets—limited antigen or hydrolyzed diets—are useful in cases of food allergy or adverse reactions to food or food additives. Success is gained with both approaches and no single diet assures positive results, so several trials are indicated. Home-prepared diets can be used (Strombeck 1999). Some animals worsen when placed on the correct diet as they undergo regressive vicariation to the Excretion Phase, so the development of diarrhea does not necessarily mean that the diet should be changed (See Homotoxicology in this section).

Other conditions such as pancreatitis can result as the body flushes homotoxins from the system. Blood testing for food allergy is notoriously inaccurate and should not be taken too seriously. Such tests may guide the clinician, but often lead to confusion on the part of the client and other doctors. The client should be informed before blood testing is done.

Searching out other toxins in the environment is frequently beyond the ability of a busy clinician, but many antigens and haptens may be involved. Perfumes, tobacco smoke, cleaners (particularly heavily scented products and those that contain pine oil), perfumed laundry detergent, perfumed fabric rinses, dryer clothing treatments, carpet deodorizers, disinfectants, cosmetics, hair sprays, incense, and aroma therapy units may be key causative agents. Chronic exposure to certain environmental toxins (petroleum distillates or tar) should be evaluated in difficult cases. Advise clients to remove all such items.

Contact antigens and inhaled antigens should be considered. Wool in carpets, clothes, or bedding should be removed. Pet beds that contain cedar chips have been associated in the author's practice, as well. Tree saps and contact with outdoor plants may also aggravate these cases.

Reactions to prescription drugs, vaccinations, nutritional supplements, herbal products, or other medicants should be considered. In some cases, there is a suspicion that injury resulting from such agents can sensitize the patient so that eosinophilic disease manifests at a later date. This relationship is hard to demonstrate but has some support in cases where application of homeopathic dilutions of therapeutic agents lead to rapid recovery.

Nutrition

General considerations/rationale

While medical therapy is focused locally upon the external lesion, the nutritional approach adds nutrients, antioxidants, and gland support for the organs of the immune

system and to help control inflammation. Because eosinophilic granuloma can have multiple causes as well as an exaggerated immune response from multiple imbalanced organs, a medical and physiologically blood evaluation is recommended to assess glandular health. This information gives clinicians the ability to formulate therapeutic nutritional protocols that address the local lesions as well as underlying organ conditions that may be ultimately responsible for the surface condition (see Chapter 2, nutritional blood testing, for more detailed information).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, spleen, and lymph provide intrinsic nutrients that nourish and help balance the immune response, neutralize cellular inflammation, and prevent degeneration (see Gland Therapy, Chapter 2, for a more detailed explanation).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties which appear to be similar to corticosteroids (Bouic 1996, Gupta 1980). A cortisone-like effect without the associated immune-suppressing effects is beneficial in immune-mediated conditions.

Quercetin: Quercetin is a flavonoid that has antioxidant properties. It also functions like an antihistamine, and has been shown to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985). Therefore, it is beneficial in the treatment of allergic skin conditions.

Essential fatty acids: Much research has been conducted on the importance of essential fatty acids in the daily diet, and on the clinical management of various degenerative diseases (Reinhart 1996, Holub 1995, Herman 1998). Seabuckthorne oil can be used to treat burns and skin irritations (Wu Fuheng 1991). It is a clinically approved in Russia for use in reducing inflammation and protecting against radiation damage (Yance 2005).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM theory, eosinophilic granulomas are due to Wind, Heat, and Toxin invading the body. Lesions come and go and they spread. The term Wind is used to describe this behavior because wind has the properties of waning and gusting—coming and going. Additionally, Wind can blow the lesions from place to place, much as the wind blows leaves over the yard. Heat refers to the inflammation. Toxins are the inflammatory mediators and any secondary bacterial invaders that may contaminate the lesions secondary to the self-trauma from pruritis. An herbal supplement designed for eosinophilic granulomas must stop the pruritis, decrease the inflammation, and address any secondary infections.

In Traditional Chinese Medicine, the Skin and Mouth are under the control of separate organ systems. Therefore, lesions in the Mouth are treated differently than those on the Skin, necessitating different formulas. To the authors' knowledge, no Western studies have been performed to investigate this belief so there is no discussion of this in the section on appropriate herbs.

Appropriate chinese herbs

Angelica (Bai zhi): Has anti-inflammatory properties (Zhong Guo Zhong Yao Za Zhi 1991).

Atractylodes (Cang zhu): Has demonstrated anti-inflammatory effects in the laboratory. It was shown to prevent xylene-induced auricular swelling, carrageenin-induced foot swelling, and acetic-acid-induced increase in abdominal capillary permeability in 1 trial (Zhang 1998).

Bupleurum (Chai hu): Has anti-inflammatory effects (Liu 1998). In addition, it has demonstrated antibiotic activity against several bacteria including B-hemolytic streptococci (Zhong Yao Xue 1988).

Cicada slough (Chan tui): Was used in a trial of 30 human patients with chronic urticaria. In this investigation 23% of the patients had significant improvement while another 50% had moderate improvement (Pi fu Bing Fang Zhi Yan Jiu Tong Xun 1972).

Dandelion (Pu gong ying): Has shown evidence of anti-inflammatory actions (Mascolo 1987).

Earthworm (Di long): Has been shown to increase the rate of wound healing. In rabbits with experimentally induced skin wounds it promoted the growth of fibroblasts, capillaries, and collagen fibers (Zhang 1999).

Forsythia (Lian cao): Has anti-inflammatory and analgesic effects. It can decrease inflammatory exudate and edema (Ma 1982, Rui 1999). In addition, it has demonstrated antibiotic effects against common skin bacteria such as Staphylococcus aureus and hemolytic streptococcus in vitro (Ma 1982).

Honeysuckle (Jin yin hua): Has been shown experimentally to have anti-inflammatory effects in rabbits and mice (Shan Xi Yi Kan 1960).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have anti-inflammatory effects. They prolong the effect of cortisone in the body either by decreasing its metabolism in the liver or by increasing the plasma concentration by decreasing protein binding (Zhong Yao Zhi 1993). They have approximately 10% of the corticosteroid activity of cortisone. They decrease edema by decreasing the permeability of blood vessels and interfering with histamine action (Zhong Cao Yao 1991).

Mouton (Mu dan pi): Has demonstrated anti-inflammatory effects in several studies. The mechanism of action seems to be through the ability to inhibit prostaglandin

synthesis and decrease the permeability of blood vessels (Wu 1990, Sheng Yao Xue Za Zhi 1979, Zhong Guo Yao Ke Da Xue Xue Bao 1990). In addition, it may help control secondary bacterial infections (Zhong Yao Cai 1991).

Platycodon (Jie geng): Causes anti-inflammatory effects by increasing the secretion of corticosterone. This effect has been proven in rats (Li 1984, Zhang 1984, Zhou 1979). It suppresses allergic reactions and decreases capillary permeability (Zhong Yao Yao Li Yu Ying Yong 1983).

Polygonum (He shou wu): Enhances adrenocortical function. Experimentally, this herb has been shown to increase the size of mice's adrenal glands (Shen 1982). It also increases hormonal secretion by the adrenal gland. These effects can increase endogenous serum cortisol levels (Zhong Yao Yao Li Yu Lin Chuang 1989).

Prunella (Xia ku cao): Has immunosuppressive activity. When administered by abdominal injection it was shown to significantly raise the level of plasma cortisol (Jiang 1988).

Rehmannia (Sheng di huang): Increase the plasma levels of adrenocortical hormone. This may lead to increased endogenous cortisol levels. It reduces swelling and inflammation (Zhong Yao Xue 1998, Zhong 1983).

Scutellaria (Huang qin): Contains biacalin and biacalein, which suppress inflammation in mice (Kubo M 1984). These can significantly inhibit histamine-induced increase in capillary permeability (Huang 1996). In addition, biacalin has antibiotic activity against Staphylococcus aureus and may have synergistic effects with ampicillin, amoxicillin, methacillin, and cefotaxime. It can help overcome B lactam resistance (Zhong Yao Xue 1988, Liu 2000).

Schizonepeta (Jing jie): Has been shown to help control rashes and itching (Zhong Yi Za Zhi).

Siegesbeckia (Xi xian cao): Has both anti-inflammatory and immunosuppressive effects. It has been shown to decrease swelling in rats (Zhong 1983). It also decreases both humoral and cellular immunity in mice (Zhong 1989).

Siler (Fang feng): Has demonstrated antibiotic efficacy against common skin pathogens such as Staphylococcus aureus (Zhong Yao Tong Bao 1988).

White mustard seed (Bai jie zi): Has anti-inflammatory effects. One of the components, sinapine, seems to be responsible for this effect (Zhang 1996). It also has antifungal and antibacterial effects (Mei 1998).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong 1993).

Xanthium (Cang er zi): Decreases inflammatory swelling. It inhibits the effect of histamine on the capillaries, thereby preventing an increase in capillary permeability (Huang 1996).

Zedoaria (E zhu): Was used in 48 people with neurodermatitis, a chronic dermatological disorder in which the skin is pruritic. It may thicken the way an eosinophilic granuloma does in animals. In this experiment, 21 of the 48 patients experienced excellent results, and 9 more had moderate improvement in their signs after injections of E zhu and Sal leng into acupuncture points (Pi Fu Bing Fang Zhi Yan Jiu tong Xun 1979).

Homotoxicology

General considerations/rationale

Eosinophilic granuloma marks a chronic inflammation reaction to particular antigens, which may gain access to the body through a wide variety of portals. This represents Impregnation Phase disease as the body responds to homotoxins that have bound to other elements and damaged the body's ability to eliminate the offending substances. The body responds through a chronic inflammatory reaction in the attempt to remove damaged elements and repair these affected tissues.

In the authors' practices, we frequently diagnose veterinary homotoxicoses related to flea collars. The most common signs are depression following application of the collar, but patients may have inappetence, seizures, anxiety, depression, vomiting, diarrhea, and upper respiratory signs, which vanish rapidly after removal of the collar. Careful questioning of humans residing in the home may reveal similar symptoms and especially chronic, recurring pharyngitis, rhinitis, tonsillitis, and headaches in people sleeping with these pets. When this is noted the people involved should be referred to appropriate medical care and the collar removed until accurate diagnosis can occur. Palmquist is especially sensitive to many chemical poison flea collars and develops a headache and sore throat within a few minutes of exposure. Many other people and animals seem to be so affected. Considering that most flea collars are ineffective in flea control, their use should not be promoted in most situations.

As with all Impregnation Phase disorders, eosinophilic granuloma complex may be recurrent and frustrating to treat; however, if the clinician integrates antihomotoxic medicines over long periods of time, a substantial percentage of patients will show improvement and reduced exacerbation in successive seasons, and some patients will exhibit remarkable responses. Because such treatment is without dangerous side effects, clients often opt for biological therapy instead of chronic use of immunosuppressive agents.

Appropriate homotoxicology formulas

Due to the wide variety of possible treatments needed in these patients, the reader is referred to the list of remedies at the end of the gastrointestinal chapter, as well as those in the allergies protocol. Pharmaceuticals may be needed

for symptom control and can be safely used while integrating antihomotoxic agents.

Coenzyme compositum: The ingredient Citricum acidum is useful for dental problems and gingivitis. This remedy also is useful for scurvy; blackening of teeth; heavy deposits of dental plaque; painful, and herpetic vesicles around the lips; as well as nausea, painful cramping in the umbilical area, and distension.

Cutis compositum: A wide-reaching formula that stimulates nonspecific defenses in a variety of cutaneous conditions. Can be used in any phase homotoxicosis. Opens skin to drainage and repair. Contains Cutis suis, Hepar suis, Splen suis, Placenta suis, Glandula suprarenalis suis, and Funiculus ubilicalis suis to support regeneration and repair of organs involved in skin health. Contains Sulfur for repair of blocked enzyme systems and Cortisonum aceticum for repair of damage from prior corticosteroid exposure. Aesculus hippocastanum supports circulation and drainage (Reckeweg 2000).

Echinacea compositum: Used to bacterial infection control and immune normalization. It is a phase remedy for the Inflammation Phase.

Engystol N: Used for viral origin gastroenteritis and allergic dermatitis. It contains Sulphur in a higher potency, which is helpful for many chronic diseases and skin conditions. In some cases this agent by itself causes marked improvement. It combines readily with *Cutis compositum* and *Ubichinon compositum* to resolve difficult cases (Palmquist 2005).

Galium-Heel: Indicated in most allergic cases. It is a phase remedy for Deposition to Dedifferentiation phases. Galium aparine, Sempervivum tectorum, Ononis spinosa, Juniperus communis, Betula alba, Saponaria officinalis, and Acidum nitricum give it a diuretic effect, and Galium mullugo provides a detoxifying effect. Phosphorus supports parenchyma (lung, liver, kidney, and heart), and Apis mellifica helps with itching. Pyrogenium-Nosode helps with infectious Inflammatory Phases, and Urtica urens treats eczema and dermatosis (Reckeweg 2000). It is also a cellular drainage and repair agent and it is used for edema and to create drainage through connective tissue.

Hepar compositum: Used for detoxification and drainage of hepatic tissues, organ support, and metabolic support. It is useful in most hepatic and gall bladder pathologies. It is also an important part of the deep detoxification formula. *Hepar compositum* is used to treat duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Chelidonium has proapoptotic characteristics (Habermehl 2006).

Hepeel: Provides liver drainage and detoxification. It is used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lamioflur: Used for ulcerations of mucocutaneous areas, diseases of the skin, and mucous membranes. Contains Hepar sulphuris for skin ulcerations and pustular eczema; Acidum nitricum for lesions on mucocutaneous junctions; and Kreosotum for eczema of the hands and mucosa margins (Reckeweg 2000).

Lymphomyosot: Used for lymph drainage and endocrine support, and to treat edema.

Mezereum homaccord: Treats herpes, dermatitis, ulcerative eczema, and pruritus (Reckeweg 2000).

Mucosa compositum: Broadly supports repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains Kali bichromicum, which is indicated for ulcers found on the gums, the tongue, the lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or, in ulcerative stomatitis or tonsillitis, it may be dry, smooth, shiny, or fissured. *Kali* has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis for mucosal support of oral problems such as stomatitis; mucosal suppuration accompanied by ulceration, inflammations, and colic of the hepatobiliary system and the gastrointestinal tract; and polyp formation (Reckeweg 2002). The Kreosotum component is for chronic gastritis with gastric hemorrhages and vomiting of brown masses. It also has a dental implication in cases with spongy gums and carious teeth and neuralgias proceeding from them, causing a burning toothache with deep caries, black patches, on the teeth and fetid discharges. The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum*, *Leptandra homaccord*, and several others. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere.

Also contained in this broad remedy is Argentum nitricum, (also in *Atropinum compositum*, *Diarrheel*, *Duodenheel*, *Gastricumheel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations). It is for distension in the upper abdomen, gastro-cardiac symptom-complex, amelioration from eructations, and gastric crises (Reckeweg 2002).

Psorinoheel: An exudation and cellular phase remedy. It treats itching, precancerous conditions, chronic skin conditions, acne, seborrhea, eczema, and pruritus.

Pulsatilla compositum: Used for regulation rigidity. If signs suddenly shift to inflammatory regressive vicariation, shift to *Traumeel*. This remedy contains homeopathically diluted Cortisonum for repair of prior therapeutic damage, which may block recovery. It stimulates the mesenchymal tissues strongly toward healing. Patients frequently develop respiratory Excretion Phase discharges of mucus. The ingredient Sulfur is a reagent in all chronic diseases (Reckeweg 2000).

Schwef-Heel: Used for chronic diseases of skin and liver. This remedy should be interposed in most skin and liver cases (Reckeweg 2000). Patients that need this remedy may look dirty and have scruffy skin conditions, red lips, a white tongue with red tip, itching and burning of the rectal area with morning diarrhea, and prolapsed rectum (Boericke 1927). Sulfur is contained in this and several other antihomotoxic formulas including *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Paeonia Heel*, *Proctheel*, *Psorinoheel*, *Sulfur-Heel*, *Thyroidea compositum*, and *Ubichinon compositum* (Reckeweg 2000).

Solidago compositum: Supports the kidney and urinary system. It is part of the deep detoxification formula. The ingredient Berberis is antihistaminic and anticholinergic (Shamsa, Ahmadiani, Khosrokhavar 1999).

Thyroidea compositum: Provides drainage of matrix and support of the endocrine system. It is a phase remedy for Impregnation Phases and it is part of the deep detoxification formula.

Traumeel: A nonsteroidal anti-inflammatory that is useful in all phases. It is helpful for regulation rigidity cases. It activates blocked enzymes in chronic disease states.

Ubichinon compositum: Provides support of energy-producing components.

Authors' suggested protocols

Nutrition

Immune and lymph support formulas: 1 tablet for every 25 pounds of body weight BID.

Skin support formula: One-half tablet for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID. (maximum 2 capsules BID.)

Quercetin: 50 mg for every 10 pounds of body weight SID.

Beyond essential fats: One-half teaspoon for every 35 pounds of body weight with food (maximum, 2 teaspoons).

Chinese herbal medicine/acupuncture

For lesions on the skin, Formulas H52 ImmunoDerm and H67 DermGuard given at a dose of 1 capsule of each for every 10 to 20 pounds twice daily.

For oral lesions formula, H33 Eosinophilic granuloma is used at a dose of 1 capsule for every 10 to 20 pounds twice daily.

The ingredients of each formula follow. They contain herbs not mentioned above, but which increase the efficacy and minimize the side effects of the respective formulas.

H33 Eosinophilic granuloma: Angelica radix (Dang gui), burreed tuber (San leng), cicata (Chan tui), dahurian angelica root (Bai zhi), dittany bark (Bai xian pi), forsythia (lian qiao), fritillaria (Bei mu), kochia (Di fu zi), licorice (Gan cao), oyster shell (Mu li), prunella (Xia ku cao), red peony (Chi shao), siler (Fang feng), white mustard seed (Bai jie zi), and zedoaria (E zhu).

H52 ImmunoDerm: Angelica radix (Dang gui), atracylodes (Cang zhu), buffalo horn shavings (Sui niu jiao), bupleurum (Chai hu), dandelion (Pu gong ying), earthworm ((Di long), fleece flower root (He shou wu), honeysuckle (Jin yin hua), kochia (Di fu zi), licorice (Gan cao), moutan (Mu dan pi), oldenlandia (Bai hua she cao), poria (Fu ling), rehmannia (Sheng di huang), scutellaria (Huang qin), siegesbeckia (Xi xian cao), tokoro (Bi xie), white peony (Bai shao), and xantium fruit (Cang er zi).

H67 DermGuard: Angelica radix (Dang gui), aurantium fruit (Zhi qiao), bupleurum (Chai hu), cicada (Chan tui), cnidium (Chauan xiong), dahurian angelica (Bai zhi), honeysuckle (Jin yin hua), licorice (Gan cao), mint (Bo he), moutan (Mud an pi), platycodon (Jie geng), poria (Fu ling), schizonepeta (Jing jie), scutellaria (Huang qin), siegesbeckia (Xi xian cao), siler (Fang feng), silkworm (Jiang can), and xantium fruit (Cang er zi).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

Treatment must be individualized, but the following represent good starting therapies, which can be readily adapted based upon clinical response.

Simple oral protocol: Engystol N, Lamioflur, and Traumeel S mixed together and given BID orally. Also deeper detoxification formula consisting of Galium-Heel, Coenzyme compositum, Ubichinon compositum, Solidago compositum, Hepar compositum, and Thyroidea compositum mixed together and given orally every 3 days. In addition, Cutis compositum given twice weekly to every other week. In difficult cases, Pulsatilla compositum may move the case toward regressive vicariation. Control of allergens is critical to success.

Autosanguis and oral combination therapy per Broadfoot (best option): Perform autosanguis therapy as follows:

Stage 1: Traumeel S IV

Stage 2: Tonsilla compositum or Pulsatilla compositum (consider Tonsilla compositum for first run and use Pulsatilla compositum as an alternative if no or poor response)

Stage 3: Engystol N and Galium-Heel combined

Stage 4: Cutis compositum

Stage 5: Coenzyme compositum

For each step above (2 through 5), inject half of this mixture into the patient subcutaneously (in cases involving one large lesion, consider injecting small amounts around the periphery of the lesion, a technique known as “circling the dragon” in Chinese medicine), and add the remaining half to an oral cocktail of the following ingredients: Psorinoheel, Lamioflur (contains *Mezereum*), and Echinacea compositum Forte tablets. Mix together and succuss it 10 times. Give 5 to 7 drops of this resulting final mixture orally BID to TID. Also treat the lesion topically with Euphorbium compositum BID. Broadfoot reports best results are when this is combined with oral blue-green algae and Gluta-DMG.

FUNGAL INFECTIONS

Definition and cause

Dermatophytosis is a cutaneous fungal infection caused by *Mycosporum canis* and other dermatophyte fungi. This fungal infection is contagious, and generally the only clinical manifestation is hair loss and a crusted lesion (Dunbar Gram 2003, Scott 1995). Other fungi can cause infections, which can also become systemic and can cause disease in other organs, such as the sinus and the lungs.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Systemic treatment with Griseofulvin, Ketoconazole, and Itraconazole are often prescribed. While fairly effective, they have potential side effects such as anemia and white blood cell suppression (with Griseofulvin) and hepatopathy (with Ketoconazole and Itraconazole). Topical cleaning, clipping the hair, and applying topical agents such as lime sulfur is also effective (Dunbar Gram 2003, Moriello 1994, Scott 1995).

Anticipated prognosis

Most infestations are self limiting and the prognosis is good (Dunbar Gram 2003, Scott 1995).

Integrative veterinary therapies

According to the American Academy of Allergy, Asthma and Immunology, sinusitis in humans and fungal infections are on the rise. This indicates that the common

treatments, e.g. antifungals, are not getting to the root of the problem, which is not caused by infection, but is actually an immune disorder caused by fungus. Researchers have found that fungal organisms were present in the mucus of 96% of patients who had surgery for chronic sinusitis, and inflammatory cells were clumped around fungi, suggesting an immune disorder caused by fungus.

This is easy to comprehend when we consider that mold spores contain numerous digestive enzymes that directly attack and damage tissue. A healthy immune system should be able to aggressively defend itself against mold spores. Direct damage by fungal spores coupled with environmental toxins is a perfect formula to initiate allergic responses. As this damage progresses we see an excellent example of progressive vicariation, which rapidly can attain the Degeneration Phase and may predispose to Degeneration Phase disease processes (see Homotoxicology, General Considerations, below).

In the veterinary field, we see an array of fungal conditions, not only in the skin but also systemic forms, and as the body attempts to destroy the fungus, the immune system damages the surrounding tissues. The integrative approach to such fungal infestations, either local or systemic, is to reduce exposure to infectious agents, support immune function, and improve and enhance the elimination of toxins from the body.

Nutrition

General considerations/rationale

The nutritional support used to address fungal infection is usually done in combination with medical therapy, although in this approach, topical medication is preferred. The therapeutic nutritional approach is to help reduce inflammation locally and balance and enhance immune function systemically.

Some approaches to fungal infection involve dietary changes, because high-carbohydrate diets may contribute to fungal overgrowth, and supplementing with a high level of omega-3 fatty acids can improve immune function. Several foods rank high on the list for dietary avoidance, including: corn, which is highly contaminated with fumonisin, aflatoxins, and other fungal toxins (Council for Agricultural Science 2003); wheat and wheat products, because wheat is often contaminated with mycotoxins; barley; cottonseed; sugar cane; sorghum; and sugar beets.

Many disease entities have been linked to fungal overgrowth. To learn more about their sources, read *Diseases Caused by Fungi and Their Mycotoxins* by Costantini (1998) (see Product Sources).

Appropriate nutrients

Nutrition/gland therapy: Glandular therapy support of the skin as well as the immune system organs (adrenals,

thymus, and lymph) is indicated (see Chapter 2, Gland Therapy, for additional information).

Quercetin: Quercetin is in the flavonoids family (see Chapter 2, Phytonutrients). It functions like an antihistamine and has antioxidant properties. It has been shown to inhibit cells from releasing histamines (Middleton 1986, Ogasawara 1985), so it is beneficial in the treatment of allergic conditions such as dermatitis, eczema, and asthma.

Phosphatidyl choline: This phospholipid is integral to cellular membranes and is an essential nutrient for healthy skin (Hanin 1987).

Evening primrose oil: EPO has been proven to have both anti-inflammatory and anti-pruritic effects and, as part of a balanced nutritional program, can exert a positive effect on animals with skin disease. Studies suggest that EPO is beneficial in people with atopic dermatitis and eczema (Hederos 1996, Humphreys 1994, Morse 1989).

Chinese herbal medicine/acupuncture

General considerations/rationale

Fungal infections are a result of Wind, Heat, and Damp invading the body. Wind blows the pathogen into the body. Heat and Damp refer to the inflammation and moist skin lesions, respectively. Treatment is aimed at eliminating the pathogen, clearing inflammation, and preventing secondary bacterial infections.

Appropriate Chinese herbs

Anemarrhena rhizome (Zhi mu): Has demonstrated inhibitory effects against some dermatophytes and some bacteria, including *Staphylococcus aureus* (Yao Xue Qing Bao Tong Xun 1987). This herb can attack the primary pathogen while simultaneously preventing secondary bacterial infections.

Angelica root (Dang gui): An immunostimulant (Zhong Hua Yi Xue Za Zhi 1978) that may help the patient eliminate the infection.

Arctium (Niu bang zi): Inhibits bacteria, including *Staphylococcus aureus* and *beta streptococcus*, and various fungi (Group of Internal Medicine 1960, Group of Virology 1973, Cao 1957).

Atractylodes rhizome (Cang zhu): Inhibits *Staphylococcus aureus* and some dermatophytes (Zhong Yao Xue 1998 318:320). It can decrease xylene-induced ear swelling and carrageenin-induced foot swelling (Zhang 1998). It may decrease the inflammation associated with fungal infections.

Gypsum (Shi gao): Has dual activities of decreasing inflammation and stimulating immunity. It increases the phagocytic activity of macrophages (Zhong Yao Xue 1998). At the same time it decreases inflammation. In 1 trial 126 human patients with various inflammatory

disease processes were treated with gypsum. Most showed improvement (Zhong Hua Wai Ke Za Zhi 1960).

Licorice (Gan cao): Can inhibit *Staphylococcus aureus* (Zhong Yao Zhi 1993).

Rehmannia (Sheng di huang): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Schizonepeta stem (Jing jie hui): Decreases acute and chronic inflammation (Zeng 1998, Xie 1983).

Siler (Fang feng): Inhibits *Staphylococcus aureus* (Zhong Yao Tong Bao 1988).

Sophora root (Shan dao gen): Increases IgM and IgG levels (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1989). It also has antibiotic activity (Xian Dai Shi Yong Yao Xue 1988).

Homotoxicology

General considerations/rationale

Fungal infections may occur if an overwhelming amount of infectious fungal agent gains access to the body. Simple dermatophytosis is a Reaction Phase disorder, while chronic, recurrent, or refractory cases indicate more serious systemic involvement.

Immune suppression by a wide variety of causes predisposes to fungal infection as does residing in a contaminated area. Systemic mycoses involve both of these factors. Many fungal infections occur following compromise of the greater defense system and are more common in Deposition, Impregnation, Degeneration, and Dedifferentiation phases. Yeast infections are commonly associated with allergic disorders, wherein homotoxins accumulate and alter the connective tissue's responses.

Homotoxicology agents are viewed as additional therapy in these cases, because antifungal drugs are both important and useful in treating systemic and topical forms. However, the clinician must remember that these drugs are homotoxins and can cause further damage to the body, particularly the liver and kidney. No cases of successful use of antihomotoxic therapy could be found in the veterinary literature at this time, but one case of feline cryptococcal encephalitis was treated successfully using an integrative approach by the author (Palmquist 2005).

Appropriate homotoxicology formulas

The best known of the classical homeopathic remedies for fungal infection/dermatophytosis are: *Sepia* for brown, scaly patches; *Tellurium* for prominent, well-defined, reddish sores; *Graphites* for thick scales or heavy discharge; and *Sulphur* for excessive itching (Cummings et al. 1984).

BHI-Allergy: A remedy that contains *Arnica* for itching, burning skin, and a host of other remedies for skin irritations and eruptions. It also contains, most notably, *Tellurium metallicum*, which is mentioned in classical

repertories. Marked skin (*Herpes circinatus*) is another indication for this remedy, as is a very sensitive back, itching of hands and feet, herpetic spots, ringworm (*Tuberc*), ring-shape lesions, offensive odors from affected parts, and circular patches of eczema. Lesions tend to be equally distributed on either side of the body. Also recommended for Pityriasis versicolor and eruptions—herpetic. (Bianchi 1995). *BHI-Allergy* also contains Graphites (see *Graphites homaccord*) and Sulphur (see *Sulphur heel* and *Engystol N*).

BHI-Skin: A good support remedy that includes *Rhus Toxicodendron* (also in *Aesculus compositum*, *Arnica-Heel*, *Echinacea compositum*, *BHI-Inflammation*, *BHI-Skin*, et. al.) *Rhus toxicodendron* (poison ivy) contains rhoitannic acid. A component of the sap, urushiol, is a strong skin irritant. It has been recommended for violent itching, and possibly for an eruption like measles all over the body, a vesicular eruption (herpes), a crusty eruption on the head, and eruptions of a vesicular nature, particularly when the eruptions are bluish-grey in color. It is one of the main remedies for *Herpes zoster*. However, *Rhus toxicodendron* is also valuable in chronic skin diseases, especially in eczema with vesicle formation. It is also a main remedy for facial and frontal impetigo if there is violent itching. This remedy also contains Graphites (see *Graphites homaccord*) and sulphur (see *Sulphur-Heel* and *Engystol N*).

Coenzyme compositum: Provides metabolic support and repair of damage to mitochondria by therapeutic agents.

Cutis compositum: Provides support and drainage of the skin and associated adnexa (Heel 2003). This remedy is of huge value in skin disorders, as one might expect from the name. It contains *Cutis suis*, for which the principal indications are: allergic reactions, dermatoses, eczema, seborrhea, dermatomycoses, neurodermatitis, and other chronic problems. It also has *Hepar suis* (found in *Hepar compositum*, *Syzygium compositum*, *Thyroidea compositum*, *Tonsilla compositum*, etc.) for chronic eczemas, neurodermatitis, psoriasis, erythemas, dermatomycoses, and eruptions that are papular or in blotches which itch and that appear on the head, face, back, female genitalia, or extremities. It also contains Sulphur (see *Sulphur Heel*) and Graphites (see *Graphites Homaccord*). The ingredient *Thuja* can also be of value in chronic skin conditions. The oil from the red cedar, from which *Thuja* is taken, is known as an antifungal agent.

Echinacea compositum: Provides immune support in Reaction and Impregnation phases.

Galium-Heel: Contains *Aurum metallicum*, which has been used successfully in a case of Feline Aspergillosis (Hoare).

Graphites homaccord: Used to treat dry, crusty or weepy patches of pigmented dermatitis. Graphites (also

found in *BHI-Allergy*, *BHI-Skin*, *Cutis compositum*, *Placenta compositum*, *Thyroidea compositum*, *Tonsilla compositum*, etc.) shares indications with *Carbo vegetabilis* and other anti-psorics, particularly Sulphur. There is a tendency toward the formation of cracks, and to various skin diseases, proceeding with crusty eruptions and the discharge of a sticky, honey-like fluid, which hardens into scabs. These are often localized in the folds and creases of the skin. Itching is aggravated by heat. There may be general loss of hair, which is hard and brittle, and alopecia areata, and possibly chronic ear discharge smelling like herring-brine.

Graphites, as a constituent, is also a remedy indicated for eczema capitis, fissures in general, intertrigo and fungal infections of the nails, and psoriasis on fingertips, nipples, corners of the mouth, and between the toes. Another important constituent, *Sepia* (in *BHI-Skin* and others) is one of the most frequently needed homeopathic remedies, and is mainly used for chronic diseases and dyscrasias (i.e., both cellular and also chronic humoral phases such as chronic eczemas and chronic discharges such as leucorrhoea). Worthy of particular note are the skin symptoms of *Sepia*, namely soreness and itching, which is frequently transformed into burning as a result of scratching (cf. Sulphur), with localization in the creases of the knees. These patients may show large, suppurating pustules, which repeatedly relapse; brown patches on the face, chest, and abdomen; and vesicles and scabies-like conditions, particularly if Sulphur has not completed the cure. The skin symptoms may express in the form of pustules, eczema, neurodermatitis, herpes, yellowish-brown scaly patches, or sloughing of the epidermis in round patches on the hands and fingers, possibly associated with painless ulcers. Chronic dermatophytosis is another condition that may respond to this remedy. (Reckeweg 2002)

Lymphomyosot: Used in lymph draining and in eczema.

Psorinoheel: A phase remedy in Excretion Phase disorders and in chronic, constitutional cases. One of the most useful components is *Bacillinum*, which is used in eczema and impetigo and is indicated in alopecia. It is useful for Pityriasis versicolor and other skin disorders, as well as general weakness and debilitation. The ingredient *Bufo* has been used for purulent blisters (pemphigus) on the skin and mucosa, and for paronychia and glandular and dermal inflammations accompanied by a tendency toward suppuration.

Psorinum nosode (also in *Tonsilla compositum* (was introduced into the homeopathic *Materia Medica* by Hering in 1833–34, and was the first nosode to be so included. It is said to be useful in chronic and acute eczemas with violent itching, especially at night, that is relieved by scratching until it bleeds. Other skin dyscras-

sias also respond well to intercurrent doses of Psorinum. According to some popular materia medicas, there is a wide variety of relationships with well-known polychrests, such as: Arsenicum album (complaints and restlessness at night, fear of death, desquamating skin eruptions); Petroleum (dry skin with cracks and oozing eruptions); and Sulphur, which is the most closely related remedy regarding discharges, burning of the skin, eruptions, vicarious conditions, and general chronicity. Thus, it is appropriately used in chronic eczema, impetigo, all kinds of skin eruptions, asthma alternating with eczema, psoriasis, boils, acne, seborrhoea, etc. (Reckeweg 2002). Also contains Sulphur (see *Sulphur-Heel*, *Engystol N*, and *Schwef-Heel*).

Schwef-Heel A Sulphur-containing remedy for red, itchy skin. It is used as a catalyst, and is given intermittently in skin conditions. This is a homaccord of Sulphur, which has deeper reaching potencies than other antihomotoxic formulas.

Sulphur-Heel: Named for Sulphur, one of the most important single remedies in homeopathy. This is easily appreciated when one discovers the number of antihomotoxic agents that contain it, such as *Causticum compositum*, *Cutis compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Mucosa compositum*, *Psorinoheel*, *Pulsatilla compositum*, *Schwef-Heel*, *Thyreoidea compositum*, *Tonsilla compositum*, *BHI-Allergy*, *BHI-Enzyme*, *BHI-Skin*, and many others.

Typical of Sulphur indications in Impregnation phases is the affection of the skin, which itches and then burns after being scratched. The body is trying to eliminate intermediate homotoxins, particularly histamine, via the skin, causing a wide variety of discharges, which are excoriating and cause reddening of the orifices and an offensive body odor. Sulphur should be given intercurrently, e.g. as an intravenous injection, in cases that do not respond to well-indicated biotherapeutic or antihomotoxic remedies. This should be done regardless of the system, e.g. chronic heart disease; skin diseases such as lichen planus, acne vulgaris, eczema, neurodermitis, and dermatoses; and liver disease. (Reckeweg 2002).

This combination also contains a variety of remedies that are useful in itchy, eczematous, eruptive skin lesions, such as Caladium, Pix liquida, Mezereum, Arsenicum, and others.

Tonsilla compositum: Provides immune support in Impregnation, Degeneration, and Dedifferentiation phases. It contains Conium (also in *Ginseng compositum*, *Testis compositum*, *Thyreoidea compositum*, *Ubichinon compositum*, and others), which is used for glandular swellings and induration, prickling and stinging, and conditions that are stony-hard to the touch (Reckeweg 2002). *Tonsilla compositum* also contains the aforementioned Graphites, Hepar suis, Psorinum, and Sulphur. Funiculus

umbicalis suis is included for regeneration of damaged tissues (Smit 2004).

Traumeel S: Used as a phase remedy and in cases of regulation rigidity.

Authors' suggested protocols

Nutrition

Skin and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Lymph support formula: One-half tablet for every 25 pounds of body weight BID.

Quercetin: 50 mg for every 10 pounds of body weight SID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Chinese herbal medicine/acupuncture

The patent formula is Xiao Feng San. It contains 3 g each of angelica root (Dang gui), rehmannia (Sheng di huang), siler (Fang feng), cicada (Chan tui), anemarrhena rhizome (Zhi mu), sophora root (Shan dao gen), sesame seeds (Hei zhi ma), schizonepeta stem (Jing jie hui), atractyloides rhizome (Cang zhu), arctium (Niu bang zi), and gypsum (Shi gao), and 1.5 g of licorice (Gan cao) (Handbook of TCM Practitioners 1987). It is dosed according to the supplier's recommendations.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

Graphites homaccord, Psorinoheel, Cutis compositum autosanguis: Give every 2 to 4 weeks, as needed.

Echinacea compositum: Give every 3 days orally.

Hepeel compositum: Give every 3 days.

Coenzyme compositum and Ubichinon compositum: Give on alternate days.

Detox Kit and Galium-Heel: Give daily BID PO for 30 days, possibly with the aforementioned autosanguis mixed in.

Echinacea comp forte, Traumeel plus Mucosa compositum and Chelidonium homaccord (for intestinal mycosis): Injected e.o.d., preferably as an autosanguis. European practitioners have reported good results from this combination (Guray 2003).

SEBORRHEIC DERMATITIS

Definition and cause

Seborrheic dermatitis is characterized by excessive dry or oily sebum, commonly caused by a combination of *Staphylococcus* and *Malassezia* dermatitis. It is fairly common in dogs and rare in cats (Mason 2003, Scott 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The recommended treatments are topical shampoos such as selenium sulfide in combination with ketoconazole when secondary yeast infections are involved. Antibacterial shampoos may also be indicated based upon the status of the skin and secondary bacterial infection. The potential of hepatopathies with ketoconazole is a precaution that should be discussed.

Anticipated prognosis

Regular antifungal or antibacterial shampoos can be used to control seborrheic dermatitis, although recurrences are common (Mason 2003).

Integrative veterinary therapies

Proper diagnostic evaluation is required to properly diagnose and treat these cases. Obtaining a full medical history and conducting a physical exam, skin scraping, and blood evaluation with thyroid levels are recommended in most cases. Impression smears and cytology may yield yeast overgrowth and secondary bacterial infections as microorganisms congregate around the exudative process in an attempt to ingest and process homotoxins being excreted or stored in affected tissues. Many chronic dermatitis cases undergo regressive vicariation and produce severe oily material (see Homotoxicology, below).

Gently cleansing the oily material away on a regular basis decreases retoxification from rancid, oxidized fatty acids, and reduces nutritional support of pathogens such as yeast and bacteria. Avoid topical agents that suppress the secretion of material (such as coal tar, corticosteroids, and antihistamines) unless their use is absolutely necessary, because these inhibit the body's natural ability to remove fat-soluble homotoxins through the skin and can be absorbed, causing further injury to the cutaneous defenses. Antihistamines are the least harmful of the aforementioned group.

The addition of therapeutic nutrition and biological therapies helps to boost immune function and improve the elimination of toxins via the skin. These improvements often minimize exacerbation and recurrences.

Nutrition

General considerations/rationale

While medical therapy is focused locally upon the skin (inflammation, pruritus, sebum), the nutritional approach adds gland support for the organs of the immune system and nutrients to help decrease local inflammation and enhance toxin elimination, especially via the skin.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal and lymph provide intrinsic nutrients for the glands of the immune system and the skin. These nutrients help enhance the elimination of toxins via the skin (see Gland Therapy and the Enhancement of Elimination, Chapter 2).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes. It helps to move fats into the cells and is important for cellular integrity. Lecithin is an essential nutrient required by the skin and all of the body's cells of the body for general health and wellness (Hanin 1987). Studies with lecithin have shown that it can emulsify fats which are important for the skin's health (Brook 1986, Spilburg 2003).

Evening primrose oil: EPO has been proven to have both anti-inflammatory and anti-pruritic effects and, as part of a balanced nutritional program, can exert a positive effect on animals with skin disease. Studies suggest that EPO is beneficial in people with atopic dermatitis and eczema (Hederos 1996, Humphreys 1994, Morse 1989).

Chinese herbal medicine/acupuncture

General considerations/rationale

Seborrheic dermatitis is due to Heat and Wind invading the Liver and Lungs. This leads to Yin and Blood deficiency. The Lungs control the skin, so Lung pathology can cause dermatitis. The Liver is the organ most likely to suffer from Wind. When the Liver is invaded by Wind, the result is pruritus.

Blood and Yin are fluids. If they are deficient in the Skin it causes dryness because the skin cannot remain healthy when it is not nourished.

Treatment is aimed at reversing the fluid deficiency, or normalizing the skin and soothing the itch. It is also necessary to control secondary infections.

Appropriate Chinese herbs

Angelica (Bai zi): Has anti-inflammatory properties (Zhong Guo Zhong Yao Za Zhi 1991). It may decrease inflammation of the skin.

Atractylodes (Cang zhu): Has activity against *Staphylococcus aureus* and dermatophytes (Zhong Yao Xue 1998). It may help prevent secondary infections.

Bupleurum (Chai hu): Decreases the effect of histamine release (Zhong Yao Yao Li Yu Ying Yong 1983) and has

antibiotic effects against streptococci (Zhong Yao Xue 1998). It may help decrease pruritis and prevent secondary skin infections.

Cicada slough (Chan tui): Has been used successfully in humans to treat chronic urticaria (Pi fu Bing Fang Zhi Yan Jiu Tong Xun 1972), which indicates that it has a beneficial effect on the skin. It may be of use in seborrheic dermatitis to help protect the skin or prevent itching due to secondary bacterial infections.

Honeysuckle (Jin yin hua): Has antibiotic effects against *Staphylococcus aureus*, *E. coli*, and *Pseudomonas aeruginosa* (Xin Yi Xue 1975), and is anti-inflammatory (Shan Xi Yi Kan 1960).

Licorice (Gan cao): Inhibits the growth of *Staphylococcus aureus* (Zhong Yao Zhi 1993). It contains glycyrrhizine and glycyrrhentic acid, which have corticosteroid activity (Zhong Cao Yao 1991). This may help prevent secondary infections and decrease pruritis.

Mint (Bo he): Relieves itching (Zhong Cao Yao Xue 1980) and has anti-inflammatory effects (Zhong Yao Xue 1998).

Moutan (Mu dan pi): Demonstrates anti-inflammatory actions via inhibition of prostaglandin synthesis and decreases vascular permeability (Sheng Yao Xue Za Zhi 1979, Zhong Guo Yao Ke Da Xue Xue Bao 1990). It inhibits the growth of *Staphylococcus aureus*, streptococci, and dermatophytes (Zhong Yao Cai 1991).

Platycodon (Jie geng): Decreases allergic reactions (Zhong Yao Yao Li Yu Ying Yong 1983), and may help with skin inflammation.

Poria (Fu ling): Has inhibitory effects on *Staphylococcus aureus* (Zhong Yao Cai 1985).

Rehmannia (Sheng di huang): Has shown anti-inflammatory activity in mice (Zhong Yao Yao Li Yu Ying Yong 1983).

Siegesbeckia (Xi xian cao): Inhibits the growth of *Staphylococcus aureus* (Kim 1979).

White peony (Bai shao): Contains paeoniflorin, which is a strong anti-inflammatory (Zhong Yao Zhi 1993). It also has antibiotic effects against *Staphylococcus aureus*, some streptococci, *E. coli*, *Pseudomonas aeruginosa*, and some dermatophytes (Xin Zhong Yi 1989).

Acupuncture has been used to treat skin allergies (Lundesberg 1988). By stimulating specific acupuncture points, it is possible to stimulate the pet's immune system and reduce the itching and inflammation associated with dermatitis. This may be applicable to the skin inflammation seen in seborrheic dermatitis or help with itching secondary to bacterial invasion of the abnormal skin.

The authors have used GV14, SP9, and SP10 to control inflammation (clear Heat in TCM terms). LI11 can be used to stop any itching and HT7 can be used to calm the animal so it does not lick or scratch and irritate the skin further. Local points can be used; these include LI4 for

the front legs, GB34 for the back legs, and GB20 for the neck (Schoen 1994).

Homotoxicology

General considerations/rationale

Seborrhea means "to run oil," and represents Excretion Phase or Inflammation Phase homotoxicoses. Seborrhea often occurs in chronic cases of dermatitis, and this condition can represent genetic or breed-related issues. In those cases, it represents the Degeneration Phase on the Six-Phase Table.

An important sign of healing is represented by an oily secretion, which begins as thick waxy material and slowly becomes progressively more liquid and lighter in viscosity. If the clinician observes such changes, especially when hair regrowth and depigmentation of hyperpigmented areas are noted, the client should be properly advised and therapy should be continued in earnest.

Appropriate homotoxicology formulas

(See also the protocols for Hypothyroidism, Cushing's disease, Addison's disease, allergic dermatitis, and otitis externa.)

Abropemol: Hyperhydrosis, hyperkeratosis, and eczema are all indications. The ingredient *Pulsatilla pratensis* is classically used for urticarial eczema, which may occur following the ingestion of rich food (diarrhea may be present). This is a useful remedy in many conditions where response to treatment (case change) is not apparently forthcoming. Ocular discharge may be present, as may be heavy, bland ear discharges (Macleod 1983). Calcium fluoratum is useful for stony swelling of glands, calcified ear canals, chronic suppurative otitis media, anal itching, fissures and cracks on the anus and foot pads, and excessive scar tissue (Boericke 1927).

BHI-Hair and -Skin: The ingredient *Thuja occidentalis* treats dry hair, hair loss, dandruff (due to Selenium), urticarial reactions, eczema located around the mouth and face, and epitherliomas. Petroleum rectifacatum is included for eczema that is worse in the winter and excessive sweating from the axillae and feet (Reckeweg 2000). *Acidum nitricum* treats jagged warts that bleed easily, foul skin secretions, and poorly healing granulomas (Macleod 1983). The presence of *Hamamelis virginiana* is useful for traumatic inflammations and venous disturbances. This remedy also treats blistering eruptions and dry skin (Macleod 1983).

BHI-Skin: Used for eczema; rashes and hives; skin eruptions; red rash all over the body; pustules; acute and chronic skin lesions; moist, suppurating lesions; and herpetic ulcers. This is a very useful remedy that contains *Berberis vulgaris* for itchy blisters, anal eczema, and pigmented eczema. *Berberis* is supportive of cutaneous,

hepatobiliary, renal, and adrenal systems, and greatly assists in excretion of homotoxins via these routes. Rhus tox is useful for red rashes, itching, and contact hypersensitivity reactions. Arsenicum album is a classic remedy for dry skin, eruptions, and boils/carbuncles. Sulfur is a useful agent in chronic dermatitis because it activates blocked enzyme systems. It is useful in eczema with intense itching and vesicular eruptions, and for patients that frequently have a bad smell. Sepia, Petroleum, and Kreosotum all assist in eczema. Hydrofluoric acidum is useful for brittle nails. Graphites (see *Graphites homaccord*) is also included (Heel 2002).

Coenzyme compositum: Provides metabolic support and reversal of iatrogenic factors. *Hepeel* and *Coenzyme compositum* may be used in conditions to reduce pruritus (Reinhart 2005).

Cutis compositum: A broad remedy that is indicated in all cutaneous diseases to establish drainage and stimulate healing of the skin. It is a wide-reaching formula that stimulates nonspecific defenses in a variety of cutaneous conditions. *Cutis compositum* can be used in any phase homotoxicosis; it opens skin to drainage and repair. It supports regeneration and repair of organs involved in skin health (*Cutis suis*, *Hepar suis*, *Splen suis*, *Placenta suis*, *Glandula suprarenalis suis*, *Funiculus umbilicalis suis*). It contains Sulfur to repair blocked enzyme systems and Cortisonum aceticum to repair damage from prior corticosteroid exposure. It supports circulation and drainage (*Aesculus hippocastanum*) (Reckeweg 2000).

Engystol N: Provides support to the immune system. Sulfur assists in allergic dermatitis and eczema, as well as in viral infections and in cases associated with vaccinosis.

Graphites homaccord: Contains Graphites, which is indicated for loss of hair, oozing cutaneous discharges, and sticky eczema behind the ear pinnae (Macloed 1983). Treats dry, chronic dermatitis and eczema; obese patients; constipation; honey-yellow crusts on dermatitis; dermatitis of the ear's meatus; moist and cold feet with poorly healing wounds; and easily ulcerating skin (Reckeweg 2000). Patients that require Graphites frequently have a tendency to obesity and constipation. Tiny abrasions may be more susceptible to infection and oozing. The patients may have dry ear canals in which otoscopic examination may show white concretions on the tympanum (Boerike 1927). Calcium carbonicum Hahnemanni complements Graphites; this assists in cases showing exudative dermatitis and facial rashes/eczema, poor-healing wounds, petechial eruption, and boils.

Hepar compositum: Used for liver drainage and support during detoxification (see Hepatitis protocols).

Hormeel S: Has a normalizing effect on the endocrine system.

Lymphomyosot: Promotes lymphatic drainage and contains homeopathically diluted thyroid hormone and iodine to activate suppressed thyroid and immune functions.

Psorinoheel: A deep-acting remedy with Psorinum and sulfur that is indicated in constitutional cases as well as the Excretion Phase.

Schwef-Heel: Contains sulfur, which is indicated in seborrhea activates many blocked enzymes systems. Oily skin, red skin, foul odors are all indications for sulfur, which may need to be given intermittently while recovery is progressing.

Solidago compositum: Provides renal support and drainage during detoxification. It is a phase remedy for the Deposition Phase. There is a connection in Traditional Chinese Medicine between skin disease and the Kidney (Zang Fu organ). Many forms of dermatitis improve when the kidney is treated and supported.

Thyroidea compositum: Provides matrix drainage and neuroendocrine support. It contains a wide variety of glandular support agents such as *Glandula thyroidea suis* and *Thymus suis*, as well as *Corpus pineale suis*, *Splen suis*, *Medulla ossis suis*, *Funiculus umbilicalis suis*, and *Hepar suis*. Other ingredients support metabolism and drainage. Cortisonum aceticum assists in cases of iatrogenic damage from corticosteroids and chronic stress.

Traumeel S: An anti-inflammatory that repairs blocked enzyme systems to stimulate healing.

Ubichinon compositum: Provides metabolic support.

Authors' suggested protocols

Nutrition

Immune and skin support formulas: 1 tablet for every 25 pounds of body weight BID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Chinese herbal medicine/acupuncture

The author recommends Formula H52 ImmunoDerm and H67 DermGuard at a dose of 1 capsule each for every 10 to 20 pounds. It may be necessary to initially use antibiotics or shampoos to control secondary infections. In addition to the herbs discussed above, these preparations contain scutellaria (*Huang Qin*), fleece flower root (*He shou wu*), siler (*Fang feng*), tokoro (*Bi xie*), schizonepeta (*Jing jie*), dandelion (*Pu gong ying*), oldenlandia (*Bai hua she cao*), kochia (*Di fu zi*), xanthium fruit (*Cang Er zi*), bitter orange (*Zhi ke*), angelica radix (*Dang gui*), buffalo horn shavings (*Sui Niu jiao*), earthworm (*Di long*), silk-worm (*Jiang can*) and cnidium (*Chuan xiong*).

The recommended acupuncture points are LI4, LI11, ST36, SP6, GB34, and SP10 (Handbook of TCM Practitioners 1987).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

Symptom formula: Schwef-Heel and/or Graphites homaccord, Psorinoheel, and Abropernol used for 2 to 4 weeks BID.

Detoxification formula (Excretion and Inflammation phase cases): Lymphomyosot, Nux vomica homaccord, and Berberis homaccord BID for 30 days; then re-evaluate case.

Detoxification formula (Deposition, Impregnation, Degeneration, and Dedifferentiation phase cases): Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, and Thyroidea compositum every 3 days for 30 to 120 days or until case change ceases. Then shift to Detox Kit for 30 days. Further use of Deep Detoxification is indicated in chronic cases.

MANGE (DEMODECTIC/SARCOPTIC)

Definition and cause

Demodex is a localized or generalized parasitic disease caused by *Demodex* spp. mites. The underlying cause is believed to be genetic or related to immune deficiency or imbalance. In cats it is most often associated with other systemic disease such as FIV. Sarcoptic mange is a highly pruritic parasitic disease caused by the mite *Sarcoptes scabiei* (Ackerman 1994, Griffin 1993, Medleau 2003, Scott 1995, Rhodes 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

For demodex the medical therapies of choice are Amitraz, Ivermectin, or Milbemycin, all of which have potential side effects and are potentially toxic. Amitraz is particularly toxic to humans, and proper precautions should be taken to protect humans from exposure to its active ingredient. None of these treatments address the underlying immune imbalance. Therapy for sarcoptic mange involves mitocidal shampoos or dips along with the medications used in demodex, and/or the use of Selamectin. In addition, antipruritic medications such as antihistamines and corticosteroids are often recommended (De Jaham 1995, Griffin 1993, Medleau 2003, Rhodes 2003).

Anticipated prognosis

Localized demodectic mange usually carries a good prognosis. Generalized demodecticosis in immune-compromised animals often has a more guarded prognosis. Sarcoptic mange has a good prognosis (Griffin 1993, Medleau 2003, Rhodes 2003).

Integrative veterinary therapies

Mange is a nondescript term meaning infestation with one of several mite ectoparasites. These ectoparasites cause irritation through their waste products and physical injury to the host (burrowing), and by their physical presence on the host, which triggers various responses directed at

elimination of the mites (pruritus, grooming, self destructive behavior). Damage directly from the mite's activities and or from the host response leads to a worsening condition.

The integrative approach expands the medical therapy to include the immune system. The integrative approach is cellular protective for the potential toxic effects of medication and mitocidal dips, and helps improve immune function and its ability to rid the body or prevent reinfestation of the mites and lessens inflammation, pruritus, and discomfort.

Nutrition

General considerations/rationale

While medical therapy is focused locally upon destruction of the mite and the skin (inflammation and/or pruritus), the nutritional approach adds gland support for the organs of the immune system as well as nutrients to help decrease local inflammation and improve waste elimination. Because mange, especially demodex, can range in severity from local to generalized and can affect other organs, it is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This gives clinicians the ability to formulate therapeutic nutritional protocols to address the skin and organ involvement such as liver inflammation secondary to medication or chemical dips (see Chapter 2, Nutritional Blood Testing, for more information).

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus and lymph provide intrinsic nutrients and help neutralize cellular immune organ damage and protect organs from ongoing inflammation and eventual degeneration (See Chapter 2, Gland Therapy, for more information).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties, which appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune suppressing effects is beneficial in inflammatory skin conditions. Bouic (1996) reports on the immune-enhancing and balancing effect that plant sterols have on the body.

Quercetin: Quercetin functions like an antihistamine and an antioxidant, and is beneficial for the skin. In its antihistamine role, quercetin has been shown to inhibit cells from releasing histamines, which makes it helpful in treating inflammatory dermatitis (Middleton 1986, Ogasawara 1985).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral for cellular membranes. It is an essential nutrient required by the skin, which is the body's largest cellular organ (Hanin 1987).

Essential fatty acids: Much research has been conducted on the importance of essential fatty acids on the clinical management of allergic dermatitis. In addition, the importance of the ratio between omega-6 and omega-3 fatty acids has been substantiated. Research on the use of polyunsaturated fatty acids has shown their beneficial and antipruritic effects on skin (Reinhart 1996, Schick 1996).

Vitamin C: De la Fuente (1998) and Penn (1991) showed that vitamin C in combination with other vitamins significantly improved immune function as compared with a placebo.

Chinese herbal medicine/acupuncture

General considerations/rationale

Mange is a result of parasites in both Western and TCM theory. Both modalities have the same treatment objectives: kill the parasite, decrease discomfort, and prevent secondary infections. It may also be prudent in some patients to improve immune function to allow the patient to clear the parasite.

Appropriate Chinese herbs

For topical application:

Alumen (Ming fan): Has been shown to inhibit bacterial growth (Chang Yang Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995), which may help to prevent secondary bacterial infections in lesions caused by scratching.

Cnidium (She chuang zi): Has antibiotic properties (Zhong Yao Xue 1998). It also decreases itching. In a study involving 607 patients with severe pruritis, it stopped itching in 84% of the participants (Lin Chuang Pi Fu Ke Za Zhi 1983).

Prickly ash (Hua jiao): Possesses antibacterial and anti-dermatophyte properties (Zhong Yao Xue 1998). This may help prevent secondary infections.

Realgar (Xiong huang): Has traditionally been used to kill internal and external parasites by TCM practitioners. It has been shown to treat pinworms and malaria (Zhong Cheng Yao Yan Jiu 1982, He Bei Zhong Ye 1988), which are internal parasites. The efficacy shown against internal parasites suggests that it would also be effective topically against external parasites.

Sulfur (Liu huang): Is commonly used topically in Western medicine for mange, often as a lime sulfur dip. It has been used as a component for the treatment of psoriasis (Liu 1999).

For immunosuppression:

Angelica root (Dang gui): Increases the phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978).

Astragalus (Huang qi): Stimulates the cellular and humoral immune systems. It contains astragalin, which enhances phagocytic activity of macrophages and antibody synthesis (Jiao 1999).

Codonopsis (Dang shen): Enhances the immune system by increasing the weight of the spleen and thymus and the total number of white blood cells and lymphocytes. (Huang 1994).

Dioscorea (Shan yao): Enhances both the cellular and humoral immune systems (Miao 1996).

Fleece flower root (He shou wu): Increases the total white cell count, especially the T-cells, and increases the phagocytic activity of macrophages (Zhong Yao Yao Li Yu Lin Chuang 1989).

Licorice (Gan cao): Can enhance the phagocytic activity of macrophages (Zhong Yao Xue 1998).

Lotus seed (Lian zi): Was shown to increase the number of T cells in the thymuses in mice (Ma 1995), which implies that it may be useful in treating immunosuppression.

Poria (Fu ling): Contains pachman, which increases the phagocytic function of macrophage (Lu 1990).

Psoralea (Bu gu zhi): Stimulates the phagocytic actions of macrophages (Wang 1990).

Rehmannia (Shu di huang): Increases the phagocytic activity of macrophages (Cao 1989).

Schizandra (Wu wei zi): Can prevent cyclophosphamide-induced decrease in the white blood count (Li 1995, Qu 1996).

White atractylodes (Bai zhu): Increases the TH cell count and the TH/TS ratio (Xu 1994). It increases the phagocytic function of macrophages (Tang 1998).

Wolfberry (Gou qi zi): Increases the phagocytic activity of macrophage phagocytic and raises the total T cell count (Zhong Cao Yao 19(7)).

Zizyphus (Suan zao ren): Enhances cellular and humoral immunity (Lang 1991).

Homotoxicology

General considerations/rationale

A genetic predisposition (Degeneration Phase) is involved with demodectic mange, and affected individuals should not be used for breeding.

Palmquist relies on conventional therapy to treat most of these (lyme dip and Ivermectin in breeds which can tolerate the drug), but in certain cases it may prove helpful to support immune function, detoxification, and repair of tissues injured by homotoxins. Antihomotoxic agents may have a place in therapy in such cases. The authors are unaware of any work reporting single use of homotoxicology in the management of veterinary mange cases.

Appropriate homotoxicology formulas

BHI-Hair and -Skin: May help repair skin and hair in recovery phase and detoxification, provide support in cases of damage from vaccines, and promote vicariation of chronic diseases (Heel 2002).

BHI-Skin: Treats eczema on elbows, scaly scratchy dermatitis, ulcerations, and urticarial reactions (Heel 2002).

Coenzyme compositum: Contains cis-Aconitum acidum for pruritus, skin diseases, and psoriasis (Reckeweg 2002). Several of the active skin catalysts in *Coenzyme compositum* are common to *Cutis compositum*.

Cutis compositum: Provides support of all skin conditions. This is a critical skin remedy, named primarily for *Cutis suis*, and indicated in allergic reactions, dermatoses, eczema, seborrheic conditions, pemphigus, psoriasis, dermatomycoses, neurodermatitis, and other skin conditions, as well as disturbances of renal excretion. Contains Ichthyolum, which has pustular acne and violent pruritus (facial) as its main indications. Ichthyol ointment serves to soften and clear out abscesses and is a stimulative treatment in inflammations. Sulphur is also a critical component (See *Sulphur-Heel*). The remedy contains Cortisone in homeopathic dilution, which is indicated for diseases manifested in the connective tissue, such as disorders of the skin, blood, and vascular systems. Fumaricum acidum, Alpha ketoglutaricum, and Natrum oxalaceticum included are for pruritus, skin diseases, and psoriasis. These catalysts are also found in *Coenzyme compositum*. Funiculus umbicalis suis is indicated for rehabilitation of tissue. This is a connective tissue remedy indicated in almost all chronic diseases. It repairs damage to connective tissue, and is used for psoriasis, skin eruptions, and dermatitis (Reckeweg 2002).

Echinacea compositum: Used for secondary infections. Arsenicum is indicated for skin eruptions and other symptoms of a stubborn nature that may border on the phase of Degeneration (Reckeweg 2002). It also contains Sulphur (see *Sulphur Heel*) and Cortisonum acidum (see *Cutis compositum*).

Engystol N: Is immune supportive in allergic and viral cases, and contains sulfur, which is indicated in chronic issues.

Graphites homaccord: Treats pigmented, greasy lesions without hair.

Hepar compositum: Improves detoxification status by its action on the liver.

Psorinoheel: A phase remedy in Excretion and Impregnation cases. Psorinum is an extract of scabies mange excretions and has been used in classical homeopathy for many years. This also contains Sulfur, which is indicated in chronic conditions (see *Sulphur-Heel*). May be helpful in so-called constitutional cases.

Schwef-Heel: Works through its higher potency of Sulfur.

Solidago compositum: Used in Deposition phases, this remedy assists the skin by its support of the kidney.

Sulphur-Heel: Primarily named for the contained remedy, Sulphur, known for its use in various skin dis-

eases, especially those of chronic nature, and pruritic eczema and suppurative skin diseases. Sulphur is one of the most important components of tissue in the body. Therefore, Sulphur is the major remedy in practically all cellular phases, particularly in the Impregnation Phase, which still displays a tendency to turn regressive. This also contains Mezereum, which is useful for pruritic skin irritations and skin suppuration, and has several other skin-active remedies as components.

Traumeel S: Treats inflammatory lesions with much inflammation.

Authors' suggested protocols

Nutrition

Skin and immune support formula: 1 tablet for every 25 pounds of body weight BID.

Lymph support formula: One-half tablet for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID. (maximum 2 capsules BID.)

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Eskimo fish oil: One-fourth to 1 teaspoon per meal for cats. 1 teaspoon for every 35 pounds of body weight per meal for dogs.

Oil of evening primrose: 1 capsule for every 25 pounds of body weight SID.

Additional vitamin C: 100 mg for every 25 pounds of body weight BID.

Quercetin: 50 mg for every 10 pounds of body weight SID.

Chinese herbal medicine

To kill the mites, the authors use a combination of sulfur (Liu huang), 30g; realgar (Xiong huang), 15g; Alumen dehydratum (Ming fan), 45g; prickly-ash (Hua jiao), 25g; and Cnidium seed (She chuang zi), 25g. Mix well and apply topically daily for 2 to 3 weeks (Yu Chuan, Chen Zi Bin 2000).

The authors also recommended H7 Immune Stimulator for 6 months in conjunction with Mitaban dips, daily Interceptor, Ivermectin, or herbal parasite dips to counteract immunosuppression. The H7 ImmuneStimulator is dosed at 1 capsule for every 10 to 20 pounds twice daily. In addition to the herbs mentioned above, Immune Stimulator contains euryale (Qian shi), longan fruit (Long yan rou), saussurea (Mu xiang), and white peony (Bai shao). These herbs increase the efficacy of the formula.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO small dog or cat)

Psorinoheel and Schwef-Heel: Mixed and given twice daily orally.

Cutis compositum: Given initially, and then as needed.

Autosanguis Therapy:

1. Traumeel
2. Hepar compositum
3. Galium-Heel
4. Cutis Heel
5. Ubichinon compositum

Oral cocktail: Schwef homaccord, Psorinoheel, and Lymphomyosot, plus the remains of autosanguis in a syringe, taken orally BID to TID.

Echinacea compositum forte tabs: Use if needed.

Ivermectin: Give PO daily in breeds that can tolerate the drug.

Nutraceuticals: AFA Algae, GlutaDMG, vitamin E, fatty acids.

Chapter Eleven

Diseases of the Digestive System

GINGIVITIS

Definition and cause

Gingivitis is an inflammation of the gingival tissues and is common in both dogs and cats. The inciting cause is bacterial accumulation in the gingival space in combination with the animal's immune response and competence. Bacterial growth results in the production of endotoxins, which lead to further inflammation, tissue destruction, and progression of gingivitis to more serious oral pathology. In addition to bacterial accumulation, plaque (a film on the teeth composed of bacteria, saliva, food, and leukocytes) accumulates, causing additional inflammation and deposition of tartar. The result is a progressive irritation and inflammatory process that can lead to periodontal disease if not addressed (Colmery 1986, Harvey 1993, Jensen 1995, Klein 2003, Marretta 2001, West-Hyde 1995, Wiggs 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment is multifaceted; prevention is the most effective means of control. Preventive measures include regularly scheduled oral prophylaxis, home brushing with enzymatic products, use of plaque-reducing dentifrices such as lactoperoxidase, cleaning of the periodontal space, use of cortisocoterioids and antibiotics as needed, and proper extraction of diseased teeth, which usually are more properly related to periodontal disease. Improved nutrition and supplemental vitamins and minerals are also recommended (Harvey 1993, Klein 2003, Marretta 2001).

Anticipated prognosis

Gingivitis is reversible if properly treated early in its course. Prognosis is more guarded once periodontal disease begins (see Stomatitis/Periodontal Disease, below).

Integrative veterinary therapies

An integrative approach to gingivitis involves early recognition of the inflammatory process and aggressive institution of preventive measures before the condition progresses to a chronic state, such as generalized stomatitis and/or periodontal disease (see below).

In addition to the local inflammatory process, there is a systemic aspect to gingivitis, stomatitis, and periodontal disease. The chronic inflammation and localized infection can predispose and cause inflammation and infection in other organ systems such as the heart, kidney, and gastrointestinal tract. It is therefore important in an integrative approach to view the entire body and offer medical therapy when indicated, as well as nutritional, herbal, and homeopathic support systemically. Using early gingivitis as an "alarm" to address the beginning of an inflammatory/degenerative internal process (as opposed to the gingivitis being an external condition) helps to control the local inflammation and prevent the beginnings of systemic degeneration.

Nutrition

General considerations/rationale

The nutritional approach to oral health consists of reducing inflammation, treating secondary infections, preventing of local, cellular auto-immune processes, and improving immune competency.

Appropriate nutrients

Nutrition/gland therapy: Nutrition and glandular adrenal, thymus, and bone marrow can help to neutralize a cellular immune attack, provide antioxidants to reduce inflammation, and provide specific nutrients to help prevent infection (see Gland Therapy, Chapter 2, for more detailed information).

Coenzyme Q10: Coenzyme Q10 is a strong antioxidant that helps to reduce the associated inflammation that is the precursor to many chronic diseases. CoQ10 has indications in the prevention and treatment of gingivitis and periodontal disease (Gaby 1998, Shigeta 1966).

With regards to periodontal disease, double-blind clinical trials show that people who supplemented with Coenzyme Q10 had improved results as compared to those taking only a placebo (Gaby 1998). Research suggests that periodontal disease is directly linked to a Coenzyme Q 10 deficiency (Nakamura 1973). In addition, double-blind studies show that people who supplemented with 50 mg daily for 3 weeks showed a significant reduction in the symptoms of periodontal disease (Wilkinson 1976).

Vitamin C: Vaananen (1993) showed that people who are vitamin-C-deficient are more prone to periodontal disease. Aurer-Kozelj (1982) showed that increasing the daily dose of vitamin C from 20 mg to 35 mg to 70 mg showed a significant improvement in periodontal disease.

Folic acid: Folic acid, both as a topical rinse and taken systemically, has been clinically proven to be beneficial in reducing inflammation and helping to stop bleeding in people with gingivitis and periodontal disease (Pack 1984; Vogel 1976, 1978).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties which appear to be similar to corticosteroids (Gupta 1980). A cortisone-like effect without the associated immune suppressing effects is beneficial in immune mediated conditions (Bouic 1996).

Chinese herbal medicine/acupuncture **General considerations/rationale**

Gingivitis is considered to be caused by Heat rising from the Stomach. The Stomach “opens” to the mouth, according to traditional Chinese Medicine. This means that disease processes in the Stomach may be reflected in the mouth. Heat in the Stomach can cause red, irritated, inflamed gingiva. We now know that the “heat” is locally produced by reaction to bacteria in the oral cavity, not in the stomach. Treatment is aimed at relieving the inflammation and irritation and modifying the intraoral bacterial population.

Appropriate Chinese herbs

Cinnamon twig (Gui zhi): Inhibits the formation of plaque on the teeth. One study of 60 human subjects found a 44% decrease in bacterial plaque index. It also decreases pain from oral pathology (Wu 1998).

Dandelion (Pu gong ying): Has demonstrated antibacterial efficacy against a variety of bacteria (Zhong Yi Yao Xue Bao 1991). It may also possess anti-inflammatory actions (Mascolo 1987), which may decrease inflammation in the gingival.

Eclipta (Han lian cao): Has shown antibiotic properties (Xin Hua Ben Cao Gang Mu 1990).

Forsythia (Lian qiao): Inhibits the growth of many types of bacteria. In addition it has anti-inflammatory and

analgesic properties (Ma 1982), which may help to decrease bacterial contributions to the stomatitis while soothing the gums.

Gypsum (Shi gao): Was used in a study consisting of 126 human patients with inflammatory diseases. Most showed improvement (Zhong Hua Wai Ke Za Zhi 1960). This may be applicable to gingivitis if the effects are seen on gingival tissue.

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid which have anti-inflammatory effects. These components have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). Many Western practitioners use corticosteroids to decrease the inflammation of the gingiva.

Peach kernel (Tao ren): Has anti-inflammatory effects (Liu 1989, Zhong Yao Tong Bao 1986). It can promote recovery from injury by increasing the partial pressure of oxygen in tissues by increasing blood flow in the micro-circulation of ischemic skin (Zhao 1996). In addition, the increased partial pressure of oxygen may inhibit the growth of anaerobic bacteria, which are common oral pathogens.

Rehmannia (Sheng di huang): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Scrophularia (Xuan shen): Inhibits many types of bacteria (Chen 1986, Zheng 1960).

Scutellaria (Huang qin): Contains biacalin, which has antibiotic activity against multiple bacteria on its own and is synergistic with penicillin-type antibiotics (Zhong Yao Xue 1988, Liu 2000). Two components, baicalin and biacalein, have been shown to suppress inflammation in mice and rats (Kubo 1984, Cao 1999). It also enhances cellular immunity (Pan 1991), which may help clear any bacterial cause of gingivitis.

Trichosanthes (Tian hua fen): Has been shown to inhibit bacterial growth (Zhong Yao Yao Li Yu Ying Yong 1983).

Viola (Zi hua di ding): Has antibacterial properties (Zhong Hua Yi Xue Za Zhi 1962).

Yi yi ren (coix): Has anti-inflammatory effects. It prevents dimethylbenzene-induced ear swelling and carrageenin-induced foot swelling in mice (Zhang Ming Fa 1998). A study of 26 women with severe menstrual cramps found that treatment with coix was highly effective at decreasing pain (Zhang Yong Luo 1998). This implies that it may be efficacious in treating the pain associated with gingivitis.

Acupuncture

The National Institutes of Health Consensus Panel on Acupuncture has listed dental pain under the category of “well demonstrated evidence of effectiveness” (Sierpina 2005).

Homotoxicology

General considerations/rationale

Gingivitis is an Inflammation Phase homotoxicosis. Gingivitis is usually a reversible condition arising from the accumulation of plaque and tartar on the surface of the tooth. Stomatitis, which is dealt with later in this text, is a more chronic form that can mimic gingivitis but represents phases to the right of the Inflammation Phase. One interesting piece of research indicated that early-age neutered cats may experience reduced incidence of gingivitis (Spain, Scarlett, Houpt 2004).

Homotoxin accumulation on dental surfaces and within dental structures can increase the viscosity and adherence of plaque and lead to alteration of oral health. (Papadimitriou, et al. 2006) It can further alter the character of saliva, which is an important portion of the greater defense mechanism in oral health and disease. Proper diet and gingival hygiene from chewing and at-home dental care can greatly reduce this condition. Chewing hard substances physically removes particles that supply substrate for bacterial growth (Brown, McGenity 2005). It also causes the release of enzymes and immune substances contained in normal salivary secretions.

Regular dental prophylaxis resolves gingivitis and is the treatment of choice. Use of dental sealant is gaining popularity in veterinary dentistry. (Gengler, et al. 2005). Such compounds concern homotoxicologists because the most common product has been shown to decrease accumulation of tartar, but its long-term effects on organs of elimination have not been illustrated. In nutritional supplements, waxes and other agents used for manufacturing tablets have been associated by holistic doctors with aggravation of liver disease and intestinal difficulties.

It is tempting to attempt treating gingivitis with other agents, particularly when clients fear routine dental prophylaxis due to anxiety over anesthesia. Anesthesia-free prophylaxis can be done on some cooperative pets, but the American Veterinary Dental Association frowns on such practices because a full mouth prophylaxis is truly impossible to do on most unsedated animals. However, it may have usefulness in clinical practice and the number of practices offering this service seems to be growing.

Dental rinses may assist in increasing the interval between anesthetized procedures (Girao, et al. 2003). Several products claiming efficacy are available on the Internet and in pet stores. No controlled studies exist for most of these products, and when Palmquist contacted one of these companies he was not welcomed in his efforts to design and implement a study on the product's effectiveness. It may be that these products have great applicability, but for now the evidence is lacking and research would be welcomed. Many companies do not fully disclose ingredients and veterinarians have rightly expressed concern over product quality and safety for this reason.

Antihomotoxic medications can be used to assist gingivitis patients for short periods of time. However, it is important that clients be informed of the importance of proper dental cleaning and home care, and the inevitable progression toward periodontal disease and eventual tooth loss, as well as the potential for disease in other organs such as the heart, liver, renal system, and joints. Most clients who properly understand this opt for proper dental care on a regular basis.

Appropriate homotoxicology formulas

Belladonna homaccord: Used for right-sided intensely red tonsillitis, pharyngitis, poor appetite, nausea and vomiting, stinging rectal pain, and focal and intense inflammatory lesions (Boericke 1927). It is more appropriate for severe gingivitis that probably represents stomatitis changes.

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis. Also treats scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in umbilical area; and distension.

Nux vomica homaccord: Treats liver and gastrointestinal disease. Useful in gingivitis (Reckeweg 2002) and after smoke inhalation. Commonly used formula for detoxification as part of the *Detox Kit*.

Traumeel S: An anti-inflammatory agent that promotes healing and modulates inflammation (Reckeweg 2000).

Ubichinon compositum: Contains Anthraquinone for swelling of gums and for GI symptoms such as distention, flatulence, and cramping abdominal pain. Also treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Immune and gingival/mouth support formulas: 1 tablet for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID. (maximum 2 capsules BID.)

Coenzyme Q10: 25 mg for every 10 pounds of body weight daily.

Additional vitamin C: 100 mg for every 25 pounds of body weight BID.

Folic acid: 50 micrograms for every 35 pounds of body weight (maximum, 200 micrograms).

Chinese herbal medicine/acupuncture

Formula H59 Ulcerative Gingivitis: 1 capsule per 10 to 20 pounds twice daily to effect. This supplement also contains globe thistle (Luo Lu), imperata (Bai mao gen),

and mirabilitum (Mang xiao) to increase the efficacy of the formula.

Recommended acupuncture points include LI11, GB20, KI3, ST6, and ST7 (Handbook of TCM Practitioners, Oct 1987).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Belladonna homaccord, Traumeel, and Nux vomica Homaccord: Mix together and give orally TID in conjunction with proper dental hygiene and professional cleaning. Give Ubichinon compositum every other day, in alternation with Coenzyme compositum if more chronic signs occur (see Stomatitis protocol, below).

STOMATITIS/PERIODONTAL DISEASE

Definition and cause

Stomatitis represents an inflammatory condition of the oral cavity, and occurs in both dogs and cats. Mucosal inflammation in stomatitis can be generalized or focal involving any region of the mouth. This is a descriptive diagnosis. Successful therapy depends upon an accurate diagnosis, which means that diagnostic processes are usually necessary (Baker 2003, Harvey 1993).

In this text we represent stomatitis and periodontal disease as the more chronic version of gingivitis, whereby the local tissue and the immune system and its response have progressed to the next phase of disease and continual vigilance and a combination of medical and alternative therapies may be required. In addition, because of the chronicity, other organs and systems may be in a similar state of inflammation and degeneration (see Gingivitis, above, for a more detailed description of the inflammatory process).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Correction of underlying causes is essential for control. Treatment of periodontal disease (See gingivitis for medical rationale), removal of infected teeth, correction of nutritional deficiencies, and use of antibiotics to control infection and corticosteroids to reduce inflammation are all indicated (Baker 2003, Lyon Wiggs 1997).

Anticipated prognosis

Prognosis is related to the underlying cause, the compliance of treatment, and the animal's immune status. In a chronic condition, there is often associated degeneration secondary to inflammation and or infection in other organ systems, which can affect the prognosis (Baker 2003).

Integrative veterinary therapies

The oral cavity contains a wealth of autonomic nerve fibers and is integrated into the central control centers. Gastrointestinal, immune, neurological, endocrine,

musculoskeletal, and vascular elements smoothly coordinate a large number of vital functions.

From a phylogenetic viewpoint this makes sense, as the jaw and tongue appear to originate with the development of bivalves. Neurological supply and coordination through the modern tongue and the bivalve's muscular foot are similar in function. Numerous chemoreceptors exist in the mouth and transmit information to the brain, which in turn coordinates secretion of gastrointestinal organs of digestion, as well as hormonal events and blood supply.

The "DAMN IT" acronym is useful in approaching diagnosis of stomatitis (each letter stands for the following potential categories of disease causation: Degenerative, Anatomic, Metabolic, Nutritional, Neoplastic, Immune-mediated, Idiopathic, Infectious, Traumatic, and Toxic). A careful examination and history are necessary in all cases. Anatomic issues can predispose to development due to failure of the form to function properly. As an example, anatomic errors such as cleft palate, missing teeth, and malocclusion can lead to drying or damage of the mucosa and subsequent alteration of structure. Regional inflammations may reflect localized dental disease such as trauma (injury, electrical injury, foreign bodies, or envenomization), cervical dental lesions in cats, or periodontal disease in both cats and dogs.

Generalized patterns suggest systemic issues such as metabolic problems (diabetes, hypothyroidism, Cushing's disease, hypoparathyroidism, hepatopathies, or renal disease), toxicities (chemotherapy, radiation therapy, caustic chemical exposure, metal poisoning, or phytotoxins), infectious immune disease (periodontal disease, bacterial infection, fungal infection, and viral infection), noninfectious immune disease (pemphigus vulgaris, systemic lupus, and other auto-aggressive conditions), nutritional diseases (poor nutrition or vitamin A toxicity), neoplasia (epulis, squamous cell carcinoma, melanoma, fibrosarcoma and osteosarcoma), and idiopathic issues (eosinophilic stomatitis, plasmocytic stomatitis, and vasculitis of other causes) (White, et al. 1992, Declercq 2004, Baird 2005, Leiva 2005, Lyon 2005).

Laboratory evaluation is suggested in any case that fails to resolve or recurs. Testing for common etiologies can be helpful (FeLV, FIV, Bartonella, Leptospira, etc.).

The integrative approach to stomatitis and periodontal disease is to focus both locally and systemically. The use of therapeutic nutrition, medicinal herbs, and homotoxicology remedies either alone or in combination with medications such as antibiotics and cortisone may be required. The combination of therapies gives the clinician the opportunity to not only control local disease but also to prevent and control secondary disease and auto immune processes that were borne from the inflammatory process in the mouth.

Nutrition

General considerations/rationale

Therapeutic nutrition must be multifaceted and address the inflammatory process in the mouth along with immune system support. Note: Because stomatitis and periodontal disease often act as the nidus for the initiation of inflammation and disease in other organs, it is recommended that the clinician evaluate the blood both medically and physiologically to determine real and impending organ involvement and disease (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutrition/glandular: In addition to the nutritional remedies recommended in the gingivitis protocol (vitamin C, folic acid, betasitosterol, and coenzyme Q10), the following is recommended:

Colostrum: Colostrum has been shown to improve intestinal health and digestion and help balance intestinal flora. In addition, colostrum can improve the immune status of the intestinal tract, which can, via intestinal production of globulins, help the overall immune competency of the body (Blake 1999). In addition, Giannobile (1994) showed that there is significant improvement in healing from surgery and improved osseous formation and periodontal regeneration in dogs supplemented with a combination product that contained colostrum.

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM, stomatitis is caused by Heat rising from the Stomach and Spleen, leading to Yin deficiency. This causes oral mucosal damage. The Stomach opens to the Mouth, in TCM theory. When there is Heat, or inflammation in the Stomach, the Mouth, as the associated organ, may manifest the inflammation. This is revealed as red, swollen gingiva. Long-term inflammation damages the fluids (Yin), which upsets the balance between the Yin and Yang. The decrease in Yin makes the Yang seem excessive. More Yang means more Heat (inflammation). This, in Western terms, can be described as inflammatory mediators creating more inflammation, and worsening rather than resolving the condition. Thus, stomatitis tends to be chronic. Therapy is aimed at decreasing the inflammation and removing or controlling the cause of the inflammation.

Appropriate Chinese herbs

Alisma (Ze xie): Enhances immunity and decreases inflammation (Dai 1991).

Anemarrhena (Zhi mu): Increases the corticosterone level in serum and decreases inflammation (Chen 1999).

Angelica (Dang gui): Has anti-inflammatory action (Yao Xue Za Zhi 1971), yet does not cause immunosup-

pression. In fact, it increases phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978).

Cinnamon (Rou gui): Normalizes the immune system. It decreases production of nonspecific antibodies (Zeng 1984). At the same time it increases the reticuloendothelial system's ability to phagocytize foreign material (You Tian Zheng Si 1990). It has been proven to have anti-inflammatory effects on both acute and chronic inflammatory conditions (Li 1989).

Crataegus (Shan zha): Enhances immunity. It increases serum lysozyme levels, serum antibody levels, and T cell activity (Jin 1992). It also has direct antibiotic activity on some bacteria (Guang Xi Zhong Yi Yao 1990, Hao 1991).

Forsythia (Lian qiao): Reduces edema and inflammation by decreasing capillary permeability (Ke Yan Tong 1982). It has demonstrated antiviral and antibacterial effects (Zhang 2002, Ma 1982).

Honeysuckle (Jin yin hua): Has antibacterial activity, mainly due to chlorogenic acid and isochlorogenic acid (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). Anti-inflammatory effects have been demonstrated experimentally in rabbits and mice (Shan Xi Yi Kan 1960).

Isatis root (Ban lan gen): Possesses antiviral activity (Wang 1997, Jiang Xi Yi Yao 1989, Li 2000). In some cases it is as effective as ribavirin (Jiang 1992). It also has antibacterial efficacy (Zhong Cheng Yao Yan Jiu 1987). In addition to direct effects on pathogens, isatis root also stimulates the immune system. It seems to affect both humoral and cellular immunity (Xu 1991).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid. These chemicals have approximately 10% of the steroid effects of cortisone (Zhong Cao Yao 1991). In addition, glycyrrhizin has shown activity against several viruses and therefore may be of use in viral-mediated stomatitis (Zhu 1996).

Ophiopogon (Mai dong): Has demonstrated the ability to inhibit several types of bacteria (Zhong Yao Xue 1998).

Oriental wormwood (Yin chen): Contains capillarin, which has anti-inflammatory properties (Wan 1987, Shan 1982).

Phellodendron (Huang bai): Has antibacterial actions against a variety of bacteria (Zhong Yao Xue 1998, Zhong Yao Da Ci Dien 1977, Zhong Cao Yao 1985).

Plantain seeds (Che qian zi): Decrease inflammation by decreasing capillary permeability (Zhang 1996).

Red peony (Chi shao): Stimulates cellular immunity by enhancing proliferation of T cells (Fan 1992).

Rehmannia (Sheng di huang): Increases the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998). This may increase the amount of cortisol in circulation, and corticosteroids are commonly used to treat stomatitis by Western practitioners. Rehmannia has been shown to

reduce swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Scrophularia (Xuan shen): Inhibits many strains of bacteria (Chen 1986, Zheng 1952).

Sophora root (Shan dou gen): Stimulates the humoral immune system, resulting in increased levels of IgM and IgG (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1989). It also has activity against several types of bacteria (Xian Dai Shi Yong Yao Xue 1988).

Homotoxicology

General considerations/rationale

Early presence of homotoxins leads to reaction by the mucosal elements in the form of Inflammation Phase disease. The mucosa recovers rapidly if these homotoxins are removed. This makes a massive case for early and aggressive home care, as well as competent professional prophylaxis. As homotoxins accumulate and are deposited the oral mucosal structure, function becomes altered. In Impregnation Phase homotoxicoses we see chronic and poorly responsive disease forms, which may not recover fully and frequently recur, frustrating client and veterinary professional alike. These conditions can progress into Degeneration Phase disease and resultant tooth loss. Degeneration Phase disorders include congenital malformation of the mouth and associated structures. Some homotoxins may lead to neoplastic changes in Dedifferentiation Phase disease.

Because most cases represent advanced homotoxicoses, management of the chronic condition, rather than cure, is often a realistic treatment goal. Some cases resolve early and represent Excretion or Inflammation phase conditions, but most cases involving cats and elderly pets involve more significant disease. Consultation with an internist or veterinary dentist may prove helpful in cases that are poorly responsive. In addition to good quality dental and internal medicine practices, homotoxicology may assist these pets. Most need long-term detoxification and symptom support. A proper diet consisting of limited antigen diets can assist some cases, and this may be associated with true allergic responses as well as adverse reactions to food ingredients or additives. The author has seen several cases improve when a raw food diet of limited ingredients is fed. Clients opting for biological therapy should be informed that some cases will not respond, while other cases will begin to respond after therapy lasting more than a year, especially when they have been kept on the Deep Detoxification Formula for several months.

Pulsatilla compositum and Traumeel are used in regulation rigidity cases, and stomatitis frequently fits this description of a disorder that is unchanging or poorly responsive. These agents can sometimes shift cases toward healing. Engystol N seems helpful and makes one wonder

about impregnated viral particles, which may trigger chronic inflammatory pathways as the immune system attempts eradication of viral elements from chronically infected tissues. Feline immunodeficiency virus, Feline leukemia virus, feline calicivirus, and Feline herpes virus may cause disease in this manner, but their individual roles are unclear (Hargis, Ginn 1999; Addie, et al. 2003; Harley, Gruffydd-Jones, Day 2003; Lommer, Verstraete 2003). Because such viral elements are present in vaccine components, research is warranted into the involvement of vaccinations in this condition, and at least some cases may be adverse reaction to vaccinations. Most holistic doctors advise reduced use of vaccinations when faced with chronic, unresponsive conditions, a practice which is in agreement with most manufacturers' written recommendation to avoid vaccinating unhealthy animals. This seems prudent considering what we currently understand about auto-aggressive pathogenesis.

So-called "Alternative Phase" disease can present as stomatitis. In these cases more severe disease lurks internally and signals its presence through inflammation near the body's exterior. Many homotoxins can damage the GI system's ability to perform its duties. Both toxins and other therapeutic agents can result in progressive vicariation. Corticoids and nonsteroidal anti-inflammatory drugs both damage intestinal mucosal elements. This can result in frank ulcer or in "leaky gut syndrome," which is linked to many other medical syndromes. In leaky gut, antigens are not properly digested into smaller molecular-weight polypeptides before gaining access to the immune system. This issue can lead to chronic inflammatory diseases such as inflammatory bowel disease and allergic syndromes, and, in this discussion, chronic stomatitis.

Successfully treating stomatitis involves providing a nonaggravating diet and clean water, while working at reducing stress, allowing homotoxins to be excreted successfully, supporting organ function, draining homotoxins, and providing metabolic support while repair occurs. Patients will be observed to cycle in and out of inflammatory states, and this is highly desirable. As in other discussions, the position of the patient on the phase table assists in determining proper therapy. In the first two phases, symptomatic treatment is often successful. As homotoxins gain deeper access and do further damage, the use of compositae class antihomotoxic agents becomes necessary to stimulate regressive vicariation.

Appropriate homotoxicology formulas

Anacardium homaccord: The namesake ingredient has been shown to have powerful anti-inflammatory and immunomodulatory effects (Ramprasath, Shanthi, and Sachdanandam 2006). Treats hunger pain, mucosal catarrh including laryngeal and pharyngeal inflammation, duodenal syndrome, constipation, oral vesicles, and

gastric/duodenal ulcers (Reckeweg 2000). Anacardium as an herbal extract has been shown to be antiviral against simian rotavirus (Goncalves, et al. 2005).

Arsuraneel: A cellular phase remedy that treats enteritis and diarrhea (*Arsenicum album*). May be useful in arsenic poisoning in areas with contaminated groundwater (Mallick, Mallick, Guha, and Khuda-Bukhsh 2003; Khuda-Bukhsh 2005). Also used in chronic disease, tumors of mucous membranes (*Marsdenia cundurango*), and diabetes mellitus (*Acidum phosphoricum*) (Reckeweg 2000).

Belladonna homaccord: Indicated in intensely red and inflamed conditions, especially Inflammation Phase conditions. Supports immune function.

BHI-Nausea: Contains *Anacardium orientale*, a potent anti-inflammatory agent.

Cantharis compositum: Contains *Arsenicum album*. Indicated in aphthous stomatitis; when the tongue is dry, red with raised papillae, and possibly coated white, brown, or black; and for violent gastroenteritis with prolonged vomiting and diarrhea, and with unbearable burning stomach-pains after eating. Also indicated for foul-smelling stools. Also contains *Mercurius solubilis*, indicated in ulcerative lesions of the mucous membranes, and *Hepar sulphuris calcareum* (Reckeweg 2002).

Coenzyme compositum: Contains *Citricum acidum*, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Echinacea compositum: When used in infection, supports the immune reaction, particularly in bacterial infections. It is a phase remedy for Inflammation Phase disease. For more advanced conditions consider *Tonsilla compositum*.

Engystol N: Used for viral origin gastroenteritis (see Parvovirus).

Galium-Heel: Used in all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Hepar compositum: Provides detoxification and drainage of hepatic tissues, organ support, and metabolic support. It is useful in most hepatic and gall bladder pathologies. It is also an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains *Natrum oxalaceticum* (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Indicated in nausea, stomach pain with a sensation of fullness, gurgling in abdomen, and cramping pain in the hypochondria. Also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Lymphomyosot: Provides lymph drainage and endocrine support to treat edema. Contains Gentiana for chronic gastritis. Treats flatulence; diarrhea; and distension of stomach with eructations, nausea, retching, and vomiting. The component *Geranium robertianum* is also useful for nausea, particularly after eating, with distension or sensation of fullness. *Myosotis arvensis* is also contained, which also has indications for bloat and distension (Reckeweg 2002).

Mercurius-Heel S: Used for viral and bacterial issues, suppuration, and tonsillitis (Reckeweg 2000).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, indicated for ulcers found on the gums, the tongue, the lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It contains Hydrastis, with mucosal support for oral problems such as stomatitis, mucosal suppuration accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002).

The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. It also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges. The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Boericke 1927). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra Homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is included in this broad remedy for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Treats liver and gastrointestinal disease. Useful in gingivitis (Reckeweg 2002). It is also used after smoke inhalation, and is a commonly used formula for detoxification as part of the *Detox Kit*.

Osteoheel: Provides support of bony healing and treats periostitis and periodontal disease.

Phosphor homaccord: Treats hepatitis, icterus, tenderness over the liver region, pancreatic diseases, ulcerated gums, thirst but vomiting right after drinking occurs, and pale-clay colored stools (Macleod 1983).

Psorinoheel: Used for chronic illness, and is an Impregnation Phase remedy.

Schwef-Heel: Treats chronic diseases of skin and liver. This remedy should be interposed in most skin and liver cases (Reckeweg 2000). Patients that need this remedy may look dirty and have scruffy skin conditions, red lips, white tongue with red tip, and an itching and burning rectal area with morning diarrhea and prolapsed rectum (Boericke 1927). Sulfur is contained in several other antihomotoxic formulas including *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Paeonia Heel*, *Proctheel*, *Psorinoheel*, *Sulfur-Heel*, *Thyroidea compositum*, and *Ubichinon compositum* (Reckeweg 2000).

Solidago compositum: Includes Berberis and other ingredients that support renal function. It is good in Deposition Phase cases.

Thyroidea compositum: A component of the Deep Detoxification Formula; drains matrix and supports endocrine function. It is a phase remedy for Impregnation Phase disease.

Tonsilla compositum: Supports immune organs in Impregnation, Degeneration, and Dedifferentiation phases.

Traumeel S: An anti-inflammatory. It also repairs blocked enzymes. It is used for regulation rigidity patients. Human studies show that it controls pain through speeded healing and homotoxin removal (Zorian, Larentsova, Zorian 1998).

Ubichinon compositum: Contains Anthraquinone for swelling of gums and GI symptoms such as distention, flatulence, and cramping abdominal pain. Also treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Immune and gingival/mouth support remedies: 1 tablet for every 25 pounds of body weight BID.

Betathyme: 1 capsule for every 35 pounds of body weight BID. (maximum 2 capsules BID)

Coenzyme Q10: 25 mg for every 10 pounds of body weight daily.

Additional vitamin C: 100 mg for every 25 pounds of body weight BID.

Folic acid: 50 micrograms for every 35 pounds of body weight (maximum, 200 micrograms).

Colostrum: One-third teaspoon of powdered formula for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H80 Gingival stomatitis/chronic: 1 capsule per 10 to 20 pounds twice daily. This formula is useful for acute or chronic gingival stomatitis of bacterial, viral, or immune-mediated etiology. In addition to the herbs cited above, H80 Gingival stomatitis/chronic contains aurantium fruit (Zhi qiao), dendrobium (Shi hu), imperata (Bai mou gen), malt (Mai ya), melia (Chuan lian zi), polyphorus (Zhu ling), and sweet wormwood (Qing hao). These additional herbs increase the efficacy of the formulation.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

In addition to proper dental, surgical, and medical management, consider:

Symptom formula: Traumeel S, Echinacea compositum, Mucosa compositum, and Cantharis compositum, mixed together and given TID orally. Consider the following as indicated: BHI-Nausea or Anacardium homaccord (oral vesicles), Osteoheel (periodontal disease and bone loss), Engystol N or Euphorbium compositum (viral conditions), Belladonna homaccord (acute inflammation with intense redness), Mercurius-Heel S (viral or bacterial infections), and Nux vomica homaccord (general gastrointestinal drainage and detoxification).

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum (alternate with Tonsilla compositum), Coenzyme compositum, and Ubichinon compositum.

TOOTH EXTRACTION

Definition and cause

Most common causes that necessitate tooth extraction are secondary to trauma or periodontal disease. Causes of periodontal disease include plaque, tartar, calculus buildup, and bacterial contamination. Underlying causes are related to genetic predisposition, age, and status of the immune system, as well as oral hygiene. Causes secondary to other disease such as neoplasia or parathyroid disease also occur. Signs range from mild redness and halitosis to purulent discharge, anorexia, and bleeding (Andreason 1981; Gorrel 1993, 1995, 2003; Harvey 1993; Wiggs 1997).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Tooth extraction is generally curative for local infections and generally requires antimicrobial and possible anti-inflammatory medications post-operative. Dietary recommendations include feeding a soft diet (Andreason 1981, Gorrel 2003, Wiggs 1997).

Anticipated prognosis

Traumatic injuries generally heal well postextraction. Extraction with early periodontal disease usually has a good prognosis, while more advanced periodontal disease has a more guarded prognosis. Oral tumors generally carry a poor prognosis.

Integrative veterinary therapies

An integrative approach to dental care emphasizes prevention. Because the most common cause of tooth extraction is periodontal disease, improvement of oral health directly impacts other organ systems such as the heart and kidney. While extraction is generally curative for the local condition, the integrative approach focuses upon general immune competence, the prevention of future periodontal disease, and avoiding tooth extractions.

Nutrition

General considerations/rationale

The nutritional approach to oral health consists of reducing inflammation, improving immune competency, and preventing infection.

Appropriate nutrients

Nutrition/gland therapy: Nutrition and glandular adrenal, thymus, and bone marrow can help neutralize a cellular immune attack and provide antioxidants to reduce inflam-

mation and specific nutrients to improve oxygenation (see Gland Therapy, Chapter 2, for additional information)

Coenzyme Q10: CoQ10 is a strong antioxidant and help reduce the associated inflammation that is the predecessor to many chronic diseases. It has indications in the prevention and treatment of chronic diseases such as gingivitis and periodontal disease (Gaby 1998, Shigeta 1966).

With regards to periodontal disease, double-blind clinical trials show that people who supplemented with Coenzyme Q10 had improved results as compared to those taking only a placebo (Gaby 1998). Research suggests that periodontal disease is directly linked to a Coenzyme Q10 deficiency (Nakamura 1973). In addition, double-blind studies show that 50 mg given daily for 3 weeks significantly reduced the symptoms of periodontal disease (Wilkinson 1976).

Vitamin C: Vaananen (1993) showed that people who are vitamin-C-deficient are more prone to periodontal disease. Aurer-Kozelj (1982) showed that increasing the daily dose of vitamin C from 20 to 35 mg to 70 mg showed a significant improvement in periodontal disease.

Chinese herbal medicine/acupuncture General considerations/rationale

Periodontal disease is due to Stomach Heat rising, and Qi, Blood, and Yin deficiency in the Kidney. The Stomach “opens” to the Mouth, according to Traditional Chinese Medicine. This means that disease processes in the Stomach may be reflected in the Mouth. Heat in the Stomach can cause red, irritated, inflamed gingiva. (We now know that the “heat” is locally produced by reaction to bacteria in the oral cavity, not in the stomach). The Kidney controls the bones, so when the Kidney suffers from Yin and Blood deficiency it means the bones may not be nourished by the normal fluids. As a result, the bone may degenerate. Deficient Kidney Qi means the bone is not strong enough to hold the teeth in place. The teeth loosen when periodontal bone degenerates.

Treatment is aimed at relieving the inflammation and irritation and modifying the intraoral bacterial population.

Appropriate Chinese herbs

Alisma (Ze xie): Has dual functions of enhancing immunity and decreasing inflammation (Dai 1991). Enhanced immunity controls overgrowth of oral bacteria.

Anemarrhena (Zhi mu): Increases the corticosterone level in serum and decreases inflammation (Chen 1999).

Angelica (Dang gui): Has anti-inflammatory action (Yao Xue Za Zhi 1971), yet does not cause immunosuppression. In fact, it increases phagocytic activity of macrophages (Zhong Hua Yi Xue Za Zhi 1978).

Cinnamon (Rou gui): Normalizes the immune system. It decreases production of nonspecific antibodies (Zeng 1984). At the same time it increases the reticuloendothelial system's ability to phagocytize foreign material (You Tian Zheng Si 1990). Cinnamon has been proven to have anti-inflammatory effects on both acute and chronic inflammatory conditions (Li 1989). It may help to decrease inflammation, yet not produce immunosuppression which would allow intraoral bacteria to proliferate and cause more destruction.

Crataegus (Shan zha): Enhances immunity. It increases serum lysozyme levels, serum antibody levels, and T cell activity (Jin 1992). In addition to its effects on immunity, it has direct antibiotic activity on some bacteria (Guang Xi Zhong Yi Yao 1990, Hao 1991).

Forsythia (Lian qiao): Reduces edema and inflammation by decreasing capillary permeability (Ke Yan Tong 1982). It has demonstrated antiviral and antibacterial effects (Zhang 2002, Ma 1982).

Honeysuckle (Jin yin hua): Has antibacterial activity mainly due to chlorogenic acid and isochlorogenic acid (Xin Yi Xue 1975, Jiang Xi Xin Yi Yao 1960). Anti-inflammatory effects have been demonstrated experimentally in rabbits and mice (Shan Xi Yi Kan 1960).

Isatis root (Ban lan gen): Possesses antiviral activity (Wang 1997, Jiang Xi Yi Yao 1989, Li 2000). In some cases it is as effective as ribavirin (Jiang 1992). It also has antibacterial efficacy (Zhong Cheng Yao Yan Jiu 1987). In addition to direct effects on pathogens, isatis root stimulates the immune system. It seems to affect both humoral and cellular immunity (Xu 1991).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid. These chemicals have approximately 10% of the steroid effects of cortisone (Zhong Cao Yao 1991). In addition, glycyrrhizin has shown activity against several viruses and therefore may be of use in viral-mediated stomatitis (Zhu 1996).

Ophiopogon (Mai dong): Has demonstrated the ability to inhibit several types of bacteria (Zhong Yao Xue 1998).

Oriental wormwood (Yin chen): Contains capillarin, which has anti-inflammatory properties (Wan 1987, Shan 1982).

Phellodendron (Huang bai): Has antibacterial actions against a variety of bacteria (Zhong Yao Xue 1998, Zhong Yao Da Ci Dien 1977, Zhong Cao Yao 1985).

Plantain seeds (Che qian zi): Decrease inflammation by decreasing capillary permeability (Zhang 1996).

Red peony (Chi shao): Stimulates cellular immunity by enhancing proliferation of T cells (Fan 1992).

Rehmannia (Sheng di huang): Increases the plasma levels of adrenocortical hormone (Zhong Yao Xue 1998). This may increase the amount of cortisol in circulation

and decrease inflammation in the oral cavity. Rehmannia has been shown to reduce swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Scrophularia (Xuan shen): Inhibits many strains of bacteria (Chen 1986, Zheng 1952).

Sophora root (Shan dou gen): Stimulates the humoral immune system resulting in increased levels of IgM and IgG (Guo Wai Yi Xue Zhong Yi Zhong Yao Fen Ce 1989). It also has activity against several types of bacteria (Xian Dai Shi Yong Yao Xue 1988).

Acupuncture

Liu Zhong, et al. (1996) treated 98 people suffering from chronic periodontitis with a combination of blood letting and acupuncture. The following acupuncture points were used: ST45, LI2, and KI3. After acupuncture, 1 ml of blood was removed from Li dui and Er jian. Sixty-three people had total resolution of signs, 29 people improved, and 6 people did not respond.

Homotoxicology

General considerations/rationale

Tooth extractions become necessary when the condition of the tooth and/or periodontal structures decline to the Degeneration Phase. At this point the best treatment is removal of the tooth because it no longer serves its vital function of mastication and protection and has taken on a toxic quality due to infection and loss of architecture. Good surgical technique, appropriate anesthesia, and pain management are recommended. Following surgery, antihomotoxic drugs can greatly improve patient comfort and surgical outcomes.

Appropriate homotoxicology formulas

Belladonna homaccord: Used for right-sided, intensely red tonsillitis; pharyngitis; poor appetite; nausea and vomiting; stinging rectal pain; and focal and intense inflammatory lesions (Boericke 1927). Also used for cholangitis (Reckeweg 2000).

Coenzyme compositum: Includes Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Echinacea compositum: The natural alternative to antibiotics, this formula supports improved immune function and is appropriate in any infection. It is a phase remedy for the Inflammation Phase.

Galium-Heel: Treats all cellular phases, hemorrhoids, and anal fissures, and is a detoxicant.

Gastricumeel: Treats acute gastritis. It includes Antimonium crudum, so it is indicated for tooth decay and toothache, and thus, may be useful when dental work is indicated (Reckeweg 2002).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis; flatulence; diarrhea; and distension of stomach with eructations, nausea, retching, and vomiting. It also contains Geranium robertianum, which is useful for nausea, particularly after eating, with distension or sensation of fullness. Myosotis arvensis is included and has indications for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or, in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It contains Hydrastis, with mucosal support for oral problems such as stomatitis and mucosal suppuration, accompanied by ulceration, inflammations and colic of the hepatobiliary system and the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies, including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. Also contained in this broad remedy is Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations). It is used for distension in the upper abdomen and the gastro-cardiac symptom-complex, and for amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease, and after smoke inhalation. It is useful in gingivitis (Reckeweg 2002). *Nux vomica homaccord* is a commonly used formula for detoxification as part of the *Detox Kit*. Recent research shows that one ingredient (Brucine) affects mitochondria in human hepatoma cells. Further research is needed to determine if homeo-

pathic dilutions are more or less active (Deng, et al. 2006).

Osteoheel: Facilitates healing of bone and reduction of pain involved with surgery and fracture. Contains Asa foetida for stabbing ostealgia and periostitis and Mercurius praecipitatus for bone fistula (Reckeweg 2000).

Traumeel S: Used as an anti-inflammatory and for repairing blocked enzymes and regulating rigidity patients. It provides control of pain through speeded healing and homotoxin removal, according to human studies (Zorian, Larentsova, Zorian 1998).

Ubichinon compositum: Contains Anthraquinone for swelling of the gums and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Immune and gingival/mouth support formulas: 1 tablet for every 25 pounds of body weight BID.

Coenzyme Q10: 25 mg for every 10 pounds of body weight daily.

Additional vitamin C: 100 mg for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H80 Gingival stomatitis/chronic: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs cited above, H80 Gingival stomatitis/chronic contains aurantium fruit (Zhi qiao), dendrobium (Shi hu), imperata (Bai mou gen), malt (Mai ya), melia (Chuan lian zi), polyphorus (Zhu ling), and sweet wormwood (Qing hao). These additional herbs increase the efficacy of the formulation.

Points that may be of benefit include LI4, GB20, LI11, KI3, ST6, ST7, and ST44 (Handbook of TCM 1987).

NOTE: If the condition is due to neoplasia, treatment is aimed at treating the cancer (see the section on neoplastic conditions.)

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Symptomatic treatment: Mucosa compositum and Echinacea compositum, as a presurgical therapy. Traumeel hourly post-op on surgery day (injection or oral drops), then TID PO for 3 days and BID for 2 more days. Also consider Osteoheel alternated with Traumeel and Gastricumeel for 5 days post-operatively.

Resuscitation therapy: Use to reverse iatrogenic damage from anesthesia, antibiotic, and analgesic medications. Galium-Heel, Nux vomica homaccord, Coenzyme compositum, and Ubichinon compositum mixed together and taken BID orally for 3 to 4 weeks.

DIARRHEA/ENTERITIS

Definition and cause

Diarrhea is classified as acute or chronic and has numerous underlying causes as summarized below. The basic underlying initiating cause and effect, however, is an inflammatory process which alters the functioning of the large intestines. While clinical signs may differ in cats and dogs, both are equally susceptible to the condition (Burrows 1995; Crystal 1998; Dennis 1993; Duval 2003; Grooters 2003; Jergens 1992, 1995; Leib 1991; Sherding 1989; Strombeck 1996). Factors associated with enteritis include:

- Interruption of the motility or absorptive capacity of the large bowel.

- Ingested food that evokes an allergic response such as gluten sensitivity.
- Poor quality food that is poorly digestible or contains food byproducts that are irritating, difficult to digest and assimilate, or contain added chemicals that are foreign, disruptive, or evoke free radical formation (see the nutrition introduction, below).
- Food that contains excessive amounts of non-digestible, irritating fiber.
- A malabsorption condition.
- Parasitic infestation.
- Secondary to other infectious (bacterial or viral such as *E. coli* or parvovirus), metabolic, or degenerative diseases such as CRF, Addison's disease, or liver disease.
- Reactions to drugs, chemotherapeutics, vaccines, or toxic compounds.
- Foreign body or obstruction.
- Large bowel smooth muscle motility problem.
- An immune-mediated infiltrative process such as IBD (see GI disease protocols).
- Neoplasia.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment is dependent upon identifying and addressing the underlying cause; the severity of the bowels' inflammatory state; and complicating factors such as protein loss, dehydration, blood loss, secondary mineral imbalances, the presence of foreign materials, and the presence of underlying primary disease causes.

Medical treatment options are protectant, motility-modifying, anti-secretory, anti-spasmodic, anthelmintic, and antimicrobial in their approach. In addition, secondary issues such as dehydration or blood loss must be simultaneously addressed. Dietary recommendations are most often bland, digestible, easily assimilable, and non-irritating in nature. Fasting and resting are often instituted prior to initiation of therapy depending on the clinical condition (Crystal 1998, Duval 2003, Grooters 2003, Leib 1991).

Anticipated prognosis

The prognosis is dependent upon identifying and addressing the underlying causes. Simple diarrhea generally responds favorably, while acute and recurrent diarrhea require compliance, dietary changes, and perhaps chronic use of medication. Longer standing diarrhea with or without protein loss can progress to immune-mediated infiltrative disease, which along with diarrhea secondary to other chronic disease such as CRF and neoplasia, carry

a much more guarded prognosis (Burrows 1995, Duval 2003, Grooters 2003).

Integrative veterinary therapies

Diarrhea can be viewed as acute or chronic, and divided into small intestine versus large intestine types. There is overlap in these systems but they make very useful tools for clinicians when approaching cases and in therapy selection. Small bowel diarrhea originates as larger volume, more liquid stool that tends to come in larger quantities, which is typical of enteritis. Hemorrhage seen in melena from small bowel origin diarrhea is dark to black as the erythrocytes have been digested leaving only iron-containing pigments. Large bowel diarrhea is characterized by urgency and increased frequency of smaller volume stools containing mucus and red blood.

Withholding food and allowing for GI rest and repair constitutes the best approach to most cases of acute diarrhea. After fasting for an appropriate time, a bland diet is instituted. For enteritis this is usually a low-residue, digestible diet that is low in fat. A basic diet consisting of half white potato, half sweet potato, a slice of turnip, and a slice of leek mixed with chicken or lamb can work surprisingly well in mild diarrhea cases (Goldstein 1999). A wide variety of simple and prescription diets exist for treatment of GI diseases, and dietary alteration and therapy may well be the most important part of designing individualized treatment plans for pets suffering with GI disease (Strombeck 1999).

Managing chronic diarrhea requires gaining information so that an understanding of that particular patient's pathophysiology can arise and translate into effective therapeutic and diagnostic actions. Diagnosis of chronic diarrhea is covered in any basic text of gastroenterology and the readers are referred to these for further information.

Recent developments in understanding the psychoneuroendocrine and immune systems reveal that the intestinal system is an important component in endocrine and immune regulation. Many neuroactive substances such as serotonin are produced in the GI system. The immune system is well represented within the digestive system, and it has been estimated that 70% to 80% of the total immune system is located in and around the alimentary tube. Cellular elements of the immune system receive vital coding in this area that consists in large part of instructions regarding tolerance of foreign antigens.

The supplementation of proper prebiotics (such as fiber) and probiotic bacteria may promote or assist in homotoxin removal by binding homotoxins to fiber or through metabolism of toxic material by bacteria, and has been a mainstay of holistic therapy for years. The common practice of treating GI upset by fasting and then giving a

bland diet is an excellent approach to mild GI conditions. Use of therapeutic diets higher in fiber may be especially useful for chronic GI disorders, such as colitis, and these diets are also indicated in geriatric patients due to the homotoxins which have been impregnated in their systems. During detoxification and drainage therapy commonly required by these patients, the presence of proper fiber will greatly assist in removal of homotoxins from the body.

Traditional Chinese Medicine (TCM) pairs the Heart and Intestine. This developmental relationship is seen in earthworms and carries forward into the structure of more advanced organisms. The primal heart developed first from circular blood vessels, which surrounded the intestinal tract. The development of a tubular gastrointestinal system was a major evolutionary step that allowed organisms to move further and survive in more varied environments. This relationship can be observed in many conditions (diarrhea in congestive heart disease), and astute clinicians often find that treating one organ system may benefit the other. The immune functions contained within the liver make it a major element in protection against invading organisms as well as other toxins. The Stomach and Spleen are also paired in TCM, as are the Lung and Large Intestine. These relationships are helpful in treating patients with chronic disease, especially when using *compositae* class remedies such as *Mucosa compositum* (affects large intestine, lung, small intestine, stomach, and bile duct), and *Hepar compositum* (affects liver, gallbladder, pancreas, small intestine, colon, and thymus) (Reckeweg 2000).

Corticoids and nonsteroidal anti-inflammatory drugs both damage intestinal mucosal elements. This can result in frank ulcer or "leaky gut syndrome," which is linked to many other medical syndromes. In leaky gut, antigens are not properly digested into smaller molecular weight polypeptides before gaining access to the immune system. This can lead to chronic inflammatory diseases such as inflammatory bowel disease and allergic syndromes. The use of digestive enzymes is suggested in these cases to assist in digestion and reduce the molecular weight of proteins in the digestive system. Further work is needed to determine whether this is helpful or not. Holistic veterinarians frequently recommend digestive enzymes, a prescribing practice that is benign and may have potential for improving the health of the microniches of the bowel. One of the proposed advantages of feeding raw foods is for their content of live and biologically active enzymes.

A wide variety of disease states can occur if the immune elements are negatively affected, and diarrhea is a common symptom. Because 70% of the immune system surrounds the gut in the gut associated lymphatic tissues (GALT), it is apparent why integrative veterinary medicine is so concerned with gut health. Just taking a casual glance at the

list of digestive diseases covered in this text gives importance to proper care of our patients' gastrointestinal and immune systems.

Pharmaceutical agents are frequently used and can have adverse reactions associated with diarrhea. Because many drugs are toxins, the body attempts to excrete them, and diarrhea and vomiting are the result. Agents that alter gut flora or function also promote the development of diarrhea (Porras, et al. 2006). Antibiotics, corticoids, nonsteroidal anti-inflammatories, and motility drugs all can be helpful as well as harmful to the body's attempt to eliminate homotoxins and regain homeostasis. Careful consideration of agents administered to any patient should occur prior to use of a product. In gastroenterology, conservative treatment approaches can yield very powerful effects.

Allergy to food and adverse reactions to food additives and food substances are important causes of chronic diarrhea and chronic illness. Food allergy can contribute to medical complications when other agents such as drugs or vaccines are given. A recently published example of this showed that corn-allergic dogs produced more IgE following routine vaccination than non-corn allergic dogs (Tater, et al. 2005). These results demonstrate once again the genetic uniqueness and diversity of each animal we treat. These variations allow for survival in a wide number of circumstances but may leave individuals susceptible to all manner of homotoxin invasions and individual intolerances.

The early identification of the cause of diarrhea and the use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and tissue-sparing and enhance toxin elimination can help control the condition and prevent ongoing or cascading inflammation and progression to more chronic conditions.

Nutrition

General considerations/rationale

The nutritional approach to diarrhea should be multifaceted and prevention oriented. The approach consists of nutrient support of the organs of the gastrointestinal tract; the enhancement of cellular and intestinal elimination and detoxification; dietary adjustment to include beneficial fiber and the removal of chemical additives, preservatives, coloring agent, dyes, byproducts and all other unnatural ingredients; and general support of immune function.

Appropriate nutrients

Nutrition/gland therapy: Nutrients and glandular intestines, adrenal, liver, and thymus can help to neutralize a cellular immune attack and reduce inflammation in an irritated intestinal tract. Support of immune system glands

can be helpful in balancing an exaggerated response toward irritated organs, helping to prevent chronic inflammation and eventual degeneration (see Chapter 2, Gland Therapy, for additional information).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes (McDonough 1987).

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the cells of the gastro-intestinal tract (Souba 1985, Windmueller 1982, Yoshimura 1993).

Digestive enzymes: Metabolically, enzymes are essential in the conversion of food to meet the energy needs of the body. They are also involved as catalysts in the many biochemical processes. Enzyme deficiency is caused either by a specific organ functioning at a less-than-optimal level, or a deficiency or lack of availability of the proper nutrients required for enzyme production. Minerals, amino acids, and fatty acids are required for the synthesis of various enzymes (Howell 1985). While the use of pancreatic enzyme therapy is controversial it is often beneficial when the digestive process is compromised. The addition of pancreatic enzymes should be part of an overall program to support digestive health.

Colostrum: Colostrum has been shown to improve intestinal health. It helps to balance intestinal flora and improve digestion. One important point raised in the IVM discussion above is the status of the immune system in relationship to the presence of intestinal parasites. Colostrum has been found to improve the immune status of the intestinal tract, which can, via intestinal production of globulins, help the overall immune competency of the body (Blake 1999).

Chinese herbal medicine/acupuncture

General considerations/rationale

Enteritis can result from improper feeding, poor diet, internal or external Cold, Qi or Yang deficiency in the Spleen or Stomach, or vital Yang deficiency in the Kidney. It is understood in Western theory how improper feeding and poor diet contribute to diarrhea. The ancient Chinese physicians recognized other etiologies as well. External Cold can be used to describe a pathogen that enters the body, causing enteritis or ingestion of food that is cold, leading to diarrhea. The Stomach and Spleen are responsible for transforming food into usable energy for the body. If these organs have a Qi deficiency they do not have the energy to perform the necessary functions; if they have a Yang deficiency there is not enough warmth to complete digestive processes. Either leads to improperly digested food entering the intestines and ultimately diar-

rhea. The Kidney is given the responsibility for warming the entire body. If the Kidney has a Yang deficiency it may not be able to send enough warmth to the Spleen and Stomach for those organs to function properly.

Appropriate Chinese herbs

Actractylodes (Bai zhu): Can be used to stop diarrhea (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). At low doses, it has a mild inhibitory effect on the contraction of isolated guinea pig ileum (Ma Xiao Song 1996).

Amomum fruit (Sha ren): Relieves bloating, spasms, and pain (Zhong Yao Xue 1988).

Angelica root (Dang gui): Has antibacterial effects. It has demonstrated inhibitory effects on *Salmonella typhi*, *E. coli*, *Corynebacterium diphtheriae*, *Vibrio cholerae*, and a- and b-hemolytic strep (Hou Xue Hua Yu Yan Jia 1981). This may help control bacterial dysentery.

Astragalus (Huang qi): Has antibacterial activity. It has shown efficacy against *Bacillus dysenteriae*, *Corynebacterium*, *staphylococci*, and others (Zhong Yao Zhi 1949).

Aurantium fruit (Zhi qiao): Was shown to inhibit contraction of isolated rabbit intestinal smooth muscles and to relieve acetylcholine- and BaCl₂-induced enterospasm (Ma Ya Bing 1996).

Bamboo shavings (Zhu ru): Inhibits many types of bacteria including *E. coli* and *Salmonella typhi* (Zhong Yao Xue 1998).

Bupleurum (Chai hu): Inhibited the effect of dimethyl benzene-induced auricular concha inflammation in mice (Liu Wei 1998). It may also decrease intestinal inflammation.

Cimicifuga (Sheng ma): Inhibits lymphocyte activation. *Cimicifuga*'s inhibitory effect on membrane permeability is greater than that of cortisol and it has been shown to inhibit the formation of antibodies (Zhu Nei Liang Fu 1984). It also suppresses proliferation of immune cells (Huang Yun 1992). These actions may help in cases of diarrhea secondary to immune system abnormalities.

Citrus (Chen pi): Reduces inflammation by decreasing the permeability of blood vessels (Zhong Yao Yao Li Yu Ying Yong 1983).

Coptis (Huang lian): Stops diarrhea (Zhong Yao Xue 1998). In a study of 100 people with acute gastroenteritis there was a 100% improvement in signs (Si Chuan Yi Xue Yuan Xue Bao 1959). One component of coptis, berberine, has been shown to have anti-inflammatory effects in rats (Yao Xue Za Zhi 1981).

Corydalis tuber (Yan hu suo): Increases secretions from adrenal glands in mice (Xi Xue Xue Bao 1988). This may release cortisol and decrease intestinal inflammation.

Immature orange peel (Qing pi): Inhibits smooth muscle contractions in the stomach and thereby relieves cramps (Zhong Yao Zhi 1984).

Licorice (Gan cao): Alleviates intestinal cramping (Zhong Yao Zhi 1993). Two of the components, glycyrrhizin and glycyrrhetic acid, have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). Licorice counteracts food poisoning and enterotoxins. The mechanism by which it has this effect is unknown. Some researchers say licorice binds toxins in the GI tract to prevent absorption; others say it may affect the liver's detoxification system (Zhong Yao Tong Bao 1986).

Peach kernel (Tao ren): Suppresses the immune system in several ways. It was shown to prevent egg-white-induced arthritis in mice (Liu Can Hui 1989). Other studies have shown suppressive effects on fibroblast growth in laboratory cell cultures. It was shown to suppress the proliferation of inflammatory cells and fibroblast hyperplasia in subjects using experimental trabeculae dissection (Wang Su Ping 1993). Another study demonstrated the ability to decrease inflammation in mice with otitis media (Zhong Yao Tong Bao 1986).

Platycodon root (Jie geng): Has been shown to promote the secretion of corticosterone in rats, thereby causing an anti-inflammatory effect (Li Yin Fang 1984, Zhang Shu Chen 1984, Zhou Wen Zheng 1979).

Pulsatilla (Bai tou weng): Has antiamebic properties. It was 100% effective in treating 26 human patients with amoebic dysentery (Wu Han Yi Xue Yuan Xue Bao 1958). In addition, it inhibits many bacteria, including *Bacillus dysenteriae* and *Salmonella typhi* (CA, 1948).

Rhubarb (Da huang): In a clinical trial involving 14 human patients with hemorrhagic necrotic enteritis, 12 of the 14 responded after 2 to 6 days (Fu Jian Zhong Yi Yao 1985).

Acupuncture points

Acupuncture has been shown to be effective in controlling or curing diarrhea in many studies. Acupuncture at GV1, ST25 and ST36 was used in a study of 500 infants with diarrhea. 485 were completely cured and 13 improved (Zhongxin X 1989). In preweaning pigs with experimentally induced *E. coli* diarrhea, a combination of acupuncture and moxibustion was superior to oral neomycin. Using acupuncture and moxibustion, 82% of the pigs responded as opposed to 71% treated with neomycin (Hwang YC 1988).

Homotoxicology

General considerations/rationale

Diarrhea generally represents an Excretion Phase disorder, but may occur as a consequence of any phase disease process in which the body attempts to remove homotoxins through the gastrointestinal system. Diarrhea is generally a desirable physiologic process, even though it is annoying to client, patient, and veterinarian alike.

However, severe, copious, or chronic diarrhea presents a threat to health as vital fluids and electrolytes are lost to the body and digestion and absorption are negatively affected. In such cases therapy is most definitely indicated.

Nutrient- and homotoxin-laden blood leaves the intestines and proceeds via the portal vein to the liver, where it is directly cleansed and processed. Many GI issues are addressed with remedies that target intestinal and hepatic tissues (i.e., *Nux vomica homaccord* and *Hepar compositum*). Enterohepatic circulation provides the opportunity for homotoxins to be reabsorbed after hepatic handling. In this way, homotoxins gain access to the circulatory system again and must be removed. Ancillary excretion and metabolism by other organs (kidney, skin, and lung) may all assist in homotoxin removal.

Antihomotoxic agents that support these organs include *Solidago compositum*, *Berberis homaccord*, and *Mucosa compositum*. Homotoxins that have escaped or bypassed hepatic processing may be deposited into connective tissue and cause disease later as further damage ensues. The health of the bowel and body seem largely determined by a healthy intestinal flora and healthy mucosal barrier (Porras, et al. 2006; Meier, Steuerwald 2005).

Many homotoxins can damage the GI system's ability to perform its duties. Both toxins and other therapeutic agents can result in progressive vicariation.

Food trials with hydrolyzed diets and limited antigen diets can be very helpful in managing chronic diarrhea.

Successfully treating GI disorders involves providing clean food and water, allowing time for repair, reducing stress, allowing homotoxins to be excreted successfully, supporting organ function, providing drainage therapy, and providing metabolic/organelle support while repair occurs. As in other discussions, the position of the patient on the phase table assists in determining proper therapy. In the first 2 phases, symptomatic treatment is often successful. As homotoxins gain deeper access and do further damage, the use of *compositae* class antihomotoxic agents becomes necessary to stimulate regressive vicariation.

Appropriate homotoxicology formulas

***Arsuraneel*:** A cellular phase remedy that treats enteritis and diarrhea (*Arsenicum album*). May be useful in arsenic poisoning in areas with contaminated groundwater (Mallick, Mallick, Guha, Khuda-Bukhsh 2003; Khuda-Bukhsh 2005). Also used in chronic disease, tumors of mucous membranes (*Marsdenia cundurango*), and diabetes mellitus (*Acidum phosphoricum*) (Reckeweg 2000).

***Atropinum compositum*:** Not available in the U.S. market at this time, but is a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). Con-

tains *Benzoicum acidum* (also common to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal: a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching and vomiting, and flatulent distension below the ribs on both sides. The stools are copious, loose, and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

***BHI-Diarrhea*:** Treats diarrhea in general. A good simple remedy for many cases of diarrhea.

***BHI-Intestine*:** Treats diarrhea, cramping, hard-black stool (*Bryonia alba*); emotional diarrhea, leg spasm and cramps, colitis (*Colocynthis*); flatulence and liver conditions (*Lycopodium*); gastroenteritis and colitis (*Nux vomica*); and mucosal inflammation (*Mercurius corrosives*). Sulphur activates a blocked metabolism, stimulates regressive vicariation, and promotes healing (Heel 2002).

***BHI-Nausea*:** Treats painful oral vesicles/stomatitis (*Anacardium*); nausea and vomiting with coughing (*Ipecacuanha*); and left-sided gastric region pain (*Argentum nitricum*).

***BHI-Pancreas*:** Treats pancreatitis and related symptomatology including diarrhea, vomiting, nausea, and constipation.

***BHI-Spasm-Pain*:** Treats leg cramps, fever, pain and inflammation, sharp pain, colic or intestinal spasm, and colitis.

***Cantharis compositum*:** Contains *Arsenicum album*, which is indicated in aphthous stomatitis; when the tongue is dry, red with raised papillae, or coated white, brown or black; and for violent gastroenteritis with prolonged vomiting and diarrhea with unbearable burning stomach pains after eating. Also treats foul-smelling stools. Contains *Mercurius solubilis*, which is indicated in ulcerative lesions of the mucous membranes, and *Hepar sulphuris calcareum* (Reckeweg 2002).

***Ceanothus homaccord*:** Used for pancreatopathy, epigastric syndrome, tenesmus, diarrhea, and hepatic issues. Splenic enlargement is a primary signalment for this remedy (Macleod 1983).

***Chelidonium homaccord*:** Used for gallbladder conditions such as cholangitis, cholecystitis, obstructive jaundice, hepatic damage, and hepatitis (Demers 2004). *Chelidonium* contains a substance known as *Chelidonine*, which has anticancer effects. "Chelidonine turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM," according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia.

Chol-Heel: An excellent remedy containing Belladonna, Chelidonium, Carduus marianus, Lycopodium, Veratrum, and Taraxicum, along with some other very useful components, all in potency chords. This can be of great relief in GI discomfort (Broadfoot 2005).

Cinnamomum homaccord: Currently not available in the United States, but used for seeping hemorrhage.

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension. It is also helpful following anti-inflammatory and antibiotic drug therapy.

Colocynthis homaccord: Treats diarrhea with lower back pain (*Citrullus colocynthis*), colic, pain below the navel, colitis with gelatinous stools.

Diarrheel S: A symptom remedy for acute and chronic diarrhea. It also treats acute gastroenteritis, belching, spurting diarrhea, pancreatopathy, and colitis. This commonly used formula contains Tormentilla, which is used for dysentery, acute gastroenteritis, and mucous and ulcerative colitis with bloody stools (Reckeweg 2002). It is also found in *BHI-Diarrhea* and *Veratrum homaccord*.

Duodenoheel: Treats hunger pains, hyperacidity, gastric and duodenal ulcers, nausea and vomiting, and dysentery with tenesmus (Reckeweg 2000).

Engystol N: Treats viral origin gastroenteritis (see Parvovirus).

Galium-Heel: Treats all cellular phases, hemorrhoids, and anal fissures, and is a detoxicant.

Gingseng compositum: Used for nausea, gastroenteritis, and constitutional support in geriatric or debilitated patients (Reckeweg 2000).

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gall bladder pathologies. It is an important part of Deep Detoxification Formula. It treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, and vomiting and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. It treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea, particularly after eating, and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Leptandra compositum: Treats epigastric syndrome, portal vein congestion, pancreatopathy, chronic liver disease, and diabetes mellitus (Reckeweg 2000).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis, flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. Geranium robertianum is useful for nausea, particularly after eating with distension or sensation of fullness. The component Myosotis arvensis has indications for bloat and distension (Reckeweg 2002).

Mercurius-Heel S: Used for viral and bacterial issues, suppuration, and tonsillitis (Reckeweg 2000).

Momordica compositum: Treats pancreatitis, epigastric disease (*Momordica balsamina*), emaciation though good appetite (*Jodum*), and vomiting with collapse (*Veratrum album*) (Reckeweg 2000).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, the tongue, the lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or, in ulcerative stomatitis or tonsillitis, it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002). It contains Hydrastis as well, with mucosal support for oral problems such as stomatitis, and mucosal suppuration, which are also accompanied by ulceration, inflammations, colic of the hepatobiliary system and the gastrointestinal tract, and polyp formation (Reckeweg 2002).

The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges. The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002.) Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. Argentum nitricum is also contained in this broad remedy, (it is also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). It is a commonly used formula for detoxification as part of the *Detox Kit*. Recent research shows that one ingredient (Brucine) affects mitochondria in human hepatoma cells. Further research is needed to determine if homeopathic dilutions are more or less active (Deng, et al. 2006).

Paeonia-Heel: Used for anal region issues such as hemorrhoids, anal fissures, colitis, spasmodic constipation, weeping anal lesions, anal pruritus, and painful defecation (Reckeweg 2000). A topical cream is useful.

Podophyllum homaccord: Treats chronic gastroenteritis, gastroenteritis in juvenile dogs and cats, dyspepsia, catarrhal colitis, hemorrhoids, and watery-green diarrhea alternating with constipation (Macloed 1983).

Procteel: Contains Lycopodium, Sulfur, Phosphorus, and Aluminum oxydatum. It may be useful for megacolon and rectal atony, hemorrhoids, sore body orifices, alternating diarrhea and constipation, hepatic disease with cystic ducts, and intestinal stasis (Reckeweg 2000).

Psorinoheel: Used for chronic illness, and is an Impregnation Phase remedy.

Schwef-Heel: Treats chronic diseases of the skin and liver. This remedy should be interposed in most skin and liver cases (Reckeweg 2000). Patients that need this remedy may look dirty and have scruffy skin conditions, red lips, a white tongue with red tip, an itching and burning rectal area with morning diarrhea, or a prolapsed rectum (Boericke 1927). Sulfur is contained in several other antihomotoxic formulas including *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Paeonia-Heel*, *Proctheel*, *Psorinoheel*, *Sulfur-Heel*, *Thyroidea compositum*, and *Ubichinon compositum* (Reckeweg 2000).

Syzygium compositum: Treats chronic gastritis, chronic enteritis, diabetes mellitus, and hepatic disorders.

Tanacet-Heel: Used for complications following removal of helminths. Also treats gastroenteritis, dysentery, and gas and pain following ascarids, especially in juvenile pets.

Ubichinon compositum: Contains Anthraquinone for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Also treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), psychosis, dysentery, fecal incontinence, and intestinal spasm. It is used widely by the authors for general vomiting cases. Consider its use in cases of gastritis following general

anesthesia. Classical provings were recently repeated and found consistent with earlier work (Van Wassenhoven 2004).

Vomitushell S: Treats nausea and vomiting with a cough (Ipecacuanha), liver and gastrointestinal issues (*Nux vomica*), eructation, and possibly anxiety or depression (Ignatia) (Reckeweg 2000). Also treats irritable bowel syndrome with stress-related issues. No known adverse reactions have occurred and it is extremely safe to use in pediatric patients. This remedy contains Aethusa for vomiting obviously originating in the nervous system. In serious cases, capillary paralysis, hematemesis, stomach cramps, and tympanic distension may occur, with an irresistible urge to pass stool. The nervous vomiting is characterized by spasmodic contractions of the esophageal muscles and violent pains which shoot upwards from the cardiac sphincter (Reckeweg 2002). In more severe vomiting consider *Veratrum homaccord* instead or in combination.

Authors Suggested Protocol

Nutrition

Immune and intestinal support formulas: 1 tablet for every 25 pounds of body weight BID.

Liver support formula: One-half tablet for every 25 pounds of body weight BID.

Glutamine: One-fourth scoop per 25 pounds of body weight daily.

Colostrum: One-third teaspoon powdered formula for every 25 pounds of body weight BID.

Probiotic: One-half capsule per 25 pounds of body weight with food.

Pan 5 Plus: 1 capsule opened and mixed with food per every 25 pounds of body weight (maximum, 4 capsules).

Chinese herbal medicine/acupuncture

Any specific etiology should be addressed. In most cases, the authors use Formula ColonGuard at a dose of 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, ColonGuard also contains codonopsis (Dang shen), linden (Wu yao), pueraria (Gegen), and raw white lotus seed (Lian zi), which help increase the efficacy of the formula.

The authors use the following acupuncture points: BL20, ST36, BL26, and Baihui.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Also see the vomiting protocol as needed.

BHI-Diarrhea: Use as a simple starting place, given hourly until effect is noted. Or use *Nux vomica*, *Veratrum homaccord*, and *Diarrheel* mixed together and given

hourly until conditions improve. Consider Mercurius-Heel in watery diarrhea with bacterial or protozoan causes.

IRRITABLE BOWEL SYNDROME

Definition and cause

Irritable bowel syndrome (IBS) is an idiopathic disorder involving the large intestine. Patients have intermittent bouts of colitis with no apparent structural alternations. IBS is much less severe than IBD. This diagnosis is “backed into,” by ruling out other causes of colitis. It might also

Homotoxicology references

- Broadfoot PJ. Inflammation: Homotoxicology and Healing, in proceedings AHVMA/Heel Homotoxicology Seminar. 2004. Denver, CO, p 27.
- Boericke W. Materia Medica with Repertory, 9th edition. Santa Rosa, CA: Boericke and Tafel, 1927. pp 90, 497–500.

be referred to as idiopathic colitis. IBS is also known as mucous colitis, spastic colitis, and nervous colitis. The reader is referred to the colitis protocol below for a more complete discussion of large bowel inflammation. Potential underlying causes include inflammation, impaired motility, food allergy, low-fiber food, and behavioral plus stress (Grooters 2003, Tams 1992).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Dietary adjustment to a higher fiber food or the addition of fiber supplementation such as psyllium often helps. In addition, motility modifiers such as Lomotil and antispasmodics such as Darbazine are beneficial. Addressing the anxiety which often accompanies IBS often helps the overall response. Anti-anxiety drugs such as amitriptyline have proven beneficial in some cases (Leib 1991, Grooters 2003, Strombeck 1996, Tams 1992).

Anticipated prognosis

Response to dietary changes, stress reduction, and slowing down the colon often controls the condition. Long-term prognosis is most often very good (Grooters 2003).

Integrative veterinary therapies

Conventional medicine relies on diet and medical therapy with a combination of drugs aimed at motility modification, inflammation control, infection control, and antiemetics. Integrative therapies address both the physical inflammation in the GI tract as well as the emotional component and stressors that may bring on the clinical symptoms. Use of nutraceutical, herbal, and homeopathic remedies that can help balance the emotions as well as the colitis without the inherent side effects of chronic medication represents a good option for the client and the animal.

Dietary recommendations are an important part of therapy for all types of colitis. A highly digestible diet with higher fiber is generally preferred. In some cases the symptoms nearly disappear. Fiber can be supplemented using pumpkin or psyllium-type laxatives. Psyllium has been shown to help some people with IBS (Hotz 1994, Manning 1977).

Stress is thought to play a part in this condition, so use of biological agents that assist mood may be helpful. Bach Flower remedies such as Rescue Remedy or Anafloa Recovery are another idea for stress management with far less potential for neurological damage than some psychotropic drugs (see Product Sources).

Early identification of the cause and the use of nutrients, nutraceuticals, medicinal herbs, and combination homeo-

pathics that are anti-inflammatory and tissue-sparing can help control the condition and prevent ongoing inflammation and progression to more chronic conditions.

Nutrition

General considerations/rationale

The nutritional approach consists of nutrient support of the stomach and intestines, reducing inflammation, and addressing the animal's emotions and behavior traits.

Appropriate nutrients

Nutrition/gland therapy: Glandular brain, pineal, intestines, and stomach supply intrinsic nutrients required by these organs. They also help to neutralize stress-induced inflammation (see Chapter 2, Gland Therapy, for additional information).

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the cells of the gastrointestinal tract (Souba 1985, Windmueller 1982, Yoshimura 1993).

Phosphatidyl serine: Phosphatidyl serine is a phospholipid, which is essential for the integrity of cell membranes, particularly of nerve and brain cells. It has been studied extensively in people with altered mental functioning and degeneration with positive results (Cenacchi 1993).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes and particularly of nerve and brain cells. It helps to move fats into the cells, and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by all cells of the body for general health and wellness (Hanin 1987).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes, which is beneficial for animals that are pancreatic enzyme deficient (McDonough 1987).

Evening primrose oil (EPO): In a double blind study, Cotterell (1990) showed that more than 50% of the women taking evening primrose oil with mentally related irritable bowel syndrome improved, while none in the non-EPO group showed a benefit.

Fiber: In a study of people with IBS, Manning (1977) and Hotz (1994) showed improvement by adding psyllium to the diet.

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM, irritable bowel syndrome is due to Qi and Yang deficiency in the Spleen and Stomach with

Heat and Damp accumulation in the Lower Burner. There may be accompanying Qi and Blood stagnation. The Spleen and Stomach are charged with converting food and water to usable substances in the body. Inability of these organs to perform this function leads to gastrointestinal signs. Without enough Qi or Yang (energy and warmth), the Stomach and Spleen are unable to transform food into usable substances in the body. The Lower Burner is the lower aspect of the trunk, namely the Intestines. When the Stomach and Spleen do not process the food properly, the intestines receive abnormal chyle. The intestines must then work on undigested foodstuffs. In this condition the stool contains mucus (Damp). Heat refers to the inflammatory cells and toxins in the stool as a result of improper digestion. Stagnation leads to pain. Blood or Qi stagnation can lead to pain and cramping. Treatment is aimed at stopping diarrhea and cramping and controlling the underlying cause of the disorder.

Appropriate Chinese herbs

Atractylodes (Bai zhu): Can treat both diarrhea and constipation, depending on the doses administered (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Coptis (Huang lian): A broad-spectrum antibiotic. It contains berberine, which is well suited for gastrointestinal infections. It is not well absorbed so is unlikely to cause systemic side effects, but works synergistically with other herbs to inhibit pathogenic gastrointestinal bacteria (The Merck Index 12th edition 2000). Berberine has the added benefit of having anti-inflammatory properties (Yao Xue Za Zhi 1981). In a trial of 100 people with acute gastroenteritis who were treated with coptis and white cardamon (Bai dou kou), there was 100% response (Si Chuan Yi Xue Yuan Xue Bao 1959). In another study, more than 1,000 people with acute bacterial dysentery were treated with coptis, either alone or along with other herbs, with excellent results and few side effects (Zhong Hua Nei Ke Za Zhi 1976).

Dry ginger (Gan jiang): Can increase peristalsis and has protective effects on the GI system (Zhong Cao Yao 1988).

Magnolia bark (Hou po): Has been shown experimentally to prevent toxin-induced diarrhea in mice (Zhu 1997). It can decrease contractions in the small intestine (Konoshima 1991). It also inhibits bacterial proliferation (Namba 1982, Yao Jian Gong Zuo Tong Xun 1980).

Pulsatilla root (Bai tou weng): Can inhibit bacterial growth (CA 1948). Interestingly, in Western thought, anxiety or stress may precipitate a bout of diarrhea with this condition. Pulsatilla has sedative effects (Zhong Yao Xue 1998).

Sanguisorba (Di yu): Helps control diarrhea. In a trial of 91 human patients suffering from bacterial dysentery, 87 responded well (Hu Nan Yi Yao Za Zhi 1978).

Saussurea (Mu xiang): Inhibits bacteria, including those that tend to overgrow in the intestines, i.e. *E. coli* and corynebacteria (Zhong Yao Yao Li Yu Ying Yong 1983).

Acupuncture

Acupuncture has been used for colitis with some reports of excellent results. In one trial, 33 people with ulcerative colitis were treated with a combination of herbal supplements and acupuncture (B1 18, B120, St36, Sp6, CV6, St 25, B125, and ST37). Twenty-eight people experienced complete resolution of signs while another 3 people had improvement in symptoms. Two people did not respond (Zhong 1998).

Homotoxicology

General considerations/rationale

Patients with IBS who have no detectable structural lesions likely are placed near the Deposition and Impregnation phases on the Six-Phase Table of Homotoxicology. Regressive vicariation takes them to the Inflammation Phase and clinical conditions of colitis and progressive vicariation drive them into worsening states. Because of the connection between the psychoneuroendocrine and immune systems, stress and strong emotions can release homotoxins and result in an altered GI condition. This especially applies to microfloral populations and bowel mobility.

The results can be excellent when antihomotoxic therapy is aimed at symptoms and phases. Because dietary changes may improve these cases substantially, therapy begins there. Symptom remedies for colitis include *Podophyllum compositum*, *Colcynthis homaccord*, *Nux vomica Homaccord*, and *Veratrum homaccord*. Other agents may be helpful as well, depending upon other signs and medical history. Injection therapy can be used in acute flare-ups with good results. The liver is involved in repair of colonic mucosal defects, and so the use of *Hepar compositum* is commonly recommended. Because stress seems to be involved, it seems prudent to select remedies supportive of adrenal function. *Tonsilla compositum* and *Thyroidea compositum* should be considered. *Berberis homaccord* and *Solidago compositum* (which contain *Berberis*) are recommended. Other formulas such as *Nervoheel*, *Ignatia homaccord*, and *BHI-Calming* can be used to reduce stress and anxiety responses. *Mucosa compositum* supports the colonic mucosa strongly and should be given intermittently.

There are no studies on probiotics for IBS, but their use may assist in recovery and is considered safe according to generally regarded as safe (GRAS) legislation. The authors do not prescribe probiotics in all such cases, but do consider their use. Ulceration and immune suppression are conditions in which probiotics may have harmful effects.

Proper training that helps the pet predict and understand its role in the home reduces stress. Palmquist has seen dogs that have repeated bouts of colitis in response to emotional issues such as owner absence and familial disharmony. Colitis vanishes quickly in these cases when attention is given to the emotional issue.

Appropriate homotoxicology formulas

Berberis homaccord: Berberis has major actions on the liver and gallbladder (Reckeweg 2000), and has been shown to have effects in diarrhea (Zhu, Ahrens 1982; Shamsa, Ahmadiani, Khosrokhavar 1999). It also treats colic, collapse, and bloody vomitus, and is supportive of adrenal and renal function. It is part of the basic *Detox Kit*.

BHI-Calming: Includes a wide variety of commonly used homeopathic remedies for anger, resentment, fear, depression, nervousness, and mania.

BHI-Diarrhea: Treats diarrhea in general. It is a good simple remedy for many cases of diarrhea.

BHI-Intestine: Treats diarrhea, cramping, hard-black stool (*Bryonia alba*); emotional diarrhea, leg spasm and cramps, colitis (*Colocynthis*); flatulence and liver conditions (*Lycopodium*); gastroenteritis and colitis (*Nux vomica*); and mucosal inflammation (*Mercurius corrosives*). Sulphur activates a blocked metabolism, stimulates regressive vicariation, and promotes healing (Heel 2002).

BHI-Spasm-Pain: Treats leg cramps, fever, pain and inflammation, sharp pain, colic or intestinal spasm, and colitis.

BHI-Stomach: Used for stomach distress relieved by eructation, stomach pain, heartburn, chalky white tongue, flatulence, and tendency to collapse.

Chol-Heel: An excellent remedy that contains *Belladonna*, *Chelidonium*, *Carduus marianus*, *Lycopodium*, *Veratrum*, and *Taraxicum*, along with some other very useful components, all in potency chords. This can be of great relief in GI discomfort (Broadfoot 2005).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Colocynthis homaccord: Treats diarrhea with lower back pain (*Citrullus colocynthis*), colic, pain below the navel, and colitis with gelatinous stools.

Diarrheel S: A symptom remedy for acute and chronic diarrhea. Treats acute gastroenteritis, belching, spurting diarrhea, pancreatopathy, and colitis. This commonly used formula contains *Tormentilla*, which is used for dysentery, acute gastroenteritis, and mucous and ulcerative colitis with bloody stools (Reckeweg 2002). It is also found in *BHI-Diarrhea* and *Veratrum homaccord*.

Duodenoheel: Treats hunger pains, hyperacidity, gastric and duodenal ulcers, nausea and vomiting, and dysentery with tenesmus (Reckeweg 2000).

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gall bladder pathologies. It is an important part of Deep Detoxification Formula. It treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains *Natrum oxalaceticum* (also found in *Coenzyme compositum*, *Ubichinoncompositum*, and *Mucosacompositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. Also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. It is used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains *Gentiana* for chronic gastritis. It treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. It contains *Geranium robertianum* for nausea, particularly after eating, with distension or sensation of fullness. *Myosotis arvensis* is contained for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in *Kali bichromicum*, which is indicated for ulcers found on the gums, the tongue, the lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or, in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. *Kali* has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002). It contains *Hydrastis* with mucosal support for oral problems such as stomatitis, mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and the gastrointestinal tract, and polyp formation (Reckeweg 2002).

The *Kreosotum* component is for chronic gastritis with gastric hemorrhages and vomiting of brown masses. It also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them

causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges. The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002).

Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra Homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. Also contained in this broad remedy is *Argentum nitricum* (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations). It is included for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is used for gastric crises (Reckeweg 2002).

Nervoheel: A first-choice agent for reducing stress and nervousness. It is useful in people with psychosomatic issues and it covers signs including restlessness, depression, mental exhaustion, neuralgia, and restless hands.

Nux vomica homaccord: Treats liver and gastrointestinal disease, and is used after smoke inhalation. Useful in gingivitis (Reckeweg 2002). It is a commonly used formula for detoxification as part of the *Detox Kit*. Recent research shows that the ingredient Brucine affects mitochondria in human hepatoma cells. Further research is needed to determine if homeopathic dilutions are more or less active (Deng, et al 2006).

Paesia-Heel: Treats anal region issues such as hemorrhoids, anal fissures, colitis, spasmodic constipation, weeping anal lesions, anal pruritus, and painful defecation (Reckeweg 2000). A topical cream is useful.

Podophyllum homaccord: Treats chronic gastroenteritis, gastroenteritis in juvenile dogs and cats, dyspepsia, catarrhal colitis, hemorrhoids, and watery-green diarrhea alternating with constipation (Macloed 1983).

Tonico-Heel: Treats nervous exhaustion, depression, anger and gastrointestinal disorders associated with stress and anxiety, anorexia, asthma, and hyperactivity.

Traumeel S: An anti-inflammatory that activates blocked enzymes.

Ubichinon compositum: Contains Anthraquinone for swelling of gums and GI symptoms such as distention, flatulence, and cramping abdominal pain. Also treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Valerianaheel: Used for oversensitivity, sleeplessness, irritability, and anger. Assists in sleep and has a sedative effect.

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), and psychosis. Symptoms include tearing up paper and clothes, and mania and sadness. Treats dysentery, fecal incontinence, and intestinal spasm. This very useful remedy is used widely by the authors for general vomiting cases.

Consider its use in cases of gastritis following general anesthesia. Classical provings were recently repeated and found consistent with earlier work (Van Wassenhoven 2004).

Vomitushell S: Treats nausea and vomiting with a cough (*Ipecacuanha*), liver and gastrointestinal issues (*Nux vomica*), eructation, and possibly anxiety or depression (*Ignatia*) (Reckeweg 2000). No known adverse reactions have occurred, so this is extremely safe to use in pediatric patients.

This remedy contains *Aethusa* for vomiting obviously originating in the nervous system. In serious cases capillary paralysis, hematemesis, stomach cramps, and tympanic distension may occur, with an irresistible urge to pass stool. The nervous vomiting is characterized by spasmodic contractions of the esophageal muscles and violent pains that shoot upwards from the cardiac sphincter (Reckeweg 2002). In more severe vomiting cases consider *Veratrum homaccord* instead or in combination.

Authors' suggested protocols

Nutrition

Intestine/IBD and/or esophagus/stomach support formulas: 1 tablet for every 25 pounds of body weight BID.

Brain/nerve support formula: One-half tablet for every 25 pounds of body weight BID.

Glutimmune: One-fourth scoop for every 25 pounds of body weight daily.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Phosphatidyl serine: 25 mg for every 25 pounds of body weight BID.

Evening primrose oil: 1 capsule (500 mg) per 25 pounds of body weight daily.

Psyllium: 1 teaspoon per 25 pounds of body weight per meal.

Probiotic: 1/2 capsule per 25 pounds of body weight with food.

Chinese herbal medicine/acupuncture

Formula Colitis/chronic-ulcerative: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, Colitis/chronic-ulcerative contains cooked aconite (Zhi fu zi) and immature bitter orange (Zhi shi) to help increase the efficacy of the formula.

The authors commonly use the following points in the treatment of irritable bowel syndrome: CV12, ST25, BL25, ST36, BL20, CV4, and GV4.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Treatment must be individualized, but the following represent good starting therapies. They can be readily adapted based upon clinical response.

Traumeel-S, Galium-Heel, Duodenoheel, Podophyllum compositum, Veratrum homaccord, Hepar compositum and/or Hepeel, Atropinum compositum, and Mucosa compositum: Mixed together and given orally BID to TID.

Tonico-Heel, Valerianaheel, BHI-Calming, Ignatia homaccord, or others: For stress-related issues. Sometimes one can choose just 1 or 2 remedies and have excellent results, while in other cases more individual products must be combined.

COLITIS**Definition and cause**

Colitis is an inflammatory process of the colon that leads to cellular inflammation and a decrease in the ability to reabsorb water, resulting in diarrhea. Long-standing colitis is often complicated with bloody diarrhea, discomfort, and weight loss. Common causes are intestinal parasites, allergic reaction (often to food), an immune-mediated reaction focused in the colon, and infections. It also can be secondary to other diseases such as CRF, liver disease, anal sac disease, perianal fistulae, and neoplasia (Burrows 2003, Guilford 1996, Leib 1995, Sherding 1992).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The medications of choice are antibiotics such as metronidazole or drugs such as sulfasalazine and corticosteroids

to reduce inflammation and suppress the immune response in combination with azothiaprime if necessary. Dietary support involves feeding a bland, low-fat, digestible, hypoallergenic diet along with the addition of fiber to increase stool bulk and improve intestinal motility. Surgical intervention is required for strictures and granulomatous inflammatory response (Dimski 1992, Burrows 2003, Guilford 1996).

Anticipated prognosis

The prognosis is often good with dietary and medical treatment and client compliance. Colitis that is long-standing or secondary to other diseases such as neoplasia carries a more guarded prognosis (Burrows 2003).

Integrative veterinary therapies

The colon and its associated microflora constitute an amazingly complex and effective mechanism for waste excretion, vital nutrient manufacturing, and immune defense for the body. Probiotic bacteria and fungi are vital to proper digestion and homotoxin elimination. These diverse components of the large intestine work in perfect concert to achieve these goals and thereby promote survival of the organism. Conditions which imbalance this system can readily lead to disease signs.

A wide variety of exogenous homotoxins can be associated with disease of the gastrointestinal system. Of particular importance are food additives such as carrageenan, a waxy substance derived from seaweed and used to bind dry food together. While listed as a GRAS food additive, this compound has received large amounts of attention in the literature (Tobacman 2001). Carrageenan is actually used in laboratories to induce colitis in experimental models. Watt and Marcus (1981) discuss carrageenan's proposed association with neoplastic change. Cohen and Ito (2002) reviewed the toxicologic effects of carrageenan and found it safe. However, veterinarians may wish to note cases of colitis presenting on diets containing this ingredient. Food dyes can also lead to inflammation of the intestinal tract in susceptible individuals, and no one knows the extent that such chemicals may form haptens and otherwise assist in the development of auto-aggressive pathologies.

Medical drugs can also lead to colon disease. Some drugs cause entero-colitis as a direct adverse reaction, and professionals are well aware of these issues. More than 700 medications list diarrhea as a potential side effect: "Those most frequently involved are antimicrobials, laxatives, magnesium-containing antacids, lactose- or sorbitol-containing products, nonsteroidal anti-inflammatory drugs, prostaglandins, colchicine, antineo-

plastics, antiarrhythmic drugs and cholinergic agents” (Chassany, Michaux, Bergmann 2000).

Stress and emotional issues can contribute to endogenous homotoxins as the psychoneuroendocrine-immune (PNEI) responds to the condition. Because minor changes in bowel conditions may cause drastic disturbances in bowel microflora, it is not uncommon to see stress associated with the presence of colitis. Palmquist has seen colitis strongly associated with stressful divorce, and other practitioners no doubt have similar stories to convey. Providing colitis patients with safe, nonstressful environments is simply practicing good medicine.

The inclusion of proper prebiotics (such as fiber) and probiotic bacteria may promote or assist in homotoxin removal by binding homotoxins to fiber or through metabolism of toxic material by bacteria. The common practice of treating GI upset by fasting and then giving a bland diet is an excellent approach to mild GI conditions. Use of therapeutic diets higher in fiber may be especially useful for colitis, and these diets are also indicated in geriatric patients due to the homotoxins, which have been impregnated in their systems. Many cases of mild colitis can be treated exclusively by altering the diet to a high-fiber, low-fat prescription product or homemade diet.

During the detoxification and drainage therapy that is commonly required by these patients, the presence of proper fiber greatly assists in removal of homotoxins from the body. Such diets are also tolerated well by geriatric patients and for that reason alone concerned healthcare professionals may recommend them as part of a geriatric nutritional program.

The early identification of the underlying cause(s) and the use of nutrients, nutraceuticals, medicinal herbs and combination homeopathics that are anti-inflammatory and tissue-sparing can help control the condition and prevent ongoing inflammation and progression to more chronic conditions.

Nutrition

General considerations/rationale

The nutritional approach to colitis is multifaceted and prevention oriented. The approach consists of nutrient support of colon cells; the enhancement of cellular elimination and detoxification; dietary adjustment to include beneficial fiber, removal of chemical additives, preservatives, coloring agent, dyes, byproducts and other unnatural ingredients, and support of overall immune function.

Appropriate nutrients

Nutritional/gland therapy: Nutrients and glandular intestine, adrenal, lymph, and thymus supply intrinsic nutrients that improve organ function and reduce cellular inflammation. This helps to spare these organs from cas-

cading inflammation and eventual degeneration (see Chapter 2, Gland Therapy, for a more detailed explanation).

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the cells of the gastro-intestinal tract (Souba 1985, Windmueller 1982, Yoshimura 1993).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon (1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes, which is beneficial for animals that are pancreatic enzyme deficient (McDonough 1987).

Colostrum: Colostrum has been shown to improve intestinal health. It helps to balance intestinal flora and improves digestion. Colostrum has been found to improve the immune status of the intestinal tract, which can, via intestinal production of globulins, help the overall immune competency of the body (Blake 1999).

Enzymes: Metabolically, enzymes are essential in the conversion of foods to meet the energy needs of the body. They are also involved as catalysts in the many biochemical processes. Enzyme deficiency is caused by underactive organ production or a deficiency or lack of availability of the proper nutrients required for enzyme production. Minerals, amino acids, and fatty acids are required for the synthesis of various enzymes (Howell (1985).

Fiber: In a study of people with IBS, Manning (1977) and Hotz (1994) showed improvement by adding psyllium to the diet.

Chinese herbal medicine/acupuncture

General considerations/rationale

Colitis is described as a Qi and Yang deficiency in the Spleen and Stomach, with Heat and Damp accumulation in the Lower Burner. Qi and Blood may become stagnant. The Stomach and Spleen function to promote digestion. With Qi and Yang deficiency there is not enough energy and heat, respectively, to complete this process. When digestion is disrupted, abnormal digesta fills the Lower Burner, or intestines in Western parlance. This abnormal chyle contains mucus in most cases (Damp) and there may be bacterial overgrowth leading to inflammation (Heat). Without proper movement in the intestinal tract, Blood and Qi may become stagnant. Stagnation leads to pain, in this case intestinal cramping.

Treatment is aimed at decreasing diarrhea and controlling secondary bacterial overgrowth, inflammation, and cramping.

Appropriate Chinese herbs

Atractylodes (Bai zhu): Treats both diarrhea and constipation, depending on the doses administered

(Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Coptis (Huang lian): A broad-spectrum antibiotic. It contains berberine, which is well suited for gastrointestinal infections. It is not well absorbed so is unlikely to cause systemic side effects, but works synergistically with other herbs to inhibit pathogenic gastrointestinal bacteria (The Merck Index 12th edition 2000). Berberine has the added benefit of having anti-inflammatory properties (Yao Xue Za Zhi 1981). In a trial of 100 people with acute gastroenteritis who were treated with coptis and white cardamon (Bai dou kou), there was 100% response (Si Chuan Yi Xue Yuan Xue Bao 1959). In another study more than 1,000 people with acute bacterial dysentery were treated with coptis, either alone or along with other herbs, with excellent results and few side effects (Zhong Hua Nei Ke Za Zhi 1976).

Dry ginger (Gan jiang): Can increase peristalsis and has a protective effects on GI system (Zhong Cao Yao 1988).

Magnolia bark (Hou po): Has been shown experimentally to prevent toxin-induced diarrhea in mice (Zhu 1997). It can decrease contractions in the small intestine (Konoshima 1991). It also inhibits bacterial proliferation (Namba 1982, Yao Jian Gong Zuo Tong Xun 1980).

Pulsatilla root (Bai tou weng): Can inhibit bacterial growth (CA 1948). Interestingly, in Western thought, anxiety or stress may precipitate a bout of diarrhea with this condition. Pulsatilla has sedative effects (Zhong Yao Xue 1998).

Sanguisorba (Di yu): Helps control diarrhea. In a trial of 91 human patients suffering from bacterial dysentery, 87 responded well (Hu Nan Yi Yao Za Zhi 1978).

Saussurea (Mu xiang): Inhibits bacteria, including those that tend to overgrow in the intestines, i.e. *E. coli* and corynebacteria (Zhong Yao Yao Li Yu Ying Yong 1983).

Acupuncture has been used for colitis with some reports of excellent results. In one trial, 33 people with ulcerative colitis were treated with a combination of herbal supplements and acupuncture (Bl18, Bl20, St36, Sp6, CV6, St25, Bl25, and ST37). Twenty-eight people experienced complete resolution of signs while another 3 people had improvement in symptoms. Two people did not respond (Zhong 1998).

Homotoxicology

General considerations/rationale

Colitis is an Inflammation Phase disorder in acute disease and an Impregnation Phase disease in more chronic conditions. It is a commonly seen gastrointestinal condition in dogs and cats.

Homotoxins alter the complex tissues and environment of the colon and the body reacts through an inflammatory

response to result in colitis. Inflammation in organs lying in close proximity can occur, as in pancreatitis and renal disease, which can lead to irritation and inflammation of the colon and resulting signs of colitis. When homotoxins are excreted via the gastrointestinal system, Excretion Phase, Inflammation Phase, Deposition Phase, Impregnation Phase, Degeneration Phase, and Dedifferentiation Phase diseases can appear in the colon itself.

The normal condition of the colon is the Excretion Phase, which results after it has completed its work on the final stages of digestion and absorption. The rate of transit through the colon is a critical determinant of health, as putrefaction, bacterial overgrowth, and resulting accumulation of homotoxins are undesirable to general health. Voiding the bowels removes homotoxins from the body in large quantities.

A more insidious situation comes from Deposition Phases caused by drug residues and their combination, interaction, or reaction with other agents at later periods of time (Reckeweg 1989). Many idiopathic conditions may be associated with such reactions, and further research is indicated but is difficult to perform. Therefore, it may be a long time before this area of medicine is fully understood.

Antihomotoxic drugs are generally safe and well tolerated and can be used to assist patients with colitis. Before selecting drugs that may have more potential harm, it may be helpful to first treat with biological therapies. Dietary change and antihomotoxic agents work well together. Some cases may be more severe and require pharmaceutical agents, and in these cases the veterinarian should remember pertinent side effects and drug residue issues.

Appropriate homotoxicology formulas

Atropinum compositum: Not available in vials on the U.S. market at this time, but a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). Tablets can be given separately or in a mixture with other antihomotoxic agents. Contains Benzoicum acidum (common also to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal (Contains Cantharis for dysentery and ulcerative colitis): a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching, vomiting, and flatulent distension below the ribs on both sides. The stools are copious, loose, and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

BHI-Intestine: Used for diarrhea, cramping, hard-black stool (*Bryonia alba*); emotional diarrhea, leg spasm and cramps, colitis (*Colocynthis*); flatulence and liver conditions (*Lycopodium*); gastroenteritis and colitis (*Nux*

vomica); and mucosal inflammation (Mercurius corrosives). Sulphur activates a blocked metabolism, stimulates regressive vicariation, and promotes healing (Heel 2002).

BHI-Spasm-Pain: Used for leg cramps, fever, pain and inflammation, sharp pain, colic or intestinal spasm, and colitis.

Coenzyme compositum: Contains *Citricum acidum*, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Colocynthis homaccord: Treats diarrhea with lower back pain (*Citrullus colocynthis*), colic, pain below the navel, and colitis with gelatinous stools.

Diarrheel S: A symptom remedy for acute and chronic diarrhea. Treats acute gastroenteritis, belching, spurting diarrhea, pancreatopathy, and colitis. This commonly used formula contains *Tormentilla*, which is used for dysentery, acute gastroenteritis, and mucous and ulcerative colitis with bloody stools (Reckeweg 2002). It is also found in *BHI-Diarrhea* and *Veratrum homaccord*.

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gall bladder pathologies. It is an important part of the Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains *Natrum oxalaceticum* (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Also treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains *Gentiana* for chronic gastritis. Treats flatulence, diarrhea, distension of stomach with eructations, nausea, retching, and vomiting. Contains *Geranium robertianum* for nausea, particularly after eating with distension or sensation of fullness. *Myosotis arvensis* is contained for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in *Kali bichromicum*, which is indicated for ulcers found on the gums, the tongue, the lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow,

mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. *Kali* has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002). It contains *Hydrastis*, with mucosal support for oral problems such as stomatitis and mucosal suppuration accompanied by ulceration, inflammations and colic of the hepatobiliary system and the gastrointestinal tract, and polyp formation (Reckeweg 2002).

The *Kreosotum* component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges. The single remedy *Phosphorus* is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). *Phosphorus* is found in many other remedies including *Echinacea compositum* and *Leptandra Homoaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. Also contained in this broad remedy is *Argentum nitricum* (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations), which is used for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Treats liver and gastrointestinal disease and is used after smoke inhalation. It is useful in gingivitis (Reckeweg 2002). This commonly used formula for detoxification is part of the *Detox Kit*. Recent research shows that 1 ingredient (*Brucine*) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Podophyllum homaccord: Used for chronic gastroenteritis, gastroenteritis in juvenile dogs and cats, dyspepsia, catarrhal colitis, hemorrhoids, and watery-green diarrhea alternating with constipation (Macloed 1983).

Ubichinon compositum: Contains *Anthraquinone* for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. It also treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), psychosis, dysentery, fecal incontinence, and intestinal spasm. This very useful remedy is used widely by the authors for general vomiting cases. Consider its use in cases of gastritis following general anesthesia. Classical provings were

recently repeated and found consistent with earlier work (Van Wassenhoven 2004).

Authors Suggested Protocol

Nutrition

Intestinal/IBD and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight daily.

Probiotic: One-half capsule per 25 pounds of body weight with food.

Colostrum: One-third teaspoon powdered formula for every 25 pounds of body weight BID.

Pan 5 Plus: 1 capsule opened and mixed with food per every 25 pounds of body weight (maximum, 4 capsules).

Psyllium: 1 teaspoon per every 25 pounds of body weight per meal.

Chinese herbal medicine/acupuncture

Colitis/chronic-ulcerative: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs mentioned above, Colitis/chronic-ulcerative contains cooked aconite (Zhi fu zi) and immature bitter orange (Zhi shi).

The authors use the following points for colitis: CV12, ST25, BL25, ST36, BL20, CV4, and GV4.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Nux vomica homaccord, Galium-Heel, Mercurius-Heel S, Veratrum compositum, and Podophyllum compositum mixed together and taken TID orally. BHI-Diarrhea or Diarrheel, as needed, along with BHI-Spasm-Pain, or Atropinum compositum for spastic pains if present. A high-fiber, low-fat diet is important in most cases.

VOMITING

Definition and cause

If the cause of vomiting is determined to be gastritis, please refer to gastritis disease protocol in this section of the book. Vomiting can be acute or chronic with many underlying causes (Guilford 1996, DeNovo 2003, Hart 2003, Strombeck 1990, Willard 1995).

Some of the more common underlying causes are:

- Allergic reactions to foods and allergens.
- Adverse reactions to chemicals including drugs, toxins, pesticides, herbicides, vaccines, etc.
- Infectious agents—bacteria, viruses, protozoan parasites.
- Foreign bodies.
- Secondary to local or systemic diseases—chronic renal disease (CRD), liver disease.
- Intestinal parasites.
- Physiological and endocrines disease and imbalances.
- Anatomical disorders.
- Neoplasia.
- Immune-mediated diseases—IBD.
- Neurological diseases.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Besides withdrawal from food and resting the system, the following medications are commonly recommended for vomiting:

- Antiemetics—chlorpromazine, metoclopramide.
- H₂ receptor antagonists such as ranitidine, cimetidine.
- Mucosal protectants such as sucralfate.
- Antibiotics such as metronidazole.
- Fluid therapy for dehydration
- Potassium supplementation.
- Corticosteroids to reduce inflammation and suppress the immune response.
- Chemotherapeutics for immune suppression and neoplasia.

Anticipated prognosis

The prognosis is dependent upon diagnosing and correcting the underlying causes (DeNovo 2003, Hart 2003, Strombeck 1990).

Integrative veterinary therapies

Proper diagnostics and a working diagnosis are needed in approaching vomiting patients. Blood chemistries, complete blood count, urinalysis, urine culture, fecal examination, fecal culture, radiographs, ultrasound, MRI, and CT scan, as well as surgery and endoscopy, are all commonly performed procedures that may be required to determine the underlying cause in chronic or persistent, nonresponsive cases. Because vomiting can originate from local or more distant issues in the body, clinicians must remember to evaluate all systems so that the underlying cause is not missed. Food allergies, adverse reactions to food or food ingredients, drug reactions, occult neoplasia, seizure disorders, subclinical or occult infections, scarring from traumatic incidents, and a wide variety of issues can make diagnosis of chronic vomiting difficult.

Vomiting that does not readily resolve, that is severe and unrelenting in nature, or that is associated with rapid patient decline or pain warrants immediate professional involvement. The reader is referred to any gastroenterology text for a full discussion of these factors. A complete history of things ingested and chemical exposure is warranted. This includes a drug history as well as topical agents and insecticides. Inquiring about missing toys or possessions can give a clue in cases involving foreign body ingestion, and severe vomiting requiring surgical intervention has been reported from use of chew treats sold in many pet stores. In this case the obstruction is caused by a “homotoxin” that will not dissolve and digest properly, leading to blockage. Changes in treats and food types and use of pet treats containing dyes and preservatives can all be involved (see Homotoxicology in this section for a more detailed discussion).

With the early identification of the underlying inflammatory process, the use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and tissue-protective can help to re-establish balance and prevent ongoing symptoms and organ degeneration.

Nutrition

General considerations/rationale

Medical therapy is often required to control the vomiting. The use of nutritional therapies is often limited to avoid initiating or increasing vomiting episodes. However, vomiting is often secondary to other conditions, diseases, or organ system involvement; and therefore, it is recom-

mended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This information gives clinicians the ability to formulate therapeutic nutritional protocols that address the stomach as well as other underlying conditions (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular stomach provides the intrinsic nutrients to help reduce cellular inflammation and damage and to help protect the stomach from ongoing inflammation and eventual degeneration. The addition of other gland and nutrient support should be considered if the underlying cause is related to other organ systems such as those secondary to kidney disease and azotemia (see other related disease protocols and Gland Therapy in Chapter 2 for more information).

Chinese herbal medicine/acupuncture

General considerations/rationale

Vomiting is caused by rebellious Stomach Qi. It can be due to external Cold, overeating, Phlegm accumulation, Cold and Yang deficiency in the Spleen and Stomach, Stomach Yin deficiency, or a combination of factors. The Qi of the Stomach descends. It ascends when it rebels, bringing stomach contents with it, and thus resulting in the vomiting. Vomiting, in TCM as in Western medicine, is not a diagnosis, but a symptom. The etiology varies. External Cold refers to an external pathogen that in effect interferes with the ability of the stomach to digest the food.

One can think of digestion as a chemical process. Back in chemistry class we were taught that when the environment cools, chemical transformations are slowed. This thought process could be used here. Overeating is recognized in Western medicine as a cause of vomiting and requires no explanation. Phlegm accumulation refers to a thick material that interferes with digestion. In this case, the vomitus may well contain a lot of mucus or phlegm. Cold or Yang deficiency in the Stomach refer to internal disease processes that interfere with digestion. The Stomach lacks sufficient heat or energy to digest the food. With Stomach Yin deficiency there are not enough fluids (digestive enzymes) in the Stomach for digestion. Treatment is aimed at decreasing vomition and treating the underlying cause.

Appropriate Chinese herbs

Aurantium fruit (Zhi qiao): Promotes gastric emptying and decreases enterospasm in mice and rabbits (Ma 1996).

Citrus (Chen pi): Increases intestinal peristalsis and may help to decrease vomiting (Jiang Su Zhong Yi Za Zhi 1981).

Codonopsis (Dang shen): Improves peristalsis in injured intestines. This effect was investigated in mice after scalding (Wang 1999).

Ginger (Gan jiang): Has been widely used as an antiemetic herb in TCM. Experiments in induced vomiting in dogs have confirmed the efficacy of this herb (Zhong Yao Xue 1998).

Inula flower (Xuan fu hua): Has antibiotic efficacy against multiple strains of bacteria (Zhong Yao Yao Li Yu Ying Yong 1983). This may be of use in bacteria-mediated vomition.

Licorice (Gan cao): Helps to reduce gastrointestinal toxicity from a variety of causes including drug ingestion, food poisoning, bacterial enterotoxins, and pesticides. Some investigators have theorized that it works by binding the offending chemical in the gastrointestinal tract; others feel it may enhance the liver's ability to detoxify the substance after absorption (Zhong Yao Tong Bao 1986).

Pinellia (Ban xia): Has an antiemetic effect. It decreased apomorphine-induced vomiting in cats (Gui 1998).

Saussurea (Mu xiang): Has demonstrated antibiotic actions against several bacterial strains (Zhong Yao Yao Li Yu Ying Yong 1983). This may be beneficial in cases of bacterial gastritis. Experiments in mice and rats have shown that saussurea helps protect the gastric mucosa from damage induced by NSAIDs, ethyl alcohol, and hydrochloric acid (Qu 1999, Ying 1999).

Acupuncture

Acupuncture has been studied in regard to nausea and vomiting of various etiologies and found to be efficacious. A review of 26 separate studies involving 3,347 patients with postoperative vomiting found that acupuncture at PC6 was as effective as Western antiemetics (Wrist acupuncture 2004).

In another study, 39 patients were treated with ondansetron with acupuncture at PC6 or ondansetron alone to control cyclophosphamide-induced vomiting. Twenty percent of the ondansetron group had severe vomiting, versus 8% of the acupuncture-plus-ondansetron group (Josefson 2003).

Homotoxicology

General considerations/rationale

Vomiting is a common clinical sign. Strictly speaking, vomiting represents an Excretion Phase change that occurs as the body attempts to rid itself of agents perceived to be in opposition to survival. It can occur in any phase on the Six-Phase Table of Homotoxicology (both regressive and progressive vicariations) as a wide variety of factors enter into control and initiation of the vomiting reaction.

The excretion of homotoxins through the GI system is an important mechanism for homotoxin removal. In

many conditions, after hepatic conjugation and biliary excretion, homotoxins pass rapidly through the GI tract to be removed through vomiting and/or diarrhea. It is generally advisable not to interfere with this important process, and the practice of giving medications that alter gut motility and secretion may actually allow homotoxins to regain access, and thereby cause more severe or deeper homotoxicoses to result.

Simple vomiting resolves rapidly upon allowing the gastrointestinal system to empty and repair itself through Excretion Phase actions. Seventy percent to 80% of all vomiting resolves within 72 hours with conservative management (withholding food and water for a few hours and then gradually reintroducing fluids first and then a low-residue, low-fat, highly digestible diet). Patients with no serious imbalances can be approached in this manner and there is good agreement for this process in both conventional and alternative veterinary practices. A precise diagnosis is often not necessary in treatment of these patients, and the doctor can record them as simply "gastritis," or "gastroenteritis," depending upon the case specifics.

The use of motility modifiers or centrally acting antiemetics in these cases may be unnecessary, and theoretically could create a Deposition or Impregnation phase condition, which could threaten future health. Use of acupuncture or biopuncture (giving antihomotoxic agents into acupuncture points or regions) seems to be extremely helpful in such cases and provides little danger to the patient (Broadfoot, Demers, Palmquist 2004; Streitberger, Ezzo, Schneider 2006; Yi 2006).

The authors have seen several cases of chronic vomiting disappear or improve markedly with simple acupuncture, biopuncture, or chiropractics, and it should be remembered that interruption of communication and control can lead to homotoxin accumulation, chemoreceptor irritation, and ultimately vomiting as a clinical sign. A note of caution is advised here, in that antihomotoxic agents can improve a patient's apparent condition but may fail to address the causative issue. Patients in Dedifferentiation Phase, for example, often have great resurgences in energy and vitality on support with antihomotoxic drugs; however, if their primary, inciting disease pathology continues, sudden death or sudden worsening may occur. This is seen in many patients under palliative therapy for tumors. This means that disappearance of vomiting is not always synonymous with cure of the primary condition. Veterinarians need to communicate this fact clearly to owners who may think differently and then be surprised at a sudden decline in their pet's condition.

If a diagnosis is evident the clinician can then design the treatment program around the specific pathology so that homotoxins that are present can be reduced or eliminated and their resulting damage repaired over time. If a diagnosis is not readily evident, the clinician must begin

therapy to protect and preserve fluid and electrolyte levels. Intravenous fluids are critical in this stage of treatment. The patient's immune and myoneural function is improved by improving hydration and electrolyte status, and recovery may follow.

Other pharmaceutical agents are used as required. The reader should note that throughout this text, discussion of adverse reactions from pharmaceuticals is not meant to direct the clinician away from these medications, but rather to serve as an effort to remind veterinarians that drugs are potent agents and often have strong effects on the body. A clinician must be free to select the best therapeutic options for their patients and pharmaceuticals do assist many patients in recovery. H-2 blockers are commonly recommended for vomiting patients and can be useful, but they do alter the microenvironment and give the possibility of future homotoxicoses. Palmquist prefers absorptive and protective agents such as sucralfate to H-2 blockers, but uses whatever agent is needed for patient recovery. These cannot be given in severe vomiting because oral alimentation may exacerbate vomiting.

Centrally acting antiemetics such as chlorpromazine are popular but can cause hypotension in dehydrated patients. There is some question as to their value, and their use may prolong hospitalization and delay recovery in certain conditions such as canine parvovirus diarrhea (Mantione, Otto 2005). An assessment must be made regarding patient comfort and recovery periods when selecting antiemetic therapy, and in some cases a trade-off may be made. Metaclopramide, an antiemetic, promotility drug that is frequently used, but whose mechanism of action is unclear, should not be used in patients with suspected obstruction because it can lead to interruption of normal protective body reflects and resultant viscous perforation. In humans, metaclopramide is also associated with central nervous system, gastrointestinal, endocrine, cardiovascular, hepatic, renal, hematologic, and allergic adverse reactions, which seem to be associated with dosage and duration of therapy. These reactions generally have not been observed or noted in veterinary medicine, but should be considered (Kerstan, Seitz, Brocker, Trautmann 2006). The package insert states that it has been associated with fatal neuroleptic malignant syndrome in human patients.

The clinician should carefully consider the use of antibiotics in these cases because they often exacerbate vomiting and gastrointestinal upset through their actions on the nervous system, gastrointestinal mucosa, cellular organelles, and microflora. Antibiotics can cause a large die off of normal intestinal gram-negative bacteria and the resultant flooding of endotoxins into the circulation can cause widespread difficulty including pancreatitis, hepatic upset, and even shock. Once again, we see Reckeweg's advice that antibiotics are valuable but must be properly used

and respected if we are to avoid shifting our patients into progressive vicariation.

Nutrient- and homotoxin-laden blood leaves the intestines and proceeds via the portal vein to the liver, where it is directly cleansed and processed. Many GI issues are addressed with remedies that target intestinal and hepatic tissues (i.e., *Nux vomica* Homaccord, *Berberis homaccord*, and *Hepar compositum*). Enterohepatic circulation provides the opportunity for homotoxins to be reabsorbed after hepatic handling. This gives homotoxins access to the circulatory system, where they can trigger centrally mediated chemoreceptors and emesis. Ancillary excretion and metabolism by other organs (kidney, skin, and lung) may all assist in homotoxin removal. Antihomotoxic agents that support these organs include *Solidago compositum*, *Berberis homaccord*, and *Mucosa compositum*. Catalysts (*Glyoxal compositum*, *Coenzyme compositum*, and *Ubichinon compositum*) assist in repair and reactivation of receptors and energy metabolism in the cytosol and mitochondria. Many chronic diseases have the decline in mitochondrial health as a common issue, and these agents cause a clinically evident improvement in energy and metabolism of patients suffering from chronic diseases.

Homotoxins that have escaped or bypassed hepatic processing may be deposited into connective tissue and cause disease later as further damage ensues. The inclusion of proper prebiotics (such as fiber) and probiotic bacteria may promote or assist in homotoxin removal by binding homotoxins to fiber or through metabolism of toxic material by bacteria. The common practice of treating GI upset by fasting and then giving a bland, low-fiber diet is an excellent initial approach to mild GI conditions. Later use of therapeutic diets higher in fiber may be especially useful for chronic GI disorders, such as colitis, which may be associated with vomiting as a secondary sign. These diets are also indicated in geriatric patients due to the homotoxins that have been impregnated in their systems. During the detoxification and drainage therapy that is commonly required by these patients, the presence of proper fiber will greatly assist in removal of homotoxins from the body.

Traditional Oriental Medicine pairs the Heart and Intestine. This developmental relationship is seen in earthworms and carries forward into the structure of more advanced organisms. The primal heart developed first from circular blood vessels, which surrounded the intestinal tract and assisted the movement of blood throughout the body. The development of a tubular gastrointestinal system was a major evolutionary step that allowed organisms to move further and survive in more varied environments. This relationship can be observed in many conditions (diarrhea in congestive heart disease), and astute clinicians often find that treating one organ system

may benefit the other. The immune functions contained within the liver make it a major element in protection against invading organisms as well as other toxins. The Stomach and Spleen are also paired in TOM, as are the Lung and Large Intestine. These relationships are helpful in treating patients with chronic disease, especially when using compositae class remedies such as *Mucosa compositum* (affects the large intestine, lung, small intestine, stomach, and bile duct), *Hepar compositum* (affects the liver, gallbladder, pancreas, small intestine, colon, and thymus), and *Tonsilla compositum* (affects the spleen and immune elements) (Reckeweg 2000).

Recent developments in understanding the psycho-neuroendocrine and immune systems reveal that the intestinal system is an important component in endocrine and immune regulation. Many neuroactive substances such as serotonin are produced in the GI system. The immune system is well represented within the digestive system, and it has been estimated that 70% to 80% of the total immune system is located in and around the alimentary tube. Cellular elements of the immune system receive vital coding in this area that consists in large part of instructions regarding tolerance of foreign antigens.

Many homotoxins can damage the GI system's ability to perform its duties. Both toxins and other therapeutic agents can result in undesirable progressive vicariation. Corticoids and nonsteroidal anti-inflammatory drugs both damage intestinal mucosal elements. This can result in frank ulceration and/or "leaky gut syndrome," which is linked to many other medical syndromes such as allergy and inflammation, malnutrition, bacterial dysbiosis, and hepatic overload (Broadfoot 2003, Silver 2003). In leaky gut, antigens are not properly digested into smaller molecular weight polypeptides before gaining access to the immune system. This issue can lead to chronic inflammatory diseases such as inflammatory bowel disease and allergic syndromes.

If the immune elements are negatively affected, then a wide variety of disease states can occur, and vomiting can emerge as a sign of the underlying homotoxicosis. Table 11.1 provides a simple illustration of how gastrointestinal diseases are often associated with vomiting in many different phases.

Successfully treating many GI disorders involves providing clean diet and water, reducing stress, allowing homotoxins to be excreted successfully; supporting organ function; and providing drainage therapy, organ support, and metabolic support while repair occurs. As in other discussions, the position of the patient on the phase table assists in determining proper therapy. Symptomatic treatment is often successful in the first 2 phases. As homotoxins gain deeper access and do further damage, the use of compositae class antihomotoxic agents becomes necessary to stimulate regressive vicariation.

Table 11.1. Common gastrointestinal conditions associated with vomiting or diarrhea and their relative position on the Six-Phase Table of Homotoxicology.

Condition	Phase Table Position
Anal gland sacculitis, acute	Inflammation
Anal gland sacculitis, chronic	Impregnation
Cholangiohepatitis, acute	Inflammation
Cholangiohepatitis, chronic	Impregnation
Chronic active hepatitis	Impregnation/Degeneration
Colitis, acute	Excretion/Inflammation
Colitis, chronic	Impregnation/Degeneration
Diarrhea	Excretion
Enteritis	Excretion
Eosinophilic granuloma	Impregnation/Degeneration
Exocrine pancreatic insufficiency	Degeneration
Food allergy	Impregnation
Gastric dilatation/bloat	Degeneration
Gastritis/vomiting	Excretion/Inflammation
Gingivitis	Inflammation
Hepatic cirrhosis	Degeneration
Hepatic lipodosis	Deposition to Degeneration
Inflammatory bowel disease	Impregnation/Degeneration
Internal parasites	Deposition
Irritable bowel syndrome	Impregnation
Malabsorption syndrome	Degeneration
Megacolon	Degeneration
Megaesophagus	Degeneration
Pancreatitis, acute	Inflammation
Pancreatitis, chronic	Impregnation
Periodontal disease	Inflammation/Deposition/ Degeneration
Stomatitis, acute	Inflammation
Stomatitis, chronic	Deposition/Impregnation/ Degeneration

Appropriate homotoxicology formulas

Anacardium homaccord: The namesake ingredient has been shown to have powerful anti-inflammatory and immunomodulatory effects (Ramprasath, Shanthi, and Sachdanandam 2006). Treats hunger pain, mucosal catarrh including laryngeal and pharyngeal inflammation, duodenal syndrome, constipation, and gastric/duodenal ulcers (Reckeweg 2000). *Anacardium* as an herbal extract has been shown to be antiviral against simian rotavirus (Goncalves, et al. 2005).

Berberis homaccord: *Berberis* has major actions on the liver and gallbladder (Reckeweg 2000), and has been shown to have effects in diarrhea (Zhu, Ahrens 1982; Shamsa, Ahmadiani, and Khosrokhavar 1999). Also treats colic, collapse, and bloody vomitus, and is supportive of adrenal and renal function. It is part of the basic *Detox Kit*.

BHI-Nausea: Used for painful oral vesicles/stomatitis (Anacardium), nausea and vomiting with coughing (Ipecacuanha), and left-sided gastric region pain (Argentum nitricum).

Cantharis compositum: Contains Arsenicum album, which is indicated in aphthous stomatitis; when the tongue is dry, red with raised papillae, and possibly coated white, brown, or black; for violent gastroenteritis with prolonged vomiting and diarrhea; with unbearable burning stomach-pains after eating; and for foul-smelling stools. Also contains Mercurius solubilis, which is indicated in ulcerative lesions of the mucous membranes, and Hepar sulphuris calcareum (Reckeweg 2002).

Chol-Heel: An excellent remedy that contains Belladonna, Chelidonium, Carduus marianus, Lycopodium, Veratrum, and Taraxicum, along with some other very useful components, all in potency chords. This can be of great relief in GI discomfort (Broadfoot 2005).

Cinnamomum homaccord: Off the U.S. market at this time but used for seeping hemorrhage.

Cocculus homaccord: Treats motion sickness and vestibular syndromes with nausea (Claussen, et al. 1984).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth; heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Colchicum compositum: Treats cachexia and neoplastic conditions.

Colocynthis homaccord: Treats diarrhea with lower back pain (Citrullus colocynthis), colic, pain below the navel, and colitis with gelatinous stools.

Diarrheel S: A symptom remedy for acute and chronic diarrhea. Treats acute gastroenteritis, belching, spurting diarrhea, pancreatopathy, and colitis. This commonly used formula contains Tormentilla for dysentery, acute gastroenteritis, and mucous and ulcerative colitis with bloody stools (Reckeweg 2002). Tormentilla is also found in *BHI-Diarrhea* and *Veratrum homaccord*.

Duodenoheel: Treats hunger pains, hyperacidity, gastric and duodenal ulcers, nausea and vomiting, and dysentery with tenesmus (Reckeweg 2000).

Engystol N: Treats viral origin gastroenteritis (see Parvovirus).

Erigoheel: Treats gastric catarrh, hepatic diseases, and duodenal ulcers with spasm. Has antipyretic effects (Demers 2004).

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Gastricumeel: Used for acute gastritis. Contains Antimonium crudum, which is indicated for tooth decay and toothache, and thus may be useful when dental work is indicated (Reckeweg 2002).

Ginseng compositum: Used for nausea, gastroenteritis, and constitutional support in geriatric or debilitated patients (Reckeweg 2000).

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. It is an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where Hepeel was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Leptandra compositum: Treats epigastric syndrome, portal vein congestion, pancreatopathy, chronic liver disease, and diabetes mellitus (Reckeweg 2000).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Used for flatulence, diarrhea, distension of the stomach with eructations, nausea, retching and vomiting, contains Geranium robertianum for nausea, particularly after eating, with distension or sensation of fullness. The ingredient Myosotis arvensis has indications for bloat and distension (Reckeweg 2002).

Mercurius-Heel S: Used for viral and bacterial issues, suppuration, and tonsillitis (Reckeweg 2000).

Momordica compositum: Treats pancreatitis, epigastric disease (Momordica balsamina), emaciation though good appetite (Jodum), and vomiting with collapse (Veratrum album) (Reckeweg 2000). Combines well with *Hepar compositum* and *Tonsilla compositum* in conditions involving the triad areas (liver, pancreas, and small intestine).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of

mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. It is useful in gingivitis (Reckeweg 2002). This is a commonly used formula for detoxification that is part of the *Detox Kit*. Recent research shows that one ingredient (Brucine) affects mitochondria in human hepatoma cells. Further research is needed to determine if homeopathic dilutions are more or less active (Deng, et al. 2006). Calves treated with Nux vomica 30cc had fewer incidents of stomach and intestinal disease than controls (Schutte 2005).

Podophyllum homaccord: Treats chronic gastroenteritis, gastroenteritis in juvenile dogs and cats, dyspepsia, catarrhal colitis, hemorrhoids, and watery-green diarrhea alternating with constipation (Macloed 1983).

Syzygium compositum: Treats chronic gastritis, chronic enteritis, diabetes mellitus, and hepatic disorders.

Tanacet-Heel: Used for complications following removal of helminths, gastroenteritis, dysentery, and gas and pain following ascarids, especially in juvenile pets.

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), psychosis, dysentery, fecal incontinence, and intestinal spasm. This very useful remedy is used widely by the authors for general vomiting cases. Consider its use in cases of gastritis following general anesthesia. Classical provings were recently repeated and found consistent with earlier work (Van Wassenhoven 2004).

Vomitushell S: Used for nausea and vomiting with a cough (Ipecacuanha), liver and gastrointestinal issues (Nux vomica), eructation, and possibly anxiety or depression (Ignatia) (Reckeweg 2000). No known adverse reactions have occurred and this is extremely safe to use in pediatric patients. This remedy contains Aethusa for vomiting that obviously originates in the nervous system. In serious cases, capillary paralysis, hematemesis, stomach cramps, and tympanitic distension may occur, with an irresistible urge to pass stool. The nervous vomiting is characterized by spasmodic contractions of the esophageal muscles and violent pains that shoot upwards from the cardiac sphincter (Reckeweg 2002). In more severe vomiting consider *Veratrum homaccord* instead or in combination.

Authors' suggested protocols

Nutrition

Esophagus and stomach support formula: 1 tablet for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H102 Vomiting/chronic: 1 capsule per 10 to 20 pounds twice daily as a basic formula for vomiting. Additional herbs may be used or substituted by practitioners who are familiar with TCM pattern diagnosis. This formula was designed for chronic vomiting due to gastritis (bacterial, viral dietary, IBD, or idiopathic). In addition to the herbs cited above, H102 Vomiting/chronic also contains atracylodes (Bai zhu), brucea fruit (Ya dan zi), hematite (Dai zhe shi), and jujube (Da zao).

The authors use the following points: CV12, PC6, ST36, BL21, CV25, BL20, and GB34 as basic points. Other points may be added by experienced acupuncturists based upon TCM pattern diagnosis.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Treatment must be individualized but the following represent good starting therapies, which can be readily adapted based upon clinical response.

Veratrum homaccord and Gastricumel: Combined and taken orally once per hour for 5 hours, and then TID as needed.

GASTRITIS

Definition and cause

Generally defined as inflammation of the stomach associated with vomiting. The cause of the inflammation ranges from secondary reactions to toxins, chemicals, medications, infections, ulcerations, immune-mediated conditions, allergens, food, and neoplasia. More common causes are chemically preserved foods; NSAIDs; infectious agents such as *Helicobacter*; and toxins such as pesticides, cleaning agents, fertilizers, and herbicides. Gastritis is common in both dogs and cats (Guilford 1996, Hart 2003, Webb 2003, Willard 1995).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy for gastritis is directed at the primary or secondary cause. Early gastritis is often managed with gastric coating and protective medication such as Pepto-Bismol or sucralfate. Antisecretory drugs such as cimetidine, famotidine, and ranitidine are often prescribed for the vomiting and for gastric ulcers, and are effective depending upon the underlying cause. Antibiotics for the treatment of *helicobacter*, corticosteroids, immune-suppressive drugs for immune-mediated diseases such as IBD, and prokinetic drugs such as Cisapride to increase gastric emptying time are often prescribed. Surgery is indicated for granulomatous reaction, foreign bodies, ulcerations, and neoplasia (Guilford 1996, Hart 2003, Happonen 1998, Liptak 2002, Webb 2003).

Dietary recommendations are a short fasting period followed by a bland diet of soft, low-fat food such as

cottage cheese, boiled rice, or pasta, along with tofu, boiled chicken, or beef as the norm.

Anticipated prognosis

The prognosis depends upon identifying and addressing the underlying cause. Simple gastritis responds well to treatment and dietary changes. Acute and chronic gastritis often has a more guarded prognosis (Guilford 1996, Hart 2003, Willard 1995).

Integrative veterinary therapies

For a general discussion of vomiting the reader is referred to vomiting or related diseases for a more in-depth discussion and protocol recommendations.

Nutrition

General considerations/rationale

Medical therapy is often required to control gastritis. Nutritional therapies are often limited to avoid initiating or increasing episodes of vomiting. Gastritis may be secondary to other conditions, diseases, or organ system involvement; and therefore, it is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This allows clinicians to formulate therapeutic nutritional protocols that address the stomach as well as other underlying conditions (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular stomach provides the intrinsic nutrients to reduce cellular inflammation and damage and help protect the stomach from ongoing inflammation and eventual degeneration. The addition of other gland and nutrient support should be considered if the underlying cause is related to other organ systems secondary to kidney disease and azotemia (see other related disease protocols and Gland Therapy in Chapter 2 for more information).

Chinese herbal medicine/acupuncture

General considerations/rationale

Improper feeding, stress, external Cold, Qi or Yang deficiency in Stomach or Spleen, Qi stagnation and Yin deficiency in Stomach can all lead to gastritis.

Improper feeding and stress are commonly recognized causes of gastritis in Western medicine. External cold can refer to the ingestion of cold food, which may cause cramping. The Spleen and Stomach are responsible for the transformation of food into usable energy. If these organs suffer from a Qi deficiency, they do not have enough energy to digest. If there is a Yang deficiency, there is not

enough heat to accomplish the chemical reactions needed to break down food. Yin is fluid; a Stomach Yin deficiency can be thought of as a deficiency of gastric acid. Again, the Stomach cannot properly digest.

Treatment is aimed at controlling cramping and vomiting and improving digestion. When treating gastritis, the clinician must stop the vomiting, improve digestion, and treat any underlying causes of vomiting, i.e., viruses, bacteria, immune-mediated inflammation, ulceration, neoplasia, etc.

Appropriate Chinese herbs

Bamboo (Zhu ru): Has antibiotic effects (Zhong Yao Xue 1998). This may be efficacious in cases of bacterial gastritis.

Corydalis tuber (Yan hu suo): Decreases the secretion of gastric acid and helps prevent gastric ulcers (Zhong Cao Yao Xue 1976). It also inhibits histamine release and formation of edema in rats, and has been shown to control both acute and chronic inflammation (Kubo 1994). This suggests it may play a role in controlling inflammatory gastritis.

Cuttle bone (Hai piao xiao): Neutralizes gastric acid (Zhong Yao Xue 1998). This may help decrease gastric ulceration.

Cyperus (Xiang fu zi): Can stop stomach cramps and pain (Zhong Cao Yao Fang Ji De Ying Yong 1976).

Dandelion (Pu gong ying): May possess anti-inflammatory actions (Mascolo 1987), which may be useful in inflammatory causes of gastritis.

Evodia (Wu zhu yu): Inhibits the formation of ulcers by decreasing secretion of gastric acid, and decreases vomiting (Zhong Yao Yao Li Du Li Yu Lin Chuan 1988).

Licorice (Gan cao): Can inhibit immersion-induced stress and hydrochloride-acid-induced ulcers (Zhu 1998, Wu 1998).

Melia (Chuan lian zi): Inhibits parasites (Zhong Yao Yao Li Yu Lin Chuan 1983). This may be of use when gastritis is due to inflammation caused by gastric parasites.

Pinellia (Ban xia): Seems to have a central nervous system effect to decrease chemical-mediated vomiting (Zhong Yao Yao Li Yu Ying Yong 1983). It can inhibit the development of hydrochloric acid and indolmycin-alcohol-induced ulcers in mice (Shen 1998). In addition, it has been shown to have efficacy against some tumor cell lines. It prevented the growth of K562 tumor cells experimentally (Wu 1996), which indicates that it may have some inhibitory effect on neoplastic causes of vomiting.

White peony (Bai shao): Contains paeoniflorin, which is a strong antipyretic anti-inflammatory. It also inhibits the secretion of gastric acid and helps to treat peptic ulcers (Zhong Yao Zhi 1993).

Acupuncture

One study examined the effect of acupuncture verses medication in the treatment of chronic gastritis. Fifty people were treated with acupuncture and 50 were treated with medication. The response rate was 98% with acupuncture and 88% with medication (Huang 2005).

Homotoxicology

General considerations/rationale

Gastritis is extremely common. Acute gastritis is an Inflammation Phase condition, whereas chronic gastritis represents Impregnation and/or Degeneration phases. General remarks about homotoxin accumulation and therapy in the enteritis protocol apply here as well, and the reader is referred to that protocol for a more in-depth discussion.

Appropriate homotoxicology formulas

Anacardium homaccord: The namesake ingredient has been shown to have powerful anti-inflammatory and immunomodulatory effects (Ramprasath, Shanthi, and Sachdanandam 2006). Treats hunger pain, mucosal catarrh including laryngeal and pharyngeal inflammation, duodenal syndrome, constipation, and gastric/duodenal ulcers (Reckeweg 2000). Anacardium as an herbal extract has been shown to be antiviral against simian rotavirus (Goncalves, et al. 2005).

Berberis homaccord: Berberis has major actions on the liver and gallbladder (Reckeweg 2000), and has been shown to have effects in diarrhea (Zhu, Ahrens 1982; Shamsa, Ahmadiani, and Khosrokhavar 1999). Treats colic, collapse, and bloody vomitus, and is supportive of adrenal and renal function. It is part of the basic *Detox Kit*.

BHI-Nausea: Used for painful oral vesicles/stomatitis (Anacardium), nausea and vomiting with coughing (Ipecacuanha), and left-sided gastric region pain (Argentum nitricum) (Heel 2002).

BHI-Stomach: Used for stomach distress relieved by eructation, stomach pain, heartburn, chalky white tongue, flatulence, and tendency to collapse.

Cantharis compositum: Contains Arsenicum album, which is indicated in aphthous stomatitis; when the tongue is dry, red with raised papillae, and possibly coated white, brown, or black; and for violent gastroenteritis with prolonged vomiting, diarrhea, and unbearable burning stomach-pains after eating. It also is used for foul-smelling stools. Contains Mercurius solubilis for ulcerative lesions of the mucous membranes and Hepar sulphuris calcareum (Reckeweg 2002).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth; heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Duodenoheel: Treats hunger pains, hyperacidity, gastric and duodenal ulcers, nausea and vomiting, and dysentery with tenesmus (Reckeweg 2000).

Engystol N: Used for viral origin gastroenteritis (see Parvovirus).

Erigotheel: Used for gastric catarrh, hepatic diseases, duodenal ulcers with spasm, and for its antipyretic actions (Demers 2004).

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Gastricumheel: Treats acute gastritis. Contains Antimonium crudum, which is indicated for tooth decay and toothache, and thus may be useful when dental work is indicated (Reckeweg 2002).

Ginseng compositum: Used for nausea, gastroenteritis, and constitutional support in geriatric or debilitated patients (Reckeweg 2000).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. is the component Geranium robertianum, and is useful for nausea, particularly after eating with distension or sensation of fullness. Myosotis arvensis is contained for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for

mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumheel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). Commonly used formula for detoxification as part of the *Detox Kit*. Recent research shows that one ingredient (Brucine) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Ubichinon compositum: Contains Anthraquinone for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), psychosis, dysentery, fecal incontinence, and intestinal spasm. This very useful remedy is used widely by the authors for general vomiting cases. Consider its use in cases of gastritis following general anesthesia. Classical provings were recently repeated and found consistent with earlier work (van Wassenhoven 2004).

Vomitushell S: Treats nausea and vomiting with a cough (Ipecacuanha), liver and gastrointestinal issues (Nux vomica), eructation, and possibly anxiety or depression (Ignatia) (Reckeweg 2000). No known adverse reactions have occurred and this is extremely safe to use in pediatric patients. This remedy contains Aethusa for vomiting that obviously originates in the nervous system. In serious cases, capillary paralysis, hematemesis, stomach cramps, and tympanitic distension may occur, with an irresistible urge to pass stool. The nervous vomiting is characterized by spasmodic contractions of the esophageal muscles and violent pains that shoot upwards from the cardiac sphincter (Reckeweg 2000). In more severe vomiting consider *Veratrum homaccord* instead or in combination.

Authors' suggested protocols

Nutrition

Esophagus and stomach support formula: 1 tablet for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

H35 Gastritis: 1 capsule per 10 to 20 pounds as needed. In addition to the herbs mentioned above, H35 Gastritis

also contains aquilaria (Chen xiang) and linderia (Wu yao), which increase efficacy of the formula.

The points the authors use are CV12, ST36, PC6, GB34, BL20, BL21, CV25, BL25, BL18, and BL22.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Gastricumeel: TID orally as beginning therapy. Duodenheel, Erigoheel, or BHI-Stomach are also often very effective.

ACUTE GASTRIC DILATATION/BLOAT

Definition and cause

Acute gastric dilatation—volvulus (GDV) is suspected to be caused by a number of different factors such as a stomach filled with ingested food, water, and air; a blockage of the pylorus; or nervous innervation abnormalities to the wall of the stomach. GDV occurs most commonly in deep-chested dogs such as Great Danes, St. Bernards, Weimaraners, German Shepherds, and Irish and Gordon Setters. It is also felt that there is a genetic predisposition tied to the width and depth of the chest (Broome 2003, Guilford 1996, Matthiesen 1993, Simpson 2005, Waschak 2003).

Risk factors have been reviewed elsewhere (Glickman, et al. 2000; Broome, Walsh 2003). Diet may have some effect on this condition and “findings suggest that the feeding of dry dog foods that list oils or fats among the first four label ingredients predispose a high-risk dog to GDV” (Raghavan, Glickman 1997, 2006).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Acute gastric dilation is classified as an emergency. Medical therapy for shock as well as supportive care and client education are important factors in the treatment of GDV. The treatment of choice is gastric decompression via intubation or trocharization followed by surgical gastropexy. After medical stability, restricted exercise along with small, multiple feedings of a high-quality, highly digestible and assimilated diet is recommended. Reducing gastric secretion with famotidine or ranitidine is often recommended (Guilford 1996, Simpson 2005, Waschak 2003).

Anticipated prognosis

The prognosis depends upon the timing of the surgery and decompression along with post-surgical recovery, dietary adjustments and feeding schedule, and the status of secondary organ system involvement or complications. The prognosis for recurrence is often good post-surgery and there are little or no post-operative complications (Simpson 2005, Waschak 2003).

Integrative veterinary therapies

Successfully treating gastric dilatation and GDV requires rapid and proper conventional surgical and medical support. Efficient patient evaluation and imaging assist in determining if volvulus and/or splenic torsion are present. Immediate surgery and decompression may be required. Due to excessive homotoxin levels, shock and cardiac events are commonplace and may occur several hours or days following initial presentation. Following decompression, the patient is stabilized and surgery is performed as indicated.

Providing clean diet and water, reducing stress, allowing toxins to be excreted successfully, supporting organ function, enhancing elimination, and offering organ and metabolic support while repair occurs constitute the steps of integrative therapies. The controlled introduction of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory, cellular-protective, and regenerating are beneficial in supporting stability and preventing recurrences.

Nutrition

General considerations/rationale

Therapeutic nutrition is focused upon improved cellular function of the nerves and muscles of the stomach. Because gastric dilation is a serious and often life-threatening condition that affects all organ systems, it is recommended that blood be analyzed both medically and physiologically to determine underlying organ involvement and disease. This allows clinicians to formulate therapeutic nutritional protocols that specifically address the stomach and other underlying organ weaknesses and nutrient and mineral deficiencies (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutritional/gland therapy: Glandular stomach and brain/nerves supply the intrinsic nutrients to reduce cellular inflammation, help prevent cellular degeneration, and improve stomach muscle and organ function (see Gland Therapy in Chapter 2 for a more detailed explanation).

Phospholipids found in glandular brain are a source of unsaturated omega-3 fatty acids, which are now thought to play a vital role in the development and maintenance of the central nervous system. High concentrations of phosphatidyl choline and serine are found in brain tissue. Horrocks (1986) reported on the potential clinical use of these nutrients in chronic neurological conditions.

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the cells of the gastro-intestinal tract (Souba 1985).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes,

particularly those of nerve and brain cells. It helps to move fats into the cells, and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by all cells for general health and wellness (Hanin 1987).

Magnesium: Physiologically, magnesium activates adenosine triphosphatase, which is required for the proper functioning of the nerve cell membranes and fuels the sodium potassium pump. Magnesium has also been associated with neuromuscular function and dysfunction. Magnesium is recommended for weakening muscle function (Bibley 1996, Levin 2002).

Chinese herbal medicine/acupuncture

General considerations/rationale

Gastric dilation is a condition of Spleen and Stomach Qi deficiency secondary to improper feeding, overeating, or drinking when the patient is stressed or nervous. When the Spleen and Stomach have a Qi deficiency they do not have sufficient strength to digest properly and the stomach can fill with food. Alternatively, the stomach may not have sufficient energy to contract properly and this can lead to smooth muscle weakness and dilation with air accumulation.

Appropriate Chinese herbs

Bitter orange (zhi qiao): Increases gastric motility (Ma Ya Bing 1996), which may help propel gas and ingesta out of the stomach, making bloat and torsion less likely.

Citrus (Chen pi): Increases peristalsis (Jiang Su Zhong Yi Za Zhi 1981).

Magnolia bark (Zhi hou po): Improves gastric motility (Ci 1999). In a trial involving 36 women who underwent hysterectomy, the women who received the magnolia bark were less likely to experience bloating (Xin Yi Yai Xue Za Zhi 1973).

Malt (Chao mai ya): Facilitates digestion of starches and carbohydrates (Zhong Yao Yao Li Yu Ying Yong 1983), which may help to move food more quickly through the intestinal tract and make bloating less likely.

Medicated leaven (Chao shen qu): Facilitates digestion (Zhong Yao Xue 1998). Again, the faster ingesta passes through, the less likely bloat is to occur.

Unripe bitter orange (Zhi shi): Has been shown to increase the motility of the small intestines and uterus (Kuang 1997, Lu 1986). It may have similar effects on the stomach.

White atractylodes (Bai zhu): Can increase the contractions of guinea pig ileum smooth muscles (Ma Xiao Song 1996). It may have a similar effect on the stomach.

Acupuncture

Gastric dilation and volvulus is a condition of altered gastric motility. Acupuncture has been shown to be as

effective as Western medicine in improving gastric motility (Zhang 1996). There have been reports of treatment of gastric volvulus using acupuncture (Wan 1981, Lining 1997).

Homotoxicology

General considerations/rationale

The gastrointestinal system is commonly affected by homotoxins owing to its important position as intermediary between the outside environment and the body itself. Both gastric dilatation and gastric dilatation with volvulus (GDV) are Degenerative Phase conditions. Degeneration Phase homotoxicoses, particularly those with a genetic predisposition, represent more serious issues wherein cure is not possible. Concurrent use of compositae class agents is necessary. The reader is referred to other appropriate sections such as cardiovascular protocols and other gastrointestinal protocols for ideas regarding therapy of gastric dilatation dogs and the many complications that may arise while these patients are undergoing care.

Appropriate homotoxicology formulas

***Atropinum compositum*:** Not available on the U.S. market at this time, but is a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). It is also for gastritis pain and spasm. Contains Benzoicum acidum (common also to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal: a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching and vomiting, and flatulent distension below the ribs on both sides. The stools are copious and loose and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

***BHI-Nausea*:** Treats painful oral vesicles/stomatitis (Anacardium), nausea and vomiting with coughing (Ipecacuanha), and left-sided gastric region pain (Argentum nitricum).

***BHI-Stomach*:** Used for stomach distress relieved by eructation, stomach pain, heartburn, chalky white tongue, flatulence, and tendency to collapse.

***Cantharis compositum*:** Contains Arsenicum album, which is indicated in aphthous stomatitis; when the tongue is dry, red with raised papillae, and possibly coated white, brown, or black; for violent gastroenteritis with prolonged vomiting and diarrhea and unbearable burning stomach-pains after eating; and for foul-smelling stools. Also contains Mercurius solubilis, which is indicated in ulcerative lesions of the mucous membranes, and Hepar sulphuris calcareum (Reckeweg 2002).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea, painful cramping in the umbilical area; and distension.

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Gastricumeel: Treats acute gastritis. Contains Antimonium crudum, which is indicated for tooth decay and toothache, and thus may be useful when dental work is indicated (Reckeweg 2002).

Ginseng compositum: Used for nausea, gastroenteritis, and constitutional support in geriatric or debilitated patients (Reckeweg 2000).

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gall bladder pathologies. It is an important part of the Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification and is used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Used for lymph drainage and endocrine support, and edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea distension of the stomach with eructations, nausea, retching, and vomiting. Contains Geranium robertianum for nausea, particularly after eating, with distension or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis,

flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Spascupreel: Useful in cases of smooth muscle spasm and pain.

Ubichinon compositum: Contains Anthraquinone for swelling of gums and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Esophagus/stomach and brain/nerve support formulas: 1 tablet for every 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight daily.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Magnesium: 10 mg for every 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

The following only applies to primary gastric dilation without torsion. Torsion is a surgical condition.

In the acute stage use the patent formula Zhi Shi Xiao Pi Wan, which contains unripe bitter orange (Zhi shi), bitter orange (zhi qiao), blue citrus (Qing pi), citrus (Chen pi), dolomiaea root (Chuan mu xiang), hawthorn fruit (Shan zha), magnolia bark (Zhi hou po), malt (Mai

ya), mirabilite (Mang xiao), radish seeds (lai fu zi), rhubarb (Da huang), and white atractylodes (Bai zhu).

In the chronic stage use the patent formula Jian Pi San at the manufacturer's recommended dose. It contains areca (Bing lang), hawthorn fruit (Shan zha), licorice (Gan cao), malt (Chao mai ya), medicated leaven (Chao shen qu), radish seed (Lai fu zi), rhubarb (Da huang), and unripe bitter orange (Zhi shi).

These formulas are recommended in Modern Complete Works of Traditional Chinese Veterinary Medicine (Yu Chuan 2000).

Acupuncture

Schoen (1994) recommends the following points for gastric dilation: ST36, BL21, CV12, CV10, St21 and BL18. For torsion he recommends ST36, St44, PC6, CV12, BL17, BL20 and BL21.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Spascupreel and Hepeel: Mix together or give separately IV and in acupuncture points.

Hepar compositum, Lymphomyosot, Gastricumeel, Atropinum compositum, Spascupreel, and Hepeel: All have components useful for bloat, and may be given every 10 to 15 minutes in a crisis.

INFLAMMATORY BOWEL DISEASE—IMMUNE-MEDIATED

Definition and cause

Inflammatory bowel disease (IBD) is a complex group of inflammatory disorders of the large and small intestine. Cellular infiltrates are present in the lamina propria. Signs of vomiting and/or diarrhea with various other GI manifestations can occur. Breed prevalence is noted, indicating at least some genetic predisposition. The current thought is that several factors predispose the disease: genetic factors, an exaggerated immune response and immune cell infiltrate, infectious agents, altered normal flora, reactions to food substances and environmental chemicals or toxins, therapeutic damage, and other unidentified issues which affect the integrity and function of the mucosa and related immune system elements (Allenspach 2006a, Diehl 2003, Dimski 1995, German 2001, Sherding 1994, Strombeck 1996). IBD is common in both dogs and cats (Sherding 1994, Tams 1993).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The primary focus of treatment is a combination of dietary adjustments, anti-inflammatories, antimicrobials, and immune suppressing medications. Dietary adjustments are focused on hypoallergenic, novel proteins and low-gluten carbohydrates (such as rice, duck, potato, fish, rabbit, venison, etc). Both high-fiber and low-residue diets have been used with success, but this depends upon the individual animal. The addition of omega-3 fatty acids that are high in both eicosapentanoic acid (EPA) and docosahexaenoic acid (DHA) have been beneficial (Dimski 1995, Leib 1995, Marks 1998).

Medications include corticosteroids, sulfa drugs such as sulfasalazine, or antibiotics such as metronidazole, along with antispasmodics. In animals with overly reactive immune responses, immunosuppressants such as azathioprine and cyclophosphamide may be required to quiet the immune attack (Strombeck 1996).

Anticipated prognosis

IBD is a controllable disease that requires client compliance and special attention to diet and medication. Because of the immune-mediated nature and the possibility of other underlying disease, the prognosis becomes somewhat guarded, especially if the disease has progressed to a protein-losing enteritis (Diehl 2003, Strombeck 1996).

Integrative veterinary therapies

A complete history, physical examination, and appropriate testing are necessary to rule out other conditions. While these patients may benefit from limited antigen or hydrolyzed diets, they are not truly food allergy patients. Patients that respond totally to food changes more properly have food allergy and not IBD. Such discussions may seem academic but are relevant when examining response to treatment and disease response patterns. Definitive diagnosis is by biopsy.

Leaky gut syndrome (LGS) becomes a large part of understanding the events leading up to chronic inflammation and cellular infiltration in IBD. The functions of a normal intestinal system include the barrier function of the mucosal elements (keeps bad things out and lets good things in), the absorption function (digestion, transformation by enzymes and flora), and the immunological cellular and humoral components (the gut-associated lymph tissue and antibody production) (Silver 2003).

Genetic issues can manifest as missing or inactive genes. These lead to deficiencies in protein synthesis and absence of needed enzymes and receptors. Any genetic alteration or omission can cause dysfunctional digestion, mucus

production, receptor activity, and injury to the mucosal surface, which in turn leads to antigen access to the immune system due to improper digestion and absorption. The initial result is Excretion Phase disease as cells activate mechanisms which release fluid and electrolytes into the bowel to flush the area clean for repair. If this is ineffective, or if genetic coding prevents that repair from occurring, then chronic inflammatory changes ensue with the onset of diarrhea, vomiting, constipation, and nausea.

Enzymes and receptors can be missing if genetic errors occur, or they can be injured and blocked in their production or function by other homotoxins. Damage by homotoxins to enzymes leads to dysfunction and potential degradation. The development of IBD then proceeds.

LGS is aggravated ultimately by increased gut permeability to which a host of things contribute. Trauma, emotional stress, toxins, drugs, exercise, radiation, and malnutrition are commonly known factors that lead to increased gut permeability. Such changes cause extra stress and increased homotoxin levels in the liver, general circulation, and other organs of excretion (kidney, skin, and lung). Fibrosis can result as homotoxins and inflammation give rise to altered connective tissue structure.

Therapy for LGS involves removing causative agents when possible (anaerobic bacterial overgrowth, giardia, coccidia, nematode parasites, fungal overgrowths); resting the bowel by providing an easily digested and absorbed form of nutrition; removing toxins and abnormal microflora, parasites, and pathogens; replacing and repopulating the microflora with appropriate probiotic cultures and digestive enzymes; and beginning the process of repairing the matrix, cells, organelles, tissues, and organs damaged in the process. Further intoxication or genetic defects may block total recovery, but these four Rs (Rest, Remove, Replace, Repair) provide a path toward helpful treatment plans for LGS patients. These actions are frequently helpful for managing IBD cases.

Because fasting can actually increase intestinal permeability, it is important to feed something during the resting period. Silver's method for addressing LGS, as outlined in his presentation, is well worth reviewing (Silver 2003).

Therapeutic agents are necessary in most cases of confirmed IBD, and these drugs can cause widespread, subclinical damage leading to increased intestinal permeability, as well as damage to immune elements and their functioning. It can be very difficult in some situations to decide whether a drug is useful or not. In treating IBS, many patients require medications such as anti-inflammatories (corticosteroids), antiparasitic agents, immunomodulators such as cyclosporin, and antibiotics such as metronidazole (Allenspach, et al. 2006b). A particularly interesting study that was just released shows no change in intestinal permeability before or after treatment (Allenspach 2006c).

It may be that the increase in intestinal permeability in these cases is a foundational issue upon which the remaining pathogenesis depends. In any case, integrative techniques allow for lower doses to be used and in some cases, for the need of drugs to be reduced. Because these patients often have or develop other health challenges, such as allergies, arthritis, diabetes, immunosuppression, obesity, etc., several medications may be used simultaneously, and the possibility for drug interactions rises dramatically. The clinician may be able to repair damage and return a patient to a higher level of health, as well as reduce the therapeutic damage done with other medications, by using coordinated integrative processes. It is also important to reduce unpleasant and difficult side effects, such as polyuria and polydyspea, which aggravate and upset clients who own these pets and cause them to seek professional care elsewhere.

Clients and professionals both desire to use fewer harmful medications in treating their animal charges. Therefore, there has been great interest in complementary treatments for IBD from both consumers and clinicians (Joos, et al. 2006). In human patients and animal patients, the interest in alternative options increases with the corticosteroid dose needed to manage IBD symptoms (Langhorst, et al. 2005). The connection between unpleasant and dangerous adverse reactions and a desire for gentler, more effective therapy is obvious.

Nutrition

General considerations/rationale

Therapeutic nutrition focuses upon the body's cellular autoimmune reaction against the chronically inflamed GI tract as well as minimizing the potential side effects of chronically required medications such as corticosteroids. Continual ingestion of chemical preservatives, additives, dyes, contaminated byproducts, and highly cooked and processed foods can lead to high free radical production, associated cellular inflammation, and intestinal cell death. Cellular debris can evoke the production of autoantibodies, which sets up an autoimmune cellular reaction. Left unchecked, this cellular process can cascade and spread throughout the intestinal tract, leading first to chronic inflammation and eventually to inflammatory bowel disease (Goldstein 2005) (see Chapter 2, Free Radicals and Inflammation, for additional information). Also, because IBD has an immune component that can affect all organ systems, it is recommended that blood be analyzed both medically and physiologically to determine underlying organ involvement and disease. This allows clinicians to formulate therapeutic nutritional protocols that specifically address the stomach or intestines and other associated organ weaknesses and nutrient and mineral deficiencies (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Gland therapies: Glandular adrenal, thymus, intestines, and stomach supply intrinsic nutrients and can help protect and reduce inflammation in gastrointestinal cells. The adrenal and thymus glands are integral to the immune response and are important in all autoimmune diseases (see Chapter 2, Gland Therapy, for more details).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes, which is beneficial for animals with compromised GI function (McDonough 1987).

Sterols: Plant-derived sterols such as betasitosterol show anti-inflammatory properties that appear to be similar to corticosteroids (Gupta 1980). They have a cortisone-like effect without the associated immune-suppressing effects. Bouic (1996) reports on the immune-enhancing and balancing effect of plant sterols, which are also beneficial to animals with immune-mediated diseases.

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the cells of the gastro-intestinal tract (Souba 1985, Windmueller 1982, Yoshimura 1993).

Essential fatty acids: It has been clinically proven that people suffering from colitis and Crohn's disease who supplement their diet with EPA and DHA, the two omega-3 fatty acids that are found in fish oil, had significantly fewer recurrences over a 1- to 2-year period (Belluzzi 1996, Mate 1991).

Chinese herbal medicine/acupuncture

General considerations/rationale

Inflammatory bowel disease is considered to be Qi and Blood stagnation with Heat and Damp affecting the Stomach and Spleen. The Stomach and Spleen (which includes the pancreas in TCM) are responsible for digestion. When they do not have the nourishment (Blood) or the free-flowing energy (Qi) to perform their functions, digestive disorders follow. In the case of IBD, the digestive disorder manifests as diarrhea and/or vomiting, especially in cats. The Heat refers to the Blood in the stool and the Damp to the mucus and white blood cells. The inflammation and bleeding in the bowels must be decreased and the diarrhea stopped to treat inflammatory bowel disease.

Appropriate Chinese herbs

Actractylodes (Bai zhu): Can be used to stop diarrhea (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). At low doses, it has a mild inhibitory effect on the

contraction of isolated guinea pig ileum (Ma Xiao Song 1996).

Amomum fruit (Sha ren): Relieves bloating, spasms, and pain. It also relieves nausea (Zhong Yao Xue 1988).

Aurantium fruit (Zhi qiao): Was shown to inhibit contraction of isolated rabbit intestinal smooth muscles and relieve acetylcholine- and BaCl₂-induced enterospasm (Ma Ya Bing 1996).

Bupleurum (Chai hu): Inhibited the effect of dimethyl benzene-induced auricular concha inflammation in mice (Liu Wei 1998).

Cimicifuga (Sheng ma): Inhibits lymphocyte activation. Cimicifuga's inhibitory effect on membrane permeability is greater than that of cortisol and it has been shown to inhibit the formation of antibodies (Zhu 1984). It also suppresses proliferation of immune cells (Huang 1992).

Citrus (Chen pi): Reduces inflammation by decreasing the permeability of blood vessels (Zhong Yao Yao Li Yu Ying Yong 1983).

Coptis (Huang lian): Stops diarrhea (Zhong Yao Xue 1998). There was a 100% improvement in signs in a study of 100 people with acute gastroenteritis (Si Chuan Yi Xue Yuan Xue Bao 1959). One component of coptis, berberine, has been shown to have an anti-inflammatory effect in rats (Yao Xue Za Zhi 1981).

Corydalis tuber (Yan hu suo): Increases secretions from adrenal glands in mice (Xi Xue Xue Bao 1988). This may release cortisol and decrease intestinal inflammation.

Immature orange peel (Qing pi): Inhibits smooth muscle contractions in the stomach, and thereby relieves cramps (Zhong Yao Zhi 1984).

Licorice (Gan cao): Alleviates intestinal cramping (Zhong Yao Zhi 1993). Two of the components, glycyrrhizin and glycyrrhetic acid, have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991).

Peach kernel (Tao ren): Suppresses the immune system in several ways. It was shown to prevent egg-white-induced arthritis in mice (Liu 1989). Other studies have shown suppressive effects on fibroblast growth in laboratory cell cultures. It was shown to suppress the proliferation of inflammatory cells and fibroblast hyperplasia in subjects using experimental trabeculae dissection (Wang 1993). Another study demonstrated the ability to decrease inflammation in mice with otitis media (Zhong Yao Tong Bao 1986).

Platycodon root (Jie geng): Has been shown to promote the secretion of corticosterone in rats, and thereby cause an anti-inflammatory effect (Li 1984, Zhang 1984, Zhou 1979).

Rhubarb (Da huang): In a clinical trial involving 14 human patients with hemorrhagic necrotic enteritis, 12

responded after 2 to 6 days (Fu Jian Zhong Yi Yao 1985).

Acupuncture points

Acupuncture has been shown to be effective in controlling or curing diarrhea in many studies. Acupuncture at GV1, St25, and ST36 was used in a study of 500 infants with diarrhea. 485 were completely cured and 13 improved (Zhonzxin 1989). In preweaning pigs with experimentally induced *E. coli* diarrhea, a combination of acupuncture and moxibustion was superior to oral neomycin. Using acupuncture and moxibustion, 82% of the pigs responded as opposed to 71% treated with neomycin (Hwang YC 1988).

Homotoxicology

General considerations/rationale

Because this condition consists of a recurring inflammatory reaction, it represents an Impregnation Phase disorder, which progresses to Degeneration Phase and even Dedifferentiation Phase as the patient ages. The development of GI lymphoma in cats with IBD is well documented. Homotoxicologists view this as a continuum of damage and degeneration related to homotoxins. Homotoxins also include the concept of psychical elements, meaning that negative or stressful emotional conditions can result in damage to the body through endogenous homotoxins and altered circulation.

Homotoxins can also injure the important tight junctions of the GI mucosal barriers, which compromises gut function and leads to inflammatory changes as antigens gain access to deeper layers of the gut. If either genetic or homotoxin damage occurs, the lymphoid system may fail to properly produce immunoglobulins, which bind with antigens to be excreted in the stool or present data to the GALT system. Proper gut motility is needed for intestinal health, and peristalsis is needed to properly move material out of the gut in a coordinated fashion. Gut motility is also related to normal populations of microflora. Homotoxins can block or even reverse this process, leading to putrefaction and static gut syndrome, a condition that increases the workload and the levels of potentially damaging homotoxins. This can lead to damage and invasion in patients with other issues, aggravating their intestinal permeability (Simpson, et al. 2006).

Clients requesting alternative therapies tend to have higher personal income and higher levels of education. They also tend to be willing to make a larger commitment to the recovery of their pets. These people read and understand material and seek other ways of accomplishing their goals. Antihomotoxic agents are well-suited for integrating into the care of inflammatory bowel syndrome patients. Clinicians are treating patients with success, but more formal research is needed in this area.

Many of these pets have been treated in the authors' offices with good success. Cure is rare, and when it occurs it may well represent incorrect diagnosis (food allergy diagnosed as inflammatory bowel disease), but in many cases the common thread to the chronic nature of the disease is the leaky bowel syndrome and veterinary medicine would do well to pay considerable attention to this condition.

Appropriate homotoxicology formulas

Please refer to the Diarrhea, Vomiting, and Colitis protocols for more formulas and details.

***Atropinum compositum*:** Not available on the U.S. market at this time, but it is a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). Contains Benzoicum acidum (also common to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal: a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching and vomiting, and flatulent distension below the ribs on both sides. The stools are copious, loose, and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

***BHI-Intestine*:** Treats diarrhea, cramping, hard-black stool (*Bryonia alba*); emotional diarrhea, leg spasm and cramps, colitis (*Colocynthis*); flatulence and liver conditions (*Lycopodium*); gastroenteritis and colitis (*Nux vomica*); and mucosal inflammation (*Mercurius corrosives*). Sulphur activates a blocked metabolism, stimulates regressive vicariation, and promotes healing (Heel 2002).

***Coenzyme compositum*:** Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area, and distension.

***Colocynthis homaccord*:** Treats diarrhea with lower back pain (*Citrullus colocynthis*), colic, pain below the navel, and colitis with gelatinous stools.

***Diarrheel S*:** A symptom remedy for acute and chronic diarrhea. Treats acute gastroenteritis, belching, spurting diarrhea, pancreatopathy, and colitis. This commonly used formula contains *Tormentilla* for dysentery, acute gastroenteritis, and mucous and ulcerative colitis with bloody stools (Reckeweg 2002). It is also found in *BHI-Diarrhea* and *Veratrum homaccord*.

***Duodenoheel*:** Treats hunger pains, hyperacidity, gastric and duodenal ulcers, nausea and vomiting, and dysentery with tenesmus (Reckeweg 2000).

***Engystol N*:** Used for viral-origin gastroenteritis (see Parvovirus).

Erigoheel: Used for gastric catarrh, hepatic diseases, and duodenal ulcers with spasm; has antipyretic indications (Demers 2004).

Galium-Heel: Treats all cellular phases, hemorrhoids, and anal fissures, and is a detoxicant.

Ginseng compositum: Treats nausea and gastroenteritis, and provides constitutional support in geriatric or debilitated patients (Reckeweg 2000).

Hepar compositum: Used for detoxification and drainage of hepatic tissues, provides organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. It is an important part of Deep Detoxification Formula. It is used to treat duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea and stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where Hepeel was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. Contains Geranium robertianum for nausea, particularly after eating with distension, or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastroin-

testinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumheel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). This commonly used formula is part of the *Detox Kit*. Recent research shows that one ingredient (*Brucine*) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Podophyllum homaccord: Treats chronic gastroenteritis, gastroenteritis in juvenile dogs and cats, dyspepsia, catarrhal colitis, hemorrhoids, and watery-green diarrhea alternating with constipation (Macloed 1983).

Procteel: Combines Lycopodium, Sulfur, Phosphorus, and Aluminum oxydatum to make a formula that may be useful for megacolon and rectal atony, hemorrhoids, sore body orifices, alternating diarrhea and constipation, hepatic disease with cystic ducts, and intestinal stasis (Reckeweg 2000).

Psorinoheel: Treats chronic illness, and is an Impregnation Phase remedy.

Schwef-Heel: Treats chronic diseases of the skin and liver. This remedy should be interposed in most skin and liver cases (Reckeweg 2000). Patients that need this remedy may look dirty and have scruffy skin conditions, red lips, a white tongue with red tip, itching and burning rectal area with morning diarrhea, or a prolapsed rectum (Boericke 1927). Sulfur is contained in several other anti-homotoxic formulas including *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Paeonia-Heel*, *Proctheel*, *Psorinoheel*, *Sulfur-Heel*, *Thyroidea compositum*, and *Ubichinon compositum* (Reckeweg 2000).

Ubichinon compositum: Contains Anthraquinone for swelling of the gums and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), psychosis, dysentery, fecal incontinence, and intestinal spasm. This very useful remedy is used widely by the authors for general vomiting cases. Consider its use in cases of gastritis following general anesthesia. Classical provings were recently repeated and found consistent with earlier work (Van Wassenhoven 2004).

Vomitushell S: Treats nausea and vomiting with a cough (*Ipecacuanha*), liver and gastrointestinal issues (*Nux vomica*), eructation, and possibly anxiety or depression (*Ignatia*) (Reckeweg 2000). No known adverse reactions have occurred and it is extremely safe to use in pediatric patients. This remedy contains *Aethusa* for vomiting, that obviously originates in the nervous system. In serious cases, capillary paralysis, hematemesis, stomach cramps, and tympanitic distension may occur, with an irresistible urge to pass stool. The nervous vomiting is characterized by spasmodic contractions of the esophageal muscles and violent pains which shoot upwards from the cardiac sphincter (Reckeweg 2002). In more severe vomiting, consider *Veratrum homaccord* instead or in combination.

Authors' suggested protocols

Nutrition

For upper GI—Esophagus, stomach, and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

For lower GI—Intestines/IBD and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Probiotic: One-half capsule for every 25 pounds of body weight with food.

Betathyme: 1 capsule for every 35 pounds of body weight BID.

Glutimmune: One-fourth scoop for every 25 pounds of body weight daily.

Eskimo fish oil: One-half to 1 teaspoon per meal for cats; 1 teaspoon for every 35 pounds of body weight for dogs.

Chinese herbal medicine/acupuncture

ColonGuard: 1 capsule per 10 to 20 pounds twice daily. It can be used in conjunction with conventional medicine, but is often not needed. In addition to the herbs mentioned above, ColonGuard also contains *angelica radix* (Dang gui), *astragalus* (Huang qi), *bamboo shavings* (Zhu

ru), *codonopsis* (Dang shen), *lindera* (Wu yao), *pueraria* (Ge gen), *pulsatilla root* (Bai tou weng), and *raw white lotus seed* (Lian zi).

The authors use BL20, ST36, BL26, Baihui, ST25, BL21, CV12, and CV4 in various combinations for inflammatory bowel disease.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Treatment must be individualized and continue for long periods of time. The following represent good starting therapies, which can be readily adapted based upon clinical response.

Starting symptom formula: Traumeel, Podophyllum compositum, Veratrum homaccord, Hepeel, and Atropinum compositum (if available) mixed together and given BID to TID orally.

Deep detoxification formula: Galiumheel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum, and Mucosa compositum mixed together and given every 3 days until patient response is seen, then 1 to 3 times weekly for 30 to 120 days minimum.

INTERNAL PARASITES: COCCIDIA/ GIARDIA/ROUNDWORM/HOOKWORM/ WHIPWORM/TAPEWORM

Definition and cause

This section covers the more common intestinal parasitic conditions: ancylostomiasis, ascariasis, cestodiasis, coccidiosis, giardiasis, and tricuriasis. Predisposing causes include eating infested rodents, transmission via flea bites or from maternal passage, egg-contaminated environment, and ingestion of fecal-contaminated food or water. Stress and immune system status play a part in the clinical signs associated with the infestation. Hemorrhagic enteritis, bronchial coughing, malabsorption, weight loss, and death are associated with immunosuppressed puppies and kittens (Barr 1994, Bowman 1992, Corwin 2003, Georgi 1992, Sherding 1994, Soulsby 1982).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy includes hygiene, flea control, and parasiticides such as albendazole, dichlorvos, fenbendazole, ivermectin, metronidazole, milbemycin oxime, pyrantel pamoate, and sulfadimethoxine. In addition, fluid replacement therapy as well as medication to help stop intestinal hemorrhage and diarrhea are often necessary (Barr 1998, Bowman 1992, Corwin 2003, Sherding 1994).

Anticipated prognosis

Prognosis is dependent upon the dog or cat's clinical state. In most instances repeated medical treatment is curative. The prognosis is more guarded with immunosuppressed animals.

Integrative veterinary therapies

Mucosal surface immunity is important, and parasitism may become harder to eliminate in cases of immunosuppression. This is seen commonly in coccidiosis. Because medication does not kill the parasite directly, but rather slows its reproductive rate while the immune system eradicates the infection, clinicians should suspect either environmental cleanliness issues and reinfection or immune suppression in cases that fail normal therapy. Addressing the immune system and gut terrain may cause the parasite to disappear without treatment in some cases, indicating the importance of normal host defenses, but in clinical practice

it is usually desirable to simply treat the parasite and the terrain, and then allow the body to repair and heal.

Both treatment and prevention are needed. Prevention involves practicing good animal husbandry. Proper hygiene, proper diet, and environmental cleanliness are critical to prevention of parasites. Clients benefit from instruction in the zoonotic nature of parasites and may clean up after their pets more conscientiously if they understand the health issues of routine parasitism. Routinely deworming dams and queens prior to delivery may help, and regular parasite evaluations and treatment are indicated for juveniles as part of the pediatric healthcare program. Modern medications are quite safe and effective in handling most simple parasitic issues. Drugs need to be repeated at appropriate intervals according to good medical practice and clients must clean up the home environment and treat other animals in the household to reduce repeated infection. The efficacy of some medications may be enhanced through integrative practice. For example, metronidazole against *Giardia* has improved efficacy when it is used in combination with milk thistle extract (silymarin) (Chon 2005).

Some drugs, such as metronidazole and sulfa types, are more likely to cause adverse reactions. These can encompass many different presentations and they are often missed as causative agents in other disease syndromes. Human medicine is beginning to document reactions that occur later in life and are associated with hypersensitivities to other drugs. Veterinarians need to become more aware of this situation and carefully observe the pharmaceutical histories of their patients. Such reactions may appear suddenly, as in pancreatitis and polyarthritis, and may not be associated with the correct causation during initial diagnostic evaluation (Juang 2006). Reckeweg warned of sulfa drugs' potential to damage the body many years ago and included homeopathically diluted pharmaceuticals in his therapy recommendations.

Side effects can occur from conventional drugs as well as from herbal preparations, and clinicians should become well versed in adverse effects associated with antiparasitic agents commonly prescribed in their offices. Reference materials and poison control should be consulted if an interaction or adverse effect is suspected.

A final note concerns the increasingly common practice of feeding raw meat to pets. Miraculous therapeutic results can occur in pets fed raw meat diets; however, clients need to be carefully instructed on their selection and preparation. Many meats are parasite-contaminated, especially wild fish and game, and should be avoided (Martini 1992). In endemic areas, *Echinococcus* infection and disease results from feeding raw viscera to pets. Appropriate care should be used in feeding raw diets, and routinely deworming pets on these diets is a sensible strategy. If a pet is doing well on a raw diet and suddenly

begins to destabilize, routine deworming with a broad-spectrum agent is advised and can cause a remarkable improvement. Because both processed, commercial diets and homemade diets can contain homotoxins, clinicians should know what diet their patients are eating and keep this in mind when diagnosing current health issues.

The integration of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and cell-protective can help improve immunity as well as cellular function after parasite removal.

Nutrition

General considerations/rationale

See the IVM explanation above for more in-depth information. Because worming medications are generally safe and effective, nutritional support focuses on reducing intestinal inflammation as well as general support of the immune system.

Appropriate nutrients

Nutrition/gland therapy: Glandular intestine, adrenal, thymus, and lymph help to neutralize a cellular immune attack, and protect and spare the intestines from ongoing inflammation and eventual degeneration (see Chapter 2, Gland Therapy, for additional information).

Colostrum: Colostrum has been shown to improve intestinal health. It helps to balance intestinal flora and improve digestion. One important point raised in the IVM discussion above is the status of the immune system in relation to the presence of intestinal parasites. Colostrum has been found to improve the immune status of the intestinal tract which can, via intestinal production of globulins, help the overall immune competency of the body (Blake 1999).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes (McDonough 1987).

Chinese herbal medicine/acupuncture

General considerations/rationale

Intestinal parasites are considered external pathogens by practitioners of TCM, just as they are by Western-trained doctors.

Appropriate Chinese herbs

Betel nut (Bing Lang): Was shown to be 61% successful in expelling roundworms from 26 human patients when given along with omphalia (Lei wan) (Jiang Su Zhong Yi Za Zhi 1960). It also was shown to clear hookworms in 24 patients when given along with pumpkin seed (Nan

gua zi) (Zhong Hua Yi Xue Za Zhi 1957). The efficacy against tapeworms in dogs, cows, and pigs was proven in a more recent study (Zhe Jiang Yi Ke Da Xue Xue Bao 1980, Zhong Hua Yi Xue Za Zhi 1956).

Brucea seed (Ya Dan zi): Contains 2 compounds, bruceantin and burceine C, which have demonstrated efficacy against the protozoa *Entamoeba histolitica* in humans (Wright 1986). It was used in 65 patients with amoebic dysentery with a 94% success rate (Zhong Yi Za Zhi 1956).

Dichroa root (Chang Shan): Has significant antiamoebic effects (Wu Han Yi Xue Yuan Xue Bao 1958).

Garlic (Da Suan): Prevents the eggs of intestinal parasites from developing into larvae (Bastidas 1969).

Melia root (Ku lian pi): Paralyzes intestinal parasites. Once the parasites can no longer move, normal intestinal peristalsis removes them from the body (Sheng Li Xue Bao 1958). As an additional benefit, melia also increases intestinal peristalsis (Zhong Yao Yao Li Yu Ying Yong 1983). In one study, 94% of 4,757 people with roundworms were successfully treated with melia root. However, at high levels (1.8 g to 3.6 g), one-third reported side effects which were unpleasant but not fatal, and included headaches, nausea, vomiting, diarrhea, abdominal pain, blurry vision, dizziness, and numb extremities (Zhong Hua Nei Ke Za Zhi 1962).

Mume (Wu Mei): Inhibits the movement of roundworms (Chang Yong Zhong Yao Xian Dai Yan Jiu Yu Lin Chuan 1995), which may make it easier for the body to eliminate the parasites. 70% of treated patients cleared hookworms in one study (Zhong Yi Za Zhi 1959).

Omphalia (Lei wan): Clears tapeworms and roundworms as demonstrated in multiple trials (Zhong Hua Yi Xue Za Zhi 1956, Zhong Yao Yao Li Yu Ying Yong 1983). In addition, omphalia (Lei wan) was 100% effective for treating hookworm in 188 human patients when given along with Da Huang and Qian niu zi (Zhong Ji Yi Kan 1960). Lie wan powder was 85% effective (Shang Hai Zhong Yi Yao Za Zhi 1957).

Pulsatilla (Bai tou Weng): Demonstrated 100% efficacy in treating 26 human patients with amoebic dysentery (Wu Han Yi Xue Yuan Xue Bao 1958).

Rhubarb (Da huang): Contains sennoside A, aloemodin, and rhein, which cause defecation to help eliminate the parasites the other herbs paralyze. It increases peristalsis in the large intestine, but does not interfere with absorption of nutrients in the small intestine (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Internal parasitism is a common veterinary condition and constitutes Deposition Phase disease, which may rapidly undergo regressive vicariation to Inflammation and Excre-

tion phases in some instances (Miro 2006). Some parasites may cause severe disruption, leading to a Degeneration Phase (*Echinococcus*), and recovery following these diseases may be negatively affected by damage to functional tissues. The majority of puppies have ascarids, and coccidia are commonly encountered in both cats and dogs (Hoskins, Malone, Smith 1982).

Acariasis may potentiate canine parvovirus morbidity and mortality in puppies through immunosuppression caused by the release of homotoxins (Faquim-Mauro, Macedo 1998). In this situation, an unknown, subclinical Deposition Phase homotoxicosis undergoes progressive vicariation after exposure to the virus. Many parasites constitute zoonotic diseases, and every veterinary clinic should institute effective preventative strategies for the parasites that are commonly seen in their locale. To fail to properly perform this function leaves a large percentage of patients in the Deposition Phase; it is a short trip to the other side of the biological divide and the Impregnation Phase, where natural recovery is less likely. Both humans and animals benefit from such programs.

Parasites produce agents that are harmful to local cellular function and inhibit local immunity (Troeger, et al. 2006). These homotoxins and the body's response generate a wide array of pathology. Upon the death or removal of parasites, Excretion Phase diarrhea may result as the body attempts elimination of these undesirable materials. Such cases of diarrhea are generally handled by simple methods as discussed in the Diarrhea protocol section of this text. Chronic parasitism can damage vital GI function, as in the case of *Giardia*, which is well known to create a thickening of the small intestine with correspondingly poor absorption (Scott, et al. 2003).

Malabsorptive diarrhea can result. Heavy infestations of ascarids can decrease bowel wall integrity and lead to "leaky gut syndrome." *Trichuris vulpis*, the whipworm, is frequently associated with colitis signs. Because this parasite damages the colon by inserting itself into the wall, it creates a mild Impregnation Phase disease and compromises mucosal integrity. These cases generally return to normal after eliminating the parasites and allowing time to heal the damage. Finally, parasites can be associated with intestinal obstruction and static bowel syndrome, and may contribute to the development of intussusception in juveniles, a Degeneration Phase disorder requiring surgical repair.

Appropriate homotoxicology formulas

Nux vomica homaccord: Treats liver and gastrointestinal disease. It is a commonly used formula for detoxification as part of the Detox Kit.

Tanacet-Heel: Treats complications following removal of helminths, gastroenteritis, dysentery, gas, and pain following ascarids, especially in juvenile pets.

Traumeel: Has an anti-inflammatory effect and activates blocked enzymes.

Authors' suggested protocols

Nutrition

Intestinal/IBD and immune support formulas: 1 tablet for every 25 pounds of body weight BID.

Colostrum: One-third teaspoon of powdered formula for every 25 pounds of body weight BID.

Probiotic MPF: One-half capsule per 25 pounds of body weight with food.

Chinese herbal medicine/acupuncture

For roundworms, whipworms, tapeworms, and coccidian, the veterinarian may choose H92 Dewormer—round, whip, tape, coccidian. This formula contains betel nut (Bing Lang), melia root (Ku lian pi), mume fruit (Wu Mei), omphalia (Lei wan), and rhubarb (Da huang). It also contains coptis (Huang lian) and saussurea (Mu xiang) to increase efficacy.

For tapeworms or hookworms, the veterinarian may use H93 Dewormer—tapeworm, hookworm, which contains garlic (Da suan) and betel nut (Bing lang).

For coccidian and giardia, H94 Dewormer—coccidia, giardia is appropriate. This formula contains brucea seed (Ya dan zi), dichroa root (Chang Shan), and pulsatilla (Bai tou weng). In addition, it contains bupleurum (Chai hu), citrus (Chen pi), sargentodoxa vine (Hong teng) and saussurea (Mu xiang) to increase the efficacy of the cited herbs.

The dose of these herbs is 1 capsule per 10 pounds a day for 10 to 14 days.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

For intestinal parasites (coccidia, giardia, roundworms, hookworms, whipworms, and tapeworms), deworm with proper conventional drugs. Treat symptoms according to the condition that is manifested (see protocols for vomiting, enteritis, diarrhea, colitis, etc.). Tanacet, Traumeel S, and Nux vomica homaccord mixed together and used orally TID is useful for parasitic colic and difficulties following removal of parasites.

MEGAESOPHAGUS

Definition and cause

Megaesophagus is a dilation of the esophagus, which may be inherited and primary or secondary to other conditions such as myasthenia gravis or a primary neuropathy. The causes may be secondary to esophageal obstruction (foreign body, neoplasia etc.), inflammation, an infectious condition affecting the esophagus, or secondary to other primary diseases such as hypothyroid or hypoadrenocorticism (Guilford 1990, Twedt 1995). The loss of neuromuscular control leads to hypomotility and a ballooning of the esophagus.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The underlying cause should be determined once megaesophagus has been diagnosed. While no specific therapy exists for the condition, control can be achieved via feeding calorically dense food from an elevated position. If the underlying cause is determined to be genetic, then advising against further breeding is indicated. Surgery is indicated for blockages and to improve tone; however, motility is not improved surgically. Drugs to quiet inflammation, such as sucralfate, may be recommended. Medication may also be required for secondary conditions such as treating myasthenia gravis or neuropathies with corticosteroids (Jenkins 1996).

Anticipated prognosis

Control can often be achieved with dietary and feeding support. Prognosis is often poor or guarded when no support is given or when there are serious underlying disease causes (Leib 1993, Longshore 2003).

Integrative veterinary therapies

Most cases involve dogs, but feline cases are reported (van Geffen, et al. 2006). Several issues can lead to esophageal dysfunction, and these include hereditary disease and acquired conditions involving the muscle or nerve constituents of the esophagus. A full medical evaluation should be recommended. Once a complete diagnosis has been reached, the client can be informed of recommended treatment options (Wray, Sparkes 2006). In most cases there are only limited options such as feeding a gruel-consistency diet from a raised tray and keeping the head elevated for 10 minutes following feeding, or using paren-

tal feeding through external feeding tubes. Aspiration pneumonia is a common complication due to esophageal reflux of material.

While no clinical trials exist, a combination of therapeutic nutrients along with acupuncture and herbal and biological therapies can often improve the animal's condition and day-to-day quality of life.

Nutrition

General considerations/rationale

Besides dietary support (as listed above), nutrition is focused upon improving smooth muscle function, nerve function, and muscle contractibility, as well as reducing the secondary symptoms and inflammation often associated with the disease.

Appropriate nutrients

Nutritional/gland therapy: Glandular esophagus/stomach and nerve can help improve functions and neutralize cellular immune-mediated inflammation in spinal nerves, esophagus, and stomach. In addition, gland therapy supplies specific intrinsic nutrients required for stomach and esophageal cellular health (see Chapter 2, Gland Therapy, for more detailed information).

Note: Because megaesophagus can affect the entire body, it is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement or disease. This allows for a more specific gland and nutritional support protocol for the patient (see Nutritional Blood Testing, Chapter 2).

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the cells of the gastro-intestinal tract (Souba 1985, Windmueller 1982, Yoshimura 1993).

Magnesium: Magnesium has also been associated with neuromuscular function and conditions such as muscle cramping, weakness, and neuromuscular dysfunction. Magnesium is recommended for weakening muscle function (Bibley 1996, Levin 2002).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes particularly those of nerve and brain cells. It helps to move fats into the cells, and is involved with acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by all cells of the body for general health and wellness (Hanin 1987).

Chinese herbal medicine/acupuncture

General considerations/rationale

According to TCM, megaesophagus is the result of Qi deficiency and Stagnation with Phlegm accumulation in the Middle Burner, affecting the Stomach and Spleen. Megaesophagus is a deficiency of energy or strength (Qi).

In terms of gastrointestinal signs, the animal does not have the strength to digest food, leading to the accumulation of Phlegm. In this case the term Phlegm refers to the liquid ingesta in the gastrointestinal tract as well as the interference with normal digestion. According to the traditional Chinese medicine system, the Stomach and Spleen are both involved with digestion. The Spleen is easily obstructed by excess liquid (or Phlegm) and becomes unable to function correctly. The normal flow of ingesta through the gastrointestinal tract is disrupted, resulting in vomiting.

Appropriate Chinese herbs

Atractylodes (Bai zhu): Was shown to exhibit excellent antineoplastic effects against esophageal cancer in vitro studies (Zhong Liu Yu Zhi Tong Xun 1976).

Astragalus (Huang qi): Has been shown to inhibit some tumors (Shi 1999). It may be of use in neoplastic etiologies of megaesophagus.

Cyperus seeds (Xiang fu zi): Stops stomach cramping (Zhong Cao Yao Fang Ji De Ying Yong 1976).

Ginseng (Ren shen): May be effective in treating megaesophagus secondary to hypoadrenocorticism or hypothyroidism. As rats age, their plasma T3, T4 cortisol levels decrease. Ginseng is able to reverse this trend (Shi 1998).

Licorice (Gan cao): Contains glycyrrhizin and glycyrrhetic acid, which have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). This may be equivalent to using low-dose steroid therapy. It may be especially useful for megaesophagus secondary to hypoadrenocorticism.

Pinellia (Ban xia): Can inhibit the growth of tumor cell strain K₅₆₂ (Wu 1996). If it has efficacy against other neoplasias it may be useful for cancerous causes of megaesophagus.

Poria (Fu ling): Contains pachman, which has antineoplastic activity (Zhou 1982). In one experiment it was shown to be very effective at inhibiting Sarcoma 180 tumors in mice (Chen 1986), which suggests that it may help control tumors leading to megaesophagus.

Pueraria (Ge gen): Has anticancer effects. It has been shown to inhibit HL-60, an acute myeloid leukemia cell line (Modern TCM Pharmacology 1997).

Acupuncture

Chang et al. (1996) demonstrated that acupuncture could affect the muscular contraction of the normal esophagus. It may be of use in promoting the contraction in patients with megaesophagus.

Homotoxicology

General considerations/rationale

Megaesophagus represents a Degeneration Phase homotoxicosis that is often frustrating to treat, and not generally curable.

No written record could be located of any successful antihomotoxic treatment, but Broadfoot reports treating one case with apparent clinical improvement. Because these agents are generally safe, it makes sense to try a course of therapy and see what response, if any, occurs. Professionals are encouraged to share their experiences in this regard with the authors.

Appropriate homotoxicology formulas

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area, and distension.

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Gastricumeel: Treats acute gastritis. Contains Antimonium crudum, which is indicated for tooth decay and toothache, and thus, may be useful when dental work is indicated (Reckeweg 2002).

Gelsemium homaccord: Used for muscle weakness and in support of cervical and cranial neural issues.

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema.

Myelin Sheath Nosode: Provides direct support of tissues involved in neurological weakness.

Neuro-Injeel: Contains broadly active ingredients that are supportive of neurological tissues (Reckeweg 2000).

Placenta compositum: Contains Plumbum metallicum, which is indicated for atonic paresis and muscular atrophy, particularly in megaesophagus.

Ubichinon compositum: Contains Anthraquinone for swelling of the gums and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Esophagus/stomach support formula: 1 tablet for every 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight daily.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Magnesium: 10 mg for every 10 pounds of body weight SID.

Chinese herbal medicine/acupuncture

The patent formula Ding Chen Tou Ge Tang may be used for the regurgitation. In addition to the herbs cited above, this formula contains agaste (Huo xiang), amomum fruit

(Sha ren), aquilaria (Chen xiang), blue citrus (Qing pi), Chinese eaglewood (Chen xiang), citrus (Chen pi), cloves (Ding xiang), leaven (Shen qu), linden (Wu yao), magnolia bark (Hou po), malt (Mai ya), massa fermentata (Shen qu), nutmeg seeds (Rou dou kou), ophiopogon (Mai men dong), round cardamon (Bai dou kou), tsaoko fruit (Cao guo), and white peony (Bai shao). These additional herbs increase the efficacy of the formula. The supplement is dosed to the supplier's directions.

Acupuncture points: The authors are not aware of any well-controlled studies to evaluate the efficacy of acupuncture in patients with megaesophagus. The following points are suggested points based upon TCM theory: PC6, BL17, CV22, CV23, and CV17.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

This advanced degenerative condition is not generally responsive to therapy. Consider the following after advising clients of its experimental nature:

Injection therapy: Placenta compositum, Coenzyme compositum, Neuro-Injeel vials given by injection twice weekly.

Oral therapy: Lymphomyosot, Galium-Heel, Myelin Sheath nosode, Gastricumeel, and Spascupreel mixed together and given orally BID to TID. Consider Gelsemium homaccord orally BID in addition to the above.

MEGACOLON

Definition and cause

An enlarged, impaired-motility, lower bowel along with chronic constipation. Genetic loss of nervous enervation is seen in humans. Hirschsprung's disease has not been reported in animals. It is believed that in animals (common in cats, rare in dogs) it is a neurological interruption of smooth muscle contraction. Acquired megacolon is secondary to chronic constipation leading to permanent damage to the smooth muscle of the bowel. Trauma, fractured pelvis and blockage of the colon, spinal nerve insult or disease, foreign body, stricture of the colon, anal sac disease, and/or perianal fistulas are all common causes (Dixon 2003, Bertoy 2002, Washabau 1999).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Removal of the underlying cause often requires surgery (foreign body, neoplasia, anal sac problem, fracture). The surgical treatment of choice is a subtotal colectomy. Medical therapy of stool softeners such as Lactulose or Metamucil and improved motility (Cisapride) can be beneficial. Fluid replacement therapy along with antibiotics are often used. A low-residue diet is also recommended (Hasler 1997, Rosin 1993, Washabau 1999).

Anticipated prognosis

In general, medical management can be helpful in the short-term but not in the long-term. Surgical correction has proven beneficial in the long-term (Dixon 2003, Washabau 1999).

Integrative veterinary therapies

Colonic dilation occurs due to lack of proper motility. The idiopathic form is most commonly seen in clinical practice involving cats, and there may be some breed-related predisposition to megacolon in Manx cats. A wide variety of causative events can contribute to the condition and any condition which blocks the outflow of stool or negatively impacts myoneural function can ultimately lead to megacolon in both dogs and cats.

A thorough physical examination and history are indicated. Blood work is useful in determining health status (hydration and electrolytes as well as organ condition) and evaluating thyroid levels. Imaging may show the presence of neoplastic processes or traumatic incidents.

The initial treatment involves rehydrating and balancing electrolytes, treating static bowel syndrome, and removing the offending stool impaction or outflow tract issues. This may be adequate in early cases, particularly if the obstruction is not long-lived. Such cases may represent with obstipation and eventual development of megacolon. Exercise and play assist colon function, as does proper diet. A high-fiber diet is helpful in some cats, but in others this may cause aggravation and more rapid constipation, so the clinician must seek the diet that is most effective for each individual. Because fiber (soluble and insoluble) assists in homotoxin removal, the authors favor these initially. Dry food removes water from the system and may promote constipation through dehydration. Meat-based and canned diets may provide additional hydration and assist in colon function in obstipation cases. Canned pumpkin is readily accepted by many patients and can be very helpful. Other commonly bulking laxatives may prove helpful as well, but often cause worsening of constipation. A soluble fiber laxative such as lactulose is preferred.

Surgical solutions should be discussed with the client in advanced cases. Surgery does not cure the colonic atony, but can be particularly helpful in cases with colon outflow tract issues. Subtotal colectomy has been shown helpful in many cats, and while these cats may have loose stools for a time after surgery they eventually tend to form more normal stool with time.

The integration of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and cell-protective can help improve cellular function.

Nutrition

General considerations/rationale

Besides dietary support (as listed above), nutrition is focused upon improving smooth muscle function, nerve innervation, and contractibility as well as reducing the secondary inflammation associated with the disease.

Appropriate nutrients

Nutritional/gland therapy: Glandular intestines and nerve help to improve muscle function and neutralize cellular immune-mediated inflammation on both spinal nerves and the large bowel. Gland therapy also supplies specific intrinsic nutrients required for intestinal cellular health (see Chapter 2, Gland Therapy, for more detailed information).

Note: Because megacolon can affect the entire body, it is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement or disease. This allows for a more specific gland and nutritional support protocol for the patient (see Chapter 2, Nutritional Blood Testing, for additional information).

Glutamine: Glutamine has been shown to improve immune function and is beneficial for the intestinal tract. It helps to improve cellular integrity and permeability, especially in inflamed conditions (Souba 1985, Windmueller 1982, Yoshimura 1993).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes, which is beneficial for animals that are pancreatic-enzyme-deficient (McDonough 1987).

Magnesium: Magnesium has also been associated with neuromuscular function and conditions such as muscle cramping and weakness and neuromuscular dysfunction. Magnesium is recommended for weakening muscle function (Bibley 1996, Levin 2002).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that is integral to cellular membranes particularly those of nerve and brain cells. It helps to move fats into the cells, and is involved in acetylcholine uptake, neurotransmission, and cellular integrity. As part of the cell membranes, lecithin is an essential nutrient required by the cells of the body for general health and wellness (Hanin 1987).

Fiber: In a study involving people with IBS, Manning (1977) and Hotz (1994) showed improvement by adding psyllium to the diet.

Chinese herbal medicine/acupuncture

General considerations/rationale

Megacolon is a condition of Qi deficiency. There is concurrent Blood deficiency and Qi stagnation. The Intestines need Qi, or energy, to move the stool. When this energy is not sufficient, constipation results. In this condition, Blood deficiency precludes normal nourishment of the Intestine. The result is dryness of the Large Intestine, which in turn leads to dry stool. The Qi stagnation causes the discomfort associated with this condition.

Appropriate Chinese herbs

Apricot seed (Xing ren): Has an analgesic effect (Zhu 1994) and may help decrease discomfort associated with the constipation.

Areca peel (Da fu pi): Increases intestinal contraction (Xin Yi Yao Xue Za Zhi 1974).

Citrus (Chen pi): Has been shown to improve the intestine's digestive function in sheep (Kuang 1996). It increases peristalsis (Jiang Su Zhong Yi Za Zhi 1981).

Hemp seed (Huo ma ren): Has laxative properties. It increases peristalsis (Zhong Yao Xue 1998; 265:266).

Immature bitter orange (Zhi shi): Increases peristalsis and promotes defecation (Zhong Guo Yi Yao Xue Bao 1991).

Rhubarb (Da huang): Contains sennoside A, aloemodin, and rhein, which cause defecation. It also increases peristalsis in the large intestine, but does not interfere with absorption of nutrients in the small intestine (Zhong Yao Xue 1998).

Saussurea (Mu xiang): Contains multiple compounds that affect the intestines. Some inhibit cramping; some enhance peristalsis (Zhong Yao Yao Li Yu Ying Yong 1983).

Trichosanthes seed (Gua lou ren): Has a laxative effect (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

White peony (Bai shao): Has been used for constipation. In one trial, 60 human patients with chronic constipation were treated with an herbal supplement consisting of peony (Bai shao) and licorice (Gan cao). Other herbs were added as needed according to the TCM disease pattern of the patient. Almost all patients responded within 2 to 7 days (Zhong Yi Za Zhi 1983).

Acupuncture

Acupuncture has been shown in multiple trials to have positive results when used for habitual constipation, especially when combined with herbal therapy. One study investigated the use of a combined patent herbal supplement consisting of Ma Zi Ren (Huo ma ren, Xing ren, Shao yao, Zhi shi, Huo po and Da huang) and modified Zeng Ye Teng (Xuan shen, Mai men dong, Sheng di huang and Bai shao) and acupuncture. Fifty-five people with chronic constipation participated in the trial. After 2 weeks 65% resolved and 27% improved (Wu 2000). A second trial involved 31 people with habitual constipation. These patients received a variety of herbal supplements based upon the TCM diagnosis along with acupuncture therapy. All patients received acupuncture therapy at Bl25, St25, and St37. Then, based upon the TCM diagnosis, various combinations of the following points were used: LI4, LI11, St36, St40, Sp3, Sp6, Sp15, Liv2, Bl20, and/or Bl21. Seventy-seven percent resolved and another 16% experienced significant improvement (Guo 1999).

Homotoxicology

General considerations/rationale

Megacolon represents a Degeneration Phase condition. In early cases, there may still be time to salvage vital systems

before their total demise, and antihomotoxic drugs may greatly assist patients. These can be used integratively or on their own. Palmquist has used cisapride alone and in combination with antihomotoxic drugs and they seem compatible.

As in all disorders, regressive vicariation may come unexpectedly and the clinician should be pleased if other inflammatory conditions suddenly arise, because this may mark the beginning of homotoxin removal and excretion accompanying organ repair and revitalization. These events are not always startling and in many cases gentle, gradual improvement is noted and improved function gradually manifests. It should be remembered that Degeneration Phase diseases may be too far advanced for biological therapy to succeed, but because this type of therapy is very gentle, it is well worth considering.

Appropriate homotoxicology formulas

Berberis homaccord: Supportive of adrenal function, drains kidneys, and supports liver function. Contains Citrullus colocynthis for support of the lumbosacral area.

BHI-Constipation: Used for constipation, constipation altering with diarrhea, and incomplete stool (Heel 2002).

BHI-Neuralgia: Used for its complement of Silicea, which may assist in cases of constipation in which the patient's stool moves in and out before finally passing.

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area, and distension.

Colocynthis homaccord: Used for diarrhea with lower back pain (Citrullus colocynthis), colic, pain below the navel, and colitis with gelatinous stools.

Cruroheel S: Contains Silicea for "bashful stool" (stool that moves in and out before passing). Also used for support of degenerate connective tissue. This remedy can bring about a strong regressive vicariation in some cases.

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Ginseng compositum: Used for nausea, gastroenteritis, and constitutional support in geriatric or debilitated patients (Reckeweg 2000).

Hepar compositum: Provides detoxification and drainage of hepatic tissues, organ and metabolic support, and is useful in most hepatic and gall bladder pathologies. It is an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa*

compositum) for changes in appetite and stomach distension due to air. Used for nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. Also used for constipation, sudden diarrhea (particularly after eating), and flatus. (Reckeweg 2002) *Calcarea carbonica* is included for constipation in which the patient has no urge to pass stool.

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, in which *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains *Gentiana* for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. Contains *Geranium robertianum* for nausea, particularly after eating with distension or sensation of fullness.

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in *Kali bichromicum*, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. *Kali* has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains *Hydrastis*, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The *Kreosotum* component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy *Phosphorus* is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). *Phosphorus* is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component *Argentum nitricum* (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructa-

tions. It is also used for gastric crises (Reckeweg 2002).

Neuralgo-Rheum-Injeel: Contains *Citrullus colocynthis* for neuralgia, stabbing pains, and sciatica. *Gnaphalium polycephalum* is included for numbness in the back and paresthesia and twinges in the lower back (Reckeweg 2000).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). This commonly used formula for detoxification is part of the *Detox Kit*. Recent research shows that 1 ingredient (*Brucine*) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Paeonia-Heel: Used for anal region issues such as hemorrhoids, anal fissures, colitis, spasmodic constipation, weeping anal lesions, anal pruritus, and painful defecation (Reckeweg 2000). A topical cream is useful.

Podophyllum homaccord: Treats chronic gastroenteritis, gastroenteritis in juvenile dogs and cats, dyspepsia, catarrhal colitis, hemorrhoids, and watery-green diarrhea alternating with constipation.

Procteel: Contains *Lycopodium*, *Sulfur*, *Phosphorus*, and *Aluminum oxydatum* to make a formula that may be useful for megacolon and rectal atony, hemorrhoids, sore body orifices, alternating diarrhea and constipation, hepatic disease with cystic ducts, and intestinal stasis (Reckeweg 2000).

Solidago compositum: Provides drainage and support of the adrenal and urinary organs and is part of the Deep Detoxification Formula.

Thyroidea compositum: Provides matrix drainage and support of endocrine function. It is part of the Deep Detoxification Formula.

Ubichinon compositum: Contains anthraquinone for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Veratrum homaccord: Treats gastritis, intense vomiting with blood, collapse (pale mucous membranes), psychosis, dysentery, fecal incontinence, and intestinal spasm. This very useful remedy has been used widely by the authors for general vomiting cases. Consider its use in cases of gastritis following general anesthesia. Classical provings were recently repeated and found consistent with earlier work (Van Wassenhoven 2004).

Authors' suggested protocols

Nutrition

Intestine and brain/nerve support formulas: 1 tablet for every 25 pounds of body weight BID.

Glutimmune: One-fourth scoop per 25 pounds of body weight daily.

Probiotic MPF: One-half capsule per 25 pounds of body weight with food.

Magnesium: 10 mg for every 10 pounds of body weight SID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Psyllium: 1 teaspoon per 25 pounds of body weight per meal.

Chinese herbal medicine/acupuncture

H11 Megacolon: 1 capsule per 10 to 20 pounds twice daily as needed for optimal results. It can be combined with conventional medicines for better results. In addition to the herbs described above, H11 Megacolon contains astragalus root (Huang qi), cimicifuga (Sheng ma), ginseng (Ren shen), magnolia bark (Hou pu), and pinellia (Ban xia). These herbs increase efficacy of the formula.

Acupuncture points: BL25, ST25, TH6, ST36, ST37, LI11, BL20, BL21, CV4, and CV6 (Handbook of TCM Practitioners 1987).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Megacolon is an advanced degenerative condition poorly responsive to therapy.

For chronic atonies and megacolon: Broadfoot has experienced some success with autosanguis using Nux vomica homaccord, Lymphomyosot plus Colocynthis homaccord, Mucosa compositum, and Coenzyme compositum plus Ubichinon compositum. Give half by injection to the patient and add the other half to an oral cocktail of Berberis homaccord and Colocynthis Homaccord, success the mixture, and administer BID to TID orally.

For cases of spinal origin: Combine Veratrum homaccord, Podophyllum compositum, Nux vomica homaccord, Berberis homaccord, Mucosa compositum, Neuralgo-Rheum-Injeel, Hepeel, BHI Enzyme, Chelidonium homaccord, and BHI-Constipation tabs and administer orally BID to TID.

For refractory cases: Consider the following for long-term use after advising clients of its experimental nature: Proctheel, Nux vomica homaccord, and Lymphomyosot mixed together and given TID orally. Also consider Deep Detoxification Formula consisting of Galium-Heel, Hepar compositum, Solidago compositum, Thyroidea compositum, Ubichinon compositum, and Coenzyme compositum mixed together and given orally twice weekly. Proper diet and use of laxatives and enemas are essential.

CHRONIC ACTIVE HEPATITIS

Definition and cause

Chronic active hepatitis is chronic inflammation of the liver, often resulting in an elevation of both serum alanine aminotransferase (ALT) and serum aspartate aminotransferase (AST), and leading to cellular infiltration (most commonly lymphocytic), liver cell death, and fibrosis. Commonly suspected sources of the chronic inflammation include toxins, copper, adverse reactions to drugs such as anticonvulsants, and infections. The condition is suspected but not proven to be associated with an immune-mediated process (Center 1996; Dill-Macky 1995; Doige 1981; Hardy 1975, 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Commonly recommended drugs include corticosteroids or immunosuppressing medications such as azathioprine along with antibiotics such as metronidazole. In addition to dietary support with restricted protein diets, there is some suggestion that polyunsaturated phosphatidylcholine may be beneficial but there is no definitive proof that this is so. Vitamins E and K are recommended along with liver-protective remedies such as SAME (S-adenosyl-L-methionine) and milk thistle (silymarin). There is no definitive proof of their effectiveness, but they are given because they are believed to be liver-protective and help to reduce inflammation. Zinc acetate is often recommended to help control plasma copper levels, which are found in copper hepatopathy (Hardy 2003, Magne 1986, Meyer 2000, Neuberg 1983).

The use of immunomodulators such as prednisone and azathioprine along with antifibrotic and protective drugs such as ursodeoxycholic acid are typically part of the therapy plan. The dietary recommendation is usually protein-restricted diets that use vegetable sources of protein (Gitlin 1884, Hardy 2003, Laflamme 2000, Leveille-Webster 1995).

Anticipated prognosis

Prognosis is dependent upon correction of the underlying cause. If the cause, such as toxicity, is determined and

corrected, the prognosis is good. Immune-mediated and chronic longstanding conditions have a more guarded prognosis (Magne 1986, Sevelius 1995).

Integrative veterinary therapies

A complete history with regard to toxin and drug exposures (both systemic and topical agents, as well as vaccinations), physical examination, and laboratory testing are needed in all cases. The clinician should also take a careful history of alternative medicine agents such as herbal, nutraceutical, and homeopathic agents, because these can be associated with increased liver enzymes and hepatotoxicity as well. Specialized testing such as bile acid determination may be helpful in the decision to conduct a biopsy, a step that is often needed for the most complete diagnosis of chronic hepatitis patients. Imaging with radiographs or ultrasound is often indicated, and ultrasound is a valuable tool in diagnosis of hepatitis in clinical practice.

Chronic active hepatitis is conventionally viewed as a disease that often requires lifetime management. When treated with integrative veterinary approaches, a surprising number of these patients may make slow progress and show improvement. Evidence now supports several long-used holistic therapies such as antioxidant vitamins, milk thistle and its extracts, and SAME.

Dietary therapy is very important in all gastrointestinal and hepatic disorders. A highly digestible diet that has reduced protein levels that are high in biological value is recommended. Diets for liver patients should also contain appropriate copper levels, and may have additional nutraceutical agents such as vitamin E, zinc, milk thistle, SAME, and others as detailed in the nutritional therapy section of this text. Glandular therapy is particularly helpful in chronic, nonresponsive cases.

Antibiotics, corticosteroids, choleretics, diuretics, intravenous or subcutaneous fluid administration, and immunosuppressive and soluble-fiber laxative drugs may also be required. Many pharmaceutical agents are toxins; while they may be vitally important in preserving the patient's life, clinicians need to exercise caution in selecting these agents and determining proper dosing for patients with altered liver function. If possible, drugs that require hepatic metabolism should be avoided. The clinician needs to know common side effects of all agents in use, so that appropriate actions can be taken if adverse reactions arise (gastrointestinal toxicity with azothiapriner, vestibular/neurological issues with metronidazole, hepatoencephalopathy following steroid administration, etc.). Complementary therapeutic agents may be harmful to patients with compromised liver function as well, and generally care is warranted in designing treatment programs for all liver patients (Miele 2004).

Clients should be encouraged to inform the clinician of all agents they are administering or considering using to avoid side effects and toxic interactions. Proper integration of therapies to reduce disease pathology, eliminate toxins, support organ repair, reduce necessary drug intervals and dosing quantities, and prevent adverse interactions is a laudable goal of all medical treatment plans. Well-meaning but improperly informed individuals can create situations which threaten treatment success; however, with proper understanding, a wide variety of agents can be used to assist a patient in coordinating healing in chronic liver disease.

Use of high-soluble and insoluble fiber diets assists in trapping and moving these toxins out of the system, and probiotics may further assist in removing toxic agents from the bowel by converting them to other less toxic agents. Soluble fiber laxatives are routinely used in treatment of hepatoencephalopathy for their ability to bind ammonia in the intestinal contents. A new veterinary probiotic product called Azodyl® (Vetoquinol) selectively removes ammonia and other nitrogen wastes from the blood and is used in reducing azotemia in renal failure patients.

Clinical application of Azodyl® may prove helpful in these cases, but research is needed to see if evidence supports the theoretical application of this particular probiotic product, since urease activity by the organism could potentially worsen conditions in hepatitis.

The use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and tissue-sparing and that enhance cellular elimination of toxins can improve cellular health and enhance liver cell regeneration.

Nutrition

General considerations/rationale

Chronic liver disease has a similar nutritional focus as more acute inflamed conditions: reducing toxins and metabolic wastes as well as increasing antioxidant and phytonutrient levels can help neutralize compounds that the liver must deal with in its role as the body's filter and detoxifier. Because of the more chronic nature of liver disease, additional nutraceuticals should be added to further help protect liver cells and reduce scarring.

Note: Because liver disease can be severe and involve multiple organ disease, it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease. This allows for a more specific gland and nutritional support protocol (see Chapter 2, Nutritional Blood Testing, for additional information).

Appropriate nutrients

Nutrition/gland therapy: Clinical trials using thymus extract have shown that it is beneficial in people with

hepatitis B (Skotnicki 1989). Additional clinical studies with oral thymus extract showed that blood values related to liver function as well as the blood immune markers all improved. Civereira (1989) showed similar results with hepatitis C (Galli 1985, Bortolotti 1988).

Glandular liver: Helps neutralize a cellular immune response and spare liver cells (see Gland Therapy in Chapter 2).

Lecithin/phosphatidyl choline: Lecithin/phosphatidyl choline has been shown to help break down scar tissue in the liver and prevent cirrhosis by reversing the cellular changes that lead to cirrhotic cell formation (Ma 1996). Phosphatidyl choline has been shown to reverse the progression of alcohol induced cirrhosis in humans (Lieber 1994).

Alpha-lipoic acid: Alpha-lipoic acid is a potent antioxidant that is proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, Co-Enzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Lykkesfeldt 1998, Scholich 1989). There was significant improvement of liver function in a study of people with cirrhosis who received a combination antioxidant-rich supplement that contained 300 mg of alpha-lipoic acid (Berkson 1999).

S-adenosylmethionine (SAME): SAME is an antioxidant and has anti-inflammatory effects on the liver (Center 2000). SAME has been shown to significantly improve survival and decrease the need for liver transplantation in people with liver disease. It has also been shown to improve liver function in less severe cases of cirrhosis (Gorbakov 1998, Mato 1999, Miglio 1975).

Vitamin E: Vitamin E was shown to decrease liver damage and immune imbalances that may contribute to the disease progression; however, further clinical work is required to definitively confirm this because another clinical trial failed to confirm these results (Ferro 1999, de la Maza 1995).

Zinc: Clinical trials have confirmed that zinc deficiencies are associated with cirrhosis in people (Scholmerich 1983, Taniguchi 1995). In double-blind testing with zinc acetate supplementation, Reding (1984) and Marchesini (1996) showed a significant improvement in portal systemic encephalopathy.

Chinese herbal medicine/acupuncture

General considerations/rationale

Traditional Chinese Medicine considers chronic active hepatitis to be a condition of Heat and Damp in the Liver and Gallbladder. There is concurrent Qi and Blood stagnation, which leads to indigestion, inappetence, mid-abdominal discomfort, and possible icterus or fever.

Heat is Inflammation. We now know that this inflammation may be due to bacteria, toxins, or immune-

mediated causes. Heat can also be used to describe the yellow seen in icteric patients. This concept of yellow as a warm color continues today. Fever is an obvious manifestation of Heat. Damp can describe purulent debris in the case of bacterial etiologies or bile accumulation if the gallbladder becomes involved.

When there is Qi stagnation in the Liver and Gallbladder there is weakness in the body. This leaves insufficient energy to digest the food. Blood stagnation causes pain, so when there is Blood stagnation in the Liver, there is epigastric pain. The Blood is also responsible for nourishing the body.

Appropriate Chinese herbs

Angelica root (Dang gui): Is hepatoprotective. It promotes generation of hepatocytes (Chong Qing Yi Yao 1989). In one study, 17 patients with chronic hepatitis and 10 with liver cirrhosis had reductions in clinical signs (Zhong Yi Yao Xin Xie 1985). Chronic active hepatitis may be due to bacteria. Angelica root has antibacterial action against different strains of bacteria, including *E. coli* (Hou Xue Hua Yu Yan Jia 1981).

Astragalus (Huang qi): Was used in 29 humans with chronic hepatitis for 1 to 3 months with good results (Zhe Jiang Zhong Yi Za Zhi 1983). Another 174 human patients who tested positive for hepatitis B antibodies were treated by injection every third day for 3 months; 75% became seronegative for hepatitis B. (Ji Lin Zhong Yi 1985).

Atractylodes (Bai zhu): Has been used in cases of infectious hepatitis with good results (An Hui Zhong Yi Xue Yuan Xue Bao 1984).

Blue citrus (Qing pi): Has hepatoprotective properties. In CCl₄-treated rats and mice, there was a 10% decrease in ALT and AST over controls when curcuma was given (Zhong Guo Mian Yi Xue Za Zhi 1989).

Bupleurum (Chai hu): Is well suited for use in chronic active hepatitis. It contains saikosaponin which has analgesic and antipyretic properties (Shen Yang Yi Xue Yuan Bao 1984). Furthermore, it has anti-inflammatory effects (Liu 1998). Studies have shown that it inhibits various bacteria (Zhong Yao Xue 1988).

Curcuma root (Yu jin): Can protect the liver by increasing the amount of superoxide dismutase, increasing serum albumin, and decreasing the ALT in cases of CCl₄ toxicity (Liu 1999). In CCl₄-treated rats and mice, there was a 10% decrease in ALT and AST over controls when curcuma was given (Zhong Guo Mian Yi Xue Za Zhi 1989). This hepatoprotective effect may extend to bacterial or inflammatory cell mediator toxins.

Cyperus (Xiang fu zi): Relieves pain and decreases fevers. The antipyretic activity in rats is 6 times stronger than aspirin (Gui Yang Yi Xue Yuan Xue Bao 1959, Indian J Med Res 1971).

Forsythia (Lian qiao): Contains an antiviral compound called rengynic acid (Zhang 2002), which may make it helpful in viral etiologies. It also inhibits many bacteria and possesses anti-inflammatory, analgesic, and antipyretic effects (Ma 1982). Other studies show that forsythia has hepatoprotective activity in cases of hepatotoxins (Group of Liver Diseases 1973).

Gentian root (Qin jiao): Is an anti-inflammatory herb. It causes the adrenal glands to secrete corticosteroids (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). In one trial 20 people with either hepatitis or neonatal jaundice were treated with gentiana along with Huang qin and Lian qiao, or with Cang zhu, Bai zhu, and Hou po for 14 days. Both groups improved (Shang Hai Zhong Yi Yao Za Zhi 1965).

Licorice (Gan cao): Has several functions that are beneficial in cases of chronic active hepatitis. It contains glycyrrhizin and glycyrrhetinic acid, which have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). Glycyrrhizin also has antiviral activity (Zhu 1996). In one study it was 77% effective in treating 330 human patients with hepatitis B. It reduced inflammation, increased regeneration of hepatic cells, and decreased hepatic necrosis and cirrhosis (Zhong Yao Tong Bao 1987).

Ophiopogon (Mai men dong): Inhibits bacteria including *E. coli* (Zhong Yao Xue 1998).

Oriental wormwood (Yin chen hao): Is an excellent herb to use in cases of hepatitis. It can relieve fevers. It has a duration of 3 to 4 hours in rats with experimentally induced pyrexia (Planta Med 1984). The compound responsible for this effect seems to be capillarin. Another compound, 6, 7-dimethoxy coumarin, has analgesic and anti-inflammatory effects (Wan Yao De 1987, Shan 1982). Oriental wormwood is also hepatoprotective in that it can induce the activity of microsomal cholesterol esterase, thereby increasing the metabolism of toxic substances (Hu Yi Qiao 1999, He Ping 1990). It can promote bile secretion, enhance bile flow, and protect the functions of hepatocytes (He Ping 1990, Sui Yan Hua 1993). It possesses antibacterial properties against multiple bacteria including *E. coli* (Zhong Yao Yao Li Yu Ying Yong 1990). Thirty-two people with acute hepatitis were treated with oriental wormwood 3 times a day for 3 to 15 days. There was significant decrease in hepatomegaly, icterus, and pyrexia (Fu Jian Zhong Yi Yao 1959).

Peach kernel (Tao ren): Prevents the depletion of glutathione in the liver caused by toxic chemicals, and increases the activity of superoxide dismutase (Sun Wei Qiang, 1993, Jiang 1995). It decreases hepatic fibrosis caused by CCl₄, allowing the recovery of hepatic tissues (Xu 1993). This may help the liver recover from inflammatory damage.

Poria (Fu ling): Protects the liver (Han 1977). It inhibits some bacteria (Nanjing College of Pharmacy 1976).

Salvia (Dan shen): Protects the liver. It improves hepatic circulation and promotes regeneration of liver cells (Zhong Yi Za Zhi 1982, Zhong Xi Yi Jie He Za Zhi 1988). It has been shown to reduce the amount of fibrosis in rats given CCl₄ or DMN (dimethylnitrosamine) (Hu Yi Yang 1999). This action may help prevent the formation of fibrosis in cases of chronic active hepatitis. In one study involving 22 human patients with chronic active hepatitis, all 11 patients who received injections of salvia and 6 of the 11 who took the salvia orally had normal liver enzymes within 3 months (Zhong Xi Yi Jie He Za Zhi 1984).

Schisandra (Wu wei zi): Has been shown experimentally to lower ALT in laboratory animals with toxin-induced hepatic damage. It seems to alter the liver cell membrane to prevent toxins from entering the cell. It also increases blood flow to the liver and promotes the regeneration of hepatic cells (Nagai 1989, Takeda 1986). This herb promotes bile secretion in healthy mice, and promotes liver regeneration in mice whose liver has been partially removed (Gao 1996, Wu 1987). Thirty-four human patients with chronic active hepatitis were treated with a formula containing Wu wei zi, Ling zhi, Dan shen, and Chai hu for 3 months. Thirty-three patients responded (Shan Xi Zhong Yi 1988).

White peony (Bai shao): Contains paeoniflorin, which is a strong antipyretic and has anti-inflammatory efficacy (Zhong Yao Zhi 1993). Additionally, it has demonstrated antibacterial actions against various bacteria including *E. coli* (Xin Zhong Yi 1989).

Acupuncture

Some acupuncturists have felt that this modality can be used to enhance liver function and decrease inflammation by reducing the toxins (infectious agents, inflammatory mediators) (Handbook of Traditional Chinese Medicine Practitioners 1987).

Homotoxicology

General considerations/rationale

Chronic active hepatitis is a descriptive diagnosis that is useful in categorizing pathology of the liver. It is not a specific or causal diagnosis, and as such has limited usefulness. This diagnosis is usually applied to canine patients, and as the name implies, pathology consists of an ongoing pathological process with the presence of inflammatory cells and development of fibrosis (Watson 2004). Human and canine conditions are similar and can serve as treatment and disease models for one another (Spee, et al. 2006). Such changes are viewed in homotoxicology as originating from the body's attempted handling of homotoxins generally in the Impregnation and Degeneration phases.

Homotoxins can manifest in many ways. Damage to the genome results in genetic causes, which are suspected in several breed-related hepatopathies (Doberman pinschers, Cocker spaniels, Labradors, Skye terriers, Bedlington terriers, and West highland white terriers, for example). Toxins (environmental and pharmaceutical, particularly anticonvulsants, heartworm preventatives, and nonsteroidal anti-inflammatory drugs), bacteria (leptospirosis), and viruses (infectious canine hepatitis virus) all can play a part in the development of chronic liver disease (Watson 2004).

Homotoxicology agents can cause homotoxin off-load from cells and the matrix. While this is desirable, the clinician must carefully supervise it. Homotoxin off-load results in increased circulating levels of homotoxins that can further irritate a weakened or diseased liver. Monitoring of hepatic enzymes is recommended, and a reduction in detoxifying products is advised when more marked increases in hepatic enzyme levels occur. Some minor rise in ALT and SAP may be desirable and simply indicate that the liver is working. For instance, Galium-Heel is a very effective cellular detoxifying agent that can cause increased enzyme levels (Miele, et al 2004). It is frequently required in treating chronic diseases. When liver enzymes rise in patients on Galium-Heel or other antihomotoxic agents, the product should be used at lower levels or given at longer intervals, and in some cases must to be discontinued for short periods of time while the body catches up with homotoxin elimination.

Concentrating on liver support with Hepar compositum and catalysts during these times is helpful. When liver enzymes increase during therapy, the veterinary clinician should assist the patient by moving homotoxins out through other elimination organs, such as the kidney (*Solidago compositum*, *Berberis homaccord*), and support of the gastrointestinal system is of utmost importance due to the entero-hepatic recycling of homotoxins (*Mucosa compositum*, *Nux homaccord*).

Appropriate homotoxicology formulas

Oral drop combinations may contain alcohol. In most cases this is such a small quantity that it is well tolerated, but when possible, selecting oral vials and tablets may reduce the workload on the liver (Reckeweg 2000). See also specific protocols for enteritis, colitis, pancreatitis, and other applicable gastrointestinal conditions for more information and remedy selection ideas.

Arsuraneel: A cellular phase remedy that treats enteritis and diarrhea (*Arsenicum album*). May be useful in arsenic poisoning in areas with contaminated ground water (Mallick, Mallick, Guha, and Khuda-Bukhsh 2003; Khuda-Bukhsh 2005). Also used in chronic disease, tumors of mucous membranes (*Marsdenia cundurango*), and diabetes mellitus (*Acidum phosphoricum*) (Reckeweg 2000).

Atropinum compositum: Not available on the U.S. market at this time, but a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). Contains Benzoicum acidum (common also to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal: a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching and vomiting, and flatulent distension below the ribs on both sides. The stools are copious, loose, and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

Berberis homaccord: *Berberis* has major actions on the liver and gallbladder (Reckeweg 2000), and has been shown to have effects in diarrhea (Zhu, Ahrens 1982; Shamsa, Ahmadiani, and Khosrokhavar 1999). Treats colic, collapse, and bloody vomitus, and is supportive of adrenal and renal function. Part of the basic *Detox Kit*. *Berberis* is also contained in *Solidago compositum*.

BHI-Chelidonium complex: Used for abdominal distention and flatulence (*Lycopodium*, *Calcarea carbonica*); Gastralgia and yellow-clay-colored stools (*Chelidonium majus*); painful, distended abdomen, spasmodic hiccup, and epigastric pain (*Belladonna*) (Heel 2002).

Ceanothus homaccord: Treats pancreatopathy, epigastric syndrome, tenesmus, diarrhea, and hepatic issues. Splenic enlargement is a primary signalment for this remedy (Macleod 1983).

Chelidonium homaccord: A commonly used agent in hepatic damage and hepatitis, and gallbladder conditions such as cholangitis, cholecystitis, and obstructive jaundice (Demers 2004). *Chelidonium* contains a substance known as Chelidonine that has anticancer effects. "Chelidonine turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM," according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia.

Chol-Heel: An excellent remedy containing *Belladonna*, *Chelidonium*, *Carduus marianus*, *Lycopodium*, *Veratrum*, and *Taraxicum*, along with some other very useful components, all in potency chords. This can be of great relief in GI discomfort (Broadfoot 2005).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area, and distension. Used as an agent to repair mitochondrial damage resulting from antibiotic therapy (also with *Ubichinon compositum* and *Galium-Heel* for that purpose).

Colchicum compositum: Used for cachexia and neoplastic conditions. Colchicine has been used in hepatitis patients to reduce cirrhosis. The use of *Colchicum compositum* should be considered but has no clinical evidence at this time. Reports of its use are welcomed by the authors.

Engystol N: Used for viral-origin gastroenteritis and hepatitis (see Parvovirus).

Erigotheel: Used for gastric catarrh, hepatic diseases, and duodenal ulcers with spasm, and as an antipyretic (Demers 2004).

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant. See notes above for proper use.

Hepar compositum: The main remedy for chronic hepatitis cases. Provides detoxification and drainage of hepatic tissues, organ and metabolic support, and is useful in most hepatic and gall bladder pathologies. It is an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Used for nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. Also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Leptandra compositum: Used for epigastric syndrome, portal vein congestion, pancreatopathy, chronic liver disease, and diabetes mellitus (Reckeweg 2000).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. Also contains Geranium robertianum for nausea, particularly after eating with distension or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or

tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). This commonly used formula for detoxification is part of the *Detox Kit*. Recent research shows that one ingredient (Brucine) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Phosphor homaccord: Treats hepatitis, icterus, tenderness over the liver region, pancreatic diseases, ulcerated gums, thirst but vomiting right after drinking occurs, and pale-clay-colored stools (Macleod 1983).

Schwef-Heel: Treats chronic diseases of the skin and liver. This remedy should be interposed in most skin and liver cases (Reckeweg 2000). Patients that need this remedy may look dirty and have scruffy skin conditions, red lips, a white tongue with red tip, itching and burning rectal area with morning diarrhea, or a prolapsed rectum (Boericke 1927). Sulfur is contained in several other anti-homotoxic formulas including *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Paeonia-Heel*, *Proctheel*, *Psorinoheel*,

Sulfur-Heel, *Thyroidea compositum*, and *Ubichinon compositum* (Reckeweg 2000).

***Syzygium compositum*:** Used for chronic gastritis, chronic enteritis, diabetes mellitus, and hepatic disorders.

***Ubichinon compositum*:** Contains Anthraquinone for swelling of the gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Liver and immune support formulas (thymus-enriched): 1 tablet for every 25 pounds of body weight BID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

S-adenosylmethionine SAME: 10 to 20 mg/kg SID or follow manufacturer's dosing directions.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Zinc: 15 mg for every 25 pounds of body weight SID.

Additional vitamin E: 50 IU for every 25 pounds of body weight.

Chinese herbal medicine/acupuncture

LiverGuard: 1 capsule per 10 to 20 pounds twice daily based upon response. In addition to the herbs cited above, LiverGuard also contains amomum fruit (Sha ren), hawthorn fruit (Shan zha), immature bitter orange (Zhi qiao), linden root (Wu yao), massa fermentata (Shen qu), mastic (Ru xiang), melia (Chuan lian zi), myrrh (Mo yao), rehmannia (Sheng di huang), and tortoise shell (Bie jia).

The authors commonly choose from the following acupuncture points: LI3, GB34, BL18, BL19, BL20, PC6, CV12, and GB34.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

In addition to the necessary conventional therapy:

Phosphor homaccord, Chelidonium homaccord, Nux homaccord, Duodenoheel: Mixed together and give BID.

Alternate: Hepeel and BHI-Enzyme—BID PO.

Gastricumeel: If vomiting.

Engystol N: For viral hepatitis.

Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum: Give every 3 days. If diarrhea, consider adding Coenzyme compositum and Ubichinon compositum twice weekly.

CHOLANGIOHEPATITIS

Definition and cause

An inflammatory process of the liver and bile ducts that can manifest as suppurative or infiltrative (lymphocytic or plasmalymphocytic). In cats, it is very commonly associated with pancreatitis and inflammatory bowel disease (Triad disease) as well as kidney disease. The initiating cause of the inflammation is commonly infection or a pre-existing condition such as extrahepatic bile duct obstruction (EHBO). An immunological response is also suspected (Bunch 1992; Center 1994, 1996, 2003; Johnson 1994).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy is broad-spectrum antibiotics, usually clavamox in combination with metronidazole and glucocorticoids. In more resistant cases immunosuppressing drugs such as azathioprine or chlorambucil in combination with prednisone are suggested. Liver protectants such as ursodeoxycholic acid (Actigall) are recommended along with water-soluble antioxidant vitamins such as vitamins E and B. Dietary recommendations are a low-fat, high-protein diet to prevent hepatic lipidosis (Bunch 1992, Center 2003).

Anticipated prognosis

More acute disease often responds well to medication and dietary changes. Chronic disease requires ongoing medication and care and can be controlled well for long periods of time (Center 2003, Johnson 1994).

Integrative veterinary therapies

The integrative approach to liver disease focuses upon the inciting inflammatory process that results in liver cell destruction. Early identification, addressing the cause, and instituting integrative measures, along with medical therapy when necessary, often gives the best prognosis.

Liver cell regeneration may be improved if the underlying cause is identified early and nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and organ sparing are used. It is possible to prevent progressive inflammation, cell death, and scarring that leads to cirrhotic conditions if integrative therapies are instituted early in the treatment of hepatitis or at early signs of liver issues such as chronic elevation of ALT, AST, or GGTP levels (Goldstein 2005).

Nutrition

General considerations/rationale

Liver health depends upon reducing toxins and metabolic wastes and increasing antioxidants and phytonutrients that help neutralize compounds that the liver must deal with in its role as the body's filter and detoxifier. Glutathione is a compound that is composed of three amino acids: glutamic acid, glycine, and cysteine. Glutathione binds and neutralizes various chemicals, toxins, herbicides, pesticides, heavy metals, etc. so they can pass through the liver and be excreted via the bile into the intestines, or pass to the kidneys to be excreted in the urine (Sen 1997).

Body glutathione levels can be raised by other nutrients such as vitamin C, whey protein, glutamine, methionine, S-adenosyl-L-methionine (SAME), and alpha-lipoic acid (Amores-Sanchez 1999, Bounous 1989, Vendemiale 1989, Wang 1997).

Appropriate nutrients

Nutrition/gland therapy: Clinical trials using thymus extract have shown that they are beneficial in people with hepatitis B (Skotnicki 1989). Additional clinical studies with oral thymus extract showed that blood values related to liver function as well as blood immune markers improved. Civeireira (1989) showed similar results with hepatitis C (Galli 1985, Bortolotti 1988). Glandular liver helps to neutralize a cellular immune response and helps spare liver cells (see Chapter 2, Gland Therapy, for additional information).

Note: Because liver disease can be severe and involve multiple organ disease, it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease. This allows for a more specific gland and nutritional support protocol (see Chapter 2, Nutritional Blood Testing, for additional information).

Lecithin/phosphatidyl choline: Has been shown to help break down scar tissue in the liver and prevent cirrhosis by reversing the cellular changes that lead to cirrhotic cell formation (Ma 1996). Phosphatidyl choline has been shown to reverse the progression of alcohol-induced cirrhosis in humans (Lieber 1994).

Alpha-lipoic acid is a potent antioxidant, proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, CoEnzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Lykkesfeldt 1998, Scholich 1989). There was significant improvement of liver function in a study of people with cirrhosis who received a combination antioxidant-rich supplement that contained 300 mg of alpha-lipoic acid (Berkson 1999).

S-adenosylmethionine (SAmE): SAmE is an antioxidant that has anti-inflammatory effects on the liver (Center 2000). SAmE has been shown to significantly improve survival and decrease the need for liver transplantation in people with liver disease. It has also been shown to improve liver function in less severe cases of cirrhosis (Gorbakov 1998, Mato 1999, Miglio 1975).

Vitamin E: Was shown to decrease liver damage and immune imbalances that may contribute to the disease progression; however, further clinical work is required to definitively confirm this because another clinical trial failed to confirm these results (Ferro 1999, de la Maza 1995).

Chinese herbal medicine/acupuncture

General considerations/rationale

Cholangiohepatitis is a disorder of Heat and Damp in the Stomach and Spleen. There is a cleansing disorder in the Liver and Gallbladder. Heat is infection or inflammation. Damp refers to purulent debris or accumulation of sludged bile in the Gallbladder. The ancient Chinese attributed the condition to the Stomach and Spleen because the signs presented, such as vomiting or in more chronic cases ascites, are categorized as Stomach and Spleen signs. The Liver and Gallbladder are said to clean the Blood at night. Toxins can build up in the blood if they are not functioning well. This concept is similar to the Western idea in which hepatoencephalopathy may result if the liver does not detoxify compounds in the body.

Treatment is aimed at decreasing the Heat (infection or inflammation), moving the Damp (increasing bile flow), and controlling signs such as ascites, anorexia, nausea, etc.

Appropriate Chinese herbs

Alisma (Ze xie): Has been used to treat hepatic lipidosis (Chinese Journal of Modern Developments in Traditional Medicine 1981). In addition it has diuretic properties (Sheng Yao Xue Za Zhi 1982).

Atractylodes (Bai zhu): Has immunomodulatory effects. It can increase the T helper cell count and increase the ratio of helper to suppressor cells (Xu 1994). It has a diuretic effect and has been used for ascites from infectious hepatitis (An Hui Zhong Yi Xue Yuan Xue Bao 1984).

Barley sprouts (Mai ya): Syrup was used in patients with hepatitis, and symptoms improved in 85% of the cases of acute hepatitis and 57% of the cases of chronic hepatitis. Positive effects were defined as improved appetite, decreased pain, and decreased liver enzyme levels (Xin Yi Yao Tong Xun 1972).

Cinnamon twigs (Gui zhi): Have demonstrated antibiotic properties against several bacteria and viruses (Zhong Yao Xue 1998). They also have diuretic actions (Zhong Yao Xue 1998).

Crataegus (Shan zha): Counteracts nausea (Zhong Xi Yi Jie He Za Zhi 1984). Nausea is most commonly seen in chronic suppurative cholangiohepatitis, but may be present in other forms of this disease.

Ginger (Gan jiang): Helps relieve signs of abdominal fullness and epigastric pain (Zhong Yi Za Zhi 1965).

Licorice (Gan cao): Can play many roles in a supplement designed for cholangiohepatitis. Corticosteroids are often part of the therapeutic protocol in Western therapy. Licorice contains glycyrrhizin and glycyrrhetic acid, which enhance the action of endogenous corticosteroids in the body (Zhong Yao Zhi 1993). Licorice is hepatoprotective and has antibacterial and antiviral properties. It has efficacy against *E. coli* and adenovirus II, among other pathogens (Zhong Yao Zhi 1993, Zhu 1996). It was 77% effective in treating 330 human patients with hepatitis B. It reduced inflammation, increased regeneration of hepatic cells, and decreased hepatic necrosis and cirrhosis (Zhong Yao Tong Bao 1987).

Oriental wormwood (Yin chen hao): Ideally suited for use in an herbal supplement designed for cholangiohepatitis. It has hepatoprotective properties. It can increase the phagocytic action of macrophages and has been shown experimentally to enhance the ability of the liver to detoxify drugs in both humans and rabbits (Hu 1999, He 1990). It has cholagogic effects (Sheng Yao Xue Za Zhi 1978). Furthermore, it has antibacterial activity against a variety of bacteria, including *E. coli* (Zhong Yao Yao Li Yu Ying Yong 1990). It also has analgesic and anti-inflammatory effects (Wan 1987, Shan 1982). Oriental wormwood was used in a trial involving 32 people with acute hepatitis. After 3 to 15 days of treatment there was significant decrease in hepatomegaly, icterus, and pyrexia (Fu Jian Zhong Yi Yao 1959). Cats with cholangiohepatitis often have concurrent pancreatitis. When wormwood was administered to rats with deoxydium-induced acute hemorrhagic necrotic pancreatitis, it decreased the death rate (Li 1996).

Pinella (Ban xia): Seems to affect the central nervous system to decrease chemical-mediated vomiting (Zhong Yao Yao Li Yu Ying Yong 1983). It may decrease nausea and vomiting secondary to hepatic failure.

Polyporus (Zhu ling): Has been shown to be hepatoprotective in studies involving the administration of CCl₄ to rats (Zhong Guo Yao Li Xue Tong Bao 1988). In addition, it is a diuretic (Yao Xue Xue Bao 1964) and may help decrease ascites. It inhibits *E. coli*, a common hepatic pathogen (Zhong Yao Xue 1998).

Poria (Fu ling): Protects the liver. It has been shown experimentally to decrease damage induced by CCl₄ (Han 1977). It has a diuretic effect as demonstrated in rabbits (Lu 1987, Lu 1988). It also inhibits bacteria (Nanjing College of Pharmacy 1976).

Acupuncture

Acupuncture may help protect the liver. In one experiment 36 rats were treated with CCl₄. The efficacy of acupuncture at St36 and LI3 for hepatoprotection was investigated. The rats treated after exposure to CCl₄ had lower AST and ALT levels, suggesting that acupuncture can protect the liver (Hsu-Jan Liu 2001).

Homotoxicology

General considerations/rationale

The liver and gallbladder are crucial organs in the body's defense against both endogenous and exogenous homotoxins. Homotoxins originating in the gastrointestinal system are absorbed and presented to the liver for handling via the portal vein system. The liver has an effective system for defense, but disease can result if homotoxins accumulate and damage the tissues associated with the liver. Disease involving the bile ducts is called cholangitis, while conditions involving both liver and bile ducts are known as cholangiohepatitis. Both conditions represent homotoxicoses of either the Inflammation Phase (in acute disease states) or the Impregnation Phase (in more chronic or recurring disease). Cellular infiltrates of immune cells may consist of neutrophils, lymphocytes, or plasmacytes.

Concurrent diseases of the gallbladder, liver, pancreas, or gastrointestinal system can result in cholangiohepatitis, particularly if the bile becomes thickened and sludged, a change commonly seen during ultrasound examination of the abdomen (Weiss, Gagne, Armstrong 1996; McCaw 1997; Newell, et al. 1998). Such abnormal terrain favors the development of bacterial invasion, and biliary ducts respond by hyperplasia, which further compromises the area. Bacterial invasion often results in suppurative infiltrates. More chronic pathologies may lead to antigenic stimulation that can result in lymphocytic and lymphoplasmacytic infiltrates.

Successfully treating cholangiohepatitis involves providing clean diet and water, reducing stress, allowing homotoxins to be excreted successfully, supporting organ function, and providing drainage therapy, organ support, and metabolic support while repair occurs.

Antibiotic agents are frequently necessary in more severe or chronic cases, and selection of agents that inhibit or kill both aerobic and anaerobic bacteria is advised. Amoxicillin and metronidazole are frequently chosen, but other medications may be needed in resistant bacterial infections. Clearing the bacterial infection may not resolve the cholangiohepatitis (Pressel, et al. 2005). Treatment goals include liquefying biliary sludge, promoting bile flow, controlling existing infection, and protecting associated tissues from further harm as homotoxins are removed and drained from the area. Ursodeoxycholic acid is commonly used to thin bile in conventional practice. *Chelido-*

nium is well known in homotoxicology practices for its ability to perform similarly, and this herb figures prominently in treatment plans for cholangiohepatitis. As is the case in treating all homotoxicoses, proper nutrition and fluid intake are helpful as well.

Regressive vicariation in these patients frequently involves some degree of gastrointestinal dysfunction, which usually consists of mild to moderate diarrhea or constipation. Stool character can vary between these two extremes as autoregulation is reinstated. Stool color may vary greatly as homotoxins clear the system. Because homotoxins can be recycled from reabsorption of gastrointestinal contents, the addition of adequate fiber can greatly assist in binding homotoxins and moving them out of the system. Supporting other excretion organs, particularly the kidney, is advised as well.

Appropriate homotoxicology formulas

Because gastrointestinal disease plays prominently in the pathogenesis of liver disease, the reader is referred to the more complete list of remedies at the end of the gastrointestinal chapter.

***Atropinum compositum*:** Currently only available in the U.S. market in tablet form, this agent functions as a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). Contains Benzoicum acidum (common also to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal: a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching and vomiting, and flatulent distension below the ribs on both sides. The stools are copious, loose, and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

***Belladonna homaccord*:** Treats right-sided intensely red tonsillitis, pharyngitis, poor appetite, nausea and vomiting, stinging rectal pain, and focal and intense inflammatory lesions (Boericke 1927). Also treats cholangitis, cholecystitis, and cholelithiasis (Reckeweg 2000).

***BHI-Chelidonium complex*:** Treats abdominal distention and flatulence (*Lycopodium*, *Calcarea carbonica*); gastralgia and yellow-clay colored stools (*Chelidonium majus*); painful, distended abdomen, spasmodic hiccup, and epigastric pain (*Belladonna*).

***BHI-Gall Bladder Rx*:** Used for disorders of the gallbladder, gallstones, gallbladder colic, abdominal bloating, and discomfort.

***Chelidonium homaccord*:** A major remedy that is used for gallbladder conditions such as cholangitis, cholecystitis, cholelithiasis, obstructive jaundice, hepatic damage, and hepatitis (Demers 2004). *Chelidonium* contains a substance known as Chelidonine, which has anticancer

effects. “Chelidonine turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM,” according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia. Chelidonium also affects choleresis, increasing bile acid independent bile flow, and Celadine reduces formation of bile calculi and has a spasmolytic effect on biliary ducts (Vahlensieck, et al. 1995; Wynn, Marsden 2003).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Engystol N: Used for viral origin and allergic gastroenteritis (see Parvovirus).

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures; and as a detoxicant.

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. It is an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. It treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Used for liver drainage and detoxification. *Hepeel* is also used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching and vomiting. Contains Geranium robertianum for nausea, particularly after eating, with distension or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or

tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). This commonly used formula is part of the Detox Kit. Recent research shows that one ingredient (Brucine) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Spascupreel: Used for spasm and pain from smooth muscle spasm (Reckeweg 2000).

Ubichinon compositum: Contains Anthraquinone for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Liver and immune support formulas (thymus-enriched): 1 tablet for every 25 pounds of body weight BID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

SAME: 10 to 20 mg/kg SID or follow manufacturer's dosing directions.

Vitamin E: 50 IU for every 20 pounds of body weight SID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula H 77 Cholangiohepatitis/Chronic: 1 capsule per 10 to 20 pounds twice daily. This supplement is indicated for acute or chronic cholangiohepatitis. In most of the cases, it needs to be combined with conventional medicine such as antibiotics, prednisone, cyproheptadine to stimulate the appetite, fluid therapy, and/or ursodiol. Once the acute phase is over many pets can be maintained on the herb alone to prevent recurrence of symptoms or progression of the disease.

In addition to the herbs discussed above, H 77 Cholangiohepatitis/Chronic also contains aconite (Fu zi) and leaven (Shen qi), which help to increase the efficacy of the formula.

The authors recommend using the following acupuncture points: CV12, ST36, PC6, BL19, Li3, SP6, GB34, and BL20.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Chelidonium homaccord, Echinacea compositum, and Nux vomica homaccord: Mix together and give orally BID to TID. Give Hepar compositum weekly to biweekly. Give Spascupreel (if spasmodic pain) TID with Coenzyme compositum if diarrhea is present. Use Engystol N if viral etiology is suspected. Administer Hepeel BID PO.

Deep detoxification formula (in chronic cases): Mix together the following and give orally 1 to 3 times weekly for long periods of time: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum, Thyroidea compositum (alternated with Tonsilla compositum in difficult infections), Coenzyme compositum, and Ubichinon compositum.

CIRRHOSIS OF THE LIVER

Definition and cause

Cirrhosis is characterized by chronic inflammation leading to hepatic fibrosis loss of normal liver cell architecture, often resulting in end-stage liver disease. The causes include infections; chronic injury; chronic exposure to medications such as corticosteroids, anticonvulsants, and fungal agents; exposure to toxins or metabolites; or it can result from chronic liver disease. Animals that are genetically prone to chronic active hepatitis or copper storage disease are more susceptible to hepatic cirrhosis. It is believed that there is an immune-mediated component to the chronic inflammatory process (Center 1986, 1999; Hardy 1985; Twedt 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Medical therapy is directed toward the underlying cause as listed above. Common therapies include corticosteroids, immunosuppressants, zinc acetate, and anti-fibrotic medications. Dietary recommendations include high-quality, digestible protein sources in food that contains normal levels of protein fat, and carbohydrates such as Hill L/D. Antioxidant vitamins, specifically vitamin E and S-adenosylmethionine, should be included to help prevent oxidative stress (Center 1989, 1996; Laflamme 2000; Twedt 2003).

Anticipated prognosis

Prognosis is dependent upon the severity of the fibrosis, the underlying cause that led to the fibrosis, and the secondary effects of the fibrosis such as ascites, icterus, weight loss, low serum protein levels, etc. (Center 1989, 1996; Laflamme 2000; Twedt 2003).

Integrative veterinary therapies

Cirrhosis is the end result of a chronic inflammatory process leading to fibrosis and loss of functional liver cells. The integrative approach focuses upon the inciting inflammatory process which leads to liver cell destruction, cellular infiltration, and scarring. Identifying and removing the underlying cause, if possible, gives the best results. The most prudent approach is becoming aware of liver issues early on and instituting integrative measures along with medical therapy as a method of: (1) identifying and eliminating the cause, (2) instituting a dietary and supplemental program that supports liver metabolism and reduces metabolic and toxic wastes, and (3) monitoring that therapy is cellular-protective to both the initiating cause and the potential side effects of medications.

Liver cell regeneration may be enhanced by early identification of the underlying inflammatory response, and the use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that are anti-inflammatory and tissue-sparing. If integrative therapies are instituted early, such as during the treatment for hepatitis or at early signs of liver issues such as chronic elevation of ALT, AST, or GGTP levels, then it is possible to prevent progressive inflammation, cell death, and scarring that precede cirrhosis (Goldstein 2005).

Nutrition

General considerations/rationale

The key to liver health is reducing toxins and metabolic wastes and increasing antioxidants and phytonutrients that can help neutralize compounds that the liver must deal

with in its role as the body's filter and detoxifier. Glutathione is a compound that is composed of 3 amino acids: glutamic acid, glycine, and cysteine. Glutathione binds and neutralizes various chemicals, toxins, herbicides, pesticides, heavy metals, etc. so they can pass through the liver and be excreted via the bile into the intestines or pass to the kidneys to be excreted in the urine (Sen 1997).

Body glutathione levels can be raised by other nutrients such as vitamin C, whey protein, glutamine, methionine, S-adenosyl-L-methionine (SAME), and alpha-lipoic acid (Amores-Sanchez 1999, Bounous 1989, Vendemiale 1989, Wang 1997).

Appropriate nutrients

Nutrition/gland therapy: Glandular liver and kidney can help improve organ function, reduce inflammation, protect liver and kidney cells, and enhance metabolic elimination of toxins and wastes (See Chapter 2, Gland Therapy, for additional information).

Note: Because cirrhosis can result from liver and associated multiple organ conditions, it is recommended that blood be analyzed both medically and physiologically to determine real and impending organ involvement and disease. This allows for a more specific gland and nutritional support protocol (See Chapter 2, Nutritional Blood Testing, for additional information).

Lecithin/phosphatidyl choline: Has been shown to help break down scar tissue in the liver and prevent cirrhosis by reversing the cellular changes that lead to cirrhotic cell formation (Ma 1996). Phosphatidyl choline has been shown to reverse the progression of alcohol-induced cirrhosis in people (Lieber 1990, 1994).

Vitamin E: Was shown to decrease liver damage and immune imbalances that may contribute to the disease progression; however, further clinical work is required to definitively confirm this because another clinical trial failed to confirm these results (Ferro 1999, de la Maza 1995).

Zinc: Clinical trials have confirmed that zinc deficiencies are associated with cirrhosis in people (Scholmerich 1983, Taniguchi 1995). In double-blind testing with zinc acetate supplementation, Reding (1984) and Marchesini (1996) showed a significantly improved portal systemic encephalopathy.

Alpha-lipoic acid: A potent antioxidant that is proven to reduce oxidative stress and inflammation. It has also been shown to increase the effectiveness of other antioxidants, such as vitamins C and E, CoEnzyme Q10, and glutathione, making them more readily available for bodily function (Busse 1992, Lykkesfeldt 1998, Scholich 1989). In a study of people with cirrhosis who received a combination antioxidant-rich supplement that contained 300 mg of alpha-lipoic acid, there was significant improvement of liver function (Berkson 1999).

S-adenosylmethionine (SAME): SAME is an antioxidant and has anti-inflammatory effects on the liver (Center 2000). It has been shown to significantly improve survival and decrease the need for liver transplantation in people with liver disease. It has also been shown to improve liver function in less severe cases of cirrhosis (Gorbakov 1998, Mato 1999, Miglio 1975).

Chinese herbal medicine/acupuncture

General considerations/rationale

Cirrhosis is a result of Qi and Blood Stagnation and Qi and Yang Deficiency in the Spleen. There may be Water and Phlegm retention. The Spleen is responsible for regulating the Water, especially in the abdomen. The Spleen also regulates the digestive system. The Spleen cannot perform these functions because of the Qi (energy) and Yang (heat) deficiency. Without proper digestion, weight loss ensues. The inability to regulate the Water leads to Water retention known as ascites in Western terminology. Qi and Blood stagnation in the abdomen describe the pain associated with the distension of the abdomen.

We now know that this condition is truly a liver pathology. Interestingly, many of the herbs the traditional Chinese practitioners used have now been shown to have hepatoprotective effects. Treatment for cirrhosis is aimed at protecting the liver from further damage, relieving ascites, and normalizing liver function.

Appropriate Chinese herbs

Alisma (Ze xie): Increases the excretion of sodium and urine, and therefore has a diuretic effect (Shi 1962, Xu 1963, Deng 1961).

Atractylodes (Cang zhu): Is hepatoprotective. Experimentally, it was shown to protect against CCL4-induced hepatic damage in mice (Guo 1985).

Ginger (Sheng jiang): Has been shown to be hepatoprotective. It decreases the amount of liver damage induced by experimental administration of CCl4 to rats and mice as evidenced by lower AST levels and sulfobromophthalein sodium (BSP) retention values (Zhang 1989).

Jujube (Da zao): Also protects the liver. Rabbits given jujube prior to being treated with CCl4 recovered faster than those that did not receive jujube (Guang Dong Zhong Yi 1962).

Licorice (Gan cao): Is hepatoprotective. It increases the cytochrome p-450 levels in the liver (Zhong Yao Tong Bao 1986). In one trial, it was 77% effective in treating 330 human patients with hepatitis B. It reduced inflammation, increased regeneration of hepatic cells, and decreased hepatic necrosis and cirrhosis (Zhong Yao Tong Bao 1987).

Polyporus (Zhu ling): Increases excretion of water, sodium chloride, and potassium in dogs (Yao Xue Xue Bao 1964). This diuretic effect may help decrease ascites.

It has also proven to be hepatoprotective in experiments involving hepatotoxicity of CCl₄ in rats (Zhong Guo Yao Li Xue Tong Bao 1988).

Poria (Fu ling): Has been shown to be hepatoprotective in CCl₄ toxicity experiments (Han 1977). It also has a diuretic effect (Lu 1988).

White atractylodes (Bai zhu): Has been used successfully for ascites from cirrhosis (An Hui Zhong Yi Xue Yuan Xue Bao 1984). In mice it was shown to control ascites via its regulatory effects on peritoneal pores (Lu 1996).

Acupuncture

Some practitioners have claimed to cure cirrhosis using acupuncture alone (Cheng 1959). However, most people now combine herbs and/or Western therapy to treat cirrhosis.

Homotoxicology

General considerations/rationale

Cirrhosis represents an end-stage disease of the liver. Normal architecture and functionality of the liver are severely compromised. This represents Degeneration Phase disease. Cure of these cases is unlikely due to the excessive damage that has already occurred. Treatment and management are similar to chronic active hepatitis; however, the clinician must emphasize support of remaining liver tissue while carefully guarding against increased release or ingestion of homotoxins. Detoxification of Degeneration Phase patients must be done extremely slowly and with much care to avoid progressive vicariation. Likewise, use of any therapeutic agent needs to be carefully considered so that the chosen agent improves patient condition with a minimum chance of aggravation or worsening. In cirrhosis, it is often much better to design very simple programs and then to implement those changes gradually. For more details about management see Chronic Active Hepatitis in this chapter.

Appropriate homotoxicology formulas

Oral drop combinations may contain alcohol. In most cases this is such a small quantity that it is well tolerated, but when possible, selecting oral vials and tablets may reduce the workload on the liver (Reckeweg 2000). Also see the list of gastrointestinal remedies at the end of chapter 23, as well as protocols for enteritis, colitis, pancreatitis, and other applicable gastrointestinal conditions for more information and remedy selection ideas.

BHI-Enzyme: Supportive of metabolism and similar to *Coenzyme compositum*. Contains water-soluble vitamins (Niacin, B₁, B₂, B₆, B₁₂, and C) and other components and cofactors of the Krebs cycle. Sulphur activates a blocked metabolism and promotes detoxification. Pulsatilla is

useful in regulation rigidity and for pain in the legs with restlessness and difficult sleep (Heel 2002).

Chelidonium homaccord: Commonly used agent in hepatic damage and hepatitis, and gallbladder conditions such as cholangitis, cholecystitis, and obstructive jaundice (Demers 2004). Chelidonium contains a substance known as Chelidonine, which has anticancer effects. "Chelidonine turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM," according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia.

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth; heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension. Used as an agent to repair mitochondrial damage resulting from antibiotic therapy (also used with *Ubichinon compositum* and *Galium-Heel* for that purpose).

Colchicum compositum: Used for cachexia and neoplastic conditions. Colchicine has been used in hepatitis patients to reduce cirrhosis (Honeckman 2003, Nikolaidis et al. 2006). The use of *Colchicum compositum* should be considered but has no clinical evidence at this time. The authors welcome reports of its use.

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant. Monitor liver enzymes and if SAP and/or ALT show marked increases, adjust use accordingly (Miele, et al. 2005). Interrupt therapy and restart as needed. Many patients benefit from a month on *Galium-Heel* 3 to 4 times per year. Another method is to use *Galium-Heel* 1 to 3 times weekly.

Hepar compositum: The main remedy for chronic hepatitis cases. Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. An important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. Also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Used for liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. Also contains Geranium robertianum for nausea, particularly after eating with distension or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Phosphor homaccord: Treats hepatitis, icterus, tenderness over the liver region, pancreatic diseases, ulcerated gums, thirst but vomiting right after drinking occurs, and pale-clay colored stools (Macleod 1983).

Ubichinon: Contains Anthraquinone for swelling of the gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with

straining or sudden diarrhea (Reckeweg 2002). *Ubichinon compositum* is a Degeneration Phase remedy.

Authors' suggested protocols

Nutrition

Liver support formula: 1 tablet for every 25 pounds of body weight BID.

Kidney support formula: One-half tablet for every 25 pounds of body weight BID.

Alpha-lipoic acid: 20 mg per 10 pounds of body weight daily.

SAME: 10 to 20 mg/kg SID or follow manufacturer's dosing directions.

Vitamin E: 50 IU for every 20 pounds of body weight SID.

Zinc: 15 mg for every 25 pounds of body weight SID.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

H75 Hepatic cirrhosis/ascites: 1 capsule per 10 to 20 pounds twice daily. In addition to the herbs cited above, H75 Hepatic cirrhosis contains cinnamon bark (Rou gui), citrus (Chen pi), magnolia bark (Hou po), plantain leaves (Che qian cao), pinellia (Ban xia), and verbena (Ma bian cao).

The following acupuncture points are used by the authors to treat cirrhosis: CV12, ST36, PC6, BL19, Li3, SP6, GB34, and BL20.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Be extremely careful not to overload a cirrhotic liver with toxins.

Galium-Heel and Phosphor homaccord: BID orally initially. Adjust dosage and frequency according to patient response.

Hepar compositum: Weekly to twice weekly. Hepeel and BHI-Enzyme (or Coenzyme compositum) given orally BID.

FATTY LIVER SYNDROME (HEPATIC LIPIDOSIS)

Definition and cause

Hepatic lipidosis, defined as fatty accumulation in liver cells, is common in cats and rare in dogs. It is a progressive disease and as more liver cells become affected, the

functioning of the liver decreases accordingly. The condition can lead to liver failure and death (Center 2003).

Chronic liver disease can progress to lipidosis. It can also be secondary to other chronic diseases such as diabetes, IBD, CRD, or infectious diseases such as FIP or toxoplasmosis. Vitamin B₁₂ deficiency has also been implicated (Day 1994, Johnson 1994).

Fatty liver syndrome begins long before the patient presents in acute disease. Changes accumulate slowly over time as the hepatocyte becomes overburdened with adipose tissue and ultrastructural alterations occur, which affect proper cellular metabolism (Center 1993).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment of these cases can proceed on an outpatient basis if the cat is eating. Hospitalization is warranted in anorectic patients. Attention should be given to reducing the patient's stress as much as is feasible because stress leads to cortisol release, which aggravates the condition.

Dietary recommendations and administration are important to treatment because many cats are off food and may require an esophageal or nasogastric feeding tube. Food should be a high-caloric, highly digestible, and high-protein. While no clinical proof exists for supplementation, adding amino acids (taurine and l-carnitine), essential fatty acids (fish oil), and vitamins (vitamins B, K) appears to be beneficial. Antibiotics are recommended for infections (Cornelius 2000, Day 1994).

Anticipated prognosis

Early correction of underlying liver disease improves prognosis. The prognosis can be good with early attention to diet, feeding tube, and supplementation. Prognosis is more guarded when secondary diseases are present or intensive therapy is not instituted early on (Center 1996, 2003, 2005).

Integrative veterinary therapies

Routine monitoring of patient condition and handling these cases long before they cross the biological divide is the preferred route (Center 2005). Proper diet, exercise, and maintenance of a favorable body condition are extremely helpful. Many cases present to the veterinarian after another mild illness surfaces and the cat fails to eat for a few days. As obligate carnivores, cats need protein on a daily basis. Failure to handle this dietary requirement leaves the hepatocyte unable to function properly and hepatic disease occurs. In mild cases it may be possible to simply feed the cat by natural means or stomach tube and see a total recovery. In such cases the incident of

hepatopathy should serve as a wake-up call to both client and veterinarian and serious steps should be taken at once to control weight and reduce homotoxin levels in the patient.

Fatty infiltration of the liver can be worsened by drug therapy, most notably corticosteroids, but also drugs such as anticonvulsants. Genetics may also play a role because some cats seem more prone to weight gain, obesity, and pancreatopathies.

Proper diet and exercise are the cornerstones of prevention of this condition. Maintaining proper body weight is proven to extend life, a goal common to all veterinarians and clients. The use of nutraceuticals, medicinal herbs, and combination homeopathics that improve lipid metabolism and have tissue-protective and regenerative effects on liver cells is beneficial for long-term liver health.

Nutrition

General considerations/rationale

While hepatic lipidosis is a well-known clinical condition in cats, the underlying mechanism is unknown, although it is believed to be a nutritional and biochemical peculiarity (Buckner 1998). The focus of therapeutic nutrition is upon the improvement of lipid metabolism, the addition of specific antioxidants and nutraceuticals that improve fat metabolism, and glandular support for the primary organs, i.e., the intestines, pancreas, and liver.

Appropriate nutrients

Nutritional/gland therapy: Glandular liver, pancreas, intestines, and pituitary supply the intrinsic nutrients that improve organ function (see Gland Therapy in Chapter 2 for a more detailed explanation).

Note: Because lipid metabolism can be influenced by many organs, a medical and physiological blood evaluation is recommended to assess glandular health. This helps clinicians formulate therapeutic nutritional protocols that address the underlying liver or other organ conditions that may be ultimately responsible for the excessive deposition of fat (see Chapter 2, Nutritional Blood Testing, for additional information).

L-carnitine and taurine: L-carnitine is required in the metabolism of fatty acids for the release of energy by the cells. Supplementing the diet with L-carnitine has a direct lowering effect on the blood triglyceride levels (Sachan 1984). In studies conducted by the Iams Company, the addition of carnitine to the diet of dogs was shown to reduce body weight by 6.4%, compared to 1.8% without supplementation (Sunvold 1998). Similar research in cats also suggests weight loss (Center 1998). Evangeliou (2003) showed that the addition of carnitine to the diet also helps to lower both cholesterol and triglyceride levels. Taurine's role and importance in feline health have been widely reported (Monson 1989).

Essential fatty acids: Fish oil has been reported to lower triglyceride levels in double-blind studies (Prichard 1995). Blue-green algae has also been reported to lower triglyceride levels in people (Iwata 1990, Gonzalez de Rivera 1993).

Lecithin/phosphatidyl choline: Phosphatidyl choline is a phospholipid that assists in lipid digestion and helps to move fats into the cells (Hanin 1987).

Enzymes: Required for the proper and efficient digestion of fats and fatty acids (Howell 1985).

Chinese herbal medicine/acupuncture

General considerations/rationale

Hepatic lipidosis is considered to be a condition of Phlegm and accumulation of Damp. There is Qi and Blood Stagnation in the Liver and Gallbladder. Phlegm and Damp refer to the fatty accumulation in the Liver and hypercholesterolemia, which is often seen with liver disorders. Qi and Blood stagnation in the Liver and Gallbladder refer to epigastric pain. There also may be bile accumulation in the Gallbladder when there is insufficient Qi in this organ. Treatment objectives include protecting the liver, decreasing the fatty accumulation, and improving the appetite.

Appropriate Chinese herbs

Alisma (Ze xie): Has been shown to inhibit the development of hepatic lipidosis secondary to high-fat diets (Institute of Pharmacy 1976).

Bupleurum (Chai hu): Protects the liver from various insults. It was shown to decrease hepatic damage caused by reperfusion injuries (Tang 1998). It also protects the liver from toxic insults such as CCl₄ administration (Chen 1994). One component of bupleurum, saikosaponin, has demonstrated protective effects on hepatic cells (Chen 1999).

Cassia seed (Cao jue ming): Helps to normalize the blood lipid profile. It lowers total cholesterol, but raises HDL levels (Zhong Yao Zhi 1984, Zhong Cao Yao 1991).

Crataegus (Shan zha): Was shown to decrease serum cholesterol in hyperlipidemic quail by 34% to 63% (Chu 1988). Another study suggests that crataegus may prevent deposition of lipids on vascular walls (Cai 2000). It also may help prevent lipid deposition in the liver; however, this supposition requires further study.

Fleece flower root (He shou wu): Helps to protect the liver. In one experiment it was shown to prevent lipid deposition in mice treated with prednisone (Liu 1992).

Oriental wormwood (Yin chen): Was shown to increase the activity of microsomal cholesterol esterase in rat liver. This indicates that it can improve hydrolytic reactions in the liver and protect it from toxic substances. It can also increase the phagocytic activity of hepatic macrophages.

(Hu 1999, He 1990). Wormwood has cholagogic efficacy, as demonstrated in the rat model (Sui 1993).

Polygonatum root (Huang jing): Decreases serum cholesterol and triglyceride levels (Jiang Su Zhong Yi 1988).

Rhubarb (Da huang): Is hepatoprotective. In one experiment it decreased the degree of hepatic necrosis the liver of mice given CCl₄ (Zhong Guo Zhong Yao Za Zhi 1989). It was used in 80 people with acute hepatitis causing jaundice, with improvement in 76 patients (Zhong Xi Yi Jie He Za Zhi 1983). It has been shown to increase the secretion of bile in dogs and cats (Xin Yi Yao Xue Za Zhi 1974).

Salvia (Dan shen): Has hepatoprotective properties. In experiments in which mice were given CCl₄, salvia had the effect of reducing liver enzymes. It improves hepatic circulation and promotes regeneration of liver cells (Zhong Yi Za Zhi 1982, Zhong Xi Yi Jie He Za Zhi 1988).

Acupuncture

Acupuncture may help protect the liver. In one experiment 36 rats were treated with CCl₄. The efficacy of acupuncture at St36 and LI3 for hepatoprotection was investigated. The rats treated after exposure to CCl₄ had lower AST and ALT levels, suggesting that acupuncture can protect the liver (Hsu-Jan 2001).

Homotoxicology

General considerations/rationale

Asymptomatic Deposition Phase pathology progresses to Impregnation Phase disease. This suddenly appears as liver dysfunction, which can rapidly progress into the Degeneration Phase (Tsochatzis, Papatheodoridis, Archimandritis 2006).

From a biological therapy viewpoint, we try to get adequate calories into the patient, assist the liver and gastrointestinal systems with digestion and absorption, and allow for homotoxin (fat) removal and organ repair. As proper nutrition is obtained and support for the hepatocyte occurs, these patients gradually recover their abilities and improve. The agents used are similar for other forms of hepatic disease, and remarks under chronic active hepatitis treatment are applicable with the following exception: cats must have significantly higher protein in their diets. The use of long-term feeding tubes may be needed, and recovery is slower with this condition. Coordination with a veterinary internist may be helpful, especially during the acute onset of more serious cases.

Appropriate homotoxicology formulas

Oral drop combinations may contain alcohol. In most cases this is such a small quantity that it is well tolerated, but when possible, selecting oral vials and tablets may reduce the workload on the liver (Reckeweg 2000). The

authors recommend making dilutions of the remedies by combining 10 drops of each formula with 1 ounce of water. This solution is succussed 10 times and then dispensed with instructions to keep the mixture refrigerated. It should be remembered that nutritional support is the most important aspect of therapy, and homotoxicology formulas support that effort.

Berberis homaccord: Berberis has major actions on the liver and gallbladder (Reckeweg 2000), and has been shown to have effects in diarrhea (Zhu, Ahrens 1982; Shamsa, Ahmadiani, and Khosrokhavar 1999). It treats colic, collapse, and bloody vomitus, and is supportive of adrenal and renal function. It is part of the basic *Detox Kit* and is contained in *Solidago compositum*.

BHI-Chelidonium complex: Treats abdominal distention and flatulence (Lycopodium, Calcarea carbonica); gastralgia, yellow-clay colored stools (Chelidonium majus); and painful, distended abdomen, spasmodic hiccup, and epigastric pain (Belladonna) (Heel 2002).

Ceanothus homaccord: Used for pancreatopathy, epigastric syndrome, tenesmus, diarrhea, and hepatic issues. Splenic enlargement is a primary signalment for this remedy (Macleod 1983).

Chelidonium homaccord: This is a commonly used agent in hepatic damage and hepatitis, and gallbladder conditions such as cholangitis, cholecystitis, and obstructive jaundice (Demers 2004). Chelidonium contains a substance known as Chelidonine, which has anticancer effects. "Chelidonine turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM," according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia.

Chol-Heel: An excellent remedy containing Belladonna, Chelidonium, Carduus marianus, Lycopodium, Veratrum, and Taraxicum, along with some other very useful components, all in potency chords. This can be of great relief in GI discomfort (Broadfoot 2005).

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth; heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension. Used as an agent to repair mitochondrial damage resulting from antibiotic therapy (also used with *Ubichinon compositum* and *Galium-Heel* for that purpose).

Engystol N: Used for viral origin gastroenteritis and hepatitis (see Parvovirus).

Erigoheel: Used for gastric catarrh, hepatic diseases, duodenal ulcers with spasm, and has antipyretic properties (Demers 2004).

Galium-Heel: Used for all cellular phases, hemorrhoids, anal fissures, and as a detoxicant. See notes above for proper use.

Hepar compositum: The main remedy for chronic hepatitis cases. Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. It is an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. Also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where *Hepeel* was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Leptandra compositum: Used for epigastric syndrome, portal vein congestion, pancreatopathy, chronic liver disease, diabetes mellitus (Reckeweg 2000).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains *Gentiana* for chronic gastritis. Used for flatulence, diarrhea, distension of stomach with eructations, nausea, retching, and vomiting. Contains *Geranium robertianum* for nausea, particularly after eating with distension or sensation of fullness. *Myosotis arvensis* is contained for bloat and distension (Reckeweg 2002).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in *Kali bichromicum*, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. *Kali* has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains *Hydrastis*, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The *Kreosotum* component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them

causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy *Phosphorus* is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). *Phosphorus* is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component *Argentum nitricum* (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumheel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Nux vomica homaccord: Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). This commonly used formula is part of the *Detox Kit*. Recent research shows that one ingredient (*Brucine*) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

Phosphor homaccord: Treats hepatitis, icterus, tenderness over the liver region, pancreatic diseases, ulcerated gums, thirst but vomiting right after drinking occurs, pale-clay-colored stools (Macleod 1983).

Schuef-Heel: Treats chronic diseases of skin and liver; should be interposed in most skin and liver cases (Reckeweg 2000). Patients that need this remedy may look dirty and have scruffy skin conditions, red lips, white tongue with red tip, itching and burning rectal area with morning diarrhea, and prolapsed rectum (Boericke 1927). *Sulfur* is contained in several other antihomotoxic formulas including *Coenzyme compositum*, *Echinacea compositum*, *Engystol*, *Ginseng compositum*, *Hepar compositum*, *Molybdan compositum*, *Mucosa compositum*, *Paonia Heel*, *Proctheel*, *Psorinoheel*, *Sulfur-Heel*, *Thyroidea compositum*, and *Ubichinon compositum* (Reckeweg 2000).

Syzygium compositum: Treats chronic gastritis, chronic enteritis, diabetes mellitus, and hepatic disorders.

Ubichinon compositum: Contains *Anthraquinone* for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Use in addition to conventional therapy and nutraceuticals as in other sections of this text.

Nutrition

Liver and pancreas support formulas: One-half tablet BID.

Intestine and pituitary support formulas: One-half tablet SID.

Megaliptrophic: 1 capsule for every 20 pounds of body weight.

Taurine: 250 mg SID.

L-Carnitine: 150 mg SID.

Eskimo fish oil: One-half to 1 teaspoon per meals for cats or blue-green algae: one-fourth teaspoon for every 25 pounds of body weight daily.

Lecithin/phosphatidyl choline: One-fourth teaspoon for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Hepatic Lipidosis: 1 capsule per 10 to 20 pounds twice daily. As in Western medicine, dietary support is critical. Underlying causes of the anorexia must be addressed.

In addition to the herbs cited above, hepatic lipidosis also contains cyperus (Xiang fu zi), pueraria (Ge gen), raphanus (Lai fu zi), and white peony (Bai shao) to help improve the efficacy of the formula.

The authors recommend the acupuncture points ST36 and LI3 as noted above.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Echinacea compositum: TID. Chelidonium Homaccord, twice daily. Hepar compositum twice weekly. Galium-Heel every other day. Ubichinon compositum and Coenzyme compositum given every other day. Hepeel BID alternated with Hepar therapy.

Product sources

Nutrition

Liver, pancreas, intestine, and pituitary support formulas: Animal Nutrition Technologies. **Alternatives:** Hepatic Support—Standard Process Veterinary Formulas; Hepato Support—Rx Vitamins for Pets; Hepagen—Thorne Veterinary Products; Enteric Support—Standard Process Veterinary Formulas; NutriGest—Rx Vitamins for Pets.

Megaliptrophic: Best For Your Pet.

L-Carnitine and taurine: Over the counter.

Eskimo fish oil: Tyler Encapsulations.

Blue-green algae: Simplexity.

Lecithin/phosphatidyl choline: Designs for Health.

ACUTE AND CHRONIC PANCREATITIS

Definition and cause

Pancreatitis is an inflammation of the pancreas. Acute pancreatitis occurs rapidly, often with serious clinical secondary signs. Acute pancreatitis is distinguished from a chronic inflammatory process of the pancreas in that the cellular integrity of the pancreas is changed in chronic episodes. Causes of pancreatitis include infectious agents; nutrition (high-fat diets); secondary inflammation to toxins, medications, vaccination, and inflammatory producers such as excessive free radicals and reactive oxygen species; and are secondary to other conditions such as hyperlipidemia and hypercalcemia (Jergens 2003, Simpson 1993, Stewart 1994, Williams 2000).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Resting of pancreatic function is essential because of the potential damage from excessive production of digestive enzymes. Withdrawal of food and water stops the digestive process and the production of enzymes. Pain and anti-inflammatory medications in combination with fluid therapy for rehydration are essential, especially in acute episodes (Jergens 2003, Williams 2000).

The diet should be low in protein and fat, such as boiled carbohydrates (oatmeal or rice), and contain low levels of lean protein, such as boiled chicken or beef. Medical therapy includes corticosteroids to reduce inflammation, antiemetics to prevent or stop vomiting, and painkillers for comfort.

Anticipated prognosis

Acute and chronic pancreatitis often responds to medication. The prognosis depends on damage to the pancreas and associated other organ damage. Intense medical therapy with acute pancreatitis often quiets the condition and helps to achieve stability. Chronic episodes are less intense; however, the risk of pancreatic cell destruction secondary to chronic inflammation makes the prognosis more guarded (Jergens 2003, Stewart 1994).

Integrative veterinary therapies

Acute pancreatitis is a medical emergency. Withdrawal of food and water and resting of the gastrointestinal system greatly assists these patients. Parenteral fluids and electrolyte maintenance are important aspects. Pharmaceutical agents can be used as needed for pain and nausea, but many patients do very nicely with antihomotoxic medications (see Homotoxicology in this protocol). Because such

medications have fewer adverse reactions, they may be preferred in these cases. Canine patients can be fasted for longer periods of time, while feline patients may require assistance with alimentation to prevent the development of other complications such as hepatic lipidosis.

The inclusion of proper prebiotics (such as fiber) and probiotic bacteria may promote or assist in homotoxin removal by binding homotoxins to fiber or through metabolism of toxic material by bacteria. Probiotic bacteria assist with the health of the mucosal lining and may prevent pancreatitis from occurring. The common practice of treating GI upset by fasting is important in treating pancreatitis, but in chronic disease it may not be feasible or possible to withhold feeding until pancreatic inflammation ceases. Giving a bland diet that is low in fat is an excellent approach. Some patients do better on low-residue diets, while others make great strides while eating higher fiber foods. A clinician should be prepared to try both dietary types in managing chronic pancreatitis. Providing digestive enzymes in supplemental amounts may help the digestive processes and reduce the workload of the pancreas.

Successfully treating chronic pancreatitis involves providing clean diet and water, reducing stress, allowing toxins to be excreted successfully, supporting organ function, and providing drainage therapy and metabolic support while repair occurs.

The properly timed addition of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-protective, and regenerative effects on the cells of the pancreas, liver, stomach, and intestine tissue can help control the clinical signs, reduce pain, shorten recovery time, and prevent recurrences.

Nutrition

General considerations/rationale

Medical therapy is often essential to control pain, vomiting, and organ inflammation. The nutritional approach of adding gland support and anti-inflammatory nutrients often speeds up stability and recovery.

Note: Pancreatitis often has systemic effects upon other organ systems, and therefore it is recommended that blood be analyzed both medically and physiologically to determine overall organ involvement. This helps clinicians to formulate therapeutic nutritional protocols that specifically address all involved organ systems (See Chapter 2, Nutritional Blood Testing, for more specific information). Also, with acute pancreatitis and related vomiting, the timing and use of oral nutraceuticals should be properly selected so as not to exacerbate vomiting.

Appropriate nutrients

Nutritional/gland therapy: Glandular pancreas, intestines, stomach, and liver supply the intrinsic nutrients to reduce

cellular inflammation and improve organ function and healing (see Gland Therapy in Chapter 2 for a more detailed explanation).

Probiotics: Have been shown to reduce intestinal pain, inflammation, and other gastrointestinal symptoms such as excessive gas production (Niedzielin 2001, Nobaek 2000).

Colostrum: Has been shown to improve intestinal health. It helps to balance intestinal flora and improves digestion (Blake 1999).

Fiber: In a study with people with IBS, Manning (1977) and Hotz (1994) showed improvement by adding psyllium to the diet.

Chinese herbal medicine/acupuncture

General considerations/rationale

Pancreatitis is due to Qi stagnation in the Liver with excessive Heat in the Stomach and Spleen. Qi stagnation in the Liver leads to abdominal pain. Any time there is stagnation there is an accumulation. Think of a flowing stream of water. If the flow is stopped, i.e., by a dam, the water accumulates. The Western-trained doctor is used to addressing this concept with substantive materials. For example, if the accumulation is pus, it is intuitive that there will be pain because abscesses are painful. To those trained in TCM, excessive accumulation of Qi can lead to pain even though these practitioners cannot point to a pocket of “Qi” to show the stagnation. Heat in the Stomach and Spleen refers to the inflammation. This Heat may manifest as fever, purulent debris, redness, and swelling.

Treatment is aimed at decreasing the inflammation (Heat) and the cause of the inflammation (bacteria, viruses, hyperlipidemia). This may be accomplished by directly attacking the inciting cause or by enhancing the immune system to allow the body to ameliorate the condition. The pain, fever, and vomiting caused by the disorder must also be controlled.

Appropriate Chinese herbs

Bupleurum (Chai hu): Contains saikosaponin A and D, which have several functions in an herbal supplement designed for pancreatitis. They have analgesic and antipyretic properties (Shen Yang Yi Xue Yuan Bao 1984). In terms of treating potential causes of pancreatitis, these compounds decrease triglyceride levels, and to a lesser extent cholesterol levels (Zhong Yao Xue 1988). In addition, bupleurum enhances both humoral and cellular immunity (Shang Hai Yi Ke Da Xue Xue Bao 1986) and has antiviral and antibacterial properties (Wang 1998, Liao 1999, Zhong Yao Xue 1988).

Cinnamon twig (Gui zhi): Has analgesic properties (Zhong Yao Xue 1998) as well as antibacterial and antiviral activity (Zhong Yao Xue 1998, Chu 1998).

Codonopsis (Dang shen): Helps stimulate the immune system (Zhong Xi Yi Jie He Za Zhi 1985). It also decreases blood cholesterol and triglyceride levels and improves the ratio of high density lipoproteins to low density lipoproteins (Hua 1994).

Coptis (Huang lian): Decreases serum lipid concentrations (Song 1992). One of the components, berberine, has anti-inflammatory effects (Yao Xue Za Zhi 1981). Coptis can also be used to lower fevers (Zhong Guo Bing Li Sheng Li Za Zhi 1991).

Evodia (Wu zhu yu): An effective antiemetic (Zhong Yao Yao Li Du Li Yu Lin Chuan 1988).

Ginger (Sheng jiang): Has strong antiemetic effects (Xi Ye Shi Lang 1990).

Licorice (Gan cao): Has antibiotic and antiviral effects (Zhong Yao Zhi 1993, Zhu 1996) and analgesic properties (Zhong Yao Xue 1998). Furthermore, it lowers serum cholesterol levels (Zhong Yao Xue 1998). Two components, glycyrrhizin and glycyrrhetic acid, decrease inflammation (Zhong Cao Yao 1991).

Pinellia (Ban xia): Lowers serum total cholesterol and LDL-C levels (Hong 1995) and has analgesic and anti-inflammatory effects (Shen Ya Qin 1998, Shen Ya Qin 1998). In terms of symptomatic relief, it can inhibit vomiting (Gui 1998).

Saussurea (Mu xiang): Has antibacterial effects against several bacteria, including *E. coli* (Zhong Yao Yao Li Yu Ying Yong 1983).

Scutellaria (Huang qin): Contains baicalin, which has antibiotic activity against many bacteria including *E. coli* (Zhong Yao Xue 1988). In addition, 2 compounds in scutellaria, baicalin and baicalein, have anti-inflammatory effects (Kubo 1984). Scutellaria can help decrease fevers (Zhong Hua Yi Xue Za Zhi 1956), and it enhances the cellular immune system (Pan 1991).

White peony (Bai shao): Inhibits various bacteria, including *E. coli* (Xin Zhong Yi 1989). It contains paeoniflorin, which is a strong antipyretic and anti-inflammatory (Zhong Yao Zhi 1993:183). It also can help control pain (Shang Hai Zhong Yi Yao Za Zhi 1983).

The use of acupuncture in pancreatitis is controversial. One study of 23 people found that acupuncture did not preclude the use of medication for pain relief (Ballegaard 1985). Others feel that acupuncture may be helpful (Su 1987).

Homotoxicology—acute pancreatitis

General considerations/rationale

Pancreatitis can occur as a manifestation of many different phases on the Six-Phase Table of Homotoxicology. Acute pancreatitis is most often due to reactions by the pancreas that result from Inflammation Phase homotoxicoses. Anything that directly traumatizes the pancreas can result in pancreatitis. Pancreatitis can arise suddenly as a component

of regressive or progressive vicariation, in which pancreatic enzymes are activated outside the normal gastrointestinal system. Activated enzymes attack normal body structures, creating irritating compounds such as soap from digestion of lipids, and these substances cause further inflammatory changes, pain, and metabolic imbalance. Rapid changes in serum calcium from soap formation can result in cardiac irregularities and sudden death. Release of substances from an inflamed pancreas, such as myocardial depressant factor, can also lead to severe complications.

Many homotoxins can damage the pancreas' ability to function normally. Both toxins and other therapeutic agents can result in progressive vicariation. Corticoids and nonsteroidal anti-inflammatory drugs both damage intestinal mucosal elements. This can result in frank ulcer or "leaky gut syndrome," which is linked to many other medical syndromes. In leaky gut, antigens are not properly digested into smaller molecular weight polypeptides before gaining access to the immune system. This issue can lead to chronic inflammatory diseases such as inflammatory bowel disease and allergic syndromes. Chronic pancreatitis is sometimes due to incomplete treatment and monitoring, and there are no good results in some cases regardless of what the clinician attempts (see Inflammatory Bowel Disease protocol, above, for further discussion of leaky gut syndrome).

Appropriate homotoxicology formulas

Gastrointestinal diseases may require a wide variety of antihomotoxic agents. A more complete list of these is included at the end of the gastrointestinal chapter, chapter 24.

Atropinum compositum: Not available on the U.S. market at this time as oral vial or injection, but available as tablets, this agent is a powerful antispasmodic for biliary, renal, and intestinal colic (Demers 2004). Contains Benzoicum acidum (also common to *Aesculus compositum*, *Arnica-Heel*, *Atropinum compositum*, and *Rhododendroneel*). It is used in inflammatory symptoms which occur throughout the alimentary canal: a slimy coating on the tongue with ulcers at the edges, stomatitis with dysphagia, eructations, retching and vomiting, and flatulent distension below the ribs on both sides. The stools are copious, loose, and white in color, with violent tenesmus and mixed with blood; there are stabbing pains in the rectum, rigors, and a feeling of being seriously ill (Reckeweg 2002).

BHI-Pancreas: Treats pancreatitis and related symptomology including diarrhea, vomiting, nausea, and constipation.

BHI-Spasm-Pain: Treats leg cramps, fever, pain and inflammation, sharp pain, colic or intestinal spasm, and colitis.

Bryaconeel: Treats inflammation of serosal surfaces, and is a geriatric medicant.

Chelidonium homaccord: A commonly used formula for problems including gallbladder conditions such as cholangitis, cholecystitis, obstructive jaundice, hepatic damage and hepatitis (Demers 2004). Chelidonium contains a substance known as Chelidonine, which has anti-cancer effects. "Chelidonine turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM," according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia.

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth; heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Duodenoheel: Treats hunger pains, hyperacidity, gastric and duodenal ulcers, nausea and vomiting, and dysentery with tenesmus (Reckeweg 2000).

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in many common gastrointestinal pathologies, such as duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). Contains Pancreas suis for glandular support. *Hepar compositum* is an important part of Deep Detoxification Formula. This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002). Veratrum album is included for vomiting and bloody diarrhea (Van Wassenhoven 2004).

Hepeel: Treats liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where Hepeel was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Leptandra compositum: Indicated for epigastric syndrome, portal vein congestion, pancreatopathy, chronic liver disease, and diabetes mellitus (Reckeweg 2000).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of stomach with eructations, nausea, retching, and vomiting. Also contains Geranium robertianum for nausea, particularly after eating with distension or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Momordica compositum: Treats pancreatitis, epigastric disease (*Momordica balsamina*), emaciation though good

appetite (Jodum), and vomiting with collapse (Veratrum album)(Reckeweg 2000).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or, in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumheel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

Syzygium compositum: Used for chronic gastritis, chronic enteritis, diabetes mellitus, and hepatic disorders.

Ubichinon compositum: Contains Anthraquinone for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Homotoxicology—chronic pancreatitis

General considerations/rationale

Chronic pancreatitis represents an Impregnation Phase to Degeneration Phase homotoxicosis. Chronic bouts of inflammation lead to gradual loss of pancreatic function

as both endocrine and exocrine pancreatic functions are damaged. Conventional therapy is aimed at reducing dietary stressors and inflammation. Biological therapy also works toward reducing stress and managing diet. Draining homotoxins and supporting organ repair are additional strategies in the battle with chronic disease.

As in hepatic diseases, pancreatic pathologies can result from leaky gut syndrome as antigens gain access to areas that they normally could not reach. Inflammation results and immune elements injure normal tissue and negatively affect its function. Inflammatory elements can activate normally quiescent digestive enzymes in the inactive, proenzymatic form. Once activated, these pancreatic enzymes can begin to digest normal tissues instead of nutritional substrates. Continuing inflammation from calcium soap formation aggravates the condition further. Inflammatory cascades result in fibrotic changes. Amyloid is also deposited, furthering the degeneration of the pancreas.

Removal of homotoxins and organ support are essential. Because the pancreas has an endocrine function, it is advisable to support the general endocrine system as well. Several common antihomotoxic drugs such as Lymphomyosot, Thyroidea compositum, Hepar compositum, and Tonsilla compositum all support endocrine and neurological function in addition to their primary target organs. Homotoxins bound to proteins alter their function, leaving cell membrane receptors blocked and less active. Organelle degeneration occurs rapidly once cellular communication is damaged. This can lead to damage of the DNA as the condition progresses. Theoretically, this is one mechanism for the development of neoplasia. Some repair is possible as homotoxins are removed, and the matrix components are repaired through the process of physiological inflammation and gelification. Regressive vicariation may occur of fibrosis is not too severe.

In chronic pancreatitis the mediation and causation of chronic inflammation may result from pathology elsewhere in the body. A septic condition from an abscessed tooth or tumor can be seen as causal conditions. Many forms of homotoxicoses are occult and unknown to owner and veterinarian alike. The cause of this condition may not be found, and it may surface as a vicariation reaction. The body speaks to the biological therapist with every sign and symptom manifest, and astute clinicians learn this language as they handle cases over time.

Nutrient- and homotoxin-laden blood leaves the intestines and proceeds via the portal vein to the liver, where it is directly cleansed and processed. Many GI issues are addressed with remedies that target intestinal and hepatic tissues (i.e., *Nux vomica homaccord* and *Hepar compositum*). Enterohepatic circulation provides the opportunity for homotoxins to be reabsorbed after hepatic handling. As a result, homotoxins gain access to the circulatory system again and must be removed. Ancillary excretion

and metabolism by other organs (kidney, skin, and lung) may all assist in homotoxin removal. Antihomotoxic agents that support these organs include *Solidago compositum*, *Berberis homaccord*, and *Mucosa compositum*. *Tonsilla compositum* supports other immune system functions and is useful in this condition. Homotoxins that have escaped or bypassed hepatic processing may be deposited into connective tissue and cause disease later as further damage ensues.

As in other discussions, the position of the patient on the phase table assists in determining proper therapy. Because chronic disease is more difficult to handle, the use of *compositae* class antihomotoxic agents becomes necessary to stimulate regressive vicariation.

Appropriate homotoxicology formulas

BHI-Pancreas: Treats pancreatitis and related symptomology including diarrhea, vomiting, nausea, and constipation.

***Chelidonium homaccord*:** Gallbladder conditions such as cholangitis, cholecystitis, obstructive jaundice, hepatic damage and hepatitis commonly used (Demers 2004). *Chelidonium* contains a substance known as *Chelidonine*, which has anticancer effects. “*Chelidonine* turned out to be a potent inducer of apoptosis triggering cell death at concentrations of 0.001 mM,” according to Habermehl (2006), a fact that may explain the clinically observed usefulness of this remedy in treating patients with biliary neoplasia.

***Coenzyme compositum*:** Contains *Citricum acidum*, which is useful for dental problems and gingivitis; scurvy; blackening of teeth; heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

***Diarrheel S*:** A symptom remedy for acute and chronic diarrhea. Treats acute gastroenteritis, belching, spurting diarrhea, pancreatopathy, and colitis.

***Galium-Heel*:** Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

***Hepar compositum*:** Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. It is an important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). This combination contains *Natrum oxalaceticum* (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa compositum*) for changes in appetite and stomach distension due to air. Treats nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

***Leptandra compositum*:** Treats epigastric syndrome, portal vein congestion, pancreatopathy, chronic liver disease, and diabetes mellitus (Reckeweg 2000).

***Lymphomyosot*:** Provides lymph drainage and endocrine support, and treats edema.

***Momordica compositum*:** Used for pancreatitis, epigastric disease (*Momordica balsamina*), emaciation though good appetite (*Jodum*), and vomiting with collapse (*Veratrum album*) (Reckeweg 2000).

***Mucosa compositum*:** Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in *Kali bichromicum*, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. *Kali* has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains *Hydrastis*, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The *Kreosotum* component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy *Phosphorus* is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). *Phosphorus* is found in many other remedies including *Echinacea compositum* and *Leptandra homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component *Argentum nitricum* (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastro-cardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

***Ubichinon compositum*:** Contains *Anthraquinone* for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Pancreas support formula: 1 tablet for every 25 pounds of body weight BID.

Esophagus/stomach and intestines/IBD formulas: One-half tablet for every 25 pounds of body weight SID.

Probiotic: One-half capsule for every 25 pounds of body weight with food.

Psyllium: 1 teaspoon per 25 pounds of body weight per meal.

Colostrum: One-third teaspoon of powdered formula for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Herbal Formula Pancreatitis: 1 capsule per 10 to 20 pounds twice daily. Depending upon the severity of the condition, in acute cases supportive therapy in the form of IV fluids, fresh frozen plasma for disseminated intravascular coagulation (DIC), and other Western therapies may be indicated.

Acupuncture points are: ST36, PC6, CV13, CV12, GB34, and ST37 (Handbook of TCM Practitioner 1987).

Homotoxicology—acute pancreatitis (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

In addition to proper medical care, consider the following antihomotoxic agents. Injection is recommended until the acute phase of the disease is completed, and then oral therapy can proceed.

Acute pancreatitis: Traumeel, IV. Leptandra compositum alternated with Momordica compositum daily by injection. Hepar compositum injected subcutaneously every other day. Leptandra compositum, Bryaconeel, Spascupreel, Duodenoheel mixed together and given BID orally if possible (not in NPO patients). Give Chelidonium homaccord at intervals for biliary drainage. If intense abdominal pain, consider Atropinum compositum (where available). Cardiacum-Heel if cardiac issues arise (3 to 6 times/day in acute issues).

Homotoxicology—chronic pancreatitis (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Chelidonium homaccord, Diarrheel, and BHI-Pancreas: Mixed together and taken BID orally. Mucosa compositum twice weekly. Ubichinon compositum and Coenzyme compositum given twice weekly. As the case responds and stabilizes, consider the Deep Detoxification Formula given orally 1 to 3 times weekly.

EXOCRINE PANCREATIC INSUFFICIENCY (EPI)

Definition and cause

Exocrine pancreatic insufficiency is the loss of exocrine pancreatic function resulting in a decrease in the production of digestive enzymes and lack of absorption and assimilation. Underlying causes are a degeneration of the pancreatic acinar tissue and failure to produce pancreatic enzymes. The second common reason for loss of acinar function is secondary to chronic episodes of pancreatitis (Jergens 2003; Simpson 2003; Williams 1996, 2000). EPI can occur in both dogs and cats (Steiner 1999, Westermarck 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The dietary approach to therapy often controls the condition. Switching to a highly digestible, low-fat, low-fiber diet is suggested. Longstanding, unthrifty animals should also receive vitamin supplementation (vitamins A, E, and B₁₂). Replacement therapy with pancreatic enzymes (Viokase) is the recommended therapy of choice (Jergens 2003, Simpson 2003, Williams 2000).

Anticipated prognosis

Most cases of EPI, if detected early, respond well to enzyme replacement therapy. However, pancreatic cellular changes are often permanent and require lifelong replacement therapy. The prognosis is more guarded when the condition is secondary to chronic bouts of pancreatitis or neoplasia (Jergens 2003, Williams 2000).

Integrative veterinary therapies

The loss of pancreatic acinar cells and the decreased production of enzymes are usually the result of an inflammatory process. This inflammation can be secondary to chronic infection or free radical damage causing a cellular autoimmune response against the target pancreatic cells. The integrative approach is aimed at reducing inflammation before cell destruction, death, infiltration, and scarring occur.

In human allergic conditions, autoimmune disorders such as systemic lupus (SLE) and immune-mediated arthritis have been implemented in the development of EPI (D'Ambrosi 1997, Dreiling 1976, Watts 1989).

Considering this inflammatory response, the use of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory and

regenerative effects on the acinar cells is indicated. If instituted early, such as during the treatment of pancreatitis, or when pancreatic enzyme symptoms such as voluminous stools first occur, it is possible to prevent the progressive inflammation, cell death, and scarring that leads to EPI (Goldstein 2005).

Nutrition

General considerations/rationale

Nutritional therapies are more beneficial when they are administered early in the treatment of the disease. Besides pancreatic enzyme replacement, nutritional therapy is directed toward reducing inflammation, enhancing enzyme production as well as improving the diet, digestion and assimilation. The dietary approach to therapy often helps to control the condition. Switching to a highly digestible, higher protein lower fat diet is recommended (Strombeck 1999).

Appropriate nutrients

Nutritional/gland therapy: Glandular pancreas and intestine can be helpful in neutralizing a cellular autoimmune reaction that can lead to cell destruction, infiltration, and scarring (see Gland Therapy in Chapter 2).

Pancreatic enzyme replacement: While the use of pancreatic enzyme therapy is controversial, it is often beneficial when the digestive process is compromised. The addition of pancreatic enzymes should be part of an overall program to reduce pancreatic inflammation and improve cellular function.

Probiotics: The addition of the proper combination of probiotics has a reported positive impact on the intestines and the digestive process (Goldin 1984, Perdigon 1987). Probiotics have been shown to improve and aid the digestive process by secreting their own source of enzymes, which is beneficial for animals that are pancreatic-enzyme-deficient (McDonough 1987).

Vitamins A, E, C, and B₁₂: Beneficial for animals with longstanding digestion problems that are unable to assimilate nutrients and vitamins required for health and the maintenance of wellness.

Chinese herbal medicine/acupuncture

General considerations/rationale

Exocrine pancreatic insufficiency is a result of Yang and Qi deficiency in the Spleen and Stomach. The Spleen and Stomach are responsible for changing the food and drink ingested into usable energy sources for the body. When there is not enough heat (Yang) or energy (Qi) to do so, the food remains partially digested. Treatment is aimed at improving digestive functions and decreasing uncomfortable gastrointestinal signs such as cramping and bloating.

Appropriate Chinese herbs

Amomum (Sha ren): Relieves bloating, spasms, and pain (Zhong Yao Xue 1988).

Atractylodes (Bai zhu): Can treat diarrhea or constipation, depending upon the dose (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Dioscorea (Shan yao): Has anti-diarrhea effects in mice with diarrhea of multiple etiologies that fall under the diagnosis of spleen deficiency in TCM (Li 1999).

Licorice (Gan cao): Stops intestinal cramping (Zhong Yao Zhi 1993).

Acupuncture

Some practitioners report success treating chronic diarrhea with acupuncture. In one human trial, 30 infants with chronic diarrhea who did not respond to Western medicine or herbs were treated with acupuncture. All were cured within 3 courses of treatment (Wenling 1989).

Homotoxicology

General considerations/rationale

German shepherd dogs are afflicted by an autosomal recessive gene, which results in pancreatic decline and maldigestion in younger dogs. Genetic disturbances such as this represent a Degeneration or Dedifferentiation phase disorder. Such conditions are generally viewed as incurable/irreversible, and clinicians are advised to concentrate on the more important treatment strategies of enzyme supplementation and dietary therapy to assist patients. The use of antihomotoxic agents may benefit these patients in other ways and may be appropriate as part of a whole patient management system. A complete discussion with the client should precede such therapy.

Exocrine pancreatic insufficiency can result from injury to the pancreatic acinar cells and such damage may be treatable via homotoxicology. This is occasionally seen as a temporary condition following pancreatitis in dogs and cats. Early treatment may assist these patients but further research is indicated. Chronic pancreatitis can be associated in some dogs and more commonly in cats. Diabetes mellitus can result from chronic pancreatitis. By the time glandular insufficiency manifests in signs of maldigestion, the disease must be fairly advanced and may not respond clinically to antihomotoxic therapy.

Autoimmune pancreatitis can lead to exocrine pancreatic insufficiency in humans, and this may well explain refractory veterinary cases as well (Van Buuren, et al. 2006). Such cases represent Impregnation Phase disorders in their origins and are often asymptomatic as they progress to more serious dysfunction.

There are no studies regarding this condition and antihomotoxic medications, so the following discussion should be viewed as experimental or theoretical in nature.

Appropriate homotoxicology formulas

Also see pancreatitis protocols.

***Echinacea compositum*:** Used in acquired cases involving infectious damage to the pancreas and as a phase remedy in Inflammation and Impregnation phase disease conditions.

***Galium-Heel*:** A phase remedy in Deposition, Impregnation, Degeneration, and Dedifferentiation phase disorders. Provides cellular detoxification and matrix drainage.

***Glyoxal compositum*:** Depolymerizes homotoxins and activates blocked enzymes and receptors. It is a phase remedy in Degeneration and Dedifferentiation phase disorders.

***Hepar compositum*:** Provides drainage, detoxification, and organ support of the liver. Contains Pankreas suis.

***Leptandra homaccord*:** Used for pancreatic repair and drainage in cases of pancreatopathy (Leptandra, Podophyllum, Niccolum metallicum, Arsenicum album, and Phosphorus). This remedy is more helpful in pancreatitis cases but has not been researched for this purpose in animals (Reckeweg 2000).

***Lymphomyosot*:** Provides lymphatic drainage and detoxification.

***Molybden compositum*:** Provides replacement of the cofactors needed in chronic cases. It is a Degeneration Phase remedy.

***Momordica compositum*:** Provides pancreatic support and drainage. Contains Momordica, Jodam, Podophyllum, Lycopodium, Lachesis, and Veratrum, which are helpful in cases of diarrhea (Reckeweg 2000).

***Mucosa compositum*:** Provides repair and support of mucosal elements following insult or injury. Contains Pankreas suis (Reckeweg 2000).

***Placenta compositum*:** A phase remedy for difficult cases. Used experimentally to assist repair and activation of blood vessels. May activate stem cell action. Its use would be intermittent in pulses.

***Psorinoheel*:** A remedy useful in deep homotoxicoses that are refractory to therapy.

***Solidago compositum*:** Provides drainage and support of the urinary system. Part of the deep detoxification program.

***Syzygium compositum*:** A classical remedy for diabetes and more advanced pancreatic diseases.

***Thryoidea compositum*:** A part of the deep detoxification formula. Drains the matrix and supports the endocrine system.

***Tonsilla compositum*:** Provides endocrine support and is an Impregnation and Dedifferentiation phase medicant. In Oriental medicine, disease of the pancreas is part of Spleen organ disease, and as such, this remedy may prove helpful in supporting immune functions (Reckeweg 2000).

Authors' suggested protocols

Nutrition

Pancreas and intestinal support formulas: 1 tablet for every 25 pounds of body weight BID.

Pan 5 Plus: 1 capsule opened and mixed with food for every 25 pounds of body weight (maximum, 4 capsules).

Probiotic MPF: One-half capsule for every 25 pounds of body weight with food.

Chinese herbal medicine/acupuncture

The authors recommend the patent formula shen ling bai zhu Tang at the manufacturer's labeled dose. In addition to the herbs mentioned above, shen ling bai zhu tang also contains coix (Yi yi ren), dolichos nut (Bai bian dou), ginseng (Ren shen), lotus seed (Lian zi), platycodon (Jie geng), and poria (Fu ling). These herbs increase the efficacy of the herbs cited above.

Shen ling bai zhu tang has undergone multiple trials in human medicine and has demonstrated efficacy in controlling diarrhea of various etiologies. In one trial 36 people with chronic diarrhea were treated with shen ling bai shu tang, with modifications depending upon classic TCM diagnosis. Seventy-eight percent had complete response, and another 17% showed improvement (Zhang 1998).

The author suggests the following points to help decrease diarrhea in cases of exocrine pancreatic insufficiency: BL20, ST36, Baihui, and ST25 (Yu 2000).

Homotoxicology—acquired cases (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Pancreatic enzyme and glandular supplements are essential in treating this Degeneration Phase disorder. Prognosis is guarded.

A modified deep detoxification formula: Galium-Heel, Hepar compositum, Solidago compositum, Thyroidea compositum, Mucosa compositum, Ubichinon compositum, and Coenzyme compositum mixed together and taken orally; give twice weekly.

Podophyllum compositum: Has shown to be valuable in pancreatic issues, and should be given BID to TID. Also consider Syzygium compositum for the regulation of blood sugar.

MALABSORPTION SYNDROME

Definition and cause

Severe alterations are needed before the bowel loses its ability to absorb nutrients. Often these patients have genetic factors, which may be aggravated by dietary intake or other environmental factors (Garden 2000, Battersby 2005). Celiac disease, a genetic-based intolerance to wheat gluten in Irish setters and humans, is an important cause of malabsorption syndrome (Stazi 2005). The enzymatic digestion of food occurs in malabsorption, but nutrients cannot be properly imported inside the body due to defects in absorptive mechanisms. A wide variety of signs develop from malabsorption such as diarrhea, vomiting, weight loss, malnutrition, and flatulence based upon the body's inability to get nutrients into the correct sphere for growth, development, and maintenance.

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Therapy depends upon the type of disease present and the underlying cause(s) (Rodriguez-Franco, et al. 1999).

Anticipated prognosis

The prognosis depends upon the type of change and the severity. Intestinal parasites are generally reversible. Colitis and inflammatory bowel disease often require ongoing medical therapy (See the following disease protocols for more detailed information: diarrhea, vomiting,

inflammatory bowel disease, colitis, and intestinal parasites).

Integrative veterinary therapies

It is important to determine the underlying cause of the malabsorption. Once diagnosed, the integrative approach can help control local inflammation, improve organ function and absorption, and help prevent cellular degeneration. The addition of nutrients, nutraceuticals, medicinal herbs, and combination homeopathics, even in genetically induced malabsorption, can help reduce inflammation, help with regenerative cellular integrity, and improve function.

Nutrition

General considerations/rationale

Therapeutic nutrition adds gland support, antioxidants, and nutrient support for the key digestive organs (liver, intestine, and pancreas) with the goal of reducing cellular inflammation and improving cellular function and assimilation.

Appropriate nutrients

Nutritional/gland therapy: Glandular liver, intestines, and pancreas supply the intrinsic nutrients that improve organ function and reduce cellular inflammation (see Gland Therapy in Chapter 2 for a more detailed explanation).

Enzymes: Metabolically, enzymes are essential in the conversion of foods to meet the energy needs of the body (Howell 1985).

Glutamine: Has been shown to improve immune function and is beneficial for the cells of the gastrointestinal tract (Souba 1985, Windmueller 1982, Yoshimura 1993).

Probiotics: Administration of the proper combination of probiotics has been reported to have a positive impact on the intestines and the digestive process (Goldin 1984, Perdigon (1987).

Colostrum: Has been shown to improve intestinal health. It helps to balance intestinal flora and improves digestion (Blake 1999).

Chinese herbal medicine/acupuncture

General considerations/rationale

Malabsorption syndrome is considered Qi and Blood stagnation with Heat and Damp affecting Stomach and Spleen. The Stomach and Spleen are given the tasks of digestion. When they do not have the nourishment (Blood) or the free-flowing energy (Qi) to perform their functions, digestive disorders follow. In the case of malabsorption, the digestive disorder manifests as diarrhea. The Heat refers to Inflammation, possibly in the intestinal walls in

Western terminology, and the Damp can be thought of as the mucus and undigested intestinal contents. One must decrease the inflammation in the bowels and stop the diarrhea to treat malabsorption.

Appropriate Chinese herbs

Actractylodes (Bai zhu): Can be used to stop diarrhea (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994). At low doses, it has a mild inhibitory effect on the contraction of isolated guinea pig ileum (Ma Xiao Song 1996).

Amomum fruit (Sha ren): Relieves bloating, spasms, and pain (Zhong Yao Xue 1988).

Aurantium fruit (Zhi qiao): Was shown to inhibit contraction of isolated rabbit intestinal smooth muscles and to relieve acetylcholine- and BaCl₂-induced enterospasm (Ma Ya Bing 1996).

Bupleurum (Chai hu): Inhibited the effect of dimethyl benzene-induced ear swelling in mice (Liu 1998). This anti-inflammatory action may help with inflammation in the intestines, allowing better absorption of nutrients.

Cimicifuga (Sheng ma): Inhibits lymphocyte activation. Cimicifuga's inhibitory effect on membrane permeability is greater than that of cortisol and it has been shown to inhibit the formation of antibodies (Zhu Nei Liang Fu 1984).

Citrus (Chen pi): Reduces inflammation by decreasing the permeability of blood vessels (Zhong Yao Yao Li Yu Ying Yong 1983). The anti-inflammatory action may decrease intestinal swelling. Citrus also can increase the activity of amylase in the saliva (Zhang 1989). If the citrus can improve digestion, absorption may be improved.

Codonopsis (Dang shen): Seems to protect the intestine. In experiments in which third-degree burns were induced in the small intestine of mice, codonopsis increased the rate of peristalsis as compared to untreated mice (Wang 1999). It may have similar protective effects from other causes of intestinal damage.

Coptis (Huang lian): Stops diarrhea (Zhong Yao Xue 1998). There was a 100% improvement in signs in a study of 100 people with acute gastroenteritis (Si Chuan Yi Xue Yuan Xue Bao 1959). One component of coptis, berberine, has been shown to have anti-inflammatory effects in rats (Yao Xue Za Zhi 1981). Berberine also increases the production of bile acids (Zhong Yao Xue 1998). This may help the body to more completely digest the food, making it easier to absorb.

Corydalis tuber (Yan hu suo): Increases secretions from adrenal glands in mice (Xi Xue Xue Bao 1988). This may release cortisol and decrease intestinal inflammation.

Immature orange peel (Qing pi): Inhibits smooth muscle contractions in the stomach and thereby relieves cramps (Zhong Yao Zhi 1984).

Licorice (Gan cao): Alleviates intestinal cramping (Zhong Yao Zhi 1993). Two of the components, glycyrrhizin and glycyrrhetic acid, have anti-inflammatory effects. They have approximately 10% of the corticosteroid activity of cortisone (Zhong Cao Yao 1991). Licorice can increase bile production (Zhu 1998, Wu 1998).

Lindera (Wu yao): Increases the secretion of gastric acid (Zhong Yao Yao Li Yu Ying Yong 1983). This may help improve digestion.

Peach kernel (Tao ren): Suppresses the immune system in several ways. It was shown to prevent egg-white-induced arthritis in mice (Liu Can Hui 1989). Other studies have shown suppressive effects on fibroblast growth in laboratory cell cultures. It was shown to suppress the proliferation of inflammatory cells and fibroblast hyperplasia in subjects using experimental trabeculae dissection (Wang 1993). Another study demonstrated the ability to decrease inflammation in mice with otitis media (Zhong Yao Tong Bao 1986).

Platycodon root (Jie geng): Has been shown to promote the secretion of corticosterone in rats, thereby causing an anti-inflammatory effect (Li 1984, Zhang 1984, Zhou 1979).

Rhubarb (Da huang): Has been shown to increase the secretion of bile in dogs and cats (Xin Yi Yao Xue Za Zhi 1974). It helps maintain a healthy intestine. Experimentally, it has been shown to prevent endotoxins from injuring the intestines, prevent viruses and bacterial translocation from damaged intestines, and maintain the intestinal mucous membrane barrier (Yang 1998, Liu 1998).

Acupuncture

Acupuncture has been shown to be effective in controlling or curing diarrhea in many studies. Acupuncture at GV1, St25, and ST-36 was used in a study of 500 infants with diarrhea; 485 were completely cured and 13 improved (Zhongxin 1989). In preweaning pigs with experimentally induced *E. coli* diarrhea, a combination of acupuncture and moxibustion was superior to oral neomycin. Using acupuncture and moxibustion, 82% of the pigs responded as opposed to 71% treated with neomycin (Hwang 1988).

Homotoxicology

General considerations/rationale

Malabsorption syndrome indicates Deposition, Impregnation, Degeneration, or Dedifferentiation phase disease. Homotoxicology deals with malabsorption by determining the cause and pathological change present, and then addressing the area with appropriate formulas to remove homotoxins and attempt tissue repair.

The prognosis depends upon the type of change and the severity. Deposition Phase conditions (such as intestinal parasites) are generally reversible with proper therapy and

time, while Impregnation (inflammatory bowel disease), Degeneration (parvovirus enteritis), and Dedifferentiation (intestinal lymphoma) phase diseases may only be managed and not cured due to the extensive damage to normal structure and function of the organism's systems. Notes from the protocol sections on diarrhea, vomiting, inflammatory bowel disease, and intestinal parasites apply.

Many antihomotoxic formulas may be needed, but the most important ones support the liver, intestine, and pancreatic tissues. Hepar compositum is one of the most important in this regard, followed by Mucosa compositum for its action on the mucosal lining. Catalysts (Glyoxal compositum, Coenzyme compositum, BHI-Enzyme, and Ubichinon compositum) are critical in the repair of chronically damaged cellular elements due to their ability to rehabilitate energy metabolism.

Appropriate homotoxicology formulas

BHI-Enzyme: A catalyst similar to *Coenzyme compositum*. Contains Sulphur at the 30X dilution and cysteinum for detoxification and activation of blocked sulfide enzymes. Pulsatilla is useful in chronic diseases. Other components support energy metabolism and reduce free radical damage. Indicated for nutritional insufficiency and exhaustion (Heel 2002).

BHI-Stomach: Used for stomach distress relieved by eructation, stomach pain, heartburn, chalky white tongue, flatulence, and tendency to collapse.

Coenzyme compositum: Contains Citricum acidum, which is useful for dental problems and gingivitis; scurvy; blackening of teeth and heavy deposits of dental plaque; painful, herpetic vesicles around the lips; nausea; painful cramping in the umbilical area; and distension.

Galium-Heel: Used for all cellular phases, hemorrhoids, and anal fissures, and as a detoxicant.

Gastricumeel: Treats acute gastritis, diseases of the stomach, and nausea.

Glyoxal compositum: Methylglyoxal and glyoxal are methylators. They assist in unblocking receptors and other proteins whose actions become blocked by binding of homotoxins. It is used intermittently and not repeated until signs of detoxification and excretion abate.

Hepar compositum: Provides detoxification and drainage of hepatic tissues and organ and metabolic support, and is useful in most hepatic and gallbladder pathologies. An important part of Deep Detoxification Formula. Treats duodenitis, pancreatitis, cystic hepatic ducts, cholelithiasis, cholangitis, cholecystitis, vomiting, and diarrhea (Demers 2004, Broadfoot 2004). Factors generated in the liver assist in healing of the bowel. This combination contains Natrum oxalaceticum (also found in *Coenzyme compositum*, *Ubichinon compositum*, and *Mucosa com-*

positum) for changes in appetite and stomach distension due to air. Used for nausea, stomach pain with a sensation of fullness, gurgling in the abdomen, and cramping pain in the hypochondria. It is also used for constipation, sudden diarrhea (particularly after eating), and flatus (Reckeweg 2002).

Hepeel: Provides liver drainage and detoxification. Used in a wide variety of conditions including cancer of the liver, where Hepeel was found to be antiproliferative, hepatoprotective, and an antioxidant when tested in human HepG2 cells (Gebhardt 2003).

Lymphomyosot: Provides lymph drainage and endocrine support, and treats edema. Contains Gentiana for chronic gastritis. Treats flatulence, diarrhea, distension of the stomach with eructations, nausea, retching, and vomiting. Also contains Geranium robertianum for nausea, particularly after eating, with distension or sensation of fullness. Myosotis arvensis is included for bloat and distension (Reckeweg 2002).

Molybdan compositum: A trace mineral formula for supplementation of Degeneration Phase cases. This formula can be overdosed, and it should be kept out of reach of children. While no adverse reactions are known when it is used at recommended doses, Reckeweg (2000) advises that therapy be interrupted for 5 days if untoward or unexpected signs appear. Therapy can be restarted at a lower dose upon their resolution (Reckeweg 2000).

Mucosa compositum: Broadly supportive for repair of mucosal elements. Used in cellular cases and in recovery periods following active disease (Reckeweg 2000). This remedy contains a useful component in Kali bichromicum, which is indicated for ulcers found on the gums, tongue, lips, and even on the gastric mucosa (gastric or duodenal ulcer). The tongue may have a thick, yellow, mucous coating, or in ulcerative stomatitis or tonsillitis it may be dry, smooth, shiny, or fissured. Kali has been used effectively in acute gastroenteritis associated with vomiting of clear, light-colored fluid or quantities of mucous bile, and in cases with hematemesis, flatulent colics, and dysenteric stools with tenesmus (Reckeweg 2002).

It also contains Hydrastis, with mucosal support for oral problems such as stomatitis, and mucosal suppuration that is accompanied by ulceration, inflammations and colic of the hepatobiliary system and of the gastrointestinal tract, and polyp formation (Reckeweg 2002). The Kreosotum component can be used in chronic gastritis with gastric hemorrhages and vomiting of brown masses. Also has a dental implication in cases with spongy gums and carious teeth, neuralgias proceeding from them causing a burning toothache with deep caries, black patches on the teeth, and fetid discharges.

The single remedy Phosphorus is broadly useful for dyspepsia and for jaw problems in dental disease (Reckeweg 2002). Phosphorus is found in many other remedies including *Echinacea compositum* and *Leptandra Homaccord*. It is rich in suis organ preparations for mucosal support, plus a large variety of remedies with indications in the gastrointestinal sphere. The component Argentum nitricum (also in *Atropinum compositum*, *Diarrheel*, *Duodenoheel*, *Gastricumeel*, *Momordica compositum*, *BHI-Nausea*, and several other combinations) is indicated for distension in the upper abdomen, gastrocardiac symptom-complex, and amelioration from eructations. It is also used for gastric crises (Reckeweg 2002).

***Nux vomica homaccord*:** Used for liver and gastrointestinal disease and after smoke inhalation. Useful in gingivitis (Reckeweg 2002). This commonly used formula for detoxification is part of the *Detox Kit*. Recent research shows that one ingredient (*Brucine*) affects mitochondria in human hepatoma cells. Further research is needed to determine whether homeopathic dilutions are more or less active (Deng, et al. 2006).

***Syzygium compositum*:** Used for chronic gastritis, chronic enteritis, diabetes mellitus, and hepatic disorders.

***Tanacet-Heel*:** Treats complications following the removal of helminths. Used for gastroenteritis, dysentery, gas, and pain following ascarids, especially in juvenile pets.

***Ubichinon compositum*:** Contains Anthraquinone for swelling of gums, and GI symptoms such as distention, flatulence, and cramping abdominal pain. Treats constipation with straining or sudden diarrhea (Reckeweg 2002).

Authors' suggested protocols

Nutrition

Intestines/IBD and pancreas support formulas: 1 tablet for every 25 pounds of body weight BID.

Liver support formula: One-half tablet for every 25 pounds of body weight BID.

Pan 5 Plus: 1 capsule opened and mixed with food for every 25 pounds of body weight (maximum, 4 capsules).

Glutimmune: One-fourth scoop for every 25 pounds of body weight SID.

Probiotic: One-half capsule for every 25 pounds of body weight with food.

Colostrum: One-third teaspoon powdered formula for every 25 pounds of body weight BID.

Chinese herbal medicine/acupuncture

Formula ColonGuard: 1 capsule per 10 to 20 pounds twice daily. It can be used in conjunction with conven-

tional medicine, but that is often not needed. In addition to the herbs mentioned above, ColonGuard also contains angelica radix (Dang gui), astragalus (Huang qi), bamboo shavings (Zhu ru), pueraria (Ge gen), pulsastilla root (Bai tou weng), and raw white lotus seed (Lian zi). In some severe cases, the practitioner may need to use conventional medicine (steroids, metronidazole, dietary restrictions, pancreatic enzymes) along with the herbal supplement. However, if drug therapy is needed, it should be at a lower dose than was needed before herbal therapy was instituted.

The authors use BL20, ST36, BL26, Baihui, ST25, BL21, CV12, and CV4 in various combinations for intestinal malabsorption.

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for cat or small dog)

Treatment must be individualized but the following represent good starting therapies that can be readily adapted based upon clinical response.

Find and treat the primary condition (neoplasia, giardiasis, chronic fibrosis, lymphangiectasia, inflammation).

Hepar compositum, Mucosa compositum, and the catalysts (Coenzyme compositum and Ubichinon compositum): Give on a rotating basis once to 3 times weekly.

Syzygium compositum, Hepeel, and BHI-Enzyme BID, Gastricumeel or BHI-Stomach BID: Mixed together and give orally BID.

Molybdan compositum: Use for the loss of critical nutrients. Give 1 tablet daily for 3 to 4 days, then 1 tablet every other to every third day orally.

Chapter Twelve

Diseases of the Eye and Ear

ANTERIOR UVEITIS

Definition and cause

Anterior uveitis is an inflammation of the iris that can arise from multiple causes. Common underlying causes include infectious agents such as blastomycosis, ehrlichiosis, leptospirosis in the dog and FIV in cats, immune-mediated reaction, trauma, and neoplasia. The underlying inflammatory process causes the cellular damage and the resultant cellular infiltration (Collins 1999, Davidson 1991, Glaze 1999, Ringle 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Because this condition is inflammatory and often immune-mediated, the treatment of choice is often topical and systemic corticosteroids along with immunosuppressant drugs such as azathioprine, covered by antibiotics.

Anticipated prognosis

As with most immune-mediated inflammatory processes, the results depend upon the initial autoimmune process and the degree of secondary cellular damage.

Integrative veterinary therapies

Inflammation of the uveal tissues of the anterior chamber of the eye can occur from many causes. Eighty percent of these cases are idiopathic. An attempt should be made to identify the correct cause, and a complete medical work-up is recommended in these animals.

An integrative approach takes into consideration local inflammation in the eye, the exaggerated immune response, and the prevention of ongoing degeneration. Nutrients, nutraceuticals, medicinal herbs, and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects on the cells of the eye can often control

the pain and discomfort, help reduce inflammation, and improve healing time.

Nutrition

General considerations/rationale

Therapeutic nutritional therapy early in the treatment can help to reduce and control the underlying inflammatory process, nourish cells, and help to balance the immune response to the tissues of the eye (target organ).

Appropriate nutrients

Nutritional/gland therapy: Glandular eye, adrenal, thymus, and spleen supply the intrinsic nutrients that reduce cellular inflammation and improve general immune organ function and balance. This helps to spare the eye from further immune attack, cascading inflammation, and eventual degeneration (see Gland Therapy, Chapter 2, for a more detailed explanation).

Note: Anterior uveitis can be a severe autoimmune reaction that can involve multiple organ systems. It is recommended that blood be analyzed both medically and physiologically to determine associated organ involvement and disease. This will allow for a more specific gland and nutritional support protocol (see Chapter 2, Nutritional Blood Testing, for more information).

The following nutrients have shown a beneficial effect on the eyes.

Essential fatty acids: Proper levels of essential fatty acids, particularly DHA and EPA, are essential for healthy eye function and retinal development (Pawlosky 1997). Hemp oil is a plant-derived oil that is high in both linoleic (LA) and linolenic (LNA) fatty acids, which are the building blocks for the longer chained eicosapentaenoic (EPA) and docosahexaenoic acid (DHA). The analysis of hemp oil shows that it is extremely low in saturated fats. More than 70% of its composition is polyunsaturated fatty acids, and less than 20% is saturated fats (Kralovansky 1994, Weil 1993). Because of its high level of gamma linolenic acid (GLA), it is being investigated for its beneficial effects on immune function (Horrobin 1992).

Lutein: Lutein is in the carotenoid family and is a potent antioxidant, which is beneficial for the health of the eye. Seddon (1994) showed the beneficial effects of lutein in people, including a decreased risk of macular degeneration and protection of eye tissue. Hankinson (1992) showed that lower levels of lutein are associated with an increased risk of cataract formation. In another study, Dagnelie (2000) found that people with retinitis pigmentosa (RP) showed a significant improvement in visual acuity and the prevention of degeneration with lutein supplementation.

Flavonoids: Quercetin has been shown to lessen the progression of diabetic retinopathy (Varma 1986). Another group of flavonoids, **Proanthocyanidans** (POCs), which come from grape seeds or pine bark, have also been shown to limit the progression of retinopathy (Fromantin 1981, Verin 1978).

Chinese herbal medicine

General considerations/rationale

According to Traditional Chinese Medicine theory, anterior uveitis is a disorder caused by Wind, Heat, and toxins in the Liver, along with a Liver Yin deficiency. According to the Western interpretation, Wind is the pathogen that “blows” the condition into the eyes. Wind can also cause pruritis. Heat is the inflammation, and toxins are the inflammatory mediators produced by the body as well as the etiologic cause—virus, bacteria, immune-mediated reaction, fungus, etc. In TCM, the Liver controls the Eyes. When there is a Yin or fluid deficiency in the Liver, the eyes may not receive the normal nourishment and they may become diseased. Treatment of anterior uveitis, therefore, involves decreasing the inflammation, controlling the etiologic cause, and decreasing discomfort.

Appropriate Chinese herbs

Bupleurum (Chai hu): Contains saikosaponin, which has analgesic and antipyretic properties (Shen Yang Yi Xue Yuan Bao 1984), as well as anti-inflammatory properties (Liu Wei 1998). Bupleurum has also demonstrated efficacy against several viruses (Wang 1998, Liao 1999, Zhong Yao Xue 1988).

Coptis (Huang lian): Contains berberine, an anti-inflammatory component. Its effects have been demonstrated in rats (Yao Xue Za Zhi 1981).

Dendrobium (Shi hu): Contains dendrobine, which has an analgesic effect only slightly weaker than phenacetin (Borch 1977).

Gardenia (Zhi zi): Can decrease inflammation by counteracting increases in capillary permeability (Zhang 1994).

Gentiana (Long Dan cao): Contains gentiopicroside and gentianine, which have marked anti-inflammatory effects. Gentiopicroside has anti-histamine activity and

can help decrease capillary permeability in inflammatory conditions (Xu Qiang 1993). It also has mild antibiotic and antifungal effects (Zhong Yao Yao Li Yu Ying Yong 1983, Wang 1983).

Honeysuckle (Jin yin hua): Has been shown to have anti-inflammatory and antipyretic properties in rabbits and mice (Shan Xi Yi Kan 1960).

Licorice (Gan cao): Contains both glycyrrhizin and glycyrrhetic acid. These compounds prolong the effect of cortisones in the body, either by decreasing their metabolism in the liver or by decreasing the protein-binding, thereby raising cortisone plasma concentration. This exerts an anti-inflammatory effect (Zhong Yao Zhi 1993). Additionally, licorice has an analgesic effect (Zhong Yao Xue 1998). Glycyrrhizin has demonstrated some antiviral effects (Zhu 1996).

Ligustrum (Nu zhen zi): Has been demonstrated to decrease inflammation, swelling, and capillary permeability in mice (Zhong Guo Zhong Yao Za Zhi 1989).

Red peony (Chi shao): Can decrease ocular inflammation. It reduces redness, swelling, and pain (Bao 1999). It also has demonstrated antiviral effects in several experiments (Yang 1994, Liu 1999).

Rehmannia (Sheng di huang): Reduces swelling and inflammation (Zhong Yao Yao Li Yu Ying Yong 1983).

Rhubarb (Da huang): Has analgesic and anti-inflammatory efficacy (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Schizonepeta (Jing jie): Can help to relieve discomfort. It has demonstrated analgesic effects (Zhong Yao Cai 1989).

Scutellaria (Huang qin): Contains biacalein, which has been shown to suppress inflammation in mice (Kubo 1984). The total flavone component has shown anti-inflammatory effects in mice and rats (Cao 1999). It also contains biacalin, which has demonstrated antibacterial effects against multiple bacteria (Wang 1999, Zhong Yao Xue 1988). Additionally, scutellaria has been shown to increase cellular immunity by promoting the production of IL2 (Pan 1991).

Vitex fruit (Man jing zi): Has analgesic properties (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Trauma (Inflammation Phase), viral infections (Impregnation Phase), metabolic diseases (Deposition Phase), and tumors (Degeneration Phase) can all be associated with anterior uveitis. Therapy depends upon the precise phase of the patient's homotoxicosis as well as other concurrent signs of disease. Intraocular and blood pressures should be determined in these pets. Consultation with an ophthalmologist should be considered.

Appropriate homotoxicology formulas

Apis homaccord: Reduces swelling.

Belladonna homaccord: Treats acute cases and red eyes.

BHI-Eye: Used for red, swollen eyes with irritation.

Galium-Heel: Used in cellular and matrix phases for detoxification and drainage, and support of glomeruli.

Hepar compositum: Provides liver support, and drainage and detoxification.

Hepeel: Provides liver detoxification and support.

Kalmia compositum: Treats connective tissue vessels, ostealgia, periostitis, and neuralgia.

Lymphomyosot: Provides drainage of lymphatics, and reduces pain and swelling.

Mucosa compositum: Supports ocular tissues through *Ocularis suis*.

Oculoheel: Treats periocular swelling and inflammation and keratitis.

Reneel: Supports the kidney.

Solidago compositum: Drains kidney and associated urogenital tissues.

Thyroidea compositum: Provides deep detoxification of matrix and support of endocrine tissues.

Tonsilla compositum: Modulates chronic immune responses.

Traumeel S: Has anti-inflammatory effects, supports ocular tissues in vasculitis, and reactivates sulfur-containing enzymes.

Authors' suggested protocols**Nutrition**

Eye and immune support formulas (contains vitamins A and E): 1 tablet for every 25 pounds of body weight BID.

Quercetin: 35 mg for every 10 pounds of body weight SID.

Lutein: 5 mg for every 50 pounds of body weight.

Proanthocyanidans (PCO): 20 mg for every 10 pounds of body weight daily.

Hemp oil: 1 teaspoon for every 25 pounds of body weight with food BID.

Chinese herbal medicine

Chronic uveitis is the recommended formula for this condition. It is dosed at a rate of 1 capsule for every 10 to 20 pounds twice daily. In addition to the herbs cited above, Chronic uveitis contains cassia seed (Jue ming zi), chrysanthemum (Ju hua), dianthus (Qu mai), siler (Fang feng), and wolfberry (Gou qi zi) to help increase the efficacy of the formula.

Homotoxicology

BHI-Eye or Oculoheel, Kalmia compositum, Lymphomyosot, Traumeel: Mix together and given 3 to 5 times

daily the first day, and then TID to BID as needed. Add Engystol N BID if a viral cause is suspected. Add Echinacea compositum if bacterial or protozoal disease is suspected.

Pure Eye Drops: Alternate with Pure Ear Drops (or Traumeel oral vials), topically.

Veratrum homaccord: Use for eye diseases tending toward degeneration.

CATARACTS

Definition and cause

Cataracts are defined as any loss of transparency, or opacity of the lens. Causes include genetic predisposition, nutritional imbalances, reaction to environmental or toxic chemicals, related disease of the eye such as iriditis, retinal degeneration or uveitis, and trauma, or they can be secondary to other diseases such as diabetes. It is believed that there is an interruption in the normal lens metabolism between the water and protein levels that starts the formation of the cataract (Gelatt 1991, 1992; Nasisse 2003).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

The recommended treatment for cataracts is the surgical removal of the lens. Medical options for cataracts are usually used for secondary conditions such as the use of topical corticosteroids to reduce the inflammation of uveitis before cataract surgery is performed. (Gelatt 1991, 1992; Nasisse 1994; Slatter 1990).

Anticipated prognosis

The prognosis for returned vision is good post surgically. This depends upon the involvement or influence of other disease processes such as diabetes, autoimmune disease, or uveitis. Untreated cataracts are a progressive disease which result in impaired or complete loss of vision (Gelatt 1992, Nasisse 2003).

Integrative veterinary therapies

An integrative approach to cataract formation and prevention focuses upon reducing cellular inflammation, nourishing the tissues of the eye, and improving waste elimination. Nutrients, nutraceuticals, medicinal herbs and combination homeopathics that have anti-inflammatory, tissue-sparing, and regenerative effects can help to prevent waste accumulation and cataract formation.

Nutrition

General considerations/rationale

Cataract therapy is most often surgical removal, and does not focus upon prevention. The nutritional approach adds nutrients, antioxidants, and gland support to help reduce initiating inflammation and improve waste elimination.

Appropriate nutrients

Nutritional/gland therapy: Glandular eye and liver supply the intrinsic nutrients to help control free radical build-up, reduce cellular inflammation, and improve elimination of metabolic wastes, all of which are beneficial for lens health (see Gland Therapy, Chapter 2, for a more detailed description).

Lutein: Lutein is in the carotenoid family and is a potent antioxidant, which is beneficial for the health of the eye. Hankinson (1992) showed that lower levels of lutein were associated with increased risk of cataract.

Vitamin E: Vitamin E is associated with decreased risk and the prevention of cataract formation (Lyle 1999, Rouhiainen 1996, Seddon 1994, Teikari 1997, Trevithick 1981). Leske (1998), in a 5-year study, showed that people who took vitamin E had 50% less risk of developing cataracts.

Vitamin C: Vitamin C is an important antioxidant for the health of the eye. Packer (1979) reported that vitamin C is required to activate vitamin E, which is important for decreased risk of cataract formation. Supplementing the diet with vitamin C has been associated with decreased cataract formation in people (Hankinson 1992; Jacques 1988, 1991, 1997; Robertson 1991).

Quercetin: Quercetin has been shown to block the accumulation of sorbitol in the eye, which may be beneficial in people with diabetic cataracts (Varma 1977). Similarly, people who consume fruit and vegetables that are

rich in antioxidants such as flavonoids are less at risk of developing cataracts (Jacques 1991, Knekt 1992).

Chinese herbal medicine/acupuncture

According to TCM, cataracts are caused by Blood and Yin deficiency in the Liver, Kidney, and Spleen. In the Western interpretation, the Liver controls the Eyes. The Eyes are not nourished when there is a Blood and/or Yin deficiency in the Liver, leading to blurry vision in most cases. The Spleen is charged with transforming food into Blood and Yin, so a deficiency in the Spleen leads to deficiency in the Liver. The Kidney is responsible for the aging process because it houses the Essence, or genetic blueprint. Degenerative changes take place as the Kidney ages, which explains why cataracts are more common in older patients.

Appropriate Chinese herbs

Because cataracts are considered a surgical disease in Western medicine, there are no studies in Western journals describing the treatment of cataracts with herbs. Some of the following herbs treat conditions that lead to cataracts in Western thought, i.e. hyperglycemia.

Ophiopogon (Mai men dong): Can lower blood glucose levels (Wan 1998).

Sage tangle (Kun bu): Has been shown to decrease blood glucose levels in mice (Zhong Cao Yao, 1987).

White atractylodes (Bai zhu): Lowers blood glucose levels (Zhong Hua Yi Xue Za Zhi, 1958).

Homotoxicology

General considerations/rationale

Cataracts result from Degenerative Phase homotoxicoses (Reckeweg 2000). There is no known medical cure for cataracts, and a complete medical work-up and early consultation with an ophthalmologist to evaluate medical and surgical modalities is indicated. When clients are not interested in pursuing surgical therapy, anti-inflammatory treatment (topical 1% prednisone) is recommended to minimize protein-leakage-induced anterior uveitis.

The classical homeopathic literature contains references to using *Cineraria* for cataracts. Boericke (1927) states that this is most effective when done for several months for traumatic cataracts. The authors have not experienced measurable success with such topical ophthalmic products in our veterinary patients. Clients should be advised of this before embarking on homeopathic treatment of cataracts in animals.

While antihomotoxic drugs cannot cure cataracts, treating the correct phase homotoxicosis may provide numerous other benefits to the patient, and ocular function and comfort may improve as a result. A full diagnostic evaluation is appropriate, with particular attention paid to breed, familial history, traumatic events, drug

history, intraocular pressure, and metabolic diseases (such as diabetes mellitus).

Appropriate homotoxicology formulas

Causticum compositum: Given for classical homeopathic indications for cataracts of Causticum and Sulphur.

Cerebrum compositum: Given for classical homeopathic indications for Sulphur and Conium. It is helpful in many geriatric patients and worth consideration for its other CNS benefits.

Cutis compositum: Contains Calc fluor and Sulphur.

Discus compositum: Contains Silica, Sulphur, and Kali carb. It is used classically for some cases of cataract, but it is particularly effective in other areas of geriatric medicine and could be considered as part of an overall program.

Engystol N: Used in chronic diseases; supports enzyme activation through Sulfur.

Galium-Heel: Used in cellular phases, provides matrix drainage, and reduces swelling and pain.

Lymphomyosot: A phase remedy for Degeneration Phase disorders.

Oculoheel: Treats ocular inflammation.

Phosphor homaccord: Intermittent use may support organ function.

Spigelia: Contains Sulphur and Kali carb, and is used in classical homeopathic prescribing for cataracts. If the remedy pattern matches the patient, consider this as a trial.

Syzygium compositum: Used to treat diabetic-induced cataracts.

Thyroidea compositum: Contains Calc fluor, Sulphur, and Conium. Provides deep matrix flushing and detoxification in advanced cases.

Authors' suggested protocols

Nutrition

Eye and liver support formulas (contain vitamins C and E): 1 tablet for every 25 pounds of body weight BID.

Lutein: 5 mg for every 50 pounds of body weight.

Quercetin: 35 mg for every 10 pounds of body weight SID.

Vitamin C: 100 mg for every 15 pounds of body weight BID.

Vitamin E: 50 IU for every 20 pounds of body weight SID.

Chinese herbal medicine/acupuncture

The authors recommend Complex 88 at a dose of 1 capsule per 10 to 20 pounds twice daily. In the authors' experience this formula helps to clear the opacity in the lens. In addition to the herbs listed above, Complex 88 contains apricot seed (Xing ren), arisaema (Dan nan

xing), asparagus (Tian men dong), astragalus (Huang qi), barbat skull cap (Ban zhi lian), centipede (Wu gong), Chinese sage (Shi jian chuan), codonopsis (Dang shen), corydalis (Yan hu suo), glehnia root (Sha shen), houttuynia (Yu xing cao), lily bulb (Bai he), oldenlandia (Bai hua she cao), oyster shell (Mu li), peucedanum (Qian hu), prunella (Xia ku cao), pseudotellaria (Tai zi shen), rehmannia (Sheng di huang), sargassum (Hai zao), scorpion (Quan xie), scrophularia (Xuan shen), selaginella (Shi shang bai), sophora root (Shan dou gen), stemoma (Bai bu), tortoise shell (Bie jie), and trichosanthes (Gua lou).

Homotoxicology (Dose: 10 drops PO for 50-pound dog; 5 drops PO for small dog or cat)

The following protocols are not expected to cure cataracts but are used to address the Degeneration Phase state of the patient. Readers should take notice of any positive effects seen in patients so treated, and are advised to seek publication of their experience.

Symptom formula: Galium-Heel, Lymphomyosot, and Oculoheel mixed together and given BID. Engystol given twice weekly PO. If anterior uveitis is present consider Traumeel intermittently.

Deep detoxification formula: Should be considered. Contains Galium-Heel, Lymphomyosot, Thyroidea compositum, Hepar compositum, Solidago compositum, Coenzyme compositum, Ubichinon compositum, and Testes compositum OR Ovarium compositum (depending upon the patient's sex) mixed together and given orally every 3 days for 60 to 120 days.

CONJUNCTIVITIS

Definition and cause

Conjunctivitis is any inflammation of the conjunctiva. The causes are allergy, infection with bacteria, chlamydia, fungi, viral organisms, environmental, immune-mediated (follicular in dogs and eosinophilic in cats), and mechanical (lash issues), or can be secondary to other diseases such as glaucoma, uveitis, keratoconjunctivitis sicca, or cancer. Conjunctivitis in cats is commonly caused secondary to calici or herpes viral infection. It is common in both dogs and cats (Angarano 1989, Champagne 2003, Gelatt 1999, Gilger 2000, Morgan 1996, Narfstrom 1999, Ramsey 2000, Stiles 2000, Whitley 2000).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Treatment is focused on the condition and dependent upon the underlying cause(s). Surgery, antibiotics, antiviral drugs such as Trifluridine, corticosteroids, and hypoallergenic diets for allergic causes are commonly used (Bedford 1999, Champagne 2003, Gilger 2000, Hendrix 1999, Larocca 2000).

Anticipated prognosis

The response to medication depends upon the underlying cause. Simple bacterial infections offer good prognosis, while immune-mediated cases and those secondary to other diseases are more often controlled rather than cured. Viral infections often can be controlled and also may lead to chronic conjunctivitis that requires chronic use of medication for control. Surgery is often curative for mechanical issues (Champagne 2003).

Integrative veterinary therapies

In most instances conjunctivitis is an inflammatory process that responds well to medication. Chronic recurrent and allergic conjunctivitis often has underlying causes that are related to the glandular immune system and its response against its own tissue. Reducing inciting inflammation and

supporting and balancing the immune response can help control future outbreaks in chronic recurrent conditions.

Nutrition

General considerations/rationale

Conjunctivitis that is non-responsive or requires chronic medication for its control benefits from nutritional and biological remedies. The reduction of inflammation as well as immune system balance often results in an improved prognosis.

Appropriate nutrients

Nutritional gland therapy: Eye and adrenal gland support have anti-inflammatory and cellular-protective benefits and can help reduce allergic reactions (see Gland Therapy in Chapter 2 for more details).

Quercetin: Quercetin is in the flavonoid family (see Phytonutrients in Chapter 2). It has an antihistamine effect and is beneficial in the treatment of allergically incited conditions (Middleton 1986, Ogasawara 1985).

Betastosterol: Animal studies have demonstrated that phytosterols have anti-inflammatory and antipyretic activity (Gupta 1980) as well as immune-modulating activity (Bouic 1996).

Chinese herbal medicine/acupuncture

General considerations/rationale

Traditional Chinese Medicine views conjunctivitis as a disorder involving Damp, Heat, and toxins. Heat refers to the reddened, inflamed conjunctiva. The Damp element is manifested by the discharge that is seen in many cases. The term “toxins” refers to the etiologic cause of the condition. In modern terms, this means viruses, fungi, bacteria, and immune-mediated inflammation. To treat conjunctivitis with one general formula, the supplement must have anti-inflammatory, analgesic, antibacterial, and antiviral functions.

Appropriate Chinese herbs

Atractylodes (Cang zhu): Effective against bacteria, dermatophytes, and some viruses (Zhong Yao Xue 1998). This suggests that it may be effective in treating conjunctivitis of bacterial, fungal, and viral etiology. In addition, it has anti-inflammatory effects and can prevent inflammatory increases in capillary permeability (Zhang 1998).

Cassia seed (Jue Ming zi): Demonstrates antibiotic effects against *Staphylococcus aureus*, *E. coli*, and other bacteria and fungi (Zhi Wu Yao You Xiao Cheng Fen Shou Ce 1986).

Chrysanthemum (Ju hua): Has antibacterial actions (Yi Xue Ji Shu Zi Liao 1974).

Equisetum (Mu ze): Has anti-inflammatory effects (Zhong Yao Xue 1998).

Eriocaulis (Gu jing cao): Has demonstrated efficacy against *Pseudomonas aeruginosa* and some dermatophytes and pathogenic fungi (Zhong Yao Xue 1998, Xiu Hua Ben Cao Gang Mu 1991).

Gardenia (zhi zi): An anti-inflammatory herb that can decrease capillary permeability (Zhang 1994). Zhi Zi has a rather pronounced inhibitory effect on *Staphylococcus aureus* (Meng 1996, Song 1997). It has demonstrated antibacterial and antifungal efficacy (Zhong Yao Zhi 1984).

Gentianna root (Long dan cao): Has antibacterial activity against multiple bacteria including *Pseudomonas aeruginosa*, *Bacillus proteus*, and *Staphylococcus aureus*. It also has antifungal efficacy (Zhong Yao Yao Li Yu Ying Yong 1983, Wang 1983). One of the components, swertiamarin, has been demonstrated to have analgesic effects in mice. It can be as effective as morphine (Lei 1982). This action may decrease discomfort associated with the condition. Two other components, gentiopicroside and gentianine, have significant anti-inflammatory effects. Gentiopicroside can block histamine effects and reduce capillary permeability (Xu 1993).

Isatis root (Ban lan gen): Has been used to treat conjunctivitis of both viral and bacterial etiologies. Isatis root has been shown to have antibacterial effects in multiple studies (Xu 1987, Cao 1999, Zhong Cheng Yao Yan Jiu 1987). Other studies have demonstrated antiviral effects (Jiang 1992, Li 1994 (1), Li 1994 (2), Zhu 1999, Li 2000). In one trial 25 people with conjunctivitis were treated with isatis root eye drops 4 times daily while 73 received 0.25% chloramphenicol 4 times a day. Symptoms resolved in 3 days in the isatis eye drop group but took 7 days to resolve in the chloramphenicol-treated group (Li 1990). Isatis root has also been used to treat viral ocular lesions. Sixty-one people with herpes simplex viral keratitis were treated with either isatis or virazole. In the isatis root group, 95% of shallow and 75% of the deep ulcers resolved. In the virazole group the success rates were 83.3% and 58.3%, respectively (Li 1998).

Moutan (Mu dan pi): Exerts an anti-inflammatory effect by interfering with prostaglandin synthesis and decreasing the permeability of blood vessels (Sheng Yao Xue Za Zhi 1979, Zhong Guo Yao Ke Da Xue Xue Bao 1990). However, despite the anti-inflammatory effect of moutan, one of its components, paeonol, can enhance phagocytosis of peripheral neutrophils of *Staphylococcus aureus*, thereby augmenting immunity (Li Feng Chun 1994). Additionally, moutan has shown antibiotic effects against multiple strains of bacteria (Zhong Yao Cai 1991).

Rhubarb (Da huang): Inhibits many species of bacteria including staphylococci and streptococci (Zhao 1999, Yang 1997). Rhubarb also demonstrates antiviral activity (Xie 1996). In addition, it possesses antipyretic, analgesic, and anti-inflammatory effects (Chang Yong Zhong Yao

Cheng Fen Yu Yao Li Shou Ce 1994). Rhubarb has an immunostimulant effect. It is able to increase macrophage phagocytosis and phytohemagglutinin-induced lymphocyte transformation reaction in mice (Zhang Bing Sheng 1997).

Scutellaria (Huang qin): Possesses antibiotic efficacy against various species of bacteria, fungi, and viruses. It contains biacilin, which seems to provide much of this effect. Biacilin can have synergistic effects with ampicillin, amoxicillin, methacillin, and cefotaxime (Wang 1999, Cao 1999, Liu 2000). In addition, the flavone component demonstrates anti-inflammatory effects. Baicalin and baicalin suppress inflammation in mice (Kubo 1984, Cao 1999). Scutellaria also stimulates the cellular immune system (Pan 1991).

Siler (Fang feng): Has demonstrated antibacterial effects against *Shigella*, *Pseudomonas aeruginosa*, and *Staphylococcus aureus* and shows efficacy against some influenza viruses (Zhong Yao Tong Bao 1988).

A combination of buddleja (Mi meng hua), schizonepeta (Jing jie), cassia seed (Ju ming zi), and celosia argentea seed (Qing xiang zi) resolved conjunctivitis in 9 of 10 humans after 2 to 6 treatments. The combination also contained Dang gui, Chi shao, Chai hu, Niu xi, Hong hua, Chuan xiong, Tao ren, and Sheng di huang (Hu Bei Yi Sheng 1976).

Homotoxicology

General considerations/rationale

Conjunctivitis can represent Inflammation Phase disorders or Impregnation Phase conditions. Acute bacterial conjunctivitis is usually simple to deal with, but if homotoxins have penetrated or altered the natural defenses, then it can become a recurrent or chronic condition. Such is commonly the case in allergic conditions, which always represent Impregnation Phase homotoxicoses.

Appropriate homotoxicology formulas

Belladonna homaccord: Used for focal, intense redness and inflammatory issues, and dry burning eyes.

BHI-Eye: Used for support of periocular tissues, conjunctivitis, and dacryocystitis.

Mercurius-Heel: Antiviral.

Mucosa compositum: Provides support of ocular repair through Ocularis suis.

Oculoheel: Used for conjunctivitis.

Oculoheel eye drops: Prescribed for conjunctivitis.

Traumeel S: Anti-inflammatory.

Authors' suggested protocols

Nutrition

Eye and adrenal support formulas: 1 tablet for every 25 pounds of body weight twice daily.

Quercetin: 35 mg for every 10 pounds of body weight SID.

Betathyme: 1 capsule for every 35 pounds of body weight BID (maximum, 2 capsules BID).

Chinese herbal medicine/acupuncture

H45 Conjunctivitis: 1 capsule for every 10 to 20 pounds twice daily as needed to control signs. In addition to the herbs mentioned above, H45 Conjunctivitis also contains leonuris fruit (Chong wei zi).

Homotoxicology

See also Herpes Virus.

Oculoheel or BHI-Eye, Belladonna homaccord, and Traumeel S: Mix together and give BID. Use Oculoheel eye drops BID in affected eyes. Add Mercurius-Heel in suppurative conjunctivitis and Apis homaccord with Lymphomyosot in cases with marked swelling.

Echinacea compositum: Use for infectious etiologies.

CORNEAL ULCERS

Definition and cause

Corneal ulcers are classified as either superficial or deep and more commonly are caused secondary to injury or self-trauma. Other causes are chronic eyelash irritation, exposure to foreign or environmental irritants, and bacterial or viral infections. They also can be secondary to other diseases such as KCS. The pain and inflammation associated with corneal ulcers often disappears when the healing is completed. Non-healing and deep ulcers often involve other tissue of the eye, such as the iris, or result in desmetoceles. Indolent ulcers result when nonvital tissues mechanically block the eyes' ability to heal (Glaze 1999; Nasisse 1982, 1997; Slatter 1990; Whitley 1999).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

Superficial corneal ulcers generally respond well to topical ointments or drops. Deep corneal ulcers often require surgical intervention such as a third eyelid flap, corneal graft, or keratotomy. Topical and systemic antibiotics, topical anesthetics, and medical dilating agents such as atropine along with an Elizabethan collar are often recommended (Champagne 1992; Gilger 1999; Gelatt 1982, 2000; Kirschner 1990).

Anticipated prognosis

Superficial corneal ulcers, especially those secondary to trauma, heal well. Deep corneal ulcers also heal well with both longstanding medical therapy and surgical intervention. Ulcers secondary to other conditions such as viral infection, KCS, and continual irritation have a poorer prognosis and often require ongoing medication, surgical correction, and client compliance (Slatter 1990, Whitley 1999).

Integrative veterinary therapies

It is essential to define and address the underlying cause of the corneal ulceration. Medical therapy and prevention

of the self-trauma is often needed to allow for proper healing. The normal cornea heals so quickly and easily that generally accepted medical modalities are sufficient in most cases. Most cases heal in 3 to 7 days. All cases should be stained with an agent capable of identifying corneal undermining, because these cases require special handling. It is also important to evaluate the patient's tear production.

The integrative approach is often needed in recurrent, nonhealing, and indolent ulcers. Along with appropriate medical therapy, nutritional support of the cornea and the use of remedies that are designed to reduce inflammation and improve blood flow often promote and enhance healing.

Nutrition

General considerations/rationale

Nutritional support of the eye helps to reduce inflammation and improve circulation to the cornea. In addition, support of related organs such as the liver often has a positive effect on the healing process.

Appropriate nutrients

Nutritional/gland therapy: Glandular eye can help reduce inflammation (see Gland Therapy in Chapter 2).

Lutein: Lutein, a member of the carotenoid family, is a potent antioxidant that benefits eye health. Seddon (1994) showed that people treated with lutein had a decreased risk of macular degeneration and increased protection of the eye. Hankinson (1992) showed that lower levels of lutein were associated with increased risk of cataract. Dagnelie (2000) found that people with retinitis pigmentosa (RP) showed a significant improvement in visual acuity with lutein supplementation.

Chinese herbal medicine/acupuncture

General considerations/rationale

Corneal ulcers are a result of excessive Heat in the Liver and Gallbladder, accompanied by Yin and Blood deficiency. The Liver is reflected in the Eyes. When there is Heat in the Liver the Eyes may become red, inflamed, and painful. This Heat may be a result of infection, i.e. bacterial, viral, or fungal. The Yin and Blood deficiency are reflected in a dry, unnourished cornea. The ulcer develops when the cornea is dry, and the lack of nourishment makes it susceptible to colonization by bacteria and fungi.

The herbs in formulas developed to treat corneal ulcers must stop pain, decrease inflammation, repel pathogens, and help heal the cornea.

Appropriate Chinese herbs

Angelica (Bai zhi): Has demonstrated anti-inflammatory effects in mice (Zhong Guo Zhong Yao Za Zhi 1991).

Angelica root (Dang gui): Has antibacterial effects (Hou Xue Hua Yu Yan Jia 1981), and is as strong as aspirin at decreasing inflammation and is 1.7 times as strong as aspirin for pain relief (Yao Xue Za Zhi 1971). Despite its effect on inflammation, it has immunostimulant effects (Zhong Hua Yi Xue Za Zhi 1978).

Astragalus (Huang qi): Improves both the humoral and cellular immune systems (Jiao 1999) and demonstrates antibacterial properties (Zhong Yao Zhi 1949). It also has analgesic effects (Zhong Yao Tong Bao 1986).

Chrysanthemum (Ju hua): Has antibacterial efficacy (Yi Xue Ji Shu Zi Liao 1974).

Dandelions (Pu gong ying): May possess anti-inflammatory actions (Mascolo 1987). Dandelions also inhibit bacteria (Zhong Yi Yao Xue Bao 1991).

Forsythia (Lian qiao): Has multiple functions in a supplement for cornea ulcers. It possesses anti-inflammatory properties. It can reduce inflammation by decreasing capillary permeability (Ke Yan Tong Xun 1982). Forsythia decreases edema and inflammatory exudate (Ma 1982). In addition, it has anti-inflammatory and analgesic effects (Rui 1999). Finally, it inhibits both viruses and bacteria (Zhang 2002, Ma 1982).

Honeysuckle (Jin yin hua): A strong antibiotic that also has activity against *Candida albicans* (Wang 1998, Liu 1998, Cao 1999, Feng 1996). It may be useful for bacterial and fungal causes of ulceration.

Plantain (Che qian cao): Has anti-inflammatory effects (*Journal of Traditional Chinese Medicine Material* 1996).

Red peony (Chi shao): Has been shown to diminish ocular inflammation. It decreases the redness, swelling, and pain in the eyes (Bao 1999). In addition, red peony has antiviral activity; it has shown efficacy against herpesviruses (Liu 1999).

Rhubarb (Da huang): Has been proven to inhibit many viruses including herpesvirus (Xie 1996). It contains emodin, rhein, and aloe-emodin, which have antibiotic effects (Zhong Yao Xue 1998). Furthermore, it has analgesic and anti-inflammatory effects (Chang Yong Zhong Yao Cheng Fen Yu Yao Li Shou Ce 1994).

Scutellaria (Huang qin): Contains baicalin, which has antibiotic activity on its own and has synergistic effects with some penicillins. Additionally, it can help overcome B lactam resistance (Zhong Yao Xue 1988, Liu 2000). Baicalin and another component of scutellaria, biacalein, have been shown to suppress inflammation in mice and rats (Kubo 1984, Cao 1999). Finally, scutellaria enhances cellular immunity and may help to clear corneal pathogens (Pan 1991).

Thlaspi (Bai jiang cao): Inhibits bacteria and viruses (Zhong Yao Xue 1998).

Viola (Zi hua di ding): Has antibacterial and antiviral effects, including activity against herpesvirus (Zhong Hua Yi Xue Za Zhi 1962).

Vitex fruit (Man jing zi): Contains vitexicarpin, which inhibits bacteria (Zhong Cao Yao Xue 1980). It has analgesic effects (Zhong Yao Xue 1998).

Homotoxicology

General considerations/rationale

Traumatic and other acute onset corneal ulcerations represent Inflammation Phase disorders. Ulceration can also result from deeper homotoxicoses and represent Degenerative Phase lesions. Changes in the state of health can result in corneal ulceration as both regressive and progressive vicariation. It is important for the clinician to identify the correct phase so that appropriate therapeutic entities are selected.

In recurrent or indolent conditions involving corneal ulceration, the clinician should recall the relationship between the eye and the liver in Traditional Chinese Medicine. Some cases resolve upon the addition of antihomotoxic medicines directed at supporting liver function and drainage. Nonhealing ulcers may also require assistance in activating blocked enzyme systems and in repairing errors in energy metabolism through use of catalyst agents. In difficult cases, autosanguis therapy may move a patient toward healing, especially when used in conjunction with autogenous serum therapy topically. Surgery is needed in some cases.

Referral of non-healing corneal ulcerations to a veterinary ophthalmologist is strongly advised because multiple entities may be involved in such cases (Reckeweg 2000).

Appropriate homotoxicology formulas

There are no veterinary studies on the use of antihomotoxic agents in the healing of corneal ulceration. Appropriate remedies commonly used include:

Belladonna homaccord: Treats localized, suppurative Inflammation Phase disorders.

BHI-Eye: Contains Belladonna and Euphrasia, which have strong indications for eye pathologies, including spasmodic photophobia, pain and pressure in the eyes, acute conjunctivitis, coryza with lachrymation, chemosis, blepharitis, corneal ulcers, and iritis. (Stoss, et al. 2000, Reckeweg 2002).

BHI-Inflammation: Used for generalized inflammatory conditions. Contains Belladonna, which has strong indicators for eye pain, or irritations of the conjunctiva with photophobia, lachrymation, and engorgement of the blood vessels (Reckeweg 2002). This is also common to many other remedies that may be used, including *Belladonna homaccord*, *Mercurius-Heel*, *Mucosa compositum*, *Traumeel*, *Viburcol*, *BHI-Bladder*, *BHI-Bronchitis*, *BHI-Eye*, and *BHI-Injury*.

Coenzyme compositum: Supports energy production.

Discus compositum: Used for long-term repair of deep connective tissue elements. This remedy contains several helpful ingredients, including *Ranunculus*, *Funicu-*

lus umbicalis suis, Mercurius precipitatus ruber, Glandula suprarenalis suis, Medulla ossis suis, and Zincum metallicum (Reckeweg 2002).

Flu Plus: Used for viral ulcers, based on the components Bryonia, Mercurius sublimates corrosives, and Zincum metallicum (Reckeweg 2002).

Galium-Heel: Provides general cellular support. Contains Aurum for corneal ulcers as well as Nitricum acidum and Conium (Reckeweg 2002).

Ginseng compositum: Contains several excellent remedies for ulceration or conjunctivitis, including Kreosotum, Hydrastis, and Conium (Reckeweg 2002).

Glyoxal compositum: Used for depolymerization of homotoxin polymers that can block enzyme function.

Hepar compositum: Provides hepatic drainage and support in chronic cases.

Lamioflur: Includes Nitricum acidum, Hydrastis canadensis, Kreosotum, and Mezereum (Reckeweg 2002).

Lymphomyosot: Treats corneal edema and swelling, and is immune-supportive.

Mercurius-Heel S: Provides antibacterial effects and support of localized ulcerative processes (Vestweber, et al. 1995, Reckeweg 2000).

Mucosa compositum: Provides drainage and support of mucosal surfaces, and support of ocular tissues. Contains several excellent remedies, including Hydrastis, Kali bichromicum, Belladonna, and Kreosotum (Reckeweg 2002).

Nasoheel: Contains Hydrastis canadensis, Kali bichromicum, Aurum muriaticum natronatum, Mercurius sulphuratus ruber, and Mercurius iodatus ruber, and provides strong support for corneal tissue that is ulcerated (Reckeweg 2002).

Oculoheel: Used for conjunctival irritation and ocular pain.

Pure eye drops: The topical form of Oculoheel.

Traumeel S: Activates blocked enzyme systems, and has anti-inflammatory effects.

Ubichinon compositum: Provides mitochondrial repair. Contains the eye remedies Conium, Hydrastis canadensis, and Ubiquinol.

Authors' suggested protocols

Nutrition

Eye support formula: 1 tablet for every 25 pounds of body weight BID.

Lutein: 5 mg for every 50 pounds of body weight.

Chinese herbal medicine/acupuncture

Formula Corneal Ulcer: 1 capsule for every 10 to 20 pounds, twice daily. Underlying causes such as ectopic cilia must be addressed or the condition will not respond well or will recur when the supplement is discontinued.

Homotoxicology

Acute ulcerations: Traumeel S BID for 3 days orally, Oculoheel BID for 5 days PO, Topical drops (Pure Eye Drops), BHI-Eye, Ginseng compositum, Coenzyme and Ubichinon. Use Nasoheel, Lamioflur, and Flu Plus for viral ulcers.

Chronic ulcers: Traumeel S once weekly, Mucosa compositum, Galium Heel, Discus compositum, and Oculoheel BID PO, Deep Detoxification Formula every 3 days for 30 to 120 days to stimulate regressive vicariation.

Deep detoxification formula: Galium-Heel, Lymphomyosot, Hepar compositum, Solidago compositum plus UriCleanse, Coenzyme compositum, Ubichinon compositum PO every 3 days.

GLAUCOMA

Definition and cause

Glaucoma's complex, multifactorial pathogenesis eventually results in increased intraocular pressure, and is characterized by optic nerve damage resulting in pain and progressive visual loss. Affected veterinary patients are usually asymptomatic until late in the disease's course. Oxidative DNA damage in the trabecular meshwork of glaucoma patients has been recently linked to glaucoma, as well as nitrous oxide alterations (Morgan 1999, Sacca 2005). Primary glaucoma is characterized by elevated intraocular pressure without concurrent ocular disease, often involving narrow angle glaucoma, with obstruction of aqueous outflow through the iridocorneal angle. Primary

open angle glaucoma is characterized by a more insidious onset, and is seen almost solely in beagles. Primary glaucoma is seen bilaterally and is most common in dogs. Glaucoma is rare in cats, and is most commonly seen as a complication of chronic anterior uveitis. Intraocular neoplasia can lead to secondary glaucoma and represents a Dedifferentiation Phase disorder, which is usually addressed by surgical removal of the affected eye.

Secondary glaucoma is characterized by elevated intraocular pressure associated with concurrent ocular disease, e.g., uveitis and/or intraocular hemorrhage (seen as a sequelae to diseases such as ehrlichiosis), neoplasia, and lens displacement. In uveitis, inflammatory mediators are liberated into the eye and alter the iridocorneal angle. Standard treatment attempts to control inflammation through the use of topical corticosteroids, along with other medications to reduce intraocular pressure. Dogs with anterior uveitis should not receive miotic agents (Picket 1997). Lens luxation has many of the characteristics of primary glaucoma, and is breed related, with a preponderance of cases involving Sharpeis and terriers. Surgical repair of lens luxation by removal of the luxated lens carries one of the best prognoses for managing long-term glaucoma.

The clinical signs of glaucoma, in addition to increased intraocular pressure, vary greatly by stage. In early glaucoma, episcleral venous congestion and conjunctival hyperemia are present, resulting in a red, painful eye (episcleral vascular congestion) with variations in vision. The pupil may be normal or slightly dilated with sluggish to normal papillary reflexes. Mild corneal edema may be present. Vomiting and a general feeling of sickness can occur in humans but is frequently missed as a significant sign in animals suffering from glaucoma. In more advanced stages, glaucoma signs include buophthalmos, corneal striae, optic disc cupping, and retinal degeneration, and possibly exposure keratitis and lens luxation. Pupillary reflex is often missing in advanced cases. Iritis, conjunctivitis, episcleritis, panophthalmitis, and trigeminal neuralgia are some differential diagnoses to be considered. Tonometry is needed to accurately diagnose this condition.

The goals of medical management of glaucoma include reducing intraocular pressure, improving blood flow to the optic nerve and retina, and decreasing the damage caused by toxic metabolites such as glutamate. In humans, risk factors include cardiovascular disease, diabetes mellitus (sugar diabetes), myopia (nearsightedness), high blood pressure, and migraine headache. Diseases of the sensory organs and of the nervous system may be induced by mercury toxicity. Retinal detachment may occur when the lymph system in the area of the eyes has been afflicted by an auto-aggressive immune system. Cataracts and disorders of the vitreous body can also demonstrate a similar

etiology. Hindrance of the outward flow of the intraocular fluid produced by the ciliary body, i.e., glaucoma, is induced at a certain percentage level by mercury (Nolte 1988).

A recent study in dogs suggested that collars and leashes could be implicated in a steep rise in intraocular pressure, which is similar to a human study that found a positive relationship in men who wore tight neckties (Pauli, et al. 2006). Thyroid disease has also been positively linked to glaucoma, as have other medical problems such as hypertension (Glaucoma Study Group C, 2006).

Medical therapy rationale, drug(s) of choice, and nutritional recommendations

A thorough ocular evaluation including intraocular pressure determination is indicated, and early referral to a veterinary ophthalmologist may be appropriate. Because certain medical conditions such as lens luxation and uveitis are associated with higher incidents of glaucoma, patients in these risk groups should be screened more frequently for glaucoma (Johnsen, Maggs, Kass 2006).

Surgery to improve the fluid flow through the eye or to decrease fluid production is generally the therapy of choice. With progressive painful disease, enucleation is often recommended (Picket 2003).

Anticipated prognosis

Glaucoma is a chronic progressive disease, and even with medical therapy blindness often occurs. Surgical intervention often improves the prognosis; however, progression of the disease often continues.

Integrative veterinary therapies

An integrative approach to glaucoma includes the addition of nutrients, medicinal herbs, and combination homeopathics to conventional medical therapy. These natural ingredients have anti-inflammatory, tissue-sparing, and regenerative effects on the eyes, and help to improve circulation and reduce intraocular pressure.

Nutrition

General considerations/rationale

While medical therapy is focused on stabilizing the intraocular pressure, therapeutic nutrition adds nutrients, antioxidants, and gland support to help reduce inflammation and improve circulation and function.

Appropriate nutrients

Nutritional/gland therapy: Glandular adrenal, thymus, and eye provide intrinsic nutrients and also help reduce

inflammation, improve organ function, and slow cellular degeneration (see Gland Therapy in Chapter 2).

Vitamin C: Vitamin C has been shown to help lower intraocular pressure in patients who did not respond well to conventional medical therapies (Fishbein 1972, Virno 1967).

Omega-3 fatty acids: In a study with animals, fish oil significantly reduced intraocular pressure as compared to other animals whose diet was supplemented with lard (McGuire 1991).

Chromium: Deficiencies of chromium and vitamin C are associated with higher intraocular pressure in people (Lane 1991).

Magnesium: Magnesium has been shown to act similar to a calcium channel blocker. Gaspar (1995) showed that magnesium improved blood supply and the visual field in people with glaucoma.

Chinese herbal medicine/acupuncture

General considerations/rationale

Glaucoma is due to stress, Liver stagnation leading to fire formation, and Wind and Fire rising up to the Eyes. In the author's interpretation, stagnation can lead to Heat or, in more severe cases, Fire. This can be likened to grass packed in a pile. It eventually becomes warm and under the right circumstances may even combust. This Heat or Fire in the Liver can manifest as ocular pathology as the Liver opens to the eyes in TCM theory. This Heat or inflammation can increase intraocular pressure. If it is severe, there may be retinal detachment and bleeding. Treatment is aimed at decreasing the intraocular pressure and protecting the vision.

Appropriate Chinese herbs

Angelica root (Dang gui): As strong as aspirin at decreasing inflammation and 1.7 times as strong as aspirin for pain relief (Yao Xue Za Zhi 1971). It may help decrease the ocular inflammation and discomfort associated with glaucoma.

Cnidium (Chuan xiong): Has anti-neoplastic effects (Liu 1993). It may be useful in cases of glaucoma secondary to neoplasia.

Cyperus (Xiang fu zi): Has demonstrated analgesic effects in mice (Gui Yang Yi Xue Yuan Xue Bao 1959). This may help control the discomfort of glaucoma. Note: This effect is mild. Western pain killers must be given if indicated.

Haliotis (Shi jue ming): Has been shown to protect the eye. It prevents D-galactose-induced lens damage in rats and prevented the formation of cataracts (Huang 1997).

Licorice (Gan cao): Can improve the general condition of blood vessels (Xu 1997). It may also preserve intraocular blood vessels damaged by high pressures.

Oyster shell (Mu li): Has demonstrated anti-neoplastic activity (Wang 1997). It may be beneficial in glaucoma of neoplastic etiology.

Peach kernel (Tao ren): Decreases inflammation (Liu 1989). In one experiment it was shown to inhibit the proliferation of inflammatory cells and fibroblast hyperplasia in subjects of experimental trabeculae dissection (Wang 1993). It also has anti-oxidation effects. It can increase the activity of SOD (Jiang 1995). As mentioned above, oxidative damage may be linked to the development of glaucoma.

Plantain seeds (Che qian zi): Can decrease intraocular pressure, as was demonstrated experimentally in rabbits (Li 1990).

Prunella (Xia ku cao): Can reduce blood glucose in normal mice as well as in mice with alloxan-induced diabetes, and can improve glucose tolerance (Liu 1995). Open angle glaucoma is linked to type II diabetes in humans (Bonovas 2004). Similar factors may occur in animals.

Salvia (Dan shen): Inhibits neoplastic cells (Li 1999).

Siler (Fang feng): Has demonstrated some efficacy against neoplastic cells (Li Li, et al. 1999). It may be of use in glaucoma secondary to neoplasia.

Skullcap (Huang qin): Contains baicalein, which has anti-neoplastic effects (Zi 2005). Again, this herb may be helpful in cases of neoplastic etiology.

Acupuncture

Acupuncture has been shown to affect the eye. In one study using Doppler flow ultrasonography, acupuncture at BL2, TH23, SI6, and GB37 was shown to increase the blood flow through the supratrochlear artery, which is the inner end branch of the ophthalmic artery (Litscher 1998). It has been reported to be useful in treating glaucoma (Ralston 1977).

Homotoxicology

General considerations/rationale

Glaucoma is a complex medical condition and can encompass Inflammation Phase through Degeneration Phase homotoxicoses. Generally speaking, most cases presented to veterinarians are in the Impregnation or Degeneration phases, and carry a correspondingly poor prognosis for long-term success with only medical therapy.

Homotoxicology therapy may be attempted after emergency management of ocular pressure in an attempt to reduce damages from homotoxins. Further research is needed to determine how effective biological therapy is in altering the disease course and in improving patient conditions.

The reader should note that, as for other areas of homotoxicology, many symptoms that are useful in pre-

scribing classical homeopathic remedies are hard to verify in animals. Therefore, the clinician choosing to use antihomotoxic medicines must make every effort to observe his patients carefully and may need to make certain educated guesses when choosing therapeutic agents. Fortunately, antihomotoxic medicines are generally safe when taken for short periods of time, so it is unlikely that any serious conditions would arise from selecting an incorrect agent.

Appropriate homotoxicology formulas

Standard medical therapy should be initiated and emergency steps taken to stabilize intraocular pressure. Antihomotoxic drugs to consider for augmenting therapy are:

Barijodeel: Used as an alternating remedy in cases involving arteriosclerotic causation (Reckeweg 1996). This remedy contains several useful therapeutics, including Aconitum, which repertorizes in the classic homeopathy realm, and Calc iodatum, which is used for activating mesenchymal processes and is useful for corneal disease such as conjunctivitis and corneal ulcers. It also contains Ignatia for eye symptoms that may include optical illusions, e.g., white, flickering, shining zigzags at the periphery of the field of vision, as occurs in detachment of the retina. Another strong component is Stramonium for dilated pupils in every affection and diseases accompanied by impairment of emotional and/or psychological functions, as well as inflammations of the eyes (Reckeweg 2002).

Belladonna homaccord: Belladonna's typical action on the eyes is characterized by symptoms referable to atropine poisoning, such as cramps in the muscles of the eyes and eyelids, enlargement of the pupils, and an inflammatory condition of the conjunctiva with photophobia, lachrymation, and pain. This is linked with engorgement of the inner blood vessels, weakness and dimness of vision, and disturbances of vision including sparks, fire, fog and diplopia, all pointing to the retina being affected. There may be a right-sided ciliary neuralgia, which is also seen with Kalmia, Sanguinaria, Chelidonium, etc. (Reckeweg 2002). A published clinical report involves the reversal of canine glaucoma in a 10-year-old Shih Tzu with previously unresponsive glaucoma, using twice weekly injections of *Belladonna homaccord* in combination with Euphrasia Eye drops (Bidarte 1997).

BHI-Eye: Contains Belladonna and Euphrasia, which has strong indications for eye pathologies, including spasmodic photophobia, pains and pressure in the eyes, acute conjunctivitis, coryza with lachrymation, chemosis, blepharitis, corneal ulcers, and iritis (Reckeweg 2002).

BHI-Inflammation: Used for generalized inflammatory conditions. Contains Belladonna, which has strong indicators for eye pain or irritations of the conjunctiva with

photophobia, lachrymation, and engorgement of the blood vessels (see above) (Reckeweg 2002). This is also common to many other remedies that may be used, including: *Belladonna compositum*, *Belladonna homaccord*, *Mercurius*, *Mucosa compositum*, *Traumeel*, *BHI-Eye*, and *BHI-Injury*.

BHI-Perspiration: Contains Cedron, which is reported to have a beneficial effect on neural origin pain that accompanies iritis and glaucoma. It has been used in malaria with tumor of the spleen, anemia, and dropsical symptoms, and particularly in recurrent fevers. Thus, it might be useful in a disease such as ehrlichiosis. Jaborandi, which contains pilocarpine, is known for its qualities as a diaphoretic, which promotes sweating, and as a myotic (i.e. causing the pupils to contract).

Heinigke, in Meilman and Krayner (1950), describes the action of Jaborandi in the form of an infusion containing 6 grams of the leaves as follows: "The face immediately flushes, the temporal arteries begin to throb, and a strange sensation of heat occurs in the mouth and face—an agreeable feeling of warmth predominates." In patients poisoned by this agent, there are also palpitations and an irregular pulse. This symptom picture of the effects of pilocarpine, which is the main active ingredient of Jaborandi, can be used to good effect according to reversal effect and the Law of Similars in visual disorders, such as difficulties in accommodation and spasms of the eyelids. This is similar to a clinical picture seen in a study on Veratrum alkaloids, in which specific extracts were injected intravenously (Meilman Krayner 1950).

A 1% to 2% solution of pilocarpine is used in ophthalmology to contract the pupils, e.g., in injuries to the iris and in glaucoma. Pilocarpine has a less powerful action than eserine, so the accommodation is affected to a lesser degree and there is a decreased tendency toward the enhancement of iritis.

The component of nitric acid is indicated in classical homeopathy for inflammations of the eye, with specks on the cornea, corneal ulcers, photophobia, and constant lachrymation. Sulphuricum acidum is indicated for numerous symptoms anywhere from the Reaction Phase to the Degeneration Phase. There is a typical taut feeling in the facial skin and ptosis of the upper eyelids, which may be accompanied by conjunctivitis with photophobia and dimness of vision. Petroleum is included for patients with skin conditions that may extend to the mucosa of the eyes, with dacryocystitis, lachrymation, easy tiredness of the eyes, weakness of vision, and floaters (Reckeweg 2002).

Coenzyma compositum: Supports energy production.

Cruroheel: Suggested in the Biotherapeutic Index as an initial therapeutic along with *Veratrum homaccord*. It contains several remedies with homeopathic indications for glaucoma: *Lycopodium clavatum*, *Hamamelis virginiana*, *Apis mellifica*, and *Pulsatilla pratensis* (Smit 2006).

Galium-Heel: Used for general cellular support. Contains Aurum, which is indicated for corneal ulcers and visual disturbances such as hemianopia. Also contains Nitricum acidum and Conium. The component Saponaria is useful in elevations in intraocular pressure (Reckeweg 2002).

Gelsemium homaccord: Particularly useful for iritis, retinitis, and accompanying headaches (Reckeweg 2000). Consider its use in cases showing violent congestions in the head. These are associated with headaches and neuralgias, particularly migraines, in which the pains may be dull or sudden or shooting. Nausea may also be linked with the headache. *Gelsemium homaccord* is also indicated in nervous insomnia and in glaucoma (Reckeweg 2002). Practitioners are advised to administer frequent small doses in the sense of cumulative stimulation therapy to achieve radical and speedy effects. This is useful for treating painful conditions, particularly headaches and cervical migraines. The ampoule form can be used to better and more radically influence the defense mechanisms (Reckeweg 1987). It can be administered in acute cases to initiate regulation (Reckeweg 1998).

Paralytic symptoms, diplopia, double vision, and ptosis may be present in cases benefiting from this agent. Double vision is very characteristic; giddiness and pains in the eyeballs are sure indications for the remedy in human patients. Intra-ocular inflammations in which serous exudations occur, dull pains, double vision, and vertigo, as well as serous iritis and choroiditis where there is a gradual impairment of vision are other indications for its use. Another symptom that may direct use of *Gelsemium* is the inability to accommodate quickly. *Gelsemium homaccord* has been used for detachment of the retina and in strabismus from weakening of the muscles. *Gelsemium* is one of the most valuable remedies in glaucoma, often palliating the severe pains and improving the neurotic symptom of the disease. It dilates the pupil through its paralyzing effect on the third cranial nerve (Hpathy 2006).

Glonoin homaccord: Nitroglycerin (Glonoinum) can be used harmlessly in low dilutions for long durations as an auxiliary remedy in glaucoma (Reckeweg 1996). The main indications for nitroglycerin include hypertension, migraine, cranial congestion, and glaucoma (Hamalcik 1992). *Glonoin homaccord* is currently unavailable in the United States, but Glonoinum is common to other remedies, including *Cactus compositum*, *Cor compositum*, *Strophanthus compositum*, and *Ypsiloheel* (Reckeweg 2000). *Ypsiloheel* is a fairly logical selection (see below).

Glyoxal compositum: Used for depolymerization of homotoxin polymers that can block enzyme function.

Hepar compositum: Includes Pancreas suis for dryness of the eyes; burning pain in the eyeballs; and dim, distorted, or loss of vision. Veratrum, Lycopodium, and

Sulfur are also included in this valuable drainage agent. Hepar compositum can have surprising effects on a wide variety of ocular issues in dogs, cats, and humans. Many patients who undergo desirable regressive vicariation resulting from antihomotoxic drugs manifest ocular changes such as increased redness and mucous discharge. This clinical observation is in agreement with information first reported in Traditional Chinese Medicine concerning a relationship between the Zang fu organ (Liver) and the Eye (Maciocia, 1989).

Hepeel: Used for detoxification of the liver. It contains Veratrum, Lycopodium, and Phosphorus.

Kalmia compositum: Treats accompanying iritis.

Lymphomyosot: Used for corneal edema and swelling, and is immune supportive. The ingredient Equisetum is particularly indicated in cases of kidney disorders and can also be very effectively applied in cases of glaucoma, owing to its diuretic and “channeling” actions (John 1991).

Mucosa compositum: Provides drainage and support of mucosal surfaces, and support of ocular tissues. It contains several excellent remedies, including Hydrastis for mucosal suppuration that is accompanied by ulceration. Kali bichromicum, Belladonna (see *Belladonna homaccord*), and Kreosotum are included for when the eyelids are also inflamed, for conjunctivitis, and for severe reddening and swelling. It possibly treats Meibomian cysts and styes. The ingredient Pancreas suis is indicated in dryness of the eyes; burning pain in the eyeballs; and dim, distorted, or loss of vision. Phosphorus (see *Phosphor homaccord*) and Sulphur (see *Spigelion*) are also included.

Nasoheel: This remedy, which includes Hydrastis canadensis, Kali bichromicum, Aurum muriaticum natronatum, Mercurius sulphuratus ruber, and Mercurius iodatus ruber, has strong support for corneal tissue that is ulcerated (Reckeweg 2002). In addition, the Mercurius components may be valuable if the intraocular pressure is in response to an elevated level of mercury in the body (Nolte 1988).

Oculoheel: Works by way of constituents specific for eye complaints. It contains the following remedies, with their indications: Apis mellifica for conjunctivitis and edema of the eyelids; Natrium muriaticum for dacryocystitis and burning, acrid epiphora; Rhus toxicodendron for conjunctivitis with a tendency toward suppuration, edema of the eyelids, and epiphora; Hepar sulfuris for tendency toward suppurations, chalazions, and hordeolums; Spigelia for neuritis, ciliary neuralgia, and trigeminal neuralgia; Staphisagria for hordeolums, chalazions, blepharconjunctivitis, and dacryocystitis; and Aethiops mineralis for ophthalmia and keratitis (Reckeweg 1996). Also contains Sulphur, a critical agent in mesenchymal therapy.

Phosphorus homaccord: Phosphorus is a component that is useful in eye problems, such as those in which there

is hypersensitivity of the sensory organs, and in eye diseases in which there are black spots dancing in front of the eyes or the patient may see as if through a mist with momentary states of blindness (Reckeweg 2002). Phosphorus cases may have hyperemia of the choroid and retina, and also amblyopia and asthenopia (Hpathy 2006). Also contains Paris quadrifolia (see *Ypsiloheel*).

Psorinoheel: Used for chronic phase diseases.

Pure eye drops: The topical form of *Oculoheel*.
